VENTILATION BY THE STEAM JET .- An application VENTILATION BY THE STEAM JET.—An application of the steam jet to the ventilation of a coal mine bas just been made by Mr. F. H. Pearce, of the Bowling Ironworks, near Bradford. A jet of steam issuing from the top of a set of pipes produces in them a partial vacuum, which draws the foul air with great velocity up these pipes, and thence out of the pit into which they run. The cost is said to be very trilling. Wood or any other kind of mines may be used. Little Which they run. The cost is said to be very trilling. Wood or any other kind of pipes may be used. Little or no attention is required, and there is no machinery to get ont of repair, while a powerful current of air, which can be regulated at pleasure, is produced. The where tan us regulated as passate, is provide a loss steam is discharged into the atmosphere above the top of the pit, and does not interfere with the men working in the shaft. Manufactories or other places where steam is in use, or can readily he got up, might thus be ventilated. The principle might he made good use of, one would think, on ship board.

BIRMINGHAM ARCHITECTURAL SOCIETY. BISMINGHAM ARCHITECTURAL SOCIETY. -- The session of this Society commenced on Monday evening in last week, on which occasion Mr. F. Empson, the President, delivered an address. The observations referred principally to the position and prospects of the society, which are of a very cheering nature. One subject of general interest was men-tioned in alluding to questions on which discussion was invited. This was the great disfigurement which is heig perpetrated on some of our public buildings. was invited. This was the great disfigurement which is heing perpetrated on some of our public buildings by external means of ventilation. Mr. Empson drew attention to the enormous appliances which have heen put upon the roof of St. Martin's Charch, which are not only ugly in themselves, hat are so prominent as not only ugly in themselves, hat are so prominent as to take attention entirely from crevy other part of the building. The speaker thought that some means onght to be adopted to prevent such a barbarous plan of destroying the heatly of our buildings. In this opinion the meeting joined, it heing asserted that it would be easy for the designer of a building to adopt any system of ventilation without so seriously injuring the building, and that it was very unjust to an archi-tect to allow any other person so to interfere with and damage his design. A cordial vote of thanks to the President for its many brought the proceedings and damage his design. A cordial vote of thanks to the President for his paper brought the proceedings to a close.—Birmingham Gazette.

SANITARY STATE OF SYDNEY .- In a recent number SANITARY STATE OF STONEY.—In a recent number of the Sydney Magazine of Science and Art, just come to hand, there is a paper read before the Philo-sophical Society of Sydney on the sanitary condi-tion of the town, by the Registrar-General of the coloury, Mr. C. Rolleston; from which it appears that "the rate of mortality in Sydney in 1856 to 1857" "the rate of mortality in Sydney in 1856 to 1857 exceeds that of London in a year of cholera, and the mean deaths of the whole of England for the last screnteen years, by 0.266, or 4 per cent." There is something here radically wrong. The deaths of children mader five years of age, a good test of the general health, are over 8 per cent. In excess of that of the city of London, and over 4 per cent. of the deaths of all England. Poverly or want is a very trilling cause of mortality at Sydney, but drankenness and habitnal intemperance a very serious and prevalent one. Of the want of adequate drainage we have be-fore sculer. fore spoken.

ELECTRIC LIGHT .--- Mr. Charles W. Harrison, Woolwich, has patented some improvements in the production of the electric light. He places pieces of nictal, or other suitable material, in gas retorts, or in tubes connected therewith, for the purpose of receiving a deposit of gas carhon, nutil they are coated to the desired thickness, and he then ents or grinds them to the required form of electrodes; or, secondly, he uses electrodes of spongy or powdered metals, prepared by compression into any desired shape. He produces lights of various colours, according to the metals used. For the positive electrode he employs a circular dise, which is kept in position by a small roller.

LOCAL BOARDS OF HEALTH APPOINTMENTS .- Will ou assist myself and others (by publication in your in-aential journal) in bringing from under the bushel the light so modestly hid of the generous liberality, now be-coming so prevalent, of incorporate bodies and local alth, towards enndidates for surveyorsbips, boards of be in inviting five or six to attend the board, and at the same time politely intimating to them that their ex-penses will not be paid? Now, sir, inasmuch as these onsiderate gentlemen make it optional with the candidates whether they attend or not, I cannot complain, dates whether they attend or not, I cannot complain, though of course some who bad been nnsuecessful would partly attrihute it to their non-attendance; but what I do cry shame npon is that so many should be thus unnecessarily and (I must call it) nujustly selected upon the same likeral terms, when, say two, or even three, who had the largest number of votes, might be invited, and the expenses of the one or two nusuc-cessful ones paid, as would be only just. Let me ask those liberal-spirited gentlemen, members of councils, how they would relish having to travel one, two, or even three hundred miles, to be not only disappointed, but mortified hy having to pay for that privilege?

DECLAMO.

INDUSTRIAL SCHOOL FOR MIDDLESEX.—At a general meeting of the Middlesex county magistracy on the 15th instant, a special report was brought up from the committee appointed under the 18th and 10th the committee appointent nuclei the automatic 19th Vite. I. 169, to provide an industrial school for the juvenile offenders of the county; and apon the motion of Mr. E. E. Autrohns, the chairman, seconded by Mr. Armstrong, a resolution was passed authorising the committee to carry out the plans, as approved by the Home Secretary, at a cost not exceeding 53,000/

KINGSTON-ON-THAMES, SURVEY. — PARISH AS-SESSMENT.—At a meeting of the Board of Guardians for the Kingston Union, on Tuesday last, fifty-six tenders were received for a new survey and valuation of the parish, the amounts varying from 1907. to 1,0007. The guardians decided on accepting the 1,0007. The guardians decided on accepting the joint tender of Mr. J. Wornbam Penfold, of Char-Joint tender of Mr. J. Wornbah Penton, of Chat-lotte-row, Mansion-house, and Halsennere, Surrey, and Mr. E. Kermock, of Kingston, who will make an entirely fresh map and valuation of the whole parish; and we think, now the matter has been placed parsa; and we fining, how the matter in social practice in the hands of these generations in the fair and equal assessment will be made, and thus put an end to the appeals which have been so frequent of late, and been the cause of so much expense and dissatisfaction to

all parties. Sussex Express. LECTURE ON EARLY ART.—The session for the winter quarter of the Croydon Literary Iustitution opened last week, when Dr. Kinkel, of the University of opened last week, when Dr. Kinkel, of the University of Rome, gave a lecture on "Early Christian and Byzan-tine Art." The decay of heathen religion and art towards the commencement of the Christian era, the extacombs of Rome, the cradle of a new style of art, the early churches, the Roman judgment hall trans-formed into the Christian meeting-bouse, the founda-tion of the Byzantine empire, its character of de-spotism and splendour, the cathedral of St. Sophia at Constantionele, the mosaic paintings used in the ornamentation of the Byzantine places of worship, and the influence that all these exercised ou Russian ornamentation of the Hyzanime pieces of worsaip, and the influence that all these excretised ou Russian and Mahometan nations, were treated of with care. RE-OPENING OF Sr. MARY WOOLNOTH CHURCH, LOMMARD-STREET,--The Standard says, this church,

which has been for some time closed in consequence of heing nuder repair, will be re-opened for Divino worship on Sunday next. The church, as many may worship on Sunday next. The ennred, as many may how, stands in a commanding position forming the western angle which connects Lombard-street and King William-street, and was designed by Hawksmoor. The front and the whole exterior have been eleansed and restored hy Messrs. Colls, of Camberwell, builders. The interior has also been decorated by the same builders. THE MARKET CROSS AT ENFIELD. - May I be

THE MARKET CROSS AT ENFIELD. — May I be allowed to call your attention, and hy so doing the attention of the London and Middlesex Archaeological Society, to the market cross at Enfield, a neat cree-tion in the Gothic style, and one which Sperling, in this "Church Walks in Middlesex," says, "is a market cross of some merit, considering that it was creeted about twenty years ago; " hat which, at pre-sent, appears to be little more than a mark for the boys of the place to throw stoces at. The iron rails roroand it are broken, and the whole hears the appear-ance of premature decay. I trust that a very short time will see a restoration.— O. S. THE LATE M. ZANTH, ANCHTRET.—The news-

time will see a restoration.—O. S. The Larte M. Zavrin, Arcuitrect.—The news-papers mention the death of M. Zauth, architect to the King of Wartenberg, and designer of the magnit-cent Moorish *chilten*, the "Wilhelma," often named during the late Court festivities in and about Stuttgardt. M. Zanth, who was associated with M. Hittorff in his fine works on the buildings of Sielly, was a corresponding member of the Institute of British Architects. He was an exquisite draughts-ware man

RAILWAY MATTERS.—The foundations of two vialuets on the South Durham and Lancashire Union Railway were kaid on the 15th inst. One of them, the Tees Viaduct, has been contracted for hy Mr. Kennard, who built the Crumlin Viaduct: the other, Actinate, was out the Granut vindet: the Ghar, the Deephere, has been taken by Messrs. Gilkes, Wilson, and Co. of Middleshorough. Both will rise to the height of more thau 150 feet, and span valleys of great width. The principal viaduct on the line, bowever, will he over the river Beelah. This will be 192 feet high.

SURVEY OF ST. LEONARD'S, SHOREDITCH.—At a meeting of the vestry, to consider tenders for the survey and valuation of the Eastern Counties Railway nud station; the works belonging to the Imperial, Independent, and Chartered Gas Companies; the pipes and mains belonging to the New River and pipes and mains belonging to the New River and East London Gas Companies; and all assessments now rated above or at 150% a year; the tenders of Mr. Hughes, Mr. Paine, and Mr. Liddiard were re-commended by the committee for adoption. The tenders ranged between 80% and 300% the last-numed heing 80%. The final appointment is specially ap-pointed to take place on Toesday, 27th inst. JAMES SAUNDERS.

CAMBRIDGE MUSIC HALL COMPETITION. — As your Cambridge correspondent has fallen into a slight error in his remarks last week, in the Bailder, on my design (No. 2, " London") for the proposed new music-hall, which, if not corrected, might bave a prejudicial effect on the minds of the committee in their selection,—I beg to say, the roof and ceiling are not constructed with a sequential briek arch, but with laminated timber ribs, as deserthed in the speci-fication—the construction is not shown in the fair drawings, but all the sectional parts are tethed with a red tiut, which has been mistaken for briek-work. The conditions of the competition state that each set of designs is to he accompanied with a sealed error laps, containing the address of the author. If con-ditions are given, the committee are bound to keep ditions are given, the committee are bound to keep to them: of course I expected so, or should have given

The Actrons ARISTO GUT OF THE CHELMSFORD STWACE.— Writs have been served upon several indi-viduals, according to the local Chronicle, as parties concerned in the fouling of the water in the river by means of the sewage, with notice of intention to claim an injunction to restrain the proceedings com-plained of. The allegation is that these individuals take so little care of the sewage on their premises that it flows into the Chelmer and pollutes the water, thus cansing "smalls, gases, and effluxia offensive to the small and injurious to the bealth of mankind, to seascape from the polluted water of the said river, and to spread over the hand of the plaintiff end ingones to the said river, and into, throughout, and labout their mill." A writ has also, it appears, been served upon the local board of health; the com-plaint, of course, being the same, as applicable to

Indout their mill." A writ has also, it appears, been served upon the local board of health; the com-plaint, of course, being the same, as applicable to the general sewage. The DISNEY PROPESSORSHIP OF ARCHEROLOGY.— The following was issued at Cambridge University on Monday.— "The Viee-Chancellor has great pleasure in anouncing to the Senate that the late John Disney, eq. of the Hyde, Essex, to whom the Uni-versity is indekted for the foundation of the Disney uprofessorship of archaeology, and for the Disney on-lection of ancient marbles, has further shown his cregard for the University, and his desire to promote this own favourite study, by bequeatbing to the chan-cellor, masters, and scholars the sum of 2,500. Three per Cent. Consols as an augmentation of the Disney professorship of thercheology for ever." SUEPOIX ABELIOLOGICAL ASSOCIATION.— The quarterly meeting of this societly was held on the 9th inst. at Halleigh, president the Rev. Lord Arthur Hiervey. The company met in the Town-hall, around the walls of which were arranged a collection of rub-bings of brasses, ehiefly from charches in the county, was the day correct on of Billey the sum of a scheduley the was the scheduley of rub-bings of brasses, ehiefly from charches in the county.

THE BUILDER.

MELROSE ABBEY .- The condition of this noble MELLOSE ADBET--The condition of this noble ruin, says the Scotsman, enamhered in the interior by masses of masonry of comparatively modern origin, and externally disfigured by intrusive walls, bas attracted the attention of several persons of taste in the neighbourhood, who have begun to inquire whether something could not be done to remove these anseemly adjuncts. Among others, Mr. David Cousin, the architect, happening to reside in Melrose during the summer, naturally became interested in the mater, and a letter addressed by him to Mr. William Thit, of Prior Bank, explains the nature of the disfigurements, and the desirableness of having them removed so as to hring out the original features and proportions of this magnificent monument of Gothic architecture. this magnificent monunent of Gothic architecture. Mr. Cousin remarks that the removal of the wall and arching objected to would display not only the beautiful carring of the old pillars, but also the original form of carring of the old pillars, but also the original form of the arches of the clerestory windows, and that the excressences could be safely removed. Sir Walter Scott, it seems, many years since, strongly urged the removal of the extraneous masonry.

LAMBON CASTLE.—Extensive changes are con-templated in this mansion, by Lord Durham. The old coal workings which fractured its walls are being built up with solid brickwork, and four of the seams out of six have been secured. The work is progress-ing as rapidly as possible, under the superintcudence of Mr. Heckels, his lordship's mining engineer; but the principal part of the castle is so much multilated that it must be taken down and rehuilt. This will afford an encountribute of constructing it on a work that it must be taken down and rehnilt. This will afford an opportunity of constructing it on a more regular and compact plan, avoiding the defects which generally arise in buildings when additions have been made to them at various times. His lordship has employed Mr. Dohson, of Newcastle, architect, to make the requisite designs for rehnilding the body of the castle, which will he commenced as soon as the stratification below is made sufficiently solid to bear the weight of the superstructure. the weight of the superstructure.

the weight of the superstructure. LANDED ESTATE AND OTHER PROPERTY.—Cer-tainly a landed estate is "an animal with its mouth always open:" but compare the physical perception and enjoyment of landed wealth with that of consols and securities. Can I get us rosy checks, health, and good humonr, riding up and down my Peravian Bonds? eas I go out shooting upon my parchment, or in summer sit noder the shadow of my moritage deed, and bob for commas and troll for semicolous in w river of liak that meanders through my meadow acco, and bob for commas and troll for semicolous in my river of lisk that meanders through my meadow of sheepskin? Wherefore, I really think land will always tempt even the knowing ones, nutil some vital change shall take place in society; for instance, till the globe makes its exit in smoke, and the blue cur-tique glowe down on the creation.—*Charles Reade's* New Ste

extent, that the celebration of service there has been stopped for the present. Hisron Sr. GEORGE, SOMERSET. - A design for a mural monument has just been selected by the Countess Poulett, to be erected here, in memory of Contess Poulet, to be creeted here, in meniory of her children, the last of whom died hut very recently. It consists of a figure, to be executed nearly life-size, in white marble, of Resignation under Berearement; one foot resing upon a plinth, which is inscribed with the words, "Not my will hut Thine be done," indicating the support derived from the promises of God's word; while beneath, with suitable architec-tural detail, will be arranged the inscription panels. It was designed and is now being executed by Mr. Physick, sof London, culptor. CURIOUS SPANISI INVENTION-—A gentleman re-siding in Conba bas invented a peculiar system of

siding in Chab has investional a peculiar system of propuling vessels. His plan proposes the building of windmills on the decks, with great wings, from which the motion is communicated to side wheels similar to the motion is communicated to side wheels similar to those of steamships. The models, it is said, have heen successfully worked, and it is expected that a windmill ship will be able to sail just as well with a contary as with a fair wind, because, it being perfectly easy to alter the position of the wings, they may be always opposed to the wind, whatever direction it may blear from blow from

FONTHILL .- It is stated that the Marquis of Westminster, in addition to Motombe House and Eaton Hall, and a palace in London-is building a palace at Fonthill, from the designs of Mr. Barn, architect.

Builder. The

OVEMBER, into which we shall enter next week, may be regarded as the commencement of the Architectural season, though not exactly the season for building. The Institute will hold its first meeting on Monday next: the Association has got into work, and so has the Liverpool Architectural Society: part of the clahorate inaugural address delivered thereat will be found on another page. The Institution of Civil Engineers will hegin its session on the 10th* The Architectural

Institute of Scotland, which has been doing its work well, and has published some admirable papers, + will also, we suppose, commence as usual in that

month : the Architectural Exhibition will open its doors to receive inventions and materials (designs will he taken in at the commencement of the month following); and, in short as we said above, the architectural scason will begin. Considerable activity, too, prevails, and a busy time may be looked for. Of the Institute of Irish Architects we do not hear much. There is some talk, we believe, of its re-construction on a broader basis : we shall rejoice to hear of its successful accomplishment. With reference to the sister-island, by the way, we have been asked to mention that a new professional journal for Ireland, entitled The Architect and Engineer, is to appear with the coming year. We do so willingly, hut we must also say that to ensure success it must be earried on with stronger resolves and hetter arrangements than accompanied some recent attempts of a similar kind there.

The Architectural Photographic Society now numbers in its ranks nearly 600 members, and ought to be able to give a rich return for the guinea subscribed. The committee have made arrange. ments with artists to supply them with views in France, Belgium, Spain, Italy, Malta, Athens, and Constantinople, and in our own country they expect to have a large and fine collection, from which the subscribers will he able, with some restrictions, to choose their own subjects. As they make their arrangements directly with the photographers themselves, the cost will be greatly reduced. Already, too, many photographers in Italy and Spain, and England, have endeavoured to conform with their expressed wishes, which will, in the end, render the views more serviceable to the profession. Next year the committee have every reason to hope to extend their operations into Asia, and to the re. maining countries of Europe.

The Architectural Union Company is making progress, though not so rapidly, considering the importance of the object to he achieved, as could be desired. About 800 shares have been subscribed for, and doubtless, when the Institute and other hodies meet, a fresh impulse will be given to the arrangements. The main terms as to the purchase of the house have been agreed upon, and the preparations neces-sary for obtaining tenders for the altera-

* The list of premiuns awarded, and subjects for which premiums are now offered, is published : we shall refer to it on another occasion.

are said to he in hand. A handsome seal thought has been shown, to which we shall have has been prepared for the company. It is other opportunities to refer. inseribed round the upper half, "Concordia Domum Dat ; " round the lower, " Architectural Union Company. Limited." The house provided for the architectural family, the Institute, the Association, the Exhibition, and other bodies, in the shape of a Greek Doric portico, forms the background. Concordia, a somewhat lusty matron, with a wreath in her left hand, invites the Past, Present, and Future, to enter the home. An old man, with records and fragments, represents the Past; a young man, with his plans, an Ionic capital and a Gothie pinnacle at his feet, the Present; and a naked hoy, to show probahly that he is not wrapped in prejudice of any kind, the Future. Concordia is generally represented on coins, if we remember rightly, with a cup in one hand, and a cornucopia in the other; and if so accompanied on the medal would have been more easily recognizable. Misconstruction was perhaps feared. As it is, wags will prohably see in the old man, the Institute; in the young one, the Association; and identify the ohild, at their feet, as the lusty tertium quid, to result one day from a union. View it as they may, however, the seal is an interesting production, very creditable to Mr. Owen Jones, who kindly designed it, and to Mr. R. Monti, who made the model from which the die was engraved. We look anxiously to see the promising and capable Present tako possession of the new Home, there to make the hest use it can of the Past, and provide handsomely for the Fature.

Next year it may be expected the Architectural Exhibition will be held in Conduit-street : on the present occasion it will take place in Suffolk-street, as before, hut with a difference, for very considerable alterations, which we have no donht will he improvements, are being made in the Gallery.* The roof of the large room was a elnmsy and ill-arranged affair, carried partly on ohstructive columns, and the walls, it will he remembered, were very hadly lighted. The roof has heen cleared away, and au entirely new roof is being put up hy Mr. Smallman, huilder, from the designs of Mr. Charles Fowler, jun. It consists of three pairs of principals, with half principals, at each end, so placed as to make the plan of it an elongated octagon. The principal rafters have no tie-heam, but there is a collarheam about 6 feet up from the foot of the rafter, and this collar is secured to the rafter hy strong iron angle ties on the face of both. + A cove is formed from the foot of rafters up to the collarheams, at which npper level there will he a flat ceiling, mostly of ground glass : hehind this at night, gas will illuminate the apartment, without heating it disagreeably ; while for day-light the outer roof will he glazed to the extent of 18 feet on each side of the ridge. The walls will be hung with canvass, painted in patterns, and the cove, we understand, will he decorated with the figures of eight kings, painted hy Mr. Hurl-stone, the president of the Society of British Artists, to whom the gallery belongs, with representations on each side of them of the artists whom they encouraged. In this, as in most things now going on, a desire is evident to do something a little hetter than was thought sufficient a few years ago. Every uew building of any size shows the same feeling: in most of them, either in the shape of colour or of sculpture, some attempt at decoration is made. In the various competitions, too, which have

The report of the committee and balance sheet, 1856-7, are now hefore us. The latter shows that the payments, including 154. returned to Architectural Asso-ciation, and 344. to members of the committee, were 4251. 198. ed. The receipts and subscriptions were 4271. 68. 6d. leaving due to Hon. Secs. 11. 135.

tions proposed to be made in the premises lately taken place, considerable freedom of

Concerning the designs for the Government Offices, nothing has been beard since the decision. The same mystery prevails as to the proposed Wellington Monument in St. Paul's Individual sculptors, considering the matter still open, are active in making known their own particular views; but of the intentions of Government in the matter we shall prohably know nothing before the meeting of Parhament.

The designs for the Cambridge Music-hall have been on view during the whole of the present week. The consideration hy the town council of the question as to whether the present Town-hall is to he altered or not is deferred until the 9tb of November, when the point will most likely be finally decided one way or the other. This we suppose will influence the decision as to the Musie-hall. We are sorry to find that the impression appears to be that a Music-hall will not he hnilt, and that the committee appealed to architeets for designs without sufficient grounds for beheving that they would he in a condition to carry out the scheme. One of our correspondents, however, says,-"It is not known when the selection will take place, but there is no doubt that full justice will be done to all hy securing the aid of competent architects in weighing the morits of design and detail exhibited in the works of the various competitors." It is to be hoped that he will prove correct.

In the Blackburn Infirmary matter the com-mittee have awarded the first premium, 1007. to Messrs. Smith and Turnbull, of Manchester, and the second to Messrs. Hibbert and Rain ford, of Preston. Even at this distance from the scene we could give evidence of personal canvassing on the part of unsnceessful com petitors, not in accordance with the published conditions of the competition. The Preston conditions of the competition. Guardian, with a perception of the real stake played for, not always exhibited hy non-pro-fessional papers, asks who is to carry ont the design ? and says,-

"The committee are bonnd in fairness to employ "The committee are bound in fairness to employ one of the firms who have been awarded a prize. We are aware that a discretion in this matter was re-served by the conditions under which plans were sent in ; and we can imagine that such a proviso was ex-pedient to guard against a possible evil. But two firms have passed through a severe ordeal, and their abilities in this peculiar architecture have received a practical recognition. The best possible test has been applied, and the result is satisfactory. We wish, however, to impress upon the committee the nearly self-evident fact that the prizes are by to means an adequate compensation for the sublities and habour expended upon the designs. The cost to the anthors of the seventy-three sets of plans could not have been less than 6007. ; their value and cost, if ordered and paid for, would range between 1,5007. and 2,0007. The prizes together only amount to 1507, ; so that the inadequaey of the reward to the risk incurred is palpable."

Again,-

" Let the profitable part of the work go where the merit and risk came from. There can be no reason for withholding from either Mesars. Smith and Turn-bull, or Mesars. Hibbert and Rainford, the absolute exertion of the building." erection of the huilding.

There ought to be no reason, but we are, nevertheless, very anxious to know the arrangement adopted in the selected design, hoping, most earnestly, that we may not have another pestilential hinderance to enre, added to those which already disgrace the country. The patients, in surgical cases, in many of our patients, in surgrear cases, in model a chance hospitals, would have twice as good a chance of recovery as they now have if they were put of surgrammed and a salishury-plain. The under a canvass tent on Salisbury-plain. motto adopted by the authors of the second design, "Le Plan Français," would lead us to believe that what has been said in these pages on the subject has, at any rate, been seen, even if it should not have been properly attended to.

Vol. XV.-No. 769.

We mentioned some time since the decision in the-

Cattle-yard Competition of the Royal Dublin Society.—Afterwards a second competition was invited, but we believe no decision has been publiely announced. The architect whose de-sign was selected in the first competition writes to ns.-

"Possibly you, or some of your professional readers, would kinally surgest what course is open for unsuccessful competitors to pursue, who, lured by the promise of a premium, send in elshorate drawings in competition, and subsequently flud that the parties receiving and professing to adjudicate fairly on the same, decline to announce any decision, or state if such premium has been awarded or not. It appears to me that an announcement could be forced, hy serving notice that unless the same were made within serving notice that unless the same were made within a given time, the drawings would not be taken back, but charged for in the usual manuer."

Before making any remark let us print the inquiry of another correspondent, "F. W. C." and one observation will apply to hoth. He savs.

"On the 17th inst. I wrote to ask your advice as to how an architect, who scut in a competition design (a premium having been offered for the hest) for a building about to be erceted, should act, when his design, at first (as he heard) selected as the hest, was not only traced, but also cut out of the book in which it was made up. Since then I have received my letter, and the builder's, which accompanied my design, hat not until I had written for them three times: both were onened. I presume he the scenture "On the 17th inst. I wrote to ask your advice design, but not unit I had writter is the start stress times: both were opened. I presume by the scerctary of the committee, although each was sealed, and had the motto written on it; and these were put into a large envelope, scaled, and the motto on it. I shall esterm it as a special favour, if yon will be read ascretch to favour up with your outing as to

good enough to favour me with your opinion as to whether, in accordance with professional practice, I have any claim for such ill-treatment ?"

We believe it is tolerably certain, that a competitor has no remedy nnless a special contract on the part of the committee can he proved. This heing the case, and we have stated it scores of times, does not common sense dictate that architects should always require a proper understanding and contract, before they make designs

standing and contract, before they make designs? The Islington Vestry-hall competition will be settled, some expect, this (Friday) evening. At a meeting of the vestry, held last week, the committee, who had heen empowered to con-sider whether the probable cost of the twelve designs for the Vestry-hall returned to the vestry is within the amount advertised, reported that, as it would have entrailed considerable or as it would have entailed considerable exthat penditure of time and money, they had not availed themselves of the vestry's permission to employ an architect in proseenting the reference. They had read the specifications, and carefully re-examined the drawings, and they found that, with the exception of the design numbered 32 and 33, they all, according to the architect's statement, earne within the stipulated cost. There were several of the designs, they said, not com-patible with the requirements of the vestry. After considerable disension, a motion was car-ried to the effect, that the twelve selected designs he referred back to the committee, to make a de-tailed report on the designs, giving a full analysis of each, and that it he printed and placed in the hands of vestrymen.

The personal interest which, it has been shown, In personal microsit which, it has neen shown, scorend of the vestymen have in particular plans lessens, we fear, the chance of a creditable de-cision, and serves to explain why some of the twelve selected designs are in the list instead of hetter designs left unmentioned. It is asserted that, at the first participant of the committee they that, at the first meeting of the committee, they put on one side all the designs which included a tower! If it were so, this was certainly nnjust iower! If it were so, this was certainly nujust; and erroneous, and probably served to put ont of court some of the hest designs,—designs, moreover, which might he carried ont without the tower. If such was the determination, competitors should have heen informed of it in the first instance. Several very sensible letters and articles have appeared in the local papers on the subject. One writer in the Islington foreatte save — Gazette says,-

" I would suggest one of two courses; either let the vestry choose accw six plaus, and request some gentleman of sufficient standing to decide which is best, or let them direct him to choose six from the

whole seventy-seven, and leave them to make the final selection." * * " 'As to cost, no committee are competent to decide that from small-scale plans; they should choose which is best, and let the architet, if he can, procure a secured tender; if he cannot, throw him over and go to the next best. The science of construction lies in getting strength where needed, and omitting it where uscless, and it may thus happen that one man may erect his building at a cost, wherein another may exceed one-half for precisely the same thing. Let it be remembered also, that the nicest koowledge of the value of a rod of hrickwork,—the keenest appreciation of the fluctuations in the timber-market,—oc the best practical acquaiotance with the anothol of rearing streets of houses, so that they will hold together without cracks and settlements just long enough to be sold into other hands, is no more a knowledge of architecture than a scaffold-pole is a building, and this is the sort of error that nearly building, and this is the sort of error that nearly very committee splits upon. The practice of forty years ago made architecture a matter of book-knowyears ago make areatteentry a matter of book-know-ledge, and every smattery who knew one order from another, dubbed bimself a critic. Now that it is rising from its degradation and hecoming again an inven-tion—an art—it is still elogged and hampered by the leaven of the old false principles. Some ten or twenty years hence we shall no doubt have a better state of biner." things.'

And in the meanwhile the meritorions must often suffer. In addition to a hnilding offering all the accommodation required, the vestry should seek to ereet a work which would not simply not discredit the important parish in which it is placed, but would tend to improve the taste of the rising generation, and have a hene ficial influence on every huilding hereafterereeted there. An influence either had or good every public huilding exerts, and governments, corpo public huilding exerts, and governments, corpo-rate hodies, and parish hoards onght to hear this most seriously in mind. The Islington vestry includes men of great intelligence and perfect integrity, and will, we feel sure, experi-ence much regret hereafter, should it, through want of sufficient consideration and exact know-

ledge, do wrong in this ease. Our statement of enrrent topics, however, has already run to greater length than was intended.

AN ARCHITECTURAL REVIEW. THE LIVERPOOL ARCHITECTURAL SOCIETY.*

To the quict followers of intellectual pursuits like ourselves, the notes of war, which have been again heard in the land, are apt to sound peculiarly dis-agreeable, from a feeling that, beside great national struggles for the securing of liberty or defence of territory, the noiseless mareh and bloodless trinmphs of intellect, whether in science, or literature, or art, may attract to themselves less regard, if they do not may attract to themselves less regord, if they do not lose something of their pertinence and dignity, in the public eye. Tet, if we vice this matter rightly, we shall see that there is no time wherein the mental improvement of ourselves and others is more called for than when either national independence. perity is endangered.

For the strength of a nation to cope with its coemies, cither within or without, consists not alone in its pecuniary resources, but in a great measure in the elevation of mind and largeness of heart of its members; and he who hy any means aids in the mental culture of those around him, and assists in the meutal culture of those around him, and assists in the establishment and dissemination through the pores of society of just principles, and right rives of things, in whatever department of useful knowledge, not only serves the cause of true learning and enlightenment, but promotes the interest of the state, braces the nerves of the hody politic for coming difficulties and dangers, and adds strength to the pillars of empire. Moreover, it should be horne in mind that the true scholar or artist is directly contributing to that true national prospecity and glory, to which vastness of territory, richness of revenue, and commercial im-portance, can only be considered at the best as sub-orlulate means and instruments, and which consist in

ordinate means and instruments, and which consist in a generally diffused knowledge, a solid literature, au a generally diffused knowledge, a solid literature, au exploring science, a correct taste, purity of life, and the possession of civil and religious liberty —all those things which tend to render private life, in whatever rank or class, dignified and bappy. It is these that exalt a nation, and not large armits and navies or even wide-spread dominion —which latter, indeed, if it be obtained, as it almost always is, by violence and winon, rather desrades the objective and control be obtained, as it almost aways is, by violate that woog, rather degrades that elevates, and cannot be held without prejudice to the interest of virtue among both conquerors and conquered. Let us take heart, then, and porsue our course with

* The following formed part of an address delivered by the president, Mr. S. Huggins, at the opening of the session, on Wednesday, the 21st instant.

whole seventy-seven, and leave them to make the final selection." * * * "As to cost, no committee to hattles of the styles. Peace hath her triumphs as are competent to decide that from small-scale plans; they should choose which is best, and let the architecture throw him over and go to the next hest. The science of construction lies in getting strength where needed, that one may exceed on c-half for precisely the same that one may exceed on c-half for precisely the same that we may exceed on c-half for precisely the same thing. Let it be remembered also, that the nicest the cost supercision of the fluctuations in the timber-market,—or the best practical acquicitance with the market,—or the best practical acquicitance with the inver-market,—or the best practical acquicitance with the market,—or the best practical acquicitance with the market,—or the best practical acquicitance with the inver-ment in architecture—the thing that still struck me profession-what the worst obstructions to advance-ment in architecture-the thing that still struck me most as a grievous evil and impediment to progress was the absence of mental freedom in design-the continued fealty, which is slavery, to styles and schools-the lack of judgment and comprehension in the treatment of those materials which munificent time has bequeathed to us from the genius of those who have gone before us. It is not a congress such as proposed somewhere in print a short time ago to settle the principles of Golhie architecture, that we want; such a congress would be as absurd as would a synol to fix the doctrinces of religion. It is coumon sense and honesty among architects and their patrons that we stand most in need of. Circumstances are so different in the present day from those of the age so different in the present day from those of the age in which the latest of them flourished, that we eannot take any style as such : as styles they are dead, but, like the earcase of the slain lion from which Sampson drew forth honey, they contain a rich nutri-ment for the architecture of the future. What we have to do with a style is to analyse it, and exercise the constructive power of our intellect in the prothe constructive power of our intellect in the pro-duction of new organisms from its clements. You may take any part of a foregone style as a key note to give the asthetic tone to what else of modern invention may be brought into contact with it. I do not believe there is any such fixity and immo-hility between the parts of styles of architecture as is generally supposed, nor so much detachment amongst them. A style may be looked upon as a find sub-stance which may be separated at pleasure, and which may be made to flow out into various streams, and mingle its branches with those of other styles widely different from it in original character. The pointed arch was first introduced into architecture for its structural advantages. It has been employed in very arch was first introduced into architecture for its structural advantages. It has been employed in very different styles, and I believe it is applicable to any arcuated system of building. The eusping is a beauty that is peculiar, I presume, to Gothic, and cannot he transplanted into classic windows; but the Saracenic architects filled in their windows with a wonderful maze of heautiful forms, in the shape of a purely geocoetrical tracery, that is equal to anything in Gothic; and this I helieve to be applicable to windows in any actic such as schurch windows that ar not to to one : that this i better to application values in any style, such as church windows, that are not to look out of, but only to admit a moderate portion of light. I never considered a high-pitched roof as essential to a building in which a Gothie style of essential to a outning in which a bound sight of beauty is to reign; nor hultresses as essential to vaults, nor vaults to buttresses. There are modes of ceiling and roofing besides stone vaulting which, in exercise to some extent oblique pressure on the walls, may require and justify the use of the huttress—which for the area, is a reproper genulosed to rest. feature, by the way, is as properly employed to resist a cylindrical vault as a pointed one. And if a but-tressed building may be true and unaffected without a tressed building may be true and unaffected without a stone ceiling, so on the other hand may a vanited building be entirely real and genuine, though innocent of buttresses, for you may thicken the walls in order to dispense with them. A huilding may he true Gothic architecture with a pointed and tracerted win-dow, though it have no other feature that is now considered peculiarly Gothic; what else is required being the mere unbiassed offshoot of common sense and a feeling for heavier. and what may seem stranger a feeling for beauty; and what may seem stranger , it may be a true Gothic building without any and a feeling for beauty; and what may seem stranger still, it may be a true foothic building without any window at all, hut lighted from a Gothic skylight. You may build a Gothic cathedral, a Gothic parish church, a Gothic Roman Catholic church, and a Gothic dissenters' chapel, all fully suited to their respective purposes, with equal claims to be considered true works of art. The purpose of the building, which must always

The purpose of the building, which must always govern its form and all else, may admit of but few parts; but if all the elements proper to its nature and purpose grow round it; it is a perfect work, perfect of its kind. It may not he so great as an edifice that developed all; yct, in being all its purpose require), and all that was contemplated in its design, it is a true and complete work of art; just as one of the lower animals—a dog, or a horse for instance— is perfect of its species, though it hoast not all the faculties of man; and such a structure, however humble its class, is more honourable to the designer, who kas, as it were, projected himself ioto his work, thau a reproduction of the Parthenon. We have searcely yet attempted the revolution in architecture analogous to that in poetry, when, instead of the

THE BUILDER.

remote and historical, the familiar and common were wrought into song. We have yet to infuse the spirit of architectural heauty into the humble exitage, the hack street row, the ordinary dwelling, which are to enshrine household virtues and domestic affections as becautiful as the mansion or the palace. Whether you will go so far with me or not, you will admit that there are many possible modifications of architecture not dreamt of in our philosophy. Let us give up the fart too much entrained amongst us of violating or changing the spirit of style. Let remote and historical, the familiar and common were

Let us give up the fear too much entertained smoogst us of violating or changing the spirit of style. Let us be free and fearless, and leave styles to beir fate. Our English Ingenage is not now what it was in structure: besides importations of new words, it bus undergone ebanges in construction also by imitation of the idioms of ancient and modern languages, rendering it more ample and copions than originally constituted. The same is true, prohably, of most languages. Who can say that the languages of architecture are not susceptible of similar modifica-tion in their structural ebaracters, responsive to the calls of the day and the advance of human improve-ment? ment

An important means I am expecting of regenera An important means 1 am expecting of reginera-tion to architecture is the introduction of the Gothic style of architecture, adapted to the general require-ments of the day. The genus of the classical sculpture has vanished before the light of Christianity, and is n thing that properly belongs to the past. "It was (as Mrs. Jamieson remarks) the apotheosis of was (as Mrs. Jamieson remarks) the apotheosis of mortal beauty and power, and found early and neces-sarily its limits of perfection, and the highest possible adaptation of its principles, in the deifaction of external nature." Gothic scalpture, on the contrary, is the expression of the new and larger life of Christianity, which is no more than the fally de-veloped life of humanity, and is a thing of infinite progression, to the capabilities of which we can see no limits. And while Gothic scalpture is susceptible of much classic tuition the classic elements are also no lmnis. And while Gothe sculpture is susceptible of much elassic tuition, the classic elements are also susceptible of so far imhibing the Gothic spirit in composition as to harmonise with its sculpture. I know of no instance of this having here attempted; know of no instance of this having heen attempted; hut a mixture analogous to it was effected in the sister art of poetry by Milton, when he introduced mythological and classical imagery into his "Paradise Lost;" which poem, so far from being injured hy it, has, hy the author's exquisite management, received increased poetic interest. His breadth and compre-hensiveness of mind aud power of mental digestion enabled him to see points of unity nuscen by less gifted poets, and to lay everything under contribution —his classic lore. his noticidal onitions, his domestic -his classic lore, his political opinions, his domestic affections, his theological convictions-to the en-ricbing of his great poem.

riching of his great poem. The true poot weaves all into song; so does the true architect convert everything into architecture. To true art insight and instinct all things are possi-hle. Art, like nature, is ever young, ever renewing and germinating. It has in it something like the force of nature, which appropriates its automnal leaves as fast as they fall, and extracts from them the sap of life for the nonrishment of new forms. Like nature, it has an insatiable appetite for the production of the hermitical and sublime, and its effort, is to prenature, it has an insatiable appetite for the production of the hemitiful and sublime, and its effort is to pre-vail over the loose materials that come dividing to it from remote nges and lands, and to absorb the dend matter, putrifying as it were in the hands of the archneologist, into works breathing a new and versal like. Its heartifying comit processes an adaptive and matter, putrying as it were in the most of the archeologist, into works breathing a new and vernal life. Its hemitiying spirit possesses an adaptive and restorative energy that brings all into order, and gives to everything its due rank in the new realm to which it is jutroduced.

which it is introduced. The great and paramount thing is to respond truly to be wants, in strict accordance with the means, of the present day and country. A change bas come over the spirit of our dream since mediaval times. A change is constantly and must be evermore coming over the dream of our life; a change that I balieve manifests itself even in the human countenance in the course of generations hy the action of new circumstances upon the soul, of which it is the index. The great duty of the architect is to recognise this change, which he does not do when he bedecks a change, which he does not do when he hedeeks a Gothie ehurch for the religious rites of the day in the costume of a time 500 years gone by-a space in which changes have taken place ten times as great as any that occurred between the widest periods of the style; changes produced by new and revolutionthe style; changes produced by new and revolution ising discoveries, by reformation in religion, by new institutions, and by the revival of elassic literature and classic architecture, which latter alone would have n wonderful influence upon the Gotbie style were it allowed fair play; for there is a great deal in the decoration and detail of even the best periods of Gothic architecture that Attie taste cannot well endure, and that no nan would repeat who had rightly studied and refined bimself by the classical remains

remains. It is absurd to contend, as has lately been done,

that hecause we are a Gothic race we must naturally love pointedness and that quality of form called rigidity, and which is present in a pointed and absent in a round arch. Revived ancient learning and elassic art compose a leaven which has been working against this instinct for the last 300 years. The goodly works of Homer, Horace, Euripides, Eschylus, and the rest, like beautiful exolics trans-phated into our intellectual soil, have taken deep root in it: their fragrant virtues have peach-ted through all the pores of our civilization and educe-tion, and inhoted every English mind with their sweetness to such an extent that, though of Gothic edseent, I should think there would now he a diffi-ently in finding anything of purely Gothie feeling or character among the elaented natives of those islands, and that this difficulty will increase with every possing and that this difficulty will increase with every passing generation.

Nor is that classic style which, under free and inde-pendent treatment of Greek and Roman architecture, would be originated in England, identical with that style which arose heneath the blue skies and glorious such a which arose beneath the bule stars and glorious sunshine of Italy—a land wherein those mysterious relations which exist between the various beauties of uature and the deep emotions of the sould must be more vivilly felt than in our less genial elime. We are graver and more abstract: we are a more domestic for the lating acceled than the weights of the and ire-side-lowing people than the miles in miles in miles of talk; and our deepest chords are tuned, and innate poetry brought out, by hlendings of the influences of nature and life, differently memory tioned to these which create an the differently proportioned to those which operate on the Italiaus; and such differences must of necessity lead differently proportioned to task of necessity lead to different netrences much of necessity lead to different netrences in the way of art—a truth which will be the more readily admitted when we consider that even in the different states of Italy local influences affected it, and Rome, Venice, Florence, Lombardy, and Bolgan had their separate develop-ments, just as distinct as were those of England, Prance, and Spain. The Venetian siyle of Italian architecture, which has been the general model to the arebitecture of England, as well as to the rest of transalnine Europe, grew up amid scenes and circumtransalpine Europe, grew up amid seenes and circum-stances very different to those which exist and operate somes (e) different to note made casting present and habits of the people at the time of its origin, its aim was magnificence, luxury, pomp, gay floridity of ornamentation diffused over the eatire face of the ornamentation diffused over the entire face of the work, which is broken up into numerous minute parts and divisions—qualities which those of a purely Auglo-classic architecture would be almost diametrically opposed to. Classe grandeur of form and proportion, concentration of decoration, contrasting with masses of plain wall, fewness and greatness of parts, and hreadth and power of effect, such as shown by Wren in the west front and dome of St. Pau's Cathedral would be the most natural to and best express the English feeling and character, which the architect just named, Sir Christopher Wron, may he considered to have more truly represented than Inigo Jones, who was a less original methet—that is, was more in-debted to Italy than bis illustrions successor. While Greek architecture is too cold for this elimate, the Italian is somewhat too warm i, but architecture may Italian is somewhat too wnrm : but architecture may be chaste without heing cold, and warm without being

be chaste without heing cold, and warm without being corrupt. What Huly has done for us is the furnishing a hright example of ancient architecture, reformed upon molern ideas, and estended to general purposes. Italy has given us new elements and features : it has solved many architectural problems. It has originated what may be called the order of fenestra-tion—no nuinportant one—hut it has not given us a stereotyped style, much less patterns for individuel works. The Italian styles and examples, as well as all other styles nod examples, are to be taken as food for the æsthetie faculties, and therally, and with-out digestion, appropriated. They will furnish us out digesticate neutrons, and not negative and with-out digestion, appropriated. They will furnish us with symhols of thought whereby to embody and express our new and enlarged sense to our contem-poraries, but they can properly do notbing more.

porares, but they can properly do notoing more. The most prominent fact discovered by what is called the great Government competition (great drawing match would be a more proper name for it) is, that a practice directly the reverse of what I have been contending for reaches to the very highest places in the profession. The present method of architectural design seems to he not to exercise what inventive power is possessed, in the formation and decoration of a shell or carcae distributed horizontally and verticelly in accordance with the building's purdecontion of a shell or earcase distributed horizontally and vertically in accordance with the building's pur-pose, but to take an illustration of some imposingly exceuted design, spoil it in order to concerl the theft, and then draw a plan and section to suit it. Second of the premiated designs are little more than copies of French, Italian, and other continental huildings; and many of the others, when divested of their gay bedizening and getting-up, in which everything was done that could he done to mislead the judges as to the relative merits of the designs, and shown up in the truth-telling dress of the engraver, exbibit little else than a collocation of windows and columns, and

the most backneyed features of the style, without a spark of ingenuity, novelty, or feeling.

HOW ARE WE TO REVIVE GOTHIC ARCHITECTURE ?

THE Builder for the 10th inst. contains an abstract The Builder for the 10th inst. contains an abstract of a paper read by Mr. Scott at the meeting of the Yorkshire Architectural Society, held at Doncaster, on the 23rd ult. "On the Present Position and Pature Prospects of the Revisual of Gotthic Architecture." As this is a subject to which I bave for some time past given much thought and attention. I may, perhaps, be allowed to say a few words touching the means by which it seems to me that the principles of this revised—mow that they are firmly established— must he earried out. After describing the causes which gave rise to this

must be earried out. After describing the causes which gave rise to this spirit of revival in church architecture, and passing not undescreed eulogiams on those who were mainly instrumental in hringing about a general revolution in this respect throughout the country, the writer goes on to say that we have at length "succeeded in ob-taining a fair knowledge of Mediaceal architecture, whether at home or abroad, and in mastering its general principles. So far as this goes, we have fairly eleared the ground before us, so that there is no more dificulty for a student in making binself acquainted difficulty for a student in making binself acquainted with Gothie than with the so-called Classic architecture : this is no small achievement, to bave thoroughly ture: this is no small achievement, to bave thoroughly mastered the grammar of our art." It is, indeed, no small achievement. Bat, as every scboolboy knows, it is one thing to know the "As in presenti" and "Syntax" by beart, and auchter thing to be able to compose good or even decent Latin prose. Neither will an accurate acquaintance with the details of the various styles of Gohine architecture enable a man to design, though it may teach him to imitate a Gobie building. It is not needed by bolkscript the details of design, though it may teach him to initiate a Gothe building. It is not merely by observing the details of window tracery, mouldings, and the like, that we can hope to attain to a practical knowledge of our "ma-tional" architecture, but by observing the spirit by which the builders of the Middle Ages were actuated in designing new forms, and in borrowing suggestions from the architects of other nations. It is in this from the architests of other nations. It is in this last respect, as it seems to me, that our architest at the present day most signally fail. We cannot pro-duce new forms of becasty in our architectural designs in the same manner as our Herefordshire eider-makers get new sorts of apples, hy grafting; though some of our modern-Gorbie architesty-some, too, who stund high on "the hizing scroll of fame," -seem to have adopted some ueb a botanical expedient, giving us uow a chip of Italian pine, now a slip of oue of those tall ugly poplars which line every eand and every highway in some parts of "the belte France." For heaven's sake let us have no patcheoryk churches] We want no foreign grafts. The old stock is not dead yet; hut is able and willing to yield us as goolly furit as ever grew thereon in our fore-fathers' days, if only we will treat bim as kindly and as tenderly as they did. The "Laucet period" of English architecture is marked hy features peculiarly its own, and which reader it perfectly distinct from the contemporary styles of the continental nations; and in heauty of form nad proportion (both in elevation and ground plan), in the holdness and elegance of its vaulting, and in its exquisite trantement of detail, especially in the sections of its mondings, it immeasurably sur-pases them. Even when they borrowed from the french the first elements of *tracery*, our English urchitects took good care to avoid the error which their continental harthern almost invariably fell hito, of making the circle fill the whole bead of the window; thus bringing the heads of the lights below the read last respect, as it seems to me, that our architects at the present day most signally fail. We cannot pro-

there continential pretries annost invariantly left files, of making the circle fill the whole bead of the window, thus bringing the heads of the lights below the read spring of the arch. Working upon the hint thus borrowed, but without for one moment forsaking these borrowed, but without for one moment lorsaking those principles of heatuy which had hitherto distinguished their works from the productions of their neighbours, they produced that style which Mr. Scott has justly termed "the noblest period of our indigenous art,"— "the noblest style of architecture which has ever pre-valled," and which has the additional merit of being securitile "our own". essentially

Vaned, ond which has the additional metric of being essentially "Gar own." In time, however, the constant repetition of the circle was found wearisome, and thought not to fit well into the form of the pointed areh. After adopting various expedients to get rid of these defects famoug the most successful of which was the occasional substitution of the spherical triaugle for the circle in the heads of the windows) our hulders seem to have borrowed another hint from the French, and to have adopted from them the system of curvilinear tracery. Unfortunately, however, in horrowing the beauties, they horrowed also the defects of this style, and by degrees loss tight of that distinct subording by which the "Early Decorated period" is distinguished. In the decline of the style, indeed, the tracery is "to be continued.

* To be continued.

marked by an interweaving of the mullions, which suggests the idea that they are *bent* out of willow wands, instead of *cut* out of stone. It was this want of constructiveness which led to the adoption of the Perpendicular style, which is to the adoption of the Perpendicular style, which was distinguished by an appearance of stability and *bracing* of parts which form a fivourable contrast to the "finnikin" pretti-ness of the contemporary styles in France and

Germany. Thus the varions styles of English Gothic archi-Latus the various sivies of Lagran contine archi-fecture form one unbroken chain, the several portions of which are so intimately linked together as to seem to grow each one from that which pieceded it. If, then, we are to take up and carry on the chain which our forefathers have forged, we must take it up at the link at which they let it drop, in order to introduce foreign material.

Let us persist in the endeavour to produce new forms of hearty in geometrical tracery; and, when we introduce curvilinear forms, let us adapt to them the bold deeply cut mouldings and constructive character of the leading bines which mark the architecture of "the later part of the tbirteenth century," taking care never to allow the pattern of the tracery to appear cut of by the arch of the window, as is frequently the ease in Late Decorated examples. The tracery should always fit into and fill the window arch

I cannot agree with Mr. Scott in considering the "French architecture of the thirteenth and four-teenth centuries" as the "great central type of Pointed architecture." Compared with the English architecture of the same period, it appears signally deficient in that very "vigour of sentiment and mas-culine boldness" which he professes to admire in it.

The *external outlines* are generally clumsy, and the buildings seem absolutely *propped up* by an exag-gerated system of buttresses. The vaults are poor, buildings seem absoundely propose up up an easi-gerated system of buttresses. The vaults are poor, and badly constructed; and there is a paucity and shallowness about the mouldings, which contrast but poorly with the bold rounds and deeply-out hollows of our "Early English" and "Early Decorated"

"Having once, however," as the writer says, "agreed on a common basis, our course must be per-fectly free and unfettered. Our aim, it is true, must be one-to construct on this basis a style which sufficiency of the day in this basis a style which will meet every exigence of the day; hut in following np that aim there is the utmost scope for individual talent, and for the most cratted efforts of individual genus. The greater the namber of minds brought taint, and for the most cratter choice of ministration gemins. The greater the number of minds brought to bear upon this work, the more copious will be the regenerated art, so only that all work upon the same foundation, and aspire to the same result."

The suggestion of an art-workman, at the meeting of the Architectural Association on the 2nd instant, that "a class" should be started "for practice and that a class should be started for practice and working drawings, where the artizan might join with the junior architect," seems to me to descrve our hest attention, as a means calculated to promote the great cause which we have in hand.

am glad to see that attention has at last been I am giad to see that attention has at hist been called (by Mr. Denison, at Doncaster) to the "stupid and conventional and unobserving practice of all the architects' offices, of setting Gothic windows, as they do Italian once, twice as near to the outside as to the inside of the wall." This is a fault which I have observed in almost every single modern Gotbic build-ing which has some under we notice and which is ing which has come under my notice, and which is utterly destructive to the effect of window-tracery, utterly destructive to the encer of stating a proper hy preventing the mullions from casting a proper

WORCESTER CATHEDRAL AND THE NEW WORKS.

THE strictures upon my papers, which have ap-peared in the *Builder*, of the 3rd and the I7th instant, seem to demand a reply, which I should cer-tainly have withheld had the writer confined himself

tainly have withheld had the writer confined himself to an expression of dissent from my opinions, without impaging the accuracy of my statements. Your correspondent, with wonderful recklessness of assertion, addinas that "nother paint nor varnish has touched the marble." In my first visit to the Cathe-dral of Worcester, I was struck, as I think every visitor must be, with the disagreesable have of the Purhock shafts, recently discuberrassed of their whitewash. I ascended into the triforium, touched the shafts, to which I found my fingers adhered, and whitewash. I ascended into the triforium, toucnen the shafts, to which I found my fingers adhered, and perceived, or thought I perceived, the small of paint. I was subsequently informed, hy one who must have had personal knowledge of the fact, and who could have been influenced by no motive to mislead me, that the marile had heen subjected to the process I have described. "C.B." appears to have heen otherthat the marble had neen subjected to the process I have described. "C. B." appears to have here otherwise informed; but I am not disposed to doubt the evidence of my senses, and my informant's statement, upon the unsupported contradiction of "C. B." Let it be confirmed by the architect, and I will cheerfully and unreservedly admit my error.

I knew, quite as well as your correspondent, that the restoration of the south transpet front had been effected by carefully replacing, in every case where it was possible, the original stoces. I have watched for weeks the process of cleaning, and preparing them for this purpose; and I allow that I should more accarately have described the present coudition of this portion of the cathedral by an employment of the word "replacement" rather than "restoration." But I am unable to perceive that, by this misuse of terms, I nave inflicted any wrong upon the architest. In the view I took of the matter, be was entilled to the praise of a faithful and exact initiator. "C. B." places him *guoad hoe* upon a level with an intelligent mason who, I suppose, would have refitted the stones quite as well as the architet. Your correspondent takes exception to the opinion the restoration of the south transept front had been

Your correspondent takes exception to the opinion I h ave expressed regarding the new pinnacles. I nive expressed regarding to enew primaries. This he does after a very disingenous, or very ignorant fashion. He says that, I " pronounce the new pin-nacles to be immoderately heavy." What I have written is, that the octangular covering is "immo-derately heavy." "C. B." has been informed that the design has been carefully studied from one of the best original examples from which they differ only hest original examples, from which they differ only hese original examples, from which they made only in being somewhat *lighter*. Ay, *lighter*, hut in what respect? Why, in the open part, the sub-structure, the shaft, and arched openings, which pre-sent a shocking disparity with the heavy stome pyrawhich as successing usparity with the nexty stone pyra-mids. Why, here is the very mistake which has been committed haid bare, and my criticism justified to the very letter. If this be "C. B.'s" method of defending his friends, well may the architect exclaim, "*Non* &c.

The information communicated by " C. B." that the " actual eastern end of the cathedral, with its window group, is new, both in design and in construction," may be accurate, and I do not doubt that on this question "C. B." is the faithful exponent of the opinions question "C.B." is the faithful exponent of the optimions of others; but if this be so, what becomes of the statement is o industriously propagated (it found its way into the *Builder*, August 22, p. 481), that the architect possessed proofs that the ancient window was of five lights, and that the new window was con-structed in accordance, &c. ? If this be so, how are to be justified the praises haped upon the archi-tect, for his wonderful sagacity in discovering and scizing upon the design of the first great master-spirit and designer, and in faithfully carrying it out ? Again, I say, non tail, &c. Your correspondent erroneously represents me to have said, that the great east window, " with the gable trefoil," has taken the place of the Geometric window of mine lights. Does "C, B." seriously intend to assert it due the ever saw an Eastern Decorated

to assert that he ever saw an Eastern Decorated window, of which the summit rose up into the gable which, of which the summit rose up into the gable above its horizontal string? Such an arrangement, I would venture to say, nowhere does exist, except in the imagination of "C. B." I was not aware that the window in question was of so recent a date as has been communicated to "C. B.;" though, from the though, from the coarseness of its execution, and inelegances of compo-sition, I did presume that it was not of the period represented by its design.

"C. B." complains that my papers leave many points of interest in Worcester Cathedral, untouched. Un-doubtedly they do; but even "C. B." will discover, when he undertakes that which he has not yet acc when he underquees that which he has not yot accom-plished—"a dilject, sustained, and thoughful examination" of Worcester Cathedral—that a de-scription which should embrace every detail and feature of so vast an edifice would fill a number of the periodical which received my humble contribu-tions, and even after each a reprint, them would tions; aud, even after such a reaping, there would remain much for careful gleaners.

My object was simply, as must he the purpos all similar cases, to direct attention to the sa the salient points of interest, exercising, of course, that discre-tiou in my selection for which I must be held rcsponsihle

"C. B." docs not coincide in my opinion, that the "C. B." does not coincide in my opnion, that the great transpet was originally built in conformity with the choir and Lady chapel. The means of arriving at an exact estimate of the date are, I confees, hut scatty. My opnion was mainly determined by the vaulting pillars; and, until the contrary be proved by documentary proofs, I am prepared to maintain, that the internal evidence is in favour of the Early English origin of this portion of the cathedral. It is onit from that the near alma sint to mising my

It is quite true that the anomalous pire to which my description alludes is the "first," and not the "SECOND from the west on the north side," From this admis-sion I leave "C. B." to expect all the consolation it may be capable of affording him, and cheerfolly award bin the nories which is not other of the form hing the optice which is due to the author of so nota-ble a discovery, if so he that he were really led to it by his own researches. Of this fact I entertain some doubt.

[Ост. 31, 1857.

momentarily deprived of the assistance of bis

here momentarily deprived of the assistance of bis faithful monitor, and commiserate the dimness of his perception when illumined by no borrowed light. As to the inaccuracy in my description of the mural painting of the crypt, it amounts to this. I have spoken of the crypts, it amounts to this. I have spoken of the crypts in the obscurity of a gloony day. Your correspondent, more highly favoured, saw it by the glare of an artificial light. Had I become aware of the figures of bishops of which "C. B." speaks, I think it probable I might have been more particular in my notice of this freeo, my ebief object of drawing attention to which was to indicate its prohable date, that it might not he sup-to advente more particular is my notice of this freeo. posed contemporaneous with the wall which it de-eorates. I do not at all doubt the greater correctness of "C. B." in this instance, and can easily reconcile myself to the error I committed, inasmuch as it has heen the means of procuring to the readers of the Builder a more accurate description of a very interesting relic.

I expressed the opinion, in a guarded way, that "a quarter of a century intervened between the com-pletion of the opposite sides of the nave." But, in period of the opposite states of the have. But, in so doing, I never entertained the conceited idea that I was fixing the precise interval which separated the declension of style observable in the south side from the purer exhibition of the decoration of the north one; nor do I comprehend how my lesser computa-tion can he held to exclude the greater. I think this criticism is justly chargeable with a want of candour.

criticism is justly chargeable with a want of candour, "C. B." is displeased that the exterior of the cathe-tral does not call forth my admiration, and proceeds to characterise my very summary account of it as incorrect. If he value truth and candour, he is bound to particularise the statement to which he attributes inaccuracy. My paper contains a reference but to these facts—the absence of a pierced paraget; the ungraceful composition of the buttresses; the disappearance of the ancient turrets; the presence of a corbel table; a line of trefol boles in front of the porch; and the disagreesble form of the summit of the windows. I challenge your corre-spondent to convict me of inaccuracy in any one of these details. I regard the statement made by "C. B." at Worcester, that the exterior of the cathethese details. I regard the statement made by "C. B." at Worcester, that the exterior of the eather dral equals in beauty the interior, as simply pre-posterons, and am quite prepared to abide by my expressed opinion of its unsatisfactory outline, its palkry detail, its present desolute aspect,—an estimate in which I am supported by some of the most dis-impuished archaeologists of the country. Here I wish that "C. B." had seen fit to conclude his strictures. I wish it for bis own sake, for the sake of the architect, and on my own account. But the aximus with which his censures were peuned was not to be concealed: --- "'Viator,'' he writes, "couples with his mistakes statements which might detreat from the reputation of the workmen who have

detract from the reputation of the workmen who have executed the restorations." This is a disingenuous, executed the restorations." This is a disingenous, an unjust, and injurious aspersion. I have written nothing which can justify it; and so far from having indulged in detraction, I have hestowed my humble meed of approbation on the way in which the works have generally heen completed. In one instance, it is true, I ventured to doubt if the imitation equalled the model. but this is a more consisting of individual model; but this is a mere question of individual appreciation, for an honest exposition of which I did not anticipate that I should be branded as a defamer of the reputation of men worthy of all my respect. "C. B." further ventures to above me

"C. B." further ventures to charge me wi "the habit of reflecting upon the dean and chapter I am quite convinced that "C. B." is in as comple with is in as complete I am quite convinced that "U. B." is in as complete ignorance of my hahits as I am of his own. But of this he may rest satisfied,—I entertain as deep a re-spect for the dignitaries of our Church, which I value as the foremost blessing of our favoured land, as can be felt by himself. I never bave happened to express in words an opinion favourable or unfavourable re-marking and deapter, and L before the specing any dean and chapter; and I believe the words never before dropped from my pcn. But is it not a uotorious fact—a fact we all deplore—that in times past deans and chapters have unfortunately been these pass deals and chapter have informately been led to give their sanction to the erection in the build-ings of which they are the constituted guardians of hideous obstructions, such as those to which I alluded ? And was it not permitted to me to deprete the con-

And was it has permitted by the to deprese the con-tinuance of this precise without exposing myself to the obarge of halitual slander? But—"the omits all mention of the architect. Hince illa lacourge. He has not rendered his papers the vehicle of the landation of the architect: here is the cause which stirs the bile of your correspondent. He has not re-echoed the prejudices and jealonsies of a doubt. "C. B." again, cannot understand what is meant by the statement, "preceded by a screen of triple arcades on shafts." I regret to find that he was

to call it) heaped upon him by "C. B." more than com-pensate bim for my refusal to sound his praises? Will be not content himself with the pedestal on which he has hear raised by my censor, and be satis-fied with bearing himself compared with an accom-plished scholar and arcbitect, who, if uot the first, occupies a place in the foremost ranks of our church restorers, to which, so far as I know, " the architect" hear no abive bas no claims

And now a word in conclusion—a word of counsel and of warning to your correspondent. We are pro-mised by the honorary member of the Worcester Diocesan Architectural Society a "*Handbook*." When "C. B." addresses bimself in an ernest and thonghtful spirit to his self-imposed task, he will discover that there exists a vast difference between skipping jauntily from one part to another of the eathedral attended by a train of admirug followers, himself the little idol of their worship,—spouting after a sufficient *cranming*— his somewhat crude and undigested architectural notions, which are listened to as oracular inspirations : I say be will discover a vast difference helveen this now a word in conclusion-a word of counsel To the system of the second of as order that inspiratouts ' I say be will discover a vast difference between this slip-shod fashion of describing a cathedral, and the production of such an account as shall be the result of 'a different, a sustained, and though if a carmina-tion,'' and in which a censoring the spirit shall be able to discover the second second second second second second to discover the second second second second second second to a second to discover errors no more grave than those of which "C. B." has been able to convict myself.

C. B.'s' sneers at the pseudonyme I am pleased to "C. B.'s" snors at the pseudonyme I am pleased to assume might well have been spared. Did be not reflect that he was here venturing upon dungcrous ground, and provoking a ready retort? Did he forget that he bimself appeared at the head of his accom-panying train in Worcester Cathedral as an *linerant ecclesiologist?* "What difference there is, then, in our respective characters, put on for the occasion, to justify the lofty superiority assumed hy my censor, I am unable to discover. But let bim indulge bis self-complagence, ice myself I an content for the nersent complacency : for myself I am content for the present to remain an obscure and unknown VIATOR,

METROPOLITAN FLOWERS

IN framing the Smoke Act, little wotted senators all the beuefits involved in that measure of legislation. The deed of charity or mercy is oft directed to a single and definite object; it is intended to alleviato a weg or to appease a wait; but its scope is illimitable, the influence is multiplied, reflected, re-fracted; it blessetb him who gives, and him who takes; so of every good measure : we reap of incorruption.

A few plants there were which germinated and struggled into bloom, despite the marky vapours of town. The ivy, although stanted in the tender shoots, held its tenure on rough walls, when unmolested; the Virginian erceper aspired to and attained the loftiest eminences; and the elematis, clustering round sustaining poles, faintly exhibited its palkh blossom; hesides the jasmine, when fairly elucd to a smuy wall, appeared to brave the worst of our invernal fogs; but they fixed weakly. These fors have of ran, appeared to prave the worst of our invernal logs." but then they flowered weakly. These forgs have of late most sensibly diminished, for as yet this senson has not brought in its train of mists a single evidence of the London particular; the city air being now as pure as it formerly was seven miles in the subarbs. Under the influence of an inverse of an

Under the influence of an improved atmosphere, most of our own indigenous garden flowers will now most of our own inducedous gracen howers will now arrive at fair maturity; and very many of the thousand graceful foreign additions to our Flora, lately accli-matised, may be cultivated with effect within 100 square miles of streets and houses. Roses and other odorous generate now adorn the Temple, where only flowers of rhetoric lately flowinshed; the lovely havthorns of rateorie nately nonrished; the lovely haw-thorns of Russell-square, as if readinated in rural vigour, gave forth last summer the incease-hreathing May; and the parks, grateful for the judicious cares of an active and skilful Commissioner, produced in all their borders, annual, biennial, and perennial evidences if down burgharms. of floral loveliness, which until this last year were unknown to Londoners.

The march of botanical science meanwhile has enriched the garden with treasures drawn from every enriched the garden with treasures drawn from every elime and country; and the stimulus given to horti-culture hy Sir Joseph Parton's admirable arrange-ment of the Crystal Palace Exhibition, has taught the admirers of floriculture how to group, train, and educate those marvels of natural heady. There are now in many erowded districts proo's of the advance of floriculture, and of the endless variety where of it is susceptible. under tastful arcmeent

the advance of florienture, and of the endless variety whereof it is susceptible, under tasteful arrangement; the most remarkable is perhaps that which is open to public view in an area of Grosvenor-square: there, in a pit some 10 fect deep below the level of the pare-ment, festoons of parasite plants adorn the window arches; beds and plots of brilliant annuals cover the cills; pots suspended from the traverse iron ties drop their pendulous tendrils in graceful dalliance, and trained on wires, extend the wary line of verdure and of richest blossom from end to end of this otherwise sleeny hollow. sleepy hollow.

The effect is derived from tasteful arrangement, rather than from the variety of plants in training-in fact there are but four or five different generæthe musk, the lubelia, the faschias, dwarf china-asters, and a few geratiums, make up the intervals at the base and on the window-cills—the Persian at the base and on the window-cills—the Persian plant, a parasite lately introduced, is the main feature; it runs along the wires and chains, concealing the artificial support; dropping its fantastic tresses, and lowurating in a profusion of azure bells, streaked with white; the ivy geranium is suspended at fitting intervals by iorisible wires, germinating wildly, not unlike the native ivy; its wanton shoots bear a whithe holosom. All these have been in health, intervals of all hearts for the hat four months and -the Persian wbitish blossom. All these have been in health, vigour, and full beauty for the last four months, and in blossom more than balf that time, in a position that

in blossom more than balf that time, in a position that hardly enjoys a quadrant of sun-light—say about three hours a day, and that some feet below the street line 1. If plants will thrive by care in such positions, what may they not arrive at in favourable aspects?— a balcony, with a sonth-sonth-east, or south-west exposure, or even a window-cill. We see in very many mean streets and lanes, narrow window openings adorated in the prettiest manner with such floral vegetation as the scant means of the industrial tenant can supply: a ledge board extends arrows. it is forced with the nulled. nanner with such floral vegetation as the scant means of the industrial tenant can supply: a ledge board extends aeross; it is fenced with tiny palisades, re-peated to every window, with miniature fire-bar gates to complete the hanging garden-ail that can be realised of examples seen at the Crystal Palace, or in the floral balconies of other roomkeepers, are imitated; and so the taste grows, imparting to the rising generation a love for floricalture, and at the same time creating amounts the class of roomkeepers same time creating amongst the class of roomkcepers an interest in those germs of nature which have arisen from their own care and attention.

Specimens of fine borticulture in private gardens are much more numerous of late years, owing to the examples shown in the public gardens, such as Kew, Chiswick, Regent's-park, &c.; but the popular pro-gress of taste in those particulars is more strongly demarcated by humbler evidences of poor dwallings. In a small yard about 15 feet by 10 feet, attached to a little temement in the lane which conducts from the end of Montague-street to Park-road, Regent's-park ; the whole space is filled in with shrubs; the walls to the eaves are decorated with varieties of flowering plants, and it would appear that the whole time of the owner must be devoted to irrigation, pruning, potting, and disposing bis numerous favouries. It is, how-cver, not so: a little water once a day, and a little Specimens of fine borticulture in private garde

and disposed by the theorem of the second products pointing of the second rever, not social title water once a day, and a little attention twice in the sesson, assure a hating find of gratification to the cultivator, whose affection for his numerous creatures grows with their growth. Small is the cost, and many are the varieties of plants flowering and odoriferons which are attainable in our markets and nurseries: for one shilling, seeds of six different kinds of flowering annuels might be purchased—enough to sow the boxes of six pairs of windows. That amount, shared by the occupants of three floors in a lodging-house would come to four-pence each floor. Pots of genoments are to be had in the early scason for fourpence each the inxrites of stocks can be had to plant in from the beds at a much cheaper rate; ivics without nousinole values of solar team of the without end, as well as the parasites which tell so well in con-cealing the quadrature of wall openings. A growing demand will still further reduce the cost of wall-

ucument win sum further reduce the cost of wall-flowers and all other nursery seedings that may be required to diversify such window exhibitions. Hyacinths and other hulbs bave heen loog in use within the room, by those who could afford the outlay for such highly cultivated treasures; but these are costly evolutions.

costly expletives. A line of any sort of verdure at the window hase A line of any sort of verdure at the window hase is cheering to the roomkeeper,—flowers still more in-spiring; but the devious tondencies of climhing plants, glittering in the sun, gladden the sight, whilst the fragrance of only a domesticated cowslip fills the heart with gratitude to the Great Author of perfection in all that breathes or vegetates. The humanizing and refining influences of flowers are irresistible to the roughest natures—they suck a

The humanizing and remning influences of flowers are irresistible to the roughest natures—they speak a language of their own—and in their spell there is a magic. Rapidly are the children of this genera-tion acquiring a taste and discrimination from the wild cultivation of the parks; they admire and enjoy them as the eaged lark carrols on fresh turf.

then as the eaged lark carrols on fresh turf. Externally viewed, the dull monotony of London street, and the lanes adjoining. The courrector, Mr. De la Marc, will very shortly commence this work; as also in the streets on the other side of the town; reference to one instance of charming effect from single plant will satisfy. At the first house in Wiltou-place, next Knightlebridge, a Virginian creeper trained hy the wall it interlaces the whole hallos therefrom trellis-work to the second floor, and fails therefrom the trases are gently put aside, and no one molests the sportive wanton, for its gorgeous foliage, ensam-trained ly the walton is gorgeous foliage, ensam-the sportive wanton, for its gorgeous foliage, ensam-trained ly the vertex and no one molests the sportive wanton, for its gorgeous foliage, ensam-time to one and window included.

A spleadid county mansion revealed through masses of arborage locks the more majestic; Nature's finest architecture of rocks, such as those we lately mentioned at West Hoathley, would be tame and naked without their ornature—a ruin bereff of its ivy is mean; and the noblest piles beaped together in eities without the finish of those science as while how the full short of their right effect. ral embellishments, fall short of their right effect nat

natural embenisments, has shown or their right enects. In jurkposition with a full-grown forest tree, the eastle assumes a majesty refreshed by the contrast; and the most deformed remains of shapeless masorry are invested with graces unspeakable when in verture

PUBLIC BUILDINGS, &c. IN THE PROVINCES.

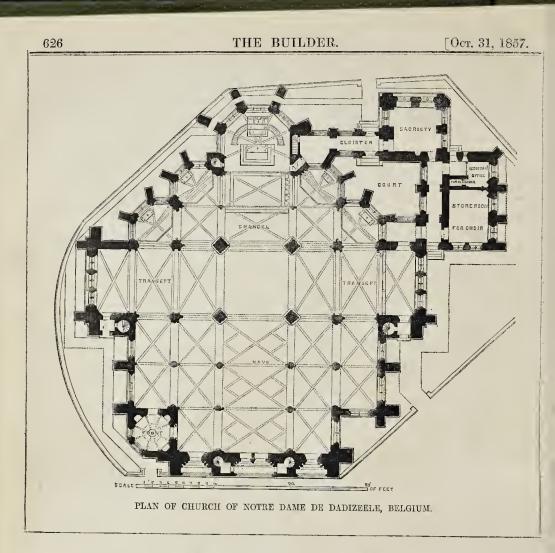

New Corn Exchange, Didoot.—The new building has been opened for busicess, though not yet com-pleted. The exchange is very close to the covered station at Didoot. The contractors are Messrs. Dom-velle, of Greenwich; and the architect is Mr. R. G. Fisher, jum. of Westminster. The building is being carried out mader the superintendence of Mr. W. E. Crake, of London. The estimate was 1,011/.

County Court-house, Wolverhampton .- For some time past the building in Queen-street, io this town, County Contributes, Wolcernampion. — for some time past the building in Queen-street, is this town, known as the Assembly rooms, has been undergoing repairs and alterations to render it more suitable for the business of the County-court, for which it has been purchased by Government. The large upper room used for the sitting of the Court bas been refitted and painted. At the end fronting Castle-street has been rected under a canopy a platform for the judge, with suitable seat and desk, as well as other arrangements for eounsel, jury, &c. as described in the local *Chronicle*. The place formerly used as an orchestra has been removed, and the space thrown into a pre-viously existing room at the back, which is now appro-priated as a conseling-room for comeal and atorneys. At the lower cul of the court seats have been placed for the public. A public office has been made of the hall on the ground-floor, and other apartments have been adapted to the new purposes in view. The por-tion of the building at present deroted to the library will be transformed into a building softs. Arrange-ments for preventing the entry of drafts into the court and offices have been made. The palisades in front effects have been made. The palisades in front effects have been made. The palisades in front ments for prevening the entry of draits into the Gohr and offices have been made. The palisades in front of the building will be refixed, and the Royal arms placed over the principal entrance to the Court-house. The improvements are being effected by Mr. John Cockeril, of this town, builder; under the superin-tendence of Mr. Reeves, of London, county-court surveyor.

Bullet's Hospital, Bath.—Messrs. Cotterell and Spackman are preparing a design for the re-ercetion of Bellott's Hospital on a scale which will be likely to meet the wishes of the public, and to carry out the becevolent designs of the founder. One feature of the plan will be the introduction of a thermal bath for the near of the impacts. sc of the inmates.

use of the inmates. Lichfeld Mescum and Public Library.—The foundation-stoue of the building has been hid. Messrs. Bidlake and Lovatt, of Wolverhampton, are the archi-tects. The building, which will be in the Italian style, will be creted at the bridge in Bird-street, near to the west entrance to the cathedral, and will have two fronts, the one facing the Close, and the other up Bird-street. On the ground-floor will be a library and reading-room; the whole area of the first-floor being devoted to the purposes of the muscum. On the hasis will be a large room for sculpture and objects of a residence for the curator, and rooms for storage, &c. annunity and rarity. It is intended also to provide a residence for the entator, and rooms for storage, &c. The building will he entered by a tower, containing stone staircase, leading to the several rooms. The materials to be used in the creation are white hricks, with dressings of Bath stone. The contractors are Messrs. Lilley and Meacham.

Drainage of St. Helier's .- The line of drainage Drainage of St. Hetters. - The fine of unling now about to be commenced, asys the Jersey Times, will be a great henchi to the thickly-populated streets surrounding St. James's Church, including Green-street, Francis-street, Clarence-road, St. James's. surrounding St. Jante's Characteroad, St. Jane's-street, Francis-street, Clarence-road, St. Jane's-street, and the lanes adjoining. The coutractor, Mr. De la Marc, will very shortly commence this work; as also in the streets on the other side of the town, including Dorst-street, and a portion of Clear View-atreet, with the lanes adjoining.

NOTRE DAME DE DADIZEELE, IN THE DIOCESE OF BRUGES.

THE (R.C.) church shown in the accompanying engraving is being excented at Dadizeele, in Belgium, and is dedicated to "Our Ladye of Dadizeele," so called from a celebrated figure of Beigum, and is dedicated to "Our Ladge of Dadizzed," so called from a celebrated figure of the Virgin, which was brought from Rome in the eighth century. The figure is excented in alabaster, and is held in great veneration by the inhabitants of all parts of the country. The existing clurch was erected hy one of the counts of Dadizzede, who is now represented hy Madame la Princesse Montmorency de Laxemburg, who haid the first stone of the future church on the 5th of September this year, as mentioned in our pages some weeks ago. The service was performed by the Lord Bishop of Bruges, assisted hy the Bishop of Ghent, a large body of elergy, the whole of the neighbouring nohility, the governor of Bruges, and a vast assemblage of peasants. The church is created in honour of the definition of "the Immaeulate Conception," a colossal figure representing which will be placed at the apex under the canopy of the central tower.

The huilding will be constructed of red brick, with French stone dressings. The roof will be groined in brick and stone, arranged in hands.

The cost will be defrayed hy subscription, collected from every parish in the diocese.

The accompanying sketch represents the east end: on the left is the hell tower, under which are the ringers' chamber and sacristy.

Messrs. Pugin and Murray, of Buckingham-street, Strand, are the architects.

SCHOOL-BUILDING NEWS.

SCHOOL-BUILDING NEWS. Eton.—The interior of the ball of Eton College bass been almost rebuilt from the designs of Mr. Wooldyear. The old roof has been removed, and a new open timber roof substituted, with a turret lantern in the centre. There are two new windows, east and west, excended in stone, and at the west end a light canopy, in Gothic oak framework, replaces the previous heavy one. At the east cad a gallery has been eracted over the space dividing the hall from the buttery, &c. It is of carved oak, the front panelled with shields of King Henry VI. The gallery is supported by a screen of lancet-shaped arches, the upper portion alone heing open, forming a cloister between the steps ascending to the hall, and those descending to the klitchen, browery, bakehouse, &c. The hall is entered by a pair of Gothie doors in the middle of this screen : thei thus described by the *Windsor and Elon Express* :— "Around the whole of the hall runs a panelling of oak about 8 feet in height, consisting of small panels about the size of school-boys' slates, cut all over with the names of Etonians of several generations; one anel of particular interest, bearing on it, carved in letters unmistakably of the period, the following in-seription :— "Queen Elizabeth Elon .- The interior of the ball of Eton Coilege bas

'Queen Elizabeth Ann: D: October x. gave 2 loaves in a mess. 1595.4

the hands of the sculptor yesterday. In neither of them was there any outlet for a chimney, or the slightest discoloring from smoke. The discovery has given rise to a great deal of conjecture, the general supposition being that the fireplaces are contemporary with the foundation of the college in 1441, and conse-quently of an antiquity of over 400 years; if so, the perfect appearance is absolutely marvellous. It is well known the original intention of the founder was to have built the whole of the callege with stone. At Eton, from some unexplained cause, the entire use of stone in construction was abandoned, and bricks came into use." Mr. Britton, in his 'Arebitectural' Antiquities of Great Britain,' quotes manuscript ac-counts in the British Museum of the expenditure of the building of Eton College, containing some very Addition of the British Museum of the expenditure of the building of Eton College, containing some very interesting information on this point. "The outer walls of the college hall (still remaining in their ori-ginal state) afford undonltahle proof of the abandon-ment of the stone and introduction of the brick, and most strauge is the welding of the two materials, no attempt having heer made to give a finish to the for-mer, the bricks heigg built into the stone in a very incongruous manner. There is little doubt this hypo-thesis respecting the stone freplaces is the correct one." Mr. Woodycar, on the discovery, so modified his plan as to include the freplaces in the designt a tesselated pavement is to he added. The alterations have hene effected at the cost of the Rev J. Wilder, one of the fellows, who has also recently placed three-memorial windows of stained glass in the south side-of the college chapel. of the college chapel,

A mess being the supply allowed at meals to every four of the scholars. At the back of the above-described panelling on the north and south sides, and also at the dais end of the hall, were discovered mas-sive stone fire-places about 12 feet in width, the mediewal earvings of each heing as perfect as if from tractor Mr. James Rowley, of Walsall.

CHURCH OF NOTRE DAME DE DADIZEELE, BELGIUM .---- MESSES. PUGIN AND MURRAY, ARCHITECTS.

SUBWAYS.

SIR,-When the Metropolitan Board of Works de cided upon a competition, they issued an advertise ment, which, although indifferently and loosely drawn and open to variety of construction, stated plainly enough certain conditions to be observed, among which were, that the sewers should be of a given depth which were, that the sewers should be of a given depth and area; that the first-class subways should contain street and leading mains for the surrounding dis-tricts; and that descriptive details should be given as part of the designs. It might have been expected, therefore, that these requirements would have been found to be complied with in those selected for pre-miums, and that the detail necessary to carry out any system of subways would have, in all eases, been shown upon them. We will see if this has been the ease

case. First-class Street. —Design for first premium. The leading aud only original feature in this is the con-struction of vaults beneath the whole of the subsoil, struction of valits beneath the whole of the subsoil, the shhway being in the centre of them. Upon the score of expense alone this will prevent, in all proba-bility, its ever being carried out; hut the system is, moreover, wrong in principle. In other respects this design complies with neither of the requirements as regards depth or size of the sever. The construction is deficient in strength, and no details are given of the ventilation, means of entry, or working shalls. The whole arrangement is, indeed, crade in the extreme, and to this may he added that the estimate appears to be extraordinarily small. be extraordiuarily small.

be extraordinarily small. Design for second premium has the leading principles of the former, but shows more consideration : the author evidently, however, has not the knowledge of the requirements of the traffic of a large town, for the coal-shoots zere to be in the carriageways, which is most objectionable, and a double curb would exist, which is without exception the most vicious and dangerons way in which a highway can be laid out and Whenever the gas-mains, which are proposed to be in separate channels by the side of the curb, require alteration or work to them, it would have to be performed from the street as at present, although perhaps with less inconvenience to the public, and no provision whatever is made for leading gas-mains, which is an absolute want. The designer has perbaps adhered sufficiently closely to the conditions given in the advertisement in other respects, and the estimate is certainly far nearer the truth than that of the first. Design, third premium, is entirely different from the

two preceding. Subways being formed close to the vanits on each side of the carriageway, the sewer being placed in the centre of the road, the galleries have not room for leading mains (one of the express onditions), nor for men to perform at ease a those operations in them which they must do i v of if system be carried out : the sewer is placed so that the ground must be broken up for a drain to be connected ground must be cleaned if necessary. The way the gullies are to connect with the sewer is bad; the means of access and for lowering pipes are left to be guessed at; whilst the ventilation proposed is open to grave objections.

Second-class Street.—Design, first premium, is nearly the same in principle as the last-mentioned, with the exception that there are to be two sewers, as well as two galleries. The terms of the advertisement appear in the main to have been complied with, but the snbway is ridiculous in its dimensions, and shows no knowledge of the conditions which a snhway to be efficient must ensure.

Design, second premium, has likewise two lines of hway; it labours nnder the disadvantage in respect suhway ;

summy : a mover make the disavantage in respect of the situation of sever that the third design for the first-class street does, and the dimensions of the sub-way are far too small for practical purposes. Design, third premium, proposes, apparently, to form vau's under the whole of the public way like the first and second premiums for a principal street : it is avoid the design and would be subject to the site of original in design, and would he subject to the risk of the scwer bursting or leaking into the subway. The the sower ourseling or leaking into the subway. The means of getting into this sever are not shown, and not easy to imagine, nor the means of getting rid of any water which might leak into the gangways; and if openings from them are made into the severs, then they would he flooded whenever the water rises above its ordinary level; and if the sewer ran full, or nearly so (which it may be presnmed it would occasionally do), the vaults and basements of the honses would be invested. It is realized by the distribution of the second It is not clear why this should have heen inundated. considered hy the judges adapted for a second class street, inasmuch as it has all the dimensions and accommodation for the first-class street. This also enables to he seen the different modes in which esti-

principle which guided the judges in selecting them. They may be divided broadly into two classes,—those which propose subways in the centre, and to construct which propose sunways in the centre, and boast and vaultage beneath the whole surface of the street, and those which propose lines of subway upon each side only. The first class, which suggests a system by no means novel, but not less objectionable, found, apmeans move, but not less objects norts, forts of a prently, the most favour; for to them are assigned the highest premiums, whatever may be the estimate of their probable cost, their deficiency in detail, or com-pliance with the conditions of the advertisement. ther probable cost, there dencency in actail, or com-pliance with the conditions of the advertisement. But this vastness of design, which appeared desirable in one class, was not so in the other; for, singularly coundy, the hittr appear to have been obosen on account of the smallness of their dimensions; and, while, other desiran emoder the same ideas, and in whilst other designs embody the same ideas, and in which the detail of the subject has heen considered, and which arc practicable as regards dimensions, those y have been approved which are far too small for serviceable purpose. only have be anv

any serviceable purpose. When the judges say "no general principles were found to apply," and that they have selected those most "susceptible of practical adaptations," they imply clearly that their own mind is made up as to what the fundamental occessities are and the ruling principle must be. If this is the case, it would have been well if they had intimated them in their straggling advertisement, and if, as from the reading of that it may be supposed, they had not formed conclusions at that time, it would he most satisfactory to the pub-ic and all the competitors, now that they have done so, if they would make them known. A.

MONUMENTS AND MEMORIALS.

Ely .- The nndergraduates' window in Ely Catho-dral, just completed by Mr. Wailes, of Newcastle, has dral, just completed by Mr. Wailes, of Newessie, Riss been put up, and forms a counterpart to the opposite lantern window representing the history of Ethel-dreda. The undergraduates' window contains figures of Archhishop Dusstan, Withburga, Edward, Edgar, Abbot Brithnoth, and Duke Brithnoth. There is also now being laid in Ely Cathedral, at the back of the reredos, a monumental mosaic slah, to the memory of Bishop Allen and his wife. It is by J.s. Liesching and Co. of Paris. The centre is a figure of 8, con-taining the family arms, which, as well as the outside

and Co. of Paris. The centre is a figure of 8, con-taining the family arms, which, as well as the outside panels, is hounded by pierre lithographe, and the mosaic work is formed by an admixture of porphyry, black marble, white and green ensuel, and malachite. *Cornard Parsa* (Suffolk).—The cast window of the parish church of Cornard Parva, near Sudhury, has been filled with stained glass, the gift of Mr. John Sikes, of Sudhury : it is to the memory of his late wite. The window is in three compartments, and the centre medilion continue a fourm of our Sariour centre medilion contains a figure of our Saviour, after Marillo, encircled hy angels, with the text at the foot of it in old Euglish,—"I am the way, the truth, and the life." On the left, the Saviour is retrath, and the life." On the left, the Saviour is re-presented as pointing to the vine, with the text, "I am the vine," &c.; and on the right as the good shepherd, with the text, "I am the good shepherd," &c. In the upper compartments are representations of the four evangelists. The artist was Mr. Clutter-buck, of Stratford, in Essex.

Stratford.—It is proposed to erect a gigantic blic lamp in the Broadway, Stratford, in memory public of the late Mr. Samnel Gurney, a benefactor of the town and district.

Sheffield.—A monument to the memory of Mr. John Harrop, in the Elizabethan style, designed by Mr. Hadfield, has been placed in the Sheffield com-tory, near the spot where rest the remains of the revered James Montgomery. The decessed was a builder, and a native of Doneaster. The monament bears the following inscription :— "This monament was erected in remembrance of John Harrop, of Sheffield, builder, hy the members of the Master Builder's Association and his friends, as a token of their csteem for his general character as a tradesman, his uniform kindgeneral character as a radiosman, ins uniform kind ness to those of his own profession, and his steady adherence to the great principles of trnth and equity Born Fehrnary 2nd, 1795; dicd May 2nd, 1855."

Chellenham.-The Carlisle Journal speaks of a visit to Messrs. Scott and Drape's establishment, to inspect a portion of a window which they have now in hand for the chapel at Cheltenham College. The in major for the vindow will be of Gothic architec-ture, and the design for the stained glass is in the Perpendicular style. The window will be 25 feet high and I4 feet wide. The design comprises fourteen figures, representing our Saviour, the Apostles, and Evangelists, each about 4 feet high. The figures and Dvangetists, each about a feet night. In figures are arranged in two rows one show the other, and are surrounded hy perpendicular canopies. The tracery above is in character with the other parts, and is excented in monograms, sprigs of vy, &c.. The central light in the tracery will contain the arms of Mr. Dohson, the principal of the college.

monument to Mango Park, the celebrated African traveller. A committee, which was appointed in I841, for the purpose of raising subscriptions in Selkirkshire, his native county, and in the neigh-bourhood, have announced that they have sufficient funds to warrant them in proceeding with a "plain and simple structure".

and simple structure.' The Scutari Ma The Scutari Monument.—Baron Marochetti's monument, to be erected at Scutari to the memory of the British officers and soldiers who fell in the Crimes, was recently about to be shipped in the barque Kyanite, of Plymouth, Capt. James Hand-ford, which vessel, after taking on board the sculp-tured marble in London, was to proceed to Penryn, and there receive the granite base and pedesial, worked in the quarrise of Messrs. J. and W. Free-man, and thence convey it to Constantinople. Monument .- Baron Marochetti's

THE LIME PROCESS FOR TREATING SEWAGE.

WILL you permit me to correct a statement which Will you permit me to correct a statement which occurs in a leading article of your journal (p. 590). and which, mentioning the line process for treat-ing sewage matter, speaks of it as having been patented by Mr. Wicksteed. Now, as this is wrong, and calculated to do injury to me, I beg to be por-mitted to state that the line process, which was in-vented hy me in 1844 (and of which I can bring in-ter 1996). rented by me in 1844 (and of which I can bring in-disputable evidence), was patented by me in 1846, being the first patent ever obtained for treating the sewage of towus, as is stated in Mr. Austin's report, page 20; whish Mr. Wicksteed's first patent bears date 1851, as may be seen in the same report. If trust, also, you will afford me the opportunity of con-troverting the statement which has been made, and is now reitersted in the same article, viz. that not more than one-seventh of the fertilizing matter can be collected by this process: if so, what becomes of the six-sevenths? Can it be found in the water? I afftrm it *cannot*: I challenge the proof that it can. The manure has been often and extensively tried, and The manure has been often and extensively tried, and The manue has been other and extensively view, and has produced the most decided and satisfactory re-sults, and has proved, to those who have fully ac-quainted themselves with its properties, that it is far too valuable to be disposed of in the manaer proposed. WILLIAM HIGGS.

** We were quite aware that Mr. Wicksteed's ** We were quite aware that Mr. Wicksteed's patent was considerably later in date than that of Mr. Higgs. The processes may be said to agree in the ase of lime for the precipitation of the "solid matters in suspension," as they are spoken of by Mr. Austin. The mechanical details of the processes, on which much depends,—asin the matter of drying the manure to make it portable and commercially valuable, which is the real difficulty,—however, are different; and if it were possible to apportion relative claims, the main gredit should he given to Dr. Clark. of Aberis the real difficulty,—however, are different; and II it were possible to apportion relative claims, the main credit should he given to Dr. Clark, of Aber-deen, who in his "new mode of rendering certain waters less impure," &c. now well known, but which dates from 1841, showed the way to subsequent in-ventors. Much credit is, we believe, due to Mr. Higgs; but we referred specifically to the patent of Mr. Wicksteed, and did so because it is that which the more the pare of how considered as having the the reporters happen to have considered as having the claim to their attention. best

Mr. Higgs is in error in representing that we said that "not more than one-seventh of the fertilizing matter can be collected" by the lime process: we did say, referring to the different processes, that at best they left *the bulk* of the valuable constituents in the supermatant liquid; and we also said that six-sevenths of the valuable constituents in sewage were there, in solution. We do not know what commercially valuable proportion of the whole Mr. Higgs can collect : we never asserted that six-sevenths could he found in the water as left; but we do find, in the reports which we referred to, frequent reference to the powerlessness we referred to, frequent reference to the powerlessness of the lime process to remove a very considerable proportion of the soluble fertilizing agents of the original sewage, whilst we also find the conclusion hy Dr. Gibbert (Appendix XII. to the Report on the Main Drainage of the Metropolis, p. 479), on the authority of the examination by Dr. R. A. Smith, that the findid, though at first cleared hy the lime process, would, after a short time, again manifest publications of the fluid run off from the lime deposit would also be inferred from the words of Dr. Hofmann and Mr. Witt; and if the supernatant Dr. Hofmann and Mr. Witt; and if the supernatant liquid does flow off, as we are told, in a comparatively Inquit a does now only as we are cost, in a comparatively pare state, it seems that some of the matters in solu-tion are disengaged; and though these at Tottenham are not allowed to escape, so that "the whole esta-blishment" is represented by Mr. Austin as "perTHE BUILDER.

there are individuals, like Mr. Higgs, who have devoted long years and much thought to the subject, and who, we hope, will eventually realize a reward for their labours and investments. As regards the Tottenham sewage, we are told that it commands a price of 4.7 10s. a ton, and that the demand last season was greater than the supply.

THE NUMBERING AND NAMING OF THE METROPOLITAN STREETS.

It has before been suggested in these pages that few things are more difficult than for a wandering stranger in London to find bis way at night. Even those tolerably acquainted with the town do not easily make their way in neighbourhoods to which they are not well accustomed. In some instances the names of the streets are imperfectly marked, in others the gas-light is so placed as not to make the name very visible: and then, when a street is found, it is not often easy to find the particular number of the houses. This might be readily remedied by marking the lamps with a faint, yet distict to clour, which be the postal division of the district; secondly, the name of the street and number of the house ad-joining should be painted on the lamps at the com-mencement of each street, and or every lamp there each cross street; and on every lamp there It has before been suggested in these pages that one at each cross street; and on every lamp there should be the number of the honse opposite to it.

This plan has been introduced into some towns This plan has been introduced into some towns northward, and has not been found very expensive. It must be evident to all that if this plan could be gene-rally introduced into the streets, it would be a very great facility to the public, and at the same time often be a means of facilitating the delivery of letters by the postmen, particularly in suburban neighbour-hoods, where the gas-lights are few and far between.

WIMBORNE MINSTER RE-OPENED.

FLACS and streamers waved from the towers of Wimborne Minster on the 29th ult.; the shops were closed, and strangers flocked into the town to be prebe pre-

Closed, and strangers flocked into the town to be pre-sent at the re-opening of the Minster, which has now heen closed for nearly two years, and during that period has heen greatly removated. Mr. Charles Mayo, of Queen's College, Oxford, who is about to publish a history of the Minster, gives, in the Dorset Okronicle of a recent date, some account of the restorations, prefaced by a few notes of the bistory of Wimborne Minster, and we shall take the liberty of condensing his remarks for behoof of our own readers. of our own readers. The town of Wimborne Minster claims an antiquity

of our own reasers. The town of Wimborne Minster claims an antiquity of about fifteen centuries. Its Roman name was Vindogladia. After the Roman occupation had cessed, little mention is made of the town till, in A.D. 713, Cuthberga, sister to Ica, King of the West Sarons, founded a mannery bere, over which she herself ruled. There seems to be no reason to doubt that Cuth-berga's oburch and nunery occupied the site of the present Minster, though no part of ber work now remains. Traces of an older building, which may possibly he bers, have heen found in excavating under the present church. The oldest portions of the exist-ing church, namely, the central tower, helow the tri-forium arcade, and the parts immediately adjacent, were prohably erected in the early part of the twelfth century. If this conjecture he correct, the arches abutting on the tower to the east and west are very early examples of the Pointed arch. The rest of the church was completed soon after, in the form originally intended.

church was completed soon alter, in the form originality intended. The exterior now presents a very different appear-ance from that which it bore two years ago. We have no longer the broken-down dilapidition cansed by years of parsimony and neglect; neither have we (er-and there on the transepts) any of those hidcous de-formities in the perpetration of which the church-wardens of past generations defighted. The enti-serverbind of the central tower, and the sub-formities in the perpetration of the portex searsity and library, the restoration of the pre-searsity and library, the restoration of the portex isof new roof throughout the whole huilding with the restored of the externor of the oher has well knows block. The transepts, contribute to this changed hook. The transepts are the only parts not yet stored. The exterior of the church is well knows blat it is nnnecessary to describe it. On entering and that it is nnnecessary to describe it. On entering modifican across the arch. The front now occupies window and door and the grouned to its forme moneted with the clock alore. It has now been thrown open, the great weat window and door and the groune exterior of the space under the tower it is Early. A the the restoration areas that are remerased to its forme window and door and the groune centre length of the over, window and door and the groune exterior of the space under the tower it is Early and the to lead to the tower, and the wonneted with the clock alore, it files on the south wander of plain character. A carrisons old orrery wander. The southern pier of the tower- arch was found wander. The southern pier of the tower- arch was found to the lock and the four-tweall. The southern pier of the tower- arch was found wanneted with the clock alore, is file on the south wanneted with the clock alore, is file on the south wanneted with the clock alore. Is file on the south wanneted with the clock alore, is file on the south wanneted with the clock alore. Is file on the south wanneted with the clock alore

Inter DULLDERN. to be very defective: a great part of it has been ent out and replaced. The holdness of this operation, and the indifferent ransoury of the tower, have given irise to some fears for the safety of the upper part; but it gives no sign of heing masafe, now that all the supports bave been removed, and the ponderous peal of eight hells has been testing the stahility of the tower repeatedly during the opening week. The nave has been fitted with oak seats of plain design hy Messrs. Holland, of London, by whom also the roof (the cjit of Sir Richard Glyn, Bart.) and all the woodwork of the church have been executed, ex-cept the roofs of the side aides of the nave, which are by Wimborne builders. Some of the columns have been entirely rebuilt, and the foundations every-where secured without disturbing the arches. The elerestory has also been taken down and rebuilt, and the windows of the Norman clerestory underneath it, formerly bidden by plaster, again exposed to view. The moulding, string-courses, &c. have been cleaned and divested of their coatings of dirt and whitewash. The new roof is in the Perpendicular style, with ham-mer-beams and gilt boses. The cental tower is open as a lantern. The walls have been strengthened with bron boits and other contrivances, and the interior has been cleaned and restored. The celling is painted in hright colours by Castell, to whom all the decorative resolouring and gilding bave been entred. The stained glass in the church has been given by varions persons. In the choir, the three lights of the east window, and those north and south of it, are

The standed galas in the church has been given by various persons. In the choir, the three lights of the cast window, and those north and south of it, are gifts of the Bankes family. The centre light is of foreign glass, the rest by Willement. Ten small elevestory lights in the choir, by Castell, were given by subscription. The cast window of the south choir by subscription. The east window of the south choir aisle, containing thirteen different subjects from the life of our Saviour, hy Lavers, was given by Mr. Thomas Hanham. The side window, given by the Duke of B-aufort, and by the ladies of Wimborne, is by Willement (inserted by Miller), and by Heaton and Butler. Four windows raised by subscription havo been put up in the crypt by Lavers. The side window of the north choir aisle was given by the Earl of Devon (Willement; inserted by Miller); the Cas-tleman family (Gibbs); and the Fryer family (Heaton and Butler). The third window of the nave clear-story on the south side was given by Mr. T. Wyat, and Butler). The third window of the nave clear-story on the south side was given by Mr. T. Wyatt, the architect.

THE SANITARY CONDITION OF SHIPS AND STEAMERS.

We have before now directed attention to the un-sanitary condition of a portion of our sbipping, and are not sarprised to hear these statements confirmed by the report of the Registrar-General of Health of last week

A Stotch schoorer, the *Facourite*, of Crail, reached the Tyne from Hamburgh, and reported that one of the scamen, named William Graham, wasill of cholera. Mr. Hort, surgeon, proceeded immediately on board, and, seeing the man was in a state of collapse, bad him removed on shore, where every effort was made to restore animation, hut be died on Monday morning. He had been ill four days. The authorities are fitting up an hospital, so that in case any more vessels from North Europe should reach the Tyne with disease on board, patients may be removed on shore without being brouget in contact with the general population. A Scotch schooner, the Favourite, of Crail, reached being brought in contact with the general population. We are glad to learn that the authorities in all the north-eastern parts of the coast are adopting precautions

Another fatal case is reported at Horsleydown, on hoard the Lütcken, on the 22nd of Septemher. The ship Lütcken arrived at Horsleydown on the after-noon of the 21st, from Harhurgh (Hanover). She had touched at Gluckstadt, and stopped there twenty hours, at which place cholera raged lately, and carried of 5 per cent. of the inhabitants. Mr. Piatt, the registrar, states that the ship Lütcken arrived at Hors-bordown on the 21st of Sourcember and the the cene

in Cranbrook-street, Bethnal-green; a girl aged two years in Sweet Apple-court, Bethnal-green; and a boy aged fourteen at Peter's-street, Bromley. The spot where the seven deaths occurred at Stratford is ontside the London district. It is thus evident that the outskirls, which, if properly eared for, should he the most healthy, are, in consequence of their unsa-nitary arrangements, the first to suffer. The Registrar-General directs attention to the water supply, and Dr. R. D. Theonyson mentions that he

The Registrar-General directs attention to the water supply, and Dr. R. D. Thompson mentions that he has made an examination of the water supplied by the Southwark company, and found 176 grains of extra-neous matter on October 15th, whereas the total im-purity in the pump well of Abby-place, West Ham (Stratford), amounted to 56-16 groins in a gallon, comprising 440 grains of organic matter. The water supply of large towns is truly a most important consideration. While, however, care is taken of the water, we must not neglect other con-ditions, for the subtle enemy to burnan life, which, though invisible to the eye, shows such palpable pre-sence, marching over a regular course, and slaying cesspools, and other offeusive matters: it visits over-crowded, and dirty dwellings, and ill-ventilated and Cesspools, and other offensive matters: it visits over-erowded and dirty dwellings, and ill-ventilated and dirty ships; but passes such places as are clean and wholesome, and well conditioned. Although we can-not see the pestilence, it is evident that it pounces upon its suitable prey with the same instinct that guides the carrion crow in the choice of its food.

KNIGHTSBRIDGE.

A NAME WITHOUT A TOWN. Some time since you had a letter from a corre-A NAME WITHOUT A TOWN. SOME time since you bad a letter from a corre-spondent, about "a town without a name," and I think that I have a matter of as great importance in "a name without a town." Your readers, of course, know Knightsbridge, and could point it ont to any in-quirer, bat I think it would puzzle any of them to define the limits of that place. Passing along from Precadily to Kensington, you may observe Knights-bridge Chapel, an ancient-looking huilding, with some important memorials concerning it; plenty of work for a future historian of this locality. This chapel was the only religions edifice for miles round, years ago; in lact, I may say the only chapel vest of Lon-don (in 1634); but the minister attending wore to his lock than to the quantity of ground over which he had to preside, encreachments have taken place and it is now "a name without a town." St. Paul's, Knightsbridge, is nort of the parish of St. George's, Hanover-square : All Saints', Knights-bridge, is part of Chelsea, =so that Knightsbridge common is not known, and Knightsbridge common is proper is not sknown, and knightsbridge common is proper is not known, and knightsbridge common is pringe exists, and oly the name. I think that this

other part of the metropolis : the name of Knights-bridge exists, and only the name. I think that this would hear looking to, as hy taking a portion from each of the encroachers, and remodeling their parishes —a parish and a parisb church would be found for

A KNIGHTSBRIDGITE

PRESERVATION OF STONE.

WITH reference to a recent inquiry in our pages as to the inducation of fire-stone, a correspondent senda us an extract from the *Lpsticich Journal* as to the employment in that town of Mr. F. Ransome's process on a house-front,—Messre. Turner's, in Prince-street. The paper says :—"The front consists of Caen stone, and was, previous to the application, in a state of complete rottenness and exioliation: the parts in a state of indication these not only heen preserved complete rottenness and extoliation: the parts in a state of incipient decay have not only heen preserved from further disintegration, but seem to he bound firmly together by an agent most perfect in its cohesive qualities; and the whole surface of the stone operated upon exhibits a degree of bardness it qualities; and the whole surface of the stone operated upon exbinits a degree of hardness it never before pos-sessed; it is also rendered quite non-absorbrut, and the appearance of the stone is improved considerably, whilst none of its characteristics are lost. The appli-cation is one of extreme simplicity, and the material used perfectly indestructible. The *rationale* of the process is thus explained:— a liquid will enter any porous body to saturation, whilst a solid cannot go further than the first interstices next the surface. Take, then two liquids canable of mediation, by further than the first interstices next the surface, Take, then, two liquids capable of producing, by mutual decomposition, a solid, and, by the introduction of these liquids into the cells of any porous body, a solid is produced by their mutual decomposition inter-nally; ergo, if a solid could not go in as a solid, it cannot come ont as a solid; and chemical decomposi-tion having destroyed the solvents, they will never again be in a state of solution." We have mentioned the process hefore, and more-

that some certaiu means of preservation are auxiously looked for.

PIERCING OF MOUNT CENIS.

ALTHOUGH funcles, both subaqueous and sub-marine, may have had their prototypes in antiquity, the piercing of the *Alps* is one of the real trophies of our times. M. Rance, chief engineer of this stupeadous work, bas communicated the following data to one of the French periodicals:—" The tunuel will extend to the length of 12 to 15 kilométres, and as man has user helorg comes an far into the entrailand the earth the length of 12 to 15 kilometes and as than has never before gone so far into the cartualis of the earth, the march is towards the unknown. The next diffi-culty is the rather large lake situated at the top of Mount Cenis, and the level of the tunnel has been Moint Cenis, and the level of the tunnel has been laid so deep for avoiding the danger of these waters percolating to a surface composed of loose saud. The great height of Mount Cenis and the lake prevent the piercing of air shafts for ventilation. Two parallel galleries, communicating with each other, are intended to obviate this inconvenience. Conjointly with the explosion of mines, a huge machine (shield) will operate the work of pierceage. It is calculated that six years' time, and forty millions of frances will he required for completing the perforation of the Alps. The company, "Victor Emmannel," think that they will there obtain the largest share of the traffic of The company, "Victor Emmannel," think that they will thereby obtain the largest share of the traffic of France with Italy and the East. Victor Emmanuel, rance with fary and the last. According to humanity, considering that this is a work interesting to humanity, is disposed to give the half of the above sum from the revenues of the State, and the company has to pay the other half-but only when 4 klomètres of the tunnel have been completed."

INAUGURATION OF THE WOLVERHAMP. TON WORKING MEN'S COLLEGE.

TON WORKING MEN'S COLLEGE. THIS event took place on the 16th instant, in St. Peter's Schools, Wolverhampton, under the presidency of the Rev. Dr. Newman. There was a numerons attendance. The Rev. T. H. Campbell delivered the inangural address, which is reported at great length in the local *Chronicle*. The rev. gentleman, in course of his address, said, —I rejoice to think there has been growing up for some years through, the length and breadth of the land a feeling of sympatry between man and his fellow-man, such as England has not for a long time, if ever, seen hefore. It has shown itself in innumerable ways—in a freedom from for-mality and constraint in the intercourse hetween men of the same station in society—in a recognition of of the same station in society—in a recognition of the bond of kindoess and regard, as the only effectual priceiple of government, in all such relations of life as those of master and servant, employer and employed, teacher and popil, --above all in the yearning of all teacher and pupil, --above all in the yearning of all who have hearts to feel, that means may be found for bridging over that terrible guid which separates class from class, for reconciling and uniting those anta-gonistic worlds of conflicting interests, that each may no longer fancy its existence to depend on the subju-gation of the other, but may know that, though there are many members, and all members have not the same office, yet they are all one body, united in one bead, penetrated and quickened by one spirit. And as this feeling has been growing and strengthening among those who have been blest with higher gifts of learning and education than their neighbours, it has learning and education than their neighbours, it has? encountered and coalesced with another feeling, that these very gifts are not given them for themselves— that they are given not in ownership but rather in trust—that they are held for the benefit of all who may come within their influence. Men have begun to feel that power, to he worth anything, must be used; that iofluence, to he worth anything, must be exercised; that learning, to be worth anything, must be brought ont; in short, that the rule holds good with mental wealth as well as with material, that the miser and the niggard can have no eojoyment of it. miser and the niggard can have no enjoyment of it. Men have hegen to understand what Shakspeare meant when he said,-

Did not go forth of ns, 'twere all alike As if we had it not."

And what a Greater than Shakspeare meant when He sid, "That a light is not hid under a bushel, but put upon a candlestick to give light to all that are in the house." And then has come the question, "How are the gifts of education to be imparted, and to whom ?" and finding also the other question, "How is the gulf hetween class and class to be bridged over ?" and netween cases and cases to be integed over : the two together have worked out one common answer for themselves, "If you who have been blest with these gifts can call together those who have not been so circumstanced, and can persuade them—or rather

over know how necessary time is to test such remedies. meet their wishes (for they will want no persuasion) Nevertheless, we have quoted the statement, in order — to join with you in a common society in which that the effect of the application may be watched, they shall lears, and you shall help them, then will The condition into which many stone buildings created both your objects he gained, both your desires within the last fitteen years have fallen is so fearful, satisfied; you will know what is the meaning of that some geriain means of neservation are axionsly, brotherhood, and what is the trans and of neivelenes meet their wishes (for they will want no persuasion) -to jojn with you in a common society in which they shall learn, and you shall help them, then will satisfied ; you will know what is the meaning of brotherhood, and what is the true end of privileges and endowments. Such or such-like were the prin-ciples from which acose the first Working Men's Colleges: such or such-like were the principles from which every one since baa arisen. which every one since has arisen.

> THE FATAL ACCIDENT TO "BIG BEN." OUR readers must have heard of the sad end to which the much-vaunted Big Ben has come. The crack which the much value of lig bet his cone. The clark which has developed itself is said to be precisely opposite to the spot on which the hammer was wont to strike it on those occasions when efforts (under difficulties) were made to cause Ben to speak out with that full developed voice which he might have scat ringing all over the metropolis had he been elevated to his final resting-place. As the hammer was far heavier than any one anticipated to be requisite to this end, and as any one anticipated to be requisite to this end, and as the section of the bell is peculiar, so far as regards the thickness of the sound bow; and as, moreover, all the quarter hells are formed on the same principle; it becomes a very serious question to determine the cause of what has occurred, and of what uay yet occur. It must be remembered, however, that Big Ben had a beavy fall on its way to London; and although the crack has only now developed itself, a'ter the expiry (almost precisely) of the year which is said to have curnost precisely of the year which is said to have relieved the makers of all responsibility, it may be a question, in favour of the principle of its construction, how far the fall was blameable. That the hammer was made to strike precisely opposite the crack may, nevertheless, militate against this idea.

RAILWAY RATING.

RAILWAY RATING. The Norfolk Quarter Sessions were occupied on the plot and 22nd inst, with an important appeal on the part of the Eastern Contiles Rollway Company against a poor-rate mude on a portion of the Eastern Understand Sec-ter and the parts of Moulton, Norfolk. THE BUILDERS' BENEVOLENT INSTITUTION.

THE BUHLDERS' BENEVOLENT INSTITUTION. ON Thursday, the 29th inst. the tenth anniversary festival of this excellent Institution, established in 1847, for giving relief and granting pensious to decayed members of the various branches of the build-ing trade and their widows—also for affording tempo-rary relief to workmen in case of accidents, was held at the London Tavern. About 220 gentlemen con-nected with the leading building firms of the metro-polls sat down to a repast served up by Messrs, Chater and Co. under the superintendence of Mr. Funge. Amoogst the principal persons present we noticed the following :- The Chairman and President, Mr. Alderman W. A. Rose; Mr. Alderman and Sheriff W. Lawrence; Mr. Alderman Wm. Gahriel; Messrs. Delarue, F.S.A.; Mr. Wm. Jackson; Mr. Joseph Peters; Mr. G. Spencer Smith; Mr. G. Smith, Jun.; Mr. W. Williams j. Mr. H. Dodd J. Mr. Alfred Smith; Mr. Henry Lee, Jun.; Mr. George Lie, Mr. Thos-Jackson, Jun.; Mr. George Lie, J. Thessurer; Messrs. Joseph Bird; Joshan Higgs; Ellis; J. Newson, Jun.; Hutchons; Thomas Cozens; G. Head; Richard Head; Samuel Head; D. Nichol-son, Jun.; Thomas Sticling; William Sticling; Wm. Todd, Jun.; J. James Herd; Watson; John Thorn; Charles Fish; W. S. Simkin; J. Williams; George Carke; &c. The following were among the principal donations

166d, joli, jost, X. Simkin j J. Williams; George Clarkes ; &c. The following were among the principal donations annonced:—Francis, Brothers, and Pett, 57. 58.; John B. J. White and Brothers, 57. 58.; W. T. Purkiss, 57. 58.; Harrop and Son, 107. 108.; Alder-man Rose, 207.; R. W. Kennard, 102.; Joss. Bird, 107.; Stephen Bird (annual), 152.; Geo. Bird (trea-surer), 157.; Henry Dodd, 107. 108.; Alder-man Rose, 207.; R. W. Kennard, 102. 108.; Geo. Hee, 27. 28.; Piper and Son, 57. 58.; M. F. Purkiss, 52. 68.; Jacken, 57. 58.; Alder-man Gabriel, 57. 58.; M. W. Vehn, 217.; Joshna Hirggs 27. 28.; (and guarantees 5 guineas for liv eyears); Alderman Gabriel, 57. 58.; Mr. W. Delarue, 27. 28.; U. Jackson, 57. 58.; T. Jackson, 57. 58.; Joseph Peters, 107. 108.; Yun. Piper, 57. 58.; Colse Shadbelt, 57. 58.; M. Hutchens, 37. 38.; Geo. Head, 37. 38.; After the usual loyal toasts, which were drunk with great enthusiasm.

great enthusiasm, The Chairman proposed the bealth of the Lord Mayor and Corporation of the City of London, which

was responded to hy Mr. Alderman Gabriel, who said that, spending as the corporation did, such enormous sums in the huild-ing embellishments and public improvements of the ing embeliasments and puole improvements of the metropolis, he was sure they could not otherwise than feel a deep interest in the prosperity and wel-fare of the Builders' Benevolent Institution. The buildings, he might add, that had hene creeted at the expense of the corporation of the City of London, were second to none throughout the United King-dem (Cherge). (Checrs.)

aom. (Cheers.) The toast was drunk with loud applanse. Mr. Sheriff Lavrence, in responding to the toast of the Sheriffs of the City of Endon and Middlesex, observed that the builders bad a very foir share in Assembly-rooms, Bridge-road, Lambeth, on the 12th of October, 1557. To the Master Masons and Builders of London, hare vicinity. Gentiemen,—We, the operative more of London, hare inclobidity on Saturdays to the industrial classes gent and boilday on Saturdays to the industrial classes gent ready and Manchester, in our own trade, and also reary many firms and professions in this metropolis. Employed as we are at a laborious and unheality overty pation, we have not hitherto had sufficient leisure to estimate the regresentation of the corporation of London. He need only mention that they had two magistrates more than Manchester, in our own trade, and also reary many firms and professions in this metropolis. Employed as we are at a laborious and unheality overty pation, we have not hitherto had sufficient leisure to estimate received in the provident and the set of the received in the importance and good management of the regretted that the Institution, (Cheers.) The Chairman in proposing the toast of the evening, the regretted that the Institution, whose interest they were assembled together to promote, was not in such a flourishing position as its friends would wish it to enditabelity and the classify rown that districts of this large metropolis, and consequently have when are completed to reside in the clossly crowded districts of the vening alone for on complyment con-sider, then, how unfitted the operative must be to take when the physical powers are completely rehausted. The use of the vening alone for on real/supression should be made for those whom advantage of the vening alone for elexing work on the viscate of the vening alone for elexing work on sturdays; and should you comply with our request_from Saturdays; and should you comply with our request_from sturdays; and should you comply with our

who were now pensioners on their hounty, had been geutlemen walking in the same path of prosperity with themselves, and in the upper hranches of their husiness. Under these circumstances he was sure they would feel it increases and the track of the same they would feel it increases and the same same they would feel Under these creumstances he was sure they would rect it incumbent on them, placed as they were in a position, prospering and to prosper, to extend the hand of relief to their less fortunate herehren. He had the assur-ance of the directors that in all instances the fonds were impartially and properly distributed, and no case was relieved without some of the directors per-sonally inquiring into the application. After culting attention to the importance of all present supporting such a valuable institution, he stated that, at a latter festival he was at, it was promosed that ends explicit. such a valuable institution, he stated that, at a late festival he was at, it was proposed that each gentle-man should get twenty new anoual subscribers. He only hoped that those whose sympathies were emisted on behalf of the Builders' Benerolent Institution would get as mmy as they could; but if they only succeeded in getting half that number, great good would be accomplished, seeing that annual subscribers were the mainstay of all societies.

Mer the mainstay of all societies. Mr. R. W. Kennard proposed the health of the Chairman, and said, associated as he was with "iron," which was a material of such increasing use and interest amongst huilders generally, he could only wonder and lament that he had not become connected with the society hefore, hut he was happy now to give in his adhesion and aid for the future to the objects of so valuable dn institution so valuable an institution.

Watabase an institution. The toast was drunk with great upplause. Mr. Thos. Piper, Jun. proposed the health of the treasurer, which was received with great euthu-

Mr. A. G. Harris, the secretary, here read the list of subscriptions (the leading of them given above), and which amounted in the aggregate to 300/.

Mr. George Bird regretted the smullness of the All, George Bird regretted the smallness of the sum announced, as last year it had amounted to con-siderably more. In consequence of the death of a number of their old subscribers, a falling off in the funds had taken place, and this, coupled with the small amount subscribed that evening, would prevent their having the usual election in Norcember This small amount subscribed that evening, would prevent their having the usual election in Novemher. This was to be the more lamented as there were a great number of pressiog and really deserving eases for relief. He did hope that all present would use their hest endeavours to forward the interests of the

The Chairman here announced, amid much applause, that Mr. Henry Dodd, of Hoston, had made the munificent gift of between four nud five acress of valuable land, in the neighbourhood of Windsor, for the purpose of building almshouses for the Insti-tution

tation. The tosts of "The Directors," responded to hy Mr. Cozens (the founder of the Institution); "The Vice-presidents and Trustees;" "The Architects and Sur-veyors;" "The Press;" and "The Stowards," having been proposed and uppropriately responded to, the company separated. Mr. T. Higgs was the "Toole" of the venuing's entortainment; and the vocalists were, Miss Leffer, Mr. A. Lester, and Mr. Heary. Henry.

Books Receibed.

The Law of Landlord and Tenant: with a copious Collection of useful Forms. By W. A. HOULDS-WORTH, Barrister at-Law. London: George Rout-Oxford ledge and Co. 1857.

ledge and Co. 1857. THE community at large is much indebted to Mr. Rontledge and his firm, for bringing within the reach of all so much literature of the first-class as they have done. It needed extraordinary liberality and plack, and a far-seeing mind, to make, for example, the costly arrangement with Sir Bulwer Lytton, every-where spokem of at the time, which enabled them to supply his novels to the public at a shilling or eighteenpence each; and although it was, of course, nadertaken on commercial grounds, and may have proved a successful speculation, such qualities deserve commendation. commendation.

commension. The little hook named ahove belongs to a series of a different description, called "The Useful Library," and only needs to be known to have a large sale. All are interested, more or less, in the laws which regulate the rights and duties of landlord aud teamt, and onght to have a knowledge of them. If they have feared to study these laws because of the language in which they are couched, or the length to which they extend the used na knowledge to use the search on the laws the search of the language in which they are couched, or the length to which they extend, they need no longer allow these reasons to pro extend, they need no longer allow these reasons to pre-vent them from getting a knowledge of the subject, for they will find Mr. Houldsworth's treatise "it once sufficiently popular to be intelligible, and sufficiently accurate to be trastworthy." It treats of the various tenancies, of distress, and other means of recovering real, of waste and repair, of ejectment, & & &; and oontains a valuable set of forms for agreements, notices, and warrants. We cordially recommend it.

THE BUILDER.

Miscellanea.

THE DESIGNS FOR THE WAR AND FOREIGN OFFICES .- We understand that the council of the Architectural institute of Scotland have made applica-tion to Sir Benjamin Hell to authorize an exhibition in Edinhurgh of the prize competition designs for the War and Poreign Offices to be creted at Westminster. As the exhibition would prove of importance to the advancement of art io Scotland, it may be hoped that the commissioners will find it within their power to grutify the public of Scotland in this way.

ARCHITECTURAL SOCIETY OF NORTHAMPTON. ARCHITEGURAL SOCIETY OF NORTHANFOR.— The annual meeting of this society was held on the 21st just. Lord Henley, in the chair, when the report was read, reviewing the progress of architecture during the year, hoth within and beyond the more immediate sphere of the Society's operations, and of which a a report is given in Last week's local *Herald.*. The Rev. G. A. Poole then read a puper on the subject of colour as applicable to architecture, of which we may have something more to say.

THE COAL-SHOOT NUISANCE .- It is bad enough to THE COAL-SHOOT NUISANCE.—It is bad enough to slip in frost on the iron coal-shoot covers with which the metropolitan streets are hesel; but, when these foot-traps are loose and insceure, summer brings no safety with it. An action was lately brought in the City Sheriff's Court, by a lady who had her leg entrapped and injured in Catherine-street, Tower-bill, by one of these importantly accent sheet and the entrapped and injured in Catherine-street, Tower-hill, by one of these imperfectly-covered shoots, and the sheriff at once gave a verdict against the house-holder, with costs, although it was urged on the part of the defendant that the shoot was properly fustened, but that the accident arose from the fragility of the store in which it was set, for which the Paviog Commissioners were responsible, as defendant never paved the court.

THE AMMERDOWN COLUMN.—This very elaborate structure, the completion of which has been delayed by legal obstructioos, was on Monday in last week submitted to public examination.

FREE LIBRARIES AND MUSEUMS .- Mr. David Chadwick, of Salford, rend a paper on this subject at the Social Science meeting at Birmingham, a few brief abstracts from which may be not uninteresting. brief abstracts from which may be not uninteresting. The following towns have recently established, or taken steps to establish, free public libraries, viz.,— Warrington, Salford, Manchester, Norwich, Win-chester, Cambridge, Bolton, Licerpool, Sheffield, Oxford, St. Helens, Hertford, Birkenhead, Nidder-minster, Lichfield, Leamington, Westminster, King's Lynn, Newesile, Preston, and Aherdeen. The fol-lowing have rejected the proposition to establish free libraries, viz.,—Exeter, Birmingham, Cheltenham, London (city), Isliogton (London), Haslenden, Hull, and St. Marybebone (London). NEW FREE LIBRARIES.

NEW FREE LIBRARIES

	Number of Volumes.	Total Issues last ycar.	No. of times the whole Library has been circulated last year.	Average daily Issues,				
iverpool Ianchester alford iolton	41,400 32,573 20,439 15,097	474,546 156,553 147,300 78,670	nearly 12 ,, 5 ,, 73 ,, 5	1,581 vols. 521 ,, 491 ,, 262 ,,				

xford 4,520 26,000 ambridge 2,579 14,628 6 86 The number of issues from public libraries is gene-relly in proportion to the opportunities afforded for their use to the working classes. If the libraries are closed in the evenings, the number of issues (and consequently the actual use of the libraries) is iess per annum than the total number of hooks in the library. If, as in the case of free libraries generally, they are open all day, till about nine o'clock in the evening, the eirculation will average about seven times the total number. As regards public museums, the effect of restricting the hours of attendauce to not later of restricting the hours of attendance to not later than four p.m. has a like effect in prevening the mass of the people visiting them. Notwithstanding the incomparable superiority of the British Muscum to all others, it uppears that the total number of visitors last year was—to the British Muscum, 361,000; Derby Free Muscum, Liverpool, 123,000; Royal Free Muscum, Salford, 580,000. The number of visitors to the Salford Royal Muscum, in the present year, will exceed S00,000. Working people know that as inhahitants and householders they con-tribute according to their rental towards the cost of maintaining free libraries and muscuns, and there fore they participate in the enjoyment of the privileges on terms of perfect equality with all other persons. The writer concludes with a hope that the pople of Birmingham, and other decelly-opphated twoss, will again consider of the immediate establishment of free public libraries and museums.

THE PUBLIC PARK AT BLACKBURN OPENED The ceremonia of opening this new park took place on the 23rd instant. The park, says the *Preston Guardian*, settends from Preston new road to the heights of Revidge, on the one hand, and stretches heights of Revidge, on the one hand, and stretches from Duke's-brow to Shire-brow on the other. The area is rather more than 50 acres. It was sold by Mr. Joseph Feilden to the corporation, for 654, an acre. Mr. Henderson, of Birkenhead, laid out the grounds. The total cost to the day of opening was 14,7004; net cost paid out of moncy borrowed for repayment in forty years, 10,0004; the balance baving been realized by a sale of ground. The grounds are ornamented by brook, lakes, and islands, bridge, mod fountains. entrance-castes and logicae, Russian groups fountains, entrance-gates and lodges, Russian guns and hattery, promenades, howling-greens, drinking

Section of the sectio and form the marine station of the tunnel. A horhown will be three constructed. Docks, lighthouses, &c. will make of the Varne station a meeting point for all the shipping of the globe. It is proposed to throw up at certain distances on the line of the tunnel thirteen temporary islands, each provided with a small reflector light and necessary workshops. It will be thus possible to sink thirteen wells, and to attack the work of horing the tunnel by twenty-eight openings at once, which will admit of this monumental labour being completed in six years. The total ex-pense will be 174,000,000 france (8,960,0002), about the minth part of the cost to France alone of the Crimean war. Orin iean war.

"EMISSART."—In these days of graph and gram discussions, one fiels emboldened to remark on public writers. May I, then, ask by what rule you apply the word emissary (p. 590, col. 3, line 26) to a channel through which swrage is to be seent? Surely if English is to he recognized as a language, it is the during of advantad are recognized as a language. duty of educated men to adhere to the established meaning of words long in use, however they may dis-

meaning of works long in use, however they may dis-pute about the coinage of new works.—Chrizux, **The meaning given by us to the word "emissary" has heen "long in use," though it is less used now than formerly. Oue of the meanings attached in the dic-tionaries to "emissary" is, "that which sends ont or emits." Emission is the act of sending out; "emissary" the means hy which auything is sent out. Even in the restricted meaning of the term, "a person sent on mission," its larger meaning is involved. The word, in the sense in which we have viewed it, is a very useful one, and oncht not to be Involved. The work, in the sense in which we have viewed it, is a very useful one, and ought not to he given up. The Latin, *emissarium*, we may remind our correspondent, is a sluice, or flood-gate.

THE SHEFFIELD CHIMEAN MONUMENT.— The Duke of Cambridge laid the first stone of this monn-ment on the 21st inst, which was held as a great day in Sheffield. Flags and banners enlivened the streets, shops were closed, and an extensive procession accom-panied his Royal Highness to the ground. The inonument, as designed by Mr. Goldie (of the firm of Weightman, Hadfield, and Goldie, of Sheffield, archi-tects), will rice from a basement of a circular flight of four steps, with advancing bastions for the Russian guns presented to the town by the Minister of War. The lower portion of the monument is a square, with advancing angle buttresses, on which will be inscribed the names of the commenzated; the intermediate faces of the square containing bas-reliefs of the four principal the names of the commemorated; the intermediate faces of the square containing bas-reliefs of the four principal events of the war, intended to be produced in hronze. A cornice composed of the rose, shannock, and thistle, crowns this portion of the composition. The upper and main portion of the design from this point as-sumes a character of greater richness, and emhodies a second of the alliance. and main portion of the design from this point as sumes a character of greater richness, and embodies a record of the alliance. In the centre, carried upon a cluster of nue shaft, bossed and carped, is a plat-form supporting a niche, with four crockcted pedi-ments, embracing pointed and carped arcles. Above rises a steep slone root, the under side of which is ranked, likewise in stone, with schlptared bosses. Armorial beriugs of the town will be produced in this portion of the work. A colosal statue, intended to set forth 'Bdtain victorious,' is throad beneath the central canopy, one band resing on a sword sheathed as for peace, and the other holding out to the victor the wreath of triumpb. The head of this statue will be a portrait of her Majesty the Queen, Round about this central feature are grouped statues of Eogland, France, Sardinia, and Turkey. The contract has been taken by Messrs. Lane and Lewis, of Birnlingham, sculptors. Lewis, of Birmiugham, seulptors. THE "BRAKE" COMPETITION,-

THE "BRAKE" COMPETITION.—In reply to an offer of a premium of 501, by the London General Orminas Company, for the "best model or design for a brake, to be worked by the driver, and applicable to the present style of onnibuses," 127 competitors sont in designs. The referees, Messrs. Joseph Wright, Gowar, and Miller, have just now made their award, and have selected for the premium the model No. 1, by Mr. Thomas Barker. STEAM HAMMERS.—These tools have gone on in-creasing in quick gradations, nutil the dimax of a 64 tons, dead hammering weight, with a fall of 7 feet 6 inches, has hen reached. A hammer of this weight has been lately creeted and is now in operation at the works of Mr. A. Fulton, of Glasgow. Gas.—The Sheffield Gas Company's directors have In reply

works of Mr. A. Fulton, of Glasgow. Gas.—The Sheffield Gas Company's directors have amounced that they are enabled to pay to their share-holders 10 and 8 per cent. out of the profils on the sale of their gas, being the full amount they can divide till the price of gas is reduced to 3s. 6d. per 1,000 cubic fect. A surplay of 5944. hesides would thus be left on hand.—The Warrington town-conneil have resolved to apply for power to erect gas works of their own, unless the present gas company garantec to make gas equal to the power of at least 17³/₂ sporm endles.—The directors of the Worksop Gas Company have given notice that they intend to reduce the price of gas from 5s. 104. to 5s. per 1,000 Gas Company have given notice that they intend to reduce the price of gas from 5s. 10d. to 5s. per 1,000 cubic fect. The directors have adopted this step as an experiment to see if the increased consumption will justify them in continuing to charge the reduced price.—The Castle Donington Gas Company have declared a dividend of 5 per cent, with a bonns of 2s. per share, and have resolved to allow a discont of 5 per cent, on all consumers' accounts of 10s. and npwards.—The Dublin people are engaged in a strangle for a reduction of the price of their gas from 5s. 10d. to 3s. 6d. by which they hope to realize a saving of 40,0000. Year. At present they pay annually for gas 100,0000. In a public statement they give the following list of the prices of gas at various places:—

rious places :—		
London		s, Od. per thonsand fect.
Liverpool	4	. 0 .,,
Whitehaven	2	6
Bolton	3	0 22
Rochdale		
Sbeffield	3	6 to 4 0 ,,
Birmingham	2	101 to 3 10 "
Bristol	4	0 39
Belfast	3	
TD 11	2	

The quality of Dublin gas is said to be very inferior, so that the relative cost of light in the undermentioned places is as follows :--

Dublin	7s.	0d.	
London	3	3	
Tironnol	0	0	

Glaso	-			9	

Many of the principal firms in Dublic have subscribed to a fund now being raised for the purpose of taking steps to obtain an ahundant supply of good gas at a meanwhile minute the state of the state o reasonable price.

THE BUILDER.

FALL OF THREE HOUSES IN SHEFFIELD .- A row FALL OF THERE HOUSES IN SHEFFIELD.—A FOW of new shops, nearly approaching completion, in Gibralter-street, Shefheld, suddenly fell down on Tuesday in last week, owing to the foundation work on which the pillars rested giving way. Fortunately no person was near at the time. The damage is on which the pillars rested giving way. Fortunately no person was near at the time. The damage is estimated at 500% or 600%. The foundation walls in front, says the Sheffield Independent, were built of "rubble" some np to the level of the street. Large beams, extending from the doors and windows, were supported by iron pillars, and the foundation giving way so as to let down one or more of the pillars, the beams were left to sustain the superstructure of brick-work without adequate support. beams were left to sustain the superstitution of orther work without adequate support. The consequence was that they snapped, and let the whole down. Fortunately the brickwork fell perpendicularly, none of it being projected into the street. The rubbish has been cleared away, and more secure foundations are now being laid.

now being laid. ORDNANCE SURVEY.—The minor triangulation of Perth and its cavirons has been commenced. In ac-cordance with the recent decision of the commission, this and other towns whose population exceed 5,000 will he drawn on a scale of 10 fect to a mile, or nearly (it being 1-500th the lineal measurement). These plans are of great importance to the sanitary commissioners, as they facilitate the means of drainage. The country districts are to be drawn on a scale of 6 inches to a mile.—Perth Courier.

Builder.

RAINTREE, in Essex, has been a battle field for principles hefore now; and it is at this moment the scene of a dispute which involves questions important to many of our readers. At the end of 1856, the Burial Board of Braintree, baving arranged to execute certain ceme tery works, advertised for tenders, and ultimately accepted the offer of Mr. James Brown. According to papers which have been furnished to us by a committee of gentlemen, who have associated to protect the interests of the contractor, including a report of the proceedings at a vestry meeting, neld on the 22nd nlt. ;-

held on the ZZAR mt. ;---"To consider a law-suit now in progress, com-menced by Mr. Jas. Brown, builder, against the Burial Board of Braintree, for the recovery of a balance, claimed by him for work done in the new cemetery, which he says cau be proved to have been done by direct orders from the Board, although with-out written instructions; and also to consider whether they will, if they lawfully may, order the same, or any part thereof, to be paid,"--the actimates for these works work heaved

the estimates for these works were hased upon hills of quantities prepared by the architect of the Board, Mr. Johnson, of Bury St. Edmund's; and sold to Mr. Brown by the Board. Further, as other builders who tendered for the work, had these quantities, which were lithographed, it may he presumed they hased their estimates upon them. Mr. Brown's ten-der for the two chapels was in the words following : - " Dec. 1855 : I herchy agree to erect two chapels, lodge, and entrance gates, for the Burial Board of the Parish of Braiutree, according to the plans, and specifications, and bills of quantities furnished by the architect of and that the Board was not liable for either the the Bourd, in a thoroughly sound and workman-like manner, for the sum of I,1601."

This tender having heen accepted, an order for commencing the work was given early in Clause XII. of the contract, hecause while the Jan. 1856, and the architect and some members of the Board attended and staked out the site. tract, the Board had not signed it, nor affixed the A hond and contract were prepared hy the clerk to the Board, and were signed hy him on the 15th of February. In the contract two clauses are found, hearing upon the matters now in disputc, viz. Clause VI. which says, "That if any alterations or deviations from the said specifications and drawings, either in the way of addition to, or omission from, the works hereby contracted for, shall be required by the Board, the contractor shall make the same accordingly ; and the value thereof shall be ascertained and settled hy the architect, and added to or deducted from the amount of the contract, as the case may require. But no such alterations or devia- this the architect replied that he was satisfied tions shall he allowed without written instruc- there was no error, but that if there should be tions signed by the chairman or clerk of the Board." And Clause XII. which provides, for it. Upon which Mr. Brown wrote to a "That if any question shall arise concerning the honse of large business in London, hy whom construction of this contract, or the said specifications and drawings, or the excention of the works hereby contracted for, or any other matter or thing relating to the same, the decision of the architect shall he final, without appeal; and that the submission to his award may, at the instance of either party, be made a rule of her Majesty's Court of Queen's Bench."

The works having heen completed, the architect certified that they had here executed to his material error heing discovered. After considerable discussion it was resolved, entire satisfaction, and that there remained a At this time Mr. Brown had done about two hy twenty-six to nineteen, "That the matter entire satisfaction, and that there remained a

THE BUILDER.

of which the sum of 96% 4s. 4d. it appears, was for extra works, and 62% 10s. for 250 feet of stone in the chapels, over and above the quantities estimated by the architect upon which the contractor's estimate had been based, and for which in express terms his tender had heen given in. The Board, it appears, was willing to pay for the extra works, hut refused to pay for the extra stone, and refused also to settle for the extra works unless the contractor gave a receipt in full of all demand.

For a long time the matter remained in frequent discussion at the Board and with the contractor, until a desire arose in the minds of all parties to refer the question in dispute to a vestry meeting of ratepayers, who ultimately would be the paymasters of the account. But it was contended by the clerk of the Board, according to the chairman of the vestry meeting referred to, Mr. Courtauld, that an action should first he brought hy the contractor in the County Court, and that then would be the proper time for referring the matter in dispute to the vestry; whereupon the contractor in accordance with the suggestions of the chairman and the clerk entered his action; which it was also understood was to he conducted as what is called a friendly suit, in which all the facts should he admitted, no technical objections taken, and the issue limited to the question, whether the architect, the coutractor, or the Board should pay for the extra stone. The case came on for hearing in the court on the 21st of May, when, to the surprise of the contractor, a technical objection was taken by the solicitor of the Board, and the cause thereupon was adjourned.

On the case coming on again for hearing on the Sth nlt. it appears, hy the report of the proceedings in the Essex Herald of the 13th, that the ground was taken on hehalf of the Board, that the Board was not liable for the extra work, hecause the chairman and other members of the Board had neglected to conform to their own rule of giving "written instructions signed hy the chairman or clerk of the Board," according to the letter of the contract the contractor had heen required to sign ; extra work or the extra stone, under the certificate of their own architect that payment was justly dne for it, given iu accordance with official scal to it, and consequently, that while the Board could hold the contractor to his agreement with them under Clause VI. he could not hold the Board to its agreement with bim nnder Clanse XII. !

In reference to the merits of the question of allowance for extra stone, it appears that some time after commencing the work, Mr. Brown suspected the hills of quantities for stone were wrong, npon which he wrote to the architect to inquire whether, in the event of deficiency in these quantitics heing ascertained, he, the contractor, would he responsible for the error? To he was advised that under the circumstances he (the contractor) would not he responsible. At the same time Mr. Brown employed surveyors to examine the hills of quantities with the specifications, to ascertain if there errors, and to what amount ; and meanwhile Mr. Brown desired to postpone his execution of the bond until he might ascertain exactly what position he would he placed in, in the event of

balance due to the contractor of 1581. 14s. 4d. ; hundred pounds' worth of the work, and being heing under judicial investigation, and one side

pressed, signed the contract, and his surveyors soon after reported that there was an error iu the architect's quantities, which was commnnicated to the chairman and other members of the Board, and also to the architect. who still considered his quantities correct, hat instructed the clerk of the works to keep a close account of all the stone used in the building, that so it might ultimately he proved in that way whether there were error or not in his quantities. Ultimately, as already stated, the architect satisfied himself that 250 feet of stone had heen required for and used in the huilding over and above the quantities he had given in, and he certified for payment of the same.

It appears that at the trial on the 13th counsel for the Board alleged that Mr. Brown "took npon himself knowingly the risk of those quantities, as he could show in his own handwriting, and, notwithstanding that, he, hy some surreptitious means, got Mr. Johnson to give a certificate for this very responsibility he took upon himself." Whereas Mr. Brown avers that this statement is wholly erroneons, and has not the shadow of foundation in fact.

At the vestry meeting, after these statements had been made hy the chairman, the clerk to the Burial Board, Mr. Cunnington, said, in explaining why the Board did not attend there, that it would be unfair to the other parties who tendered, having accepted Mr. Brown's as the lowest, then to add upwards of 51. per cent. on the ground of a mistake, which prndence ought to have guarded him against committing. Mr. Brown, in the conrse of his statements emhodied above, said, -as his reason for signing the contract after he had been informed by the architect that the risk as to the accuracy of the quantities must attach to the contractor,-that the clerk to the Board refused to allow him to postpone it, suggesting that the builder next on the list would be called on to do it if he, Brown, delayed. He went on to say there were really 450 additional feet of stone used, but that he had charged only 250 feet, and that the architeet had allowed the charge. Further, that he had been told hy the committee that they did not wish him to lose the money, hut that the architect was responsible to him, and not they. He had then taken the advice of Mr. Duffield, of Chelmsford, who said he clearly had no claim upon Mr. Johnson, who was servaut to the Board and not to him.

The architect's letter, dated Fch. 4, IS56, in reply to the contractor's inquiry as to how he would stand affected if the printed quantities should be found incorrect, is as follows :- "I herewith send you the plans of lodge and gates for the cemetery at Braintree, also the quantities of the additional work, aud will thank you to put your price to them, and let Mr. Cunnington have the amount. I have no douht as to the correctness of the quantities supplied, but the risk, if any, must he your own, as it was optional with the contractors who delivered the tenders to take them or not: the plans and specifications were open to all to take their own quantitics if they had pleased."

It was asked during the meeting whether the Burial Board, or the architect, received the profit of the sale of the quantities to the uilders, hut the inquiry was not answered.

On the part of the contractor, one of the speakers pointed out that, as the architect admitted that the stone now charged for was not in the quantities on which the tender had been made, they would only be paying for what they had had hy discharging the contractor's claim, and he further denounced very strongly the refusal of the Board to pay the sum they admitted to be due (961.) without a receipt in full !

only heing heard, it is premature for this meet-

ing to express an opinion npon the subject." Since the meeting the chairman has written as follows touching the defence set up hy the Board, namely, that they had not signed the eontract :---

eontract :---" If it were hy design that the Board entrapped the contractor into the false and unjust position of heing legally hound by the award of the arbitrator (the architect) if in farour of the Board, while they (leBoard) by this trick-I say trick if it were hy design-would escape from that award if against themselves: if, I say, this were hy design, it would be simply as has as any compound of treachery and mean dishousety could well he. But of course it was nol,--of course it could not have heen,--by design that this was done; and I must assume that, until the matter fell into the lawyers' hands, the one-sided excention of the contract was an inadvertent neglect only, pubably arising from the

iaadvertent neglect only, probably arising from the two distinct instruments, the hond and the contract, being on the same sheet, and coming to be thought of as a houd only.

of as a hond only. But what confounds mc, and strikes me to the earth I stand on, is to find that men cannot see, that to designedly *exail* themselves of this indvertent neglect of theirs--at one moment to *disacove* the contract into which they truly had entered, because their own neglect to seal it had disabled the con-tractor from producing the deed as evidence of the fact on his own behalf; while also, too, at the next mergent they *affire* the contract and make it ridences There on his own benait; while also, too, at the next moment they affirm the contract, and make it evidence on their own behalf on some other point,—that men, I say, cannot see that all this is, in spirit and trath, as unworthy as the frauddent design in the first instance would have been.

It was truly said at the meeting resterday, that no individual member of the Board would he capable of taking such a course as this in the conduct of his own private affairs; and the fact is unhappily notorious, that men acting together in boards and corporations, will do things without shame which individually no

while to things without shame which maryunally no one of them would be so shameless as to think of. It is also unhapply, I think, very generally sup-posed, that a lawyer, acting for his client, may properly put aside all other considerations, and have property put assue an other considerations, and marc regard aloue to the client's cause, unscruppilous as to its character, and very little scruppilous as to the means by which he may gain it. Now when these two institutions (corporation and law) are put into action together for questionable purposes, we may commonly look for, and shall not unfrequently find, the worst examples of wrong-doing, smothered up in forms of procedure perverted from their ness,—of pharisaical morality,—of whited sepulchres full of dead pharisaical morality, - of whited s men's bones, and all uncleanness.

Incar's bones, and all uncleances. Had I been a lawyer, I trust I should earn the reproaches of many hoerds and corporations, for certainly in the present case I should have said to the Braintree Board:-- Gentlemen, if you come to me, plense to wash your hands cleau, for sec, there's dirt upon them. Here's your contract, prepared by your-selves, which you have got signed by your builder, which you have accepted and proceeded upon, by which you bold him bound: after getting one party to the the second state of the second state of the second state of the second proceeded upon, by which you bold him bound: after getting one party to the the second state of the second state of the second state of the second second state of the second state of the second state of the second second state of the second state of the second state of the second second state of the second state of the second state of the second second state of the second state o sign this contract between two parties, why did not your clerk bring it to you, the other party, to sign or seal also? That you were bound to do then: that you are ten times more urgently bound to do now: you are ten times more trejenity bound to do how: just take your official seal, and put it to your con-tract, and having done this act of merest justice to your claimant, and put him in the position he has a right to stand in, then come into court if you please-your hands are now cleam-and if we gain your canse, we shall gain it honestly in the sight of all men."

Here the matter at present remains. We have thought it right to place all the facts of the case (so far as we are acquainted with them) hefore our professional readers, satisfied that hoth contractors and architects will see that it involves questions of very considerable impor-ance. Justice would say at first sight, if the hnilder has been compelled to use more stone than he was told would be required, he ought to be paid for it by those who have the advan-tage of it. Nevertheless, we are not prepared assert, offhand, that the Board could be comto pelled, if the ease were tried simply on its merits, to pay the contractor for the stone used to carry out the original intention set forth by the plans and specificatiou. The con-tractor agreed to erect certain chapels, lodge, and gates, "according to the plans and specifi-cations" (though there he added in his teuder,* "and bils of quantities") "furnished hy the architect," for a certain sum, and the Board would probably be able to enforce the

* The words of the actual contract are not before us.

nndertaking, quite irrespective of the quantities. The huilder was, moreover, informed hefore the contract was signed, that the responsibility as to the correctness or incorrectness of the bills of quantities rested with himself; and we must be the program of the fort the fort the fort the second the not shut our eyes to the fact that some of those who tendered might have discovered the error and increased their estimate accordingly; while others, according to the architect's letter, might actually have taken out their own quantities: so that any addition now to Mr. Brown's stipu-ted any might have injurities to them. so that any addition now to Mr. Brown Schler lated sum might be an injustice to them. To what extent the Board identified themselves with the furnishing of the quantities we do not know: generally speaking, this step in the pro-ceedings, is taken quite irrespective of the employer

The strong point in Mr. Brown's case is, that the architect has certified the correctness of his charge for the extra stone, notwithstanding

his charge for the extra scole, howins and ing the intimation given by him in the first instance. We are not proposing to speak very de-finitely on the matter, hecause the informa-tion we have is not complete. There is one point in connection with it, however, on bailing our concernent years negligible and that which we can speak very positively, and that which we can speak very positively, and that is the inexpediency, to use no stronger word, of the practice, of quite recent date, of arebiteets supplying to huilders proposing to tender, the "quantities" in buildings about to be carried out under their superintendence. We have the names of some architects before where the names of some architects before We have the names of some architects before us, who make more money by this part of the husiness than hy the designing and super-intending, and with much less trouble. And why should they not, many will, doubtless, ask? Why should they not increase their income by the exercise of a knowledge they are bound to possess? Where is the evil? Iu reply, we should say the evil is that the archi-tect thus becomes to a certain extent the servant of the accutators as well as ch his first employer. of the contractor as well as of his first employer, being bound to the former to see that he is not called upon for more work than was provided for in the bills of quantities. Usually the confor in the bills of quantities. Usually the eon-ditions set forth that the contract is made irrespective of the correctness or otherwise of any bills of quantitics ; hut still the moral obligatiou exists, and the architect's right position is materially interfered with. We must repeat, therefore, the expression of our conviction that it is not a wholesome practice.

A DAY IN LIVERPOOL.

A DAY IN LIVERPOOL. LIKE poor Robinson Crusce, who had to eat his bisenit as he went shout collecting household goods from the wreck, having uo time to lose,—we must accept materials for our journal as they interject themselves, whilst pressed by a rising tilde of duties; and most register the facts and thoughts of each week, as they are offered. The architecture of our northern towns has become too important to he left out of consideration, in any view we might have to take as to the at cf our country; but, to furnish a lett ont of consideration, in any view we might brive to take as to the art of our country; but, to furnish a description of it becomes a lahour of considerable maguitude; and a earefully compiled volume, rather than the pages of any periodical work, would he re-quired to do justice to the progress which has been reach as an exact there for me. We mercello of aired to do justice to the progress which has been ade in and around those towns. We-people of made in and around those towns. We—people of London—have our particular topics of interest, ~ presa-ing even painfally, as peculiarly, on us,—but having their relation with the welfare of the country. So, our readers in the provinces—often justly prond of their achievements in architecture—must take some-thing of "the will for the dead," and accept our "go of "the will for the dead," and accept our ordinary fragments of description for the elaborate and exhaustive accounts which might seem to be their due, hut which would he supplied at cousider-

[Nov. 7, 1857.

of huilding of a superior kind that is now going forward is considerable. The impression from a walk through the principal quarkers of the town, after visit-ing other towns, is that more must he doing in Liverpool than at any other place in the kingdom, London and Westminster perbaps not excepted. The population is larger than that of any other town: in 1851 it was 258,236 persons, Manchestr heing 228,433 persons, whilst Bristol with Clifton was somewhat more than 180,000, Birmingham nearly 175,000, and Leeds ahout 110,000. The town of strangers. The funds of the exportails generally. The principal works going forward, are in the streets adjacent to the Town-hall and Exchange. Of these latter buildings, which together form a group possessing considerable merit, the Town-hall itself preserves a high place in our estimation. Amongst the fatures which contribute to its effect, may he enred the small dimensions of the windows of the

preserves a high place in our estimation. Amonget the features which contribute to its effect, may be named the small dimensions of its windows of the upper story, and the statue on the summit of the building, seems to retain an unsullied whiteness, which, view ed against the dark clouds, is the source of consider-able beauty of appearance. Wood, of Bath, was the able beauty of appearance. Wood, of Bath, was the architect. The Exchange huildings proper, are inferior to the structure with which they group : the windows generally are without architraves ; and the details have more poverty of character than those of the Town-hall. The arrangement of the masses, and the piazza round three sides of the quadrangle, are, however, im-portant accessories to the general effect which we have alluded to. In the news-room, some alto-rilivos over the chimney-pieces are works of much interest. The discussion in reference to the designs for the Wellington Monument, lends interest to the examination of the Monument, lends interest to the examination of the Nelson Moonment in the Exchange area--a work of monumental sculpture of the allegorical class, which has some pretension as compared with others of about the same date. Nelson is represented as a naked figure, and amongst the attendant allegorical figures, is a representation of Death as a skeleton, placing his hand on the breast of the hero. Here, if there he previously, it may be dustised whethere placing his hand on the breast of the hero. Here, if there be perspicuity, it may be doubled whether there is plastic heauty. But, as a whole, the work displays appreciation of certain right principles of monumental sculpture: the platform of support, the pedestal with its accessory figures of captives chained, and basso-riticos, and the group at the summit, all combine together; and the only particular demarit, otherwise than the allegory of the kind we have referred to, consists in the omission of mouldings of sufficiently architectural character. With vegences to another subject on which we

of sufficiently architectural character. With reference to another subject on which we have lately said much,-mamely, the importance of studying the accessories and the arca around a build-ing,-we may observe, for the hetter understanding of a reference which we made to the Liverpool Custom-house, that the flagging in front of that building scemes to have been retrenched since we last saw it, by which the portice has lost the little effect that it had. The best evidence of the importance of our arguments on the head of the importance of our arguments on best evidence of the importance of our arguments on this head-needed only from the fact of the constant disregard of the matter, if not in design, at least in the actual execution of works—is afforded by the state the actual execution of Works—15 dubrach of the State of the ground about SL George's Hall. The dirty grass, or earth strewn with rubbish; the common wooden gates, and the posts and rails in front of the enclosing halustrade, are most injurious to the effect of the building itself, and should not he allowed to remain one week longer. The design and arrangement of the building its conception are arrangement remain one week longer. The design and arrangement of the balastrade and its accessories, are critainly much to be regretted: in some places, standing near to the balastrade, the steps and base to the building heyond, are not to be seen without difficulty; or, at all events, they cannot he seem as they should be in their entirety, from the opposite side of the trans. The second of the mullear station is street, where the screen of the railway station is. This peculiarity of course results partly from the site street, where the screen of the miliway station is ordinary fragments of description for the elaborate and exhansive accounts which might seem to be their due, but which would he supplied at consider-able intervals. There are advantages to the architect especially, as we urged once on the occasion of a visit to a place of ferred, in cultivation of the babit of noting all that thes import noce than the towns to which we have re-ferred, in cultivation of the babit of noting all that sid, quoting from Sterne, "What a large volume of adventures unay he grasped within this little span of the way, misses nothing that he can fairly lays is hands on !" May we not, then, try what we can that or ? We did indeed supply a few particulars in the evart part of this year; but since that period considerable progress has here made, several works of magnitude have been completed or commenced, and the quantity

building deficient as to the sculptural element. The interior of the great hall, on the occasion of this visit, appeared to us less describing than the arrange-ments we bave been speaking about, of the objections recorded on the score of the completion of the work generally. It is not to be expected that any architect should divine the intentions of another; and it may fairly should divine the intentions of another; and it may fairly, he said of the interior finishing of St. George's Hall, that it has been completed more in accordance with the intention of the original artist, than has the decoration or completion of any other huilding earried forward under more than one archited,-unless Mr. Pennethorne's work at Somerset House is to be ensidered an exception. The introduc-tion of the organ and gallery may be regretted, on account of the loss of the visia; but the gal-lery, and, indeed, the whole of that portion of the building, is beautifully designed. We think it cannot but he lamented that the structural and decorative requisites in the architecture, were left so as to appear but he lamented that the structural and decorative requisites in the architecture, were left so as to appear in some measure in opposition to one another. The hall is lighted—hesides the semicircular light at the end—hy windows at one side only. These windows, indeed, are so deeply recessed, that they do not appear at all in a view from the end; hut we are not snre that the contrast which yet is observable between the two sides of the hall, in a work of this class, is quite satisfactory: and the arrangement, accompanied as it two states of the nam, in a work of this case, is quite satisfactory; and the arrangement, accompanied as it is, by a provision on that side externally, for the lighting—by the omission of a acciling to the portico— the columns and entablature thus heing left to form a screen—allows an opportunity which need not have The columns and encountere this height in the form is screen-allows an opportunity which need not have heen presented, to the opportunity and agaed in pages of hexagons and triangles, and are heing filled with stained glass. The colours, if not the patterns at present inserted (inferior hoth to Mediateral works, and to many works of recent execution), scarcely apply the beauties of stained glass. In there is still difficulty in combining the effects of colour as pro-duced hy such glass, with general decoration, as well as in making the application to Classical archi-tecture. Tracerical forms, or somewhat intricate geometrical patterns, might be introduced with better effect than mere uniform geometrical figures. The concert-room is now completed, and the semicircular staircase-hall helow may be considered so likewise. In the latter, the ascent hegins somewhat too near the entrance. Columns of the Grecian Doric order, decorded in polychromy of a cool tone of colour, sup-In the fact, the with Corintina columns. A nariow golder y sur-rounds the room in bow-fronted divisions, and is supported on carvaides. The general churacter of the architecture is that of the Cieque-cento Italian style. Round the walls are pilasters, panelled and enriched with ornament on a gold ground. entrebed with ornament on a gold ground. There is an elaborste frieze, with *chimere*, serolle, and peteras, and a cove with diagonal bands and coffers, with elaborate scroll-work. The platond of the ceiling is divided into radinting panels, with lattice-work, to allow of ventilation. The fronts of the boxes also are filled in with lattice.work, which is partly gilt and hacked by crimson eloth. The principal wall.surface is divided into panels, which are painted in imitation of maple. In the circumstic decoration, the chief colours used are eream and gold; hut light hive, or like, and positive colour to some extent, are intro-There is colours used are cream and gold; hut light hue, or like, and positive colour to some extent, are intro-duced in small portions. The columns of the recess, which are rather heavy in appearance, are enriched with scroll-work for a portion of the height of the shaft, the rest heing finted, with ornament on the fillets and gibling in the bollows. The recess is spannel by an elliptic arch, with glazed panels and tympanum. The intercolumns are glazed with look-ing class. The stoge advances into the anditory, and is panelled and curiehed with scrolls on the front. The architecture may be different in style, hoth to the exterior, and to other portions of the interior of the huiding; hut it is consistent with the purpose of the room, and has, we thick, unusual heauity and merit. The defective construction, or planning, of the

room, and has, we thick, unusual heauly and merit. The defective construction, or planning, of the Law Courts, was made manifest during the short visit which we paid to them. The sessions were then going on . All the steps and floors of passages have been exrefully covered with kamptulicon, so that there is nothing to distract the sound of what the jury should hear; yet it was painfully evident that the jury should hear; yet it was painfully evident that the interests of prisoners must be endangered. The time we spent, offered, however, a saddening picture of the state of arime in Liverpool. There were four trials gone through, or in progress, during the time referred to—little more than half an hour—and in each one out of three of the cases a woman was the calprit; and in the other case, a woman was the calprit; and in the other case, as that such predominance of females. The police say that such predominance of female eriminality is usual in the town. As to erime generally, it may he enough to mention that in the Woolton New Model Prison, lately built for 850

prisoners, there were in it at one time, just previous to our visit, no less than 1,150 prisoners of hoth scress. A visit to a criminal court is a painful thing in another respect: the ignorance of those who have not graduated in crime, of the simple purport of the proceedings on which the verdict will be pronounced ; the open levity of counsel; the facts which come out, showing dread of the police, sufficient to produce suspicion, if not the crime itself: all these and other things strike the attention of those who are not habituated to the atmosphere of law and "justice." Difficult as the questions of prevention, punishment, and reformation are, there is manch more than has been yet attempted that might he done, through hetter education and the provision of homes. The measures of police which may be necessary, should precent themselves in some other light than as the tyranny of the npper classes. The absence of *suspicion* no both sides; the recognition of a mutual serviceableness; and a kindly, whilst unpatronising, interest by the higher class in the donestic condition of those who are called "the poor," are what are needed to amend the melaocholy condition of too many of our wealthy towns.

In the way of provision of comforts for the seafaring class, thereby amending what has helped to induce the commission of crime, the Saikurs' Home must even now have exerted a very heneficial influence. Owing to the temporary absence of the chief officials, and the accident of the hormless writer of these notes heing mistaken for a Latter-day Saint, we did not obtain access to the rooms themselves, hut may observe that the arrangement of the plan,—with a central coart glazed at the top, and six tiers of galleries oo iron supports, running round and giving admission to the rooms,—mfords a most convenient arrangement for like cases. The court in the "Home," at Liverpool, is provided with stoves, open on all sides, so that the men can sit round; the smoke-pipes heing carried straight up to the roof; and it has scats and tables, and, when we saw it, was occupied by what appeared an orderly and intelligent class of men. The decorative character of the building helongs to the modern unmitigeted Elizabethan, io which the forms of scrolls seem as though studionsly selected for their ugliness. The dooring hadiness is character. The fronts generally exhibit a considerable surface of multioned window-opening; and the angles are surmonneld by turrets.

The docks have been vasily extended during the last twenty years, and, notwithstanding the probable completion, with Government aid of the docks at Birkeuhead, on the opposite side of the Mersey, complaints are still made of deficient accommodation. About the time of our visit, a memorial of the Shipowners' Association, agreed to at a meeting on the 17th of October, was presented to the dock committee,—wherein *very scrions inconcentience*, and trade "constantly increasing to an extent beyond all contemplation," were spoken of. It was asserted that steamers had doubled their tounage in five years; that ships had to lie for weeks in the river unable to get iuto dock; that vessels were divated from the port of Liverpool; and the memorialist therefore asked for "a very great increase of dock space, and especially "qay space, on the Liverpool side of the Mersey," "within the earliest practicable priod." We have, indeed, heard the truth of this representation questioned; but in all the docks that we visited, the gany space was fully occupied. In the Brainley Moore and other new docks, the arrangements for those of the older docks. Besides the moveable eranes of great strength, which seem provided in abundance, the railway waggous. The inspentito do this wave, such docks gates, and the Cyclopera-looking masoury, good brickwork, and massive iron columus of the wave houses, would deserve much study from our profesional renders. But we cannot say that in all cases, the house the priod render such sing from our profesional renders. But we cannot say that in all eases is structurally estilicent; a better character of design in the dock buildings, walls, and gates is sneeded. Nothing, however, has been produced in Liverpool any time that equals in deformity the design of the indiges to the new hundings-tige. They dominate over the quay side with such ngliness as we have merer seen since the regin of run began. The length of the stage is so great as to require several bridges; at the stage as 4.5. Georges' pinchea

ways there are some of great magnitude and interest. We can morely refer to the roof of the Tithe-Barnstreet station, and the "bow and string " bridges of plate-iron and huffice-work, near to the station. It is pleasing to see, about the town of Liverpool, basias and drinking foundarian inserted in the walls of buildings adjoining the footway. About the docks these basins are of polished red granite. As to the watersupply, it would appear that there is still much difficulty; and certainly the colour and taste of the water supply, it would appear that there is still much difficulty; and certainly the colour not taste of the water of the ordinary supply are anything ant satisfactory. The sewerage, we fear, judging from the stench from gully-holes in the neighthorhood of the docks, is like that of other places; in some parts of the town, the immense volume of water which there is to dilute; and as some persons we suppose would say, to assist in the ejectment of the sewage of Liverpool, of Birkchech, of Runcorn, Warrington, Manchester, Stockport, Bury, Ashton-ander-Lyne, and numerous other populous places draining into the Mersey and its tributaries, we are assured that the sewage deposits on the shore at New Brighton, at the month of the river, os as to produce serious coosequences from time to time to persons visiting that otherwise agreeable place of resort. Referring to the docks—improvements in the streats adjacent tothemare greatly required. Along "the line of docks," the widening of the street will be effected at conromous cest; the hoildings to he removed being lofty warchouses of massive and durable construction. Whils the normineut works of excellence in the streets hear to the street works of excellence in the

Whilst the prominent works of architecture in Manchester are warehouses, the Liverpool architecture is displayed chiefly in piles of huildings let out in offices. The warehouses generally have no decorative enrichment. Perhaps the most prominent of the works referred to—from the quantify and merit of the decoration—is the building in Water-street—a portion of the Tower buildings, erecting from Mr. Picton's designs for Sir Joseph Bailey, bart, aod mentioned by us some time ago. It now presents one of the rich elevations to a nerrow street -, hat when the warehouses are removed, this side will front the George's Dock. The windows of the two lower storiesin each front are grouped together, under n segmental areh with a hold torus as a label moulding. The piers are rusticated in the lower part; but the has of the building has scarcely massiveness sufficient for the prominence which is given to the feature which has pist been alloded to. The windows mer wide, and of four lights in the wooden multions and casements, which hear evidence of the study which Mr. Picton zives to such matters of detail—as exemplified in the. Middleton-buildings at the corner of Fenwick'street, higher up. The first-floor windows are Vanetian, with an arched-beaded centre light and granite shafts, and are finaked by Coritisin three-quarter columns on trasses. The cornice of the order is carried round the building as a string, and breaks forward under the windows of the top story. The latter have segmental pediments, trusses, and pilasters, which are panelled with red and grey genuite alternating in compartments. Much embellishment of a superior character is introduced in the tympon of the pediments, and helven the modilion and dentil cornice of the building, in the interspaces hetween groups of trusses which occur over the piers between the windows, are portions of a frize with heads, and triblycave building, which is making a good beginning in Charget-street, is, we are informed, also from Mr. Picton's design.

Pictor's design. In Dule-street, next the Town-hall, a building for the Liverpool and London Insurance Company is now far advanced. It was referred to in our pageain a very recent number, when we were noting some particulars of the great rents realized in Liverpool. We may now add that it is stated to us that the average price paid for the ground was 50%, the square yard, and that some portion sold fetched 70%, a yard. Mr. Cockerell is the architect. The general character and details of the building hear much resemblance to the Sun Fire Office in London, as in the use of columns in the upper story, and in the ornament of Greec-Italian character. Below the cornice is a frieze with/ windows in it, and festoans. One of the fronts is broken into a centre and two wings: and next he two recesses the statreases occur. The heads of the steps are represented enved on the exterior. The want of freshness, by the resemlance to the Sun Fire Office, is to her gretted. Mr. Cockerell's other prominent work in Liverpool—the Branch Bank in Castle-street—improves greatly on acquaintance. There is a building of posite to the premises of the Insurance Company, which has been often referred to and illustrated; and which would afford the opporand illustrated; and which would allord the oppor-tunity for some good lessons. It was early in the period of what we may call the recent revival of art in architecture. Considerable skill is shown in the design and treatment of the ornament, which is of Greek character; and though boldly cut, has endured well the action of the weather. The ornament, how-ever, is badly placed, and the main features of the design are tame and common-place. Mr. Colling's work, eshibited in the drawings which he had in the Architectured Exhibition and which was previously work, exhibited in the drawings which he has ut the Architectural Exhibition, and which was previously and then noticed by us, is now approaching comple-tion externally. The building is expected to be com-pleted in March, ISSS, and is called "The Ahany." The objections which we offered to the drawing are, are accorded, form, of them, anarchi in the comas we expected, few of them apparent in the com as we expected, it work the more application in the con-pleted structure; and the work may be justly con-sidered a superior example, both of the fitting use of coloured materials, and of the application of many of the resources which are derivable from Gothic archi-tecture, to a general Italian groundwork of style. The ornament has the combined merit of beauty The ornament has the combined merit of beauty and distinctive characler; and in that particular the architect has failed only in the coffers of the the architect has failed only in the coffers of the soffit of the coroice, which, besides the too great variety in them, are so minute in their parts as to be inoperative in comparison with the ro-settes of the old Roman pattern, and in the location of the ornament below the windows, which is bidden by the projection of the cornice. The general orna-ment, we must say, possesses in a marked degree the attributes of novely, character, variety, and concerned meet. The interstient being deeply out the ment, we must say, possesses in a marked degree the attributes of novelty, character, variety, and general merit. The interstices being deeply ont, the ornament shows well; and much of the work being otherwise merely surface corrichment, the stone will probably not be put to too severe a test. The ornaprovidely not be put to too severe a test. The orna-ment is, as we have said, Gothicio origin, but greatly modified from that style. The archivolts of the alter-nate windows are varied: the ornament, in one case, is derived from leaves, but is flat on the fare; in the other case it includes a number of several states. other case, it includes a number of rosettes, or pateras.

At the back of the Exchange, at the corner of the street in which is the building last mentioned, is another structure, erecting for business purposes. makes use, in the fronts, of materials of two kinds,-It makes use, in trons, of match as of two knows, a yellow-coloured stone and a drab-coloured one, or grey granite. These are placed alternating in the courses of the matic work, which constitutes part of the design in the basement, and in portions of the front, which form masses, with areb-headed recesses front, which form masses, with areb-neared recesses for windows, the latter having ornamented key-stones and carved enrichments. The frieze and cornice of the buildings bave oblong windows and trusses. The dark-coloured material is used for window-dressings.

one, in any way interested in art or history, should leave Liverpool without a visit to the remark-able collection of antiquities forming the museum of Mr. Meyer, the purchaser of the Faussett, the Hertz, and other collections, which would bave found their and other collections, which would bave found their appropriate location in the British Museum. A choice selection of the ivories, and many others of the works of art were exhibited in Manchester; but what was left included Egyptian, Assyrian, Greek, Etruscan, Roman, Early British, Saxon, and Medieval remains; fragments of architecture and sculpture, personal oroa-ments of all kindly, each and concerne arms and fragments of architecture and sculpture, personal orna-meuts of all kinds; seels and cameos; arms and armour; cinerary uros, Egyptian munmites, and, in abort, antiquites in extraordinary variety and of the most valuable description. The collection of old china is hardly to be surpassed: it is rich in excellent specimens of the blue and white Wedgewood ware, with the designs by Flaxman. The arrangement of the whole runscun is such as helps greatly the study of what it contains. It is understood to be Mr., Mararé intertion to ressent the whole adhabites to per's intention to present the whole collection to Derhy Museum and Free Library at some future iod. Whenever that munificent gift is made, we Meyer's the Be period. Whenever that munificent gift is made, we trust it will be duly appreciated by the people of Liverpool. At present it cannot be said that the collection is so appreciated: the attendance is about thirty persons a week, and few of that number take aoy interest in what is exhibited. The sixpenny fee aoy for for admission does not half pay the current expenses which Mr. Meyer's devotion to the pursuit, and his liberality to the public, have entailed upon him.

Interarity to the punch, have entailed upon him. Of the huilding for the muscum and library, above referred to, we are able to say nothing. Dimly clouded intelligence reached us of something some-where going forward; but as we contrived to pass round St. George's Hall without seeing the new huld-ing, we opine that the progress in the work is not considerable. Of the mass of buildings forming the Liverpool workhouse, and several recent churches that we need we need not give any account: a dow that we passed, we need not give any account; a day in Liverpool, especially about the docks, or the hilly part of the town, is a thoroughly tiring husices; and what we have left nunoticed must stand deferred till the opportunity for another visit shall turn up. AN EFFORT FOR LAMBETH

CENTRAL "PLACE" IN LONDON, UNITING TEA-FALGAR-SQUARE WITH THE BOROUGH ACROSS THE WATER.

HOWEVER important it may be to embellish a great city, and to provide for its traffic, yct there are questions connected with its moral and physical health questions connected with its moral and physical heilth of fur higher moment. In your remarks, appended to my last letter but one, you well called the quarter of Lambith, so often alluded to, viz. that which lies hetween Westminster and Waterloo-hridge roads, and the South-Western line, an "Alsatia." What White-friars, as described by the eloquent pen of Scott, was in the centre of past London, such is this spot in the centre of present London. It is a storehouse of moral and physical misers allocated to axist and faster in the and physical misery allowed to exist and fester in the heart of the metropolis. Your own observations, and my former letters, have shown how elosely, if uot exactly, it occupies the centre situation of this vast dwelting-place of human beings, holding just that position whence its moral and physical diverging position whence its moral and physical diverging circle can most readily and widely infect the largest cover can most reasonly and widely inter the largest population. Cronched by the margin of the Thames, it has a ready access to both banks. To show its character with the police, it need but be said that the perpetrators of the late mystery at Waterloo-bridge have been more songht for in this quarter than dse-where, and yet this fertile source of crime is per-witted to remain actualized. mitted to remain notouche

We have, within the last few years, removed St. Giles's, and cleared the purlieus of Field-lane. I am sure you agree with me that it is time that the atten-Government and the inhabitants of London tion of should be turned to this other quarter, occupying a much more central position than eather of these, and one which embraces not only a larger scope for evil in the streets, lanes, and teucments of the City, hut commands also the whole navigation of the Thames in the neighbourbood. It has, indeed, every possible facility for crime and concealment, both hy land and water, that London can afford.

Thus, although other eyes seem to have been blind to the force of its site, and its ready access to the metropolis generally, those of vice and dissipation have been long awake to it. These evil denizons have have over long wave to it. These our durates over established themselves undisturbed in a situation whence they have the readiest means to do the utmost possible mischief. With vice and dissipation come dirt and drunkenness, and with these discusse and pestilence. As at present occupied, this spot is a storehouse and a sallying point for typhus and cholera, whence most quickly to attack the central parts of the

But the evil is double,--moral and physical. As soon as the shades of night begin, you may see issue forth from this uest of iniquity troops of the evil and misguidiog, as well as misguided, across the narrow bridge of Huugerford, who then spread themselves about the Strand, Charing-cross, Fleet-street, and the neighbourhood, and only return to their first haunds deep in the night, or on the following morning. Various are the trades and divisions of evil occupations of such as these, for I do not solely allude to the unfortunates who erowd some of our principal thoroughfares at night. Surely it would be well if our police authorities would turn their especial attention to the evils of this locality, that possesses, from The to the evis of this because, the power of mischief. Let Sir Richard Mayoe turn the bull's eye of his particular attention on the quarter in question. Surely it only requires that public attention should be fully awakened to the present occupation of this ecotral spot to induce steps to be taken to promptly force on it a sublication. a radical change

In regard to the importance of this situation, we ay thus even learn from the teachings of the evil. may thus even learn from the teachings of the evil. If this spot be so strong for cvil, may it not be equally so for good? Not only thus would a upas-tree he extirpated, but on its site a tree for good fruit planted. That this is my thought, my former letters have shown, and also my ideas as to the mode. But the extreme to which Ig on whe visionary. The stability of our position in public matters is the result, they say. of so many presentive checks as not to allow. say, of so many preventive checks as not to allow, may be, of the freedom of such a step as would create so expanded an architectural centre to London set in the indicated is in the neutral active to bound question might he cleared out, as St. Gles's and Field-lane have already been ; and this, according to my belief, would he most effectively done by Governmeet, in the first place, purchasiog the property and establishing its regulations on the spot.

Even if an architectural scheme on such a scale as Even if an orchitectural scheme on such a scale as I have submitted to you he visionary. I fancy that the purch we and complete "éclairage" of the district might become a good "speculation" for Government. The "quirdnat space" I have alluded to as "Lam-beth-terrace would make an admirable commercial quarter of the first class ; and even its architectur.d qualities might well move hand-in-hand with those of commerce, if it were to hecome the site of such

structures as the "Manchester warehouses" lately

structures as the manufacture waterboard incom-raised in St. Paul's-churchyard. It is not in the least, however, that I have mode-rated my architectural visions with respect to this spot in connection with Tratalgor-square, and the wide spot in connection with irradigor-square, and the vice bridge uniting them, that I sholded to this mode of occopying it, but only to indicate one of the many ways in which it might he made available, which might address themselves, more favourably than my own pet idea, to the business mind.

I will not at present say more than to call back the attention of your renders to the fact, that the point of most ready access of all Londou is at the present moment an especial storehouse of crime, filth, a pestileuce. Epsilon. and

HE PAYMENT OF ART - CERTIFICATE MASTERS UNDER "THE DEPARTMENT." ART - CERTIFICATED

THE circular recently issued by the Department of Art, making known the means by which localities may obtain the services of au art-certificated master, has bronght us a number of letters from masters in ars prought as a number of reters (our insects an existing schools and other correspondents. One writer, after stating the arrangements under which schools may be formed, says,—"There are also cer-tain notes for the information of schools of art established before the date of these conditions, viz. :- '1. In places where schools of art have been esta een esta-1. In places where schools of art have been established previously to the date of these regulations, the number of the population under instruction in drawing, and not the number of the schools, must hereafter be the rule. There must be at least one per cent, of the population taught drawing by the artmaster, or mader his superintendence, or the artmaster, or nucler his superintendence, or the artmaster will not be estilled to the annual payment of 3s, on the prizes [on every child who takes a prize]. The children should, if the requisite number of one per cent, is not renched after August, 1858, the certificate, or other allowances to the master, cannot be granted.

There arc other regulations which do not affect There are other regulations which do not affect existing institutions, so I shall not prolong this letter by transcribing them, but merely wish to call your attention to the injustice of three new rules. In the first place, all the old masters who accepted office before Mr. Cole was appointed to his present position, continue to receive their former income, while those appointed since have merely a guarantee of shout balf for a limited agrid.

appointed since have merely a guarantee of shout ball for a limited period. Secondly, if the master do not give instruction to the required number of one per cent. of the popula-tion of the place, his certificate allowance (10. on each certificate) will not be granted. To make this an impartial rule, it should be carried out universally. an impartial rule, it should be earlied out animerating. But in London, under the director's own inspection, there are altogether only 3,198 pupils under instruc-tion in drawing, including the students at all the district schools in and around the metropolis; a list which 1 subjoin from their own printed doen me

I have ventured on these statistics to prove that few, if any, of the schools at present are in a condition to comply with these regulations, and I maintain that to expect competent teachers to undertake such work for such very limited remuneration, is both unreasonable and unjust. If the Department, or the local committees, wish to retain the services of efficient men, they must hold out hetter inducements. There men, they must hold out hetter inducements. There appear to be no opportunities for advancement, and all our prospect of promotion seems to be entirely stopped. 500, at 6d., 124. 108. per anuum; 10 per cent. on the above, at 3s. each, as prize pupits; 74. 108.: total for the annual instruction of 500 children, 2024. AN ARTIST.'

It would probably be pointed out by the heads of the Department at home that much of the duty is

* Since discontinued.

confined merely to supervision of the instruction by the art-master; and, moreover, that his real remne-ration is intended to rest on the results of the teaching, and not on the mere registration file teams ing, and not on the mere registration fee. Moreover, they would say, collateral advantages are secured to him, such as a class for schoolmasters and pupil teachers, with payments also on the results of suceasing teaching, namely 30s, for every prize taken by a pupil teacher. A private school, willing to take instruction on higher terms, unst also be namel. Above all this, he is paid on the exciting the has obtained from the Department. With these various aids, it is thoughly we can sourcely say how truly, that enough is done by the public to yid at encovering enough is done by the public to aid au energetic and willing teacher in carrying out the scheme of srt instruction which it is intended to offer as widely as

willing teacher in carrying out the scheme of art instruction which it is intended to offer as wildly as possible to the public. The scheme of the scheme of the scheme of art instruction which it is intended to offer as wildly as possible to the public. The scheme of the scheme of the scheme of art instruction which it is intended to offer as wildly as personal of the scheme of the scheme of the scheme instruction which it is now published, " srys,..." that in some precedent and the scheme of the scheme of the phaces as Manchester, Liverpool, Birmingham, Shef-field, &c. a plan like this throws such an amount of responsibility upon the masters, for so comparatively small a remuneration, that one can scercely believe that it is seriously intended to be carried out. In Birmingham, and the sarronnding district, where there has certainly been no lack of success in quictly extend-ing the elementary system of instruction, and with a scentral school in which there are a much larger number of young mea and youths than in any other school in the kingdom, the numbers have never reached to more than one-half per cent. of the whole population." Mr. Mills has had lang experience, and is entitled to be heard. The great object the Department have ind to emale an efficient master, with personal exer-tion to maintain his position, to extend largely the idelities for learning draving at the smallest possible cost of the public. We are very much disposed to can do the arguit a right one, but they must take are not to carry it too fir a util there is a sufficiently termuneration. Government must real. We want mare ability as teachers, and these will not be obtained uses they are properly paid.

unless they are properly paid.

AN ARCHITECTURAL REVIEW. THE LIVERPOOL ARCHITECTURAL SOCIETY.

THE LIVERPOL ALCHITECTURAL REVIEW. THE LIVERPOL ALCHITECTURAL SOCIET.⁴. So much has been already said against copyism, that one gels weary of the subject. But it is still necessary to say that copying and designing are two different things. French palaces are very nseld to imspire-to provoke emulation. But we can gain nothing by copying them. Beanty lies sleeping in the fallen ruins of the past, in existing literature and art, in the hoson of surrounding nature, and in our daily life; but it will not be invoked by the slothful, antibiking initiator. It awaits alone the awakening breath of thought and feeling in the earnest, trath-bound soil. Copy a window or portice or picturesque gable into a desigo, and you have performed no operation of art. These are results of art-faculties in other men; but you have omitted what coustitutes the essential vitality of a work, and without which, iu an artistic point of view; it is uterly valueless. In exact proportion to the purity of thought of which at is work proceeds—the purity of thought of which is work-most high will it trais in public estimation, so long will it endure. The attempt to originate absolutely use elements is vain and unnecessary; but we must breache the breach of a new life tirong hynteryer we draw from the arus of the past, and make them plastic in our the arus of the past, and make them plastic in our The urns of the past, and make them plastic in our hands. I believe the Classic architecture, which has been so traumelled and stereotypel, is susceptible of endless variety in its details and features, and of the same systematic lawlessness of proportion as the Gothic Gothic

(Gothic. One evil result, I fear, of this wholesale copying of exteriors, must have been the production of very impracticable and worthless plans—a result which, indeed, contemporary criticism has too much of a tendency to bring about. Though in designing new 6 Government offices it was of some political corse-quence to the country that the plans should be such as would afford the greatest facility possible for the due administration of almirs, hut little was uttered by it he press touching the merit or demerit of that part of the designs. The instructions issued to architects very wronever rentired certain indispensable accommodaproperly required certain indispensable accommoda-tition for scerataries of state, under and private scerataries, clerks, messengers, and so forth; hut

A paper read before the Education Section of the National Association for the Promotion of Social Science, usasembled at Birmingham, London: Simpkin und Mar-shall.
 † See p. 622, aute. From the address of Mr. Huggios: Liverpool Architectural Society.

crities and the public received and treated the comcritics and the public received and treated the com-petition as if the sole object had been the architer-tural and sculptural embellishment of the metropolis, and the satisfying of the metbetic appeitie of the people. Had the subject of competition been a new metropolitan earbedrad, or other great national monument, there would have been more sense in this; but in offices for the daily transaction of important and indispenselie national business it shows a forget-falness of the neglish unid. A cause of much short-coming in architectural de-

Induces of the useful and unsultes it shows a lorger-follows of the useful and practicel which is not characteristic of the English mind. A cause of much short-coming is architectural de-tsign is our not having to any reasonable extent drawn upon the resources afforded by the mechanical and scientific skill and enterprise of our own day, nor rightly accepted many of the materials that Provi-dence has held out to us, and which properly used might lead to new forms and proportions, and give tries to new have of design. These architects of Medicoul E-prope whose forms we are so scrilely copying would not have made their windows nor the thequirestatic were any centing. What held due to a the start of the start they could have made iron ones with the facility and the granter extent than in stone—we might excette in a greater extent than is stone—we might excette in east-iron, which, well painted, would be as durable as admant! A advantage in the use of iron grain riss, over and above their cherpness, is that we should be more intrestried as to form than is stone, and be at libery to make greater departure from the enve of equal horizontal threats, and this with less need of but-tresses. This has lately, it appears, been tried in France. I have often wondered that cast-iron bas not become the most for questy employed material for spires and latterns of rhurches, for which feature it would have many advantages over stone; it would be less expressive, and sooner raised, being cast in produced in east-iron, such as have uver been excli-toring composed of oneu and priced work might be pieces, which could be taken up separately and riveted together in their final position. Beantiful and acrial forms composed of open and pierced work might be produced in cast-iron, such as have never been exhi-bited in store, of which latter naterial there need be no initiation; for general beanty and variety would be better secured by piniting them a colour that would contrast with the store helve. The few instances in which cast-iron bas been employed for these purposes in workers. these advantages to the advantages to the advantages to be advantages to be advantages to the store the store been employed for these purposes. Mine Cast-trou use been employed for these purposes in modern times, while they prove the advantages to be derived from its application, show, also, the great scope that remains for improvement in its mode of treatment and development of its capabilities; and if, with the mechanical means and knowledge of the pre-sent day, it were again brought into use, common sense would, I think, soon lead to its extensive alop-tics.

tion. But it is to the neglect of wood, and injustice done to it as a buildug material, that I would nore particularly direct your attention. Timher has more and higher structural powers and capa-bilities than stone. It is not only more easily wrought into any given form of beauty and grace than stone, but it will go heyond stone, and em-body forms of which masonry is incapable. And I do not enurider its liability to e-mbustion and decay, which is so much harped upon, as a sufficient exense I do not consider its liability to combustion and decay, which is so much harped upon, as a sufficient excuse for the aluxost total neglect to mildid its properties. I cannot see why in small churches, where stone vandling is out of the question as too expensive, groined ceilings of wood have not been tried. A groined vault, formed with bent rick, as real support-ing arches, filled in with lath and plaster or cement, or with an ornamental boarding, which might be decorated with colour, and perforated at pleasure for ventilation, would be as hernifial and genuine a ceiling as could be constructed of any material. For my own part L consider campontry has here a

ceiling as could be constructed of any material. For my own part, I consider carpentry has here a new and untried field—a much larger one than masonry ever had or ean have; for not only are the opinted, the epinderical, the conical, the groined, the domed, the pendentive forms—all that masonry ever essayed—at the service of the carpenter, at one fifth of the expense of stone, but, as before intimated, he may realize effects all but unationable in the rigid, ponderons substance of the masonry, such as by trellis rihs and pierced work; and there is searcely a vision of beauty that could enter into the archite tural minil but what could be excented in the material I am advocating—a fact which is certainly a set-off agniast the disadvantage of the disferency in durability, or the disadvantage of the deficiency in durability, or rather risk of combastion, for, duly painted, I believe timber would be quite as durable as most species of stone

stone. So far from heing under any temptation to imitate a stone one with it, a moment's reflection would tell us that the nature and properties of wood rendered it a more fitting material thau stone for the expression sought in Gothic ground ceilings, particularly that of clasticity, which the stone in Gothic is often forced to assume to a very absurd extent.

The analogies of wood are with more heautiful The analogies of wood are with more heantiful natural constructions than are those of stone—with the plant or arburaceous products of the vegetable kingdom—and therefore it is more legitimately em-ployed in overspreading forms, such as a ceiting, than stone could be, which has quite different analogies. The ceilings of Henry the Seventh's Chaplel and other of the later Gothic edifices, where huge pendant unsays of stone mallo uniform with the supporting

masses of stone, made nniform with the supporting parts of the vanit, evince a desire to emulate in stone parts of the vanit, evince a desire to emulate in store the powers and capabilities of timher, would have been more rational if excented in timher, and quite as bean-tiful and artistic. Groined timbor ceilings would not only give greater completeness and perfection to the church than the fussy, naquiet, open roo's on which the eye looks in vain for repose, and which are fally as liable to be bornt as any oth r; but they would be better accossically, and would also have the effect of equalising the tomperature—an advantage which cannot be had, whatever the thickness of the walls, with nothing overhead but shates and boards. In great works, and where funds are adequate to

In great works, and where funds are adequate to s effective use and treatment, let stone be used in such its effe parts; but it is quite evident that a finber ceiling of the kind I have described cannot with any justice be called a shan mercly hecause it is combustible. If be colled a sham merely because it is combustible. If a building is durably constructed, so much the better —it is durable urchitectune; but it is architecture, however ephemaral, if it be truthfully constructed and artistically and consistently decorated. Such structures as the Cothedral of Amiens or the choir of that at Beauwis, the strain of whose elevenstory vaults is received and trunsforred to the earth by buttresses 150 for this bit. feetived and transforred to the earth by ontiresses 150 feet high in the air, are a wonderful trimuph of con-structive science; but they are not more truly archi-tecture than if their ceilings were constructed of wood, with little or no strain, and requiring no flying buttresses. The chief characteristic of such structures is their constructive during; the manifest motive of two numeric the the Characteristic of the structures. The number of the late of the edites; the number too many of the late of the edites; the life of mean architecture, it is not the overcoming of mechanical difficulties which they exhibit that constitute them such. A building may be worthy, by its mechanical skill and during, to be numbered among the wonlers of the world. It may have dones and vaults in furlong in hwadth and theing buttersees accounts; the formaskill and daring, to be numhered among the womers of the work. It may have dones and vaults a furlong in hreadth, and flying huttresses spanning the firma-meut like a rainbow; but its true place as a work of art will depend on the degree of beauty of form and proportion it possesses. If beauty was not aimed at, it is not architecture. We are pleased by the con-templation of fitness of means to end, and by the evidence of mechanical and constructive ingenuity displayed in the anatomy of a building; but archi-tecture is a psychical principle, and appeals to higher facilities than are called into play by the contemplation of skiful construction; and such an amount of sup-porting material and superaburdance of abutment should generally be given to an edifice as to leave the architect unshareked in the ercretise of his artistic powers. Architecture is not the off-pring of grannics, or the eubadiment of the law of forces: beauty is so unch a want of our nature th. we may let our desire for it overrun present constructive means, and suggest hundan want. In the a want of our nature to two may let our desire lor it overrow present constructive means, and suggest modes of realisation that ideas of ntility would never have led to; and, indeed, the higher the class of any given work, the more the idea of construction will he in abeyance, and subordinated to the law of beauty.

But there is another feature in Gothic architecture to which wood is no less applicable-I mean the win-dow, which would be quite as rational and artistic if dow, which would be quite as rational and artistic if formed of Baltic pine timber or oak as it is when formed of stone. Nay, it is more consistent with the nature of wood than of stone to assume such farms; wood is better fitted for designs wherein the unsterial is necessarily supposed flexible, and the expression of flexibility is cought, as is particularly the case in the flowing leaf and flamboyant tracery, hecanso it really is lexible to some extent, which the stone is not, and may be even hent to the flowing lines of the trae

eery. We have heard a great deal of Freemasons : I should We have near a great deal of Freemsons, a resolution like to see a band of Free arpenters. Its pedgree would be as ancient as its rival's, for Noah, the patriarch of masson; was I should think, more of a curpenter than a mason.

curpenter than a mason. Architecture being to serve the physical as well as the intellectual and nother wants of man, mast be formed upon various ideas arising out of his metere, and constitution, and social condition; and its fine-art essence—the spirit of the beautiful in building—is expable of heing so formed and adapted to every changing circumstance. It can be as much at home is the heing that formed and adapted when ut changing circumstance. It can be as much at home in the humblest cottage as in the royal palace. How-ever small the structure, it will contain her; however large, she can pervade and fill it. She has no ob-justion to wood, or iron, or even to cement as the uniterial of her taberaacle, any more than to granife or marble; nor bas she any partiality with regord to style; all she demands is trath—trath to pur-pose, to climate, to everything. However stern and unyielding the requirements of utility, she can ohey

them without sacrifice of essence or compromise of digaty. She can pierce the clouds in a spire or the rock in a cave temple as readity as she spreads her meshes over the earth; she can float over the sea in a ship, or span the river in a bridge. Utility will never demand any form, science will never offer any continuetion, nature or discovery will never present may material, but what architecture may appropriate mad beautify; and so far from these requirements or gifts being dangerous to the spirit of the beauti-ful in building, they will be so may means of its further development—so may new lights into fresh regions—suggestions for new incernations and re-reveilage of its spirit. She must grow with the growth of society in eivilisation and refluement, and press itdo her service all of nature, science, scalp-ture, painting, literature, history that she can use, which will come to her aid when she bids them with dance and with song. them without sacrifice of essence or compromise of dance and with song. The carcer of orchitecture caunot be considered as

finished until it has assumed aspects suited to every climate and every condition—social, religious, moral, cimate and every condition—social, feligious, hural, intellectual, and physical—of which man is capable; and unfil it has recognised every mole of construc-tion, and used every material consistent with its uature and properties—nutil it has availed itself of every advantage which the advancing mind of suc-ceeding ages may create for it, and possesses as many varies and eater of hearing are found in it urrat species and orders of heanty as are found in its great prototype.

n I take such a view of architecture as this, it Whe grows in my estimation into n larger thing than it is grows in my estimation into a larger tange tails (all if is popularly considered. Ecgineering, for example, melts into it, and is entirely embraced by the theory. Indeed, I caunot state any distinction between archi-tecture and cogineering, that will eadure in any broad view of the former. Bridges, for example, are as susceptible of heauty as houses. Bridges, and will cade accelute, and unrehouses and fractionary mills, and aqueducts, and worchouses, and factories-everything erected by man upon the face of the earth -may, like the works of nature, have its own species and order of heauty.

The speaker theu commented on various works in

[The speaker theu commented on various works in Liverpool, and urged, in concluding his very able address, that the great element of strength in intel-lectual pursuit is sincerity.] Sincerity (he continued) in the exercise of what powers of common scuse, imagination, feeling, or fancy we may possess, will operate like a creative spirit that will open to us new worlds of thought and emotion—that will cell

The future from its cradle, and the past Out of its grave, and make the present last In thoughts and joys which sleep, but cannot die, Folded within their own eternity.

Devotion to the promotion and discovery of truth, in whatever department of intellectual and useful pursuit, is devotion to good, which must be its end and result; is devotion to good, which must be its cut add result; for truth, in leading to nobler ideas of God and his works, is one with good. But it also directly operates heneficially upon ourselves, by at once pre-occuping the mind with pure and lofty images, that must inspire a distaste for vice. A full mind, some one has well observed, is the true Pantheism: it is only in some corrers of the brain that high we have eavy what corner of the brain, that which we leave empty, that vice can obtain a lodging. The man who joins in some noble pursuit is in less danger of heing drawn along in an ignohle one

I address these words more especially to students, and whose guidance I know is a serious consideration with their seniors. To them a few carnest words touching the conduct of life will not he deemed impertinent or uncalled for.

I see before me young men about to go out into the world to practice on their own account. A great point with such will be how they are to get into prac-tice. I am sorry to say that, at the present day, success in this is not generally in proportion to the artistic and moral excellence of the man—rather otherwise; and though I would not by any means have them to judge of an architect's character hy his good or ill success in his profession, and estimate his in-tegrity in the inverse ratio of bis acquired wealth, yet, if professional advancement were the paramonnt consideration in life, my advice to them would be not to be over serupulous with regard to the means they employed. Be not, I would say to them, too careful employed. Be not, a wond say to them, too taken to let your speech at all times correspond with your real sentiments, and to follow your own intuitive con-victions of what is right. If some well-to-do person calls upou you, desirous of huilding a large house for a sum considerably under prime cost, don't tell him what you think of him, or even hint that it is wrong. Set to work and see what you can do by an amhignous specification to entrap some unwary huilder. Whatspecification to entrop some inverse with der. What content consence may say about it, don't 'mp tot, therefore, as ign equal merits to those who have welth. Retain them in some way, for its attainment? If Mr. Soctt and his comports bility, it is not too much to anticipate that these who have welth. Retain them in some way, for its attainment? THE BUILDER.

the universe, you must give value for this: for every-thing you goin you lose something: the thief, it is well said, steals from himself. As he who does a good were smu, suchs room ninsen. As ne who does a good action is proportionally cauchide, so he who is guilty of a mean one is by that dead contaminated and de-graded. You gain money, but you must forfeit what all the gold of C.lifornia could not replace—the consolation and the hope that spring out of the culti-vation of your moral nature. You have violated its laws, and you must pay the penalty: you have sown the wind, you shall reap the whirlwind.

A quiet conscience in the breast Hath only peace, hath only rest.

THE REVIVALISTS AND THE VERNACULAR ARCHITECTURE.

It is impossible not to admire the energy and deter-mination with which Mr. Scott is endeavouring to aid, if not to take the lead, in the osalaught against Classic architecture as applied in the public and private huldings of the country. No one can for a single moment hesitate in acknowledging the desira. single moment hesister in acknowledging the desira-bility of improving what he terms "the veroacular architecture of the present day;" and ull real lovers of pure art must rejoice, that by the pen and peeel, in theory as well as in actual practice, the public mind is becoming more deeply inferented in the inquiry as to the expandities of Gothie for universal application; meaning, of course, the use of Pointed instead of semi-circular arches, as elements of construction or orna-mental datal mental detail.

I have been led to make the foregoing remarks from having read Mr. Scott's last essay at the Doucaster meeting of the Yorkshire Architectural Society. in which an interesting résumé is given of the rise and development of Pointed architecture, its present and development of Poluted architecture, its present position, and future prospects. On that occasion, speaking within sight of the nohle parish church speaking within sight of the nohle parish church which is rising under his direction.—surrounded, probably, hy frieuds and admirers only, Mr. Scott may he prodoned for having permitted his zeal for his adopted style to lead him to utter bard things of others, who from education, partiality, or other eir-earmstuces, may have bitherto failed to perceive and acknowledge the universal applicability of Gothe, or to disparage and disallow the becauties of the Classic. It is near neares that it wenture into mint and it

It is very rarely that I venture iot print, and it hecomes especially bazardons when I purpose hreaking a lauce or two with so well-prepared and redoubtable an antagonist. However, it is only a friendly jonst, and not a mortal encounter, that I propose to myself; and Mr. Scott, for old acquaitance sake, will grant my humone a little exercise.

and Mr. Scott, for old acquantance safe, win grant my humour a little exercise. I do not know whether Mr. Scott reckons me as one of his devoted hand, who have belped, or are still helping, to carry out the "great artistic revolu-tion," hut as I have knowingly committed myself to the adoption of Classic as well as Gothic, according to the taste of my friends, and shall still do the same, neared of cance accuracided that U have no claim to I must of course acknowledge that I have no claim to such a high and orthodox position, hut must he one such a night and offerous position, nor mines the one of these who are conspiring against our vernacular architecture, and indirectly aiding and abetting in re-ducing it to its present how state of degradation. It is very hard to be in such a dilemma, but it is evident that all who cannot at once turn up preterplaperfect Goths, and sign the pledge, unst be accessories hefore or after the fact, to the debasing of the current archi-tecture of her Majesty's realm. It has never occurred to me, and prohably many of my professional brethren are equally ignorant of the

fact that this pure Gothic movement is a ' and arduous undertaking." It is usually a ' mighty and arduous undertaking." It is usually admitted that all who desire to excel in art or science must lahour hard for distinction. The struggle cannot be anothe minuted of statistication. The strength channel of a statistication is irrespective of another. Circumstances and position sometimes abate the difficulties, but never entirely supersede the uccessity for exertion. The higher the aim, so much the more are energy and perseverance required. Is it uot an admitted fact that Mr. Scott, at all events, has met with the due reward of his exat all events, has met with the due reward of his ex-critions, not only in the selectm and confidence of the public, but (if such transcendeut.lism ever thicks about it) rewards of a more substantial character, and not warding, also, in full ahundance. Perhaps one may not fairly appreciate the efforts of the greating more, but where man write hocks

refining one may not fairly appreciate the varies of the excelsion party, but when men write books deliver lectures or make speeches, it is that they may be heard of men, and ohtain that honourable distinction which every true artist or architect aims to obtain, not for the sake of fame only, hut for its collateral consequence (vulgo a subsistence). May we not, therefore, a sign equal merits to those who have

[Nov. 7, 1857.

have reproduced or faithfully and skilfully adapted

Mite Grecian or Roman style. Mr. Scott says that "the wretched incubus our vernacular architecture is alien to our race and our religion." Without reverting to the difficulty of proof religion." Without reverting to the difficulty of proof that Englend ever had a purely indigenous architec-ture, I will ask whether such an assertion can, with propriety, he made, except by sapposing ourselves living in the sixteenth instead of the nineteenth cen-tury? The religion of this country is, or ought to be, Protestant. I have yet to learn that the architec-tural forms and details of our buildings have any-thing the with the Reference or nur other Christian thing to do with the Reformed or any other Christian church, the Roman Catholic not excepted, which em-ploys Classic in Italy, and Gothie in Britain. In fact, if Mr. Scott's remark is carried to its legitimate net, if ar, solution relation of the standard of the standard

that the "glorious architecture of our forceathers" was certainly in perfect harmony with the religion they professed. This point might he worked out much more cloborately, but I will now only remark, in passing, that Mr. Scott has unwittingly given one of the strongest reasons against the universal adoption of Mediaval architecture. Perhops Mr. Scott will be able to explain more satisfactorily on a future occasion how this faithful and carnest-mindel band, who are destined to work a revolution in architecture, were instinctively led for-ward, unbiased and unguided, to the same object and result; and how it came to pass that when they intuitively discovered the "right and the beautifal" in the one style, they, at the same time, were made in the one style, they, at the same time, were made sensible of the "intrinsic haseness" of the other. I am careful to use his own words, because it might be considered that it was hardly possible for an accom-plished architect to use such terms, and so utterly to depreciate and ignore the works of his predecessors ad contenues and ignore the works of this practicessore and contemporaries. It is true that Mr. Scoti imme-diately makes a kind of apology, and is afraid that he may he considered too liliheral: but even when he speaks of the glorious works of Sir Christopher Wren. and others, he calls there high-pressure productions; and that their fitness for a national style is not to be judged by such examples. This wholesale way of disposing of all the architecture of this country, from disposing of all the architecture of this source of the present time, shows anything hut an unbiassed mind, but the term will equally apply to any of the most beautiful monuments of this or may other country: they are monuments of this of any other country: they are all the results of severe study and great experiences, whether they are of the purest Greek, Roman, or Gothic,—whether of the earliest ages or the nineteenth century. Of course, Mr. Scott's eloquent description of what our towns and villages ought to be architec-turally depends very much upon the limits to which the numeroup work he lowed to co. A res we to go the vernacular may be allowed to go. Are we to a hack to the Middle Pointed or Perpendicular for Are we to go starting-point? The element of picturesqueness is much more dependent upon form and outline than details; and it is easy to fancy a perfectly leautiful village or town, in which not a single pointed arch nor mullioned window can he seen, nor even a high-pitched roof. It appears to me that a true artist can-not design an intrinsically ngly huilding. The powers mind will show themselves, and it will he found or mind will show themselves, and it will he found that the unitteresting character of an ordinary huild-ing for domestic purposes is to be attributed to the active presence of the mere huilder, and the absence of the true architect. As the profession extends its influence, so we may hope for a better state of things. For one professed architect who originates, there are a score of huilders who imitate; and when Mr. Scott and his friends have decided upon the vernacular, they will scone furth their best to onis corrictured, and every will soon find their best points caricatured, and every principle of propriety defied and set at nought.

I perfectly coincide with the résumé of Mr. Scott, and his correct description of the origin and progress and mis correct description of the origin and projects of the movement towards therevival of Pointed archi-tecture in our churches. I am also fully prepared to admit its surpassing beauty and general fitness, and an thankful to all who have laboured hard to make its true principles more thoroughly understood.

The village and town churches are now properly cared for, and all persons possessed of any taste of feeling must acknowledge that the simple form of the village church, with its modern tower or spire, leaves nothing to be desired. There is, however, a prohlem, which the revivalists will have to solve, and that is, how for the Pointed style can be accessfull applied to the erection of large churches, in which the preacher can he seen and heard hy the whole congregation, and in which the chancel is reduced to the simple require-In which the Charles is related to the similar tequate terms ments of the Protestant ritual. If it fail in this, but which is only a fair test of its elasticity and adapta-bility, it is not too much to anticipate that these huldings will he erected in a different style.

that throughout the whole there is an unduc exaltation of self and company, and a most unwarrantable depre-ciation of those individuals who, though not hitten with the Medieval manin, are called upon, in the legitimate exercise of their profession, to erect Gothie Iggiturate exercise of their profession, to ercet Gothic churches. It may be correct that there is an actual majority of works in which the true feeling does not prevail, and which bave been erected by architects without Mr. Scott's arbitrary pale of eivilisation; hut is it not the legitimate result that all caunot be first-raters, and that, instead of complaining, he, Mr. Scott, ought to rejoice that the principles which have been laid down are considered worthy of adoption by the majority of the profession, when called upon to erect churches or other ecclesiastical buildings ? Surely, they cannot mean to ride rough-shod over the length and hreadth of the land, and stamp out all those they cannot mean to ride rough shed over the length and hreadth of the land, and stamp out all those attempts which do not emanate from the learned and accomplished few. There are abundance of high-pressure buildings which fall to the lion's share; and there must, and always will be, a certain proportion, if not an actual majority, of mediocre productions.

In leaving this part of the subject, I cannot but think that the writer would bave done well to have omitted the whole of this paragraph. It must be very tender ground indeed to revert to the subject of comtender ground indeed to revert to the subject of con-petition, for no one practised it more universally or successfully in the commencement of his career, and even now he is found in the list of competitors when the stake is worthy of the effort. I fully agree with Mr. Scott that Gothie architec-ture, if the Perpendicular period be included, can he adapted with fair success to numberless buildings be-sides the charch. school. and other buildings architecture.

es the church, school, and other buildings exclusively such the child active and the participation of the constraints of the participation of the participation of the study, and that it is not unlikely to take its place, besides other regular styles, in domestic architecture, and to have its ardent admirers and advocates; but that it will ever become the native or

vocates; but that it will ever become the native or vernacular style, to the exclusion of all others, I can-not helieve, and for the following reasons. In the first place, the eircunstances of the present day are totally different to those of the fourteenth century, which Mr. Scott proposes as the starting-point, from which those who are cngaged in the attempt to achieve a vernacular style are to aim at developments. developments.

developments. Almost all architecture worthy of the name was at that period exclusively in the hands of the educated classes, and knowledge and literature were then nearly confined to the ecclesization body. It is well known that the ahlest architects were churchmen, that they possessed the means as well as the ability to design and control the creetion of ahheys, monasteries, and churches. The dignitaries of the Romish Church em-ployed nuch of their superfluous wealth in the creetion of buildings calculated to impress the usefuncted yeo-manry and the poor with feelings of reverence and the poor with fcclings of reverence and ance. Whilst, therefore, the few could so manry and the I implicit reliance. implicit reliance. Whilst, therefore, the few could so completely control the many, it is no wonder that masterly performances emanated from their hands, in the same way that any autocrat can despotically direct the labours of his subjects to the achievement of any the labours of his subjects to the achievement of any desired object. There was also a perfect unity of pur-pose, and, as usual, one or two master-minds in the kingdom ruled over and gave the key-note to all the rest. I am confident in the persuasion that, under no other circumstances, would the same results have been attained. And what is the case now? I is there the slightest parallelism? How many ecclesiastics and ministers of relicion are exactly acced in their and ministers of religion are exactly agreed in their opinions ? Can ten or even a less number of architects opprions r Can ten or even a less number of arenticets be found who think alike on the subject of style? Even Mr. Scott claims "perfect freedom" of thought and action to all who agree to start with him from the same point. For how long a period would any har-mony of movement continue? And how very soon would they be found diverging, more or less, from the series and action and starting whith a brain if every original centre and starting-point. Again, if every architect were content with his knowledge of his art architet white bourteen the mark and mark of the second approximations, there might he some slight hope of agreement for a short period; but presently we should find that one, after the harassing fatigues of his find that one, after the harassing fatigues of his arduous and painful duties, hurries off to the sunny elimes of Italy, and feeds his fancy and writes his book; and another goes in the opposite direction, and finds food for contemplation and study there. Some may visit the East. Now of this we are certain, that the journey is undertaken for two reasons, of which a search after something novel is not the least important.

It is curious to watch the result of this. If an It is curious to watch the result of this. If an architect writes a book, and makes pretty illustra-tions of this or that arch, and this or that win-dow, he cannot help finding that he has failen violently in love with something which he has seen under particular circumstances, and considers perfec-tion. Perhaps it may be little more than the peculiar form of an ogive head, but that fixes the hent of his studies; and if he were to go another year into the

who chiefly complex roll traver amongst more prices who chiefly complex architects, whether clergy or laivy. They, too, inbite their favourite notions; and on re-turning, not unfrequently wish the realization in this country of something which they have seen in their travels. We cannot fance y such an individual giving up his erotchet because his architect tells him it is not in the indiremone or versenced ar table.

up his crotchet because his architect tells him it is not in the indigenous or vernacellar style. Again, the free institutions of the country are alike opposed to any arbitrary rules of practising architec-ture. The very fact of the Legislature applying for plans for palaces of administration, without defining any style, is of itself a convincing proof how unsettled men's minds are on such a subject. The real fact is, that though men almost universally admire a good building when it is done, they do not take that para-mount interest in its design and development; and though Mr. Scott annears to think that there is a mount interest in its design and development; and though Mr. Scott appears to think that there is a very growing feeling in favour of Gothie architecture, I am inclined to think that it is confined to a com-paratively narrow circle. That freedom of which we all hoast is most cer-tially the greatest neary to a national style-for did John Humphries built his house in the Classic, Thouras Williams availed understellar here this is

Williams would, undoubtedly, have bis Th. the Gothic.

the Gothic. This is, I think, taking a fairly philosophical view of the whole subject, and when it is also borne in mind that for a great number of utilitarian purposes a modifaction of Classie is best adapted, and that for engineering works Gothie is nearly, if not quite inad-missible, surely it is vain, on the part of the re-vivalists, to induge the hope that we are on the eve of accomplishing any but the smallest approximation to maiverselity of style

of accomprising any de the stands approximate to universality of style. I am quite willing to make the attempt in the same direction when occasion requires it, but must be as free as the air to please myself and others.

J. HENRY STEVENS.

BRANCH FEEDERS FOR RAILWAYS.

It is rather a tantalizing circumstance, that branch railways, which ought to have been most profitable and extensive traffic feeders to main lines of railway, have but too often proved ruinous; and that the sat experience of this untoward result has checked, or universal network of railways with which it was at one time expected that the whole country would be interlaced.

Amongst the principal causes of this state of Autougst the principal causes of this state of matters doubtless was the fact that such branches as have heen made ware of far too costly and ponderous a description; but one chief cause of this very costlia description; but one chief cause of this very costin-ness has been the state of the law as regards railway gauge in general. By 9 and 10 Vict. e. 57, a uniform gauge for all iron roads, of 4 fect 84 inches, was fixed; so that hranches were necessarily laid out upon the same grand scale in most respects as the main lines already constructed. Another cause of exponse was, and is, the necessity of obtaining special Acts of Parliament for every spearate hranche or feeder. But were these minor and tributary lines to be exempted from the main gauge law, and a general Act of from the main gauge law, and a general Act of Parliament passed, promotive of such branch lines, and under which all could be constructed at less law costs than now, a lighter and more profitable order of costs than now, a lighter and more prolitone order of tributary lines might soon he plettcostly spread over the face of the land, to the vast benefit of general commerce and interccurse, as well as of the main trunk and main branch lines already formed, and of others which would soon he added to the general system. As it is, we have, as it were, but the leafless, twigless trunk and large branches of a complete railway twigess trunk and large branches of a complete railway system, and from wart of the unituder ramifications the great lines languish in a state of comparative atrophy, and the greater portion of the country districts are still restricted to the old expensive jog-trot system of traffic which prevailed 100 years ago.

Considerations such as these, apparently, have in-duced a well-known architect, Mr. Edmund Sharpe, to indite and publish "A Letter on Branch Railways, addressed to the Dist V. to induce and publish. A Letter of Drahen Hain vis, aldressed to the Right Hon. Lord Stanley, of Alderley, president of the Board of Trade, containing suggestions for the creation of a system of secondary railways for the agricultural districts."* In this tract rainways for the agricultural districts. In this tract the author points out, as we have here done, but more fully and explicitly, the hinderances to the expansion of our railway system, and suggests the necessary

* Simpkin, Marshall, and Co. of Paternoster-row, publishe.

East, it is not improhable that he might find himself inelining towards the cognate forms of Saracenic, Our graver friend who travels northward, is not likely to be cheated out of his first love; but would be found, hevertheless, diverging at an opposite angle altogether from our Eastern friend; and it is clear conoigh what the result would he. Another great difficulty in the way of a universal style is the teudency to travel amongst those perties who chieffy wands of the result would and the state of the result would he. Another great difficulty in the way of a universal style is the teudency to travel amongst those perties and be chieffy and the result would he. Another great difficulty in the way of a universal style is the teudency to travel amongst those perties and be chieffy and the result would here and be and the result would here and be and the result would here and the result would here and the state by inches. As re-style is the teudency to travel amongst those perties and be chieffy and the result would here and be and the result would here and be and the result would here an and the result would here and the result would here and the result would here and there and the result woul such a decrease of gange, Mr. Sharpe observes, that the narrow mineral railways of 2-feet gauge and upwards, existing in different parts of the kingdom, and costing from 800% to 1,200% per mile, illustrate the extent to which this reduction of cost, dependent the extent to which this reduction of cost, dependent principally on width of gauge, may he carried. Three feet he considers to he a width which, intermediate, as it is, between that of the mineral tranway, and that of the ordinary first-class railway, would meet the requirements of the secondary railways, and he is actuated by a certain amount of practical experience in the matter, in recommending such a gauge for the purpose in view.

There is no reason, he remarks, why extensions of this 3-feet tramway should not be carried into every quarry, mine, factory, or farmyard, of the valley or district along which the line runs; nor why each large farmer and occupier should not have his two or three tunels, carries as this worker. large larmer and occupier should not have his two or three trueks, carrying off his produce nud bringing back his coal and lime; and as is incidentally re-marked in regard to the latter of these articles, there is no doubt that immense tracts of laud now lying comparatively waste throughout the kingdom, might, by its introduction at a cheap rate of carriage, be brought into profitable cultivation.

brought into profitable calibration. Of the disadvantages noder which those districts labour that are remote from a railway, the author gives the following instance, adduced by an agricul-turist residing near Portmadoe, in North Wales :---

turist residing near Portmadoe, in North Wales: ----"He informed me that the dealers who frequent that district, with the object of supplying the great markets of the manufacturing counties, have a regularly descending scale, in the prices which they offer, as the distance in-creases from the point where they leave the rail. In the case of cartic, which are bought by the head, it is difficult to register this abatement of price; hut in the case of jugs, which are bought by weight, it can be closely fixed. A pork-hatcher, for example, starting from the rail at Caernarron, by the time he strives at Barmouth, will not give so much by fd. per lb. for the live animal, as he will as Caernarron; it he loss, which the farmer stasting, heing in this case no less than 15 per cent. on the value of the by railway." Our readers know Mr. Sharpe chieffy as the author

Our readers know Mr. Sharpe chiefly as the author Our readers know Mr. She percent as the author of "Architecturel Parallels," and other similar works, but he has had long connection with the practical working of a railway, and is well qualified, by special experience as well as general ability, to speak on the subject in hand.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

ARCHITECTS. The first meeting of the session was held at the rooms in Grosvenor-street, on Monday evening last, the 2nd instant, Mr. Scoles, V.P., in the chair. A long list of eandidates for membership was read; and, at the close of the proceedings, Mr. John Clayton was elected a fellow. Mr. C. C. Nelson, honorary secretary, announced various donations, and Mr. Djuby Wyatt laid hefore the meeting an ontline of a work on Heraldry, about to be published by Mr. John Papworth, ealculated to supply a deficiency. Mr. Wyatt Papworth then read a paper entitled "An Attempt to delormine the Periods in England, when Fir, Deal, and Honse Painting were first intro-luced, with Remarks on the Processes of the Latter." A discussion ensued on the use of varnish without paint, and the value of zine paint, in which Mr. C. H. Smith, Mr. Crace, Mr. Godwin, Mr. L'Anson, Mr. Ashpitel, Mr. James Thomson, and others took part, and was of practical value. We shall recur to it when we have more space at command. A ruthing of the brass, which has been prepared as a memorial to the late Mr. John Britton, to be creeted in Solisbury Cathedral, was exhibited. Two Angels under a eanopy hold a seroll, inserthed,— " In memory of Johu Britton, historian of this ediffer, and dutier a canopy hold a seroll, inserthed,— " In memory of Johu Britton, historian of this ediffer, be reced for heosing endies of works on the Cathedral and Mediaval Antiquities of England, this memorial is the reading of the brass of the fare has a the Architeesty be record theose majeries of works on the Cathedral and Mediaval Antiquities of England, this memorial in the conservence of the Dean and Chapter] by members of the taste and piety of their forefuthers, and when the solution the site fore the versatile monuments of the taste and piety of their forefuthers, and be record by ", T.T70, at Kington St. Michael, Wilts. Died Janusry 1, 1557, in London. Buried at Norwood Carnelery, Bury." Around the whole is an ornamental border, com THE first meeting of the session was held at the

and will be inserted in a slab of marble. Mr. T. H. Wyatt, in presenting the rubbing, said

the committee had deputed to him its creetion in Salishury Cathedral : there was some little difference of opinion as to the site between the Dean and the committee, and this also had been left to bim to settle.

ARCHITECTURAL ASSOCIATION.

On Friday, the 30th ult. a meeting of the memb was held at the hall in Lyon's inn, Mr. J. Norton, V.P. in the chair.

Mr. E. Mallandaine read a pap r on " Architecture Mr. E. Mainmanic read a pair on Architecture, and in connexion with Competition." A part of this we give in the author's words below. A discussion ensued, in which Mr. Wigley observed

that, although it might be utopian to anticipate that they could altogether cure the evils inseparable from the present system of computation, still it was com-nt for them as an association to propose remepetent for them as an association to propose reme-dies and resolutions for that purpose, and to suzzest homesty as well as competency on the purt of judges in matters of competing without competency there could be no honesty in judges. It might be replied, to any complaints that were made against the present system of competition, that there was no code of rules proposed by the profession; and although general rules existed in connexion with these matters, still unless they were formulated into a code they could not be expected to have the effort they other. netent could not be expected to have the effect they other-wise would. The self-sufficiency of a set of men, wise would. The self-sufficiency of a set of men, brought together on a competition committee, was frequently estonishing. They no longer had the modesty of individuals, but acted with the de-polism of numbers; and if an individual architet: com-plained, the answer was, two or more heads are better than one. It was, therefore, the duy of the association and other prefersional budies to show them something like architectural sense on the subject. It would be remembered that the Architectural Association ably moved in this matter in 1849, but Institution any local in the matter in the provided and the set of and with this view he would propose,-

and with this view he would propose,— "1. That Mesers, Billings, Capes, Cooling, Gray, Har-ward, Rickman, Trucfitt and Young, with power to add to their number, be requested to join the members of the committee to revise and publish a new competition code, first printed by the Association in 1850. 2. That it be made biading on all members of the Asso-riation, present and future, to sign the competition code when approved by a special meeting that they breach of such code shall render the members liable to exclusion from the Association. 3. That the competition code be rubbished by means of a loose sheet inserted in the professional papers once of your, means the code shall means the for

every year.

a losse sheet instried in the professional papers once every year.
4. That a copy of the ecompetition code he forwarded by the secretary of the Association to every competition committee, with a request that it is adopted, so is o allow of the members of the Association taking part is the term of the members and their friends, to carry on the expense of publishing.
6. That every member of the Association, the is also a member of the Institute, he invited to concur in a memorial to the council of the Institute, he invited to concur in a memorial to the council of the Institute, he invited to concur in a memorial to the council of the Institute, he invited to concur in a memorial to the council of the Institute, representing what has been done and resolved on by the Association, and calling up the first that is the the president or the secretary of the Association, ro both, be requested to communicate with the local and professional papers, in the name of the Association, whenever any defects on unare their notice."
Myr. Benvel 1 sconded the resolutions - and after

Mr. Benwell seconded the resolutions; and after remarks by Mr. Capes, Mr. Rickman, Mr. Lloyd, and Mr. Bunker, the resolutions were carried.

THE PRACTICE OF ARCHITECTURE.*

WE suppose our student hy this time to be well acquainted with all our modern appliances in conacquanted with all our modern approaces to con-struction. And here, I may remark in passing that wonderful as are some of the ancient structures in our own land, and more wonderful, perhaps, some of far distant countries,—of some of which the method of instant countries. construction seems to have been lost to us for ever. -we must, if we even lay ourselves open to the charge of self-glorification,—we must congratulate ourselves on being in possession of some of the most wonderful contrivances for increasing the weak power of human bands, and carrying out the boldest of human ideas. The travelling-crane, the stean-engine, the pile-driving machine, the even mechanical use of rails, for lessening the labour of traction in the conveyance of materials, are a few of our modern boasts, which enable us, when we earnestly put forth our powers, to erect structures of wonderful size and in-portance, and with a speed bitherto unrivalled in the annals of building. We do not require our tens of

* From a paper by Mr. Edward Mallaudnine, on "Archi-tectore, and in connection with Competition," read at meet-ing of Architectnal Association, as already mentioned.

thousands to scoop out our canals with unremitting and fatel toil, as inhumanly are now has been done by Eastern despots ; the unsamble labourers perishing in heaps as the work proceeded. We do not want our hundreds of thousands of humin cattle to build pyramids, and to be decimated in return. But, be it pyramids, and to be desimated in reurs. But, be it spaces with shame, how often do we needed the great facilities and knowledge we possess for erecting in-perishable structures. How often do we prefice build-ing with nustable brickwork, so unsightly that we hasten to cover with a hideous mask of coment,-eement, forsooth !-- in our weak attempts at something beautiful, something architectoral? How often do we use, even with our eyes open, the most perishable How often do description of stone, harily worthy of the name, and then, with an infatuation apparently the punishment of the misdememour, pitifully search for some indurating compound, to perpetuate the transitory archi

tecture! All this is very degrading : we possess an inexhaus-tible supply of some of the finest building stone in the world; and we content ourselves with emend, or the use of some foreign or bastard description of material : we even bear of walls of concrete! We have the largest quantity of iron perhaps of any nation, and certainly the greatest means of uost readily making it available, and micht make it greatly con-ducive to rendering our hulblings, I will not say fire-prior, hut less susceptible of taking fire. We have iron, and we use only timber, — timber for our flows, roo's, partitions, and, when we want cheap buildings (and it is a great mistake to think so), for our en-losures. Inprintions, and, when we want charp outfittings (and its is a great missiake to think so), for our enclosures. In-stead of semicircular arches to our windows, we much have straight, or "no arches at all," which of course fail, and produce softlements. Instead of proportionable supports to carry a superincumbent front, we throw across a timber breastsummer, supported by for across a inner pressioning, suppried by feebe story, posts, and even that hreastsummer pat in without any thought as to shrinkage or settlement. If our partitions must be of limber, why are they not more frequently inseed? The expense is but trilling. How cannot be frequently inseed - the expense is out thinky. If we cannot be frequency, let us at least not become ruinous without fire. Again, is it proper construction to carry up two stories of brick walls perhaps 14 inches in thickness, on nothing but timber or even names in unexness, on nothing but timber or even iron girlers, with a few space columns under them ? What ensures? Dispidation! We cannot even re-member the wholesame rule of "Pier over pier; and yoil over void." over void.'

But all this is, pirhaps, tedious. The knowledge of the most approved methods of construction of course supposes our student to be well acquainted with all the known systems of rooms, trussing, framing, vaulting, &c. We now initiate him into the arts of design. But,

as Sir Joshna Brynolds said, "Notling ever out of nothing eame." What is design? It is not copying some good example. It is not using column, entablature, and triglyph, with a proper proportion of pilasters in continuation, and round the edufice : this is simply attempting to come dom want of design. It is not the insertion of an evenly halanced number of windows (though must probably an odd number) with the pretitest and strictly proportional mllow-ance of architrave, pediment, and console to orun-ment them; the use of a few mustications, or even all-important triumph, the introduction of a lesser or greater breaks in the fronts, producing that few lesser or greater breaks in the rooms, promoting that delightful play of light and shade so refreshing to the artistic mi

These are all nothing: they form but the keyboard, the notes, the strings—the means, the appliances. These latter are not music; the former not design.

We must make our young architects acquainted first with the mechanical parts of bis fine art; make him *draw* as rapidly as he can write, until, in fact, to draw will be the easier expression of the two of his ideas. We must give him the grammar of his art, the known rules of taste, of proportion. We must We must feast his mind with the contemplation of the hest examples of ancient or modern architecture, streouously warning him again t copying; point out their beauties and their defects in regard of taste; keep bactories and interferent regard of presented and the field of the second state of the treach aim the much resided wive, or more property bree orders. We must teach him to bint, by way of distinguishing the various materials shown in bis drawings; and here earchilly prevent him from run-ning into any excess of skybrush and colour; so that he shall not produce "a sky before or after able to construct a roof onder it."

After these elements, he will do well to connect a little his ideas by visiting existing structures-say churches, hospita's, theatres, baths, elub-houses, &c. &c.-not, of course, neglecting the requirements of the more homely but much more frequently required domestic dwelling-house or mansion, with all its varied appurtenances of closets, libraries, music-rooms, and, perlups, studios, &c.-never contemplating the possibility even, if be have a mansion or a ducal

eastle to emhellish interiorly, to do it in unarchitec-

eastle to embedish interiority, to do it in unarchitec-tural discord with the exterior. In all these buildings he will earefully remark the varied requirements or, not less important, the various omissions; studionsly noting all in that important auxiliary his travelling note-book.

anxiary his traveling note-book. And thus at length, with a practical, which should only be a synonymous term with scientific, knowledge of his profession; with a cultivated taste on feltered but frained by rides; and an intimute acquaintance with the requirements of the buildings he is going to handle, our architect will design. He will design in the only sound manner.

first fix upon the style he intends to adopt-be it Pointed, Italian, Romanesque, Elizabethan. He will rounes, rease, roune, communeque, promotions, ils will produce his plos, putting every thing in its legitimate place, studying economy of space with facility of access. No waste of room in pasages will show itself, staireages will be unde of convenient and, in rublic buildings, of ample size, and absolutely in-combustible; and last, though not least, all will be well lighted, -- a rather important point now some-times unattended to by our architects, who most unaccountably forget that to see, it is most necessary to bave light

With a well-stulied plan the arcbitect will be often With a well-stulied plan the architect will be often surprised to find the number of opportunities which present themselves for displaying those artistic quali-ties which he bas been cherishing. I do not mean that lavish ornaneutation which I might almost stigmatise as sculpturesque disfigurement, and which is of no higher order in architectural attimments than the profue staining in the steel of the Dumascus blade but I do mean those encode of notifion, outblade ; but I do mean those graces of position, ont line, height, and those ineffable breaks so dear to the mere chiuro scuro architect, equally dear with these herven loving and nicely behanced cloud-copped towers, so indispensable for effect.

Every bruity conspicuous and requisite in an eleva-tion can be produced as well after as before a cre-fully-studied plan, with the additional satisfaction of having a building suitable interiorly for its purpose, witho it which, it is superfluous to add, it cannot be suitable at all.

Surface a bit. Turer have hern some very good remarks made as to what I may term speaking buildings. I mean those that shall declare, on mere external inspection, the purpose to which they are devoted. This is catering into a rather useless and too refined theory or

It is very ensy, no doubt, to erect what may be termed selfish-looking buildings—holdings that seem to say to the spectator—" Do not look at me; I have not hid myself out to be looked at, and have no pre-not hid myself out to be looked at, and have no pretensions to beauty;" the designer of them, of course, solacing himself with the reflection of their intrinsic internal value. Poor idea! As though it is not as cheap to he beautiful (I mean architecturally) as

ugly ! What necessity is there for making our workbon What necessity is there for making our workbon and warchouses appear mere tablom prisons? We can, of course, with great propriety, muke our prisons gloomy Jooking, sombre, and massive, well expressing their use; and easily, in connection with the strength and solidity required in them. Our theatres may overflow exteriorly with scalphared representations, are not existing the scalphared representations. overnow exteriory with scalipared representations, or even pinitings, freating of the gavidy and lewidy within. Our palaces may denote regai magnificence and that grandeur inseparable from large buildings, which is very appropriate. But what is to distin-guish these latter from the palatial clubbouse, the docal marsion, or the basy gigantic hotel? I forgot. The red-coated sentinel and the awe-inspiring solitary hon, and solitary unicoru, holding undivided, but oh! how diga fiel sway, over their respective 24-juch by 24-iuch pillars | But is this architecture ?

After having so far superintended our student as to make him master of all the arts of design, we have make hun mister of all the arts of design, we have yet an important dury to perform by hinn, and cause him to a quire yet other information, though by some considered not necessary, even to the accomplished architect. It is, nevertheless, a very important branch of his all-embracing profession, and, in some some knik up, with his way existence. I allade allude enses, knit up with his very existence. I alinde more particularly to surveying, which includes the measuring pricing, and estimating of buildings. It is very rarely, perhaps too rarely, found that both the architectural portion (I mean that while relates to design) of the profession, and the estimating and valuing portion, are successfully practised by the same individual; hat its principles at least, should be well known to the arcbitect. It is first of all im-possible to successfully carry it on without an in-timate acquaintance with all the practical details of building: it requires the knowledge of all trade customs as regards pricing and valuing. The com-petent practice of it involves almost an apprenticeship to the building trade. I need hardly remark that a man may be n very good surveyor, but a very sorry architest, in an art point of view

I have not alluded to the practice of land-survey-

ing, a knowledge of which, at least to a limited exton, will prove useful to the architect; but is gene-rally followed by itself, and is incorporated, perhaps too generally, with the practice of the so-called

I think that I may here supply an amplification of I think that I may here supply an amplification of my title and definition of architecture, and again name it as divided into civil architecture, embrac-ing all domestic buildings, theatres, baths, hospitals, palaces, clinb-bouses, &c. ecclesizatical architecture, specially devoted to eathcdrals, churches, and chaples, specially devoted to eathcdrals, churches, and chaples, spectrally devoted to exhicit a single architecture, including parsonage-bounes, &c.; marine architecture, including all docks, barbours of refuge, light-houses, bridges, quays, &c.; military architecture, or fortification, including all fortresses, towers, ramports, and the effects of artiblery on them, &c.; and, finally, naval architecture, or the art of ship-building, including the best methods of propelling, &c. Is not a vulnary on exceedent the architecture.

the best methods of propelling, &c. Is not a railway or a sewor a work of the easiest accomplishment to an educated surveyor? Is there anything so insuperable in the construction of tun-nels, arches, and the forming of embankments? Is there ever any skill shown in the present construction of these necessary appendages to railway progression, that architects should, from *incompletence*, be shut out from *them*, or from the superintendence of our bridges? bridges P

Indiges r Is there any science in our numerous suspension bridges, including even Niagara and the Menai, designed and superintended hy men deep in Algebra, but apparently absolutely ignorant of gravitation? To reproduce the sensible ideas of the late Mr. Elmes (father to the architect of St. George's Holly, in not an architect as well advard by the scarship,

is not an architect as well adapted hy his searching, studions, and intelligent character to grapple with even quite new opportunities, as a man in most cases even quite new opportunities, as a man in most cases raised from the ranks (to use a military phrase), from the recent handling of the spade and the wheelborrow ? The creeting of fortifications (I do not quite mean impromptu defences in an energy's country, though this might be embraced,—why should not though this

might be embraced, — why should not armics have their architect as well as their chaplain or their sursuch a term the restring of fortifications by the so-termed Royal Engineer is at best hut a usurpation hy him of the province of the architect, as the ordnance surveys by our worthy sappers and miners are a trenching on the employment of our civil land-surveyors

Were I to enter more in detail into the require-ments of the architect, I should class his studies for theoretical attainments under the heads of geometry, a portion of algebra, conic-sections, place and descriptive, line-drawing, dynamics, stone-cutting, carpen-try. Proceeding, we should then have the study of perspective and colouring, with the laws of shadows, or selography, all these of course, from works on the special subjects.

The importance of a well-stocked *library* eannot too much insisted on. In fact, it is the life and source of all architectural knowledge; and for a list of hooks, I caunot do hetter than refer you to one furnished by the late Alfred Bartholomew, in bis sterling work on "Architecture and Specifications." Without reading, we can know comparatively nothing : previous experience and knowledge are to us plately lost. What time and labour are required absolutely lost. absolutely lost. What time and labour are required for him to behold with his own cycs but even a small portion of architectural huilding practice! And yet, as though either hind to its advantages, or too igalously succeptible as to the use to which it may he turned, with what sedulons care are the greatest facilities in this respect kept out of the reach of the audition in this spectra by the student is the start of the solemnity are the jealous doors opened to the intra-sion—of whom ?—The younger members of their own profession !—hy an unamiable assemblage.

We must give their due prominence to the lectures he obtained at the London colleges, aud-oh and-oh. bow sparing the number !-- at the Royal Academy.

Now, if I have not already wearied you, I will make what will, no douht, appear, to orthodox curs, a very traesonable assertion. I think if a complete revolution were the consequence of it, the effects would be most beneficial. I wish to assert, that all that I have pointed out may he successfully studied and acquired by a learner in the profession with far the office of the most eminent practitioner, great as might be what he could there *pick* up. With a great preemiary saving to himself, and the ntimate ud-vant up also of self-reliance, and without those impediments (they are nothing class) of traving and copying drawings, writing letters, copying hills of quantities, and those numberless ins and outs of quantities, and those numberless ins and outs of Now, if I bave not already wearied you, I will

qu'autities, and those numberless ins and outs of dreary occupied idlences, so familiar to the present generation of yoang architects. The weary five or seven years arc listlessly dragged through with an object by the *papil*, and with a dis-play of the most utter indifference, perhaps, by the master. He has promised "to teach and instruct, or cause to be tanglat and instructed," in what? In all of conce in which the munit in grocent. He is: cause to be taught and instructed," in what? In * The average mortality of all England is at the rate of all, of course, in which the pupil is ignorant. He is 238 in the 1,000.

not asked to go, brick in hand, but neither is he sortupulously to refrain from putting in the way of his pupil the least advantages or facilities; to dismiss him at the expiration of his orticles, in an architectural point of view, a mere overgrown hoy. The apparent utter want of honesty in all this is unac-The apparent utter want of honesty in all this is unac-countable, except on the supposition that professors are unwilling to train np skilled youths who some day might rival them in their practice. With the result hefore our eyes, it seems to the interest of architecture, and certainly to that of the

interest of architecture, and certainly to that of the young student, that he do not enter an office until, hy study, untrammelled by the monotony and stupid routine of an office, he have well qualified himself. The money sived in premium will go far towards paying skilled professors in the various hranches for imparting their valuable information, and when able to present himself without blushing as an aspirant to architectural honours, a half-year respectively in the offices of two or three architects in tolerable prac-tice in order to accurre the business-like portion of the offices of two or three architects in tolerable prac-tice, in order to acquire the busices-like portion of his practice, will then enable him to become what he never will be, or hut after subsequent years of weary-ing lahoar, moder the present system of being taught hy a practitioner. And if such be his fa'c, he will find himself with a lacrative practice at a time when, as things are at present managed, he would he only an out-of-date architect's assistant.

architect's assistant

In London, certaioly, with its manifold advantages so clearly made out by our friend Mr. Capes, he could not fail to render himself accomplished. I need hardly say, that from all these advantages he is for the present kept, by the chain of pupilage. I therefore hail with peculiar satisfaction the resolution, as some slight mitigation of the evil, recently passed by thi ciation respecting the Saturday half-holiday. ed hy this Association respecting the Saturday half-holiday. If he be able also to secure the advantages of foreign travel iu art-hallowed regions, his education may he pronounced near its completion.

In all these matters much might be done by the Association and the Institute: at present, I fear, our efforts have too much the appearance of supplying the evil effects of the negligence or incompetence of our professors,

REPORT OF THE CITY OFFICER OF HEALTH.

THE ninth annual report of the sanitary condition of the City of London, by Dr. Letheby, desorves the careful consideration of all who desire the welfare of the community. The facts stated in this report ought the community. The facts stated in this report ought to have a great effect in rousing the energies of those who have charge of other communities. It appears that out of the City population of nearly 130,000 souls, there died in the course of the yetr 2,904 persous, there area in the course of the yet $I_{2,3}$ by per-sons. This is at the rate of 22.3 per I,000 of the inhabitants; or it is one death among-t every forly-five of the living. This is called 9 per cent, below the general average, and represents a saving in the year of 286 lives. We learn that it is only nine years since a proper health establishment was formed in the Citr, and that ince that its at the deaths have some the City, and that since that time the deaths have constantly decreased, and have been reduced from the annual number of 3,763 to 2,904, the number above stated. The difference is 859, or closely upon 1,000 lives; and it is well worthy of remark, that this great saving has been mainly effected in one district, viz. the rentral.

We glean the following remarks :-- " There are some aces where the mortality is still high : in fact, a places where the mortality is still high: in fact, a cloud of death is always hanging where the vitality of the people is slowly sapped, and where disease makes easy conquest. It is not enough that these places are continually the hannt of such endemine maladies as phthisis, fever, and the other putrid class, but often they herome the seats of stronger pestilence." Dr. Letheby remarks that it does not come within his province to discuss the meaus of education which will enable the poorer classes to properly appreciate and attend to sanitary arrangements, and con-tinues: --- "But I cannot help saying that there seems to me to be an every way of doing it. Raise up but a few honses that are well adapted for the necessities of the poor, and yon will soon find that they are strong incentives to the forming of hetter habits, and to the acking for better homes. The spirit of improvement which has led to the destruction of the poor man's places seesing for better nomes. The spirit of improvement which has led to the destruction of the poor man's hannts has had but little regard for the poor man's wants; and, alter all, the mujesty of a great city may be not the glittering diadem upon the front of Death

The average mortality of the city is 22.3 in the 1,000 :* there are, however, some parts where the death-rate amounts to 27 in the 1,000. The following numbers show the great loss which takes place in young lives :--Of the 2,904 deaths for the year, 1,163 occurred amongst infants of less than 5 years

of age; 193 between the ages of 5 and 20; 391 be-tween 20 and 40; 522 between 40 and 60; 549 between 60 and 80; and only 86 after the fifth epoch between 60 and 80; and only 86 after the fifth opoin of life. Of a thonsand persons, therefore, who died last year in the City, 400 did not reach their fifth year, 406 died before reaching their twentieth year, 601 hefore the third peoch, 751 before the fourth, 970 before the fifth, and only thirty were left to struggle to the sixth epoch. The doctor remarks :---"As in the vision of Mirza, therefore, we may see the bridge of human life, with its 100 arches that span the city. We can see multitudes of people striving the city. the city. We can see multitudes of people striving to pass over it; and as we look more attentively, we to pass over it; and as we look more attentively, we may see the passengers dropping through the taps and pitfalls of the bridge into the great tide that flows henceth. But faster than in the dream of Mirza is the falling through of the erowd that struggles to pass over, for thicker and closer are the bidden traps and pitfalls that beset the way. Of the thousands who energy from the dark cloud that bangs there it higher the dark cloud that bangs about the bridge's entrance, only one or two will reach the hundredth arch; more than a third will have react the intervent area; more than a third will have dropped through before they have traversed the twentieth part of the way; more than half before they have got to the erown of the thirtieth arch; and hy the time the remnant of the crowd have reached the middle of the bridge, there will be but three-tenths of all the number tottering on.

The difference in the proportion of infant death in various usions is worth notice. The number and time of the deaths of those engaged

The number and time of the deaths of those engaged in different pursuits is an important consideration, Of all the males at twenty years of age and puwards, the deaths per 1,000 were 22.5; but "the different classes of society have contributed very unequally to the aggregate_for butchers, poulters, and fish-mongers, shopkeepers, and merchants, have died at the rate of ouly 15 or 16 in the 1,000; while tailors, have supersented and the superstant shows and the supersented and the s succurred at the rate of from 20 to 23 in the 1,000. succombed at the rate of from 20 to 20 in concept The death rate of blacksmiths and gasfitters, painters The denk rate of blacksmiths and gasfitters, painters and gloziers, dyers, hargemen and watermen, is 28 to 30 in the 1,000 ; esbmec, draymen, ostlers, and stable-keepers, at the rate of 31 in the 1,000, elerks and needlewomen, at from 34 to 35 in the 1,000, and the Londou working classes of earpenters, masons, and labourers, at from 43 to 45 in the 1,000. We notice that while the merchant, shopkceper, and domestic servant, will live, taking the average, till mently 57 years of age, the printer and compositor lives but to 45. It is true that the hate hours and confinement partly cause this large destruction of the lives of a valuable class of workers; but as we have before hinted, the bad ventilation and other ill causes which are allowed to exist in muny printing-offices, are elsif means of producing this mortality which is so much above the average.

The average life of women is 55, but the poor needlewoman drops into her grave at the average age of 40.

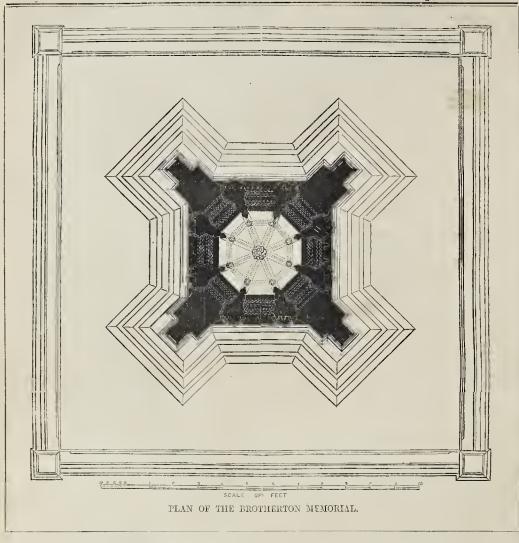

of 40. After some remarks on the various diseases which have been, more or less, fatal, the reporter proceeds to enumerate the sanitory improvements which have been effected in the year: 5,294 houres have been connerate the samitary improvements which have been effected in the year 5,294 houres have been examined, and 2,131 orders have been issued for various sanitary improvements. The inspectors have furnished letailed accounts of the state of 4,718 rooms, each of which has been carefully measured. rooms, each of which has been correctily measured, and circumstantially described in respect to its cleanliness, state of repair, reutal, and the number and condition of its inhabitants. These rooms were tennied by 3,783, and these figures show what a large proportion of these poor people can only afford the reut of a single room; in these rooms there were 13,277 persons.

In 125 of these rooms there were found 624 per-In 125 of these rooms there were found 624 per-sons. Several cares of overcrowding are given, but Dr. Letheby remarks that, in connection with these, he hopes son to have them all registered as common lodying-honeses; and that when this is accomplished, and the inspector of longing-honeses appointed, it will he the means, through the state ray powers of the Act of 1851, of putting a check on the unwholesome practices of such places.

SEWERAGE OF IPSWICH .- The town council of SEWERAGE OF IFSWICH.—The town council of Ipswich have agreed to a plan of sewerage for the town submittel by Mr. Peter Bruff to the sewerage committee, and recommended by them for adop-tion by the council. Mr. Bruff proposes the formation of a mulu intercepting sewer equal to $2\frac{1}{3}$ miles in length, and other works. The estimated net cost of executing the whole, including outfall works for storage of storm-waters, lateral sewers and treast drains but readings of concensulant to way for works for storage of storm-waters, lateral sewers and street drains, but exclusive of compensation to owners and occupiers of private property, is 35,7947, odds, of which sum 21,4707. odds is for 1pswich town, and 4,3157. for Stoke suburb. Compensation, &c. inclu-sive, the probable expenditure in all is estimated at 30,0007.

THE BUILDER.

SALFORD.

OUR readers have been informed of the various steps which preceded the selection of the design for a memorial to the late Mr. Brotherton. Mr. Brotherton represented Salford in parliament

Mr. Brotherton represented Salford in porliament twenty-four years, and during the whole of that time all his election expenses were defrayed by his friends and constitueots. Two full-length portraits of Mr. Brotherton were obtained in his life-time-one hy Bradley, of Manchester, and the other hy Westeott, of Liverpool, and presented to the corporation of Salford, and deposited respectively in the Town-hall and the Salford Royal Free Museum and Library in Peel-nark.

and the Salford Royal Free Museum and Library in Peel-park. The subscriptions received since his death, in January last, for a memorial to his memory, already exceed 2,500. Of this sum 1,000 guineas have beco appropriated to a statue in bronze, hy Mr. Noble, of London, to be erected in Peel-park, and 500 guineas have heen set apart for a moumeot over his grave in the Salford new cemetery. The remaining 1,000/ or upwards, is intended to he invested, and the interest annually appropriated, for the purchase of books, to he presented to the Salford Free Lihrary, and other kindred institutions, in order, say the com-mittee, that his memorymay he perpetuated, and his ex-ellent example constantly brought to our remembrance, and that of our children and descendants, by testi-mony as decided and enduring as the love, esteem, and recent of a grateful constituency, and of devoted and

which is ent out of the rock, and covered hy an equilateral is of glided and incised metal, and the spindle or rod half-brick arels, it is intended to throw another, in four is brought down through the spire to the under side half-brick rims, abutting on skew backs, cut out of shead brock, with the spandils filled up to the not and screw, which will he so arranged as to he ground line with brickwork, the whole of which, hidden by the foliage of the entre bass, at the inter-with the arch itself, will he set and fully flushed in with cement, to form a level platform, for the moun-of the strones in the monument are to he dowtails hase of the mountent, it is proposed to leave an entrance at one end, easily communicated with hy the removal of the stone slab with which it is intended to lias lime and sand, composed of pounded stone, as cover it. The whole of the monument. removal of the scole shab with which it is interned to cover it. The whole of the monument was to have heen erected in Halifax stone, but it has been suggested to adopt the magoesian limestone, from the Mans-field Woolhouse quarry, near Mansfield, of a similar kind to that used for the Martyrs' memorial at Oxford. The matter is now under eonsideration.

The design consists of an octagonal hase, with angle buttcesces, on a stepped and weathered founda-tion. Between each buttress is an arcade, consisting of five niches and figures. On the first stage of the monment is introduced a draperied urn, under an opeu groited enony, supported hy pillars, and ceclesiastical figures. The base or foundation for the pedestals on which they stand is to he formed out of one stone, as also is the arched and groined roof over the figures, hy the adoption of which arrangement the requirement of metal cramps is to be avoided, and the tie or binding of the whole made complete. The spire ahore is hollow, with a solid top stone, The design consists of an octagonal hase, with

15 FEET

ment are intended to be the entire thickness of the walls. The work has been ndertaken by Mr. Tbomas Richard Williams, of Lombard-street, Man-chester, at the outlay named in the printed instrac-tions, viz. five handred gniness.

It is expected that the monument will be completed by the month of August, next year. The architects are Messes. Holmes and Walker, of Manchester, who obtained the first prize, and have been commissioned to carry out the works.

CHURCH-BUILDING NEWS.

CHURCH-BUILDING NEWS. Ogford.—Amongst the long vacation improvements are the following :—The Clapel of Excter College, which will be the largest building in Oxford, bas reached the sprinzings of the windows. The opening of Balliol Chapel we have already noticed. At Magdalen Chapel Messrs. Hardman, of Birming-tark of a sints which have kept the light out so bong. The colours are rich, and the drawings would be good if the figures were not all so become a great object of attraction. The ruised pin-nades of St. Mary's, to say nothing of green and shattered easements, and ruiser will so spoil the light-street. The parish, it is added, has coo-sented to contribute one-half of the simated cost of its restoration. its restoration.

its restoration. Caddington.—The village church of Caddington baving fallen into a state of decay, has been restored hy Mr. Street, from voluntary contributions, assisted by the representatives of the late Mr. Baker Morrell. The church, which is dedicated to St. Nicholes, is in the Decorated style, with some late additions, and has a chancel, nave, two aisles, and a fine old tower. The roofs are entirely new. The church is re-fitted throngbont with open sexts, the western gallery taken down, and the tower thrown into the church. A westry has heen added on the north side of the chuncel. westry has been added on the north side of the chancel. The pulpit is of store. The whole of the chancel. In pulpit is of store. The whole of the chancel is liad with Minton's black, red, and buff tiles. The chancel is fitted up with oak seats for the choir, with two prayer-lesks at the ends for the choir, with two prayer-desks at the ends for the clergy, and its parement is Isid with Minton's encaustic tiles, encir-cling slahs of white marble. A staiced east window, designed by Mr. Street, was not ready at the re-opeu-ing by the Bishop of Oxford.

any the bishop of Oklord. Cambridge.-The restoration of the church of St. Mary-the Less bas heen decided upon, and a sub-scription was commenced some time ogo. A beginning of the works in contemplation (the new roof) will be made in the spring or summer of next year, and care is heing taken, according to the Chronicle, that the work shall be executed in a manner worthy of the original heauty of the haliding. In order to effect this, the master and fallows of St. Feter's College, and some other subscribers have doubled their subscriptions, and a little more assistance from the public will secure the accomplishment of the work. The sum of 1,300/. is required in order to execute the roof in oak.

sum of 1,300/, is required in order to execute the roof in oak. Deddingdon.—A vestry was lately held at the Town-hall, Deddington, for the purpose of recon-sidering the report of the diocesan architeet as to the present dangerous state of the parish church, and of devising means for restoring the same, and also to decide upon the uccessity of removing the gallery, now so injurioasly alniting against the south aisle, and the best means of providing necessary accommodation for the parishioners. It was unanimously resolved— "That heavy and very general repairs appearing to be absolutely necessary to our parisb church, as well as the removal of the gallery in the south aisle thereof, the most efficient plan to be adopted would be to arrangement, many additional sittings would be gained by the removal of the gallery, and that the same be endeavoured to be carried out by voluntary contribu-tions, without resorting to a compulsory rate:" A tions, which to be carried to a by volmary volmation de-tions, which are resorting to a compulsory rate." A committee to carry out the resolution was appointed. *Silkstone*.—The repairs and restorations of the old

c committee to carry out the resolution was appointed. Silkstome.-The repairs and restorations of the old c oburch of Silkstone are progressing, and the work-nmen, fifty-five in number, have just had a dinner given them hy Mrs. Clark, in honour of the rearing of the chancel, which is new. The old part of the church is now covered in, the whole of the roof being new except the principals. The windows are also to be new, those in the chancel, four io number, to he of stained glass. The doors, pulpit, reading-dosks, ecommunion-table and rail, &c. are to be new. It has been found necessary to enter ioto an additional cou-tract, the cost of which will be fully more than the aoriginal. o orig

completed. The alterations comprehend, among others of importance, the opening of the chancel and tower arches, so that an undstructed view is now obtained from the east to the west end. The gallery has been cleared away, and the plan has involved the destruction of the old high pews: in their stead, the church has been filled up with seats of one beight, and of the same design as the old seats left at the west off. This has given a considerable increase in the end. This has given a considerable increase in the number of the sittings. Amongst the other alterations end. may be noticed a new pulpit and reading-desk, a new ringing-floor, over the tower-areh, with access by a new circular staircase in the north-east angle of the tower. A new vestry has also here made on the north side of the chancel, and the chancel has been restored. Flues have here constructed under the paying by means of which the whole of the building submitted to, and approved by the Beds. Archeeolo-gical Society, who made a grant towards the expense restoration.

Reading.---A necessity having arisen for increased accommodation in the Baptist Chapel, King's-road, application was made to a limited number of archi-tects to furnish designs for enlarging and improving tects to furnish designs for enlarging and improving the chapel, vestries, and school-rooms; and they have unanimonaly selected one hy Messrs. Poulton and Woodman, of this town. The plan selected proposes to extend the chapel in front, building a focade to the Ning's-road, with lobby entrances to the body of the chapel and galleries, which are so arranged as to provide separate means of geress from the various parts of the huilding. It is proposed to alter the ceiling of the present edifice, and to construct a dome in the centre, the unper half being of glass. The Criting of the present editice, and to construct a dome in the centre, the upper half being of glass. The lighting will be at night by a gaselier, suspended from the centre of the dome. The ventilation will be through the dome. The pews are to be re-arranged on a plau which will, with the colargement, add about two-thirds to the present arcommodation. The chaptel will be beated by warm-air flues under the

Basingstoke .--The foundation stones of the two The standard scheme is the second scheme is the second scheme is a second scheme is the secon Data stone takings with first paules are the materials of which the walls will be composed. Vestries will be attached to each building. The entrance is in the old balf-timber style, standing on a platform excavated out of the embaukment. A timber bridge will unite the levels of the eccentery across the approach-read. The entrance-gates are to be immediately under this bridge, and will be of ornamental east ircowork. The walks and roads are to he laid out in various serpen tiue lines, and one of the walks will form the only separating mark between the conscerated and uncon only secrated portions. The preservation of the well-known rules of the "Holy Ghost" Chapel is contemplated. The architects are Messrs. Poulton and Wo dman.

Woonman, "The parish church of St. Bartho-lomew Hyde, under the superintendence of Mr. Colson, architet, has been repewed on anew floor. Mr. John Brown, builder, was the contractor.

Cheadle.—A chapel, in the Gothic style of archi-tecture, from plans by Mr. J. Wilson, of Bath, capa-hle of seating about 100 persons, has been opened at Alton

Atton. Sedgley.— The new Congregational Chapel, at Sedgley, bas been opeued for divice service. The site fronts the road from Sedgley to Deepfelds, and the huilding will accommodate 400 adults and 150 chil-dren, with provision, when side galleries are added, for increasing the number of adults by 156. The for increasing the number of adults by 150. The holider's contract was 1,3467, and the cost, including other expenses, is 1,3622. Is. 11d. The form of the chapel is rectangular, 66 feet 6 inches long by 37 feet broad. The entrances are on each side leading to side aisles, from which the seating (which is open framed), is approached at the further end; elevated side aisles, from which the seating (which is open framed), is approached at the further end: elevated two steps above the aisle floor is the table pew so arranged that it can be used as a platform at public meetings. Over the entrance lobby is an end gallery for children. The roof is open timbered, ceiled across the collar beam, and divided by moniled rhs into panels. The woodwork is staticed and varished throughout. The style of architecture adopted is that of the fourteenth century. The change is hull with of the fourteenth century. The chapel is huilt with Gornal stoue rubble work and Box ground stone dressren, fifty-five in number, have just had a dinner fiven them hy Mrs. Clark, in honour of the rearing the chancel, which is new. The old part of the hureb is now covered in, the woble of the root being new covered in, the woble of the root being enew, those in the chancel, four io number, to be f stained glass. The doors, pulpit, reading-desks, inter ior is lighted by five double-light and traceried momunion-table and rail, &e. are to be new. It has beneddy divors, filled in with sheet glass, and hor-stat, the cost of which will be fully more than the *W* restoning.—The restoration of the chureb bere is architects were Messrs. Massis, Subk and Son, of Birmingham, provided the gaseliers and ornamental irowork. *Bolton.*—The parish church siceple having been reported by Mr. Holt, architect, to be in an unsafe state, a meeting was convened by the vicar, to constate, a meeting was convened by the vicer, to con-sider the subject. It appears that, many years ago, the steeple was eased by a stone wall inside, and that wall, not baving heen properly hound to the old build-ing, has given way, so that it has been found ucces-sary to discontinue the ringing of the hells. The feeling manifested at the meeting, says the *Preston Guardian*, was decidedly in favour of renovaling the structure in preference to building a new one; and it was unanicously decided to call in Mr. Belchouse, of Manchester, to give his opinion of the state of the building, and the best means of restoring it. Mr. Belthouse hos since examined the steeple, io company with Mr. Holt, and expressed his helief that the tower was safe, although the wall inside, which was intended

Belliouse ness since examined the succepte, io rouppany with Mr. Holt, and expressed his helief that the tower was safe, although the wall inside, which was intended to strengthen it, bad given way. *Outenood* (*Wickefield*),—The foundation stone of a new church has heen laid at Outwood, neur Wake-field, by the Bishop of Ripon. The colifice is about to be built by subscription from the iohabitants: it is to he called the Church of St. Mary Magdalene, and will be built, after plans furnished by Mr. W. H. Dykes, of York, with nave, north usile, chancel, organ chapel, and vestry, and will seat 400 persons. A south aisle, with tower and spire, will be added, when more room is required and sufficient funds are raised. The church is to serve for a new district, to be taken from the present parish of Stanley. *Isle of Man*.—The foundation stone of a new Moman Catholic chapel has been haid in Douglas, Isle of Man. The site of the new edifice, which is to he called ''St. Mary's of the Isley'' is on Prospect-hill, in the most improving part of the towe.

called "St. Mary's of the lsle," is on Prospect-hill, in the most improving part of the towo. *Nairn.*—St. Columha's church, Nairn, was conse-crated on the 22nd ult. by the Bisbop of Moray and Ross. The hoilding, which is in the Early English style, consists of a cbancel, 24 fect long and 18 fect hroad, and a nave of three bays, 36 feet long and 24 feet hroad. The west-end wall is only a temporary creation, as it is intended hereafter to add another by and a force. The chuncel is lickled at the east. the top, and is of real software the real of the same is lighted at the east end by a triple lancet of the same character as the rest of the huilding. The root is of timher, open to the top, and is of red Mernel pine, which is to he varnished. The part over the chancel is laid out in panels, of superior work to the rest. The font, which is the gift of school children, is a hexagon, of Naira stooe, and is panelled for future carving.

PROVINCIAL NEWS

Aston.-The district of Little Bromwich, in the parish of Aston, is about to he provided with school-rooms, which will be creeted in connection with St. Margaret's, Ward-end, the church of the district. The foundation-stone of the schools was to he lid on The nondeation stone of the sensors was to at rid on Wednesday last, hy Mr. C. B. Adderley, M.P. The site has been given hy Mr. C. Reeves, of Ward-end, and it is proposed to erect, at a cost of 450*l*. a school which will accommodate seventy ebildreu. Plans for

which will accommodate seventy children. Plans for the building bave heen prepared by Mr. C. Edge. There is still a deficiency of 150. Birkenhead.—The foundation-stone of new schools in councetion with the Wesleyan Clangel, Price's-street, Birkenhead, has been laid at the new site in Beckwith-street. The schools have already made some progress, and, when completed, will accommo-date 300 children. Mr. Joseph Brattan is the archi-tect, and Mr. J. Hogarth the contractor. North Petherton.—Schools, from plans prepared hy Mr. C. Knowles, architect, have been arceted at North Mor Green, at a cost, including site, &c. of 4300, raised by subscription. every one. New gasworks have been creeted. New warehouses and quays have been built, and the river side. Blast furnaces have been huilt, and two new stations, mills, and workshops bare sprung up. Two yards have been established for building iron ships, and are employing several hundred hands. The Tees Conservaucy are improving the river approach to the town, and have spent many thousand pounds in the work

Note: Isle of Man, —The Isle of Man fishermen have resolved to petition Government for the formation of a low-water harhour at Port Erin, near the Calf of Man, for the protection of the berring fleet and the vessels which now frequent it as a hay of shelter.

NEWS FROM SCOTLAND.

Edinburgh. - The Grand Lodge of Freemasons intend, with the help of the other Scottish Indges, to expend 10,000?. in the purchase, adaptation, and adornment of a large teuement in George-street, for their use. Plans of an ornamented front, facing the street, and of a hall, to he crected on the area helind, are to be prepared, and the whole works completed previously to St. Andrew's day, 1858.

Glusgow.—The streets, lanes, and sewerage of this etty, says the local *Gazetle*, have been, and continue to he, in a most digraceful state, and getting worse and worse every year. The state of Mitchell-street, running into the principal thoroughfares, is instanced to heave head but the and worse every jear. The state of antice fraction strength running into the principal thoroughfares, is instanced as being had, but the erocked streets and lanes still worse. It is full time the Glasgow people were awakening to the fact that cholera is again threateoiug.

Galashiels .- The committee appointed to look for site for a town-hall have instructed Mr. Hall to draw out a general plan of a public hall, with court-room and waiting rooms, and police cells helow, such as will he suitable to the requirements of the town. The committee are negotiating as to a site in Bankstreet.

Forres .- The last remnant of the Mantle-wall, as was called. which once surrounded the College of it was called, which once surrounded the College of the Cathedral Kirk of Moray, says the Forres Gazette, has lately heen repaired at the expense of the Com-missioners of Woods and Forests. At the east there was a gateway in the wall, called the Pans' Port, the approach hy which the hishop, when his residence was at Spynic, used to center, after fording the Lossie within a few yards of the spot. The Port is a pointed arch, and had been furnished with a portcullis, which was drawn up in a groove still visihle in the wall, when ingress and egress was required. The Port has when ingress and egress was required. The Port has heen repaired. A strong huttress has heen built at the south side, and the whole of the joints and open-ings between the stones of the fahric have been filled up with Roman cement. A cope of dressed freestone bas heen placed on the top of the wall, for its preser-vertion. vation.

Birnam (Dunkeld) .- The projected new town of Birnam scems to have made a heginning. Some time South scens to have made a degranged south of a bission of the ago the foundation stone of an Episconi Chapel was laid by Bishop Wordsworth, and the crection is heing proceeded with. A parsonage and school in connec-tion with it are in contemplation, and likely to be soon commenced. Large additions to an already ex-tensive establishment of a Mr. Anderson have been fixed on. Four feuing lots have been taken. Sites for villas on the Torr Wood are heing taken.

STAINED-GLASS WINDOWS

In the new R. Catholic Church of the Immaculate Conception at Prescot, Lancashire, recently opened there, are several stained-glass windows, viz. a large four-light altar window, two in the transept, and three in the chancel.

In the ensured, is given in memory of the late Hon. Gilbert Stapleton. It has four lights, contain-ing full-length figures, under rich canonics, of St. ing full-length figures, under rich canopies, of St. Mary and the Divine Infant, St. Joseph, St. Ignatius Loyola, and St. Francis Xavier;—in the tracery the arms of the Stapletons, and in the upper opening the coronation of the Virgin.

coronistion of the Virgin. The three side chancel windows are of two lights each, with subject medallions, viz. the Annunciation, the Nativity of our Saviour, Christ hearing the Cross, the Crucilizion, the Ascension of Our Saviour, and

The south ranset window, given in memory of Mr. B. Bretherton, of Rainhill, is composed of four full length fource under scenario rin St. Buckle Mr. B. Bretherton, of Rainhill, is composed of Dur fall-length figures under canopies, viz. St. Bartholo-mew, St. Jane of Valois, St. Patrick, and St. Bridget. The north transcept window contains four figures also, viz. St. George, St. Gregory the Great, St. Augustin of Cauterhury, and St. Thomas of Canterhury. The nave windows, fifteen in number, are filled with quar-tic and advanced header. ries and coloured horders.

which is filled with a full-length figure of the proto-martyr nuder a rich canopy; --the four side-lights have ornamental glass in geometrical patterns. The three large tracery openings are filled in the following mauner, viz. the centre one with the martyrdom of the saind, the two others with groups of angels bear-

the same, the two onces and group of more ing palm-branches. *Chichester.*—A new painted window bas just heen creeted in the north aise of the nave of the cathedral. The multions and tracery of the window (which is of Factors). three lights), with cusped circles above, of Early English character, have been restored in Caen stone hy Mr. T. Kitson, of Chichester. The glass was excented hy Mr. J. R. Clayton, London. The subhy jects represented have all reference to the healing of the sick, as the Pool of Bethesda, the Healing of the Leper, Peter and John at the Beautiful Gate of the Temple, and others of similar character. Half length figures of the apostles, Peter, John, Paul, and Bar-nabas, occupy the upper and lower portions of the side líghts.

Walsall.—A memorial window has heen placed in Rushall Church, to the memory of the late Mr. George Strongitharn. The window has been painted by Messrs. Ward and Co. of London, and has been put np in the chancel.

FOREIGN INTELLIGENCE.

Paris — The emperor has commissioned Mons, littorff, architect, to erect, opposite the church of St. Gerousin l'Auxerrois, an analogons building in the Gothie style, to serve as a pendant to that interest-ing structure. It is destined for the Mairie of the Fourth Amendicana to a structure. ing structure. It is destined for the Justice to use Fourth Arrondissement, and will be surmounted by a clock tower, which will be used for the services of the church of St. Germain.—The improvements pro-jected for the Eleventh and Twelfth Arrondissements, proceed at a great rate. The adjugatement of the Rue des Mathurin St. Jacques, modified three times, is now definitively fixed, and a part is already covered hy huildings. Its prolongation will be on the scale of 12 mbtres in its breadth, and end in the Rue des To metry in a stream, and the in the axis of the Carmes, in a direction parallel to the axis of the Marché.—The new building of the Musée Chuny, which lies on the horder of that street, is now com-pleted, and will be a neeful complement to the old useum, whose archæological riches have not been hitherto well displayed. — The Rue des Ecoles, which is to be 20 mètres hroad, hitherto a heap of rubbish has been lined with fine huildings.

Milan : Leonardo da Vinci .- The monnment to he erected in that eity to the memory of this great painter, will occupy one of the choicest spots of the Lombard capital, viz. the Piazza Sau Fidele, on the spot where once stood the mansion of the Fiuance Minister of Italy, M. Prina. The Academy of Arts of Milan have voted 60, penses of the monument. have voted 60,000 francs towards the ex-

CATTLE-YARD COMPETITION OF THE ROYAL DUBLIN SOCIETY.

SIR,-IN alluding to this affair, which will stand pre-eminent on the list of extraordinary competitions, and illustrate to perfection the liability of architeeand illustrate to perfection the hability of architec-tural practitioners to be made the hughears of com-mittees, you say "there is no remedy nuless a special contract on the part of the committee can be proved." Pardon me for troubling you further after your ver-dict, but I feel that the *facts* have not been fully or chard wat before you you would not have availed Pardon me for troubling yon further after your ver-diel, but I feel that the *facts* have not been fully or clearly pat before yon, or yon would not have arrived at such a cooclusion. In ordinary husiness transac-tions hetween man and man, to prove a contract satisfactorily in the eyes of the law, the previous pre-caution of a stamp afficted is indispensible, but in a matter where a public hody, by advertisement, invites the members of a profession to embark their talents, time, and labour, in the hope of the hest production gaining a promised reward, and that theo, hy further divertisement, such body acknowledges that a com-petitor did reach the maximum poiet, hat nevertheless *to* assume a very different shape. Every man's time is his money, and there is such a thing as obtaining money mader false pretences; *argo*, if a committee tamper willingly, and without the in-tatest, in justice, to incur as serious a responsibility as if it were *bond fide* with the latter commodity. There can he no necessity for "a special contract" to he proved further thas that of their own amking, yiz. the official advertisement officing the premium (as in this case was done in *two* separate instance),

(as in this case was done in *two* separate instances), the receipt of the plans in competition, the acknow-ledgment that there was a "thest" plan, and the de-elining to award the premium nevertheless. Day and These and colored norders. These windows were accented at the St. Helen's date, documentary and verbal evidence, can he given Crown Glass Company's Works, who have recently 'for *all* this; and, may I ask, are the competing archi-put up also a large five-light window at St. Stephen's tects so pusithanimous as to sahmit, tarily, to base Church, Brownlow-hill, Laverpool, the centre light of their lahorious drawings shelved as waste paper, while

the society coolly re-pockets the 25% and says, "Take them out of this, we won't have them now ?" Apart from either local or personal considerations,

Apart from either local or personal considerations, this competition involves a principle (or rather a want of it) which, for the sake of the profession at large, should and must be shown up. The plans declared "best" in the first competition, and distinguished hy the motio "Never venture, never win," were my sole design and draughtsmanship, int in the second com-petition I also sent in an elahorate set, which still remains in the society house, as I will not withdraw there would L being this metter to a wrist. It is a remains in the society music, as I with not with any them until I hring this matter to a crisis. It is a significant fact, that the assistant scaretary told me personally that the drawings sent by a certain gentleman (named at the time) in the second compegentematic transmission of and the official announce-ment was only delayed until a hulder's tender to execute them within the stipulated amount should bave heen received; but when I sought subsequently bave heen received; but when I sought subsequently for information as to the ultimate decision, this gentleoans's name merged into the title of "Pro bono Publico," and the worthy official declines to say who he is, or whether or not the premium was awarded, as, in his letter of September 21st, may be seen. Such doings ean only be exposed hy the aid of the press; and, for the profession generally, irrespective of per-sonal compliment—which, of course, I shall feel like-wise,—I respectfully solicit the insertion of this letter. Joury J. LYONS. JOHN J. LYONS.

THE CAMBRIDGE MUSIC-HALL COMPETITION.

THE authors of the design marked "Industria" complain that the notice in our pages (p. 591) gives the impression that there is but one entrance to the Musichall in their design, whereas there are two, hesides the approach mentioned; namely, one in Jesus-lane, and a second in Park-street. The writer of the notice is not able to refer as to Jesus-lane, but remembers that not ahle to refer as to Jesus-Iane, but remembers that the entrance in Park-street is a small one simply for performers, and repeals the expression of his opinion that the approaches are inadequate. The authors of the design say they do not understand the remark that the audience coming out would have to "pass through the frustrum of a wedge." When we say that the doorway of the Music-hall is 8 ft. wide, others will understand the passage 5 ft. wide, others will understand the illustration if they do not. A letter from "a Frieod of a Member of the Com-mittee," now before us, complains in strong terms of personal carvasing on the part of "ludustria." The statement made hy the author of "London "(p. 619) may be correct as far as his intention goes; hut an arch coloured loke, with the walls, is unquestionably coloured lake, with the walls, is unquestionably shown. He was quite right as to the preservation of the anonymous. A correspondent, competent to form an opinion, writes :-- "I consider that most of the drawings are unfairly made. If a committee of archi-tects were to inspect them critically and report upon them, I am sure they would show that none of the desigus could be carried out. The site is of a peculiar shape, the approaches are not good, and the huilding would interfere with the ancient windows of adjacent property; and the adjoining property abuts npon several walls where fine windows are shown in the plans.

THE BRIGHTON PAVILION COMPETITION.

THE committee have awarded the first premium of The committee nave availed the first premium to 100, (a second 100, to he given on a tender for the work heing accepted, or it being ahadoned) to "Unity is strength," and 500, to "Covendo Tutus," hold on condition of a declaration that the work can he done for 10,0007. The anthors of the design marked "Unity is strength," chosen as first in the competition are Mr. W. J. Green and Mr. L. Deville. We have received complaints from several competitors of the cut not in early discussion and the several competitors of the received complaints from several competitors of the curt, not to say discourtcons, note from the Town Clerk, Mr. Sharood, informing them, without one word of thanks, that their drawings may be had on application. "It is a good sample," says one, "of the courtesy shown to competitors by committees; and in this case, too, we had to pay two guineas each for copies of the plans of the existing buildings."

ISLINGTON VESTRY.HALL COMPETITION. THE report of the Special and Offices Committee on the twelve selected designs has henen printed, and is now hefore us. It will be laid before the Vestry this (Friday) evening. Some, when they see prefixed to the designs such notices as these, — to No. 8, "The thickness of the walls, as shown in this plan, are insufficient;" to No 52, "The general con-struction of this design is not good, and the walls are not of sufficient thickness;" and so on,—will, perhaps, wonder why the committee selected them. We would wager a new hat that we could name three out of the four desigos which the committee will probably name to the vestry as the hest, if required, and should ISLINGTON VESTRY-HALL COMPETITION.

not wonder if they prove to be the work of parties intimately connected with the vc-trymen.

Intimately connected with the vestrymen. The committee, in making their first selection, bave avowedly taken the question of cost for granted. They must hear in mind that one of the express conditions under which honest architects worked way. conditions under which honest architects worked way, that the building should not cast, iocluding commis-sion, &c. more than 5,500/,; and that if they select the design of a competitor who has disregarded this, they will commit a glaring act of injustice, not to be got rid of or p-lilated, as some other injustice may be by the adage, false though it be, that " there is no accounting for taste."

THE ARCHITECTURAL EXHIBITION.

THE following passage from the report of the committee, quoted by us last week, may be usefully brought to the notice of our readers :---

" The committee have turned an earnest consideraton towards the two great competitions of this summer, namely those for the Government Offices and the Memorial Church at Constantinople, and they have made some ioquiry with a view to obtain they have made some ioquiry with a view to obtain from ber Majesty's Government the use of some place of exhibition (such as unused rooms in the Houses of Parliament), in order to bring together again if possible the hest of the drawings for the Government Offices; but the reply received is not such as to induce them to believe that this will be effected. The successful designs will besides remain in the hands of the Chief Commissioner of Public Works. As the space at disposal in Sufolk-street is really no more than sufficient for ordinary purposes, the com-nittee request those who can do so, either to send per-spective views only, or to prepare reduced drawings of their designs, or to send photographs of them; and they propose to rehax as regards these two comthey propose to relax as regards these two com-petitions that regulation which excludes all drawings exhibited before in London, if it should be found desirable."

THE METROPOLITAN SEWAGE QUESTION A HYDRAULIC PROBLEM.

THE METROPOLITAN SEWAGE QUESTION A HYDRAULIC PROBLEM.
A HYDRAULIC PROBLEM.
A NEW scheme for the purification of the Thames and the disposel of the metropolitan envage has been proposed by Mr. F. Lipscombe, a hydraulist, who has patented the plan on which he proposes to proceed. If he a printed a prospectas, from which we shall endewout to explain, ebiedly in his own words, the main principle and arrangements of the scheme.
After stating his objections to the "open ditches" to the recess, amongst which he cumerates the risk of stagnation and accumulation during frost, and even by the force of head which, the patente proceeds to show "the unsuitability of *inclined* channels for covergance of sewage many miles" as being the ease of all the difficulty. The inelined plane principle, he remarks, is "unsuitable, on account of its presence, although starting from a splendid fail," whereas, "a pipe, when made to start with an abrupt downward (or vertical) direction, with the view of obtaining the atmost amount of hydrostatic presence, and the actrical in a horizontal line to its outfall fields by the volget schedingst possible velocity to water traveling through it." And the "horizontal portion of the pipe merely serve as quide to the torrent; and, however, long, either adds to *our takes usay*, to any appreciable ertent, the [1:pelling power erated by the weight of water in the falls, which (falls) are unalative in their hydrostatic pressure. The patenter, therefore, has been led experimentally to pressure, which was an exceed probe hid own apport the principle. A two, like word of the exerced point of the scheres in diameter," he conting the about the average), bid down as recommended by the patente, will give a velocity to the exerce of about 25 miles per hour, discharging 1,012,429 gollons per hour, discharging 1,012,429 gollons per thor, which would be attered. The would be extra- altogether, prohably.

It would reach 100,000." He proposes several exit pipes on the coast, so as to apread the sewage, and dilute it at once in the ocean, at or beneath low water level. In the following abstract the whole scheme is

indicated :-

Indicated :--"Ist. It is proposed that the sewage should be dis-crowded, fortid, and ruinons to health. There was an the Essex or Kentish shore. 2nd. It is proposed to divide London into several dis-tricts, as may be found convenient, with the object of venient elevations. No. 1 may be composed of the highest contiguous portions. No. 2 the next highest. No. 3 the bighest con-venient elevations. So is the next highest. No. 3 the several elevation despite the source at the shifter to orthour porient within its own area. By this arrangement we obtain the highly important advantage of draining the greater the contens several were ago.

part of the sewage to several highly elevated points, pre-partsory to its being sent away; thereby getting good align the several back of the several factors and the charge, each of them, anyords of a million gallons per hour, at distant outfulls. "Bid. It is proposed to lay an iron pipe from each of the hefore-mentomed. London districts, to distant outfulls, down to about low water mark, and give each pipe a pech-liar form, as inteady described, as will elicit the utmost umount of hydrostnic pressure due to the several falls, and by means of that pressure to discharge the sewage coming from the higher districts, at a very high relocity, and at a high average relocity even from low ones. Thus may the London sewage be converged to seawater without the possibility of the pipes becoming choked, or giving off any offensive smells during its transit, at a cost several milloms less than any other likely plan that has been proposed."

Without committing ourselves to any special opioion on Mr. Lipscombe's scheme, it may at least be freely admitted that hydrostatic pressure, as a bydraulic power, when properly applied, has already done wonderful things, and that, nevertheless, the principle may be said to be still in its inflancy. We have often urged a consideration of this subject on the public attention, as in describing some of Armstrong's hydraulic grange for example and in supresting the public attention, as in describing some of Armstrong's bydraulic eranes, for example, and in suggesting the employment of the ordinary water supply, especially under continuous pressure, in the multiplication of such hydraulic engines for use in warehouses. As regardls Mr. Lipsconhe's scheme, it is at all events well worthy of further consideration and discussion, on such points particularly as the strength of the pipes, the depth of their deposit in the ground, the inflaence of gravity and friction in retarding the segarge. & of sewage, &c.

SANITARY ARRANGEMENTS FOR BARRACKS AND HOSPITALS.

THE stalements made by Mr. R. Rawlioson in a paper on this subject, read at the recent meeting for the promotion of social science in Birmingham, conthe promotion of social science in Birmingham, con-firm strongly our views as to the want of a sanitary commission for the army in India. For the first time in the bistory of this country, sanitary works had due attention given to them during the late war by Government. We have over and over again pointed out the sad state of our home poor in their houses and in their persons: the couldition of the soldier bas also been alluded to. We have recently directed attention to the necessity for sanitary works and arrangemonts for harracks and armies in India, and we are glad now to be able to say that Government has taken up the question in earnest. An army medical report will be published about Christmas time; hut, in the mean-time, a committee of practical men has commeuced its labours. Every harrack is to be inspected, and a "medy is at once to be applied." The following abstract of Mr. Rawlinson's paper will show it was meded in a substant diversity of 03,959 men, we have been diversity and the second

needed:--Before Schastopol the British, out of 03,959 men, lost, from wounds and mechanical injuries, 1,761; killed in actioo, 2,668; deaths from disease and other causes, 16,298--the total of deaths heing 20,717. Besides this there were 12,903 invalided, making a total loss to our effective force of 33,620 mea. The French Bosses were in larger ratio, ithe Russians probably much greater. Sir John Priogle wrote about a cen-tury ago as follows:-- ''Amoog the chief causes of sickness and mortality in an army, the reader will little expect that I should raok (what are intended for its health and preservation) the hostitals themselves. This health and preservation) the hospitals themselves, and that on account of had air and other incon-veniences atteoding them." That might have here written in the present day. The public will little expect to be informed that soldiers in barracks, even in Great Heinin, marike factor them submission in the second expect to be informed that soldiers in barracks, even in Great Britain, perish faster than criminals in gools, and more than twice as fast as men in towns' police; and that in some colonial harracks there had been as much as 50 per cent. in a few months of deaths amongst men of the finest regiments. Mr. Rawhinson illustrated this by reference to the official returns, and Showed from the evidence taken from the Army Com-mittee Report of 1855. He further stated that Dr. Lyon Playfair had informed him that the air of the sleeping-rooms of the Wellington Barracks. London sleeping-rooms of the Wellington Barracks, London, contained nhout ten times the normal quantity of carhonic acid in healthy air. Fresh air, free and in ahundance, should be provided for in barracks, in tents, and shore all in hospitals. Medicine, meat, and clothing were of secondary importance. Malignant fevers, generated by foul air, destroyed far more than all the shot, shells, hullets, or steed used in action. There were few barracks in which means of ventida tion were fully provided for and duly attended to. For the most part the sleeping-rooms were over-erowided, fortid, and rainons to health. There was an enormous amount of fever amongst the meu eom-posing the armies in the Crimen, Russian as well as the Allies. During the first winter almost every case sleeping-rooms of the Wellington Barracks, London

taken into the British hospitals became one of fever, and so this state of things continued until the arrival and so this state of things continued until the arrival of the Sanitary Commission in the spring of 1855. From this time fever ahated in the British army nutil regiments and hospitale were much fecer from fever than in England or on any home station. How was this, and what had been done? The great panacea was fresh air. The impervious felt covering to the huts caused much mischief: ridge ventilation removed the evil. Before the arrival of the Sanitary Com-mission, and at the time of its arrival, the British heavily avera as ful and dealy as the Fromeh With hospitals were as foul and deadly as the French. With the alteration in the sewers, the flushing and cleansing, the variation in the servers the meaning and eccasing the variation and the line washing , there hegan to be a change for the better. The British hospitals becaute work to the und. From his observation, reading, and experience, Mr. and From his observation gradual such a books to the end. From his observation gradual and experience, Mr. Rawliuson made the following conclusions — Every barrack in existence in which a British soldier was quartered should be inspected as soon as practicable by persons fully competent to the duty, with a view to sanitary improvements, and such improvements should be carried out as specifily as possible. Barracks had been placed on sites where remedy was not practicable. There were also buildings so inconcentent in form and arrangements, having sub-soil doors, walls, and ceilings, so saturated with filth that destruction by free or immediate abandon-ment onght to be resorted to. Common sewers ought never to he allowed beneath or within any should only come up to the outer walls. The sub-soil hoceath all barracks and hospitals should be dry. should only come up to the white white. The sub-soil heocath all harracks and hospitals should be dry, fresh, and sweet. There should be arrangements in all cases to allow of a free perfaition between subsoil and basement floor. The construction should be such as to admit of cleansing, and to prevent any harbour of vurnit. Barrack rooms should be loty and spacious, having not less than 1,000 cubic feet of air space per man. There should he at least one open fire place in each room. The windows should open from above, and at or near the ceiling. There should not he less than its equare feet of window space per man. In all barrack rooms there should he permanent means for ventilation (inde-pendently of the doors and windows), which could neither be seen by the men nor be tampered with... There should he an area of exit and inlet for the fresh air of not less than 15 square inches to each man. The means of ventilation should be simple, and if each room had these means distinct and independent The heats of relations a statistic and independent of all other rooms it would be better. There should be soil pans, &c. and lavatories for each room, or not less than one to every six men. These should be out of the harrack room, but close to it and under eover.

NEW DOCKS.

The Northumherland Dock at Hayholc-on-the-

The Northamberland Dock at Hayhole-on-the-Tyne, has been formally opened. The area of the tidal basin is two acres. It is 475 feet long and 175 feet wile, with a 70-feet entrance. The lock is 250 feet long and 52 feet wile. The area of the dock is fify-five acres, and at present it is capable of accommodating 400 vessels. The averace depth of water at high-water neap tides on the sills of the entrances is 18 feet, at spring tides, 24 feet. The channels through the entrances of the basin and lock were opened on the 22nd of June, 1857, and ahout that time the closing of the ends of the emhankment was commenced with. At the 24 feet. The chancis through the entraces of the basin and lock were opened on the 22nd of June, 1857, and about that time the closicg of the ends of the enthumkent was commenced with. At the time the docks were commenced, in 1853, upwards and on its completion, the shipments amounted to 1,400,000 tons, showing an increase during the pro-gress of the works of 200,000 tons of coals. Mr. John Plews, of London, is the cogineer in chief of the dock; Mr. J. Plews, jun. the resident engineer. The contractor for the whole work is Mr. David Thornhury, of Washinborugh. The contractors for the iron gate were Messrs. Hawks, Crawshoy, and Co. Gateshead. The cost of the dock is estimated at about 200,000. The mone for constructing the dock has been resided by the River Type Commis-site side of the river another dock. This is the first dock on the Type ; but on the oppo-site side of the river another dock, the Jarrow, is in progress, and will involve an onlay of about a quarter of a million sterling. This dock is a project of the North-Eastern Railway Company. The contractors are Messrs. Jackson, Gow, and Bean. The dock will the vonthumberland Dock, a total amount of dock accommodation on the Type, of minet-five acres. An Act of Parliament has been obtained for a third dock at Cohle Dece, extending from the hasin of the Northumberland Dock, a total amount of dock accommodation on the Twe, of minet-five acres. An Act of Parliament has been obtained for a third dock at Cohle Dece, extending from the hasin of the Northumberland Dock to Smith's Quay, and about the size of Jarrow Dock, manchy, forty acres. The Coble Dece Dock will have a a aget hof water of 26 feet. The hasin will he one acre and three-quarters

and will have a depth of water of 28 feet. There and will have a depth of water of 28 feet. Three will he a 70-feet entrance. When the Coble Dene Dock is formed, there will he, on the north side of the river, dock accommodation to the extent o' nearly two miles, extending from Howdon to Smith's Qury, and giving a total dock area of minety-five acres. The three docks named, will place the Type thiel in this prepared of all the views or parts in the third in this respect of all the rivers or ports in the kingdom

At Maryport a wet dock has also just heen opened At Maryport a wet dock mis also just near oppiet. This is the only one of its kind as yet hetween the Mersey and the Clyde. The new dock has heen formed at the west end of the old harbour of Mary-port. Its length is 600 feet, and width 240 feet; area a little over three acres. The entrance is 50 feet in width, and the depth of water over the sill 21 feet at spring-tides, and about 10 feet at neaps. The stone used in the construction of the walls and enstone used in the construction of the walls and en-trance of the dock is red sandstone-chiefly obtained from quarries in the neighbourhood: the sill is formed of Lazonhy stone, and the hollow quoins of granite from the Nith. The gates are built of green-heart timher—one of the three kinds of timber which are said alone to resist the rayages of the worm, so destructive to works of this kind. The lineal quayage at the dock is 1,630 feet, and the additional quay space is 12,000 superficial yards-of which 2,100 superficial yards are available for the which 2,100 superficial yards are available for the landage and storeage of timher. The plaus for the docks were furnished by Mr. Dees, and they have been carried out under the superintendence of Mr. Stanley, the resident engineer. The constractor for the dock-works is Mr. Nelson, of Carlisle. The gates were constructed on the spot by the trustees, under the direction of the cogineers, and the ma-chinery has heen furnished by various firms. Among the firms who have contracted for different portions of the work, the *Carlisle Journal* mentions the firms who have contracted for different portions of the work, the *Carrisle Journal* mentions Messrs. Tulk and Ley, of the Lowea from Works; Mr. T. Tickle, of Junction Foundry Maryport; Messrs. Cowan and Sheldon, of Woodlank from Works; Mr. Thomas Pearson, of Maryport; and Mr. Brown, of Maryport, the latter of whom eco-structed the coal hurries. The cost has exceeded A0.000'40.0007

OLLER GRATES FOR HEATING GREEN-HOUSES WITH HOT WATER FROM AN OPEN FIRE IN A SITTING-ROOM.

I AM surprised that among the number of grates

A As surprised to a among the number of grates which complete for pulfic patronage, nou has been advertised for the above purpose. When we consider how general the taste for garden-ing has become, and how frequently honses are now supplied with green-houses adjoining sitting-rooms, it is not a little surprising that no general attempt In its not a fittle surprising that no general attempt has been made to make parlour or kitchen fires avail-able for warming conservatories. The boiler may be placed at the hack, or under the fire, or both, it having been proved by the manner in which com-hustion is surtained in Arnott's Smoke-consuming Grate (as well as the Builder's smokeless fire), that norm here at the better of the sector. open hars at the hottom of the grate are not necesary, and that a fire will readily burn although resting on a solid and unventilated hase. Where grates are expressly manufactured to heat hollers for this pur-pose, there would be no difficulty in adjusting the situation of the boiler so as to obtain the requisite amount of heat from a moderate fire. This arrange-Amont of heat from a moderate fre. This arrange-ment would be most convenient for the amatenr gar-dener, hecause the simple act of lighting the fire in his sitting-room throughout the winter will preserve his plants in safety without further trouble. I ven-ture to predict that a large demand would arise for holler grates adapted to this purpose, if they could be surplied at a mederate occt. supplied at a moderate cost

THE USE OF CEMENT.

WITH reference to the decay of soft stones at the Army and Navy Club House, and other huildings, army and way only from respectable firms, and present day, that is, if from respectable firms, and properly used. I should like strongly to impress property decide and half have stronger to impress upon architects and half have no wish to turn out jobs in the summer months, that the heat of the sum is so powerful that it draws all the water from the exment before it has time to set, it is then entirely perished; therefore, when the face is broken, it may be erumbled with the finger and thumh, aud yet the hest cement may bave been used. What I would suggest should he, to have a tarpaulin that

would keep off the heat us well as the rain. There is one job of cemeut-work which I should wish to draw your attention to, that is, Sir W. B. Ffolkes's, of Hillington Hall, in Norfolk, some of which was done more than thir'y years since, and stands like flint: that was done at that time by Mr. Robert Armstrong, master plesterer, with Messrs. Francis and Son's Remon cement, and there

and Armstrong at that time, being a thoroughly practical man, sought the best mechanics in London. I need not point out to you, sir, how there are some very queer plasterers drawn into our trade hy what we call hawk-hoys, as it has already been done in your pages. Many architects do not like outside jobs beguu at this time of the year, but it is the sonndest time to do coment-work in; it is upon the account of the jobs in the fields failing by the acre, but there it is done with queer men, with queer mate-rials, and what is worse, on thoroughly soddened brickwork, which is sure to fail with the slightest

trost. Sir, as I have only mentioned Roman cement in my letter, you may think I prefer that to Portland cement, but I do not when it is good, hut there is some rubbish in the market. I would rather use lime and sand, properly beaten up, than that. J. W.

GLASGOW ARCHÆOLOGICAL SOCIETY

THE first meeting of the second session of this society was held on Monday, the 2nd instant, in the society was held on Monday, the 2nd instant, in the Buth-street Rooms. The chair was occupied by Mr. Michael Connal. Mr. Robt. Hart read a paper, enti-tled "Reminiscences of James Watt," which con-tained a great variety of interesting information regarding the early experiments of Watt, and the scenes of his early labours, hesides other valuable un-published memorabilia of the illustrions inventor, obtained from himself when the author enjoyed his fiendship more than forty wars aco. A nane was friendsbip, more than forty years ago. A paper was read, "On the ancient Tolbooth of Glasgow," hy Mr. Neil, in which that gentleman not only traced the history of the huilding, the steeple of which still history stands. instory of the manuag, the steeple of which shift stands, but also of the more aucient Tollooqh, which occupied the same sit-. He said that the architect of the building erected in 1626 was unknown, and he expressed his option that the corporation had obexpressed his opinion that the configuration had ob-tained the design from the Continent. This, however, was controverted by architects present. The style of architecture was that which prevailed in Scotland in the seventeenth century, which exhibited, no doult, many foreign characteristics, hut was more nearly allied to the English Elizabetban style than to any other other.

PREMIUMS GIVEN AND OFFERED BY THE INSTITUTION OF CIVIL ENGINEERS.

THE Council of the Iostitution of Civil Engineers The Connel of the lostinition of Civil Eigneers have recently awarded the following premiums for papers read during the past session — A Telford Medal to D. K. Chrk, for his paper "On the Im-provement of Railway Locomotive Stock," to R. Hunt, for his paper "On the Application of Electro-Hunt, for his paper "On the Application of Alectro-Magnetism as a Metive Power," to G. Rennie, for his paper "On the Europerment of Rubble-Béton, or Courcete, in Works of Engineering and Arebitec-ture;" and to W. B. Adams, for his paper "On the Varieties of Permaneut Way practically used on Railways;"—a Council Premium of Books, snitably "Ou Suhmariue Electric Telegraphs;" to G. B. Bruce, for his "Description of the Method of Build-ing Bridges upon Brick Cylinders in Iudia;" to A. S. Lukin and C. E. Conder, for their paper "Ou the Disturbances of Suspension-bridges, and the mode of counteracting them; to W. Bell, for his paper "Oo the Laws of the Strength of Wrought and Cast "Drop" *Lett. P. R. Conders for his reaser* "On the For its association of the second of the second of the layer of the layer of the layer of the Bordeaux and Bayonne Railway; " and to T. Duan, for his paper " On Chain-eahle and Timher-testing Maclines."

Premiums are offered for papers, amongst others, the following subjects :--

The history and practical results of timher and iron piling, for foundations, or other purposes, and for wharf and dock walls; with notices of mechanical modes of driving, and of other modes of inserting the piles.

Accounts of the failure of large structures, consist-ing of one or more arches, with the presuncd or ascertained causes. The construction and use of wrought-iron girders

and joists, with arches, iron plates, concrete, or other incombnstihle substances, for huildings.

The construction of suspension-hridges with rigid atforms; their adaptation to railways, and the platforms;

modes of anchoring the stay-chains. On the construction of catch-water reservoirs in mountain districts, for the supply of towns, or for

mountain districts, for the supply of towns, or for manufcturing purposes. Accounts of existing waterworks; showing the methods of supply, the distribution throughout the streets of towns, and the general practical results. The drainage and severage of large towns; excm-plified by accounts of the systems at present pursued, with regard to the level and position of the outfall, the form, dimensions, and material of the severs, the is none in the market at the present time better; prevention of emanations from them, the arrangements happened to be in St. James's park on my way to

for connecting the house-drains with the public sewers, the disposal of the sewage, whether in a liquid form, as irrigation, or in a solid form after dorization.

Mechanical methods of horing and of sicking large shafts, of introducing the tubbing and impervious living, and of traversing running sand, and other difficult strata.

Descriptions of the oven, and of the best proces Descriptions of the oven, and of the best processes used in Great Britain, and on the continent, in the manufacture of Coke for railway and other purposes; with the comparative values of the products. Description of east or wrought iron cranes, scaf-folding, and machinery, employed in large works, in stone quarries, hoists or lifts on quars, in warehouses, encounter where other steam or water is used as

&c. especially where either steam or water is used as a motive power.

a motive power. Iuproved processes and machinery for sawing, working, and carving timber or stone. On the improvements which may he effected in the huildings, machinery, and apparatus for producing sugar from the cane, in the plantations and sugar-works of the British colonies, and the comparison with beet-root, with regard to quantity, quality, and secondary of manufacture. economy of manufacture.

Memoirs and accounts of the works and inventions of any of the following engineers :--Sir Hugh Mid-dleton, Arthur Woolf, Jonathan Horshlower, Richard Trevithick, William Murdoch (of Soho), Alexauder Nimmo, and John Rennie,

STRIKES, &c.

THE strike of cabinet-makers at Liverpool, which had continued for twenty-three weeks, is now at an end, the men having at length agreed to return to work on the masters' terms......It access likely that the dispute as to the Manchester joiners' strike will be referred to arbitration, the correspondence in the local newspapers having pointed strongly in this direc-tion,...a far more sensible way of arranging matters than persisting in a strike which will make a gloomy winter onlycomeine...imiter all, and hencfit none. The where only gloomier, — injure all, and hencift none. The sbipwrights of the port of Bristol, we are sorry to hear, have here impelled to turn out on strike, in conse-quence of the masters having notified their intention to reduce wages from 5s. to 4s. 6d. a day. There is very bit course wages from 35, to 45, out, a day. Intel is very fittle doing, and the choice of the men, it is ferred, lies between the reduced rate and nothing at all.— A meeting of the journeymen joiners in Greenock, in reference to the reduction of their wages, was held on Solurday week, when it was agreed to ask for a con-ference with the masters. At a meeting of the jour-neymen exprediction, and this has been inti-not to submit to the reduction, and this has been intimated to the employers. A number of carpenters have for some time been going about idle, and more, in consequence of this resolution, were to be paid off in a few days.

NOTES UPON IRON.

The iron trade, in South Staffordshire in parlienlar, displays an anount of health which is surprising to many persons. With one exception — and there operations have been resumed — no suspension has taken place, notwithstanding the strong sympathy which subsists between the iron trade and America. Which subsists between the iron trade and Anderdea. It anours well for the soundness of some houses here who can present an unyielding front to a state of things which reduces a weekly receipt represented at about this time by thousands, to a comparative trifle. On Change at Wolverhampton, on Wednesday, it was stated with considerable confidence that one of the lead-ment reduces house it increased hed exceeded and stated with considerable confidence to a top of the lead-ing iron.trading houses in Liverpool had suspended pay-ment on account of the postponement of remittances from America. If this should be so, the effects will he seriously fell by a number of small iron-masters. Happily the home orders keep up,—so much so as to furnish nearly full-time employment to most of the firms. Some arc kept on by orders on account of the East-India Directorate. But others there are who East-initia Directorate. Due to fait a track at a mo-are very poorly off for orders, and are unable to keep the whole of their machinery in gear. In all eases where the stipulation is made by enstromers, prices are taken which display very little adherence to Quarterday resolutions on such matters.

THE ACCIDENT TO "BIG BEN."

THE AUCIDENT TO "BIG BEN." SIB,--The public are informed of the unfortunate death, by fracture, of "Big Ben of Westminster," which event, it is said, took place on or about the time of the third striking of "Ben" by the square-headed hammer at the weekly ringing of Satorday, 24th ult, when it was discovered that his voice was no longer E natural, but altogether uncertain and de-fective. My object is to inform sor that although bo longer E natural, but atogener uncertain and fective. My object is to inform you that, although the parties engaged in ringing "Big Ben" might not have discovered the calamity until as stated, I am confident is occurred on the Saturday previously. I

Westminster-bridge on the latter day, when the enstomary ringing at one o'clock on Saturdays com-meneed. The deep sourorous tone at once convinced me it was "Big Ben" my cars were, for the first menced. The deep sonorons tone at once convinced me it was "Big Ben" my cars were, for the first time, heing delighted with. On ranching the foot of the bridge, where there was hitle to intercept the sound, and the direction of the wind favourable. I heard it to much advantage. At this time it was perfect. As I descended the pier-stairs, to take a down passage in the river bost, a change in the ringing was made from slow to quicker time. I had no sonor got into the boat than it was apparent to me another change had taken place, which I stributed to a multiling of the bell, as I could not comprehend anything so suddeo and unfortunate as that the bell anything so suddeo and unfortunate as that the bell had really become cracked, much as the sound be-tokened it. The ringing then eensed for the day.

WILLIAM DYER.

THE IMPROVEMENT OF TRAFALGAR SQUARE.

SQUARE. I VENTURE to send the following suggestions, as supplemental to the elever remarks of your corre-spondent "Epsiloa," as to the centralisation of Trafalgar-square. Were his views carried out, the necessity at presect existing of finishing off the monn-ment and other parts, in so shamefully incomplete and state, would then be still more apparent. I propose, then, as follows:--Aher finishing the Nelson Column ment and other parts, in so shamefully incomplete and state, would then be still more apparent. I propose, then, as follows:--Aher finishing the Nelson Column granite plinths at the corners, and placing some equally respectable monarch with King George IV. on the vacant periestal at the west end of the square, the following additions as improvements. Upon the terrace balastrade, at equal distances, short tamps should be affixed: at present, except at the extreme and, all is farkness. Lamps should also be continued along the sloping walls bounding the east and west sides: the line of pasts at the south end should also have gas lights, say at every third post. To say nothing of ornament, the light afforded would be a public benefit: now a Chimerion dathcess is spread over the whole area. The stone inclosures of the fountains require a light ornamental ironwork or rails, where a lump at each of the four sides would have a good effect, especially on a summer or entry atuman evening, when the fountials relay the wate mould improve the appearance of things. The fountains thereselves might even be made more astis-factory if, instead of flowing out of ginger-heer-hottic period silver, &c.--that would send the water ont in the form of an embrella. Fish of vorious kinds,-gold, silver, &c.--that would send the water ont in the form of an embrella. Fish of vorious kinds,-gold, silver, &c.--that would send the, water ont in the found on a longer digithtil - in fast, they make the air much collar, and it is time thy I VENTURE to send the following suggestions, as where purposes of an entering of the sensor. The sensor of the sensor of

PEPYS ON THE THAMES AND ON ORGANS. I FIND the following entry in Pepys's Diary :-

1 FIND the following entry in Pepy's Dary :— "1666. Jan. 5.—Reading a discourse about the River Thames, the reason of its being choked with mud in several places, with shelves, which is plain, is by the encroachments made upon the river, and run-ning out of causeways into the river at every wood-warfe, which was not heretofore when Westminster Hall and White H.I.I were built, and Redriffe Church." The necessity for embridge the size in near still

I Hall and White H.all were built, and Redrifte Church." The necessity for embanking the river is now still greater thom it was at the time when the above was written, for other reasons besides those mentioned therein. And besides the embanking, it would be bigbly desirable to straighten the course of the river, especially at the Isle of Dogs. This might be done by converting the West India Docks into a canal, and dividing the "Reach" into docks, which could be made accessible from Middlesox by a higb-level junc-tion from the Blackwall Railway, that being a bigh-level road. The way of the river would has be a mile shorter than now. The dock space would be more than doubled, the river would be more free from mand, and the inpure water would cscape more mapidly. But the mole comes from above London, wand must be deposited somewhere, and if the above bimprovements were made, mush more of it would (as

ome does at present) accumulate upon the sandbanks at the mouth of the river and off the Essex coast. These might then be converted into available land, instead of being, as at present, places for ships to reaground upon."

THE BUILDER.

In the work above quoted are the following notices of organs in London chorches, which, perbaps, will be interesting to some of your receot correspondents.

De interesting to some of your recect correspondents. "1607. Jan. 23.—To St. James's, to see the organ Mrs. Turcer told me of the other night, of my late Lord Aubigney's, and 1 took my Lord Bronneker with me, be being acquainted with my present Lord Almoner, Mr. Howard, brother to the Duke of Nor-folk; so he and I did see the organ, but I do not like it, it being but a hauble, with a virginal joining to it. to it

to it. April 4.—To Hackney, where gool neat's tongne, and things to rat and drink, and very merry, the weather beiog mighty pleasant; and here I was told that at their church they have a fair p pir of organs, which play while people sing, which I am mighty glad of, whishing the fike at our church at London, and would give 50% towards it. 21st (Lord's Day).—To Hackney Church, where very full, and found much difficulty to get pews, I offering the sexton money and he could not help me. So my wife and Mercer ventured into a pew, and 1

offering the sexion money and he could not help me. So my wife and Marcer ventured into a pew, and 1 into another. A knight and his hady very eivil to me when they earne, being Sir G. Viner and his hady, rich io jewells, but most in beauty-almost the finest woman I ever saw. That which I went chiefly to see was the young liadies of the schools, whereof there is a great store, very pretty, and also the *organ*, which is band-ome, and thrues the psalm and plays with the people, which is mightly pretty, and makes me mightly earnest to have a pair at our church (St. Olaf, Hart-street), I having almost a mind to give them a pair, if they would settle a maintenance on them for it." W. SCARGILL.

Miscellanea.

PRISCULATER. A GENERAL INDEX FOR THE "BUTLDER."--May I suggest how valuable a general index to the Builder for the whole time of its existence would be? The Bauzeitung (Vienna) has just given one for its twenty years' course-1836-1855-in one eol, for two forins, or about 4s. The Builder is now a stock book of reference; but we want it to be made readily accessible. The "Archeologia" of the Antiquarian Society gives such an index from time to the met readily accessible. The "Archeologia" of the Antiquarian Society gives such an index from time to the met and no joke to hunt through fourteen or fifteen indexes for any subject, but, if brought under one bead, and well classified, the thing is soon done. All I would ask would be to have the present indexes put well together under the valous heads, in oue volume. As a ease in point, there has receally been some well tugether under the values hends, in one volume. As a case in point, there has recouly been some sparring about the scaffolding made of whole timher, who first introduced it, &c. &c. Now the Builder for 1945, pp. 33, 34, 34, 19, 10, tells all about it, and gives, moreover, the diagram (p. 91) of a elever derick used at Liverpool. Page 41, moreover, gives the cir-cular scaffold used at Westminster. Now had I had a general index to the Builder at hand, I and others would at once have dipped into that storehones of in-formation, and have known the rights of the matter in dispute. Pray consider this suggestion, --Amrcus. Exercise of MANNESTER CITY SURVEOR.

Bignet: Any Constant ans Suggestion. "Interest. Electron of Maxohesizer Citr Surveyon.— The Manchester City Council, at their special meeting last week, elected Mr. James Gascoigne Lynde, of Westminster, to the office of eity surveyor, at the salary of 750. per annum. Mr. C. E. Cawley, of Manchester, and Mr. G. W. Stevenson, of Halifar, SUBWAYS. - Sir, - I have read with much attention,

SUBWAYS. - Sir, - I have read with much attent and concur with your correspondent (A), in general remarks on the distribution of prizes for and ensure with your correspondent (A), in his general remarks on the distribution of prizes for the compactitive drawings for subwys. A more satisfac-tory result would have been given, had a ticket for gach compactive hear thrown into a hat, and all fact is certainly proved, that the head prize of one hundred guineas has been awarded to a youth of 19 Japar Rogers's pamphlet—" Furts and Falaries, of the Swage System "—1 consider it a discredit to all coocerned.—FAIR PLAY. THE DESIGNS FOR SIB-WAYS.—SDE: In your review of the "Sub-way" designs, after describing the scheme of Design NO. 11, which ruceived the inclosed area. The figures should be "from 30!, to 32." In scheming our drsign, my brother and mysolf to be overloaded at dress, and the recet. FREDERIC WARREN. THE DESIGNS FOR SIB-WAYS.—SDE: In your line al yard." The figures should be "from 30!, to be scheme of Design NO. 11, which ruceived the institution informs an that our recent observations on the scheme of Design NO. 11, which ruceived the institution informs an that our recent observations on the scheme of Design NO. 11, which ruceived the institution informs an that our recent observations on the scheme of Design NO. 11, which ruceived the institution informs an that our recent observations on the reposed front will not be without effect, and that considerable difference in a long street. FREDERIC WARREN.

RAILWAY MATTERS.—An address by way of testi-monial has heen presented on illuminated vellam to Mr. Edward Pesse, the Quaker, who originated the Stoekton and Durlington railway, and is regarded by some, though others dony ir, as "the father of railways." Mr. Pease may he said to have been the man who discovered George Stephenson, and presented him to the world.—The "Dubln Freeman" says.—" We had an opportunity of exa-mining a model of a uovly invented railway brake, arranged by Mr. Mathews, of this eity, which, so far as we are able to judge, seems to possess many ad-vantages over the present brake. The principle on which it is formed is the *Skid* principle, and the man-re in which the force requisite to bring it itota action is applied seems peculiarly effective. The restraining RAILWAY MATTERS .- An address by way of testi-Faigment. ——I we of the proops on the Eastend Counties line have been carried away by a flood. The traffic beyond Broxbourue was entirely stopped. In this dilemma the directors applied to the London General Oumibus Company, who at once offered to provide fifty omnibuses and 100 borses to assist them. Several of the company is omnibuses, therefore, were set to work on the traffic between Broxbourne, Ware, and Herftord.——At a recent meeting of the East India Railway company, in London, Mr. Crawford, M.P., who presided, said,—It was satisfactory to the shareholicrs that the iojury to the works was not so serious as had been appreheaded. They had got a list of their loss at Delbi, which included Mr. Thylor, engineer, and Mr. Beon, inspector. There were five of their officers lost at Cawnopre:—Mr. Miller, Mr. Heberden, Mr. La Touch, Mr. Hohson, chir Leomotive superintendent. He referred to the gallant conduct of Mr. Boyle and Mr. Kelly in their able defene at a station or house at Arrah, with the aid of a few Sikha, against a large force of mutimers during seven days. By means of engineering skill and uniting exertions, Mr. Boyle defended the place, which was no better rule and and the Unit assistance arrived. The prospect of the company, he added, was excluent. RAILWAY TRAFFIC.—The traffic returns of the rulways in the United Kingdom, for the week anding Oct. 17, smoanted to 445, 8207, and for the cor-responding week of 1556 to 473, 6207, showing an increase of 14,7007. The gross receipts of the eight aniways having their termini in the metropolis, unonned to 207,6864; and has year to 207,6214.

responding week of 1856 to 473,620, showing an increase of 14,700. The gross receipts of the eight railways having their termini in the metropolis, amounted to 207,6867; and last year to 207,6212, showing an increase of 657. The increase on the Great Western amounted to 2,9047; on the North-Western to 7757; on the Brighton and South Coast to 3187; and on the South-Eastern to 1,0137; total 5,9010. But from this must be deducted 7864. total, 5,010. But from this must be deduced 780%, decrease on the Eastern Counties, 2,6450, on the Great Northern; 1067, on the London and Black-wall; and 1,4087, on the South-Western: tregther, 4,9457, The receipts on the other lines in the United Kingdom amounted to 280,634%, and for the cor-responding period of 1856 to 265,0097, is showing an increase of 14,6337.

Increase of 14,635. TAFP VALE EXTENSION RAILWAY.—The viaduet at Cruplin is not the only structure worthy of notice on this line. The Maesyeenmawr Viaduet at the Runnay Junction, about six miles from Crumlin, is 552 feet 6 inches, long, hreadth at top over the parapet, 28 feet 6 inches; breadth at the foundation of the piers, 40 feet; thickness of piers at bottom, 10 feet; oitto at springway, 5 feet 6 inches; height of bridge above the river, 120 feet; number of openings, 16; span of openings, 40 feet; orches, semi-circular; time building, two years; timber used in scaffolding, 32,000 enbicfeet; architeets, Messrs. Liddel and Gordoo; the total cost is under 20,000?. This viaduet is built of stone obtained in the neighbourhood. The masonry is what is termed rockwork, with a block course at the springing of the arches. There is nothing orma-mental about the work, the main object heing strength. Thre MAYON-ELECT or MANCHESTER, ONCE A TAFF VALE EXTENSION RAILWAY .- The viaduet at

"SCREEN" SHUTTERS.-From a desire to serve the early closing movement, which I believe you bave also at heart equally with myself, I send suggestions for an improved labour-saving, and consequently time-saving, shutter, to replace the common kind of single shutter generally in use. It would, I believe, answer equally as well as the revolving shutter, at a very much less cost of fixing, and would involve but little extra expense beyond those commonly in use, as the single shutters might prohably be used in the manufacture of the might prohably be used in the manufacture of the new kind I propose to be employed. It is suggested then that they be made on the "screen" principle to fold up into a box outside at the end of each wiodow, and of course on a level with the top and bottom of the framework, having a support underneath the box. By the present system of shutters in general use, where the shop front is large, some half-hour, and often mach more (as they get misplaced, and from other causes are found difficult to fix properly) is spent in shuttiog up, and this time is subtracted from the already too little leisure time of the very often overworked assistant. Other contingencies render the quick clos-ing of shops advisable, such as crowds auschled from some special cause, we weather, and cold nights. some special cause, wet weather, and cold nights .-HUMANITARIAN.

some special cause, wet weather, and coid nights.-HUMANTARIAN. SOUTH WALES INSTITUTE OF ENGINEERS.--A general meeting was held at Merthyr, on Thursday in last week, for the purpose of receiving the names of members, agreeing to the rules, electing offlers, &c, of the new association, to be called the "South Wales Institute of Engineers." About fifty gentle-men econected with cugineering were present. Mr. Menelocs, of Dowlais, who presided on the former occasion, again took the chair. After agreeing to varions rules, the members proceeded to the election of officers, when Mr. Williams, of Dowlais, the first proposer and origioator of the institute, was unani-mously elected president for the ensuing year. The rice-presidents cleted were-Mr. E. Rogers, Aber-carn, Mr. Adams, Ebbw Vale, Mr. Martin, Dowlais; Mr. T. Evans, Dowlais; and Mr. Clarke, Aberdare. The council arc,-Mr. Turran, Dowlais, Mr. R. H. Hys, Aherdare; Mr. DeWillams, and Mr. Bediling-ton, Rhymocy; Mr. Edward Williams, Dowlais; Mr. S. B. Rogers Nartur and N. Mediling-ton, Rhymocy; Mr. Edward Williams, Dowlais; Rhys, Aherdare; Mr. D. Williams and Mr. Boulnay, ton, Rhymcey; Mr. Edward Williams, Dowlais; Mr. S. B. Rogors, Nant-y-glo; Mr. Huxham, Pooty-pridd; Mr. Richards, Ehbw Vale; Mr. Pearce, Cyfarthfa; Mr. D. Robeits, Rhymney; Mr. Cox, Newport; Mr. J. James, Blaioa. The memhers then ton, Kny. Mr. S. B. dined together.

THE SHEFFIELD SCHOOL OF ART .- The four-THE SHEPPILD SCHOOL OF ARG.—Int four-teenth annual meeting of this school was held on Thursday in last week, Dr. Branson, the president, in the chair. Mr. Young Mitchell read the annual report and abstract of accounts. The council re-gretted that no disjunction had taken place in the debt on the building since the last annual meeting. The amount of the debt is 1,680%; and not expect The amount of the debt is 1,680.4; and not expect-ing to raise so large an amount at present, they bed borrowed 1,000% at 5 per cent. ou mortgage of the building. It was matter for congratulation that the namber of pupils for the present quarter is 263, being eighty-two more than for the corresponding quarter of last year, when the old school was in nse. The clucational progress continued to be highly satisfiedory as myred by the numerous medds, oh-The educational progress continued to be highly satisfactory, as proved by the numerous medals ob-tained by the pupils at the late examinations. The general account gives the expenditure of the year at 997.; and the income, including a balance of 12. from last year, and a grant of 4062. from Govern-ment, at 959.; leaving a halance squinst the Iosti-tution of 387. The total cost of the hullding, in-eluding the purchase of land, solicitors' charges, &c. is 7.3087. &s.7d. is 7.3087. 4s. 7d.

is 7,305/. 45, 74. ALL SAINTS, BLACKHEATH.—The memorial stone of All Saints' Church, Blackheath, was laid by the Right Hon, the Earl of Dartmouth, on Monday, the 26th of October. The church is designed in the Decorated style, and consists of a nave and aisles, chaucel, and north porch. Provision is mude for the addition of a tower and spire at the sonth-west angle of the building. The church when finished will ac-commodate 600 persons. The materials are Kentish rag and Bath stone. The architect is Mr. Ferrey, and the contractors are Mesers. Holland. The amount of the contract is 3,700?.

SMOKY CHIMNEYS. - In reply to "J. G." complains of the want of a remark for smoky elim-neys, will you allow me to point out the cause of chimneys smoking at both ends, and the means to be adopted to make them smoke out at one ead only, and adoptica to make them smoke out at one can only, and that the top end? The general cause of smoky chim-neys is the too great width or space at the hottom thereof. The remedy is simple: coutract the lower part of the chimney (equal to the narrowsch part above) down to the fire-place, and you will thereby increase the velocity of the smoke, which will ruch to the ten event Increase the velocity of the smoke, which will rule to the top, not having a cooling chamber to impede its progress. The draw-plate (an unseemly appendage) acts on the same principle : it contracts the month of the chimney, and thereby increases the draft. WM. PICKERING.

THE BUILDER.

NEW APPLICATIONS OF PHOTOGRAPHT. — At a recent meeting of the Liverpool Photographic Society, a paper was read hy Mr. Forrest, in reference to the effect npon the photograph of burning in the impres-sion, with a coating of glass over it. He found that a negative applied to a piece of opal glass which had been very finely ground, collodionized, and sensitisad, produced a very beautiful impression by the transfer-ring agency of light, and, after being fixed, washed, and dried in the usual manner, a film was found abering to the glass, and could not be removed by rubhing. Views of this character would be displayed to advantage in hall lamps, or stoircase windows NEW APPLICATIONS OF PHOTOGRAPHY. -- At a rubhing. Views of this character would be displayed to advantage in hall lamps, or staircase windows might be thus fitted up with beantiful landscepe scenery. So early as 1820, a beautiful transparent yellow had heen produced by laying salts of silver upon glass. He described a process whereby he had obtained the yellow silver tint in opal glass, and exhibited several specimens, the results of his various ernerinets. experimeots.

MENORIAL CHURCHES AT CAWNFORE AND DELHI. —An officer of engineers, who is a near relative of seven of the Cawnpore victims, says;—"There is some talk of raising a monument over that well. They doo't understand the natives, or they would do nothing of the sort. What does a Hindoo care for a marble pyramid or obelisk? Now what they should do is this:—Build above that well a Chris-tian temple, as small as you please, but splendid, so that future generations of Mahomedans and Hindoos; 'Look here I. On this spot your fathers wrought the blackest of their deeds to get rid of Christianity from India. See what came of it! Christian titles are now cele-hardted and Christian worship presented on the very site of that well, and above the asles of 200 mar-tyrs." The Society for the Propagation of the MEMORIAL CHURCHES AT CAWNPORE AND DELHI. tyrs." The Society for the Propagation of the Gospel have adopted the idea of memorial churches at Cawnpore and Delbi, and announce that they are ready Cawnopre and Delb, and announce that they are ready to receive subscriptions. First of all, however, it is to he hoped that the justice of the case at Cawopere will be met by the punishment, upon the spot, of the diabulical wretches who committed such acts as were there perpetrated. The Hindoos would also appreciate this are are inductively and the spot of the second sec

this as a retributive act. GAS.—At the first general meeting of the Barslem and Tunstall Gas Company, the report of the directors stated that the extensive alterations now in progress at the Longport works were proceeding satisfactorily, and would abortly enable the company to supply the whole of the district included within the limits of the Act.— The Eccleshall Gas Company's directors report that from increased revenue, combined with diminished expense of working during the past year, it has been resolved to pay the shareholders a dividend of Wilton.—At Fochvors, some gentlemen con-nected with the place subscribed to provide gas-1 mps in the principal thoroughfares, and the directors of the gas company, besides contributing, offered to supply the requisite gas free of expense. Still the subscrip-tions raised were inadequate, and, ou this being made known to the Dake of Richmond, his Grace agreed to make up the necessary funds. The work w indic up the location for My Mesers. John Blaikie and sons, of Aherdeen, and last week the main street was lighted up for the first time. THE REFEREES' DRAINAGE SCHEME FOR LONDON.

The Metropolitan Board of Works have declined to adopt the scheme proposed by the engineers by the First Commissioner of her Majesty's Works, and have forwarded to his office a communication containing a statement of reasons, and asking for an interview. An appointment was made for Thursday last

WANTED! A COVERING FOR LEAD .- Can any of your subscribers inform me, from actual experience, the hest material wherewith to line a leaden eistern, in which water is stored for domestic and culinary purposes, so as to prevent the water being contamipublication a remedy is suggested in No. 665, by Mr. Wentworth L. Scott; but can any one recommend Mr. Wontworth L. Scott ; but can any one recommend if or efficiency, durability, and non-loginrious action on the lead, after thoroughly testing it? The deleterious effects of water stored in leaden eisterns are universally acknowledged, and yet how seldom are efficient means taken to prevent the water coming in contact with the head. The constants are do to some origin to remark lead! To conateract, and to some extent to remedy, the evils arising to water in leaden cisterns, is what is generally restrict to a but the most sensible way to me appears to be to prevent the water having any communication with the lead ; and the question then arises, what is the material best fitted for the object ? SUBSCRIBER,

*** Lead may be avoided altogether by the use of slate.

[Nov. 7, 1857.

DESTRUCTION BY FIRE OF HAWARDEN CHURCH -The village of Hawarden, Flintshire, was on Thurs-day, in last week, illuminated with flames, which had encircled the church of St. Deoiol, --- otherwise Hawar-den church. This church was built about 1275, and was the property of Sir Stephen Glynne. Considerable improvement had been effected in it of late years, the church having heen completely restored. The fire was first discovered in the nave and chancel. By the time the engines had arrived from Chester, seven miles distant, the roofs of the nave and side aisles had fallen, carrying with them the galleries, and burying in one undistinguishable mass several marble monuin one undistiguisable mass several motion houter ments, carved stalls, fond, loctern, pulpit, reading-desk, and screen. The efforts of the fire brigade vere then obliefly directed to save the chancel, which was at first burning furiously. They were so far anc-cessful as to preserve four painted windows; but the organ, which was worth 2500, was totally destroyed. partly by fire and partly by the efforts of the villagers to save it. The tower remains entire, but it is feared to save it. The tower remains entire, but it is leafed that the arches on which it rests are so far injured as to make the whole unsafe. It was discovered that, heyond all doubt, the church had been purposely set on fire. The damage done is estimated at 4,000. No clue to the perpetrator of the erime has yet been found.

SUSSEX ARCHÆOLOGICAL SOCIETY .- The autumi quarterly meeting of this society was held at Cuckfield on the 16th ult. Mr. J. G. Dodson, M.P. in the on the 16th alt. Mr. J. G. Dodson, M.P. in the chair during the early part of the time, and afterwards Mr. R. W. Blencowe. Several new members were elected, and various objects of interest exhibited. The Rev. Mr. Dale then read a paper on traces of Saxon and Norman architecture in Bolaey Church, which is reported in the Brighton Gazette of the 22nd ult. After some little discussion and other procedure, the company went to inspect the church, Ockendon House, and Cuckfield-place, and alterwards partook of a cold collation at the Telbot Hotel.

of a cold collation at the Talbot Hotel. COLLINSTOWS SCHOOL-HOUSZ.—After the con-firmation at Castlepollard, on Friday last, the 23rd instant, the Bishop of Meath returned to Collinstown to preside at a meeting in aid of the societies of the Meath Diocesan Church Missions, and of that for promoting Christianity among the Jews. The new school house, erected at the sole expense of Mr. J. Billing. school-house, erected at the sole expense of W. Meade Smythe, csq. after the designs of Mr. J. Billing, architect, bing sufficiently advanced to admit of using the principal school-room for the occasion, advantage was taken of the presence of the Bishop of Meath and of his uncle, Mr. Meade Smythe, the munificent huilder of the school-house, to inaugurate determined the school-house, to inaugurate the building.

WELLINGTON-STREET, STRAND .- Sir : There is a "WEALINGTON-STREET, STRAND.--Sir: Three is a frightful chasm in front of the new west wing of Soncrest House. I think it runs close to the pave-ment for an extent of about 150 fect. This well is about 50 fect deep; and any boy of teu years of age might surmont the low halustrade, 4 fect high, and ride, and if he fell into it, would be dashed to pieces against the stones at the bottom. I will say no more, lest some wantons should try it; and if they were, web would be to blane? Fruy coursel a remedy. An iron railing, 5 feet high, would doit.--B. D. unce Burgers - Von are much interested in the

PAYING BRIDGES -You are much interested in the bridges crossing the Thames. I passed over South wark-bridge, paying 1d. toll. During my passage there were in all five foot-passengers and two corriages, and yet the proprietors persist in charging the public Id, toll: time, quarter-past eleven a.m. 2nd November, 1857. On the same day, an hour later, I passed over Waterloo-hridge (toll, a bd.), there were seventy-nine foot-passengers and nineteen carriages during my passage—so much for a ad. toll. These proprietors seem better to know their own interest and the claims

of the public.-JOHNNY. THAMES TUNNEL.-14,260 passengers passed through the Tunnel during the week ending 24th Octoher, and paid 597. 9s. BOILER EXPLOSIONS.—The fearful loss of life

BOILER EXTLOSIONS.—The fearful loss of life arising from the explosion of hollors has led me to reflect how such casualities may be leasened and alle-viated. I am only an actively thinking man, uncon-nected with any mechanical employment, yet my suggestions will, I hope, be none the less acceptable, if useful. It has occurred to me that, in pluce of one boiler, if two were employed, oce only to be worked at a time, a constant supervision might be made, and their eleansing and defects being attended to and more readily kaown, there would he less liability to explosions. Another suggestion I submit, deferm-inally and under fear of miscalculation, is, that if a massive wrought-iron railing, or framework, encircled these, not privage closely adhering to the sides, hut a little agart from them, the force of an explosion might be considerably decreased. It is a had state of things to look forward to such explosions being likely to happen at all, but it is to be feared that at present, to happen at all, but it is to be feared that at and perhaps for some time to come, such occurrences must he expected to take place.-GABRIEL.

WHY KEEP RABBITS ?-Perhaps the Builder will Wur KEFF RABBITS --Perhaps the Builder will sak this question of my follow-workmen. Now that the cholera threatens us, it may he worth a thought whether these innocent pet animals do not add much to the danger of the erowded neighhourhoods in whose-courts they are hoxed up. On each side of the bouse in which I live, in a new part of St. Paneras, there are rabhits kept, and the odours arising therefrom are mything hut healthful. I none part of the street, this last week, a respectable family was attacked with a virulent fever: first the shild died, then the father, and now the mother lies in a then the father, and now the mother lies in a dangerous state. A stable, not far from the back of dangerous state. A stable, not far from the back of the house, may perhaps have been the cause; but it is evident that even in clean streets the inhabitants must be watchful that nothing be allowed to accumu-late in the hack-varies. Another evil is that the dast-bins are allowed to be over-filled hefore the dustman is called. The parish of St. Giles has given a hint to its parishioners (and other parishes should follow the example) not to be deterred by the bonus expected by this functionary, whose duty it is to collect the dust, &c. daily without payment.—One of THE MILLON. THE MILLION.

Concert the dust, & e. andy without payment. — USE OF THE MILLON. BRITISIN LEAD.—The produce of lead in Great Britain amounts to fully two-thirds of the produce of Europe. Spain staods second, producing about one-third as much: united, the production of these two states is equal to seven-eights of the European pro-duce. The lead deposits of the United States etcand upwards of 3,000 square miles in the States of Missouri, Illinois, Wisconsin, Oregon, North Carolina, and California. A few years since, the Western Sintes of North America produced large quantities of lead : as much as 40,000,000 of pounds have been produced in 1851; but the deposits opened ont, it is said, have not continued equally productive in depth, and their present comparative poverty is demonstrated by the large importations of British lead into these States.— Useful Metals and their Alloys. INSTITUTION OF CIVIL EXCIPTERS IN SCOTEAND The first meeting of the session of this newly-formed

INSTRUMENT OF CIVIL EXCINENCES IN SCOTEAND The first meeting of the session of this newly-formed association was held in the Philosophical Society's Hall, George-street, Edinburgh, on Wednesday in week hefore last. Professor Rankine, the president of the institution, occupied the chair. The secretary read the minutes of a meeting held in June, and an-nounced the names of eight influential gentlemen proposed as members, to be ballotted for at the next meeting. The president then delivered an inaugural address.

PROPOSE as Internet, for the modeline of the method in the method in meeting. The president then delivered an inaugural address.
 ENGLISH ENGINEERS IN DENMARK,—We learn from a Flenshurg journal that, on the 12th of October, the King of Denmark conferred the Order of the Danehrog upon Mr. Paton, eivil engineer, for his pamphlet on the Jutland Railway, and other services.
 This is the second time during the present reign that this order, the highest hut one in Denmark, has been invested with it on the occasion of the opcoing, by the King of Denmark, of the Royal Danish Railway.
 BOARD OF ENAMINERS FOR DISTRICT SURVEYORSHIPS.—At a meeting of the Board of Examiners, held on the 27th ult.—present, Mr. C. Fowler (in the chair), Mr. Geo. Pownall, Mr. Imman, Mr. Whicherord, Mr. Godwin, Mr. Scoles, Mr. Pennethorne, and Mr. C. C. Nelson, honorary secretary—several candidates presended themselves, and ne orificate of competency was given to Mr. T. E. Knightley.
 THE QUEEN'S PARK ESTATE, CHESTER.—This estate, which comprises about 102 statute acres of land, and a unmher of villa residences, producing a rental of from 600/, to 700/, per annum, was disposed of hy public auction at the Royal Hotel, Chester, on Monday; it was knocked down to Mr. Warner, of Manchester, for 19,000/.
 IMPROVEMENTS IN THE SUFFOR-STREET GALFERTES.—This estate, Mich engaged on these works is Mr. Francis H. Fowler, not Mr. C. Fowler, as was statel.
 ROMAR BEMAINS AT FILEY.—Some tooled stones,

stated.

Stated. ROMAN REMAINS AT FILEY.—Some tooled stones, set in mortar on puddled clay, and showing the action of fire, with Roman coins and pottery, bones of do-mestic and other animals, &c. have heen found at a barrow ou the Cairu head, near Filey, and are de-scribed more particularly by the *Iork Herald*. Theremeters are not been found to be the found of the f

TENDERS FOR THE NEW BRIDE AT SUNDERLAND. —This matter was decided by the Sunderland Corpo-ration accepting the tender of Mr. Benjamin C. Lawton, of Newcasile, for 34,697/. The following tenders were sent in :--

Butler	£36,613
Kinuaird, London	36,037
Richard Cail, Newcastle	35,245
B. C. Lawton, Newcastle	34,697
7 A	03,100

Neil 31,485 Messrs, Forster and Lawton, of Birtley, sent a tender (but not in time) for 34,3907; and it is observable that, with a single exception, there is a close approxi-mation in the tenders to Mr. Stephenson's estimate of the cost of the birdee 32 1567 the cost of the bridge, 35,156%.

THE BUILDER.

TYPES .- Mr. Editor: It would add much to the TYPES.—Mr. Editor: It would add mucb to the value of the descriptions of the illustrations in the *Builder*, if the writers would notice, in many cases that occur, the type upon which the plao, elevation, or details of the building given may be founded. In the case of the Church of Notre Dame de Dadizcele, of which you gave the plan and a view in your last, numher, the plan is evidently founded upon that of the exquisite Church of Lieber Frauen Kirke at Treves, which is attached to the eathedral. The ends of the transmission drave are source in the Dedixede Church Which is attached to the eathedral. The ends of the transepts and nave are square in the Dadizeele Church, instead of polygonal, and the nave is longer by one bay; but in other respects the recent church closely follows its prototype in plan, as you may see by the sketch enclosed, and which I made at Treves a few weeks ago.—Thos, L. DONALDSON.

KENNINGTON. - Tenders have been received for ABANACETON. — Inders have been received for building new mistress's house, new infant school, and elass-room in Bolton-street, Kennington; Mr. Y. H. Fowler, architect. The quantifies taken out by Mr. Smither. The tenders ranged from—Cooke, S141. to Notley, 5741.

THE GENERAL POST OFFICE, ST. MARTIN'S-LE-GRAND.--Very considerable alterations have heen made here to give additional room, but architecturally they cannot he considered improvements. The hall has been filled up with offices, and spoilt altogether.

The ben filed up with offices, and epoilt altogether. Is been filed up with offices, and epoilt altogether. ISDUSTRIAL ENFLOYMENT OF PRISONERS.—It is indicative of the dawn of common sense in the man-mement of our goals, as places of ciminal punish-ment, remarks the *Brighton Gasette*; in reference to a recent county magistrate's decision, when we find the Surrey magistrate's decision of the reso-fution of making the Wandsworth Prison a self-supporting institution, by turning the labour of the contrary; and we should like to see the same prin-ciple generally acted upon, not only in goals, that also in workhouses, with this difference in favour of the latter,—that all the money earned beyond the cost of his maintennee should be put to the account of the badge of panperism, and restart in the world as a man of independence. Were such a system acted upon, we should be freed from an immesse amount of taxation, and feel ourselves in a better position to hear my burdens which such a crisis as the Russian war, or the revolt in India, migbt impose upon us. war, or the revolt in India, might impose upon us.

THE BUILDER.

Builder. The

VOL. XV .--- No. 771.

HE successful accomplishment of the Atlantie telegraph would be an event, in the matter-of-fact history of the world, standing ont beyond all others as a consummation of progress, just snell as, in the world's *prophetic* history, is the "drying np" of the "mystical river Enphrates," whatever that may he, and the making of "a way" to the west thereby for "the Kings of the East," whoever these may he. There

would even he as much feasibility in the attempt to interpret the one of these series of events as a prediction of the other, as there is in not a few other similar attempts.

The coming year, it is to be hoped, will see the great telegraphic event successfully accomplished.

The first indication or suggestion of the possibility of throwing a telegraphic cahle across the Atlantic ocean, and of so uniting the two opposite hemispheres of the globe, is said to have been made by Professor Morse, of America, in Angust, 1843, in a letter to the Sceretary of the United States Treasnry. There was a vast deal to do, however, even in the advancement of the principles of electric telegraphy, as subsequent progress has proved, ere such an event was really possible; and Professor Faraday appears to have been not far wrong in predicting that on these principles, as then ascertained, it was very donhtful whether an Atlantic telegraph were really possible.

Towards the close of last year only, had the electrical element of wide-ocean telegraphy assumed its present phase. Science had then shown*

That gntta-pereha covered submarine wires do not transmit as simple insulated conductors, but that they have to be charged as Leyden jars, before they can transmit at all.

That, consequently, such wires transmit with a velocity that is in no way accordant to the movement of the electrical enrrent in an nnemharrassed way along simple conductors.

That magneto-electric enrrents travel more quickly along such wires, than simple voltaie currents.

That magneto-electric enrrents travel more quickly when in high energy than when in low, although voltaic currents of large intensity do not travel more quickly than voltaic currents of small intensity.

That the velocity of the transmission of signals along insulated submerged wires can he enormonsly increased, from the rate indeed of of one in two seconds, to the rate of eight in a single second, by making each alternate signal with a current of different quality, positive following negative, and negative following positive.

That the diminition of the velocity of the transmission of a magneto-electric current in induction-embarrassed coated wires, is not in the inverse ratio of the squares of the distance traversed, but much more nearly in the ratio of simple arithmetical progression.

That several distinct waves of electricity may be travelling along different parts of a long

* Tide, "The Electric Telegraph: a History of Pre-liminary Experimental Proceedings, and the descriptive Account of the present State and Prospects of the Under-taking," published in July, 1857, by order of the Directors of the Company. London: Jarrold and Sons, 47, St. Faul's Churchyard.

wire simultaneously, and within certain limits, line, from its moderate depths as well as from without interference

That large coated wires used beneath the water or the earth are worse conductors, so far as velocity of transmission is concerned, than small ones, and therefore are not so well suited as small ones for the phrposes of submarine transmission of telegraphic signals; and, That by the nse of comparatively small coated

wires, and of electro-magnetic induction coils for the exciting agents, telegraphic signals can be transmitted through 2,000 miles with a speed amply sufficient for all commercial and economical purposes.

Upon this electrical hasis the question of occanic telegraphy was standing when the present year dawned.

In the working of the great telegraph, the chain of connections, so far as it has been linked together up to the present time, stands thus :---

A powerful voltaic entrent goes through a generating coil near at hand. The generating coil makes a temporary magnet. The magnet produces a transmission enrrent in a secondary coil. The enrrent crosses the Atlantie in the eahle, and makes a temporary magnet on the farther side of the ocean. The temporary magnet works a permanent magnet hnng on a pivot, so that it can traverse. The next liuk in the chain is this: there is a local short-eirenit voltaic battery standing ready near the recording instrument, and this hattery has its electrical flood-gates opened when the permanent magnet traverses one way, and shnt when it traverses the other. When the flood-gates are opened, the current from the local battery flows ont, and prints the message it is desired to record. The perpetual maintenance hatteries, double induction coils, and springless sensitive receiving instrnments, designed for the work of the ocean telegraph, are most of them inventions for which patent rights are held by the company. The actual recording work of the telegraph will be performed hy the ordinary instrument of Professor Morse, carefully adjusted in the workshop of the company.

In this recording instrument, a ribbon of paper is nnrolled from a hollow cylinder or dram by a train of elock-work, and, as it is unrolled, a sharp style, magnetically directed, indents a series of dots or lines upon the paper. When the style is thrust down only for an instant as the paper is dragged along heneath, a dot is impressed. When it is kept down for a little more than an instant, a lengthened line or dash is left on the onward moving paper as a

track. The style is thus magnetically controlled. The "telegraphic platean" is a very singular engineering feature in the Atlantic telegraphic project. It is a comparatively narrow hand which has literally and actually heen laid down, as it were on purpose, mainly by that great and eclehrated engineer, the Gulf Stream, which has heen, for thousands of years at least, at work in carrying northwards the debris of microscopie tropical shells, and dropping them into the yawuing depths of the Atlantie Ocean at a certain parallel of latitnde, and so constituting the telegraphic platcan which looks exactly like a a signal is transmitted to the other end of the no doubt had considerable assistance afforded it by the southward cold currents hearing mndloaded ieehergs : these would melt and drop their loads regularly in the same intermediate The contrast between the platean and have been quoting, is a very striking and extraordinary one. This platean has been found, by they may do with almost as much facility as it innumerable soundings, to be the only available has been sent. or practicable route for an Atlantic telegraph The inventor of this new development of

its gradual descent and ascent, and its comparatively level conrsc.

Excellently well adapted, as the heantiful and elaborate arrangements appear to he, for the facilitation, to the utmost possible extent, of the winged words of the modern Mercury what will the general reader think when we tell him that the swiftest possible result of such partitions is absolutely a slow process in com-parison with a new one, of which modern science has just caught a glimpse? ... This new process, however, is not one that is likely by any means to supersede recent arrangements, at least to any extent: it would rather appear to be a timely aid, addition, and consummation merely of those ingenions processes which have made the telegraph what it now is. We have already noted the advent of this climax to electro-telegraphic progress. Steam --- all powerful and Protean steam----is the agent now abont to mount the telegraph and "grease the lightning." Whether the special form in which it is proposed to apply the power of steam to the generation of the requisite cleetricity and to the transmission and recording of messages,—set up hefore hand, and stamped off, wholesale, by the record-ing telegraph,—be in all respects the matured and practicable one which it is considered to be, we cannot even yet assnre our readers ; hut we can, at least, now give them a few more details as to the modus operandi.

The invention, then, which is to supersede the present tedious (!) processes, and work the telegraph by steam instead of hy hand, is in general as follows :-

A series of gutta percha hands, abont six inches wide and a quarter of an inch thick, are coiled on wheels or drums arranged for the purpose. These hands are studded down both purpose. sides with a single row of holes at short intervals apart. When a message is to he sent, the clerks wind off these bands, inserting in the holes small hrass pins, which, according to their comhinations in twos or threes (with blank holes between), represent certain words or letters. In this manner the message is, as it were, ' set ' in the hands with great rapidity, and if the up number of hands employed he sufficiently large-say as numerous as the compositors employed length to five or six columns of a newspaper, for example, could he set up and ready for mission in the course of a single hour ! Of course this operation in no respect interferes with the telegraph wire itself, which continues free for nsc nntil the bands of messages are actually heing despatched. The gutta-percha bands when full are removed to the instrumentroom, a simple appliance preventing any derange-ment or falling out of the pins while being moved about. In the instrument room, the bands are connected with ordinary steam machinery, hy which they are drawn in regular order with the ntmost rapidity hetween the charged poles of an electrical machine, in such a manner that, during the moment of each pin's passing, it forms electrical communication between the instrument and the telegraph, and raised railway-path of Titanie dimensions run- wire, where the spark perforates a paper and ning across a country of tremendons ravines and records the message. The only limit to the rocky heights. The Gulf Stream, however, has rapidity of this operation is the rate at which the bands can he drawn, since the electrical contact of each pin, even for the 200th part of a second, is more than sufficient to transmit a word or signal from London and register it in America. As the message is recorded, say in America, with the awful yawning depths of the Atlantic Occan | the same rapidity as that with which it is transsouth and north of its parallel, as shown in mitted from London, a number of reading elerks, charts appended to the work from which we of conrse, will he requisite in order to translate it, by dividing it into small portions, and this

electric telegraphy, as we have before noted, is Mr. Isham Baggs.

Whether the precise mode in which the company who are carrying out Mr. Baggs's invention uean to apply the power of steam to the telegraph, be the hest possible, or the most practicable or advantageous mode or not really signifies little : the idea, as we have said, is an excellent one, and there canuot be a doubt hut that it will very shortly be realized in some shape or other, whereby all its obvious advantages will be fully attained, and telegraphic messages be immensely cheepaned and vasly multiplied, to the substantial benefit of the public no less than of the telegraphic companies; and, it is to be hoped, of the inventor himself and the company by whose enterprise the new development is being worked out into practice.

And now, reverting to the Atlantic telegraph, the application of steam power to which would be an immense advantage, let us say a few words on the present state and prospects of this grand and trnly cosmical scheme.

When the cable broke in the Atlantic Ocean, after 400 miles of it had been payed out, the American steam-ship *Niagara*, and its British consort, the Agamemnon, deposited the bulk of the cable at the Keyham yard, belonging to Government, at Devoloport, auditater it will remain till next year, experiments meantime being made with it hy Mr. Whitehouse, the cleetrcian, which may assist in solving several enrious electrical problems. Even the 400 miles of it lying in the Atlantic are heing well watched night and day, and may shed some interesting light ou the subject of terrestrial electro-magnetic eurrents, and other cosmical electric and magnetic phenomena.

Next year's endervour to lay the line will be made with 800 additional miles of cable, or 3,000 miles in all to meet emergencies, and the expedition, including the Niagara, which, meantime, is being altered interiorly at New York, will sail at an earlier period of the year than hefore—most likely at the end of June or heginning of July, so that in case of any hitch occurring there may he ample time to repair it, and still leave Angust open for another effort. The cahle will, of course, be the same in kind in fact, it will be essentially the same cable as before. The two portions of this cable, placed in the two warships, it may be remembered, were, unfortunately, it was said, covered with wire spun in contrary spirals, so that the one portion would tend to univisit the other. Were eme portion to *toisis* at all with the other, this yould certainly be the result; hut no mere straight pull in the line of the cable, such as it is aloue very likely to he exposed to, can well act so as to *variesis* either portion. The danger of kinking or fouling is itself a sufficient reason for the careful avoidance of any twisting action in paying ont. It is now proposed to join the two portions in mid-occan as was at first contemplated, the *Niagares* then proceeding eastward, and the *-guamenon* westward. The deep sea fishermen, it seems, recommended a different course from either this or the previous one, namely, from west to cast entirely, that is from Newfoundland to Ireland, in order to take adinstead of the contrary course westwards; and although that stream does not dip lower than seventy fathems while the cable is to be liad farbelow that depth, it must be remembered that in laying it, hotb the ships and the cable will have the stream to cope with in the first place.

The paying-out apparatus is to be improved, so as to guard against the strain on the cable, cansed either hy the sudden pitching of the ship, or hy the action of the brake-apparatus. Considering the anticipated freedom from pitching in the *Great Eastern*, or *Leviathan*, would not such a ship be autimaluable, though, donbtless, a costly adjunct in the laying of the Atlantic telegraph cable? There would be a peculiar fitness in the association of two such grand results of nineteenth-century progress.

peculiar fitness in the association of two such grand results of nineteenth-century progress. We hear nothing of any means being intended to be applied for the salvation or recovery of the cable, should it after all he again hroken in the deep ocean. Surely there can be no gract or insurmountable difficulty here. We should like to know what fatal objection could he made to either of the two suggestions we ourselves, for example, some time since made ; namely—at intervals of a certain number of miles of the cable, as it ruu out, to affix a rope, attached to a buoy, so arranged as to float on the surface when the cable has reached the bottom, the rope being capable of lifting the end of the cable should it he broken. Oue or two only of these huoys and ropes might he requisite, if, as we also suggested, the cable were overrun by a ring attached to the rope; and in this case, indeed, those in the steamer or two required, under such circumstances, to follow in the wake of the ship containing the cable, would not need to lay down any huoy at all.

any hoy at all. Many plans and suggestions for the safe deposit of the cable have been made since the attempt to lay it was temporarily frustrated by the untoward accident ou hoard the Niagara, but on this subject we cannot here enter. We may, however, simply refer to a little tract "On Laying Telegraphic Cahles in the Deep Sea," by a natical and practical man, who appears to know what he is treating of,—namely, Master James Bodie, R.N.* who was appointed to the Agamemnon when that ship was first prepared for the reception of the Atlantic cable, and had an opportunity of minutely noting all the arrangements and appliances for its safe deposition then made on board the ship. Master Bodie considers that light as the cable was comparatively to others, still it was unnecessarily heavy, and hence the velocity and the perpendicularity with which it rushed out; and that were the core covered with hemp rope in place of wire rope, except on the coasts, where anchors might get foul of it, it would he sufficiently strong, and what rate specific gravities descend in the ocean, deduced by himself, experimentally, from deep sea soundings, and which cannot but be a most useful aid in the settlement of the question of the safe deposit of the Atlantic telegraph

Very considerable progress is being made in Very consideranc progress is being index in filing up the telegraphic gaps, as we may call them, between this country and its Indian empire. The greatest gap is still the stretch between Bombay, or at least Kurrachec, and Suez, at the head of the Red Sea. No telegraph has as yet been laid dears, aither in the Red or the Arabian Sea and the Red Sea. No telegraph has as yet been laid down, either in the Red or the Arahian Sea, aud this is mainly, though not entirely, what prevents our Indian telegraphic news from reach ng us in less than from three weeks to a month. Steamers have still to cross the Arabian Sea and the Red Sea; and, although there are other gaps to heat least and, annough there are only of minor import-auce as causes of delay. The shortest route, however, would be hy the Euphrates and the Persian Guil. Malta is about to become a distin-guished point in Iudian telegraphic communication through Sardinia; and the Austran Govern-ment have agreed to the laying of a submarine line from Ragusa, on the Adriatic, forking out of the Corfu an | Malta cable to Candia, and thence to Alexandria, with a view to the extension of the line to India via Alexandria, and the Red Sca or the Persian Gulf, to Kurrachee and Bomhay, which would be brought within fifteen days of Loudon hy this Austrian adjunct alone; and, were either the Red Sea line or the Euphrates line laid down, of course the telegraph com-munication hetween London and India would be instantancous

As the question is often put to ns, how is the telegram conveyed from Iudia to England, why is it that it does not come to us instantaneously, and how is it that we are dependant on foreign telegraphs for its conveyance; let us repeat, or rather re-state in another form, that at present the Indian uews, after steaming up the Red Sea from India, and crossing the isthmus of Suez, is arrival from Suez (no telegraph report being as yet sent across the isthmus, although we helieve there is a partial line running from Cairo). The summary of the news so made up at Alexandria is forwarded to Malta, and thence (till the cable already made be hald down between Cagliari.

* Harris, printer to her Majesty, Fore-street, Devon-

Nov. 14, 1857.

Handed in to the telegraph-office there, it is forwarded to Spezzia and thence to Turin. Thence there are two telegraphic routes, one vid Switzerland, the Rhine provinces, Belgium, and through the submarine cable from Ostend to London; the other vid France to Paris, and thence (through the submarine cable) from Calais to London. A third route may also be employed, viz. from the Rhine Provinces to Austerdam, and thence, vid the Electric and International Telegraph Company's submarine wires, from Holland to Londou.

thence (through the submarine cable) from Calais to London. A third route may also be comployed, viz. from the Rhine Provinces to Ansterdam, and thence, viá the Electric and International Telegraph Company's submarine wires, from Holland to Londou. A line has been proposed to connect Alexandria, Malta, and Gibraltar, with England direct, but in the present state of the money market any further great extension of long submarine lines is not at all probable. At present, therefore, as will be seen, in telegraphic communication England is quite dependent on continental powers.

As regards internal communication in India itself, we may add, there are already 5,000 miles of telegraph in the interior, and measures will be taken to insure uniformity of design and management throughout the whole range of line from Calcutta, Madras, and Bombay to Great Britain. In furtherance of this, a coast line between Calcutta and Madras is in vigorous prosecution.

FIR, DEAL, AND HOUSE PAINTING.

AN ATTEMPT TO DETERMINE THE PERIODS IN ENG-LAND WHEN THESE WERE FIRST INTRODUCED, WITH REMARKS ON THE PROCESSES OF THE LATTER.*

It has been generally supposed that the timber seen in old buildings is almost without exception oak; but it will be found on investigation, that many other kinds of wood were used, a knowledge of which, tested as they have thus been in trying positions, would be highly serviceable to the architect and to the huilder. From records quoted in Mr. Turner's "Domestic Architecture of Eugland," † it appears that in 1253, temp. Henry III. the builties of Southsampton were commanded to buy 200 Norway boards of fir to be used at Winchester for wainscoti, that in 1255, 1,000 Norway boards were purchased for wainscoting certain rooms in Windsor Castle, and that a hones of deal was to be made, running on six wheels and roofed with lead. The word used, "sapo or sappo," has been translated "deal," this latter is stated to be derived from the Dutch, deelen, or Gernan, dielen, "fitwood," which would gerhaps be the better translation of the word "sapo."} Turuer gives his opinion that "Norway planks were largely imported into this country from an early used was fit, possibly because it was cheaper and more casily worked than oak," and that "Norway planks were sliggli jub the has in his favour the fact that treaties " for the benefit of trade." were made by Heary III. with one or two of the kings of Norway; the use of the timber, however, would appear (from hese records) to have been onfined to the royal works. Deal hoards bought for doors and windows, are mentioned between 1272 and 1307. One of the halls appropriated for the royal seat at the eoronation of Edward IV. (14307), was ordered to be covered with boards " de espo." The wardrobic accounts of Edward IV. (14307), was ordered to be covered with boards " de espo." The wardrobic accounts of Edward IV. (14307), was ordered to be covered with boards " de espo." The wardrobic accounts of Edward IV. (14307), was ordered to be covered with boards " de espo." The wardrobic accounts of Edward IV. (14307), was ordered to be covered with boards " de espo." The wardrobic accounts of

The above extracts show that fir timber was imported at that early period; and omitting the last record, we must now pass over an interval of about 200 years to the next date, for the first statement 1 have been able to find of the actual importation of timber, which is as late as 1517, temp. Henry VILL when the Ducht in particular were accessed of bringing over iron, timber, and leather, ready manufactured. During that monarch's reign the searcity of timber began to be experienced, and several statutes were passed for fixing the price of barrels; requiring the importation of clap-boards for their manufacture; and for the preservation of the forests of England, but excluding the counties where iron-works had been carried on from very ancient times. Queen Elizabeth (1558-1603) having reduced the forests still further; passed ablacquent Acts for their preservation. Mr, Clayton, in his work on the ancient timber edifices of

* Read by Mr. Wyatt Papworth, at the Ordinary General Meeting of the Royal Institute of British Architects, on the 2nd inst, as already mentioned.

† The omission in this work of information as to the exact kind of wood used in the different buildings is the more to be repretted, as the author of the second volume states that he had visited every place he described. 1 French, sapin. the western part of Eagland, states that the timber buildings of Englaud (of this period, that of the six-teenth century) were invariably constructed of oak, of extreme duration Harrison (1573), the often quoted writer in the reign of Elizabeth, says,—" The wals of our houses on the inner sides he either hanged with tapestic, arras worke, or painted eloths—or els they are seeled with oke of our owne, or wainscot brought hither out of the East countries;" and in another place, "in times past, men were contented to dwell in houses buyled of sallow, willow, plum-tree, hard heame, and elme, so that the use of oake was in a manner dedicated unto churches, religions houses, princes' palaces, noblemen's lodgings and navigation; a manner dedicated unto churches, religious houses, princes' palaces, noblemen's lodgings and navigation ; but now all these are rejected, and nothing but oke auie whit reguarded." It will he observed that deal is not mentioned for hulding purposes. During the last years of Elizabeth's reign, cottagers and farmers' houses were building in all directions, and in London the progress was likened to an inundation. Large quantities of timber were thus needed, as brick had not yet hean adouted for general use.

quantifies of timber were thus needed, as brick had not yet heen adopted for general use. Although without any historical record of the fact, it is to ahout this period (1558-1608), and to the above-named canses, that I should attribute the general introduction of foreign timber as an article of com-were (a shi 1553 (1st of Mary) the Eglish had disco-vered Archaugel, and in 1560 commenced trading to Narva, then helonging to Sweden. The fitness of fir, besidts other woods for huilding, is set forth by an Evapish writer in 1558 exerenteen veras before the besides other woods for hubbing, is set forth by an Euglish writer in 1556, seventeen years before the death of Elizabeth :--'' Firr timber is meet for divers workes, and greatly esteemed for his height and big-nesse, whereof are made the ship masts and pillars for houses, for it is very strong and able to abide great force. It is used also in building, for great gates and door posts: in fine, good for any building within, hut not so well enduring without doores, and very soon set a.fre. The firre, the poplar, the ash, and the elme are meet for the inner parts of the house, but they serve not so well in the weather as the oke doth. The best to bear weight is the fir and the larch, which, howseever you lay them, will acither beed nor break, and ence faile till wormes consume them. Ash for this borde; the best to clean, the firre, the poplar, and the beech.'' In or ahout 1603, Sir Walter Raleigh presented to James I. some observations on trade and presented to James I. some observations on trade and presented to James I. some observations on trade and commerce, showing how the Dutch had engrossed the transport of the produce of other countries, and stat-ing that "the exceeding groves of woods were in the East Kingdoms, but the huge piles of wainseot, clap-boad, fir, deal, masts, and timber, is in the Low Countries, where none grow, wherewith they served themselves and other parts, and this hingdom, with those commodities." From other accounts it appears that for about seventy years a very considerable trade had heen carried on with Russin—Archangel, it will he remembered, was discovered by the English in 1558), and that down to about the year 1590 a large number of ships sailed annually to that country, but in 1600 only four had heen sent out, and in 1602 only two or three; whereas the Russian trade of the Dutch two or three; whereas the Russian trade of the Dutch two or three; whereas the Kussian trade of the Ditco employed from thirty to forty ships each as large as two of the English, and all chiefly laden with English goads. Though the above shows the extent of the trading, yet a pamphlet, published about fifty years later, in 1662, whils describing the produce of Russia, and the timber ground of Russian and the start of the trade of the start of the start of the start of the trade of the start of the trade of the start of t mentions oak as the only timber exported. By the year 1638 Germany, Prussia, and Norway, all sent timber and deal hoards. In 1662, Charles II. interdicted the importation from the Netherlands and Ger-many of deal boards, fir, timher, and other articles, upon any pretenec whatever.

upon any pretence whatever. Besides a panel, to which I shall refer presently: the date of which is somewhat uncertain, the earliest instance of the actual use of deal I have here able to find, is in the description of Wimbledon Hall, crected in 1558 by Sir Thomas Cecil. This building herame in 1558 by Sir Thomas Cecil. in 1538 by Sir Thomas Cech. And Summing attention about 1640, the property of Queen Heurieuta Maria, and was surveyed by order of the Parliament, in 1649. The accounts do not state whicher any re-pairs were made in the sixty years between the date of its resting each theaverage. If the deal therefore, of its erection and the survey. If the deal, therefore, which was introduced so largely in the floor boards and wainscoting was not in the original crection, we and wanscotting was not in the original recetion, we must infer that the house was put into repair or modernised near the mildle of the seventeenth cen-tury, when it was prepared for the queen; I am in favour of the deal having been used in the original evention. erection.

The account of Wimbledon Hall extends over fifty pages of the Arelæologia, and describes how each roou was paved, lighted, and eeiled; whether wains-coted, eoloured, or plastered; what fixtures remained therein; concluding with the state and extent of the cardena and buildings the next and excitions below: therein; concluding with the state and extent of the the cogmizance of that haminy. The survey arready gardens and buildings the park, and erections belong-ing to the estate. The use of deal for floor hoards, the oak wainseot was varnished green, with gold wainscoting, wall licings, presses, Se. frequently stars, crosses, Se.; or coloured with "livor color" occurs in the account, which time will not permit me and varnished; or varnished with "libted with to give at length. In the basement was a dry larder, avenues a press of deal wainscot. Among the exterior absence of all description to the contrary, the deal so

buildings a pheasant garden is described, severed from the park hy a pale of deal boards, 10 feet high. The land of Richmond Palace is likewise described as part fenced with brick, and part with deal boards. Another early instance may be obtained by infer-ence, in Brandenburgh House, Hammersmith, erceted limit the burging of Charlen Dealer for 1620.

ence, in Brandenburgh House, Hammersmith, erected about the beginning of Charles L's reign (say 1625), by Sir Nicholas Crisp, the materials of which were sold by auction in 1822, *the dry rot* having got info the timbers (Falkener's Hammersmith, edit. 1839). Sir Bulstrode Whitelocke, ambassador to Sweden in the time of Cromwell, on his return in 1654, hrought a cargo of deal hoards, which he mentions in his journal to have heen used at Fawley Court for new flooring the ball and few wrainsecting it

journal to have here used at rawley Control new flooring bis hall, and for wainscoling it. Respecting the asserted practice of "painting" during the thirteenth century, Turner says a few instances do occur of directions to paint the wood-work, but in a note he adds that the chapel built by Henry III. (1216-72) at Window, had a wooden roof formed and coloured to imitate one of stone at Lichformed and coloured to imitate one of stone at Lich-field, and that wooden and stone posts or piers and arches were painted marhle colour, as were those of the halls of Guildford and Ludgershall. During this century, the ordinary custom was to decorate in paint or colour the wainscoting with patterns or subjects taken from sacred or profane history. Green was the favorite colour, very frequently starred with gold, with horders of a different pattern, male and female back. So, This weinscoting concernity only with borders of a different pattern, male and female heads, &e. This wainscoting being generally only 5 feet or 6 feet high, the wall or plaster above it was painted in fresco or in water, to represent some his-fory, or a curtain. The Queen's chamber, at the Tower, was to have the walls whitewashed and pointed, and within those pointings painted flowers; the next year the same chamber was to be thoroughly whitewal internally and newly painted with roses; also the King's own chamber was to be controly whitewashed. But this was not confined to internal work, for in the following year the king directs that water-pipes should be nut un to the great dower, so that the walls of the following year the king directs that water-pipes should he put up to the great tower, so that the walls of the said tower, which has heen newly wbitewashed, might he in nowise injured by the dropping of rain water, nor be casily weakened. Even the charpel of St. Catherine, in Nottingham Castle, was to he white-washed on every side, and pointed lineally : directions are also given to whitewash within and without the King's chapel, the Quece's chapel and chamher, and the Quece's great wardrobe, all at Guildford, where the hall also was whitewashed. Whitewashing would appear to have been then almost a royal luxury; though notwholly so, for evidence is found that during the thirteenth and fourteenth centroires the citizens of London not only whitewashed their walls, hut were compelled by the magistrates to do the same to the London not only whitewashed their walls, hut were compelled by the magistrates to do the same to the thatch of the roofing, as a precation against fire. White lead and oil, with fine and inferior varialses, were also extensively employed in this period for the decorations. Turner, in support of external painting, states that the habitable buildings heing of timber, it would require painting in some way to be preserved from the weather, for although park paings will stand for almost any length of time, yet eaved woodwork, and even plain timber when mixed with plaster, re-quire painting. He appears to have formed this opinion upon the present mode in Lancabire and Chesbire, of painting (colouring ?) the timbers black and the intersites white. Clayton says, "it would seem pro-hable, from the appearance of the timbers in many of interstices white. Clayton says, "it would seem pro-hable, from the appearance of the timbers in many of these buildings (the towa-hable of the sixtcenth cen-tury) that their sarfaces were originally protected by a description of paint, of a rich brown colour; it is, however, extremely uncertain whether the practice of blackening them, as usually done in the precent day, can be traced to ancient origin. The following extract from a record, dated 1574, will remove any doubt on the point. The plastering and whitening the fore-front of my Mr. his house in Coleman-street, and the courte, with the blacking of the timber work, 42s. 6d." The extensive component of inserts in the form

The extensive employment of tapestry in the four The extensive employment of tapestry in the four-teenth and fifteenth centuries would appear to have allowed the whitewasher to rest, except for the ceil-ings, which were "white lined," as usual; a few walls, however, were white lined even in Elizabett's reign; but then they were decorated with pocsies and moral proverhs on fantastic labels, of which Lucking-field farnishes so profuse an example. At Hardwick Hall, 1750, the walls of the state room are divided in the the height he as divingent the unner and the oak panels of the wainset of one of the rooms are all marked in gold with the Stafford kool, the cognizance of that family. The survey already mentioned of Wimbledou 11all in 1649, states that

much employed may be supposed to have here left plain. The "knotts" in the garden "are compassed about on three sides thereof with very handsome rails, piked with spired posts, in every corner and angle, all of wood, varnished with white, which very much-adoros and set forth the garden." Oil painting is thus not noticed.

of wood, vintised with the garden." Of painting is thus not noticed. As an illustration of the use of deal in the reign of Elizabeth, and also of this mode of decaration, Mr. Reynolds Rove, of Combridge, has forwarded a panel of fir: it originally had a ground-work of ver-million, in the centre of which was a pattern laid on in gold of a good thickness. This panel had formerly belonged to Swansey Manor House, in Cambridge-shire, *temp*. Elizabeth, which still contains some of the same kind of work, probably under the coat of the same kind of work, probably under the coat of the same kind of work, probably under the coat of London, and evidently intended as a guide to builders. Describing the finishing of the various classes of houses illustrated; he specifies that the walls of each floor are to be "plastered and sized," the partitions to be "last render and sized." The inter some show windows and modifions is worth 12d, per yard, heing cloured on one side with a stone colour laid in oil for windows, doors, rails and hanisters for a taireases, shop windows and modifions is worth 12d, per yard, heing coloured on one side with a stone colour 12d. For a pard, and for a light of a window, 6d.; for a lead originate on one side with a stone colour 12d. For a pard, and for a light of a window, 6d.; for a lead original paint for metal-work. "Whitewashing with size" is given as worth 2d, per yard. In 16f. it was agreed that the wainsot in the original paint for metal-work. "Wh size" is given as worth 2d. per yard.

In 1671 it was agreed that the wainseot in the Hall of the Carpenters' Company should "be hand-somely painted, and the walls above the wainseot on somely painted, and the walls above the wainsed om-the south side hung with painted cloth of some next painting-work suitable to the front side." A French traveller in England in 1672, remarks that "the houses of Canterbury are well built and painted after the Dutch fashion." For many years after 1700, the following description from a work of the period will convey some idea of the extent of painting practised. "Out-door painting for doors,shop-windows, window-frames, pediments, archittares, friezes, and cornices, and all other timber-work exposed to the weather; ought affict setting up to be primed with Spanish trames, potuments, architraves, Friezes, and eornices-and all other timher-work exposed to the workher, onght at first setting up to be primed with Spanish hrown, Spanish white, and red lead (about a fifth part) to make the other two colours dry, ground in linesed oil: then again with the same colour, only whiter, and, lastly, with fair white made of lead, and about a fifth part in quantity (not weight) of Spanish white. "Wainscot colour," "white colour," and "waint colour" ore enumerated; also "ordinary branchel painting "and "plain japan, either black or white." Ou considering this rectial of painter's work I have thought that these, wainscot and valuat colours, were used for the purpose of making woodwork resemble those woods. An interesting account has hately been published of a lady of rank, who, in 1612 or 1613 appears to have entirely ehanged the fashion of the arrangements of houses in France, and to have en the st who painted rooms in any other colour than red or taway. The next and last tiem in the descriptions is "white and so and the paint the stark of the set of the purpose of the set of the of the arrangements of houses in France, and to have been the first who painted rooms in any other colour than red or taway. The next and last item in the description is "whiting and colouring on plasteret's work." Here I would request your attention to the continued use of "colour" (distemper) for interor work, down to such a late period (1700), a fact which I conceive at once accounts for the extensive use made of it in our churches. It is clear that from about 1700, oil paint heceme a disguiser of materials, and we know from his own description that the interior of St. Paul's Cathedral was painted under Sir Christopher Wren's direction. In a work of 1703, the contrivance of closets in most rooms, and painted waiuscet are mentioned as two great improvements. Perhaps the farst infitmation of oil paint heing used to a large extent *internally*, is in a "Compendium" of 1721. It states that the taking of the dimensions for painters' works while doors, is the same with that of the joiners, by girtings about the mouldings and men-hers of considers, &c., in the painte never requires work and half work as the joiners do, but recknos his work once, it was with such as was mean and never painted." as the new buildings advanted year, 'if he walls of any of the rooms were covered with wainscool, it was with such as was mean and never painted." as the new buildings advanced, the rooms were all wainscoole and painted in a costly and band-some manner. some manuer.

Ware, in 1767, writes that "fir, as it is cheap and works carry, since the use of pair has been so frequent, has in a manner superseded all other kinds." In the descriptions of building given at the end of his work, he specifies that the walls are to be rendered

and fronted for bangings, and paints all the wainscoted ever complained of the want of figures, which, after and fronted for hangings, and paints all the wanneoted rooms a "common or stone evolur" it three times in oil. In 1775 a large mansion in the country is stated to have paper to the ground-floor rooms, whils the walls of the hed-rooms, garreds, and hase-ment were lime-whited. And at the beginning of the present century, says a later writer, the houses of traders and middle-classes, particularly in the pro-vinces, were chiefly adorned with simple wastings of vace with the procession. rose pink, whitening, and size. A friend, now in his eighty-fifth year, remembers the lining to walls heing left unpainted, and much of the woodwork even in the rooms connected with the Homes of Parliament were also of plain deal. The plastered walls of homes were also of plain deat. The plastered walls of honses were coloured, the sashes painted white, the doors, were coloured, the sashes painted white, the doors, skirtings, and other parts generally black. Several present can no doubt recall many houses in the country still exhibiting this ancient style of orna-mentation. Thus we may conclude that house paint-ing, or, as it has been very descriptively termed, the "three coats and flat work," did not eome into fashion until about the period of William and Mary and Anee, in to which time either colouring by distemper or by up to which time either colouring by distemper or by whitewash had heen in vogue for plasterwork, leaving inside woodwork more or less untouched.*

CLOCKS AND LOCKS.

UNDER the title of "Clocks and Locks," Mr. Deni-son has issued a little hook, the first part of which is a new and enlarged edition of a reprint from the eighth edition of the Eucyclopacita Britannica, and a kind of third edition of one of Weale's series of Treatises; and the second part is also a reprint from the Environmentia and was noticed by we next the Encyclopædia, and was noticed by us some time since. Encyclopedia, and was noticed by us some time since, when it appeared in the form of a lecture hy Mr. Denison. Much of the first part is occupied with the author's history of the great Westminster clock, of which he was the designer, and with an account of his own improvements in clocks.⁺ The treatise con-tains some very nseful information and guidance as to church and turret clocks and dials. We may quote a few of his remarks on the firm of dials -""The activity high description of dial for the start of the start o

"The establi-hed form of dial for turret clocks is a sheet of copper made convex, to preserve its shape; and this is just the worst form which human ingenuity could have contrived for it. For, in the first place, the minute-hand, heing necessarily ontside of the hour hand, is thrown still farther off the minutes to which it has to point by the convexity of the dial; and consequently, when it is in any position except nearly vertical, it is impossible to see accurately where it is pointing; and if it is bent enough to avoid this effect of parallar, it looks very ill. Secondly, a convex dial at a considerable height from the ground looks even more convex than it really is; because the lines of sight from the middle and the top of the dial make a smaller angle with the eye than the lines from the middle and the bottom, in propor-tion to the degree of convexity. Obvious as is the hour hand, is thrown still farther off the minutes the lines from the middle and the bottom, in propor-tion to the degree of convexity. Obvious as is the remedy for these defects, by simply making the dial concave instead of convex, it has, we believe, never been adopted until Mr. Dent introduced this improve-tion of the term of term of the term of ment also, at Mr. Denison's suggestion, in some clocks for the Great Northern Railway, at Doncaster, clocks for the oreal vorthern tuniway, at Doncaster, and on the platform at the King's-cross station. As convex dials look more curved than they are, these look less curved than they are, and, in fact, might easily be taken for flat ones, though the curvature is exactly the same as usual. Old couvex dials are easily altered to concave, and the improvement is very strik-ing where it has been done. There is no recent usual ing where it has been done. There is no reason why the same form should not be adopted in stone, element, The same form should not be adopted in stone, carment, slate, or cast irou, in which materials dials are some-times, and properly enough, made with the middle' part countersumk for the bour hand, so that the' mioute-hand may go close to the figures and avoid parallax. When dials are large, copper, or even iron or slate, is quite a nseless expense, if the stonework is moderately smooth, as most kinds of stone take and retain paint very well, and the gilding will stand upon it better than it often does on copper or iron. The figures are generally made much too large. People have a pattern-dial painted; and if the figures are not as lorg as one-third of the radius, and there-fore occupying, with the minutes, shout two-thirds of the whole area of the dial, they fancy they are not large enough to be real at a distance; whereas the fact is, the more the dial is occupied by the figures, the is, the more the dial is occupied by the figures, the is, the more the dial is occupied by the figures, the less distinct they are, and the more difficult it is to distinguish the position of the hands, which is what people really want to see, and not to read the figures, which might very well he replaced by twelve large apots. There is a clock with a dial of this kind in the London Athenaeum; and though it is constantly referred to as a regulator of watches, nobody bas

4 Clocks and Lacks. From the Encyclopedia Britannica. econd Edition. With a full Account of the Great Clock t Westuinster. By Edmund Berkett Denison, M.A. C. Edinbargh: Adam and Charles Elack, 1857.

THE BUILDER.

Ever complained of the want of tagures, which, after all, do not mean what they say, as you read 'twenty' miuntes to' something, when the minute-hand points to virt.* The rule which has been adopted, after various experiments, as the hest for the proportions of the disl, is this:—Divide the radius into three, and leave the inner two-thirds clear and flat, and of some colour forming a strong contrast to the colour of the hands, black or dark hlue if they are gilt, and white if they are block. The figures should occupy the if they are black. The figures should occupy the next two-thirds of the remaining third, and the next two-intros of the remaining third, has the minutes hest in the remainder, near the edge, and with every fifth minute more strongly marked than the rest; and there should not be a rim round the dish, as there generally is, of the same colour or gilding did, as there generally is, of the same colour or gilding as the figures. The worst kind of dial of all are the things called skeleton dials, which either have no middle except the stonework, forming no contrast to the hands (to which state the authorities of Trinity College, Cambridge, have lately altered their well-known double-striking, as it used to he said, once for Trinity and once for his former college, St. John's, which had no clock), or else taking special trouble to perplex the spectator by filing up the middle without interfering with the architecture, it is much better to have none, as is the case in many eathedrals and interfering with the architecture, it is much better to have none, as is the case in many cathedrals and large churches, leaving the information to be given by the striking of the hours and quarters. This also will sure something, perhaps a good deal, in the size aud cost of the clock; and if it is one without a train remontoire or gravity escapement, will enable it to go better. The size of public dials is often very inade-quite to their height and the distance at which they are intended to be seen. They ought to be at least 1 foot in diameter, for every 10 fect of height above the ground, and in many cases more, whenever the dial will be seen far off; and this rule onght to be enforced on architects, as they are often not aware of it till too late, and indeed scidom make proper provi-sions for the clock or the weights in building a sions for the clock or the weights in building a tower.

As to lighting them, he says :-

"The art of illuminating dials cannot be said to be in a satisfactory state. Where there happens to be, as there seldon is, a projecting roof at some little distance below the dial, it may be illuminated hy re-flection, like that at the Horse Gnards-about the only merit which that appresitiously-venerated and had clock has; and perbaps the same thing might he fore shop windows at night, to be turned hack against the wall during the day; but such an arrangement would be expensive in working and attendance, even if it could he conveniently arranged. It has also here proposed to sink the dial writin the wall, and illuminate it hy jets of gas pointing inwards from a kind of projecting rim, like what is called in church windows a 'hood-moulding' carried all round. But it is a great objection to sunk dials, even of less depth than would be required here, that they do not receive light enough by day, and do not get their faces washed with the rain. The common mode of illumina-tion is my making the dials cither euticely, or all ex-cept the figures and minutes and a ring to carry them, comes cither cound on the prime results of the prime results. "The art of illuminating dials cannot be said to in a satisfactory state. Where there happens to tion is by making the dials either cutirely, or all ex-cept the figures and minutes and a ring to carry them, of glass, either ground or lined in the inside with linen (paint loses its colour from the gas). The gas is kept always alight, but the clock is made to turn it nearly off and full on at the proper times, by a twenty-four-hour wheel, with pins set in it by hand as the length of the day varies. Self-acting apparatus has, been auplied, but it is somewhat complicated, and an nanceessary expense. But these dials always look very ill by day; and it seems often to be forgotten that; and also, that the annual expense of lighting three or four dials far exceeds the interest of the entire cost of any orchinery clock. White opaque glass with black any ordinary clock. White opaque glass with figures has lately heen introduced, and it is and it is very superior to the common method. It is need in the great Westminster clock dials. It is somewhat of an great Westminster clock dials. It is somewhat of an objection to illuminating large dials from the inside, that it makes it impossible to counterpoise the hands outside, except with very short and therefore very heavy counterpoises. And it hands are only counter-poised inside, there is no counterpoise at all to the force of the wind, which is then constantly tending to loseen them on the arbor, and that tendency is aggra-vated by the hand itself pressing on the arbor one way us it ascends, and the other as it descende, and if a as it ascends, and the other as it descends; and if a large hand once gets in the smallest degree loose, it becomes rapidly worse by the constant shaking. It is mentioned in Reid's hook, that the minute-hand of S. Paul's eathedral, which is above 8 feet long, used to fall over above a minute as it passed from the left to the right side of x_{II} , hefore it was counterpoised

Nov. 14, 1857.

outside. In the conditions to be followed in the outside. In the conditions to be followed in new Westimister clock it was expressly required that the hands be counterpoised externally, for wind as well as weight.' The long hand should be straight and plain, to distinguish it as much as possible from the hour hand, which should end in a 'heart' or swell. Many indexide and emission and the surface and the context seem to bails, when should end in a "neart" or swell. Many clockmakers and architects, on the contrary, seem to aim at making the hands as like each other as they ean; and it is not nneommon to see even the counter-poises gill, probably with the same object of produc-ing apparent symmetry and real confision."

In respect to the Westminster clock, Mr. Denison states that the final estimate of Mr. Dent for its construction was 1,800%. The weight of the great hell was increased from fourteen to sixteen tons by an acciwas increased from fourieen to state out out of an ac-dental deviation of the founders from Mr. Denison's design, and the composition of the metal, as pre-scribed by him, was somewhat different from what scribed by him, was somewhat different from what was usual, containing 7 of tin to 22 of copper, instead was naval, containing 7 of tin to 22 of copper, instead of 1 of tin to 4 of copper. The density and strength of the metal were thus greater than of any known hell metal, and the hell allogether more powerful than had been expected by any holy. Consequently, all previous calculations as to the proper weight of the hammer had turned out wrong. The hell went on increasing in sound as the hammer was increased, up to 12 ext. or ahout 1-28th of the weight of the bell. Mr. Vulliany had assumed that the weight of the hammer ought to be from the 200th to the 160th part of the bell's weight, and Mr. Denison himself part of the bel's weight, and Mr. Denison himself assumed 4 to 5 evt. or about 1-60th of the bel's weight, to he the proper proportion. In respect to the striking of the hours and quarters, Mr. Denison

"It should be understood by the public that the "It should be understood by the public that the first, second, and third quarters begins half a minute helver the right time, to get out of the way of the event the right time, to get out of the way of the hours, and act as a warning to people to get out their watches for the first blow of the hour, which is intended to be always exact within a second of Greenwich time.

The Londoners are not destined to astonish country cousins with the 7-inch jumps of the long hand, Mr. Denison considering it not safe to let such heavy hands so move. The clock is to wind itself up by hydraulie power, applied from a cistern, on the hydraulie crane principle, hut eapable of heing set aside and substituted by hand power, if out of order. The striking part only is to be wound up hy water on this self-acting principle. In a postseript to part first, Mr. Denison,

In a postscript to part irst, art. Bension, in ins trenchant style, makes a somewhat surfous onslaught noon Mr. Cole, of the Government Department of Science and Art, as to the procentement of a clock for the Brompton Museum. First of all, the author states, Mr. Cole appeared desirous that Mr. Dent should make one as a model of the great Westiminster clock and available of eact that prove from force houses shout make one is a mode of the great vectorization of the deat clock, and regardless of cost; but soon after, he con-tinues, it was suggested to Mr. Dent by Mr. Cole that "it might be worth this while to put up a clock at that place at a low price, for the sake of the adver-tisement', and, if he would not, there was somehody else who would." Mr. Dent declined to do husiness else who would." Mr. Dent decined to do husiness on such terms, and accordingly Mr. Cole, it is added, ordered the clock of another maker, of whom it is said that he was not even among the fifty-one makers that he was not even among the bity-one makers rewarded or publicly mentioned hy the Exhibition jury of 1851; "though, indeed, it was proposed, in joke, to give him a special medal for his clocks--not on account of their goodness." The remarks which follow do not seem justified, even by the statements or bible thereas have

on which they are based. In regard to the 2nd part of Mr. Denison's volume, we have already, as remarked, given the substance; and we shall therefore confine ourselves mainly to some additional matter not contained in the lecture therein quoted.

In speaking of certain American locks, the author

The easting of both these American locks-which have all their heavy parts of cast iron,—is vasily superior to any iron casting we have ever seen made in England; and on the whole, the United States are evidently far ahead of us in the manufacture of hoth good and cheap locks; and all because our prople are two stunid to substitute machinery for hand-work, and good and cheap locks; and all because our prople are too stupid to substitute machinery for hand-work, and hecense (as Mr. Hobbs said in the discussion at the Society of Arts, on the establishment lately set up by the Government for the manufacture of arms at Woolwich), "if the English workmen ean do any-thing to make a machine go wrong, they will y Mercas, in America, they will do alt they ean to help it." In the same way the American and French manufac-turers of clocks have driven our makers hoth of common clocks and of ornamental clocks out of our own market : and any enterprising manufacturer To the right side of XII, hefore it was counterpoised in a street near the *Bailder* office there is a clock or market; and any enterprising manufacturer is a street near the *Bailder* office there is a clock or market; and any enterprising manufacturer is a hatter's shop with the figure of a bat merely at each of the usual figure-points, yet the time is indicated as clearly as usual.

It is necessary, Mr. Denison justly remarks, to cantion the public against shop-window locks in general, unless it be known or evident that those sold at a moderate price within are the same_-which, we dare say, it may be pretty decisively added, they seldom or never are. Since 1851, says the author, Mr. Chubh and some other makers of tumbler locks, have adopted false notebes in all their best locks, together with revolv-ing "curtains," and these provisions, be adds, "un-doubtedly make the locks much more difficult to pick; in fact, so difficult, and requiring such nicely of instruments and manipulation, that they may be con-sidered practically safe, except under extraordinary circumstances. But then it must be remembered that all the great robheries, of which there are several carents practically safe, except under extraordinary circumstances. But then it must be remembered that all the great rohberies, of which there are several every year, do present extraordinary circumstances, and that they are never attempted except where the temptation has been made great, by the thieves seeing that they had unexpected facilities offered them. It is, therefore, by no means safe to assume that a lock will never be picked, merely because it would take a first-rate hand a long time to do it. The process need not be coultinous. A good hand will do part of his work, and measure it, or mark it off upon his false key one day, and more another, until it is all done, and his key ready for action at the first con-venient opportunity. Recent experience has shown that your own officers, clerks, and servants, are the people from whom you have most to apprehend, and they are just the people who have the most time and opportunity to perform their key-making operations undisturbed."

andishrbed." As to the revolving cartains here alluded to, we may remark, that if all of them he as liable to go wrong, even in spite of heing directly under the maker's eye, as one or two of which we have had some experience, they must be a general nuisance. In the cases refirred to the revolving curtain was apt, from the mere shutting of the house-door on which it was placed, to be shaken aside or out of position, spi-feighth to mere the transfer from term curting in-The pinces, to prevent even the trackey to be of pointer, sur-ficiently to prevent even the trackey from getting into the lock till picked at hy the end of a pencil, or some other implement with a sharpish point. Bad con-struction, bowever, may he the cause of annoyance in such instances.

such instances. Almost the only lock (besides his own unpatented one) of which Mr. Denison may be said to speak in anything like strong terms of its general merits, as a cheap and good lock for common use, is one patented since the publication of his article in the "Ency-clopædia Britannica." He calls it "Tucker's last patent," and speaks of several forms of Tucker's new inventions, besides the ordinary door-lock, and the desk, sliding door, or pinno-lock,—of all of which he says, " these are decidedly the best cheap locks of any that have yet hern hrought out."

yet heen hrought out." As we before observed, while treating of locks and As we before observed, while treating of locks and keys, the majority of the locks used in our ordinary dwelling-houses are of the most trampery descrip-tion, heing usually out of order within the first six muths; so that a good serviceable lock is still much wanted; but if huyers of houses and their occupiers would only resolve not to put up with such locks as are still too often used, and prove a constant source of aunoyance and expense, we might surely now hope to see, in this respect, a speedy and com-plete reform.

THE BURIAL BOARD OF ST. MARYLEBONE AND THE CONTRACTORS.

IT will he remembered, that after the completion of the Marylebone Cemetery at Finchley, the works were found to be defective in a remarkable manner, and that certain allegations were made, both against the contractors and the architects. An action was brought against the contractors' surveice, Messrs. Thos. Culverhouse, John Nicholson, and John Culverhouse, who, in turn, brought an action against the Board. Ultimately, all the matters in dispute were referred to the arhitrament of Mr. T. D. Arcbibald, referred to the arhitrament of Mr. T. D. Arebibald, barrister-at-law. Mr. Archibald has recently made his award, and has assessed the damages sustained by the Board at 1,827, which Messra. Culverhouse and Nicholson are to pay, together with all costs of the reference. For the counter action, it was decided that they had no grounds, and they were to pay all costs of the reference in that respect also. At a stormy adjourned meeting of ratepayers, held on the 2nd inst. to consider this award, called origi-nally with the view of relieving the surcites to some extent. some extracts from the cvidence of witnesses

J. Brown, foreman to the contractors, said: The chief contractor told me to take up the 9-inch pipes (contracted for) which I had laid down, and put 6-inch pipes down instead. The elerk of the works was not there, he was pone to dinner, and I took them up immediately. My business was to lay down pipes. The master told me on

THE CRYSTAL PALACE. DR. JOHNSON.

ADMIRERS of Johnson and our antiquariau readers will he gratified to know that the Johnson relies, from Inner Temple-lane, which were sold a few weeks since as old materials, at, in fact, a nominal price (we he-lieve nucler 201), have been secured for the Crystal Peleca Company, and are now after heing excitibility as old materials, at, in fact, a normulal price (we no-lieve under 20Å), have been secured for the Crystal Palace Company, and are now, after being carefully marked under the inspection of an experienced archi-tect, housed in the north wing of the building, ready for re-erection in the grounds of the palace. It is understood that the Honourable the Benchers of the society will present to the company the carved hood from the doorway, and the staircase which in the first instance they reserved from the sale. Fitted up with photographs of the huilding in its last condition, original or photographic portraits from Sir Joshua Reynolds's numerous paintings of Johnson's associates and contemporaries, autographs of huinself and other men of eminence of the age, and other relics, it will form a nucleus for a highly interesting record of the last century, and its great men in art and literature. We trust, therefore, ere long, to witness an ec-tion, with its adjuncts, which, evanin our own age and certainly in the cyse of posterity, will stand, perhaps.

tion, with its adjusts, which, itsuin our house have certainly in the eyes of posterity, will stand, perhaps, only accord in interest (diminished to some extent, of course, hy its changed locality to Staksperer's house at Stratford-upon-Avon, now the property of the nation.

THE NEW DOM OF BERLIN.

THE New Dot of Infinite some some some some delay in the progress of this great work; however, it is now proceeding again. It will be creeted close to the Stadt-Schloss, over the residence of Fredrick the Great. M. Heydi, the Minister of Funnee, has been Great. M. Heydi, the Amset of Finders has been entrasted with the chief leadership of the building. The foundations of the choir are laid in the bed of the river Spree. An especial arrangement is made for the convenience of Cornelius: as his age does not ant of deay, the arrangements are so managed that M, de Coruchis will be able to paint in the crypt, undisturbed by the construction of the building being proceeded with above him.

DESIGNS FOR RESIDENCES IN THE UNITED STATES.

WE mentioned not long ago the appearance of a useful volume, hy Mr. Calvert Vaux, containing designs for villas and cottages, prepared for execution, and many of them executed, in the United States,* and we now return to the volume according to promis in order to give a fuller notion of its contents, and to repeat that it deserves a sale as well in this country as in America. The book contains 300 wood enas in America. The book contains sow who can gravings of views, plans, and details, and some very sensible letter-press. Mr. Vaur, who will be remem-bered hy many of our London readers, when he went to America become the partner of Mr. Downing, whose useful career was hrought to a close by the burning of the Henry Clay steamer. "Il bello e il buono," the motto on Mr. Downing's seal, was also the pursuit of his life. Some of the designs in the book were produced under their joint supervision, while some few belong to a time when Mr. F. C. Withers was in partnership with the author. The value of art in building, Mr. Vaux says, is hut heginning to he recognized in America :--

Mr. Vanx says, is hut heginning to he recoguized in Ametica:---"A very transient visit into any part of the country shows that most of the villas and cottages are erceted viltout regard to artistic propriety, and at considerable loss to their owners, from the nseless outby incurred by the majority of the houses, would be improved by a little more ventilation. Square boxes, small and large, are springing up in every direction, constructed without any sitempt at proportion, or the sightest apparent desire to make them agreeable objects in the landscape. These tell their tale simply and unceremoniously: they are the satural result of the miners of the simply and unceremonionaly: they are the owners, for they show not only include the satural results of the miner of the simply and unceremonionaly is they are the owners, for they show not only that the landscape. These tell their tale simply and unceremonionaly: they are the owners, for they show not only that the landscape. These tell the construct even when quite young, to buy his own to tand live in his own honse. On the other hand, while tubes tells its monotonous story of a youth pased with the on oculivation of the higher natural percep-tions, and of a system of education in which the study of the beastiful is its most simple elements is neglected and apparently despised. The lack of taste perceptible all over the country in anall building is a decided bas to healthy enjorments; it is a wataness this a decided bas to healthy enjorments; it is a wataness they endown of the beast which be assuttering for a full exercise of freedom of speech and action should naturally result in a tall, free during in engorements; it is a vertaines of freedom of speech and action abould naturally result in a tall, free autoring means, and every habitation in which a free autoring means and every habitation in which a free aver in Generation weels."

American dwells." Fig. 1 is a Suburhan Villa executed some years ago in Georgetown, Dist. Col. for Mr. R. P. Dodge, The plan of the principal floor shows a porch that occupies the lower story of a tower, and forms a continuation to the veranda on the principal front. The main hall, lighted from this porch, is of liberal dimensions, and leads to a drawing-room that is pro-vided with windows opening on to the front veranda, and with handsome bay at the farther end. There is also a means of access from this room to a more retired have a non-prince on the other side of the house. The also a means of access from this room to a more retired plazar, or ombra, on the other side of the house. The diming-room, which communicates with the ombra, is, as shown, eutered from this parlour as well as from the outer had, and has a large pantry, or service-room, attached. The house cost ahout 15,000 dollars,

room, attented. The holes cost about 1000 to make but might be carried out in a plainer way for 10,000. Fig. 2 is a villa of brick and stone, intended to be ereded ucar Poughkeepsie, and is estimated, simply finished, at 16,000 dollars. The house is approached inisbed, at 16,000 dollars. The house is approached through a proch connecting two verandas, see Fig. 3, thus affording a lengthened covered promenade. The veranda, we may here observe, appears to be an essen-tial feature in these residences. The hall would be used as a cool morning-room in summer. Figs. 4 and 5 illustrate a villa "with wings and atics," about to be executed for Mr. Thos. Earle, of Worcester, Mass. and is estimated at about 16,000 dollars. The principal rooms communicate with each other, and with the hall.

dollars. The principal rooms communicate with each other, and with the hall. Figs. 6 and 7 set forth a Morine Villa, which has been erected at Newport, Rhode Island, for Mr. D. Parish. It is built of brick and brown stone, and the contract was taken at something under and the contra 20,000 dollars

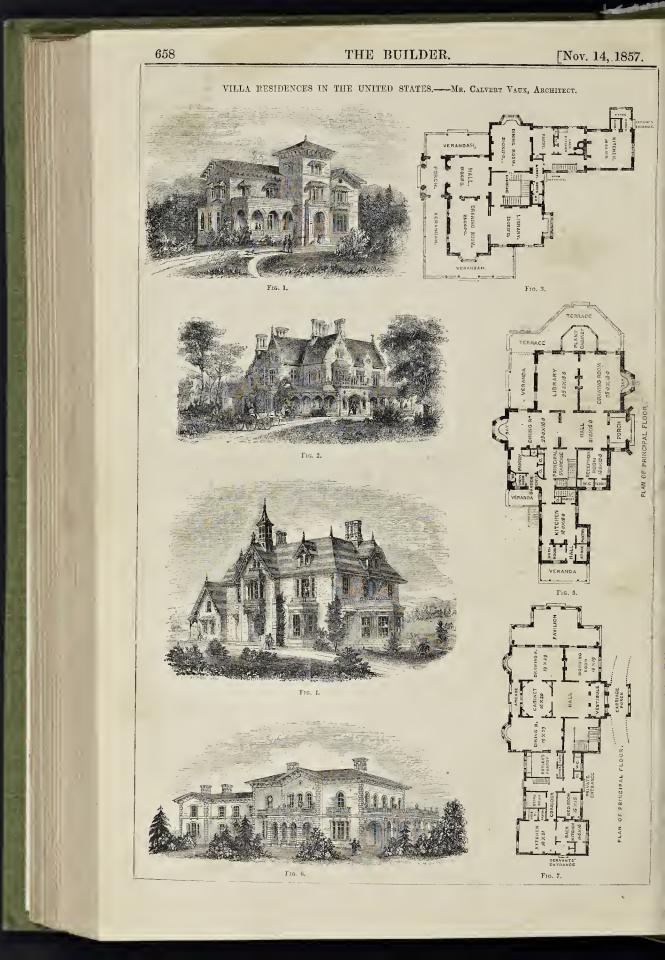

Mr. Vaux has erceted a country house for Mr. N. P Willis, at Idlewild. He has evidently built for him-self a good reputation.[†]

• "Villas and Cottages." By Calvert Vaux. New York: Harper. London: Sampson Low, and Co. Lud-gate-hill. 1857.

† Let us add, as showing the course pursued in N York, that the suthor's card, printed at the end of book, states his terms to be :--

"2's per cent. for plans and specification, 1 , detail drawings, 1's, superintendence.

- - 5 per cent. usual commission of architects."

THE BUILDER.

THE ARTESIAN FOUNTAIN AT GRENELLE, PARIS .---- M. IVON, ENGINEER.

THE ARTESIAN WELL AT GRENELLE, PARIS. In the year 1833, M. Malot was charged, by the Municipal Conneil of the City of Paris, with the boring of an artesian well upon the left hank of the Seine, on the Place Bretenil, a vast space of ground extending in front of the Ahattoir de Grenelle, not far from the Hôtel des Invables

The workmen commenced on the 24th Septem. The works of boring and tubes that the skilfal geological engineer must have encountered when noe knows that the works of boring and tubes were not completed till the 26th of Fehrnary, 1841—more fhan seven years of tribulations, and deceptions, which would bave disheartened most engineers. But M. Mulot

promising always success in a manner so certain, and based upon scrious geological doenments and calculations, the men betook themselves juxta-positive with vigour to the work, and the implements of difficult in a different beds of earth, marked upon the geological map, traced a priori. At last the green sand was reached : it was the last bed of andly there. The borer had arrived at the extraordinary and predicted depth of about 1,790 English text.

Since 1841, a cage of woodwork had been created round the table of ascension; but as the juxta-position of that creation rendered repairs difficult in case of accident, the administration decided that a cast-iron monumental fountain should receive the ascending tube, and should replace the rustic scaffolding established origi-

659

of which is raised 139 feet 8 inches above the ground.

The enclosure of the staircase is of hexagonal form, and 6 feet 10 inches wide. Four external platforms or balconics encircle the monument, and project gusbing sheets of bubbling water.

THE REVIVAL QUESTION.

THE REVIVAL QUESTION. A CORRESONDERT, 'W, P,' whiles in the number of the Builder for the 31st of October, on "How are we to revive Gothic Architecture?" His purpose and feeling are evidently excellent. Far be it from any one to declaim against his reverent estimation of "our national architecture," "the noblest style of architecture that has ever prevailed." He is honest end eigende in his indement. d simple in bis judgment.! It would, however, he entircly unnecessary to notic

his remarks if they contained nothing more powerful and noticeable than the well-worn similes and statements respecting the grammar of art and original composition, and the difference hetween design and imitation; but his letter contains some notions that, although conventional and ordinary, are really false.

The new grafts on the old stock are not by any means to he of foreign birth or growth. All the forms invented hy continental artists, and all the suggestions ombodied in their works, are to he care-fully passed over by English architects. This state-ment is apparently made under the excitement of a hotman or indicarous are to at the inter of over a f lecture on indigenous art, or of the study of some of the very bold and very dogmatic teachings of re-vivalists : surely it is not to he received in soherness.

Are the buildings of France, Germany, and Italy perfectly out of the pale of heauty, and uscless for artistic teaching? Is their expression so ntterly in-compatible with the Gothie feeling in other places that they cannot supply one sentiment or enlarge for benefit the circle of architectural forms and feelings ?

"W. P." did not mean this. He would probably instantly disclaim it. His mind was, perhaps, fixed on the forcible and nunatural introduction of illassorted forms of continental art into our own ancient buildings.

How pathetic is his crelamation, "For heaven's sake let us have uo patchwork churches!" Why churches, friend? Mr. Scott does not con-fue himself in any way to ceclesiastical huilding: be is argoing for the aim of his revival—for the fitness is algoing for the aim of this revived—tor its fittes of Gothic architecture for all purposes. And if "W. P." wishes to guard against patchwork building, he must enforce bis objection to it on wider grounds than its application to old English churches. No one that its application to bit Largosa chiractes. No one doubts for a moment that there is evil in importation to them of foreign forms, mainly hecause their cha-racter is already chosen and fired, and is better un-changed. They are relies—not mere articles of use : they helong to us by hirthright—not hy our toil ; they ought to be preceived, stable and perfect, for our followers. But modern huldings are of a different order : they are the hoads that we are to write—the order : they are the books that we are to write-the wealth we are to leave for the henefit of our suc-cessors, and in them we onght to use every thought that we can cull from nature and art in our own country, in our own minds, and in all other places— all cast in our own mould.

There will be no more patchwork in a well-woven concord of ideas—some gathered from old work, and some from original toughts—some from foreign, and some from native huildings—than in a landscape of the first order taken partly from nature, and planned

the new order by rules of art. "W. P." lays down hefore us the means by which the revival must be carried out. He finds it necessary the revival must be carried out. He finds it necessary to give us a short sketch of the periods of English, art : he does this in the ordinary way : Early Eaglish, Early and Late Decorated, and Perpendicular, all pass Early and Late Decorated, and Perpendicular, all pass in review. He is, perhaps, mistaken ahout the source to which he traces the failure in the progress of art in the fourteenth century. It is apparently to be more ascribed to the peculiarly altered texture of the thought than to the original want of consideration. thought than to the original want of consideration. The people, during the change from geometrical to eurvilinear outlines, found their field less coufined, — their opportunities vssily increased, — and their free-dom really unlimited; then they gave way to the force of their imagination, — gradually cast off the grasp of reason and custom, — and gave the rein to rich and varying fancies. As they advanced, they in time heeame conscious that they had lost roanmand, and had got out of the way. This led them to turn for rest and reform to the style of sharpness, precision, and lines, — called Perpendicular.

for fest and reform to the style of sharpness, precision, and lines,—called Perpendicular. That they did lose sight of the principles of the direct subordination of parts, and the depth and holdness of moulding, is also manifest; but these in-attentions to laws and to constitution are now, as then, the natural and continual consequences of an unrectroined face.

a mount source is now in the metry of vorticity remarks. "W. P." makes an observation concerning the one unbroken chain of styles; but this comparison, as he puts it, will hardly answer his aim. He does not puts it, will hardly answer his aim. He does not intend that we are to consider the latest point of our needed that we are to consider the intest point of our ancestors' work as the proper slarting-post for our own advance; yet they only ended the chain when they creased to build at all-originally. This is rather against the revival in principle. Mr. Scott would not endorse it.

"W. P." eannot mcan, either, that this unbroken chain was broken at any point at which we are to take

up. We suffer much from far-fetched and ill-formed comparisons. "W. P." would have read us a lesson hetter in the bomely prose we like best. He must mean that, to carry on the architecture of the past, we must begin our *progress* where our ancestors left the main high road for that road they really followed -or of the chain-that we must take off the links that fit not the rest, and forge additions to it that shall carry it on in good proportion and in proper strength.

rength. Concerning "W. P.'s" opinion of the "stupid, when the machanering custom," that Mr. Concerning "W. P.s' opinion of the "supper conventional, and unobserving custom," that Mr. Deuison so loudly denounces, it is evident that he is somewhat led away from his observation of old churches hy Mr. D.'s talk of modern nones. Thin walls, small cost, and necessarily large internal open-ingen necessitate a certain law in the matter. the ings, necessitate a certain law in the matter: the massive masonry and the lavish cost of ancient work allow of any conceivable device. We are now have pered, hut "W. P." is right in urging that we ought to do the hest we can with our opportunity. He will probably read me and my remarks justly: if so, he and I will both he satisfied. S. F. C.

WORCESTER CATHEDRAL: THE NEW WORKS, AND "VIATOR.

I Do not intend to enter into any controversy with "Viator." When I observed in "Viator's" critical description of Worcester Cathedral, printed in your colamos, many statements which I knew to be in-correct, together with many expressions of opioion which I believed to he calculated to mislead, I wrote to you for the purpose of correcting the errors, and of excerding way protest against the opinions. I reof recording my protest against the opinions. I re-tain my own opinions, and my corrections of "Via-tors" "crors require action er vindica-tion. But I trust that you will permit me to leave your correspondent's ready flow of anonymous peryour correspondents ready now or anonymous per-sonalities to the regarded with which they must be regarded by every candid and eourteous reader. In his last production, "Vistor" states that I said at Worcester, that the exterior of the esthedral was

capal in heavity to the exterior of the entertain was statement he is pleased to regard as "simply pre-posterous." I never said auxihing of the kind at Worcester. What I did say was, that "the exterior of the Early English parts of the enthedial, as originally built, was no less consistent with the style of the architecture, and no less wortby of admiration than the interior." I am well aware of admiration that the interior. I am well aware of the present sad condition of this exterior, and I have expressed myself without reserve upon this matter ; at the same time I can see evident traces of what this exterior once was, — traces which would reader it an easy work to reproduce the whole in its original character. Were such a restoration effected, — were an rasy work for terrorate the write in its original character. Were such a restoration effected, --were the early buttresses to resume their first aspeet, and the corhel-table and parapet to become again what they were 600 years ago, and the Early English win-dows once more to appear in their true forms, and to reproduce their original grouping,—and were such a restoration to be completed in all its details in this same spirit, I should be ready to appeal to any competent and impartial judge to prononnec au opinion upon the external dignity and beauty of the Early English Gothic of Worcester Cathedral. "Viator" compels me to rectify another mis-statement. He deliherately asserts that the "Handbook of Worcester Csthedre)" which I have nudertaken to write is "a self-imposed task." Instead of this heing the fact, a duty entrusted to me by others, this is undertaken at the request of those gentlemen whose property this "Handbook" will become when it is completed. "Viator's" own essay on Worcestor Ca-thedral appears really to he a "self-imposed task." "Viator" may object to such a duty being entrusted " Viator" may object to such a duty being entrusted to me, and when my work is published he may regard it with contemptuous derision: I sincerely regret to he obliged to admit that his commendation and his the conduct of antice of the second s then, the natural and continual consequences of an an arcestrained facey. "W.P." caunot often have seen hent willow wands

[Nov. 14, 1857.

in moulded stonework : the nicety of workmanship and it is just possible, however, that some importance may attach to the exact position of such an object as the anomalous pier in the Worcester choir, and though "Vistor" may not look a second time before he deter-mines whether the lions in a shield of arms are or are not numes whether the noise is a sine of arms we could not a sine quartered with finers.de.j.ys, or whether the lions them-selves are quiedly walking with three legs upon the ground, or see in an erect attitude on their two hind legs only; yet these are just the matters which either furnish eorrect historical data, or lead the student of bitary acter. Wheth on L thick of " Winter" conturnish correct historical data, or lead the student of history astray. What an I think of "Viator," con-sidering that his "quartered" lions and flours-de-lys "can searcely lay claim to an antiquity higher than the twelfth century?" The obscurity of the gloomy day must have been very obsenre indeed, to have so completely overshadowed all remembrance of the fact that the French Hiles were first placed on the shield of England by Edward—not the Coufessor—Int the Third.

Third. "Vistor" is angry with me because I supposed him to be a *traveller*. I did so without the slightest idea of giving offence. I believed that he was a "tra-veller," because he wrote himself" Vistor." If I had supposed he would have preferred it, I would have rendered him a "wayfarer," or, had I known his faucy for Latin, he might have heen left, untranslate-able, "Vistor." Indeed, if I could have imagined that able, "Viator." Indeed, if I could have imagined that he had selected his assumed designation upon the same principle that be described the cathedral, I would even have supposed that "Viator," in his particular case, signified one who resides regularly at Woreester. As signification on the sector regularly at woreseter. As it is, I take my final leave of your correspondent as "Vistor," which may mean whatever he pleases. I hope, however, that you will permit me, in plain English, to assure you that I am faithfully yours, CHARLES BOUTELL.

CHURCH-BUILDING NEWS.

Lincoln .- The mouument to the late bishop (Kaye) of Lincoln has been erected in the south arm of the of Lucoin bas here erected in the south arm of the east transpert of the cathedral, contiguous to the tomb of Bishop, Grostete. It consists of a square Gothic hase, supporting afigure of the late bishop, sculptured in white marble. The deceased is represented in the moment of death: he is clothed in bis episcopal when and wronge on a wattrage his head supported rohes, and reposes on a mattress, his head supported by a pillow, his right arm across his breast, with the by a pillow, his right arm across his breast, with the hand clasping the sacred volume, and the left hand just relaxed from the crozier which lies by his side. The sculptor was Mr. Westmacott, R.A. The pedestal is arcaded on each side, the intervals heing pierced with trafoils, surrounded by foliage. Around the edge of the table runs the record in Latin of the decased's titles, and the dates at which he gained his various promptions. pron

Directions. Little Canfield. - The ehurch bere, which was originally oue of the earliest and rudest of the sacred edifices in this neighbourhood, has been lately and to unitely rebuilt, and is now completed in the Decorated style, except the south door, which has been kept to the original. Eight new windows have been placed in the church and vestry : the wooden bell pareet in the charter and very : the wooden bell tarret has been removed, a gable carried up with eross and coping, and a new tower and spire rising to the height of 80 feet creeted on the north side of the charch, with an entrance at the west side, and windows north and east, in character. The tower communicating by an arch with the nave of the church, the gullery or organ loft has been removed, and the instrument now stands under the tower arch. A new porch with tracery has also been huilt on the site of the old wooden structure at the south entrance: this is in the Perpendicular style. The whole of this renovation, including the tower walls, buttresses, and spire, has heren worked in Gaeus stone. In the interior the chancel floor has hern laid throughout with enexustic tiles: a nicbe, surmounted with tracery in stone, has been placed in the north wall adjoining the volte, and here piece in the volte bar dypoints ito vestry, and to the latter a new stone staircase has been built. The old pews in the chancel have given place to open Gothic benches. The rector, the Rev. C. Lesingthun Smith, was his own architect and paymaster. The contracts were taken and the works executed by Mr. W. Jago, of Great Dunmow, mason and bailder.

Geddington. -On the 29th ult. the old church of St. Mary Magdalene, Geddington, was re-opened, after extensive repair and restoration. The church has been enlarged by the lengthening of the north aisle, and much additional room has been gained horth arsic, and miner additional form has need galaced by the removal of the huge galleries and pews which before disfigured it. The seats are all open, and of deal, stined and varnished, and afford accommodation for upwards of 500 persons. The floor has heen pared with Minton's titles. A new vestry and porch have heen huilt. Several arches, before builden, have heen thrown open, and a new one huilt in the south aisle. The woodwork was done by Mr. S. R. Brown, in this church is the length and height of the chancel,

in this church is the length and height of the chancel, which dates as far hack as 1360. Bernick Bassett.—The church here, which has recently been undergoing repair, has been re-opened. The huilding, part of which is in the Early English style, and dates from the cleventh century, is almost entirely new, only parts of the nave and channel walls being fielt of the old structure. The vestry is new, as also the tower. The stone used is found in the neighbourhood, the dressings heing of Bath stone. The tower is covered with a pyramidal root, hung with plain red tiles, and surmounted by a finial and gill cock. All the roofs are of deal, stained, and are covered with stone slabs, with crosses on the nave and chancel. All the fittings are of English oak, as are ulso the public, desk, and lectern. The chancel eco-tains four beoches, with carred poppy-head eods, altar rail, and table. The chancel is laid with Minton's tiles. There is a stained glass cast window, and on tiles. There is a stained glass east window, and on the south side a memorial window to Mrs. Hawking. The work was excented by Mr. Major, of Swindon. The architect employed was Mr. Thomas Wyatt, of London. The east of the rebuilding was about 9004. Towards this, a donation left by the late Mrs. Hawkins, of Avebury, amonating to 2007, was avail-able; and in addition, the sum of 1007. was given by the Marquis of Lansdownc, the lay impropriator of the parish. the parish.

the parish. *Hawarden.*—The chancel of the church, which has received comparatively slight iojury from the firs, is being enclosed by a brick wall, and with deal board-ing and asphalte felting the roof will be made water-proof, and the chancel will then be used for divine service notil the remainder of the church has been rebuilt and restored; after which all the damage done rebuilt and restored; after which all the damage done to the chancel will be made good. With rerebuilt and reslored; after which all the damage done to the chaacel will be made good. With re-ference to the re-building, a meeting of the parish-ioners has been held, at which Mr. James Harrison, of Chester, architest, reported as to the state of the church. He estimated the expense of re-huilding the pillars and arches in the nave, and restoring the windows in the west end, the roof of the nave and alsles, the floor, scats, doors, and the pillars, arches, and floor to the tower, re-glazing the windows, and completing all damage, at an jouthay of 3,025%. He also estimated the restoration of the roofs, stalls, &c. in the chancel, at 4137. A plan for raising funds, by rate and subscription, was agreed to, and a sub-scription list at once opened, when 5007, each were subscribed by Sir S. R. Glynne, Mr. Gladstone, M.P. and the Rev. R. Glynne, the rector; and 1007, each by the Bishop of St. Asaph, the Hon. Mrs. Tablot, and others: various smaller sums were also sub-scribed.

scribed. Literpool.—The church of St. Slephen, Crown-street, was re-opened on the 27th September, the work having then so far progressed as to admit of public worship being celebrated. The alterations, says the *Courier*, were imperatively called for on account of the defective construction of the roof, the entire of which was untiered, and the chancel portion was anile onen to the security of the weather. The actions of the entert constraints of the chancel portion was quile open to the severity of the weather. The chancel-roof has been made good, and over the nave a new polygonal panelled ceiling has been put up to prevent down draughts. The whole of the church internally has been cleaned down and coloured, and the entire of the woodwork newly varnished. The chancel has been improved. The cast window, bitherto covered with a curtain, which gave a dismal look to the church, bus been removed and replaced by a stained-glass window, manufactured by Messrs. Pilkington, of St. Helen's : the window is necessarily simple in its design. The top having three circular portions, is filled with a medalion of the "Stoning of St. Stephee," and with two groups of angels bearing palms: the coctor of the five lights has a large figure of St. Stephen under a campy. A new reredos St. Stepheo," and with two groups of angels bearing palma: the ecotre of the five lights has a large figure of St. Stephen under a canopy. A new reredos of Caen stone, with marble shafts, supporting crocketed and finialled eanopies, has been erceted in the elaneel. The stone enving has been erceuted by Mr. R. W. Tucboff. The warning of the church has been improved, under the superintendence of Mr. Hazard, warning and domestic cogineer. The work has been errived, out from the designs, and nuder the superintendence of Mr. Thomas W. Kingsmill, of Dublin. A member of the congregation acted as clerk of the works.

clerk of the works. Neumarket.—For some months past the formerly dilapidated fabric of St. Mary's Church, Newmarket, has been undergoing a thorough repair. The old pews and galleries were subslituted by open seats, affording more accommodation : a gallery, extending the entire length of the body of the church, has been creeled, the floor laid with oak, and gas-pipes carried to every part of the building, the walls cleaned and repaired, and new windows put up. Burringers — The new church, here, here, here

Burring/am,—the new church here has been mane opened for divine service. The edifice is in the Early English style, and huilt of red brick, with slated roof. list, a The interior is also all of hrickwork, in three colours, when diapered. The pulpit and font are of brickwork, with.

blended with mosaics. The windows are glazed in blended with mosaics. The windows are glazed in geometrical patterns, except the easternmost, which is a painted window of the two Marys at the tomb, presented hy Mr. H. Healey, of Ashby. The length of the church, from east to west, including the chaocel, is 67 feet; and the whole occupies about 2 roods and 36 percles. There are twenty-eight stalls in the church, and n few seats for children, all of which are of American deal, stained. The cost of the building, exclusive of internal arraneements is 1,0002, and exclusive of internal arrangements, is I,000/. and with the internal arrangements, 1,300/. About 640/. bave been raised by public subscriptions. Mr. Teulon exclusive of internal arrangements, was the architect; and Mr. Johnson, of Laisby, near Grimsby, the builder.

Otterburn (Northumberland) .- A new church has Otterowra (Northember(2013).—A new caurch ans heren erecled in this village, and was recently conse-crated by the Bisbop of Durbam. The edifice is in the Decorated Gothic style of architecture, from de-signs by Mr. John Dobsoo, architect; and cost about 3 000/

PROVINCIAL NEWS.

PROVINCIAL NEWS. E/y.—The bishop and deam and chapter have made arrangements for the erection of schools in the eity of E/y. There will be two in the upper and one in the lower town. In Silverstreet, in the upper town there will he schools for 400 children, and a committee-room; also a school for infants in Goal-street, with a residence. Io the lower town in Broad-street there will be an iut ant school for 100, and an adult school for 100. Mr. S. S. Teulon is the architect. The style of the buildings is Early Decorated. They will be of hirks and Casierton store.

style of the buildings is Early Decorated. They will be of briek and Casterton stone. Chippenham.—The local guardians have determined to erect a new workhouse. The sile has been selected, and an agreement signed for purchase of the land. Mr. Christopher Creeke, of Bournemouth, has been appointed architect for the completion of the building. It will be erected in a field at Rowden-hill, near the Bath turnpike-road, and shout half a mile from the town. town

Stafford .- St. Peter's Schools, Hixon, have been opcoed. They are erected on a piece of land adjoin-ing the church, the gift of Earl Ferrers. The erection Spectral. They are elected on a piece of Infin algoin-ing the church, the gift of Earl Ferres. The erection is of red brick, faced with stone, with stone copings to the gailes, and is 36 feet by 18. The walls are 13 feet high, with an opeu timbered roof, rising 7 feet from the wall-plate. The timber of the roof is stained and varoished. The building is lighted by five lancet windows, one at each end, and three to the front. The school-room is centered by two porches, one for hoys and another for girls, and the floor is boarded. Requisite outbuildings algoin for the convenience of the sebolars, and the master's house, creted in a similar style is attached. The school premises are surrounded by a playground. *West Hartlepool.*—The contract for the erection of a new pile of warchouses on the cast side of the Swainson Dock, West Hartlepool, has been let to Mr. Samuel Baslow, of West Hartlepool, at 11,0000. The range of buildings will be 400 feet long by 100 feet wide.

wide

Alnwick .--- A movement is in progress in Alnwick Alwarek.—A movement is in progress in Alwrick for the purpose of obtaining a covered building or corn-exchange, where farmers and corn-merchants may meet together and transact their husiness. Lichfield.—The contractors for the Museum are Messra, Lilly, of Meosham; not Messrs. Lilly and Meacham, as stated.

NEWS FROM SCOTLAND AND IRELAND.

Kilmarnock.— Building operations have heen going on here with activity for some time past. A number of villas have been erected in the suborbs. In Port-land-steet, the Royal Bank buildings, from the designs of Messrs. Peddle and Kinnear, of Edinhurgh, ner approaching completion. The Episcopal Chapel in St. Marnock-street has been consecrated: the building parlakes of the Early English style, and consists of chancel and nave, with open timber root, which, together with the seats, are stained. In the same sirect a range of dwelling-bouses and shops is in course of creation. They are in the Italian style, having triangular and segmental pediments over the windows. The architect is Mr. Ingram, of Kil-marnock. In Fould's-street, a small chapel has been evented, and a number of other houses in various parts of the town. Mendeen.—The anticipated scientific meeting of Kilmarnock .- Building operations have been going

parts of the town. *Aberd-em.*—The anticipated scientific meeting of the British Association, in 1859, has induced some of the more enterprising and intelligent of the citizens of Aberdeen to beatir themselves in order to provide an adequate place of meeting for their expected visi-tors; and this they propose to effect by mems of a subscription for the erection of a building to he per-manently devoted to such public purposes as "a music-hull" is usually intended for. A subscription is amounting to 16000 has devoked been act and list, amounting to 1,600/. has already been got, and when 2,500/. are roised, the work will be proceeded with. The hall will belong to a Joint Stock (limited)

Company, and will prohably cost some 5,0007. or so, and be capable of accommodaling 2,500 persons. The provost heads the subscription list with 1007. Bellisst.—A correspondent says:—"The Roman Catholic workmen of Belfast are ahout to build a splendid hall, with library and reading-room attached. This new hall is intended to hold 3,000 persons, and, when completed, will be one of the finest buildings in Usier." Ulster.

STAINED GLASS.

Lincoln .--- Another memorial window has just heen Lincoln.—Another memorial window has just heen placed in the chargel of St. Anne's Bedbouses. The window has been designed and executed by the Rev. Heory Usher, a nalive of Lincoln, who has long de-voted altention to this att. The window is the north triplet in the chancel, and consists of three figures of nearly life-like size, nuder foliated canopies—one in each compartment. The central figure represents Elizabeth, the wile of Zuecharias, ond his wife: on the left side is Simeon in the act of blessing Zaecharias and his wife (Luke ii. 34), and on the right side Joseph of Arimathea, having his traditional emblem, a haw-thorn branch, in his hand. At the foot of the figures in the foreground is grass hestrewed with flowers, and mountain scenery in the distance. The window on mountain scenery in the distance. The window on the opposite side was executed by Mr. Usher some two years since, and for the west window be has already prepared designs, the subject being the Na-tivity of our Lord, and the Visit of the Magi.

Ashbourn .- A lancet window has been placed in Ashbaum.—A lancet window has heen placed in the north transept of the old church here by Mr. Lister, to the memory of his late nucle. The window has heen painted by Mr. W. Warrington, of London. It consists of horders, foldage, and three medallions. The npper medallion is emblematic of Charity, em-hodying the inscription, "I was hungry and ye gave me meat;" the middle one of Houesty—the just steward rendering his talents to his lord; and the lower one of Hospitality.—"I was a stranger and ye took me in." *Winelewise* — A commensation window of stained

Winchester .--A commemoration window of sta glass is being placed by Mr. Gibbs, of London, in Win-chester Cathedral, at the western extremity of the south aisle of the nave, in honour of the officers of the 97th regiment who fell in the Crimca during the late war.

late war. *Aberhafesp.*—Another stained glass window has heen placed in the chancel of Aberhafesp eburch, near Newtown. This window is ahout 12 feet high by 6 wide, and is in the perpendicular style, with somewhat forid tracery. The three bottom lights illustrate the narrative of the Caoaanitha woman's appeal to the Saviour to "have mercy on her, and head her daughter." The Saviour is attended by seven of his anastics including SJ. John and SJ. Peter. The appeal to the Saviour to "have merey on her, and heal her daughter." The Saviour is attended by seven of his apostles, including SI. John and SI. Peter. The upper parts of the lower lights contain handscapes of the auxient fortified eity of Tyre; and coasts, with trees and foliage peculiar to eastern scenes, forming a relief to the figures in the foreground. The upper parts, or tracery lights, are filled with the Heavenly Host, represented by doves ascending almost sur-rounded by vast numbers of eherohs. This window is the gift of Lieutenant General Proetor, and is the work of Messrs. Thomas Baillie and Co. of London.

SANITARY STATEMENTS.

SANITARY STATEMENTS. The Effect of Sanitary Measures.—In a paper read at the late Birminghum Couference, Mr. May, of Macelessich, added another item to the existing series of proofs of the saving of life and money which may be produced by ssnitary strangements. In 1847 and 1848 Mr. May called the attention of the inha-bitants of Macelessicht to the mortality which prevailed there, and the state of thiogs which led to it. When these evils were made sufficiently apparent to com-mand attention, the Public Health Act was intro-dnced, and constructive works were immediately com-menced in the wort streets, and courts the most neeced in the worst streets, and courts the most netroivaly filthy, and where sickness and mortality were unost in excess. The streets were sewered, paved, and flagged, the houses all drained, additional paved, and magged, the noises all drained, auditional means of ventilation introduced, and the yards and courts drained aod flagged; and the contrast which they then presented, and effects which followed, were They then presented, and effects which followed, were most striking. First, with regord to the rate of mortality. For seven years it was 33 in a thousand on the neverages it has now been reduced to 26 in a thousand. If this fact were taken alone it might he considered of little value, but it will be remembered that certain streets were described as possessing a frightful rate of mortality; and as these streets were the first to be improved, the decrease in the mortality has been in one of the streels 60 per cent.; in a fourth, 34 per cent.; and in a fifth, 12 per cent. It is deserving of re-mark, that the street in which the decreases was the greatest was the first to he improved, and that in which there was the least decrease was the last

escented, showing that the longer the works have been in operation the greater the decrease, up to a certain limit. The average age of death of all per-sons was twenty-four years, or ten years less than the adjoioing rural districts : it is now twenty-nine years, or five years less than the rural district. But to afford a tablier example of the difference between the or ne years less than the rural district. But to another a striking example of the difference hetween the average age of death in streets where the sanilary arrangements were completed, and others devoid of such, four of each were fairly selected for comparison, such, four of each were fairly selected for comparison, and in the former the average age of death was 34, whilst in the latter it was 19 years. Throughout England the mortality of children under 5 years is 39 per ceot. Here it is 40 per cent. and the reduction has been 18 per cent. For each death it is proved from correct data that there are 28 cases of sickness, so that it will be cocceived how large a number of exses of sickness must have been prevented, with all their attendant loss and suffering ; but in order to prove the fact, it was ascertained that according to the relief books of the hoard of guardians the number of cases of sickness relieved and attended by number of cases of sickness relieved and attended by the union surgeon, io the streets that were drained were from 24 to 29 per cent. less compared with the past, whilst, in certain other streets enumerated and not draiced, there was no decrease at all. The must, it is fair to presume, have necessarily been There corresponding decrease of cases attended by other medical men than the union surgeon, in the firstnamed streets. Other works were done and other improvements followed, including a considerable decrease in the amount of crime. Evils of Inhabited Stables.—The monthly report

of Dr. R. D. Thomson, the medical officer of health in Marylehone, states that amongst the deaths during the five weeks ending Octoher 31st, fifteen arc regis-tered as having occurred in mews, and nineteen eases of zymotic sickness had been attended by the parochial surgeons in similar localities. The inspection of houses over stables in mews had occupied much of the time of the inspectors, and had continued to lay bare a highly unhealthy condition of the servants of the higher classes. 163 "inbabited stables" had been examined during the mouth. When asked, at a meeting of a representative council, whether he considered Ing of a representative connect, whether he considered the mere fact of persons living over stables where horses were kept, and of which there were so many instances in that parish, was in itself injurious to persons so living irrespective of any other cause, Dr. Thomson said the point very much depended upon the situation of such habitations. He did not mean to imply that the mere fact of persons living over stables containing borses was injurious to health, hut the fact was that in most instances the mews had been con-structed in such a way that the bhildings were without was that in most instances the mews bad been con-structed in such a way that the huildings were without closets, and had very had drainage, and these circum-stances, coupled with the keep of horese henceth the dwellings, had a prejudicial effect on health, but it did not arise solely from horese being kept underneab. A medical man told us, not many days ago, of a groom residing over a stahle in Belgravia who had lost three children, one after the other, as they reached a certain age, and who had been, with tears in his eyes, to ask him how he could save the fourth, then sixkening in a similar mauner. The advice was, leave the stable, and get a healthy lodging. The advice was taken, and that child is now healthy and thriving. We know of half a dozen such cases, and cen, therefore, corrobo-rate most positively Dr. Thomson's statements.

THE METROPOLITAN BOARD OF WORKS.

THE President of the Metropolitan Board of Works and the Chief Commissioner had a conference on Thursday in last week, on the first principles to he adopted with reference to the main drainage; the details to he settled by the referees appointed hy the Chief Commissioner and the engineer of the Board assisted hy two others. Mr. Thwaites laid the case of the Board hefore the Chief Commissioner, and of the board pointed out that the principal point of difference were the proposed open channels, the increased area to be drained, and the expense of carrying the point of discharge or outfall so much lower down the river. of discharge of out and so that have a down that here, Upon the first point, namely, the open canals, Sir B. Hall at once admitted that open canals were objec-tionable. With respect to the second point, the ex-tension of the area, Sr. B. Hall, according to the reports of the daily press, wished the Board etearly to understand that it was the daily of that body to inter-set all impairies flowing into the Thames within the metropolitan area, but discharged itself within that area, then the sawage passing into such stream point, the point of outfall, the Chief Commissioner Reach, and that if the Board were to have it it, effit, public opinion would protest against it, and the Board's works would prohally he stopped by reports of the daily press, wished the Board ctearly to understand that it was the duty of that body to inter-

Chancery as a nuisance. On Friday Mr. Thwaites reported to his own Board the result of the inter-view. He stated that Sir B. Holl had given up the open chaunels and the extended drainage area. This discrepancy at once struck the Board, and Mr. discrepancy at once struck the board, and the Thwaites was again asked to explain, but he adhered to his first assertion. The Board thereupon resolved to have their own short-band writer's notes written out in extenso, and printed for the information of the Board.

There appears to be also a misonderstanding as to who should pay the cost of the extension to Sea Reach. Sir B. Hall pointed out that the cost would be merely an annual rate of five furthings in the pound additional.

Next Monday the several questions thus stated will come on for unravelmeot by the Metropolitan Board.

LAMBETH ASSOCIATION FOR PROVIDING IMPROVED DWELLINGS FOR THE LABOUR-ING CLASSES.

THIS association, formed under the provisions of the Labourers' Dwellings Act, has commenced its work in Lumbeth, on a vacant piece of ground situated between the railway and Vanxhall-walk. A brick building is now in course of creetion there, which will contain site. four room or thirthe safe which will building is now in course of creation there, which will contain sity-four rooms, or thirty-two sets of two rooms each. The approach to the first and two upper stories is by means of a stairease communicating will extremal galleries. It is expected that the association will he able to let the two rooms for 3s. 6J, per week, and then ohtain a fair profit. Four water-closets are provided on each floor: this gives one closet for the use of two families. As an codeavour has been made use of two immires. As an occurred a work mass to huid more becapy than usual, in order to let at a less rent than is ordiuarily paid in improved or model dwelliogs, the directors have been content with this amount of water-closet accommodation, as they are amount of water-closet accommodation, so they are convinced that even this is much better than the poor now obtain. Each room is ventilated by means of the patent syphon ventilator. The architects are Messrs. Ashpitel and Whitebeord; and the huilders, Messrs. Colls. We understand that the directors of the asso-itistic here endeed devines to here and traders Coils. We inderstand that the arceiors of the asso-ciation have ordered drawings to he made, and tenders to be obtained for fifteen houses, to be built in the same locality. Each house will contain four suites of same overly. Inter doise which contain four surface of three rooms each, and will be for the accommodation of those who are able to pay a somewhat higher rent than will be charged to the inbahitants of the house now building.

THE BRAINTREE BURIAL BOARD AND THEIR CONTRACTOR.

My attention has been called to an article in yoar publication of Saturday last (p. 633), relative to a claim made hy Mr. Brown, a coutractor, sgainst our Burial Baard. I have no reason to complain of the manner in which yoa have treated the subject, but I do complain of the "committee of gentlemen who have associated to protect the interests of the cou-tractor," that they, being in possession of all the procession worth. My attention has been called to an article in your have associated to protect the interess of the Cost tractor," that they, being in possession of all the necessary particulars, have apparently withheld from you one or two facts, which become of import-ance when they attack the Board with the accusation of doing an injustice.

The question, which, as you say, is one of prin-ciple, is, whether a huilder, who has purchased bills of quantities from an architect, has a right to sue the quantities from an architect, us a right to such the architect's employers, if, in consequence of on error in these quantities, he finds it necessary to use more materials than he anticipated. On this point the Board wish for a decision. But

On this point the Isbard wish for a decision. But Mr. Courtaild, who was chairman of the vestry meet-ing to which you have alluded, not content to wait the result of the trial which has commenced, and is now in progress, has written and published a letter, in which there is a total absence of that propriety of feeling which we have a right to expect from one who occupies the notition Mr. Courtendless content. feeling which we have a right to expect from one who occupies the position Mr. Courtauld has gained. To this letter I have published a reply, which is, I fear, too long for insertion in your paper, hut I enclose a copy, referring you particularly to Clause I. in Mr. Brown's scentry, as showing the terms upon which Mr. Brown's contract was undertaken;* and when I tell you that the Born contend that the bills of quantities were prepared by the architect, aud sold by him for bis own profit, and that the

board deny that Mr. Brown, or bis surctics, signed the security uoder pressure, I think you will see that the board have not only an important principle for which they are contanding, but that they are doing so fairly and dispassionately. If I may offer my own ideas on the main question, and on which you have refrained from giving a positive optimion. I will do so. It appears to me to be a convenient practice, that bills of quantities should be prepared, whether by the architect or not I con-sider immaterial. I think builders perfectly justified in seading in tenders based on these quantities; hat have the use of them should stop. Whenever the tender of a huilder is accepted, he ought, before signing his contract, to satisfy himsalf that he has based bis calculations on correct data. If it should thro out that the quantities are wrong, surely he would have a remedy against the person from whom he purchased them, but if after satisfying himself of neglecting to do so, he signs a contract or security to complete the works, according to the plans, for a signibuted sum, he surely ought to have no remedy against his employers because he neglected to do that which it was negleably bid duty to do more than theirs. acquiries sum, as surely ough to have no remedy against bis employers because be neglected to do that which it was palpably bis duty to do more than theirs. Try the question from the opposite point of view. Suppose, when a nontract is completed, the employer care to the heilds. Suppose, when a nontract is completed, the employed says to the builder, "You based your calculations on the assumption that you would require 1,000 feet of stone, when, in fact, you have only used 500 feet. I have contracted to pay you 1,000%, but I shall refuse to pay you more than 900%, in consequence of this mistake." What would the builder say about justice then a

Probably all bills of quantities are more or less inaccurate; but so long as they are used merely to assist the calculations of the multitude of persons who tender, they are a very useful invention ; but to hold that because a man, on the faith of them, has advisedly signed a bond, or other legal document, to advisedly signed a bond, or other regar focuments, or perform certain works, be may afterwards repudiate his liability, would be a most dangerous policy, and, as it appears to me, within the limits of neither law aor equity. A. CUNNINGTON. nor equity.

** We have since received a communication from Mr. Brown, the contractor, and documents from other parties interested, and we postpone further comments in consequence.

LIVERPOOL ARCHITECTURAL SOCIETY. GLASGOW CATHEDRAL.

Ar a meeting of the above society, held on Wednes-day, the 4th inst. Mr. Hargins, president, who was in the obair, exhibited a manasorint "Table of Archi-teets and their Works, chronologically arrangel," which had heen presented to him hy its compiler, Mr. Francis Sullivan, of Manchester, kaown to the profession hy some contributions to the Builder. It contained a very full list of the principal architects of all ages and nations, from Hiram, the huilder of Solomon's Temple, and Dedalus, the architect of the Labyriath of Cr.te, down to the hetest deceased practitioner of our own time and country.-Mr. F. Howard read a paper "On the Decoration of Glasgow Cathedral with Stained Glass." The author read copions extracts from the proceedings of the committee, at Glasgow, appointed to select an arrist to execute a design for the windows. Upon these proceedings he commented, contending that he committee had not shown any reasonable grounds for the selection of a Munich artist, and that they were incorrect in their notions of glass designs. Il referred to what might he considered the alter of a Munich Ar a meeting of the above society, held on Wednes-

incorrect in their notions of glass designs. He referred to what might he considered the elements of Munich celebrity, which had merely need outside the King of Bavaria paying high prices for designs. These bad been toroduced itot various buildings in Bavaria, and had been the means of raising up a number of the way nonline way. Was it to and near ocen the means of raising up a number of glass-stainers in their own peculiar way. Was it to be supposed that artists would excente the work for 2, the square foot? and if not, where would they get the designs at all? He contended but the works of the Manifest estimates and the state of the state of the state of the Manifest estimates and the state of the state of the state of the Manifest estimates and the state of the state of the state of the Manifest estimates and the state of the state of the state of the Manifest estimates and the state of the state of the state of the state of the Manifest estimates and the state of th get the designs at arr. He contracted the deman of the Mucieh artists were merely copies of old German works, and did not possess that ingenuity which was attributed to them. They were such windows as Eoglish artists had been improperly accessed of making. nogiten artists had ocen improperty accused of making. If it were intended that such pictures should be an example to British artists, they declined to take them. Mr. Howard offered some practical observations on the various siyles of glass-staining, and the mode of treating subjects, and defended the English artists from incensity — a charge involved in the recent works in the world had been produced on commission.

works in the world had been produced on commission. The Elgin marbles would not have been exceuted except they had been ordered. Michelangelo and Rafiaelle received commissions for their most cele-brated efforts, and all the greatest works in Italy and in this country had been exceuted on commission. Mr. James M. Hay said :- The school which the German and Freach artists follow is one opeu to the gravest objections. Glass-painting is an ort of its own, aod not an imitation of pictures, with light and shadow, distant hackgrounds and aciral perspective. Each subject should be complete of itself, and con-fined within the stone framework or multions pro-vided by the architect. The art to which glass-painting is more closely allied than any other is mossie, for the artist makes out his subject somewhat after the same manner, and, by cleverly combining mesaic, for the artist makes out his subject somewhat after the same manner, and, by eleverly comhining pieces of glass of various colours, produces a work of such hrilliney, sparkling effect, and gem-like appear-ance as can be obtained by no other menns. I can testify to the absence of this quality in the Munich windows at Cologne Cathedral, to which allusion has heen made, as well as to the window by Luban, of Tours, in the Church of the Innocents in this town. This false style has heen abordment for wares he all Tours, in the Church of the Innocents in this town, Tbis false style bas been abandanch for years by all our hest glass painters. I will mention one exception. The Duke of Northumberland has had excented a window for his private chapel at Almwick Casile: the cattoon for this window was designed and prepared by Mr. Dyce, and was exbilited at the Art Treasures Exhi-bition at Manchester; and while the drawing, com-ration and colour are could if and superior to any. bition at Manchester; and while the drawing, com-position, and colour are equal, if not superior, to any-thing the Munich artists have done, there are the same faults which characterise that school. The window is of five lights, and the composition extends across them all: the actual framework of stone multions is ignored; and twisted columns, strong and massive, with capitals and ogee arebes, all of a non-despript character, are introduced, patiend, sitting the real architecture at defance. This is the kind of class patients with which the Observe committee are real architecture at dehance. This is the kuid of glass painting with which the Glasgow committee are desirous of decorating the fuest—theonly eathedral in Scotland, and apply to Munich for what they can bay_ equally well and better done at bome. But bave equally well and better done at bone. But a different principle from that of the Munich school is exhibited in all the best works of our best glass-painters : each compartment of a window is treated as a glass panel : the architectural framework is con-sidered as perfect, and receives from their hands no supplementary additions of painted canopies, pedestals, arches, and other *et celeræ* : the resources of their art, limited though they be, are sufficiently large to dispense with such factitious aids.*

THE BRISTOL GENERAL HOSPITAL

THE BRISTOL GENERAL HOSPITAL. THE new building which has heen erected, by public subscription, for the purposes of this charity, is situated in the rear of the old hospital in Guines-street. It is described as a central tower, from which two wings radiate at right angles, one facing the New-ent and having a southern aspect, the other facing Bathurst-basin and having a western aspect. Attached to the extremity of the western wing, and in the reary, is another building, so that the hospital may be said to form three sides of a square. The latter has a uorthern aspect, and the whole edifies stands upon a platform. The ground-floor of the building is appro-priated to the accommodation of the resideut officers, the committee, and the out-patients. The room in the committee, and the out-patients. The room in the base of the tower is the board-room : next to it the base of the tower is the bord-room: next to it is succession in the southern wing, are the library, the house-surgeon's dayroom and hedroom, the pupils' dayroom, and matron's dayroom and hedroom. On the opposite side of the corridor with which these apartments communicate is the main cutrance, the apartments communicate is the main entrance, the stairense of the second and third doors, a dining-room, and some storerooms. In the western wing, in the front, are the nutseum, the surgeons' consulting-rooms, and the waiting-rooms for the out-patients of the surgeons and physicians, and in the back, the stair-case of the first-floor, two casually wards for males and females, and some other rooms. Outside both these fronts is a colonande, and here the patients will take the air when occasion requires. The part of the building attached to the extremity of the western wing, and facing uorth, contains the physicians' wing, and facing worth, contains the physicians' room, the dispensary, and the drug-room. On the opposite side of the corridor is the porter's room, the window of which overlooks the yard, and some small

window of which overlooks the yard, and some small rooms for different purposes. The upper part of the huilding will be devoted to the in-patients and the nurses. The first floor will be occupied by males. The room in the central tower will be the sitting-room, during the day, of shose patients who are able to leave their beds. In the southern wing are two large wards, capable of

^{1, *} The Giasgow papers state that Sir Benjamin Hall, as Ellief Commissioner of Works, has ordered the removal of two staticed glass windows receasily set up in the crypt of Biasgow Cathedral, and they are very angry thereat. We ware not heard the grounds for the order,

contaising from sixteen to twenty beds each, with washing-closets attached; and between the wards is a room for the nurses, this being obtained by a projec-tion in the face of the bailding. These rooms are so arranged that a single nurse can overlook two wards. On the opposite side of the corridor, that is, in the back of the building, is a very complete bath-room, a coal-store, a scellery, in which any medical cookery will be done, a small ward for exceptional cases, and another for patients after an operation. The western wing is arranged in a precisely similar way.-two wing is arranged in a precisely similar way—two wards, with a nurses' room between in the projection of the front; but the northern part of the building attached to it furnishes another ward, making five upon the whole floor.

upon the whole floor. The second floor, which is reached hy its own The second floor, which is reached hy its own staircase, is for the formale patients. Its arrange-ments are precisely similar to those of the first floor, with this difference, —that at the back of the central tower, that is, in the angle where the two wings meet, is the operating theatre. The basement of the building contains a spacious kitchen, a sitting-room for servants, a spacious washbouse, in which the work will be done by steam, and all the other conveniences which can add to the completeness of the huilding, and the comfort of its inmates. The floors are formed with Keene's cement on con-crete, the only exceptions being the badrooms in the

The floors are formed with Keene's cement on con-orcle, the only exceptions being the bedrooms in the top story, occupied by the nurses. An air-shaft runs up through the huilding at the angle of the wings, and every ward, every room, eorridor, and closet is supplied with hot and cold air, with means of escape, the polluted air being drawn off by an appa-ratus in the roof. In addition to this, every room bas one, and every ward two, open freplaces. Hot, cold, and chilted water, is carried by pipes np to cach floor, and the whole building is ligbled by gas. Steam will be the chief servant of the house. The new hospital has been designed by Mr. W. B. Gingell, and we are told, in its present state, its cost will be about 15,000. It is expable of receiving from 180 to 200 in-patients.

he about 15,000%. It is capable of receiving from 180 to 200 in-patients. We give these particulars with which we have been favored, but we reserve an opinion as to the plan and arrangements of the hospital in a sanitary plan and arrangements of the hospital in a sanitary point of view, until we have an opportunity to inspect it personally,

MONUMENT TO THE LATE ASSISTANT-SURGEON THOMSON.

MONUMENT TO THE LATE ASSISTANT-SURGEON THOMSON. THE monument to that heroie man of science the late Assistant-Surgeon Thomson, of the 44th Regi-ment, is now complete. It is a granite obelisk, 65 feet high, comprising a shaft finely polished, and a base, on which are inscribed the deeds of him it re-cords, and three steps. It stands on an elevated hill at the wester extremity of Forres, a place made best known by "Macbeth." This well-deserred memorial was originated by the late Director-General, Sir James McGrigor. It will not soon be forgotten bow Surgeon James Thomson, after the battle of the Alma, when the British were leaving the field, voluntarily remained helind with 700 desperately wounded Russians, 400 of whom he succeeded in restoriog. He contrived to escape the daogers which menaced him throughont his stay, but died very shortly after, from the effects of bard-sbips and privations. The muster-roll written by Fame in the Crimea has no nohler name in it than James Thomson. "His life was useful, and his death was giorious."

ISLINGTON VESTRY-HALL COMPETITION.

ISLINGTON VESTIG-HALL COMPETITION. ON Friday, the 6th, the report of the special com-mittee, referred to in our last, was laid before the Vestry. In reply to inquiries as to whether the designs selected could he carried out for the amount fixed, Mr. Harvey said it was taken for granted hy the committee in solecting, as it was on that under-standing alone architects bad competed.

The committee being asked to state which were the best four out of the twelve, uaned No. 46, "Con Amore;" No. 50, "Utility;" No. 57, "Whytting-ton;" and No. 71, "A. B. C."

The Vestry then proceeded to the selection of the

It was resolved that the committee should commumeate with the anthors of the designs, and take measures to satisfy themselves that the designs could be executed for the fixed cost.

"WOODMAN, SPARE THAT TREE."

"WOODMAN, SPARE THAT THEE. SIB,—Yoor observations on London gardens in a recent number emboddens me to claim your sympathy for the trees in this neighbourhood, which are threat-ead with deformity or annihilation by the vestry of St. Marylehone. Their surveyor gives ns notice that it is against the law for any tree to overbang the garden-wall, and threatens that, if they are not daly summed, our premises will be entered, and the tree ent eropped, onr premises will be entered, and the tree cut do

down. To my cyc the most pleasing suburbs of London are those where the road is bord-red by gardens, whose overhanging trees form a grateful variety to the cease-less lines of houses. They are useful too, for often have I seen groups of people seeking shelter from a sudden shower under their foliage. One tree in this reighnomhood was peenliarly admired by the cele-brated landscape-gardener you have alluded to, its graceful branches forming a most picturesque object in a bend of the road. It has already been injured by order of the surveyor, and is now again threatened by printed notice. We look to the press as our protector against ignorant and overheaving authority, and we hope not in vain. hope not in vain

AN INHABITANT OF ST. JOHN'S-WOOD.

NOTES UPON IRON

GLOOMY apprehensions and fearful forebodings are supreme in South Staffordshire. No failures are yet reported, but it seems almost impossible that some firms can bold out much longer. Every one held fast bis confidence till the Dounistouns wont. The con-nections of that firm are as many and so extensive, and the interest in three st many and so extensive. nections of that firm are so many and so critensive, and the interest in these again so many and diversified, that the aunouncement by that firm, dated the 7th inst. was felt as "a heavy blow, and grave discourage-ment." These views were shown to be hy no means groundless, when on Weilcosely afterooon, the honses concerned received circulars from Messrs. E. B. Codrington and Co. of Liverpool, asking for time in consequence of the suspension of Messrs. Dennistoun. Some good home orders are being re-eived in certain directions, and no altering in stimulated in the tind directions, and no alteration is stipulated in the kind directions and no alternation is supurated in the whole of tender; but in most others no order can be got unless for a four months' hill, which at 10 per cent, and its uncertainty, is a greater risk than will be undertaken. The period is one of great suspanse.

SCENERY AND MUSIC.

SCENERY AND MUSIC. The Haymarket Theatre.—Mr. Tom Taylor, an artist hinsel, has taken care to have two or three very pretty scenes for bis new comedy. "An Unequal Match," which bas been produced by Mr. Buckstone (the manager himself playing in it), with very great and well-deserved success. The curtian rises on "A Village in Glaizedale, Verkshire," by Mr. Morris, with the inn and the force, and the stage haid out in walks and grass plots, the whole vary naturally and pleasantly built up ; and it falls, in the third act, on a German watering-place, with the brannen and the reading-room, and a picturesque neunatinous landscape behind, very credit-able to Mr. O'Connor. The scene for the second act, an interior, Jacobean in style, with a carved chinney-pice in two slories, strikes us as not quite a new an interior, Jaconean in style, with a carved chimney-picce in two stories, strikes us as not quite a new frieud. Miss Amy Sodgwick, who has the principal part in the piece, has not yet attained completely the art which hides art, but must, nevertheless, be con-sidered a great acquisition. Compton is admirable: in fact, it is an exceedingly interesting and nicely written piece, very well acted, and deserves to he seem

seen. English Opera at the Lyceum.—Hure, too, seenery has not been disregarded: indeed, the general com-pleteness with which Mr. Balfe's new opera, "The Rose of Castille," has heen produced, concioned with the admirable singing of Miss Pyne and Mr. Har-rison, has done much towards obtaining the full measure of success which attends it. The seeme for the first act is the outside of a Spanish Posnda, with next home every the write into the word, and a mean The Vestry then proceeded to the selection of the massare of success which attends it. The seene for two plans for the premiums, on a motion by Mr. Cox, the first act is the outside of a Spusish Posada, with pert house over the gale into the yearly and a monn-timous background, very nicely painted and put the rest. The mode of vestry ought to have more information out of the question of cost. Mr. James Wagstaff thought the costleter, For the second act we have a Moorish intervert, considered industries of vestry outly to the set of the vestry proceeded to select the two designs by taking a show of hauds for each scriating, and striklog off the lowest, and the repeating the process, till at length the two successful designs were annoanced to he,— lst, No. 50, "Utility," found to be by Mr. Henry and a national lyrical stage worthy of the country, should show they are in carnest by supporting the undertaking at the Lyceum.

undertaking at the Lyceum. Julien's Concerts at Her Majesty's Theatre.— Foremost anongst the causes which have fostered the growth of a laste for superior music amongst the masses in this country, must he placed Julien's Concerts. The provision of the best music for the public at small cost is no trifling good, and those who maxiely it descree our canned, supmet. There was a public at small cost is no triang good, and theorems provide it deserve our earnest support. There was a little want of spirit perceptible in the performances, and enthusisem in the audience, a few nights ago; but the new "Indian Quadrille," which will have heen produced before the appearance of our number, will doubtless bring hoth back, and all the house to a statistic the processity short eason. The hand the close of the necessarily short season. The hand is a lmirable,

RECENT PATENTS.*

L. J. BRETHON .- Improvements in Machinery for L. J. BRETHON.—Improvements in Machinery for Manufacturing Draining Pipes, Bricks, Tiles, and all other similar Platis Acticles. Dated Jan. 10, 1857.—This machinery is applied to the manufacture of solid or perforsted bricks, &c. having a regular press section. A variable accurse machine is not solid. of solid or perforsted hricks, &c. having a regular cross section. A vertical serve reorvers in an upright eyilader. A rotary motion is given to the helix, by horse or steam power, and the elay is thrown into the upper hox of the eyiloder as it is dag from the ground, without any other preparation than that of heing mixed with water : it is ground, mingled, and freed from hard or filamentous substances, and finally forced down through side-moulding apritures. Groupee Toxinxson Boxspirit. Sussex-place.

GEORGE TOMLINSON BOUSFILLD, Sussez-place, GEORGE TOMLINSON BOUSFILLD, SUBSC-PACE, Loughborogh-to-ad, Brixton, Surrey.—Machinery for compressing Clay and other Materials applicable to the Manufacture of Bricks and other Articles. A communication. Dated March 5, 1857.—In this invention moulds are employed which correspond in form to the article to be formed from the clay or other material by compression. One, two, or more of these moulds are attached to a mould-carrier, which is moved up and down hetween suitable ouides hy an eccentric moulds are attached to a mould-carrier, which is more up and down hetween suitable guides by an oceenfric on the main axis of the machine. The moulds carried by the mould-carriers are bottomless, and into them by the monu-carriers are bottomiess, and into them fit pistons or plungers which receive motion from eams placed on the same axis as the eccentric before mentioned, and there are also other pistons or plungers attached to the top framing of the machine, which enter the moulds when they are moved up hy the recentric eccentric.

SAMUEL HEMMING, Bow, Middlescx.—Malerial for Roofing or other Building Purposes. Dated March 21, 1857.—This invention consists in forming from pulp produced from the fibres of straw, grass, hemp, wood, or other similar vegetable productions, by any of the well-known processes at present in use, plain, figured, or corrugated surfaces of material from plain, figured, or corrugated surfaces of material from the said pulp, by causing it to be placed in any con-venient manner within dies or moulds of suitable shape or construction corresponding to the form re-quired, antil sufficiently dried and hardened (by pressure or otherwise) for removal, the said surfaces being subsequently rendered impervions to moisture by any of the usual preparations.—Not proceeded with

by any of the dama preparations are pre-with. W. SwAIN.—Improvements in Heating and Feuti-lating. Data Dec. 27, 1856.—Claims: 1. Heating and ventilating rooms and buildings by means of a tubular chamber situated at the back of a grate or stove, the heated air and products of combinition from the fire being male to pass through tubes in the said chamber, and the air delivered into the room from the externed at means the situates and the situates and the exterior of the said tabes. 2. Withdrawing the warm and vitiated air of the npper part of the room, and delivering it through perforations at the back of the grate, so as to promote combustion and prevent the formation of smoke. 3. The construction of de-cached tubular chambers to be used with grates and tached tubular chambers to he used with grates and tached ubular connects to be used with grates and stores of the ordinary construction as described. 4. A method of heating hot-houses and conservatories, and charging the heated air supplied to the same with the vapour of water. 5. A method of constructing hot-air chambers. 6. A method of ventilating kilns and hot-air stoves.

J. BIRD.—Improvements in the Manufacture of Articles suitable to be used as Window-heads and Sills, Lintels, and other similar Parts of Buildings. Dated Jan. 19, 1857.—This consists in manufacturing articles to he used as window-heads, sills, lintels, &c. from fire or other elay, in a dry or nearly dry state, by forcing it into a mould by a great pressure. The by toreing it into a mould by a great pressure. The articles thus moulded are buradd in a kiln, in which are three or more wolls or supports, across which the articles to be burnt rest, heing kept apart by sepa-rating hricks. At the front of the kiln is a server, which, as the articles shrink during the burning, is used to force forward a block long enough to rest on

* From the lists published in the Mechanics' Magazine and other journals.

all the supports, so as to keep the articles constantly in entact with the separating bicks, and never leave them room coundy to twist or get out of shape. F. CLARK. — Improvements in Floating Docks. Dated Jan. 19, 1857. — This consists in arranging a floating dock so that it may be sunk to receive the ship, and alterwards be floated by pumping the water from the space between the side of the ship and the interior side of the dock. W. R. BowDITCL. — Improvements in the Manu-facture of a Compound to be used as a Tarnish for Water Colours, and as a Carrier for Water Colours or Paints. Dated Dec. 20, 1856. — The patentee takes of milk I gall, of hard scop, 21b. and of common alum, 14 b. The scopi soliced thin and put into the milk, which is heated to about 120 deg. Fahr, and the mixture is stirred until the scap is dissolved. The alum is dissolved in the smallest quantity of water possible, and is then added to the mixture of scop and milk, and thronyclify incorporated by stirring. The mass is next ground fine in a colour mill. When The mass is next ground fine in a colour mill. When ground the semi-find mass is washed with water until the wash water bardly reddens blue litmus paper. It is then left at rest until the water at the top is It is then left at rest until the water at the top is elear, and this is 1un off. More water is then added, the whole mixed, left to settle, and the clear fluid drawn off. This is repeated until the clear water on the top of the thick white mass hardly affects blue litmus paper.

Itimus paper. N. C. SZERELMEY.— Improvements in Preparing Combinations of Materials for rendering Walls and other Structures Waterproof. Dated Jan. 2, 1857.—These improved "Greek cements" are pro-duced thus.—The patentee takes water, blood, ground bricks, powdered coppered slag, powdered irou slag argillaceous earth, and gascous matter produced from milk. These are boiled together, and called com-pound No. 1. In a second compound are employed gas or coal tar (or linseed od), rosin, or asphalte), pound No. 1. In a second compound are employed gas or coal tar (or livesed oil, rosin, or asphalte), hydraulic linue, grit, and calcined fiint. These are boiled, and are theu, by an iron ladle, transferred to a second iron pol, so that the air may come freely in contact, and after the mixture has cooled, it is again boiled until it spontaneously hursts into combustion, and after it has burned a very short time the fire is extinguished by a close fitting cover. This prepara-tion is colled No. 2. These cements, though capa-tion is colled No. 2. tion is called No. 2. These cements, though eaparate he of separate use, are preferred to be employed in succession on walls or other structures.

A CAMBRIAN MONUMENT .- A deputation from the Liverpool Cambrian Society recently attended at Plas Madoc, near Rushon, the scat of Mr. G. H. Whalley, for the purpose of viewing the site on the Eglewseg plateau, offered by that gentleman for the erection of for the purpose of vicening the safe of a Datavase, platen, offered by that gentleman for the erection of the Cambrian monument in honour of Prince Llewelyn, and the Crimeran and other herors of Wales, including those now fighting the hattles of their country in India, and of all Welsbmen entitled in times past "or to come" to the respect and gravitade of their coun-trymen. Ou the spot they were met by a committee of the National Esteddod, to be held at Llangollen in September next. Mr. Whalley stated that Lady Hall, end others of influence, were warm supporters of the and others of influence, were warm supporters of the movement. The company then adjourned to a tent on the apex of the mountain, where various appro-priate resolutions were passed approving of the project. and promotive of it.

THE BROTHERTON MEMORIAL. — You have done good scrive to the public by giving a view of the Brotherton Memorial, and as one interested in good monumental works I am especially glad; and if I may venture an opinion, I would pronounce the lower and the opper part as decidedly good. The centre or middle portion, however, shows such an evident amount of weakness, that it would be well for the architects and econmittee to reconsider this por-tion. I would suggest to straughten the supports by (instead of one column at the back of figure), three in the form of a trefoil. Their junction also with the lower part is poor, and has a certain meanness about it, and to get rid of this I would ad a pirreed par-pet immediately over the cornice: and these, instead of detracting from, would add to the heauty of the design, and the small amount of extra expense would ation.—W. L. THE BROTNERTON MEMORIAL. - You have done ation .- W. L.

ation.—W. L. THE GURNEY TESTIMONIAL, STRATFORD.—The design of the "Gurney testimooial" has heen pre-pared by Mr. G. A. Dixon, surveyor the Local Board of Health, says the *Chelmsford Chronicle*, and will he submitted for the approval of the provisional committee prior to a public meeting of the in-habitants which will be convened at an early period, when it is expected the design will be adopted, and a subscription promoted for earrying out the object. The site for the erection of the oholisk is the Broad-way. Stratford, the west end of SL John's Church. way, Stratford, the west end of St. Joha's Church.

INSTITUTION OF MECHANICAL ENGINEERS.— The general meeting of members of this institution was held on Wednesday in last week, at the Institu-tion, Birmingham; Mr. S. Lloyd in the chair. Several new members were elected, and the president, vice-presidents, and members of council, were nominated for election at the ensuing annual meeting. The first paper read was a "Description of Naylor's Improved Steam-Hammer," by Mr. Charles 'Markham, of Derby: the next was, "On Lighting Railway Trains with Gas, with a Description of Nr. T. J. Thompson's System," by Mr. J. Kitson, of Leeds: the last paper was a "Description of a Ventilating Apparatus for Buildings," &e. by Mr. Samuel Thornton, of Bir-mingham. After the meeting, a hydraulie engine, by Mr. David After, the meeting, a hydraulie engine, by Mr. David Jor, of Leeds, was shown at work, designed to be used as a simple and convenient motive-power of several purposes where steam-power is objection-able, or not available. INSTITUTION OF MECHANICAL ENGINEERS.-

to be used as a simple and convenient motive-power for several purposes where steam-power is objection-able, or not available. NON-CONSUMITION OF SMORE.--Mr. William Jackson, the extensive builder npon the Gore Estate, at Kensington, was last week summonde to the Ham-mersmith Police Court, for not consuming the smoke of a temporary steam furnee at Gloucester Lodge, used in saving timber. Mr. Walls, his manager, appeared in his place, and it was stated on his hehalf that he was not likely to do anything willingly to injure a property on which be had a million of money at stake. Plans showing the huildings creted, and to be erected, in Prince Albert-road, with a view of the new entrance into Hyde-park, were exhibited, in order to show the value of the interest Mr. Jackson had in the property, and it was stated that no expense would be spared to consume the smoke. The minimum penalty of 40s. with eostis was inflicted and paid. THE BRAINNOHAM BOROUGH SURVEYOR. -- A special meeting of the consult of this horongb has heen held to take into consideration the resolution passed, which recommended the dismissal of the here were thereore Mr.

passed, which recommended the dismissal of the borough surveyor, Mr. Pigott Smith, on account of borough surveyor, Mr. Figott Smith, on account of bis refusal to appear hefore them, to answer questions on the matters in dispute hetwith him and the coun-cil. The confirmation of this resolution was mored by Mr. S. Briggs, and seconded by Mr. Brinsley. Alderman Hodgson moved an amendment in favour of inquiry into the charges, and Mr. Sturges one re-quiring the resignation of the borough surveyor; but the original motion for dismissal was carried by 31 to 30. Soc being neutral

the original motion for dismissal was carried by 31 to 20, free being neutral. BRISTOL MINING SCHOOL.—The first lecture of the sessiou was given hy Mr. Thomas Austin, C.E. on "Sur-voying and Drawing Instruments." Much importance was at one time attached to the introduction of several wires into the warp of the wire tape; but as these wires were necessarily converted by the woof into believes in the process of manufacture, this tape was more liable to stretch than the ordinary tape. The leaded lines tape, with ribbed yarn was the least more liable to stretch than the ordinary tape. The double linen tape, with ribbed warp, was the least objectionable of any of the tapes, and was very useful in taking offsets, or amongst buildings, or other intri-cate work. The American rule was an implement usually made in yard or two-yard lengths, in pieces of horu or whalehone, four or six inches long, about half an inch wide, and one existenth of an inch thick, and made to adhere together by the application of the other there were then radiced to their proper thin glue: they were then reduced to their proper form, and the inches marked off npon one of their sorfaces: at these marks a hole was drilled, through the entire number, and a silver wire drawn through the entire number, and a silver whe wave when through the boles. These, when completed, were remarkably correct. Offset rods and staves, station staves and surveying arrows, and angular instruments used in field work, were next described; also the plane theo-dolite, the eircumferenter, and its various improve-ments, the theodolite, quadrant, sextant, & & &c.

THE JOINERS' STRIKE at MANCHESTER .- Since THE JOINERS STRIKE at MANCHESTER.—Since our last notice of this strike, three of the local archi-tcels, of long standing,—Messrs. Richard Lane, Wil-liam Hayley, and Isaac Holden, have offered to act, in conjunction with the mayor, as arbitrators in the direct on and the market builder. aispute, and the master huilders have at once unequi-vocally accepted the arbitration, and agreed to abide by the decision of the arbitrators. The committee of the workmen, in their reply, however, merely thank the architects named, and refer them to a copy of another letter addressed to the secretary of the mas-ters' association, in which they speak of a deputation heing " prepared to meet a deputation from the builders and the geatlemen you name in your latter dispute, and the master huilders have at once une nemy prepared to meet a deputation from the builders and the gentlemen you name in your letter to settle this dispute," at the same time announcing a "resolution" they had just come to, to "equalize the working time at the rate of fifty-six hours per week they are provide as otherwise others. the year round, or otherwise adhere to the rules last issued by the operatives, viz. 58 hours in the summer months, and 53 hours in the winter months." This, therefore, is neither a frank acceptance nor an equally frank refusal of the proposed tribunal, and is too like the fast-and-loose understanding of some previous arbitrations of a similar kind we have some re-. Ilection of, to yield, we fear, any satisfactory result in the present strike.

Nov. 21, 1857.

Builder. The

Vol. XV .-- No. 772.

ATIONAL Art-Education, and the machinery for effecting it, are matters of no trifling moment, and call for serious attention.

The statements made hy Mr. Redgrave at the distribution of national medals concerning the expense of teaching drawing in parochial schools, and the instructions for those who wish to obtain the services of an art-certificated master, seem to have

created among the masters in con-nection with the Department of Scieuce and Art a feeling of in-security, and, according to the letters which have appeared in our pages, and a dozen which have not, no

small discontent also.

It may he well, at some future time, to examine this and other matters in connection with it thoroughly, in order to discover the real facts concerning it, as well as to take a general view of the means that are being employed for the spread of art-education hy the department. At present let us take a cursory glance.

There are two classes of masters of schools of art. One is composed of those who, under the School of Design system, received appointments with an annual government grant made towards their salary; the other, of men who have heen trained in the central school in London, and receive their appointments from the Department of Science and Art; the contribu-tion towards the salary of the latter heing in the form of payments on certificates of competency awarded by the department. Thus, a man who possesses certificates for one branch of art, receives 10*l*. annually : possessing certificates for two hranches of art, he receives 20*l*.; and so The practical difference in the allowance to the two classes is, that a master appointed under the School of Design may receive 3001. a year from Government, and one who holds his appointment from the Department (if he is a very clever fellow) may receive 301. latter class who will be affected hy the new regulations; and, as they are the types of all future school-of-art masters, what affects them will affect all future appointments. There is also another difference in the position of the two other prospects, and finds himself possessed of men; for, whilst the fortunate possessor of an appointment from the School of Design teaches only in his central school, and in what other places, on whatever terms, he chooses,-the departmental master has to work a fixed number of education is his expected task, but to do so hours per week, in whatever places, and upou what terms, the School of Art committee and other people arrange for him. It would he thought from this that the recently-appointed teachers arc inferior men to their seniors in office, hut a glance at the subjects for examination for the higher certificates obtained hy the former, and a comparison of the condition and operations of the lately-established with the older schools, will lead to a very different conclusion. Here then are two sets of men engaged in the same occupation, hut not with the same amount of work, and vastly dispropor-Those who work the tioned remuncration. hardest, and have the least pay, are fearful, and it may be not without some cause, that the new regulations will still further diminish their for those who have the non-remunerative task salaries; at the same time asking that all masters of the instruction of the people; and, iuasmuch doing a certain amount of work shall have as art-power is socially and commercially a great

equal remnneration. This is a subject well de- good, we must not be too chary, at first, of it is to be hoped that the Department will be no longer bound hy the grave-clothes of the School of Design, hut on its own responsibility settle the matter equitably for hotb sides.

But without entering deeply into the matter, let us see what are the functions of the artcertificated master, and take an impartial glance at the positiou in which he is placed.

The avowed object of the Department is the art-cducation of the people, the opeuing up of new thoughts, and the placing in the hands of the lower classes a medium of expression and a weapou for work which have hitherto not been possessed by them. The obvious reason for this is, that it must necessarily increase national prosperity ; for, hy making us a more artistic and a more intelligent people, hy teaching us the relation that thoughts hear to things, in cultivating the one and facilitating the production of the other, we become more independently powerful, more productive, and, consequently, more wealthy. This is the husiness view of the case, and one, too, not to he neglected. Another aspect which the work of the Department may assume is a moral one. The possession of a good eye and an educated hand must necessarily carry with it something hesides its mere mer-cantile value. It is a key to the ignorant, by which they may unlock for themselves the door of heauty, and lay open to their eyes the inex-haustihle treasures of nature. Indeed, the possession of a cultivated perception is an incessant note of interrogation to all that is passively beautiful in nature or wonderful in art. And however much we have hitherto ignored the fact, yet the ultimate influence on the lower classes of a knowledge of the beautiful, and of the capacity for its admiration, must be to strengthen the moral faculties. Thus the results of art-education will he hoth to put a tongue into our fingers by which we may express form, and cause a recoil on our minds which must generate thought and inquiry.

The means for all this are as yet necessarily experimental. It has been found that the schools of art and design have not attained the object in view : it becomes, therefore, a question as to what means are to he adopted for its attainment, and under what circumstances. The trained and educated master of art (in its truest and not its conventional sense) is regarded as It is the the most fitting person to achieve the looked-for result, and upon his shoulder is placed the onus of the task. This is natural. But when a man has spent the best years of his life in mastering a difficult professiou, often at great sacrifice of so subtle a weapon as art-power, he rationally looks for some return for his long lahours, as well as a recognition of his professional position. To labour patiently in the mission of artwithout adequate remuneration he has not looked forward to. Here a difficulty presents itself. Our means of extending art influence to the lower classes are through the ordinary parochial schools; and such schools are not in a position to pay professional prices. How theu are the masses of the people to be reached? The majority of our country towns are not able even to-or, at least, will not-support a school of art, which is the recognised focus from which art-teaching must radiate ; and, without this, how are we to make art-educatiou general ? To meet these difficultics, it is evident that at first we must couple the general education in art of the people with the special art-education of particular persons, in order to create remnnerative positions

serving the careful consideration of the Depart-ment, and when it receives such cousideration, ment assistance. The man who has been ment assistance. The man who has heen severely trained in the Government's own school, at some expense hoth to himself and his country, must he made the means of this good to his fellow-countrymen; but, like other men in similar positions, he must he paid for it ; and, if we are to expect able, efficient, and intelligent men, they must he paid equivalently to their professional position

So much may he said for the future masters of schools of art; hut, in all justice, lct us look at hoth sides of the question.

It is a mistaken notion to suppose that the certificated art-master is to be the perpetual teacher of drawing in parochial schools. From the fact of its heing impossible as a permanent husiness speculation, we may decide it is not to be the case; and it is his own fault, and worse than his fault, if he does not make it a means to an end, and not the end itself. In a country town where a school of art may be established, he must he the teacher of such schools for a time, because there is prohably no one else besides himself who will teach it as systematically and well as himself. But, as he progresses, he will raise the means of shifting this arduous duty from his own shoulders to those of others, who together will he hetter able to discharge it.

And in this manner the schoolmasters and pupil-tcachers in every national school, in or near the town, should be compelled, as a part of their work, to attend a class for their special education at the school of art. The fact of teaching drawing in their schools increasing the salaries of the schoolmasters to the extent of Sl. for each school taught, will help to impress upon them the advantage of the power; but at any sacrifice they must be the power; but at any saturde they have been at the provide the providet the provide the p they are well ahle to impart instruction, and have the greatest power over their pupils : and as for the most part they are well educated and intelligent men, the task of acquiring the power of drawing will be comparatively easy to them.

Thus, then, in time, will the art-teacher raise up to himself the disciples who will help him in his mission. But in the interval, whilst he is labouring for a common good, he should not be made a sacrifice, which would he a most suicidal proceeding, inasmuch as it would certainly result in thinning the ranks of the hest men, hy giving them fair cause for descriion to a more grateful field of enterprise.*

Let each mau who is scut out to a provincial town he paid liberally, according to his standing, from the annual Government grant to science and art; and let this continue for a inited period, say one or two years, as the case may be. At the end of that time he ought to have made himself a position, inde-pendent of the greater part of State assistance, and should then be made the local iuspector of art-teaching in the neighbourhood; for hy this time we have supposed that the work, in parochial or non-remunerative schools, has been undertakeu hy his own pupils : he theu has to see that his machinery works well, and keeps in good order, and also to attend to his central school of art. By this means we might spread art education over a larger surface than our present system does; for, amongst the schoolmasters taught to draw, should be included those within a moderate distance of each town, and whose schools might be periodically inspected by the local inspector. Surely among other experiments this might he fairly tried in cases which would fathom its advantages.

* Not an uncommon case even now.

THE FUNCTIONS OF THE SCIENCE AND ART DEPARTMENT.

A SERIES of lectures on the Department of Art and A SERIES of lectures on the Department of Art and the Museum at Brompton was commenced on Mon-day exceing last, in the new theatre there: the lec-turer was Mr. Henry Cole, C.B., and the subject the Functions of the Department. It was an interesting statement, and will be made generally accessible hy being published for one penny. We would gladly print a considerable portion of it, but are forced by the multiplicity of matters which press upon us to for the peneture to two or three purprets. confine ourselves to two or three paragraphs.

Of the state contributions for promoting public education, Mr. Cole said,-

"The total national expenditure for promoting Public Education and Science and Art in every way through the primary division of the Education Board, the British Muscum, National Gallery, grants to Universities, and grant to this Department, may be conversions, and grant to this Department, may be taken, at the present time, to be in round numhers a million of pounds sterling, which divided among our population, say, of 30,000,000, makes the contribu-tion of each to average nincpence per head per an-num. It is difficult to calculate the annual value of num. It is difficult to calculate the annual value of the production of this country; but I tbink, seeing that our imports and exports last year amounted to 238,543,6807. It is not an over-estimate to place it as heing worth 400,000,0007. a year. The state con-tribution towards Education, Science, and Art, which vitally influences this enormous amount, therefore, bears the proportion of the outlay of oue pound on bebalf of Education, Science, and Art for every 4002. bebalf of Education, Science, and Art for every 4004. of production, or one penny in every 14. 13z. 44. The annual Parliamentary vote for the Science and Art Department only, being under 75,0007. is less than a ûve-thousandth part of the estimated annual production, and is about a thousandth part of the annual taxation of the country. It is as if a man with 1,0007. a year devoted 24. 6s. 3d. a year to the general education of his children, and gave them the calibrated lementgene of devortion before and a little additional advantages of drawing-lessons and a little navigation, at a cost to himself of 3s. 9d. a year. In navigation, at a cost to himself of 3s. 9d. a year. In the same proportion the agricultural labourcr, who earns only 25d. a year, devotes 1s. 3d. to the education of his family, and has to deny bimself the luxury of half a piut of heer in a year in helping his children to a knowledge of drawing, and earbling them to cut and rule straight lines. It may be pointed out as a coincidence at least worthy to be reinembered by any who oppose State ald towards education, that whilst democratic power in this courter has increased as a demand upon the

in this country has increased, so a demand upou the Government to exercise certain new functions has in-In this country has mercased, so a demand upon the Government to exercise certain new functions has in-creased also. As the people have felt their wants, and have had power to express them in Parliament, so the central authority has been called upon to administer to these wants, and it is the Government itself rather than the people which has endeavoured to obtain and preserve as much local co-operation as possible. This has been the case especially with the subjects of public education, in which, so far as I have observed, it is the completion of localities, and particularly where the jealousy of local authority is hottest, that the Govern-ment does not do enough for them. The Education Boards in England and Ireland, the Schools of D.sign, and the greater number of the grants for promoting Science and Art, have all arisen since the passing of the Reform Bill in 1880. It was rather the in-fluence of the Crown that created the Royal Academy the Apresentatives in 1810 on the subject of Public Galleries, even if it existed at all, that the the Chan-cellor of the Explonence is said the how refueed to mons' representatives in 1810 on the subject of Public Gallerics, even if it existed at all, that the then Chan-cellor of the Exchequer is said to have refused to accept the Dulwich Gallery of Pictures as a gift to the nation, on the condition of honsing and taking eare of the Pictures. Last year the Government, through Lord Stanley of Alderky as President of the Board of Trade, half a structure on their own re-sponsibility to scence Mr. Sheepshanks' munificent gift of pictures, valued at 60,000/. and Parliament afterwards cheerfally voted a sum under 5,000/. re-quisite for its cost. In half a century such has heen the change of public opinion in respect of National Galleries of Pictures."

" The number of Navigation or Science schools of all kinds at the present time in connection with the Department is twenty two. The number of Schools of all kinds at the present time in connection with the Department is twenty-two. The number of Schools of Art thronghout the United Kingdom at the present time is sixty-five; and, according to the last returns, they were the means of educating upwards of 35,000 students in drawing and painting. These numbers include children in poor schools under iostruction in drawing. Since the Schools of Design were expanded into Schools of Art, and made to embrace the teaching of drawing in public schools, the progress has here as follows:—In 1851, 3,200 students learning drawing ceast the State 32, 24, 44, each. In 1856, 35,000

nificant, being a triffe more than 1 in 1,000 of the population, and it is disheartening to feel that, accord-ing to the present state of public feeling for Azt, per-haps half a century most elapse before every mechanic will have had the means in his youth of acquiring those elementary principles of Art which would im-prove the daily work of his future life."

Speaking of the contents of the Museum, he said that many of the things exhibited had been either altogether hidden previously, or inadequately exhihited :-

"The arebitectural collections belonging to the Department for years were buried in the cellars of Somerset House, and were but most imperfeelly shown at Marlhorough House. The prints and drawings possessed by the Department have never heen seen by the general public. The casts of the Architectural Museum are surely better displayed than in Canon-row. The union of these collections, and the addition of the models of St. Pau's and various elassical buildings, betoken what an Archi-tectural Museum may hecome, if the individuals and the State will act togethor. Every foreigner who hus seen this commencement sees in it the germ of the finest Architectural Museum in Europe, if the public support the attempt." "The architectural collections belonging to the support the attempt.

And he added, "The iron Museum is only to be re-garded as a temporary refuge for the destitute."

CANNING TOWN AND HALLSVILLE, WEST HAM.

THE recent outbreak of cholera in this neighhourhood has led to further efforts ou the part of some of the clergy aud more influential inhabitants to obtain improvements in the drainage of the place, and such other mitigations of its miserable condition as may render the development of disease less likely. At the commencement of the year a petition had been forwarded to the Sceretary of State for the Home Development Home Department, setting forth,-

"That the houses in the district have, for the most part, been built without any regard to the health or comfort of the inhabitants.

comfort of the inhabitants. That the district is a marsh 7 feet below high-water mark, the tide of the Thames being only kept out by the river-wall. It is wholly undrained, and intersected with overflowing and pestilential ditches, which are the only outlet for all the sewage and fifth

of the neighbourhood. That the health of the neighbourhood has already suffered much from the neglect of proper precautions, the proportion of deaths to the population heing frightfully large."

And earnestly praying,-

"That immediate and independent measures he adopted to carry off the sewage from their houses, and the stagnant water which accumulates on the surface of the soil."

There was a correspondence in consequence between the General Board of Health (to whom Sir George Grey referred the petition), and the West Ham Local Board of Health, hut nothing was done.

A few weeks ago the cholera appeared in the parish, and carried off several of the inhabitants. The gentlemen who had moved hefore—the Rev. Mr. Marsh, the Rev. Mr. Mason, and Mr. Antonio Brady—immediately addressed the Board of Health again, and said, in the course of their communication ;--

"Public attention has been lately called hy your Board to the near approach of cholera. At least seven fatal cases have already occurred in this parish, and a heavy responsibility attaches to those who have heavy responsibility attaches to those who have neglected the warnings of experience, and allowed the present state of Hallaville to continue. It is not for us to suggest remedial measures, hat we would, nevertbeless, most earnestly entrent you at once to send an inspector (uncennected with the neighbour-bood) to report upon the sanitary state of West Ham, and especially that part of it lying in the Plaistow marbes."

They further urged that the inspector should instruct the Local Board as to the precautionary measures necessary now to be taken, and they suggested that advantages would follow "if the provisions of the Metropolitan Building Act were extended to West Ham." This was on the 16th ult. The President of the Board, the Right Hon. Mr. Cowper, went down im-mediately, and found honses without drainage, east the State 3*l*. 2s. 4d. each. In 1856, 35,000 without ventilation, without water-supply, ex-cau be estimated. But this number is really insig-ing an evaporating surface of the foulest

kind, and the roads a mass of mud and filth; the whole heing a marsh 7 feet helow high-water mark. In Vicarage-terrace the only kind, drain available is a sink under the pump, into which they habitually empty all the slops of their houses ! The sink communicates with the well, and the people have no other water to drink! The Board have addressed the Local Board of Health, calling upon them to take " immediate and effective measures for removing, or at least for mitigating, conditions so conducive to the development of the disease, under which most of the inhabitants of their districts are placed." At any cost, something should be done immediately.

We are not now approaching this place for the first time. Nearly two years ago we de-scribed the immiuently dangerous position of scrihed the imminently dangerous position of Canning-town, and in our fourteenth volume (p. 99), gave a sketch, showing that "the arti-ficial bank of Bow-creek, and the embankment of the Thames, are all that prevent the houses here from heing flooded every high tide." We pointed out that it was impossible to provide for the drainage of the place by the ordinary means, and said,—"The houses here have heen erected without the means of either carrying off the refuse or promety preting rid of the damp. the refuse or properly getting rid of the damp. In the course of time the *debris* of these and other houses will raise the level; hut it is sad to think of the sacrifice of human life which must take place in the mean time without prompt measures." Again,—"If something is prompt measures." Again,—"If something is not done, iu two or three years the ground will be poisoned by cesspools, water will staud on the surface, and evils of a serions nature will follow." "Let us hope for the introduction of measures proportionate to the extent of the future requirements. Flesh and blood are precious materials."

The measures were not taken, and the evils have become more apparent : again, therefore, we call for remedial measures. The creetion of dwell-ing-places in such a position should not be per-uited. Being here, their entry of the statement were mitted. Being here, their owners must do what can be done to save life. Flesh and hlood, as we hefore said, are precions materials, and the country cannot afford to indulge in prevent ible disease, involuntary demoralization, and premature deaths.

MEMOIR OF LOUIS VON ZANTH, ARCHITECT.*

THE death of a distinguished hrother architect, The death of a distinguished hrother architect, and more particularly of one who has been a corre-sponding member of our hody and a liheral contri-butor to our collection, demands some notice on our part. I feel it, therefore, to he a duty which devolves on me as your secretary of foreign corre-spondence, to seize as early an opportunity as pos-sible to pay that respect to the memory of our departed colleague, Herr Zanth, who has by his works well merited a page in the history of our art. I have access to helian that he was hown how

I have reason to helieve that he was born about 1798, at Breslau, in Silesia, and was consequently a 1/98, at Bresiau, in Suiesia, and was consequently a Prassian subject. His father was an eminent medi-cal man, and chief physician to Jerome Buonauatte during the residence of that sovereign at Cassel. Louis was educated partly at Cassel and partly at Paris, and, it is supposed, was a pupil at the Lycke Napoléon. Having evinced a decided taste for draw-ing, be was placed at Stuttgard, where his widowed rowther resided number the architter Hischer, unomother resided, under the architect Fischer, pro-fessor of the Polytechnic School in that town. About 1819, Zanth went to Paris, and became the pupil of Monsieur Hittorff, and although he had then made of Monsteir Filton, and Annoog the Last the index little progress in composition, he showed an evident bias for decorative detail and great purity of draw-ing. He followed his excellent master's advice, and took part in the competitions of the School of Architecture; hut heing of a reflective and delike-rative turn of mind, which cannot at a given moment the incorrigation and hence under such a command the imagination, and hence under such a pressure becomes faltering and undecided, he was never able to improvise with sufficient rapidity, and could not accustom bimself to the excitement, bustle, and clamour to which the impressionable youth of our neighbours yield when engaged in such exer-cises. This eircumstance affected his conceptions, cises. This erreumstance affected his conceptions, and although his "projets" were drawn out with the most elaborate care, he never could carry off a medal. But when keft to bimself, and to the quiet of his own leisure and reflection, his designs were

* Read by Professor Donaldson, at the meeting of the Institute of Architects, on the 16th, as mentioned cisewhere.

eareful treatment. Zanth from the pupil hecame the assistant of his friend and master, and in 1823 both went to Sicily, with the view to investigate fully and thoroughly the antiquities of that island, which as yet have never heen adequately illustrated, numerous and costly as are the works, and learned as are the authors, treating upon its ruins. During their stay, Mesara. Hittorff and Zanth were struck by the heauty of the nume-rous buildings created since the Greek times, and which adorn the cities of Messian, Catauia, Palerno, and other places, created hy the different conquerors of the island, since it was in the possession of the and other places, creeted by the different conquerors of the island, since it was in the possession of the Romans. They, therefore, took accurate drawings of the churebes, palaces, monasteries, hospitals, public fonntains, private houses, us also details of altars, tombs, pulpits, stalls, and other decorative embellishments in the churches, which are marked by a happy freedom of design, novelty, and effective combination. The work, which appeared in the joint names of the authors, was specially colited by Mons. Hittorff, in numbers, hetween the years 1826-35. The choice of subjects is extremely varied, contain-ing examples of Moresque, Saracenic, and Byzan-tine, as those of Palermo and Mon Reale, and em-mencing every period of modern architecture without the is those of raterino and when itelevis, and the bracing every period of modern architecture without an exclosive adherence to any. The excention of the work is in outline, and may be eited for the judi-cious selection of the subjects, the purity of the draw-ing, and exquisite character of the engravings. At the same time appeared many numbers of their work on the ancient monuments. It is to be the

work on the ancient monuments. It is to he re-gretted that this valuable publication has been suspended from the wart of particulars to complete their previous studies, which a personal visit to Sielly can alow satisfactorily supply. It is to be hoped that the survivor may accomplish what still remains a desideratum—a work on Sieulo-Greeian architecture, rendered complete by the light of modern rescarches, and the experience and herming which have of late rendered complete ny me ngit of much have, of late and the experience and learning which have, of late years, heen brought to hear on works of this class, and for the checkdation of which no one has proved himself more competent than Monsieur Hittorff.

Miniseli more completent than poinstent information. Zanth was especially struck by the peculiar mag-nificence of Mon Reale, and the Eastern aspect of the Capella Reale and of the palaces of La Zisa and La Cuba, at Palermo, of which he subsequently made some splendid and elaborate coloured views to a large intermediate fact this actual of art secure to have had some splendid and elaborate coloured views to a large size; and in fact this style of art seems to have had a decided influence on his fature artistic taste. In 1830 Zanth quitted Paris to seek a new sphere of employment, and returned to Stutigard, where he constructed many charming tuwn and country houses; perfectly adaleted to the convenience of the occupants, elegant in detail, picture: que in their masses. These creetions, and some of his heautiful drawings, were brought under the notice of the king, who im-mediately appointed him as his architect, and com-missioned him to make drawings for a theate to be attached to the palace; but which, unfortunately, was never excended.

was never executed. His royal patron was desirous to form for himself a kind of special personal retreat, or suburban villa, to which he might occasionally retire for the day, or a few hours, like those of the papal families in the to which he might occasionally reture for the day, or a few hours, like those of the papel families in the neighbourhood of Rome, as the Villa Papa Giulio, or those at Fraseati and Thvolk, or as is found in various parts of Germany; or "magna componere parvis," like that at Chiswick, belonging to the Doke of Devonshire. It was to consist of a principal casino, hot-houses, and conservatories; porticees, klosks, a helvedere, ball-room, theatre, and domestic offices, connected one with the other by the general distri-bution of the carrier an bich was to be adorned with connected one with the other hy the general distri-bution of the garleu, which was to he adorned with parterres, pieces of water, and fountains. The Wil-helma is situated at the extremity of the royal park of Rosenstein, at a league from Stuttgard, and near, the town of Canastadt, famous for its mineral waters, and the gardens extend down to the Necker. The style selected hy his sovertign was the Moreague. The plot of ground appropriated to the Wilhelma lites on a hanging level, rising from the Vecker; and Zaath found great difficulty in combining its various parts with the grounds of Rosenstein, which had been laid out by an ignorant gardener, without any reference to the undulations of the surface. In order to make himself acquainted with the most celebrated hotto the unaulations of the surface. In order to make himself acquainted with the most celebrated hot-houses in England, he came to this contry, and visited those of Chatsworth and others, and also studied the application of iron to the various purposes of the forcing-houses, as also its fluxess for the areades, cupales, kiosks, and columns of the porticoes. On the occasion of this visit he exhibited his mag-

On the occession of this visit he exhibited his infor-nificent series of Sicilian drawings in these rooms, and was elected an bonorary and corresponding mem-her of our hody. The studies of the Wilhelma were commenced about 1838: it was the favourite theme of his future existence, the one great object upon which he employed the remaining years of his life. His time, his health, bis talents, and his means were

THE BUILDER. admirahle, and evinced considerable originality and eareful treatment. Zanth from the pnpil hecame the assistant of his chivalrons love for his art. I bave said that the king selected the Moresque style for the architecture of his villa; a style which has not in our days been adopted for an architectural monument of any importance. With the exception of the edifice called the mosque,

in the Schwetzingen gardens, near Manheim, no serious attempt has been made to reconcile the forms, combinations, and decorations suited for one climate, so as to he adapted for another essentially different. The volume of Owen Jones was the only authentic reference for such a style; but of course it is evident, with even this admirable illustration of Moorisb work with even this admirable illustration of Moorisb work in the Alhambra, that much must be left to the imagination, the taste, and the discretion of the architect, to hermonize the fantastic poetry of the style, its brilliant decorations, and its piquant in-dividuality, with the ordinary wants and conveniences of modern European life. Our friend did not fetter himself by a slavish adherence to precedent, nur neglect any means of success; and he employed stone of rations columts from the adhining supervise for the neglect any means of success; and he employed stolle of various colours from the adjoining quarties for the principal buildings, rieb coloured brick for the offlexs, and cast iron for various details. The Wilhelma presents a conscientious mastery of difficulties, and the triumph of the architect was assured when the most renowned sovereigns of Europe, attended by their numerous hrilliaut suites, found themselves in the arcine the meriliant suites, found themselves in their numerous hrilliaut suites, found themselves in the easino, the conservatories, gradeness, and porticocs, brilliantly illuminated, and reflecting the exquisite decorations, which, harmoniously distributed through-out, charmed the eye and satisfied the taste. Aud although the magician who had created the fairy scene was not there, his master spirit delighted the hrilliant circle assembled in this truly royal villa.

Zanth has published ten chromolithographic illus-trations of Wilhelma, drawn with the most elaborate patience, truly German ; and they were executed by the most eminent lithographers in Berlin and Paris. He most eminent hthographers in Berlin and Paris. He spared no expense to insure the most hrilliant result, and one of the plates, the general view, required twenty stones. The French government, with a liberality that does honor to its love and patronage of art, subscribed for forty copies: it were to be wished that our own government feit more alive to the expe-diency of encouraging in a like manner publications of this class. He presented a copy of this costly work to our library.

that one of what government the more inter to the type diency of encouraging in a like manuer publications of this class. He presented a copy of this costly work to our library. A wealthy lauded proprietor in Hungary sent for hin to make the plans for a large village, with houses and farms of different sizes, a church, and other public huildings; in connection with the restored eastle of the lord. These designs are of the greatest interest; for he scrupplously studied to make them conform to the materials at command, hrick and wood, which were alone procurable in the country; and he gave them a notional charvicer, clevated by elegant and appropriate combinations and proportions, without departing from simplicity and utility. Zanth's health had of late years yicked to the unc-mitting to the material and the followed his art; and, absolute rest heigt mercsary, he last year visited

mitting toil with which he followed his art; and, absolute rest heing necessary, he last year visited Haly with Mons. Hittorff and family. His anxious friends had hoped that he might have enjoyed an ole-gant repose amidist use keenes without the fatigue of thought, and that the fire of his genius might have heen rekindled hy the renewed contemplation of the nohle works of that classics coil. But the tone of his early energy was gone; the languid invalid looked without enciting at these monuments which he had without emotion at those monuments which he had once regarded with the liveliest enthusiasm, and bis residence of some months at Rome was one of suffering and discomfort. While there he received instruction from his king to design a Protestant church, to b attached to the royal palace. This be completed, not without great effort, after the Basiliea type, and, on attached to the royal palace. This be completed, not without great effort, after the Basilica type, and, on bis return in Jane last, presented it to the king, who approved of the conception, and the church was decided to be carried out as designed by him, and to he com-uncneed early in 1858. He had also completed some time since the drawings for a Roman Catholic church, which it was recently intended to ercet after the con-cordat entered into between the King of Wartemburg and the Pone

which is the theorem into the second and the second at the second athe second athe second at the second at the second at the sec

tecture around them. They learned that it was Herr Zaoth, and that he lay at that moment on his bed of siekness. The Emperor of Russia, anxious to ex-press his satisfaction to the artist, sent Prince Gort-schwöff at once to the bed-side of poor Zanth, to pre-sent him with the decoration of Commander of the Order of Studiebus and the prince binself, attached Such him with the decoration of Commander of the Order of Stanishavs, and the prince binself attached to the breast of the sick artist the ribbon and eross of the order, accompanying the act with the gracions and torebing expressions of admiration which the emperor had uttered. Zanth was on his death-bed, but this act of kind consideration so thed the last moments of one whose devotion to his art and with the utility had advecting to the last.

amiahle disposition had endeared him to all who knew Zanth was an enthusiastic follower of architecture : Zanth was an enthusiastic follower of architecture; his predilections were for classic art. He was un-rivalled as a draughtsman for the miuute accuracy of every part and the finish of every detail. His large perspective drawings were the most scruppilous pos-sible renderings of the buildings they represented; and although they might want somewhat of acrial of art of the moure detained edited in and and alrough incy might what somewhat of adrial effect, yet they were always strikingly effective and grandly rendered. He was extremely susceptible in his feelings, and sbrinking from observation. In dis-position he was most generous, ever ready to acknow-ledge talent in others, and most firm in his attachas a friend.

No man is a prophet in his own country, and it is to be feared that the noble, upright, and highly-gifted architect of the Wilhelma was not as fully gifted architect of the Wilhelma was not as fully appreciated by those immediately near bim, as he was by the sovereigns of other states, and by his profes-sional hrethren in other countries, who honoured bim as an arist and esteemed him as a man. He had received the Cross of St. Gregory the Great from the Pope; that of the Liou of Zabringen from the Great Duke of Baden; that of St. Louis from the Duchess Regent of Parma; and he was member of the academies of Berlin, Munich, Milan, &c.

These few notes consist of the impressions produced by an intimate friendship and intercourse of five-and-twenty years, but I am indebted for many particulars to our mutual friend Monsieur Hittorff, who was to to our mutual intend subsect relation, who was to him as a brother, not merely in art, but in affection. Zanth was limited in his fricudships; his modest and retiring nature made him instinctively avoid numerons attachments; but the few who kuew bim appreciated the rare moral and intellectual qualities, which made them share in the triumph of his suc-esses, and lament him as one whose loss it is not easy to replace.

THE GREAT BELL AT WESTMINSTER.

THE GREAT BELL AT WESTMINSTER. Pick people give anything so liberally as advice, especially in matters which really do not concern them; there heing a searct pleasure in imagining they possess more discrimination than the rest of the world. It is now nearly two years since I offered some remarks on the forms, methods of easting, and inging of large bells, with suggestions on the subject. I stated that in proportion as the bell is increased in size and weight, so is it less likely to be sound and free from the chances of being easily cracked. If the hell is to be a large one, the metal must be fused at several furnaces, varying in intensity of heat, and some ready for the model before others; but when-reduce the model before others; but when-reduce the advice one so formed, as the chances are that different metilings may vary in temperature, and one will solidly before the other; also that per-tions of oxide or ently matter, floating on the sur-face, may prevent the perfect junction and incorpora-tions of oxide or ently matter, floating on the sur-face on the present or the perfect junction and incorpora-tions of oxide or ently meter. face, may prevent the perfect junction and incorpora-

face, may prevent the perfect junction and the prevent the perfect junction and the struck hy a clapper within, or by a hanner on the outside. Such continued battering upon a large hollow, casi or crystalline substance, perhaps in the first instance not perfectly sound, must, sconcer or later, excitably encode the metal. This may happen when the hell is quite new, or it may be used for several conturies hefter the fredure is ob-used for several conturies hefter the fredure is obused for several centuries helve the frecture is ob-served. A number of comparatively insignificant harmnerings or concussions will produce a very sur-prising effect if continued for a long period. The fracture may, at first, be so trilling as to be almost in appreciable by the most refined ear; hut every stroke of the laumer will increase the evil, nutil the vibra-tions of the metal are so interrupted, that instead of a long-continued harmonions sound, an unpleasant jarring noise is produced, and the bell becomes useless. Now that the bell at Westminster is broken, we can readily understand the cause, for we are told by Mr. Denison * that it was knocked sometimes within, and frequently on the outside, with a dapper or a

Are, periods " which is a shocked solutions within, and frequently on the outside, with a clapper or a heamner, from two to three times as heavy in propor-tion to the bell as any of the other large bells in England, and pulled sometimes by as many as *ten* men. The reason assigned for this difference in the

size of the clapper is, that the bell had a much greater thus constituted, might he led into a train of ideas and size of the chapper is, that the bein had a mound greated power of hearing blows than nsual. Suppose, for ex-ample, it was required to break a large hell: the mode of procedure would be to strike it with violent and repeated blows from a heavy barmner, till the operation was ultimately successful: then why not argeet the same tamination in all cases, if the same occess be adopted? The general *tone* of the learned gentleman, whose pro

on the 28th of January, 1856. When the bell was completed, Mr. Denison described it to a very nucompleted, Mr. Demson described it to a very un-merous audience, at the Royal Institution in Albe-marle-street, on Friday, the 6th of last March, in terms which induced us to believe that he was, in every respect, satisfied with it; that the whole pro-ceeding had terminated procisely as he expected; and, in fact, we were given to understand, that it was the only good bell in the world. Whether this was the case or not, it is immaterial now to inquire : all hopes case or not, it is immacrate now to inquire an topic of that one good bell are ended; it is useless, spoilt for ever, before it had been placed in its final destina-tion; but not before it had been delivered, highly approved of, and paid for out of the public ex-

Cacquer. I do not agree with the adage, that "experience makes all folks wise:" some people cannot see folly which is evident to the rest of the world. But I readily admit, that "experience makes wise men wiser:" the greatest philosophers sometimes over-elect thereabers, but their writtens may more shoot themselves; but their mistakes may prove valuable lessons of instruction to those who know how to benefit by them. For this reason, we must sin-erely hope that Mr. Denison has learned, by expe-rience in hell-metal, that the old shape, and the old method of manufacturing unusually large bells, is unlimited as to expense, quite uncertain as to the result; and, if ever so successful at first, that they result; and, if ever so successful at hirst, that they may terminate at any indefinite period: therefore, as the nation has just heen at the expense of having a good and durable bell, it may not be amiss to remind him that failners, similar to that which has already hap-pened to the Westminster bell, will, in all burnan probability, occur again and again, if the same form, the same weight of metal, and the same circum-stances, generally, be repeated.

Mr. Denison told us, at the Royal Institution, that when HE undertook the responsibility of determining the size and shope and composition of the five bells, the Chief Commissioner of Works anthorized the the Chief Commissioner of Works anthorized the making of such experiments as might be required, before finally determining the design and com-position of the bells;—and, further, that these experiments cost about 100. The great bell can now only be considered as one unsuccessful experi-ment, causing a loss to the nation, and we are still ignorant of any certain or successful termination: the metal may be recast several times, with the same result because in recasting a uniture of courser and the neta may be recast seven times, with the same result; because, in recasting a mixture of copper and tin, weighing sixteen tons, there are difficulties to contend with, little known to any but a bell-founder, or metallupgical chemist; and the expense may not stop at "Big Ben," for, every time be is malted and for inclating of commist; and the expense hay not stop at "Big Ben;" for, every time he is nelted and east, be will, probably, come out of the monid with a different voice, which may not clime in harmoniously with his little companions; and as it is much easier to alter four little bells than one large one, it is ex-To after four fittle bells than one large one, it is ex-tremely probable that they will all have to be reeast, to try and make them correspond in sound with their stentorian neighbour. This is by no means an imaginary incident: the present large hell was in-teuded to sound E flat; whereas, by some unaccount-able mismangement, it tarned out to be E natural. The next comprisent ways were to be E chem. The next experiment may prove to be E sharp.

Before the public is called upon to pay for casting another "Big Ben," which may again cad in vexations disappointment, it is to be hoped that the entire sub-ject will be thoroughly investigated, and certain wellper win be horoughly investigated, and tertain wei-considered experiments, upon a large scale, be under-taken, for the purpose of suggesting some modification of the old ponderous bell, which may answer every purpose intended, during the period of at least a em-tury, with a grand-sounding, dignified tone; and, if a satisfactory tone can be heard, with full effect, in St. Jamos' replace as of Low heat a low it is for what usid Satisfactory tone can be nearly with the survey, in sur James's-parks, or at Lamberb-palace, is it of such vital importance that it should be heard distinctly in Hyde-park, or the Regent's-park? The outline of research, or class of subjects for experiment, should not be under the survey distinct of the survey in the survey of the surve the entire direction of more amateurs, however learned they may be on other subjects. There can he no ob-jection to one or two well-informed amateurs, who Bettom to use or two werthing annatents, who mittee formed of two or three gontlemen eminently and certainly there should be added one or two prac- tieal bell-founders, or elever incebanics. A party, and certainly there should be added one or two prac- tieal bell-founders, or elever incebanics. A party, and certainly there should be added one or two prac- tieal bell-founders, or elever incebanics. A party, and certainly there should be added one or two prac- tieal bell-founders, or elever incebanics. A party, and certainly there should be added one or two prac- tieal bell-founders, or elever incebanics. A party, and certainly the date of Hardwick Hall bound be 1670 instead of 1750.

experiments as yet but imperfectly developed.* All persons in a civilized state of society are una-nimous in their admiration of classical learning and collegiate studies: such acquirements generally give those who possess them almost unbounded advantages there who possess then all less hearted, but the love of pre-cedent, and the desire of following in the popular current, have frequently induced such persons to adopt notions contrary to the plainest dictates of reason and The general tone of the learned gentleman, whose carriery to the planest dictates or reason and name appears so conspicuously embossed on "Big notions contrary to the planest dictates or reason and Ben," is to the effect, that he knows more abont bells common sense; and, consequently, the most incon-than any one else: this is certainly the substance of sistent schemes bave been admitted without serutiny, his two hours' discourse, delivered, before the bell and applied without reflection. The steam-engine, the was cast, at the Royal institute of British Architects, make 28th of January, 1856. When the bell was matured by men unknown to the universities but very for in advance of ignorance. They were self-taught: all the most learned men are, without exception, self-taught; for, if they are more learned in any department of art or science than the rest of mankind, of course no one can teach them: they advance by their own studious habits, and perhaps, mashached by scho-lastic authority, boldly venture upon untrodden regious of science to make discoveries of great public utility, whilst their more learned contemporaries are fearful of risking their reputation in pursuit of what may be deemed wild and visionary theories : therefore

"Give to the dictates of the learn'd respect, Nor proudly untaught sentiments reject."

C. H. SMITH.

FIR, DEAL, AND HOUSE PAINTING.

AN ATTEMPT TO DETERMINE THE PERIODS IN ENG-LAND WHEN THESE WERE FIRST INTRODUCED, WITH REMARKS ON THE PROCESSES OF THE LATTER.†

IN every branch of painting in oil applicable to huildings, the general process will be found very similar, with the exception of such variations as easily similar, with the exception of such variations as easily suggest themselves to the careful workman. The first essential is, that the wood plaster or cement should be perfectly dry. This is acknowledged by all, and yet when despatch is the order of the day, it must be neglected. One writer goes to the extent of stating, that "Perhaps in general cases, where persons are building on their own estates or for themselves, two or three genera are not too long to suffer the stace to remain unmainted. Those hows foremetly in specific specific states of the states of the states of the states of the specific states are not too long to suffer the stace to the states of the stat remain unpainted; though now frequently in specu-lative works as many weeks are searcely allowed."

The wook works as many weeks are scarcely allowed." The wook-work having been prepared for fixing, has first to undergo the operation of "knotting," in order to prevent the turpentine in the knots of fir-wood, from passing through the several costs of paint. One method for hest work is to cut out the knot whils the work is at the banch, to a slicht down and the fill the work is at the bench, to a slight depth, and to fill up the hole with a stiff putty made of white lead, up the hole with a stiff puty made of white lead, japan, and turpentine. There are many ways of "killing" the knots. The best and surest is to cover them with gold or silver leaf. Sometimes a lump of fresh-slaked lime is laid on for about twenty-four hours, then scraped off, a costing of size knotling applied, and if not sofficiently killed, they are coaled with red and white lead in liuseed oil, and rubbed down when quite dry. The general method is to cover the parts with the "size knotling" i.e. a preparation of red lead white lead and whitemine mode into a the parts with the "size knotting," i. e. a preparation of red lead, white lead, and whitening, made into a thin paste with size. The most common mode is to paint them with red ochre, which is worth nothing. The next process is that of *priming*, which consists in giving a cont of white lead with red lead, and a little driver in linseed oil. This is the first coat, and upon which the look of the paint on completion depends. This first, or minime coat, is put on helore "stopwhich the look of the paint on completion depends. This first, or priming coat, is put on hefore "stop-ping" the work, shoald that process he required. It consists of filling up with putly any cracks or other imperfections on the surface of the wood. If the putly used in the process of stopping be introduced before the first coat of colour is laid on, it becomes foces when dry. A good painter, after the application of this first coat, removes by punnicing all irregu-larities from the surface, especially those rendered apparent by the knots and fibres of the wood. A smooth surface being thus obtained, a second coat is eiven consisting of white lead and oil; about onegiven, consisting of white lead and oil : about one-fourth part of turpentine is sometimes added for quick fourth part of unpentule is solicitizes added for diplex work. If four ccats are to be put on this second one has sometimes a proportion of red lead, amounting to a fields colour, but if only three, it is generally made to assume the that of the finishing coat. It should have a good body and be laid even. This cost, when thoroughly dry and hard, is in best work rubbed down with fue scale paper, and carding examined to ascer-tain whether any further stopping be required; and then the third cost, or "ground colour" applied, of a somewhat darker (int than wanted when finished,

Nov. 21, 1857.

having sufficient oil for easy working, but not too fluid : thus, two-thirds oil and one-third turpentine are employed; or sometimes in equal proportions of oil and turpentine. The *flatting* cost follows, the object of which is to prevent the gloss or glaze of the oil, and to obtain a flat dead appearance. The advantage is not confined to the look of the paint, for it hides all defects in the wood or other material that is painted. White lead is mixed with turpentine, to which a little copal varuish is sometimes added, and when the tit is put in, it is always made lighter than the ground colour, or it would, when finished, appear in a series of shades and stripes. Flatting must be executed quickly, and the hrush is generally, if not always, carried up the wall and not across it. If must be understood that a flatting coat is not considered as a coat of paint: being wholly of turpentine, it is by exposure to the air evaporated, leaving a thin it is by exposure to the air evaporated, leaving a thin coat of pigment which is only required for effect, not for use. Some pointers, particularly where the work is required to dry rapidly, use a large proportion of turpentine in the several coats ; thus the ground coat has two-thirds oil and one-third turpentine. If four coats are to be laid on, the third has a little more turpentine than usual, which in the second is about a quarter, and so on. I would suggest for particular attention, that *tarpentine*, on the wole, is chiefly nseful for the purpose of saving oil and labour. It should never be employed where really lasting work is required. The necessity of having the substance perfectly dry before it is pulated bas already been noticed, and it is equally important that each roat of paint should be quite hard before another is applied, more especially where the work is exposed to the sun. paint should be quite hard before another is applied, more especially where the work is exposed to the sun. When the material is quite dry, the first cost is readily absorbed by the wood or plaster. Plaster to be painted requires some additional care in the work-manship itself: unless it be quite good, the line works ont in minute bubbles and destroys the effect of the paint, which can only be corrected by rubhing down and repainting; even then with uo great certainty of success. Some persons advocate the use of a priming or of a second coat, made of strong double size, stained with some colour to mark where the brush goes. The second coat, made of strong double size, stained with some colour to mark where the brush goes. The second coat then consists of white lead in all oil, used as stiff as possible: the third coat is made of single size with a little white lead ground in water to mark the course of the brush; and the fourth coat of white lead in two-thirds oil and one-third turpentine, with a little blue-back to take off the rawness of the white. Such work as this is now generally repu-diated; those in its favore state that it is of equal benefit with a coat of paint for miscle, hut confess that it is not so for outside work. Its objectors state that such when of a coats present the paint from sinking into the wood or plaster, cansing the paint for minking into the wood or plaster, cansing the paint for sinking into the wood or plaster, cansing the paint tool seel off and chip : I fear that it is much practised in inferior work. When inside work has to be finished inferior work. When inside work has to be finished of any colour, it becomes necessary to provide for it at the bird or second operation, according to the number of costs; porticularly if the work is to he fusished flat, or as it is termed, dead white, grey, &c. All new *outside work* should be primed a flesh colour, All new outside work should be printed a less costant, mixed in all lineard oil. The second cost may be of the same mixture if four-coat work is to be done; and in this coat all defects are to be made good. If three coats only are to he applied, this one should be laid on with core. The third and fourth coats, whichfaid on with care. The third and fourth coats, which, ever may be determined upon, are generally white, stone colour, lead colour, checolate, olive, and in-visible green, all in linseed oil. When white lead is employed alone, it has been recommended to dilute it with balf drying or boiled oil, and half linseed oil, as the boiled oil affects the colour of the white lead as the boiled oil affects the colour of the white lead as as the boiled off affects the colour of the white lead a little, but in all other colours hoiled oil may be con-sidered the best for the purpose of preservation. When it is required to cover a painted material, or "to repaint," the surface must be prepared to receive the coats of paint: it is sometimes first washed, or if the work be very greasy, turpentine is used, after which the paint is rubbed down with punice-stone and water, or with some potsah in it, until an even surface is obtained, removing any knobs or imperfections in the previous coatings. In re-painting, the first coat is called "second" colouring, the old work being considered equal to a primed state, ti is composed of white lead, turpentine, and oil, with It is composed of white lead, turpentine, and oil, with the pigment required for the colour that may be the pignet requires for the coolst taking of wanted. Some painters use two-birds torpentine and one-fourth oil; others three-fourths turpentine and one-fourth oil; and even all turpentine, drier, and a very little red lead; but this last mast be worked very quick, crossed once, and laid with the grain of the wood, as it is not much better than a flatting content of the short much better that a function coal. For third colouring of fuilsh, the white lead is thunned with half tarpentine and balf liaseed oil, drier, and a vorr little blue black, to take off the rawness of the white, and also to make it cover better. For the best rooms the flatting coat is re-quired, as before described. Two coats of new paint are frequently sufficient for ordinary work where painted

previously. Light-coloured work, as margins, rails, and so on, is generally painted before the darker work, as monklings, &c. Carved work especially requires care prevent the work being clogged up.

as monutings, but the work being clogged up. Where the face of old work presents a very had and uneven appearance from histers or other causes, the inequalities are filled up with a cement. Modern specifications often require that the woodwork should have four or more coats, until the paint "heres out." This is certainly necessary when it may be anticipated that little oil will be used, or where the priming and early coats may not have heen properly attended to. The early costs may not have then properly attended to. The result is a deadness in one part, the glaze continuing in another. It often happens, too, that the sun and air has quickly dispersed the greater part of the most and his questy using the print, i.e. its oil, and the work presents the same fastness. Care is also required when constantly painting in checolate or hlack: if these are made too thin with boiled oil, histers occur, which causes the paint to peel off, and leave the wood almost hare.

Painting plaster work demands a few observations. White lead and linseed oil, with some litbarge as drier, are mixed to the consistence of thin cream, applied; the oil is entirely absorbed into the er in a few bours. This coat will perhaps be and plaster in a few burst. This cost will perhaps be sufficiently dry in a day or two, when another, a little thicker, is given, the oil of which is also wholly or ouly partially absorbed, according to the nature of the plaster. In a few days a third coat can be applied, made rather thick, and (according to the absorption of the oil from the second coat) one-fourth or less of tur-pentine is added, and likewise the mirmants annoachim The of Hom to each deal the and the hord of reas of the pentine is added, and likewise the pigments approaching to the tint required. Should the plaster be thoroughly saturated, the flatting or finishing coat is applied as hefore described. When very durable work is re-quired, a fourth coat is put on, thinned with equal proportions of turpentine and oil, and then the flatting coat. If the plaster he not flatted, the last coat is work of the plaster he not flatted, the last coat is coat. If the plaster he not flatted, the last coat is made of two parts turpentine to one of oil. By thus painting, plaster is rendered incapable of absorption, panding, passed is relative inservice inservices, and its surface becomes hardened by the oil to a depth of about an eighth of an ineh, rendering it less hrittle, and enabling the surface to be washed. To effect absorption quickly, painters sometimes give the plaster two or three coats of hoiling linscel-oil, which plaster two or three coats of homing insect-oil, which are soon absorbed, and then give it the other coats of paint. The substance, generally, constituting inse-tenths of the hody of paint, is carbonate of lead, commonly called white lead, the quality of which is therefore of the greatest importance to the durability of the work. White lead is sold to improve by being kept for several years before use. Besides the three qualities manufactured, six or more chief modes of adulteration have been recorded: 1, by carmodes of adulteration have been recorded : 1, by ear-boants of line, as chalk, whiting, &c. 2, sulphate of line, as gypsum, selenite, plaster of Paris; 3, ear-boands of baryta : 4, sulphate of baryta : 5, pipe and other clays; and 6, starch, flour, &c. Fine whiting ground in oil is very difficult of 'detection: it not only renders the paint a much less compact body, but causes it to be more easily acted upon by the atmo-sphere; thus hlanching it and destroying it by re-peated washings. These adulterations will in some measure account for the creat difference that exists in peated washings. These adulterations will in some measure account for the great difference that exists in the prices of painters' work. The other metallic white paint now used is zinc white, well known for its intense whiteness, its resistance to sulphurous and other deteriorating causes, and its harmless qualities to the painter and the inmates of the house under decoration. It is requisite that the oil used should he as white as possible, all the brushes and pots well cleaned with spirits if they have been used before for white lead, and driers or colours with a lead basis should not be mixed with it. Zinc white possesses Broud not be mixed with it. Zhue while possesses less hody han while lead, and great ear is requisite that the colour when ground in oil is of sufficient con-sistence to be laid on a flat surface without showing through; for in that state any oil in excess will form through; for m that state any oil in excess will form a slight glutinous casting on the surface, retaining every particle of dust hrought in contract with it, until it has evaporated. In general this white will not dry so quickly as the older colour, but bis defect is remedied by the application of proper drying oils. With these precentions a few trials will enable any painter who chooses to work sine white to overcome the difficulties which appear at first to condemn the invention. It is asserted that in consequence of the evert durability of the colour of this coint, a house

will dry directly. For finishing, the white lead is mixed in half linseed oil and half turpentine, and used as stiff as possible: hlue-black, or some colour, and a bitle drier, are requisite. The use of distemper is older than that of oil and varoisb. Whitewashing is a kind of distemper, espe-cially when size is used with it. The extracts from the second is the forement of this peak have and

Variable. Whitewashing is a kind of also imper, espe-cially when size is used with it. The extracts from the records in the former part of this paper have no doubt reference to this kind of paniting, and the word "colour" would he more applicable as a trans-lation than "paint," which is generally used. Com-mon distemper colour for walls is Spauish white, or whiting, hroken into water, to which is added strong size whils warn, and then allowed to cool, when it should appear a thin jelly: two coats are generally necessary : when applied to old work, it should be first washed by a brush with water: this process in old publications is called "painting in water colours." Papered rooms coloured in this manner, especially if flock papers were used, look very well, as the pattern can he seen through the costs of colour. A convenience in the nee of this preparation is that the rooms may be completed and dry in one day, with very little dirt or inconvenience. It is not generally known that walls which have been distempered cannot afterwards be line-whited, in con-sequence of line when laid on whiting becoming It is not generally known white works works in a con-sequence of line when laid on whiting becoming yellow. Of colours, however, can be applied a'ter-wards, and then white lead is used. Apptraents that are to be varoished are prepared in two ways. The first is by applying the intended distemper colour, and then covering it with as many coats of coloured or nucoloured varish as may be required. It may be useful to observe that distemper causes the word to swell, and that if the material be not quite dry previous to the application of the varnish, the latter penetrates into the size, but is prevented from reach-ing the wood by the moistror retained in it, which opposes any union with the resins forming the base of the varnish. The varnish then gives to the distemper the hardness of cement, which, not yielding to the shrinking of the wood, scales of in drying. The shrinking of the wood, scales of in drying. The second method is to grind and mix up the colour with varnish, which produces a better result, especi-ally if the coating he applied when the wood-work is dry, and if it be very clear, so as to dispose the wood to imbible it. The successive coats then become in-corporated with the first. Generally hut little colour corporated with the first. Generally hut fittle colour is added to the last cost of varnish, and in some cases it may he applied colourless. It then forms glazing, and its brilliancy is greater; the colour also is stronger. The use of size produces a considerable saving of varnish, and the splendour given to this last theory occurrent the imperfections of an uncent saving of varmins, and the spiendom given to this last stratum conceals the imperfections of an unequal coaling of the colour. For new plaster-work a coat of size is requisite; a solution of glue in water, not too strong, is applied warm, that it may penetrate the plaster, which should be already quite dry. Ad-ditional effect may also be obtained by a eareful puncicing after the first cont.

ditional effect may also be obtained by a carchi-puncicing after the first cont. It is generally asserted that varaish is more liable to injury by dirt than oil painting, and that the means of repairing it cannot he the same, because the dirt adheres more strongly to the resinous parts of the varaish than to the oil surface. Soap and water applied carefully with a sponge, and the use of clean warm woollen cloths to dry the work, are efficacious means of cleaning both surfaces. The steps of wooden staircases which have heen painted, graued, and varaished, wear better than those which have heen only painted; the gloss is only very slightly injured by the operation of cleaning, and neither dust nor dirt adheres so easily. A coat of varaish can dirt adheres so easily. A coat of varaish can be again put on at any time. The processes of graining and marbling may be traced back as far at least as the time of Jaues VI. of Soathand (1567-1603), during whose reign a room of Hopetoun Tower was painted in initiation of marble. Before that period, init-tions, as I have already mentioned, were done in stone-colour, marble-colour, wainscot-colour, &c. In 1676 marbling was excented, as well as initiations of olive and waluut woods; and in 1668 tortoise-shell was copied on

excetted, as well as initations of olive and waluut woods; and in 1658 tortoise-shell was copied on battens and mouldings. The friend theor referred to tells me that the doors of the chapel in Cou-duit-street, Bond-street, attracted much attention from the novelty of their heing grained to imitate wainsect, done perhaps about the yeur 1610, when a new front was given to the building. From some letters in my possession I find that manogany was imitated in 1815, and maple-wood in 1817. The imitating matribes and most kind of woods has nothing very peculiar in its mode of execution, being similar to acteal painting, the result depending more on *natural* With these precations a few trials will enable any painter who chooses to work zine while to overcome the difficulties which oppear at first to condemn the great durability of the colour of this paint, a house painted with it may be washed for a succession of three, four, and even five years; and that after each and hright as when frech painted. Clearcole has already been referred to in conjunc-tion with coats of oil paint. It is a cheep mode of grainting is in the first instance the same as for with coats of oil paint. It is a cheep mode of grainting is in the first instance the same as for with coats of oil paint. It is a cheep mode of grainting is in the first instance of execution, being similar to exceede has already been referred to in conjunc-tion with coats of oil paint. It is a cheep mode of grainting is in the first instance the same as for with coats of oil paint. It is a cheep mode of grainting the meessary to paint the same as for with coats of oil paint. It is a cheep mode of grainting the mixes when first painted, which might is necessary to when it is necessary to paint of oil and spirits of turpentine, and is brought up to oil and spirits of turpentine, and is brought up to wates and mixed with size, laid ou : this

The shades and grain are given by thin glazings of Vandyke hrown, hurnt sienna, or number, ground in water, and unixed with small heer, which is a suf-ficiently glutinous vehicle; hut imitation weinscot requires a thicker one, in order to receive the im-pression of the combs by which the grain is imitated. Thus oak graining is executed with colour in turpen-tine mixed with a little turpentine varnish; the work heing covered with it, the combing is done without delay as it dries very quickly. The lights are then taken out with a camel's bair hrosh, or a rag moist-ened with acrement's hear housed. In cheap work the operation ends here, and the surface is covered with capal varnish to protect it; hut good work is "over grained," that is, a glaze of colour in beer, as drik as my he requisite, is laid over the comhed work, in shades thrown across the work. Sometimes the whole panel is laid in with this glaze, and the lights taken out with a sponge, a brush is then used to lighten The shades and grain are given by thin glazings of the whole panel is laid in with this glaze, and the lights taken out with a sponge, a brush is then used to lighten the elges; when quite dry the work is overgrained with the same colour laid on thin and softened off. For graining withscot in oil, bees-wax is used instead of varnish to the colour, mixed in equal quantities of turpentine and oil; one, two, or three coats of a good oil varnish, such as copal, are applied when the work is coute dvy.

quite dry. Time only allows me to mention the use of staining and varnishing, and to refer slightly to the process of polishing wood by varnish and wax. Varnish and polish, and vareishing, and to refer slightly to the process of polishing wool by varnish and war. Varnish and polish, both form a glazing, and give a lastre to the wood they cover, as well as heighten the colours of the wood, but from their wart of consistence they yield to any shrinking and swelling, rising in scales or cracking when much knocked about, which damages ean only he repaired by application to a proper workman. Waxing, on the contrary, resists percussion, but it does not possess in the same degree as varish the property of giving lustre to the hodies on which it is applied; any accidents, however, happening to its polish are easily repaired by rubbing. As another method of covering a surface, the hoad may be employed without the use of oil painting. The surface having been prepared, it was at once grained, the natural colour of the wood forming the ground of the imita-tion wood, the whole was then varnished as usual. In coarse deal, the knots might he worked into the patter, but in wood selected for the purpose, the small knots could hardly be said to disfigure the work. Another advantage to be considered of material importance is, that as there is no oil painting ruined, the material would be drying up to the last minute of finishing the house, when the graining and varuish-ing would be done in a few days.

The proper time to paint is a subject worth con-sideration. For interior work it is not so important as it is for exterior; though for the former some part of the warm, not hot season, should be selected, not only It is nor exterior; though nor the former some part of the warm, not hot season, should be selected, not only togetrid of thesmell morequickly, but hecause moderate heat improves the look of the work, while cold air chills the oil. For external work, the proper season is modoubtedly the autumn, when the days are suffi-ciently hot to dry the work properly, and the weather sufficiently settled to allow of its heing earried on continuously. If a house is done up for the summer, the paint then executed in the spring is chilled by the cold and roined by the unsettled weather. Or should the paint then executed later, say in the month of June or July, the hot san dries up the oil, the really effective preservative property of the paint, before it can be absorbed. Such work is consequently worth-less at the cud of less than two years, whereas were it done at a later period the result would be a better appearance, lasting for perhaps donble that time. Aspect should also be considered when external paint-ing is required to he performed. ing is required to he performed.

The Chairman (Mr. Scoles, V.P.) in reference to Mr. The Chairman (Mr. Scoles, V.P.) in reference to Mr. Wyatt Pajworth's remarks on variabing without point-ing, stated that the late Sir Anthony Carlisle had the interior wood-work of his house in Langham-phace, so variabled throughout, and the effect of the varuished d-al was very like gatin wood. The wood-work of the Swiss cottage, at the Colosseum, in the Regent's-park, was also only varnished.

pose the surface of the paper. But if used with a less volatile oil, the varaish would produce a totally differ-ent effect, and, for wood-work, only copal varaish in oil should he used. This would give a very hard surface, as might be seen on the panels of carriages. Besides as might be seen on the panels of carriages. Besides Sir A. Carlisle's house, he might meution a honse huilt about the year 1813, at Brighton, by the late Mr. Bonomi, for Mr. Prince Hoare, in which the joiners' work was varaished, and it was in a very good condition many years afterwards, the varnish having arquired a very dark rich colour. With regard to cleaning paint, a solution of wood ashes was frequently employed formerly for washing either linen or paint. This mitture if too strong had a tendenar to decom employed formerly for washing either linen or paint. This uniture, if too strong, had a tendeney to decom-pose the paint, and careless use of pearlash and soda would awash off all the paint, though if nsed gently it would effect the object required. With regard to paint, the only valuable quality of white lead was its extreme density. In the course of his early experiments he had tried to make a pigment from sulphate of lime, using the finest plaster of Paris; and, although this made a heantiful pigment, there was no body in it. This material was applicable to water-colour painting, if mixed with a very little gam, to prevent its brashing off. It had advantages over the white, generally used for water colours, and made of lead or zine; and if the slightest film of it were of lead or zinc; and if the slightest film of it were used it would he almost transpareot when laid on, but when dry intensely white. In experimenting upon maguesian limestone he had found that magnesis was also applicable as a water colour. He did not know of any sulphate or mixture of sulphur that would have any effect upon it. It was totally unaffected by the vapour from sewers or drains, and therefore superior to white lead for distemper painting.

Mr. J. G. Crace (C.V.) said that the very best way Mr. J. G. Crace (C. v.) said that the very best way of treating wood was simply to variability, and not to smother it over with paint. Eight or ten years ago he had been employed to paint a house in the 1sle of Arran, for the present Duke of Hamilton, and he had found the wood work, of red pine, so free from knots, and so wall scenarized that he surgespite that it should and so well excerted, that he suggested that it should he at once varnished. This was done with great success, and the work had lasted, and looked now as well as when it was done. He believed paint had not hern used as a preservative to wood before the time of William and Mary: hefore that time painting was a decorative process. The style of architecture and the decorative process. The style of architecture and the use of wood scen in the buildings of William's day, altogether came, he thought, from Holland. Mr. Crace referred to a document in his possession, heing a tende for painting the work at Greenwich Hospital, in the year 1696, by William Thompson. The price asked for painting outside work three times in oil was panting outside work inree times in out way per yard. There was also a price for painting ics, iron bars, and inside work, and for painting 8d. sash "three times in good inside work, and 107 painting of "three times in good inside work, and well primed." Mr. Crace also referred to papers alluding to the "walant" nad "wainsot" coloars mentioned by Me. Wyait Papworth. Among these were charges for "all outside painting 3 times in oil, at \$1." and for "all outside painting 3 times in oil, at \$1." and for "all inside, walnut or wainscot, 9d. per yard." for "an inside, wainut or wanscot, on per yard: these prices showed that graining was not intended. At this period (1696, seven years before the accession of Queen Anne) he believed painting was chiefly executed in white; for in cleaning of the paint from old wood work of that age, he almost invariably found that the original aclour had hear white. A blue tint that the original colour had been white. A blue tint, was alterwards used, and, in the time of George III. various shades of stone colour and drab. Graining and marbling were introduced into this country about the year 1782. Mr. Grae stated that his constry boot introduction by French workmen at Carlton House for the Prince of Wales; they were then considered be spread novelties, or at all events as a reintroduction. With regard to the operations of painting, he could not too entrestly urge the necessity of eareful "knotting," the neglect of which could not afterknotting, the negree of which could not alter-wards be remedied. The evil arising from this neglect was constantly seen in the common application of two coats of builders' pairt, after which the dark spats showing the forms of the knots soon bronne visible. For bad work a remedy might be found in rubbing down, sand papering, or purice stoning; but had knotting could only be got over by scraping down to the knots themselves, and redoing the work from the heginning. The use of size colour was also to be guarded against, as its application in the first instance guarded against, as its application in the first instance prevented the absorption of the oil points by the wood, and all the after processes only formed a skin laid on the woodwork, rather than a conting to effect its preservation. When the sun (as in a window-shatter, fore xample), struck upon wood sized before pointing, it was sure to crack and flake off. With regard to pigments, Spanish white was only whiting: none but those with a metallie hase had any hody at all. White-lead furcished the hest body that could he applied to woodwork. Zine naint possessed hory at all. White real turnished the last body his could be applied to woodwork. Zinc paint possessed several valuable qualities, but it had very little body. Any one who had used it would know that after even

THE BUILDER.

seven or eight coats the grain of the wood could he seven or eight coals the grain of the world could be seen; and he would call particular attention to the fact that zinc paint would not clean well. It had a face which might be compared to wax, and any attempt to clean it seemed to rub in the dirt, so that a bright clear surface could not be got, as with so and a migur clear surface could not be got, as with so and a paint. To clean paint he strongly recommended that the raw alkalics should not be used, as they would infallibly take off the flatting coat. The best mode of cleaning was hy means of good soap, not too strong, laid on with a large brush, so as to make a lather: this should be a range of usi, so as to make a nation: I missionia to washed off clean with a sponge, and wiped dry with a leather. With regard to varish, nothing bat copal should he used, as no other would stand wear so well. It was the most expensive of all variables, and there-

fore could not be applied good in cheap work. In reply to an inquiry if there was any practical In reply to an inquiry if there was any practica-disadvantage in applying zinc paint upou previous coats of lead, Mr. Grace stated that the manufacturers of zinc paint appeared to have come to the opinion, that it was best applied as a finish upon a body of fine quality, and, under favourable circumstances, would last well. Some experiments which he had tried in a long corridor at the Houses of Parliament, under the direction of Sir C. Barry, where the manufacturers of the zinc paint conducted all the operations, seemed to show that there was practically no difference in the durahility of good white lead and good zinc paint.

Mr. G. Godwiu (Fellow) said that the testimonials in favour of zinc paint were very strong; and, if it had no other advantage, its prevention of the misery arising in the shape of painters' cholic, loss of hands, &c. from the use of lead, would make every member of the profession anxious to use it. His own limited experience had furnished him with two cases of failure, which he was told had arisen from apply-ing the zinc without cleaning off the coats of lead paint underneath; and the intended white paint had turned ont to be nearly hlack. Mr. Wyatt Papworth's paper had brought many valuable facts together, and would, no douht, lead many to understand why one would be domining the thirty per cent. ebcaper person could do painters' work thirty per cent. ebcaper than another, and yet get more money hy it. He moved the thanks of the meeting to Mr. Papworth his paper.

Mr. Ashpitel (Fellow) referred to a large public ining room in the City, where he had employed zine white, with a satisfactory result, upon coats of red lead, and found that it was not effected by gas-

red teah, and found that it was not allected by gas-light, as lead paint was. Mr. Jennings (Fellow) observed that the use of paint had the advantage over ordinary varnish, that, hesides protecting the work, it gave it a linder sur-face, and enabled it to hear a severer blow than if varnish had been employed. French polisb produced the hest effect; but if two coats of copal varnish were applied, and then polished, the effect would be as good, and the surface as hard as if the work bad hear nuived. had heen painted. Mr. Thomson (Fellow) referred to a case in which

a pair of wainscot doors were carefully finished, rubbed down, and hand-polished to a satin surface. One side of these was afterwards varnished, and the effect was it hore out upon what was termed the figure of the wood, and it sunk into the softer parts : so that it not only produced a rough appearance, hut also changed the actual texture of the wood, which, on being touched by the hand, was as coarse as a rasp, and some excellent work was spoilt by the experiment.

Mr. Crace said that, in the experiment, Mr. Crace said that, in the experiments at the Houses of Parliament, to which he had referred, it was clear that the zine paint had not the marked supe-liable which was bliefed for it. On the worked riority which was claimed for it. Ou the sanitary question he added, that the workmen did not like it so well as the lead point. They said that it smell sour, and made their throats sore. He had in his establish-meat mea who had worked there more than five-andthirty years with lead paint, without having a day's illness. Ite helieved it depended entirely upon eleanliuess, and, among the various artizans employed by him, he would match the painters against any others for healthy looking men, and steady, well-conducted Imen

Mr. I'Anson (Fellow) referred to a case in which zinc paint (mixed, he believed, with varnish) had been applied over distemper, and the work had stood remarkably well. His own experience was, that it Teinaranity well. This own experience was, that in required five coats of ine to produce an appearance equal to four coats of lead paint. He found that the workmen nauscated and disliked the use of zine more than that of lead; but he could not say whether the permanent effects of the latter were most deleterious

or not. The Chairman referred to the green-honses in the Palace Gardens at Salisbury, which had been painted last yeer, but the appearance of which had led him to ascertisin that zinc paint had been employed, and that the result, he thought, was unfavourable on the score of durability. that the result, he thought, was unfavourable on the score of durability. Mr. Digby Wystt (Hon. Sec.) said that, in any fine pate in the noble enthusiasm with which Mr. Waring

Nov. 21, 1857.

revival of the ancient or modern Italian styles of decoration, the effect of the other tints employed de-peuded mainly on the brightness, purity, and dura-bility of the white; and the most beautiful rose tints were obtained through the slightly transparent upper coat of white. In the use of lead paint, or other mate-rials which had a tendency to turn yellow, this im-portant advantage was lost, and it was desirable, there-fore, the consider any material which amcered to nossess fore, to cousider any material which appeared to possess a character of permanence and purity, with a view to arrive at something like the white pigments which the ancients obtained from their fine white marble.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

ON Monday, the 16th, the ordinary general meet-ing was held, Mr. J. J. Scoles, V.P. in the chair.

In G was here, bit of second version of a donation with C C. Colson, honorary scoretary, announced various presents, including a portion of a donation from Mr. G. Wightwick, in the shape of 100 drawings, and five or six lectures delivered at the Athenerum, Plymouth, with casel and footlights for the draw-iour and this is be mitted and remained with drawings ; and this, he pointed out, was especially deserv-

In the bask hanks of the Institute. Mr. Digby Wyatt bore witness to the value of the donation, and

Professor Donaldson said he helieved it was Mr. Wightwick's original intention to have left these works to the Iustitute in his will, hut he had adopted this more agreeable method of presecting them to the Iostitute. He moved,—" That the honorary secretary be requested to acknowledge the donation in the most distance are agreeable to be a second to be flattering terms.

The motion having been seconded, it was carried with applause.

Professor Donaldson, as honorary secretary Professor Domusion, as howed, Foreign correspondence, presented a dupation from M. Ilittorff, of Paris; a memoir of Herr Schickel, architect, of Berlin; and a profile bost of M. Roeland, honorary corresponding member at Ghent, who had scat them numerous domations, and amongst them scat them numerous donations, and amongst them drawings of candelabra in the church of St. Bavon, at Ghent, in brass and copper. They originally he-longed to Charles I.; and on heing sold with his effects, were bought by Bishop Trieste, of Ghent, and by bim presented to the church of St. Bavon. The candelabra, of which there were four, were of con-siderable height, and they contained the arms of Charles I. The Institute had representations of other candelabra, designed by Buonperiti and Raffielle candelabra, designed by Buonarotti and Raffaelle, and as they were drawn to the same size, it was init was in tended to have them placed together, so as to show those that were the actual execution, and those that were merely the designs, of these illustrious masters. They had also been favoured with a number of prints of the huildings M. Roeland had executed at Ghent, some of which were very interesting. One was of a large church at Brussels, now in course of construction; another, of a brilliant coffee room, which he had added to one the clubs of Gheut, entirely of marble; and t they would he able from the drawings to form some idea of its heauty. There were also drawings of another church he was constructing at Ghent, and of a riding house and some shops. He (Professor Doualdson) had further to present, The History of the Academy of Fine Arts at Dusseldorf, by Heir Weigmann, architect, of Dusseldorf; also a donation from Signor Kaftangioglou, architect, of Athens.

The Chairman announced the decease of Mr. James Morrisou, the well-known millionaire, who at the formation of the Institute not only became an hon. fellow himself, but put down his son's name.

fellow himself, but put down his son's name. The Signor Lysandros Kaftangioglou, architect, director of the Royal School of Fine Arts, Athens, who had excented a college for young ladies for the Queen of Athens, Herr Rudolph Weigmann, architect, Dusseldorf, Professor of Architecture, and Secretary of the Royal Academy of Fine Arts at Dusseldorf (who restored the great Gothic church of the Saviour at Duisharg, and is the author of various works on architecture, engineering, and perspective), were elected as hon, and corresponding members. Professor Donaldson then read a "Memoir of the late Herr Zanth, architect, of Stutteardt, Wur-

the late Herr Zanth, architet, of Stutigardt, Wur-temburg, hon. and corresponding member," and author of the "Architecture of the Wilhelma, or Palace of the King of Wurtemhung." The paper, which we have given in full on another page, was profusely illustrated with views of the gardens, ind architectural features of the palace, and was received with much applause.

Ceived with much applause. Mr. Digby Wyati (in the absence of Mr. J. B. Waring, associate), read a paper on the "Arts con-nected with Architecture in Tuscany," heautifully illustrated with examples of stained glass, fresco ornament, and markle, enamel, and wood inlay, as practised in central Italy during the Mediæval and Change active particle.

had taken up this interesting subject, and it was to be hoped that he would give them further information great national monument, St. Paul's. The nation's on it by way of complement to the series. Pro-ductions of this kind, conceived and carried out in and it was a consummation that all architects and on it by way of complement to the series. Pro-ductions of this kind, conceived and carried out in this spirit of performance, were virtually the fulfilling of the purposes of all high art; and, perbaps, there could not be a more striking exemplification in Eng-land of the want of these grand adjuncts to the com-pletion of the architectural picture, than the case of our own St. Paul's. Mr. Waring had had it down a that the useful should never be disconnected from the heantifal. He (Professor Donaldson) would adopt the converse of that proposition, and say that the beautifal should never be dissociated from the mesful. It was the beautiful that gave to the nerful its senti-ment and its expression, and it was the beautiful that brought home conviction to the mind and feeling, and without which no impression was made upon the heart. Let us look at St. Paul's itself. There we found a huilding in fine harmonious proportion —there we found a building of very consider-able size: it was carried out with great skill and study, and grandeur of design; but webcever entered the interior of St. Paul's felt, as it were, a chilling effect, arising from a want of combination with its architectural beauties of thoses subsidiary arts and decorations that, if introduced, would render it iumintably impressive and imposing. Now, if St. Paul's bad been carried out with stained glass win-dows, and freeco or mosaies, enamel inliding, or mar-quettre, in various parts of the building, or marnumitably impressive and imposing. Now, if St. Paul's bad been carried out with stained glass win-dows, and fresco or mosaics, enamel inlay, or mar-quetric, in various parts of the building, what a gorgeous effect would be produced upon the eye and npon the miad, and what an effect, abstractly con-sidered, would be produced by that glorious work of the greatest architect this country had produced. Why, we should all he warmed by a scatiment of inspiration as we entered its splendid portals, instead of being chilled by the monotony and want of comment that reigned through its immease recesses. Nothing could be more appropriate for introduction into St. Paul's than the decorations described by Mr. Woring and Mr. D. Wyatt. It was painful to reflect how poor and niggardly we were in this country, and how marked the contrast was in the case of similar struc-tures carried out in Paris, where the Church of St. Vincent de Paul, which had all these enhelishments, had been carried out at a cost of between 90,000. An ifoun amount to carry out these works on such a scale in our London churches? In the Church of St. Vincent de Paul the windows were paired in the two decould be rule vincing. feent amount to earry out these works on such a scale in our London churches? In the Church of St. Vincent de Paul the windows were painted ia the way described by Mr. Waring. Each window was a splendid picture, and cach picture formed part of the entire architecture; and instead of your building being ent np into so many holes letting in the glaring light of day, you had pictures and windows of the most resplondent colours. This was also the case in the Church of St. Gudule, at Brussels, where there were heastiful pictures in the arsing chaptels round the choirs; although there in discordance with the style, Conquescience pictures in the apstal chapets round the ehoirs; although there in discordance with the style, but which in St. Paul's would be at once harmonions and imposing. It had been said there was an objec-tion to receding pictures, but, to a certain extent, they must he receding, otherwise they were tame and flat At Lille he saw this carried out at the ends of th the At Lille he saw this chrise during out at the ends of the side aisle, which had a perspective representation tending to extend the length. At first sight it had a very happy perspective effect, but as you approached it, it was lost; but there was a great deal of art introduced to entry out the idea of the architect. It was not for the architect exclusively to restrict the deal of the architect exclusively to restrict It was not for the architect exclusively to restrict himself to mere geometrical form and line, but rather embellish his architecture with such ancillaries as they had had described that evening. What he much admired in the paper was the logic of Mr. Waring's mind. It was no common mind treat-What he much admired in the paper was the logic of Mr. Woriqy's miud. It was no common mind treat-ing the subject, and, hy means of able analysis, leading to an important ultimate purpose, showing low the proposed system was not likely to obstruct the huild-ing, but that it was conducive to great effect on the wind of the babelder. If was visible it a produce ing, but that it was conducive to great effect on the mind of the heloder. If we wished to produce noble impressions on the miod of the spectator, it was by using all those accessories that might ap-propriately eater and be applied to the architecture of a huilding. In Gothie architecture, the architecture of these demonst of hearity into their huildings; and it bad been from a fearfulness and hesitation that the public mind had not been prepared to receive the like decorations in the Classical, or, as he would term it, the Italian style of building; but no doubt, if they wished to convey the hest possible effect, it was by the introduction of such assistance as Mr. Waring had so ably brought under their consideration. Mr. C. Barry conceived that all must feel how

Mr. C. Barry conceived that all must feel how Mr. C. Barry conceived that all must heel how difficult, in the pursuit of their profession, it was to have all their ideas fully and harmoniously carried out,—difficulties connected not only with the taste of the artist or architect who designed, hut sometimes in the want of the sinews of war. They would all agree

artists alike must desiderate

Thanks were voted, and the Chairman having called attention to a contrivance, for striking the centre of circular drains, by Mr. James Buckle, elerk of works, and a model of which was laid on the table, the meet-ing was adjourned to November 30th.

THE ARCHITECTURAL ASSOCIATION. SQUARING DIMENSIONS.

On Friday, the 13th inst. the semi-monthly meeting was held, Mr. J. Norton, Vice-President, in the chair. Mr. Bunker, Honorary Secretary, rend a communica-tion which had heen addressed to the Conacil of Plymouth touching the advertisement for designs for a guildhall, which asked :--

"1. Will the architect receiving the bighest pre-mium be employed to carry out his design at the usual per centage, provided his competency is found to be nudeniable? 2. Will professional assistance be even by the

2. Will professional assistance be sought by the committee in enabling them to award the several pren**i**ums i

3. Will there be a public exhibition of the designs reviously to the selection heing made for the pre-

mums ? 4, and lastly. Will the committee pledge themselves to reject all designs that do not fully and honestly comply with the whole of the conditions contained in the instructions furaished to architects ?"

The speaker added that no reply had been received, hut they had heard privately that since the communi-cation had heen transmitted, the competition had heen deferred. Mr. Bunker also read a letter of consider-ahle length from Mr. Hewitt, ia which he dealt with the question of competition generally, hut which it was determined not to adopt or forward until some forther information was received from the Council. The suggestions in Mr. Hewitt's communication were contained in the following programme at the conclusion of his letter :-

"1. Roagh sketches only of the proposed design in outline, slightly tiated, to he prepared to a scale of 20 feet 1 inch, to consist of the following drawings only, viz. a plan of each floor, one elevation, one sec-

ionly, viz. a plant of each noise, one devation, one sec-tion, and one external perspective view. 2. The design to he accompanied by a general description of the materials and construction, capa-bilities and arcas of office, &c. and an approximate estimate.

These sketches to be taken into consideration by 3 the Council, and a number not greater than twenty-one, nor less than eleven, to be selected, the authors of those selected to he alone entitled to conditions and terms first issued.

6) those selection is note the next to continuous and terms first issued.
4. The author of the best design to be employed to carry out bis design mono the usual terms, unless any serious objection exist.
5. The premiums, amounting in this case to 500?.
to be awarded to the remainder of the limited competitors, in the order and in the proportion the Council thiuk deserving; no premium, however, to exceed 500?, nor to be less than 10?.
6. Three architects of repute, and entirely disinterested, to be called in to report on the designs, and assist the Council in making the award.
7. The designs not to be publicly exhibited until after the award is made.

after the award is made.

8. Any canvassing on the part of any competitor, either directly or indirectly, to disqualify and exclude him from the competitioa.

9. All designs to be submitted under an assumed mark or motto, and which in uo case is to be one by which the author's name may he divulged."

The Committee on Competitions reported that they Inc commutee on competitions reported that they had met, and that the following resolution was carried uconimously, viz. "That this committee be-lieve that any code of laws which is not generally adopted by the profession is quite imadeguate to deal with the present cvils of competition."

with the present cvils of competition." Subsequently the following resolutions were carried: "That the committee consider it desirable that a scries of inquiries and suggestions should be framed for the parpose of conveying information and assisting committees in preparing the conditions of future competitions, and for their guidance in arriving at their decisions. And that it is desirable that a sub-committee of the Architectural Association be appointed to draw up suggestions, to be forwarded to all partice having the conduct of competitions; and that they submit the same to the general body."

The report of the counsittee was adopted; and the same committee reappointed to further consider and pursue the subject. The chairman then stated, relative to the occupa-

tion by the Association of a part of the new buildings of the Architectural Union Company, in Conduit-street, the following resolution, which it was proposed to consider and discuss at the next meeting :--

"That regard being had to the importance of securing a union-point for the profession, and the favourableness of the present position of the Architectural Union Company, it is advisable that the Architectural Association should take steps to assist in the object, by its removal to the premises of the company."

company." Mr. Rickman then delivered a visé voce dissertation on "Squaring Dimensions," but which rather took the form of a résumé oa the "arithmetic of archi-tecture" generally, and which it would be impossible to deal with without diagrams. The speaker said, if they properly studied the subject, they would flud that it was one of the greatest interest: it moreover tranched closely on a subject which was now heing greatly discussed, —that of the adoption of the decimal system. The great difference hetween our frequently made use of the duodecimal than of the decimal, ad, when we got above the fractions of decimal; and, when we got above the fractions of shillings and pence, and treated of pounds, we rarely followed out the decimal system. The influence of the daodecimal system was so great, that four out of five of the dimensions we squared, in going through great quantities, were influenced entirely by the duo-decimal system. He did not intend to go into the great quantities, were inducated currey up the amo-decimal system. He did not intead to go into the subject, as had beeu done with another subject in another place, by treating of the antiquity of squaring dimensions. He had not been either to the British Museum or to the library of the Institute to read Museum of to the nurry of the Institute of read up old works on the subject, to ascertain how they squared dimensions in the days of Sir Christopher Wren,—whether the cubical contents of Stonehenge or the masses of the Pyramida were superimposed or calculated by decimals or duodecimals, or whether the ancient works of the Pirzeus at Atheas, or the palaces calculated by decimals or duodecimals, or whether the ancient works of the Pircus at Atheas, or the palaces of the Greeks and Romans were hy scale work. Those who were in an arobitet's office might he considered as heing pretty well masters of duodecimals, hut not so of decimals; and if in-structed to equare a whole parcel of figures, and they did it hy the old system, it would be comparatirely a process of dradgery, and they would take no interest in it: but if they took an interest in it, they would find ont a heppy knack of their own, in working out their arithmetic, of eliminating certain dimen-sions, and of combining them mentally in many ways. Of all the mental calculating processes we went throngh in figuring, that of getting rid of the factors— of multiplying or dividing together various factors so as to produce unity, whether that nuity was 1, or 10, or 12, or 100, or more,—this process of eliminating or getting rid of the superfluity of figures was the most interesting and valuabile in the subject they were then getting rid of the superfluity of ligarcs was the most interesting and valuable in the subject they were then considering. To do this a knowledge of the com-position of numbers was of the greatest importance. Thus the composition of 10 and 12 was manifestly different,—that of 10, as a concrete number, heing 2 multiplied by 5, and 12 heing $2 \times 2 \times 3$. Other numbers might be combined in a more complicated way. They knew the difference between prime num-bers and concrete numbers, and the happy kaack of introducing the component natis of concrete numbers bers and contrict numbers, naw the mapping latter to introducing the component parts of concrete numbers was of great importance. Though it might at first appear that the duodecimal was more simple than the decimal, still, practically, the fact of our always using decimals in higher numbers showed that it ways using decimals in higher numbers showed that it was the most simple and available; and although we more frequently made use of 12, still he hoped some day to see the decimal system, in squaring up ordinary dimensions, adopted. A very nseful elementary ex-ercise was that of going through a course of dividing 1000 na hto its alioned narks. and another interestdimensions, adopted. A very nactal elementary ex-creise was that of going through a course of dividing 1,000 up into its aliquot parts; and another interest-ing process consisted in multiplying several given symbolic figures by the same symbolic figures; and Mr. Hay, of Ediahargh, in his work on arithmetic, pointed out several interesting characters of this kind in the works of the ancient Greeks, and in more modern works. There was another method of looking at figures which some had, and which, though it did not much facilitate, served to assist the mind over-tasked by long squaring; it was the system of *Me-moria technica*, or artificial memory—the adoption of a set of symbols irrespective of the subject under con-sideration, and which, by means of a code, were referred from one to another, so that any given lines of gibberish, or forms, night be made to denote the reigns of kings and dates, and so become the repre-sentatives of numbers. He would not recommend the adoption of this system, for what we wanted inscatarives of numbers. He would not recommend the adoption of this system, for what we wanted in-stead of the Memoria technica was a thorough know-ledge of concrete numbers. The higher and more rapidly you could run up in reducing your 1,000 into its aliquot, the more useful would it be in squaring dimensions. There was another division of number dimensions. There was another division of numbers, which was practically of great importance in the surveryor's office; namely, the determination of the aliquot parts of a foot superficial in inches. Mr. Bidder, who might be said to have "lisped in num-bers, for the numbers came," the Swiss calculating boy, and others, used the decimal system—from unity downwards, or from unity upwards, according to the decimal association; or, as Professor De Morgan termed it, "the all 10 system."

THE DIFFERENCES IN BUILDERS' TENDERS.

I TRUST you will excuse this attempt to solve the I sturr yon will excuse this attempt to solve the perplexities of some persons who have, at various periods, favonred you with amounts which appear to mystify them, and which have heen headed "Biod Builders." The subsequent paragraphs are intend-d to show that those who have received that designation are so called from a want of acute perception by the parties who have thus named them, and that the dis-tinction (?) receils on such as cannot see through the operation of the "force of circumstances," and may prove them to demonstration to be blind contributors, who misaprly the appellation most cuitable to them. who missipply the appellation most suitable to them-selves, or they would see some of the following reasons for the glaring discrepancies observed in divers valuations.

When quantities ARE NOT supplied.

The haste with which some estimators found their tenders on the area or the cubic contacts of a building, causes them often to exceed greatly, and as frequently to fail far short of, the totals of their more circum-spect neighbours, who carefully wade through the specification, and measure the drawings, &e.

When quantities ARE furnished.

Indefinite wording may eause the real meaning to be misunderstood.

The insertion of general descriptions, including many details, and which may be classified as " sport-

Indity decails, and which may be consider as a pro-ing items," leads to confusion. Manuscript instead of lithographed blank bills, with the errors made in copying not properly cor-rected; and the occasionally indifferent permanship, involving uncertainty as to the figures, &c.

Whether quantities ARE RENDERED OR NOT

Il-framed and loose specifications, and inadequate drawings.

Incompetence in the person who prices

Carelessness in moneying out after the items are

The utopian impetuosity of building owners; who, when they determine to erect a mansion, house, fac-tory, &c. imagine that their work should perforce take precedence over that of every other individual; and who constantly urge that the artificers ought to be immediately on the ground, - that the season will pass away to their loss; thinking all difficulties surpass away to next toss; thinking an timerate sam-mounted till pay-day—that have of all diurnals, which they desire to be delayed as long as possible; and wishing the structural features to appear com-pleted in an impossible time; thus hurrying on the pretent as impossible time; and marking ou the architect, surveyor, and builder; putting an evil con-struction on their labours, "holding them np" to the contempt their employees in such cases alone deserve, and langhing at such as "go to the wall" from want of opportunity to examine, and if usedful, revise their calculations

Even highly respectable competitors, who have other works in the same locality, are able and willing to execute contracts at a lower price than near "of the same standing," who would have to send plant and workmen into the district for the sole purpose of

workmen into the district for the sole purpose of carrying out one object. Contractors, who are not busy, are often glad to take a large building in hand for a "lump sum," that will bardy, or perlaps not quite, return to them their outlay, in order that useful, usive, and intelligent men may be retained in their service, and give their masters the chance of turning their ablines to profit-able account on some future operation. Areain such able account on some future occasion. Again, such as have extensive works on hand sometimes tender at a sum sufficiently large to insure the rejection of a sum sumction rate of the repetion of their offers, being unwilling to seem distochined to submit a price, although not cager to enlarge their present responsibilities. Sometimes tradesmou in a "small way of husiness."

Sometimes to desence in a "small way of husiness", are articly ready to lose now, to obtain the unone of cheap, or strictly honest contractors, with the ulterior determination to charge eu extravagant sam for what they see in prepetite, and expect to have offered them afterwards, without competition. Thuctuations in the prime cost of goods cause such variations as the following :- One tradesman, having bad money at command, at the right time, invested his capital in the purchase, "is a bargain," of a large stock of materials that happenal to be just colled into requisition, to a considerable degree. Another was nable to become proprietor when the same articles 2. Orleans to Vierzon multiple to become proprietor when the same articles 2. Orleans to a poin might bave been obtained "for a song;" and he Montargis and Briare.

THE BUILDER.

knows that while be has the power he must buy, though a better speculation offers, now, before the supply is cut off, although they have risen to an un-precedented market value. While a third has all his property "locked up," and will be compelled to borrow, at a high rate of interest, to secure at any sacrifice what he requires, by the date be is mader the necessity of using the same. Observation has taught many, that although the correspond from from the or athouries, stated that all

nverseer has, from babit or otherwise, stated that all the materials are to he of the best description, and the matching are in he in the best description, and that the labour is to be performed in the most work-manific manner, his practice, from timidity, ignorance, nr incessant occupation, is often to allow the concret to be little better than the soil removed to make room for it; the bricks to be the refuse of the field; the stone, such as has been repeatedly rejected, previously stone, such as has been repeatedly rejected, previously to removal, from the quarry; the timber and deals sappy and shaky; the iron castings foul; the iron-mongery of the most trumpery kind, and such as be-comes the aggravating source of continual complaints; a nuisance to all who handle it; the plaster to be mixed up with the *debris* from the raid building

they shall, by "putting in low enough," have the work secured to them at the amount of the pext highest tender, the excess being privately paid. The competition is mercly a gross sham, to defraud the conscientious of his legitimate chance, and the archi-The

test of part of his proper commission. Fortunately, this parasitie race is not numerous, and, as a body, builders are "honourable men;" yet arc not all.

Two cures for the above abuses present them. selves ;---first, for the profession to found their charges on personal, fair valuations; and, secondly, for an able ełe of works to be invariably appointed to each huilding of any importance. "None are so hlind as those who will not see."

L. BIDEN.

RAILWAYS AND OTHER ENGINEERING WORKS ABROAD.

WE proceed to lay before our readers a list various engiueering works abroad, projected or in haud.

FRENCH RAILWAYS-NEW CONCESSIONS. A .--- To the Northern Railway Company.

Paris to Soissons, to be done in three years.
 Boulogne to Calais, branching to Marquise, in

three years. 3. Amiens to Terguier, on the Creil and St. Quentiu line, in six years. 4. A cross line from the Lille and Culais line to

4. A cross line from the Lane and Charles and Source, in the Convention of July is Convention of July is a Convention of July is a Convention of July is a convention of the Belgian railway, in two years. Also may be included the Ancients and Rouce, in Bavarian Castom-house, which the Western Company participate for one-third, to he doue in six years, and a line from third, to he convention
 2. To be lattice iron for the lattice iron of s A swing bridge, of a swing bridge.

Concessions to become definite if claimed by com

Hirson 2. From the above line to a point between Busiguy

4. Beauvois to a point in Paris and Pontoise rail-way, which the Western Company are about to con-

done in eight years.

Paris to Tours by Châtcaudun.

3.

 Dougles to the Montanhan railway, by Albi. Conditional concessions to become definite if claimed in four years, and to be done in eight years, are as follow :-

Tours to Vierzon.
 Orleaus to a point in the Bonrbon line, between

Montluçon to Limoges by Guéret.

- Poitiers to Limoges. Angers to Niort.
- 6. Limoges tn Brives.

The lines left hy the Grand Central (now fused into the Orleans and Lyous lines), are for completion

Montlucon to Moulins 1

2. Limoges tn Agen.

3. Coutras to Périgueux

4. Montauhan in Lot and to Rodez.

Arvant in Lot.
 Périgueux to the Montauban railway.

C.—The convention relative to the fusion of the Lyons and Mediterranean lines into a Paris and Mediterranean railway divides them into three groups—the ancient, modern, and eventual.

The first is composed of those open for traffic ; also the the Besançon and Belfort, Dôle and Chagny, Dôle and Bourg, Marseilles and Toulon, and Lyons and Geneva, in course of construction.

The second comprises-

I. Lyons line by the Bourbonnais, the St. Ger-main-des-fosses, and Clermont, Arvant, Pny, and St. Etienne liues.

Nevers and Moulins to Châlons, Châtillon to Montbard ; Salins to Verrières and Jougue ; Montbeliard to Delle and Aidineourt.

Delay of exceution for all these, eight years.

The eventnal group, to be conceded in four years at least --- Brioude to Alais, Montbrison to Andre-zieux, Privas and Carpentras, Toulon to Nice, Avig-non to Gap, Gap to the Sardinian frontier, if the Piedmontese line will be constructed to meet it from

All to be done in eight years from date of concession.

A line is projected from Vitay-le-Frauçois to Nevers, by Troyes, Brienon, Auserre, and Clamcey, which, about 1,000 metres long, will be the means of completing the long line from Bayonne to Stras-

Bességes and Aiais Railway is ready to be opened

Bessgirs and man startery is reary to be spin-in a few days. Branch of the Caeu line, from Lissienx to Hon-fleur.—Earth-works about half done as far as Poat-d'Erèque. From thence to Honfleur, the only work commence do as yet is the Hébertot tunnel, eleven shafts, of 50 mètres depth thereabouts, having been work, who fixed ions through from end to end sunk; the *heading* is now through from end to end, so that the water, which occasioned much trouble and so that the water, which occasioned much trouble and expense, now finds its way out at the lower end. The Lissieux tuuncl will be through in a very short time. The line will be open to Pont d'Evêque in about a year. The line from Toulon to Nice is being con-structed, under the direction of Mr. Gaduel, who has structed, under the direction of Mr. Gaddel, who has taken up quarters for binself and staff of assistants at Cannes. The important line from Lyons to Bor-deaux is conceded to the Orleans Company: it is to pass by Clermont, in the mountainous district of Auvergue, by Used Tulle and Brive. The Lyons and Grenohle line is decided to be con-curated in the output of the Amer

The Lyons and Orelow has a deviate to be con-structed in the valley of the Ainan. The Kehl-bridge over the Rhine, near Strasbourg. The Convention of July 2, 1857, states that--

I. The bridge will traverse the Rhiue opposite the

2. To be lattice ironwork for double line, with footpath for the public on one side.

3. A swing bridge, of 30 mètres opening, to be placed at each end.

4. The length of bridge to be 265 mètres; four piers in the river, 63 mètres from face to face.

After the inauguration of the railway from Chalonssur-Marine to the camp, M. Duméry, locomotive engineer-in-chief to the Chemin de Fer de l'Est, engineer-in-chief to the Chemin de Fer de l'Est, submitted to the Emperor Napoleon a new loco-motive, with furnace to consume its own smoke. This is effected by making use of an inverted syphon, througb which the coal passes, and is carbonised in its upward passage, becoming coke when it reaches the level of the fire. The smoke is consumed in its upward passage through the upper stratum of incandescent coke. Sarrehruck e-al was used, and the result satisfied the authorities. Surveys are to be made from Avignon to the Alps, by the valleys of the Dorance and the Coulon rivers. In Holstein, the Gluckstadt and Itzchoe is verging towards completion.

towards completion. Denmark.—Lubeek and Hamburg line conceded to

the Lubeck and Buchen Railway Company. Bavaria.— By the opening of the line from Munich to Rosenheim, which was proposed for the 12th October

Ermont to Argenteuil.

nies, or the Government, within four years, and to completed in eight years from date of concession. 1. Soissons to the froutier, by Laon, Vervins, and

and Landrecies

3. Senlis to the Paris and Soissons liue.

struct

B .- Concessions to the Orleans Railway, to be

Nantes to Napoleon-Vendée, Bourges to Moutluçon.

(the *fete* of the king), the whole line will be thrown open from Caen, by Paris, Strasbourg, Munich, to Rosenheim, except the bridge over the Rhine above mentioned.

The Ligurian coast-line is advertised for concessionists by the Sardinian Governmeut. Specifi-eation to be seen at the offices of the Sardinian legation eation to be seen at the offices of the Sardinian legation in the capital cities of Europe—London Paris, &c. It is to start at the river Var, the Niceue frontier of France, and end near Spezzia, at the Modenese frontier. Tenders to be sent in before January 1, 1858. Saxony.—Interesting surveys are being made he-tween Annaberg and Bohemia, in that very moun-tainous part of Europe. Bohemian lines open this year—Toepkitz to Assig. Parderbitz to Keniggratz, Kladno to the iron mines of Nutschitz.

The Portuguese Government have refused subven-ons to new companies. The line from Lisbon to The Fortuguese covernment have feased solver-tions to new companies. The line from Lisbon to Oporto is finished, or nearly so. A company has heen formed to drain the Venctian marknes, on the shores of the Adriatic, from Venice

to the Isonzo.

The François-Joseph group of Anstrian railways proposes to limit its former scheme by suppressing some branch lines.

On the Northern Spanish Railway, the section Vittoria to Nauclaus to he shortly commenced. Con-tract taken at five per cent. under the schedule of pric

prices. The line from Nocera to Cava (Naples) was opened on 31st July last. The gradients are from 1 in 100 to 1 in 50 and 1 in 40, and heavy works were obliged to be made for the purpose of avoiding steeper ones. The engines, of a new construction for heavy inclines, were made in the weakbane of the million: a the were made in the workshops of the railway, on the spot, under their chief engineers, one French and

apot, inder then there eighteds, the relation and another Neapolitan. Prussia.-Tbo Dorimund, Witten Steele Essen and Mulheim Railway, have, after much delay, ob-tained authorisation to construct it.

Spain.—Saragossa to France : commission of French engineers appointed to report. The Archduke Max has obtained from the Emperor

of Austria the power to construct all the Lombardo-Venetian lines as projected, and hopes at the end of the next year to see Piedmont and Lombardy united by railway

The rapidity of excention of the works in construc-tion between Naples, the States of the Church, Tus-eany, Modena, and Lombardy, is the admiration of

every one. The high bridge over the Reno, near Bologna, has fifteen arches, of large span: 1,000 workmen are employed on it. The Clausurout and T-

The Chaumont and Langres section of the Paris and Mulhouse line was opened to the public on 1st

October: The line has, in the above section, nine cuttings, two tunnels, and seven bridges. In 34 kilomètres it crosses the Marne river four times.

The late heavy rains have retarded the opening of the Bességes and Alais line.

Surveys have been commenced on the new line from Paris to Soissons, lately conceded. Surveys are also being made for a line from Caen

to Angers

A new line is projected from Dieppe to Paris, by Neufehatel, Forges, Gournay, Gisors, to Pontoise, on the Northern line, and Argenteuil, on the Western line

The French engineers who have levelled over the continuation of the Kursk-Kowno line to Liebau, report that it should run by Liebau, on account of the insurmountable difficulties, and be prolonged to Riga by Dunaburg. The same engineer, M. Duméry, who invented the

new furnace for burning Freuch coal in locomotives, nas also just hrought out a new apparatus (adaptable new furnace for hurning French coal in locomotives, nas also just hrought out a new apparatus (adaptable to all steam-engices), celled a "condail réchanffeur." By means of this the steam is passed from the boiler into a heating cylinder, in which its temperature and density are gradually increased hefore it enters the working cylinder. This increase is so contrived that at the commencement of the stroke the steam enters: the working cylinder but slightly augmented in tem-perature and density, and that the maximum of these two is attained only after the stroke has been com-pleted hy the piston.

pleted hy the piston. The Western Swiss Railway has commenced works between Iverdon and Vaumai

The Provincial Council of Turin have voted 8,000/. in favour of a new line from Savona to Turin.

-The line from Temesvar to Szegedin Hungary.—The line from Temesvar to Szegedin was opened for traffic on the 24th ult. Thus the ronte is complete from Vienna to Temevar except the passage of the river Theiss, which is to he spanned by a magnificent iron bridge, mast-high above water, to he furshed next June. The traject is now per-formed by a substantial temporary bridge and tem-porary deviation of the line at that point. Hungary .-

The Victor Emmanucl Railway purposes completing junction across the Rhone next summer, at Culoz. It is not true that the Seville and Cordova line has its

It is not true toat the Seville and Corova the mas been finished, as reported lately in some papers: Il kilomötres only are contracted for, viz. from Lova to Penafor. The whole line is cruested to be opened in the beginning of 1850. The works of the Kænigsberg line to the Russian frontier are to be commenced before this winter.

Mons and Hannont Railway works very actively carried on. To be open in six weeks. The prolongation of the Munich line from Rosen-heim to Saltzborrg will not be anthorised until the line from Linz to Passan is seriously put into hands.

In Denmark the Gluckstadt and Itzehoe line is to be open in a few days. The Duke of Rianzarès has obtained the concession for the Lishon and Cintra line.

for the Lishon and Cintra line. The French Government, to conciliate the wishes of the interested, will give approval to prolongation direct of the Burgundy line to the Sardinian fron-tier, near Chambéry. The Northern Railway has ordered for its numerous new concessions 30,000 tons of rails, and 10,000

tons of chairs.

Great activity on the Caen and Cherbourg works. The marsbes of Cotentin present some difficulty, the emhankments subsiding rapidly by their own weight into the soft ground; but the contractor hopes, by continued filling, to gain solidity at the end.

A French engineer proposes to run tramways for horses from the Provence lines to the favourite resorts of strangers, &c. Hyères and Cannes, &c.

THE IMPROVEMENT OF THE CONDITION OF THE ENGLISH WORKMAN

CONSIDERING the enormons wealth of this country, viewing accumulated property in a mass, as well as the huge fortunes which have been gathered up by individuals, it would seem that we are a thrifty nation. Unfortunately, nevertheless, in many points we are both careless and extravagant. It would be easy to give a long list of particulars which would explain our meaning, and show that in many iostances those who had the means of preveoting it have wasted human life by not making certain necessary provi-sious; and that the industrions class, the mainspring of the prosperity and strength of Eagland, bave not heen sufficiently careful of themselves.

heen sufficiently careful of themselves. A change is coming over the management of our workshops and manufactories: the introduction of steam power, and the subdivision of labour, which has, in a great measure, been the result, have caused colosed establishments to rise np which are really colossed establishments to rise np which are really woulderful to behold. Fifty years ago, a manufactory which employed 100 men was an establishment worthy of notice: now we may travel over this land and see it thickly studded with works where from 1,000 to 2,000 hands are busily employed. Whether

worthy of holde: now we may later love this had and see it tickly studied with works where from 1,000 to 2,000 hands are busily employed. Whether this concentration of human power will be eventually hetter for the working classes, or otherwise, is a ques-tion worthy of the most eareful consideration, but which we will not now attempt to discuss. One thing, however, is certain, that some of these man-factories, including the men employed and their families, have a population of 3,000 or 4,000, enough living people to ceupy a small town. Amongst such important bodies of the English people, there should be provisions made of extent in proportion to the magnitude of the subject. If load government is found useful in towns, would not a system of manage-ment in these large commuties he equally valuable? We are induced to bring this matter before our readers, in consequence of various couversatiu us with hoth the managers and workanen of several large manifactories. In most cases the masters are most auxious to do all in their powr. for the benefit and improvement of the social position of the men, but there seems to be a fear on their part of being in-trusive: the operatives are similarly sensitive, and so it is that little in couparison with what might be done is effected. It is a pleasaut circumstance, that in Lancashire and elsewhere, the masters and the workpeople have, in some instances, ated together in that kindly and wise way which is to the advantage of all parties; but in the great mojority of cases this has not brea done, and there can be no doult that many means of saving money, and also adding to the confort of the employed, is lost by the want of agreement hetween the great body of the men and their employers. In many very important establishments, no proeir employers.

their employers. In many very important establishments, no pro-vision is made for sickness or accidents; and yet how vision is made for statues of a feature, and jet now easy it would be to devote a few pence weekly to a fund for that purpose. At Stephenson's (Newcastle), each workman pays a penny weekly, and with part of this sum adouation is made to the towo infirmary, which gives the means of admission for a certain number to that institution, and the remainder of the money is distributed in weekly sums to those who require

aid. In other places, where large numbers of persons are employed, some have moved in the right direction; but nothing in proportion to be importance of the subject, has yet been carried out; and believing firmly that, by system, the English workman may be able to provide for himself and family in an independent manner, a cheap and wholesome dwelling, provision in sickness, cheap and good education, and medical ad-vice, we invite consideration to the subject. It is worthy of note that the ribbon weavers of Coven-try are, to a considerable extent, their own masters,

It is worthy of note that the ribbon wavers of Coven-try are, to a considerable extent, their own masters. A large number possess boons which are worth 407, and upwards. The purchase of such expensive matters by workers who, on the average, earn not much more than twenty shillings a week, is a remarkable instance of both thrift and industry. Many of these looms are placed in various parts of the town, in rooms in the upper stories of the houses, and during the last few years steam power has been applied to many of them by placing steam engines in central situations, and then laying on the steam power as the water companies do water to the various houses. It is evident that some difficulty must be felt in adapting many parts of the ancient eity of Coventry to the purpose above mentioned. It is customary for the ribbon weavers and their families to live in the rooms which contain the looms, and it is certain that some which contain the looms, and it is certain that some of these are not well situated. In order to remedy

which contain the looms, and it is certain that some of these are not well situated. In order to remedy the ceil complained of, the Mesrs. Cash (we are told by Mr. Cooper, in a contemporary) are erecting a block of 300 houses, in a plensant neighbourhood outside the city. The looms in all these houses are to be turned by one huge steam engine, and the temats of the houses are to have the engyment of gardens. This is a step in the right direction which is wortby of the greatest praise. Mr. Cooper states that out of between 3,000 nod 4,000 houses which are at work in Coventry, fully three-fourths are the property of "men who have had to practise hard saving and sclid-denial." In some instances achenes of union and mutual assist-ance, similar to the frechold land and building socie-ties, have been resorted to, and we are told that the value of looms alone which are the property of the workmen amounts to 120,0007, and to this 10,0007, or nywards must be added for winding-engines, filling-wheels, jacks, &c. We should be glad to find them extending their views to the purchase of dwellings.

IRON TRAMWAYS IN LONDON THOROUGHFARES.

An improvement for which we have long contended is now about to be begun by the General Onnihus Com-pany, or rather by a special company, already regis-cred as the London Onnihus Tranavay Company, and which has beeu originated by the management of the General Onnihus Company, whose constituents have authorised its formation, and voted the requisite area for the transport of the company for the special com-The other all others is comparing whose the regulation of the same anthronised its formation, and voted the requisite supplies out of their surplus funds. The subject was brought before the General Omnibus Company in the reports of the Gérauts and Council of Supervision at a extraordinary general meeting held on the 10th inst. From these reports it appears that the liue of transway to be first formed (under approval yet to be obtained from Parliament) will traverse the New-road, beginning at Notting-hill-gate, and running via Genud Junction-road, New-road, City-road, and Moorgate-street, to the Bunk, with brancles to the Great Western and North-Western railway stations, and to Fleet-street via Bagnigge Wells-road. The estimate of espital required is 50,000. The new transway omnihases, according to the report of the engineer, Mr. James Samuel, will weigh about 2 tons instead of 21 ext. and earry sitzy passengers instead of the report. follows :

 Sa Miles of double tramway (including sidings) at 3,0007. per mile
 £25,000

 34 Omnibuses, at 2207. each.
 7,480

 320 Hyrses, at 267. each
 8,320

Law, Parliamentary, engineering, and preliminary expenses 5.000

The tramway will be double, and flush with the surface. It will occupy the middle of the road, and will be of bammered iron, on longitudinal bearings.

ALLOWAY NEW KIRK AND BURNS'S MONUMENT. -The higher the walls of the new church at Alloway-- the algorer the whits of the new church at AlloWay-rise, says the *Ayr Advertiser*, the more evident appears the accuracy of our first impression, that it all but ruins Barns's monumout. The expression of regret and indignation, instead of passing away, as Mr. Beird might imagine, is deepening and spreading.

CHELSEA SUSPENSION-BRIDGE .---- MR. THOMAS PAGE, ENGINEER.

CHELSEA SUSPENSION-BRIDGE

IN a previous volume (XII. p. 186), we gave a view of the Suspension-bridge, then in course of construc-tion over the Thames at Chelsea, together with description over the Thames at Cheisea, together with descrip-tive particulars of the foundations and superstructure. The hridge is approaching completion : January is to see it opened : the approaches are formed, and the emhankment of the Thames adjoining it, on the Mid-dlesex side, is completed, and we now therefore add to the previous illustration a view at large of one of the piers, with the cast-iron columnar towers which the previous illustration a view at large of one of the piers, with the cast-iron columnar towers which carry the chains, and varions details of parts of the construction. A comparison with the previous view shows that some few alterations in form have heen made: for example, the towers are now in one story, up to the hearing point, instead of two; and the pointed shape of the arch over the roadway and below it has given place to the semi-cir-cular and elliptical form. The dimensions have been but slightly altered. The total length hetween the antiments is 705 feet; and including the ahutmonts, 915 feet: the centre spon at point of suspension is antiments is 705 feet; and including the abutiments, 915 feet; the centre span at point of suspension is 347 feet; the side spans, 185 feet; the defiction of chains at centre is 29 feet; and at the sides, 30 feet 6 inches; the height of the readway at towers above Trinity high-water mark is 24 feet 2 inches; the height in centre is 24 feet 6 inches; and at the abutiments, 23 feet; the clear headway above Trinity high-water mark is 216 tet 8 inches; at the abutiments it is 20 feet 2 inches. The piece many which the towers are built are each

it is 20 feet 2 inches. The piers upon which the towers are built are each 88 feet in length and 10 feet 3 inches in width, and terminate in enred eutwaters 7 feet 6 inches above the level of high-water mark. The foundations of these piers are similar to those which are heing formed for the arches of new Westminster-hridge, and which are described enre full und dofunded by us at a time these piets are similar to these which are tang being for the archese of new Weisse which are tang being when opinion was running adverse.⁸ They consist of timher piles driven into the London elay below the bed of the river at intervals of 3 fect over the entire area of the piers, and cat off at nearly low-water level. The outside of the piers is formed by east-iron piles of 12 inches diameter and 27 feet long, driven 20 feet below low-water mark, and, between these, east-iron plates are driven so as to protect on all sides the enearing piles by a metallic easing. The space thus enelosed is then dredged to the hard stratum of gravel above the elay, filed in with concrete, and the whole seemed hy wronght-iron tie-bars. On the bearing piles is a flooring of solid stone bedded on the concrete. All the caisson above how water is lined with brick-work, and the entwaters at each end, where exposed to constant shocks from drifting vessels, are built of solid brickwork. solid brickwork.

solid brickwork. Each tower is formed of eight east-iron hollow columns, 1 inch thick, connected by cross-frames, as shown in fig. 1. These columns, with spread-ing feet, go down to within 2 fect of low-water mark. The height from high-water mark to the point of suspension of the lower chain is 59 feet 0 inches, namely, 7 feet 6 inches from high-water mark to the platform, and 52 feet from the platform to the anderside of the lower chain. The sectional area of the chains at the centre of the hridge is 212 square inches, which gradually increases

The sectional area of the chains at the centre of the hridge is 212 square inches, which gradually increases in proportion to the strain, towards the towers, where it is 226. The suspension rods passing from the chains to the roadway of the hridge are 2 inches in diameter, and placed 8 feet apart. They have a joint at each extremity, the upper one allowing a motion parallel with the chains, and the lower a transverse motion. The roadway has a rise of 18 inches from the laud momorings to the centre. Two wrought from longitudinal lattice girders (as described in our first account) extend the entire length of the bridge, and are secured to the suspension-rods to which the trans-verse girders supporting the carriageway are also are secured to the suspension-rods to which the frans-verse girders supporting the carriageway are also holted. These girders are eighty-seven in number. They are formed of boiler-plate, strengthened with angle iron, and are 32 feet long hy 2 feet 8 inches deep, and weigh 32 evet. each. Between these girders pass wrought-iron hearings, to which are bolted plates of iron of the same material which forms the roadway. On the upner surface these plates are covered with On the upper surface these plates are covered with hitumen, over which are laid compressed slabs of asphalte and cork cuttiogs. This forms the bod for a On the upper sufface take that a phase are space as a sphalte and cork cuttings. This forms the bed for a wood pavement of blocks of ship oak, which are again coated over with asphalte and the paved surface of the road completed.

The bridge was designed and is being carried out hy Mr. Thomas Page. Mr. R. A. Rumble is the resident inspector; Messrs. Young and Co. are the contractors.

We may add, that Messrs. Howard and Ravenhill, of Rotherbithe, have executed all the chains, sus-pending-rods, and plates, and that these have borne the severe test of a tensile strain of 13½ tons per inch, without yielding dath of an inch to a foot, and that the work is very satisfactory.

* For diagrams see vol. xiv. p. 166.

So far as respects the design, artistically considered, we must confess to having no admiration for the termination of the piers, although the globe, we are told, is to he of glass; and as to the toll-house, now mearly finished, we should seriously advise an altera-tion: they are not worthy of the important con-struction to which they are the preface. The appreciate during the series of the series of the

The annexed details will make our account clearer. Fig. I is a section through pier, showing the foun-dation of the iron columns. Fig. 2, section of half the roadway. Fig. 3 shows the anchorage of the suspending-

chains

Figs. 4, 5, 6, and 7, show the arrangements of the chains at the point of suspension, with the rollers heneath

Fig. 8, the joint of the suspension-rods.

OLD SEWERS A LATENT SOURCE OF DISEASE,

ALL modern howses are built npon a system, which by a little presention, and a searcely appre-ciable expense, affords at the same time health and comfort to the occupant. A very few years back, no provision whatever was made to guard against the absorption of moisture in the foundation walls of a house; latterly, every working bricklayer knows, that by the use of a single layer of slate (fixed in cement), ever so little above the ground range of a foundation, the rise of damp in walls is repressed. What a carledowne of cwile is axoided by this simple

foundation, the rise of damp in wais is represent. What a catalogue of evils is avoided by this simple provision 1 The servants of an establishment are saved from all the penalties which *damp walls* are sure to catal npon the occupant of a basement story; all the aches to which the human constitution is subject are at once obviated; and apartments which, huilt on the surface, were formerly damp some 2 or 3 feet upward; or if sunken only 4 feet below the level, were damp to the seling are now netfectly dry and fit for sleepto the ceiling, are now perfectly dry, and fit for sleep-

ing-rooms. The evil of damp walls is, however, but a small matter when contrasted with other abominations, reliques—no, we cannot say of barbarous times,—but of the little regard which was paid by builders of only twenty years back to the casements required for every human habitation. The most important con-sideration in founding a structure, after the general plans are decided, is the proper disposition, arrange-ment, and formation of the severs: the first postulate is a sufficient full; the second, the due allocation of sioks and traps; the third, the proper and solid con-formation of the duct whereby the sullage is conveyed to the main or public sever. Until very recently, the house-drain was constructed

to the main or public sewer. Until very recently, the house-drain was constructed in 4-inch brickwork, carried out throughout the whole covered area; the arch or covering was in the same gauge, formed of bats or place bricks, packed loogely together, with just as much mortar as might keep the whole mass in position, and then the whole system of house-drainage was covered in. In process of time these drains is well filled in

keep the whole mass in position, and then the whole system of house-drainage was covered in. In process of time those drains, if well filled in with water, hecome solid, and as the pirase runs, water bound; in fact, the mortar of an old sever is invariably harder than the hrick—hut there is an agency ever at work below the surface, against which it never entered into the heads of speculative builders to provide. The rats of London number millions, and their domain is the severs; they occupy the street lines in strong colonies, and they make discursive trists into the tributories; socking their sustemance from the larders and waste of the circunjacent domi-ciles. They invade every house, and whilst the mortar is wet or green, they permeate the thin con-text of 4-inch brickwork; burrowing into every spartment, and making spertures through which the malignant and suppressed vepours of compound ordure ascend, and fill the mausion to the roof with the seeds of cholern. As water gravitates downward, those subtle vapours tend upwards; the pertu-parting agitation to find vent upwards; thus fill with malaria the chambers which the yeare formed to disinfect. to disinfect.

With mature to humbre to humbre with a severe, is at times so rank, so overpowering, and so lethal, that the tenant would he justified in throwing up his occu-pancy, on the plea of danger to the health of his family. To tamper with such imperfect drains, or to endeavour to cobble them up, is wholly useless. You may find out a dozen ratholes, and cement them; you may open out the external areas, and clear the traps; but all is in vain. The entire system is diseased, and pregnant with infection—it is open at every chink, therefore the only remedy is to clear away the whole original system, and to lay down in place thereof non-absorbent tubular drain-pipes, well inted together at the joints with properly attempered mortar. The confined and sublimated vapours occe

through the hrickwork, hut drain-pipes are permea

permeable. By thus providing for security against damp in basement walls, and by simply using the proper conduit for house sewage, every ground or sunken idoor of the metropolis may he rendered wholesome, comfortable, and elean. Meanwhile, a visitation from house to house, to look after these matters, is seriously incumbent on parish anthorities. Whilst they impect external severs, decayed house-drains are in equal need of revision.

revision. 0.

HARROW REVISITED.

HARROW REVISITED. It is gratifying to find that the anthorities of all our public schools do not stand stock still. It is wise to advance with the times, and keep pace with the progress of the age. Harrow is in the hands of improvers : the huiders have heen hay, and are busy now ; and, what is more, they have contrived to mix the useful with the ornamental. As usual in all such cases, a critic might find food for his anamiable allow-ance of groumhing,—to show his learning; for critics always assume to themselves the privilege of knowing more than anybody else. Stark criticism is not my husiness : it is simply to describe what L saw of the statal state of things in the famona village ;—such an odd, quaint, dear little up and down, in and out village, as it is, with its gneer nocks and corners, little houses, and wire-elad windows. houses, and wire-elad windows.

The old village is getting quite invenile, quite fresh and perky, and, like ladies past a certain age, has begun to smarten itself ap, and disguise its many cracks and wrinkles. What with additions and demoeracks and wrinkles. What with additions and demo-litions, it has hecome more smart, more gay and jounty, than it used to he,—in my juvenile days. A flow years have made many changes, and certainly for the better : much has heen done, but not too much, in the way of alteration. After a few years' ramhling over many strange lands, we find great changes when we return to our old haunts. Whole generations of juveniles have come and gone, passed through the dingy portals of the old sebool, and entcred into the weather. ancy portais of the old school, and entered into the rough and stormy paths of life; but the weather-heaton school-bouse stands hravely where it did, and the old church—such a rare old church,—still crowns the hill,—with a uew face to be sure, but proud of its hoar antiquity, and, may he, proud of its smart new dressing

hear antiquity, and, may ne, prond of its smart energy dressing. The old turropike-house has gone,—elean disap-peared, with its odd chimney and queer quaint gables : although it may be missed, it is no loss; but yet it is an ancient landmark swept away, and more than one weather-heaten wooden house has followed in its wake,—by this time burnt for firewood: peace to their ashes. The old sign at the "King's Head" still swiges in its gibbet, and creaks as shrill as ever on its rusty hioges. The house itself has been smitten with the norvaling taste for change: the two queer its rasty hioges. The house itself has been smitten with the prevailing taste for change: the two queer little parloars have been knocked into one--actually into one room,-smartened up with new sashes, and squares of coloured glass, the artistic production of the most eminent glazier of the village. Mine host and his artist fricnd, the glazier, are proud of the effect of their joint lahours. They have put in new glass, hut knocked out many a rominiscence by so doing : many a well-remembered name scrawled on the ancient sources has gone for ever.—like the

on the ancient squares has gone for ever,-like the nohle fellows who scratched them on the frail and

nohe fellows who scratched them on the frail and brittle glass. A few, very few days since, I read in the melan-choly columns of our Indian news the death of as fine a icllow as ever drew salve in defeuce of the honour of our hrave old fing. I searched for the well-remembered square where I seaw him scratch his name, but alss I like himself, it has gone. Oh, mine host of the old "King's Head," may the gods forgive you, for I cannot. And why has mine host thrown these two old rooms of his into one? Because the master of the school was going to give a dinner to the inhabitants of the vil-age, in equipmenoration of the creterion of new school-

lage, in commemoration of the erection of new sc lage, in commemoration of the crection of new school-rooms and the uew memorial chapel. Good,—the occasion is good, the cause is good, but, master land-lord and gizzier, you have demolished what you can never replace. Give your sign a new face, repaint "bluff Hall," if you will; but you should have left these scribbled squares of glass for the sake of the names they bore, and for the men who scratched them there. Time-honoured names of brave men were on those sources of thine mine hast; hut they are gone. there. Inne-nonource names of prave men were on those squares of thine, mine host; hut they are gone. The old church has heen smartened up, the time-caten walls eased with a new coat, not of "rough cater wais eased with a new coat, not of 'Tolga east,' thank goodness: let us hope the church menders have for once done what they ought to have done, although perhaps they may also have done what they ought not to have done. They have improved the ehurch inside and out, therefore let us give them thanks; for it is not one of the usual churchwarden's blockse_mit will ness muscle years will, and mat blotches, —it will pass muster very well; and, as I an not eritically disposed, I will not write a critique. There is one "restoration" in the church which

gladdened my eyes: it was to see the time-worn monumental brass of the founder of the school rescued from its old position, saved from the nailed boots of the villagers, and now fixed in a pillar in a conspicuous the vinagers, and now incern a pinar to a conspicuous part of the eburch. It was grierous to see the brazen effigy of the generous founder of the noble school so utterly disregarded as to form part of the pavement of a pew, daily trampled underfoot, and effaced by the feet of our villoge friends, who owe everything to the man whose monument they so security treated.

The Surely this is a sign we live in hetter times. monumental brass of the founder of Harrow School how the set of the set

countrymen, and irrends, I thank you for your justice, though 'is but tardy and long withheld. The old font too,—what strange vicissitudes it has seen: once the ornament of the church; then the ornament of a little garden; then the receptacle for boots and shoes, hlacking brushes, and rubbish of that kind,—to say nothing of bath hricks and hearth-stones. It is strange, but true, that this venerable piece of antiquity—a quaint old fint of Purbeck marble—was and quiry - a quant out int of Purpeck matche-was turned out of the church, yiley ahused for many years, and at last re-polished and restored to its proper place in the old church, from which it had been re-moved, doubtless, hy the hands of some long since defunct improving churchwarden.

It used to grieve me much to see this old font filled with dirty boots and shoes instead of holy water. often raised my voice, but in vain. I have at last b the satisfaction to see the four restored, as well as the founder's brass; so let us hope that the worthy people of the village have satisfied their consciences, and done at last what ought to have been done many years ago

They did well when they saved this venerable font ; aud so did I; for when it was in the course of restora-tion I preserved a chip to convert into a seal, which has travelled many a weary mile with me over se land in many and varied climes. a and

It will be gratifying to all true Harrovians to know that the monumental brass of old Lyon, the founder of the school, bas, after many years of vile ahuse and shameful neglect, been carefully preserved in a slab on one of the pillars of the church. Could old Lyon have risen from his grave, he would have shaken his bony fist in the pale faces of the authorities of the school for their neglect of his monument, and he would have said, in a voice of thunder—

"Eregi monumentum wre perennius, Regalique situ pyramidum altius : Quod non imber edax, non Aquilo impotens Possit diruere, aut innumernbilis Annorum series, et fuga temporum."

Of the old school house nothing need be said here and gently used by Time himself. It looks down complacently on the new wonders springing up at its feet, et, and long moy it do so. The school chapel has heen pulled down-quite a

recent building-to make room for the new memorial chapel now in course of completion, and but recently consecrated.

Side by side with the new chapel is also a new school-house, built entirely of very red brieks, to correspond in some measure with the venerable front of the old school.

These new class-rooms are a great addition, These new class-rooms are a great addition, not only to the architectural appearance of the village, but to the convenience of any one connected with the school. It is a simple, unpretending building, not at all burdenced with decorations, being evidently built more for use than ornament; it has a quaint air of hence with more formal then decout, and if not donce utility, more formal than elegant; and, if not picturesque, it has the merit of being ueither out of character nor unsightly-negative virtues, but virtues after all.

If it claim the merit of harmonising with the old school, and being in character with the head-master's residence, it has at the same time the privilege of being in rather violent contrast with the florid oraamentation, and white stone dressings of the new Memorial Chapel-however, variety is pleasing--and here, certainly, we have both variety and courtasting cdifices, placed side by side to claim attention from those who are critically disposed, which I am not.

The new chopel is totally different in style, cha-racter, and general feature, from anything else in the old village, and bids fair to be one more how added to the rustic wonders of the place. It is a building of considerable size for a school chapel, and of consider-able pretension as well, -os, indeed, it ought to be

under the circumstances of its creetion. It has been raised for a twofold purpose, as a school chapel for the boys, and to commemorate the neurony of those gallant Harrovians who perished in the Crimean war.

paration. The steeple is not yet complete, nor indeed are all the external or internal decorations. It is a great addition to the architectural features

It is a great addition to the architectural features of the little village, and will, undoubtedly, be a centre of attraction for the numerous visitors to Harrow. It might have been placed in a better position; but then it might have been placed in a worse—so we are quits with criticism on this bead. The names of those heroic Harrovians who fell in the chine will be the second second second second second the criticism on the second second second second second the criticism of the second second second second second second the criticism of the second s

the Grinean war will be emblazoned in a conspicuous place in the cbapel—the last tribute which the living prace in the coapit-the last timute which the hang can pay to the dead-there, let us hope, to remain, not only in memory of the fallen brave, who nobly did their daty in the hour of need, hut at the same time to set an example of courage and devotion, of deeds nobly dared, and victories won, to the numerous generation of young and generous hearts, having this memorial constantly before them while enjoying the sunny morn of life, and passing through the school--to fit themselves for similar honours, when they may pass away—for it is something, after all, to leave an honoured name behind.

But let us descend the hill and cross a noble But he us descent the and and the - "Oh Phoebus, what a name! "---and cast a glance at the grand im-provements effected in the bathing-place. A few provements effected in the bathing-place. A few years back this was a mere muldy poul, good enough for pigs to wallow in, but scarcely adapted for the purpose for which it was intended; for, certes, the bathers often came out more like "*little pigs than* gentlement." Now, however, all is changed. The bathers often has here were a bathed, and alloted bathing-place has been paved, bricked, and slated, lined round with dressing sheds, and what is of more one of the standard standard standard stream of clear water. This improvement is a decided step in the right direction, and if the water is not exactly equally clear with the limpid stream of Baudusia, or Father Thames at Eton, it is clear and wholesome, and of inestimable value to the boys. It is an improvement which merits notice and deserves our warmest appro-hation, for it has been the menns of giving to Harrow School what Harrovians much wanted, a place where they can bathe in clean water. The boys are proud of "Duck Paddle" now, and so they ought to be, for the cost is money really well spent.

for toe cost is money really well spent. Basides these alterations and improvements the new racquet grounds must not be overlooked. They are couveniently placed, and are a useful addition to the necessary equipments of a grent public school, where ample accommodation is required for all kinds of really groups.

manly games. While on the subject of these improvements, it has scenared to us that something not only night be done, but ought really to be done, to improve the little dingy room dignified with the name of the Library. A great public school like Harrow ought to have not only a hetter room hut a hetter library than it has at present. In this respect Harrow is far behind its rival. Elon; and now base that the school is well up in numbers as well as in reputation, we hope the "Harrow gentlemen" of the present and future generations will put their shoulders to the wheel and make a stir, not only to most the question of a better library and more suitable room, but will set to work hbrary and more suitable room, but will set to work in carnest, and at least take one step more in the right direction, and get up a library worthy of the name and reputation of the brave old school. It would soon he furnished by presents from "old fellows," and in a few years would assume propor-tions worthy of the standing which Harrow bas acquired in the list of our public schools. This hasty and rambling sketch night be much extended the subject height assumed.

Anis maky and tambing sector might be inten-extended, the subject being anything but exhausted; and, before closing, it may be well to add that the authorities have shown great wisdom, and some liber-ality, in providing a suitable place for the children of the inhabitants of the old village. This is wise, for they have great and undoubted claims to share the benefits of Lyon's noble higacy to the inhabitants of

What changes we find after a few years' absence from any place! Here at Harrow is the "old 'pike" demolished, the oll church restored inside and out, the founder's old monumental brass corefully restored, the new chapel pulled down to make room for a newer, and dear dirty old Duck Puddle is a puddle to longer. Old houses knocked down and new ones run up, old faces gone, and old friends after them, and so on to the end of the chapter, a clear and convincing proof, ye gentlemen of Harrow, that the longer we live the older we get. Amen. L.

MR. OTTLEY'S LECTURES ON PAINTERS AND PAINTING.-ON Wednesday last, Mr. Ottley, for-merly art critic on the *Morning Chronicle*, delivered the second of a series of Lectures on Painters and the Crimean war. It has ornamented scats, brass lamps, and will, it is hoped, be filed with stained-glass windows; one of which is already in its place, and others are in pre-

PROVINCIAL NEWS.

Inswich.—Mr. Bruff's plan for the complete sew-erage of this fown has been brought under the special consideration of the town council. The plan recom-mended, instead of the concentrated pumping system mended, instead of the concentrated pumping system before proposed, the use of the river as the natural outfall, by constructing a sever on each hank, to be discharged at certain points below the town, the month of each sever being tide-flapped, so as to dis-charge the sewage freely for eight hours, and partially for five hours each day, and to store it during the remainder of the day. The total estimated cost was 30,0002, which the committee recommended should be raised in eight years by rates. The recommenda-tion of the committee was adopted by sixteen to eight. cight

cignt. Misterton (Leicestershire).—The esquire of this place, with his brother, the Rev. G. H. Franks, rector, are erecting schools at their own cost. They consist of a boys' and girls' school, with residence attached, and an infant school, with class-rooms to each school, proceeds burgers, and out buildings the schole form. and an inflatt school, with class rooms to each school, porcebes, lavatory, and out-buildings, the whole form-ing one group, situated in a pleasant meadow, well backed with woodland. The huildings are creating in the native material, red brick being varied with grey-ended bricks, the windows all of stone; the style that of the fourteenth century, hut very simple. The work is proceeding under the superintendence of Mr. Teulon. Messrs. Laws, of Lutterworth, are the contractors

Guildford.—The alterations and additions to the Guildford.—The alterations and additions to the completed. The new buildings comprise schools for 150 children, a faver hospital, additional wards for male and female paupers, alterations to the old infir-mary, a new lying-in ward, &c. The school buildings mary, a new lying-in ward, &c. The school buildings contain two large school-rooms, two dining-halls, dormitories, sitting-rooms and bed-rooms for the schoolmaster and schoolmistress, with lavatories, bath-rooms, &c. On the boys' side are two work-rooms for industrial truining, and on the girls' a laundry. All the rooms are lofty, and well lighted and ventilated. The schools and playerounds are detached from the main building, with the view of scparating the children from the adult papers. The separating the children from the adult paupers. The new hospital, which is also placed at some distance from the other buildings, in order to prevent infec-tion, contains three wards for male patients, and the ton, contains three words for male patients, and the same number for female patients, with nurse's room, bath-rooms, &c. Great pains have been taken to secure perfect ventilation in the wards of the new hospital, and to improve the ventilation in the old infirmary, which originally was extremely defective. A new workroom has been errected for dissolute women, and new rooms provided for the aged and able-bodied men and women. The works have heen executed by Mr. O. S. Ellis, from the designs and under the superintendence of the architect, Mr. C. H Howell. The amount of the contract was 5,947?

Howell. The amount of the contract was 5,947. and the actual cost of the works 5,938. *Tewkesbury*.—The Corn Exchange at Tewkesbury has been inaugurated. The new building bas heen crected on the vacant space in front of the Townhall, and forms part of it. The front, which is of stone, is of the Dorie order. The plinth is of Stanway Hill stone, forming a contrast in colour to the Bath stone above. Two three-quarter columns and two anteas which the focut hotmose which are placed two axis. above. Two three-quarter columns and two anteas divide the front, between which are placed two windivide the front, between which are placed two win-dows and the door. The roof is of wood and iron, in three spans, the centre being of glass, supported by traused girders. The contractors were Messrs. Collins and Knight. The front shows some sculpture de-signed and excented hy Mr. H. Frith, of Gloncester. The total cost of the building is about 700%. *Tenbury.*—The first stone of a Corn Exchange and public building has been laid at Tenbury, in Wor-

cerstershire.

Swansea .- New schools are being creeted at the Scansea.—New schools are being creeted at the Cockitt, Swansea. Plans being prepared by Mr. R. Kyrke Peuson, the diocesan architect, application was uade to the Educational Board of the Privy Council, who made a grant of 350. towards defraying the cost. The remainder is private subscriptions, partly obtained. The committee having advertised for tenders, several were sent in, and the tender of Messres. David Evans and William Roherts, being the heaver, was excented. The buildiew will convirt of Messrs, David Evans and Wilnam Roners, being inc. Jowest, was accepted. The huilding will consist of two school-rooms, one for boys and one for girls, with separate entrances and lobbies, a class-room, and a residence for the master. The size of each school-room is 27 feet by 15 feet, and the elass-room 15 feet by 16 feet. There will thus be afforded accommodaby 16 reft. There will thus be allorded accommoda-tion for 150 children. The cost of schools, resi-dence, boundary-walls, &e. will be about 700/. The building will of necessity be plain in ebaracter, but so far corresponding in appearance with the recently-created church for the vicar. h for the vicar. Messrs. Cooper aud Tullis, masons

Preston.—Messrs. Cooper and Tullis, masons and builders, of this town, says the Preston Guardian, have just completed the construction of a new wing at Fulwood-harracks, which is designed for the accom-

modation of married soldiers and their wives. The site is at the north-east end of the cavalry barracks, motion of married soluties and their wides. The site is at the north-east card of the cavalry barracks, at the extreme end, the dwellings in front facing the exercise_cround. The cultire range of tenements is 111 yards long and 33 feet wide, with a flagged paropet all round, three yards in width. There are ten divi-sions, eight dwellings or compartments in each, and thus accommodation is provided for eighty soldiers and their wives. There is no attempt at ornamenta-tion in the mehitecture. The walls inside are of brick, and externally the building is constructed of hammer-dressed Longridge stone. The huilding is two stories in height. Behind and in a line with the dwellings are a wash-house, drying-room, laundry, and other necessary appurtenances, all of stone. The stairs are of oak, and the floors of Baltic timher an inch and a half thick, with oak joists. Mr. J. White-head exceuted the ironwork, and Messrs. Wilding and Watson the plumbing, glaziog, and painting. The cost has heen 8,5207. The entire amount expended in the harracks at Fulwood is 145,5207.

CHURCH-BUILDING NEWS

Little Addington.—The church of Little Adding-ton has been restored and re-opened. The roofing has hear nearesd, and the church re-seated. The tower, which is at the west end of the nave, and tower, which is si^t the west end of the nave, and within the hody of the church, was origically open on the north, south, and east sides. For many years the arches and piers which supported those three sides were hidden from view by being huilt up, and an un-sightly gallery placed at the west end of the church. This gallery has been removed, and the three arches opened and restored. A groined ceiling in the north porth has heen restored, and the plastering removed. The old oak pulpit and the chancel screen have been preserved and restored, these heing the only two spe-cimens of ancient woodwork in the church. It is to he hoped the chancel will soon he new roofed and re-stored. The restorations have heen executed under the superiotendence of Mr. E. F. Law, of Northampthe superintendence of Mr. E. F. Law, of Northamp

b hetween 9,0004. and 10,0004. Dorchester.-The Congregational church in South-street has been opened. In style it is Decorated (Gothie, executed from a design hy Messrs. Poulton and Woodman, of Reading, iu random walling of Ridgway stone, with Bath stone dressings. The front is ornamental, with a traceried window and gable, with finial over it. On each side is a porch, the south forming the base of the spire. This latter is of Bath stone, springing from light open tracery work. The dimensions of the body of the church are 76 feet by 37 feet, and the form is a parallelo-gram, with vestries and a school-house in the rear. The school-house is shout 40 feet hy 32 feet. The church, in the interior, is ceiled, but in the open-tishicad ead, and will accommodate GOO persons. The foor is of Poole Pottery tiles. The window at the near is of stained glass, hy Mr. Lavers, of London. The pulpit platform is of Can stone, and is sur-rounded with ornamental inonwork, decorated with Haden's hot-air apparatus, and lighted at night by t two gaseliers. Mr. Wellspring, of Dorchester, was the contractor.

alteration has heen made in the style of the edifice. The roof has heen raised, and left open. A gallery now rues entirely round the chapel, supported on slight iron gillars. The pews are low henches. The architect for the alterations was Mr. Simpson, of Brigbton; the contractors, Messra. Wisden and Auscombe. In close proximity with the chapel a new Smaday-school, uopretending in character, has sprung up, built by Messrs. Goddard and Blaker. This holds 300 children. It opeos into the infant school, held daily, for 260 children. A sum of SOU, has been subscribed, leaving 7007, still due. *Goldsborough*. — The rector has nneovered some recesses of architectural work in the chaneel of Goldshorough church is colled a specimen of the

Goisshorough church, which had been plastered over lor ages. Goldshorough church is called a specimen of the carly Norman style, and contains two effigies of Cru-saders in full punoply, said to have heen the com-panious of Robert Curthose, in fighting the Paynim host on the plains of the East. Their descendants are labourers in the village at the present day.

THE STAINED GLASS FOR GLASGOW CATHEDRAL.

I AM very glad to observe, from the Bailder, that the decoration of Giasgow Cathedral with stained glass is now exciting some degree of interest in England, and that it has recently formed the subject of dis-cussion at the meeting of two architectural societies. I am also happy to observe that on both these occa-sions the decision of the committee was condemned. It has all along heen consistently and vigorously opposed hy the architects of Glasgow, who have taken active, and, I helieve, effectual measures to prevent the resolution of the committee from heing carried into effect.

The power of the committee to determine anything at all is not recengoised by Government; and I am quite convinced that Sir Benjamin Hall is by no means satisfied with the result of their deliberations, and singlet with the result of their denotations, and that he will never consent to the course they recom-mend or sanction such a ridiculous likel on British art: so that, upon the whole, the prohability is, that the resolution of the committee will become a dead letter

I trust, however, that the matter will yet he more I trust, however, that the matter will yet he more generally taken up by architectural societies through-out the country. Here, unfortunately, we are in a very had position for bringing anything of the kind hefore the public. We have no such thing as a pro-fessional organ in Scotland. Moreover, our architec-tural society—the I astitute—is virtually defunct here : only two meetings were attempted last session, and they were hoth miserable failures. This is owing to a misunderstanding with coultres. This is owing to a misunderstanding with coultres. This is owing to a misunderstanding with coultres. As to the removal of the statuced glass windows from the crypt: the windows—speciences of the Manieh school—are unsuited for the position they occupy, and, in my humble opinion, the sooner they are out of it the hetter.

of it the hetter. GLASGOW

STAINED GLASS.

St. Mark's Church, Whitechapel.—Five lofty Innects, subscribed for hy the congregation, have just been arceted in the chancel. They are geometrical, and contain eight medallions of subjects from the life of our Lord. Mr. Warrington was the artist.

St. Nicholas's Church, Liverpool.—The same artist has recently done for this edifice four north aisle windows, Perpendicular pictorial. Two of them are Orimean memorials to the rector's son, one a memorial to a late rector, the other to a merchant.

Childwalt Church, near Liverpool. -- A window has also been put up by Mr. Warrington in the north transpt of this church. It is decorated, and is a memorial subject window to a Liverpool merchant's memorial surject window to a Laverpool merchant's wite. This makes, with the east window, the fourth window the artist bus done in this church, and he is now about decorating the entire transcept for the same gentleman, and also painting a murd memorial in a window, of which the blank tracery is inside, for the vicar.

St. Matthew's, Stoke Newington .- A memorial window was creeted on the eve of All Saints, in the south side of the aisle of St. Matthew's Church, Stoke Newington, consisting, in its stonework, of three main lights, and a large quatrofoil, the centre one of the three lights and a large quarterist, the event cover the one of the artice lights filled with grissille diapered painted glass, with bands of colour, and coloured centre bosses: in the upper parts of the two side lights are figures of SS. Peter and Paul : beneath these are panels of diapered glass, having in their centres medialitons, into which are worked the initials of those by whom the memorial have been cented. The large upper maturful has a Brighton. — The enlargement of London-road dehapel, and the schools adjoining it, undertaken at ecost of 1,500?, has heen completed. The size of the dehapel is doubled: it now holds 1,000 persons. No

St. Michael's, Coventry .- The memorial window

to the late Colonel the Hon. F. G. Hood, in this ehurch, bas just heen completed. Beneath the window is engraved the following inscription :---"To the honour and glory of God, and in memory of Colonel the Hoo Tracks Groups of God, and in memory of Coloner the Hoo. Tracks Grossnor Ilood, who commanded the Grenadier Guards at the hattle of the Alma, September 20, 1854, and fell in the trenches before Sebastopol, October 18, 1854, aged 45;—this window was erected by the iohabitants of this city and neighhourhood."

hourhood." St. Mary's, Bary.—A new painted window has been put into the cast end of the north aisle of this church, hy Mr. Edward Greene, to the memory of the late Mrs. Greene. The window consists of three lights, each of which contains two subjects, the upper one beiog the Old Testament type of the Gospel incident portrayed on the lower. The subjects are :— 1. "The Gathering of the Manna," with the legend, "Your fathers did cat manna, and are dead," and below, "The Last Supper," with, "I am the living bread which cometh down from Heaven." 2. "The Serpent in the Wilderness,"—"As Moses lifted up, the screpent in the Wilderness," the lower subject representing, "Our Lord and Nicodemus," with the inscription, "So must the Soa of Man he lifted up." And, 3. "The Dividing of the Waters of the lifted representing, "Our Lord and Nicodemus," with the inscription, "So must the Soa of Man he lifted up." And, 3. "The Dividing of the Waters of the Red Sea,"---"The fathers were haptised unto Moses in the sea," helvs which is "The Baptism of Christ," with legend, "As many as have been haptised into Christ have pat on Christ." The small lights in the tracery at the top of the window contain acgels holding scrolls and the sacred mocogram; and the spaces helween the upper mel lower live of subjects contain the symbolical pelicao, the Alpha and Omega, and the Agnus Dei. The rest of the window is filled in with diagner and horder work of leaves and flowers. The work has heen executed by Messrs. Heaton and Butler, to whose hands the west window of the nave has been entrusted. has been entrusted.

LONDON SEWAGE CONVEYED BY HYDROSTATIC PRESSURE.

I was greatly pleased with the short notice of Mr. I was greatly pleased with the short notice of Mr. Lipsconhe's proposal for conveying seware to the sea, which appeared in your number of the 7th inst. If 1 do not greatly mistake, he has hit upon the solution of one of the great questions of the day; and I have the more confidence in the success of his plans he-cause (though I do not mean to dispute his putent, as I coafess I never thought of applying the principle on a large scale) your account of them immediately reminded me of an application of his method which I had in operation for some years at a former residence of my own. I was an ardent agriculturist, and therefore deter-

of my own. I was an ardent agriculturist, and therefore deter-mined not to waste the sewage from my house; hut as it was built in a low situation, —so much so that in time of flood the strem which ran through the grounds came almost into the hack premises, — I had to devise a method for conveying the precious fluid to a tank sufficiently distant not to be offensive, and to he near the hand to which I wished to apply it. After coming over the want of fall, which precluded any ordinary method of proceeding, it struck me that I had a head of water at an elevation of some 12 or 14 free in the upstars closed. I therefore determined to have a tank made, liued with hrick set in cement, from the upper margin of which I earried a line of charp-pipes, well socketed into each other, for some hundreds of yards, heneath huildings, &c. 11 they terminated at the hottom of the disarding soil-pipe of the closets, which was of leal, and which was well secared into the end of the line of horizontal elay-pipes. I was an ardent agriculturist, and therefore deter-

the closets, which was of lear, and which was well secured into the end of the line of ibrizontial clay-pipes. My proceedings were openly ridiculed hy the work-men employed. They wanted to build a great barrel-drain of a foot in diameter, which would inevitably have here clogged up with the stagmant filth, whereas my pipes were only 3 inches (I think) in diameter I When all was ready, and the work dry, I had the ground left open, to see if any lenkage occurred at the joints : all prophesic dthat such small pipes would he sure to be choked up, and the stuff would never reach the outfall into the tank, &e, which was on a dead level, and I believe actually rather up-hill. However, I had confidence in the pressure of fluids equally in all directions; and it was not helical; for, after re-pestedly emptying the pans of the closets, and having all the alops poured down, at has I had the gratifica-tion of sceing the fluid begin to discharge itself into the tank. After a few trifing defects in some of the joints had heeu repaired with Roman cement, all was evered with earth, and for years a perfect drainage into my tank went ou without disturbance from rats or any symptoms of closking; though other larger trains, from the scullery, &e. had repeatedly to be repaired. New this little experiment nally was a trial on a

Trans, non-repaired. Now, this little experiment really was a trial on a very small seale of the plan by which, as I understand it, Mr. Lipscomhe proposes to do what so many long

heads have heen pnzzling over these several years, in reference to the drainage of the metropolis; and, as far as those parts are concerned situated at a certain elevation ahove the sea level, I have the greatest confidence in the idea. As to those parts at a very low level, I presume he would raise the sewage hy steam power to reservoirs at a sofficient elevation; or perhaps force it at once through the pipes, as Mr. Mechi does at his farm, by forcing pumps. Should means of profitably applying scwage on a

Should means of profitably applying score and a large scale to agriculture he devised, it is evident that, by ramifications of pipes in all directions from the mains, it may be conveyed to a large extent of country, just as a water company supplies houses and streets from its mains under hydrostatic pressure. Depend upon it, sir, it is a fertile principe. HYDRODYNAMICS.

THE BRAINTREE CEMETERY CASE. ERRONEOUS QUANTITIES.

opy of altered quantities from the clerk of the Board, which was accompanied by the following letter :-

" I am directed by the Braintree Burial Board to "I am directed by the Braintree Burial Board to inform you that they have determined upon certain alterations in the work tendered for hy yon on the 24th September, 1855, and that their architect has prepared a new hill of quantities (of which I enclose a copy), consequent on such alterations." * * This letter having hene sent to each party origi-nally tendering, shows that the Board ordered the architect to prepare the quantities; that the clerk (the Board's servant) sold then; and also it recog-nises that all our estimates were based upon these hills of quantities.

of quantities. By your quotations from the letter of S. Courtauld,

say contrarts of the vestry meeting), you have fully shown the ground upon which the Board deny the power of the architect to certify, viz.—that they have not attached their official seal to the contract, which No available then one of the Board induced me to sign. At this very time he was acting as solicitor between myself and the Board; and having signed the contract, I trusted him to affix their seal, thinking of source that as an bonest lawyer he would see them do it. Had I as an bonest lawyer he would see them do it. Had I not implicitly left it to him. I should not have heen duped by sigging what the other party did not siga, worse position to obtain ready payment for that part of the deht which they all admit to be just. As to my being avgreat that the rise of the quantity

As to my being aware that the risk of the quanti-ties was mine, you will see by the architect's letter that he was *positive* they were correct, while I only suspected they were not. Besides, it was because I had doke two hundred pounds' worth of work, and the elerk asserted I should have no claim for it till the 'contrast was excented, that I signed it. I preferred to risk the lesser amount to the greater; the Board has almost reversed my choice hy d hut herately refusing to pay that part of my bill which they confess to owe.

they confess to over. * * * * As you correctly observe, the strong point is my ease is that the architect has certified the correctness of my claim and has even explained the different items of my hill to the Board. But the solicitors to the Board exclaim, "We do not recognise an archi-tect, for our scal is not upon the contract, which makes him umpire and his decision final without armed." appeal." Perhaps it is not for me to comment on the moral

Perhaps it is not for me to comment on the moral rectitude of such a defence. I only aver that I trusted the Board as a body of honourable men, and there-fore, at the suggestion of the chairman and the clerk of the Board agreed to try the claim for the 60%. For extra stone, as a friendly suit, in the County Court, never expecting to he entrapped into the unpleasant position of plaintiff in an action where legal techni-calities were allowed to outweigh justice, and where gentlemen would undertake to defend that part of a deht (96%) which, out of court, and even before the whole parish in vextr assembled, they acknowledged whole parish in vestry assembled, they acknowledged to he righteons. November 9th.

JAMES BROWN

In consequence of a letter appearing in your pub-lication of Saturday last (page 662), signed "A. Cannington," I hag the favour of a small portion of your valuable space in reply to a statement in that letter. I allude to that part where he says "the a Board contends that the bills of quantifies were pre-pared hy the architect, and sold by him for his own profit." This I deny. The quantities were prepared by me in consequence of having a direct order from

THE BUILDER.

the Board to do so, and who also authorised them to be sold at one guinea a copy ; two copies were sold hy the Board or their representative (one of which copies be solut at the ginancial copy i, who converted the Board or their representative (one of which copies Mr. Brown had), and three by myself; the total pro-ceeds of the sale being five guines. The lowest tender delivered for the works was 1,160% upon which the usual per centage, if it be charged, would he about 17. The time of myself and cleft in preparing the quantities was five days (bey being executed in anastatic printing), heades paying for printing and carriage, 21.; hot, instead of my charging the Board upon either of the above principles, which I should be justified in doing, I am content to take the proceeds of the sale as renunceration for my trouble and money out of pocket. It will, therefore, be seen that the words, "sold" by him for his onen profit," is not a fact, and might very well have heen left out of Mr. Cuanington's communication. Nov. 16. J. JOHNSON, Architect. Nov. 16.

J. JOHNSON, Architect.

METROPOLITAN BOARD OF WORKS. THE MAIN DRAINAGE.

AT a meeting of the Board held on Monday last, 16th, Mr. Thwaites in the chair, it was resolved, by twenty-eight to three, on the motion of Mr. Bristow, secouded hy Mr. Carpinael,-

"Tbat this Board, having taken into consideration the interview between its chairman and officers and Her Majesty's First Commissioner of Works and his Her Majesty's First Commissioner of Works and his referees on the 5th of Norember inst, reiterates its conviction that to extend the point of outfall from B^* to Sea Reach at the cost of the metropolitan ratepayers would he unjust, and in direct contra-vention of the principles of the Metropolis Local Management Act."

The discussion displayed considerable ability and common sense, and would serve to give a better im-pression as to the character of the Board than is entertained by some.

INSTITUTION OF CIVIL ENGINEERS. LIGHTING MINES BY GAS.

THE first meeting of the new session, held on the 10tb inst. Mr. Robert Stephenson, M.P. president, in the chair, was occupied by receiving a paper "On Lighting Mines by Gas," by Mr. Alexander Wright. The paper commenced by noticing the almost uni-versal introduction of gas for the purpose of illumina-tion, and the causes of the attention of the author heing turned to its adaptation to the lighting of mines, where the present mode of eemploying tallow-candles, or oil-lamps, was found to be prejudicial to the health of the miners, whils the light afforded was so inadequate, that men could not perform their duty properly. It was stated, that the expenditure of oil and tallow in the mines of England might he roughly THE first meeting of the new session, held on the Inaccipate, but was stated, that the expenditure of oil and tallow in the mines of Eegland might he roughly estimated at 500,000′, per annum. In Cornwall and Devon alone there were about 30,000 men employed underground, who were lighted

at an annual expense of 90,000, per annun; and in one of the large mines the annual expenditure for candles had reached as high as 7,0007. A general review of the state of lighting and venti-

lation of the Cornish mines induced the attention of the author to the introduction of gas for superseding calles and oil-lamps. An attempt had been pre-viously made at the Tresevean mine in Gwennan, but it was abandaned. He concurred that it was pre-ferable to make the trial upon a mine where explosive gases were not given off, as in coal-mines; and where the work was closer, and did not extend so rapidly.

The mine selected for the experiment was the Balleswidden mine : the depth of the shaft was described as being about 780 feet, whence there hranched out several levels and tramways, at various depths, and in numerous directions. About 340 minurs were employed underground, in two changes, or shifts, each of about eight hours' duration. Each man worked about five days during the week underground, and one day aboveground. In the ordinary mode of lighting, each miner burned

four candles in eight hours, obtaining only an inade-quate light for the expense incurred.

The gas which was introduced to this mine was manufactured at the surface, and was forced by a maintactured at the surface, and was tobed by a pump into a heavy gas-holder, composed of east-iron plates, whence it issued by a descending pipe into the mine, under a pressure equal to 18.7 inches of water. The shafts and levels were fitted with wronght-iron tubes, proved by high-pressure steam, and from the hranches, flexible tubes and burners were carried into The pitches and chambers for the miners, and to the pitches and chambers for the miners, and to the potenty of isolation, of green fields, and habbling floors for picking the ore. The transways, also, had sufficient number of hurners, to preduce the necessity for using any candles or lamps in the mine. The quantity of gas consumed was about 4,000 "A paper was read at the meeting of Tuesday last, the fifth ints." On the Conversion of Wood by Machinery," by Mr. G. L. Molesworth.

[Nov. 21, 1857.

lighting was stated to he much in favour of gas;—as the annual cost of candles was S34'. 3s. 4d. — whereas that of gas was 457'. 2s. including interest on plant, wear and tear, and all expenses. It was stated that the sanitary condition of the mine was visibly improved : the vantilation was better, and there was an entire absence of the sicken-ing smoke and bad odour, previously pervading the mine, which the author believed to arise from some particular componds of hydrogen and earbon, given off during the immerfect combustion of the candles.* off during the imperfect combustion of the candles.*

THE VACANT SPACE NEAR ST. PAUL'S CATHEDRAL.

THE subject of the appropriation of this piece of ground was a few days since brought under the conground was a few days since hrought under the con-sideration of the corporation of the City of London; and, so far as might he gathered from the reports published in the morning papers, an evident desire seemed to he shown to preserve the space, which enables us to take the finest view that is to be had of this glorious structure—the "Pearl of the City." But then this peculiar spot of l and, which, uncovered, displays so fine a picture, is wortb 50,000/.—a large sum undoubtedly, hut not more than the worth of the view which, hy means of this opening, is offered to hoth forcign visitors and the people at home. Some small paintings, hy Corregio, and other famed artists, are worth from 10,000/, to 15,0002, each, and private individuals of taste are delighted to he in the possession of such treasures. If a single

he in the possession of such treasures. If a single effort of the gifted pencil is worth about the quarter If a single of fifty thousand pounds, how can we feel that this price is too mucb for the picture which is offered to the sight of the passer by, from the eastern part of this opening? Moreover, it would be only doing a tardy act of justice to Sir Christopher Wren, a staty act to justice of on one of the provider when extent a work which is not only a credit to the architect, hut to the nation. This noble building has been surrounded in all directions in a manure which nust cause every one of sufficient knowledge to re-gret the taste of our forefathers.

gret the take of our forelations. Sir Christopher Wren hoped, when the City was in ruins, that he might have been permitted to remodel it—to make a terrace along the hawks of "Father. Thames," to form a magnificent flight of steps from Thames," to form a magnificent flight of steps from the cathedral to the river, and to plan the streets of the new city in intersecting straight lines, which would have added not only to the health of the heart of the metropolis, hut would have also given us the means of appreciating the merits of the exterior design of our chief cathedral. Unfortunately, how-ever, pounds, shillings, and pence, and a strange perversity, caused the City to rise from the ashes in all the crooked and narrow ways which had been formed by circumstances, and under the necessity contingent with a large population lodged within defensive walls. defensive walls.

At the recent meeting at which this subject was considered, many strong arguments were used in favour of preserving the land, and hut faw on the contrary, except the bare money value of the property. With the large revenues of the corporation, although at present orecretary by the expense of various important altera-tions, the sum above stated might be spared, and the next generation, and those that follow, will appreciate the taste and public spirit which caused the City authorities to leave them a fine view of St. Paul's.

It is to he hoped that those who have so ahly It is to be hoped that those who have so anly advocated the preservation of this space, which is of such great value to the public, will make renewed exertiona; and that at the next meeting we shall he told that the corporation have declined building here. Independently of other advantages, it would he a famous site for important public monuments.

GRAVEYARD SCULPTURE AND FUNEREAL POMP.

FUMP. Soure months ago you kindly gave space in your columns to some remarks of mine, on the gross errors committed in a grammatical sense, or rather an ortlographical one, by our sculptors of the various mementormori which disgrace and disfigure our cometeries. To thank you for that favour is to acknowledge my obligations to you, for the public press, through yon, multiplies the writer's views ten thousand fold.

thousand fold. Allow me, then, once again to refer to our "grave-yards," now called "cemetories." Generally they are placed in picturesque situations — they have all that the poetry of isolation, of green fields, and habbling brooks," or snnny hill sides, and extensive prospects, o'er hill and dale, een give to render such locali-ties at once the fitting places for solitary grief,

or of saddened and ballowing reflection. Why, then, it may be asked, are these sacred reposi-tories shunned by the man of taste, the reflective, the pensive mind? Why? Because every feeling is offended, and every insult offered to the eye and the imagination. Under the garb of humility, you have the pompous slah of "departed greaturess," all the virtues are enrolled to tell how a man discharged the duties of life, whils the notorious fact is con-ecaled, that intoxication sapped, madness primed, and death fired the train, which resulted in an end re-joiced over hy all, especially by "the sorrowing widow, and her weeping fatherless children." In more than one instance could I point out, in every subtriban cemetery, cases where such inscriptions suburban cemetery, cases where such inscriptions would show that— "The fun'ral baked meats Did joyful furnish forth the marriage tables;"

and all the grief that was real was displayed in paying.

"The hearse, the coach, the panoply of pride, The graveyard sculptor,-would that he had died, Ere such a bill as this was shown !"

Ay, and so say I, for I have come to the conclu-sion that epitaphs and all the parade of woe are a mockery, a delosion, and a suare. A poor family loses a relative, near, dear, distant, or uncared for; a pompons funeral is determined upon; the "Gothic" hearse is hespoke, the feathers and "all the mockeries of oried" are there. All more and entry are in the of grief" are there. All wonder, admire, and in the end imitate, never reflecting on the cost,—never ask-ing how the "fatherless" will be pinched to pay for the black plones,—how many an empty stomach will protest against --

"The swilling Bacchanals, who drink success To trada."

and show the only sign of weeping in the drink-glazed eye.

I would ask of the Builder to denounce the whole I would ask of the Buttler to accounce the wave of our existing system of hurids and the after-death perpetuations. Do, pray, coudemn the New-road style of mourning: let ns, when we take a walk in our "graveyards" scase to he reminded that we are in the workshop of "Fitz-Humhug," or "Pretentious Breinless" Brainless.

Dramess. Departed greatness sleeps in modest rest. A horse-slaughterer, or a quack doctor, or any other sepul-chral advertising knave, blazons fabulosa qualities, and calls them virtues, and honats of goodness where only hieamery, imposition, and impudence, dehaded igno-rance and enriched themselves on the follies of a growning of guidest bar their down on the call. rance and christed themselves on the folles of a generation. "Sufficient for their day was the evil thereof:" why are their heirs and successors to reap another harvest? is the question of your ioquirer. Let the present generation show by their practice how they discontenance such pretensions, absurdi-ties, and gross impositions.

A WALKER AMONG THE TOMBS.

FASHION IN THE WEST.

THERE are many strange phases of this metropolis, which strike the attentive observer, and few are more curious than the regular changes and observances which take place periodically in different ancihour-hoods. Amongst these, it may be mentioned, that almost as soon as the primrose and walldowers have superseded the crocus, a change comes over the appearance of the London buildings. In squares and afteres numerous holdies of painters are at work, and streets numerous hodics' of painters are at work, and iron work and staceo are freed from the town smoke, and clad in hues more in contrast with the budding shruhs and trees. At that time the large extent of Surphis and iffees. At that time the targe extent of the western fashionable neighbourhood is deserted of its population, and many places are as quiet as a country village. At the doors of large massions, trusty porters and housekeepers loiter, underked with plash or powder,—the window-shutters of dining and drawing rooms are closed,—the assistants of the west-est in many loss are consistent of the westend tradesmen have an easy time of it, and in many instances the principals are looking as anxiously for the return of summer as school-boys do for the arrival of the swallows.

It seems a strange inconsistency, and yet so custom It seems a strange neonascency, and yes so casion wills it, that when the bads open in youngest and fresheat beauty, and when hright greenery herins to clothe the fine form of nature in the country, it is the time for its votaries to rush from these is the time for its votaries to rush from these sweet retreats, and seek shelter in the town. It is a Quistoite measure, however, to criticize fishion. As the painters and decorators complete their work, a busy scene of industry commences in the dwellings. The windows and shutters are opened to admit the fresh spring air--apholsterers are busy, and soon the balconics and windows become gay with choice flowers and plants, which perfume the air and afford a pleasure to the pent-up Londoner which it is difficult to describe. As the spring advances, one by one the families reach the town; the sound of carringes begins to waken the quiet streets; and, by a gradual increase of arrivals, the "west-end," before

the hawthorn-hlossoms have blown off, becomes as noisy in its particular way as Whitechapel, or parts of the Borough. Now come forth your dealers in won-derful news, with load voices, annoaneing third editions of the *Times, Post*, and *Standard*. German hands, which have heen traveling in the provinces, "discourse" very decent music. The butcher, the poulterer, and fishmonger are roused from their few months of torpor, and the sound of rolling wheels escarely eccess from midday till the approach of early dawn. The porter has now assumed his chair of state and dignity of costume: the halls are lined with statwart attendants, clad in their peculiar costume.*

and unfaily of costine: the main are mined with stalwart attendants, clad in their peculiar costume.^{*} As the trees in the squares get thick with leaves, the busile in the west increases; and long after the other districts have been in as quiet a state the other districts have been in as quiet a state of repose as can be expected in this vast metropolis, the humming sound of the neighbourhoods of fashion may be distinctly heard in the suburbs. Hearing these and other voices of this city, in the gloom of night, thoughts arise of the many sad phases of the huge population which is here congregated, and hope is felt for the time when there may be a better under-standing between the west and the east, and when the energy which is used in following through the extent, directed towards raising up and improving those thousands of human beings who are, now, even worse, than lost. than lost.

A PROTECTIVE COVERING FOR LEAD.

A PROTECTIVE COVERING FOR LEAD. WILL you permit me, in answer to "Subscriber," to say I have found upon several occasions two coat-ings, of "equal proportion," of dry while lead and targeotine, and then thioued ap with gold size and targeotine to the consistency of ordinary paint, not only render an old eistern sound, provided there are no cracks in it, but also prevent a new one, or lead pipe, for years, from being destroyed. I can speak from several years' experience, and would gladly give on. in my rough way (mon your promise to shield you, in my rough way (upon your promise to shield me from the ire of my hrother planhers, the anger of Mr. Zineman, the wrath of Master Slate-worker, and the venom of Gutta-percha and Co.) the result as follows : -

No. 1. A draught-pipe of pnmp was caten through in No.1. A damagin spice of panel was taken introduct in twelve months: a second one was laid down with the same result: a third one was fixed with the above coating, and, for anght I know, remains there at work now: it is from four to five years since it was laid

aown. No. 2. In a cistern snpplied with pnmp or spring water, the bottom was entirely eaten through in a very short time: a second one was soldered in, and I helieve to be at work, and has no sign of imperfection : it had three coats of the above composition nearly three

three coars of the acceleration was "fixed in such a years ago. No. 3. A very large eistern was "fixed in such a place as none but a surveyor can direct" (and did Nena Sahib only know of it, he would use his intrast to get there),—" supplied with river water," quite new seven or eight years: after drying it thoroughly two years since, I painted it three times with the foregoing composition, and last week examined it, and found it perfect. An ARTIZAN.

NUMBERING AND NAMING THE STREETS.

STREETS. I PERCEIVE the Board of Works have commenced a very necessary reform, by amalgamating the "ter-races," "rows," &c. of the New-road into the "Esston-road" and "Marylchone-road," with con-secutive numberings from end to end. I see, also, that they have judiciously placed the odd and even numbers on opposite sides, but a great improvement in the matter would have head to have made them run with the conres of the river, and it would he well in future numbers to do so in those streets which run parallel with the river; and it such as run at well in future numbers to do so in those streets which ron parallel with the river; and in such as run at angles from the river, to cause them to commence from the river, and proceed northward or southward as they are north or south of it. In re-naming the streets, I perceive, from the list recently given, that no definite philosophic plan has heen attempted, hut that a purely arbitrary nonen-clature has heen adopted. The various congeries of streets and sonares ourbit

COVERING FOR GREENHOUSE FLUES.

COVERING FOR GREENHOUSE FLUES. IN reply to "C. H. K."—First, The hest description of covering is the 12 or 14-inch square paving tiles or bricks: between each joint of the tiles lay a piece of iron hooping, an inch and a half wide, and use for the joints of the tiles a fine close joint of mortar, composed of lime, loam, and fine pounded brieldust, the inside of the fues being first well pargetted. Second. That the first eight or ten feet are likely a wife from the heat is the and the sandisetion of

Second. That the first eight or ten' feet are likely to suffer from the heat is true, and the application of cast-iron plates, say a quarter of an inch blick, as a first covering, is desirable, with the tile above, in manner as described, leaving a space of an inch and a half or two inches filled nearly in with sand: thus the iron will have room to expand (or a covering of Welch fire-lamps may be employed). Third. To the inquiry if the fluces in their course may descend as well as ascend—Yes, and without detriment, if proper judgment he exercised in the formation of the same. A BRICKLAYEE OF EXPERIENCE,

e same. A BRICKLAYER OF EXPERIENCE.

THE JOINTING OF MASONRY. WORKS IN EXETER.

It is to be hoped that the attention your corre-It is to be hoped that the attention your corre-spondent has lately culied to the compo-work recently done in Exeter will not be without its good effects. The restorations, too, for ever going on ahout the eathedral-to the credit of the Chapter be it spoken-would, no doubt, be all the hetter done ander the eye of an architect; hut a practice prevails in that eily and neighborshood which is almost worse than the continuation of plaster and slapdash-which needs the voice of *Punch* or your own good-untured strictures to discourage—and that is the unscientific and dishonest way in which the walls—whether of squared ashlar, or of rough or increating range—are pointed: it is discourage—ant can be she unscaled a unsolute way in which the walls—whether of squared adhar, or of rongh or irregular range—are pointed; it is regular tack and point of the hircklayers dabbed on—sometimes half a foot wide, projecting about half as much where there are joints, and sometimes where there are none at all; no matter, so that regularity and squareness he produced: and what is worse, the cearse joints, most of which are all the cearser from having the corners and arrises on the face broken off, are filled and brought level with common motar, on the surface of which, while green, some fine rubble is scattered, to complete the sham, and then over all is dabbed on the tuck and point! There are architects in Exter of reputed celebrity who must know a better way of doing such work, unless they consider such practical details hemath their notice, and leave it all to the mason; just as a celebrate divil engineer once told the House, in reply to a question put to him about some iron-work, that." In your number, 176 (1846), your friend "X."

"the hiacksmith would attend to that." In your number, 176 (1846), your friend " $X_{*}^{\mu\nu}$ well describes the pointing of ancient masonery, "All must be real." Pray tell the ecclesiastic mason in *Semper Fidelis*, that in pointing no mortar should ever project beyond the surface of the work; nay,

* It must be understood that we continue to protest against any but the most absolutely required changes in the names of old streets. These have associations which compensate a thousand fold for an occasional incouveri-euco.-ED.

that it should be rather a triffe within it, and formed with a weathered or sloping surface, allowing the bed of the ashlar course above it to protect it rather : and that every joint should tell its own tale honesity, and mark distinctly the form of every irregularity, whether natural or rough from the hammer, of every stone. The Church of St. Lawrence, which has called forth these remarks, is a sud specimen of the mode of pointing prevailing in the locality : it is well to know that no architect has been employed about the work. At the Training College near the city, built a few that it should be rather a trifle within it, and formed that no architect has been employed about the work. At the Training College near the city, built a few years ago, the architect has set an example how pointing should he done where the stone-work is irre-gular. At Plymouth hey understand the thing well, and at other places in the county; hut in Exeter and its neighbourhood tuck and point seems to be the way thought necessary in all work of restoration where the walls are built of hewn ashlar. Much of it is dislodged by the first frost, and none can last many years; and so the last state of a renovated huilding becomes almost worse than it was hefore it was touched. X. Y. Z.

RECENT PATENTS.*

RECENT PATENTS." W. CLARK.-Improvements in Air and Water-proof Coatings, and in their Applications. (A com-numication.) Dated Dec. 26, 1556.—This relates to coatings to he employed particularly in dycing and painting, in the preservation of moulded plasters, porous stones, and organic pervious alterable sub-stances. It is a kind of artificial leather composed of gelatine and tannin. The patente imprints or coats the objects to be treated with gelatine, isinglass, or glue, and after drying soaks them in a solution of tannin, or of matters containing tannic acid, such as tannin, or of matters containing tannic acid, such as

tannin, or of matters containing tannie acid, such as nutgoil, sumach, bolah, or oak bark. F. WALTON.—An Improved Plastic Composi-tion, and in the Application of Machinery for Manufacturing the same. Dated January 20, 1857.—This consists in an improved plastic composition made of less or other resins pos-sessing properties combined with fibrous substances for inparties tenedits and strength and if reconsist for imparting tenacity and strength, and if requisite with colouring matter to improve the appearance. Also, in the application of masticating machinery and of a heated cylinder, furuished with a piston roo and screw for preparing the composition, and keeping it in proper condition for working. Also in the application of ornamental forms with the composition.

application of ornamental forms with the composition. L. W. WARKINS.—The Manufacture of a Pully to be used in Glazing, Gr. Dated January 3, 1857. The improved putty is a composition of two parts of an oil obtained in the refuting of rape and hoseed oils, and commonly known as hlack acid oil, from its con-taining sulphuric acid, which acid is used in the re-fining of the said oils, added to one part of any alkali in solution, and mixed with it in a vessel, until, by In solution, and inside with it in a vessel, until, by continual stirring, it assumes a creamy or scopy ap-pearance. It is then mixed by hand lahour, or any other mechanical force, with a sufficient quantity of whiting, until it attains the consistency of dough, when it is termed putty. WILLIAM EDWARD NEWTON, Chancery-lane, London.—Tracing Cloth. (A communication). Dated March 5, 1857.—The improved process of manufac-ture is as follows.—The patentee first prenares a

ture is as follows :- The patentee first prepares a composition of the following materials, although not composition of the polytoking materials, antiogen hol-confining himself to the exact proportions named. Eight parts by weight spirits of turpeutine or cam-phine, eight parts castor oil, two parts Canada halsam, one part balasm copaiva. This combination, when well nicked, is to he applied to the tracing muslin as by means of a sponge, spreading it evenly over the surface. The sheet is rolled up and allowed to stand in this term. for thirty-six hours or so; it is then unrolled, and any excess of composition is to be rubbed off. It is It is then to be again rolled up for a like period, when, if on uncoiling it the surface does not appear to he dry, it must be further rubbed or wiped. It is then to he rolled again, and in two weeks thereafter will have become fit for use.

become fit for use. M. TRATILES.—Improvements in Tools for Cutting Cylindrical and Conical Forms. Dated January 6, 1857.—For long cylindrical articles the patentee arails himself of a lahe; hut for smaller the tool is rotated by hand. The mandril is hollow, to receive the wood to be cut, and the front end of the central opening is bell-mouthed. In the side of the mandril is a diagroup lengess does negroup th agroups the interior opening is ber-moduled. If the side of the hadarfn is a diagonal recess, deep enough to expose the initerior of the mandril, and to permit of the edge of a flat blade projecting therein. These blades are secured by champing screws, which permit of their adjustment or removal for sharpening. Rotary motion being given to the mandril, the wood is rapidly reduced.

JOHN WHEATMAN and JOHN SMITH, Sbeffield.— Grinding Circular Saws. Dated March 14, 1857.— This invention consists in substituting for the grinding body of the grinding body of the grinding body at present in use a common sand or grinding

* From the lists published in the Mechanics' Magazine and other journals.

stone in saw grinding machines, in which the edge or periphery of the grinding hody acts directly upon the saw secured to a table or hed-plate. GEORGE MARSHALL, Morpetb, Northumberland.— Saw-setting Apparatus. Dated March 16, 1857.— In carrying out this invention, the apparatus is con-structed with a novel arrangement of lence and spring or a lever to answer the same purpose. The lence has two or more set screws to move it backwards and forwards, or to sceare it when adjusted to suit the forwards, or to secure it when adjusted to suit the setting of saws, and has also a rest for the saw-plate. setting of saws, and has also a rest for the saw-plate. The spring used in one mode of constructing the said apparatus is made so that when the punch is struck it operates to press the saw-plate firm on the rest, and at the same time is so arranged as to force the punch up after each stroke. The feace may be rest, and at the same time is so arring on a so not the bench buy natice acts where the stroke. The fence may be variously worked, and the apparatus may be modified to suit frame, large, and different kinds of saws. J. WILSON.—Improvements in the Manufacture of Steel. Dated Jan. 2, 1857.—These consist in roast-ing or calcining granulated cast iron, and afterwards

melting the roasted metal to obtain cast steel. in obtaining steel from rich iron ores by substituting such ores in place of bar iron in the usual process of ementation to obtain steel, and in melting the pro-duct so obtained with from 6 to 8 per cent. of oxide of manganese to obtain cast steel.

of marganese to obtain east steel. The provide the set of the set weigh upwards of four tons.

PROVINCIAL PORTRAIT GALLERIES.

WHILST appreciating fully the attempts in the metropolis to establish schools and galleries of art, metropolis to establish sebools and gallerics of art, we have long been nost earnestly impressed with the necessity which exists for fostering similar institutions firmingham, Glasgow, Manchester, Edinburch, and a few other places, there are periodical exhibitions of pictures by living artists, which are not only hene-ficial to the public taste of these spots, but are also of great benefit to the rising artists, who have in many instances been indebted to these local exhibitions for gaining that knowledge of their powers which has in-duced them, often with the hest effects, to try their We have now, however, more particularly in mind

the collection of postraits, of our eminent men, which it is proposed to form in London, and feel regret that it does not make so much progress as the importance of the idea deserves. Valuable as such a collection of the portraits of the great and noble men of the whole the portraits of the great and noble men of the whole land will be in this centre of our population, it should not prevent the formation of local collections. Much good might be done in such large towns, for example, as Manchester, Birningham, &c. hy col-lecting into one place the portraits of the chief men who have distinguished themselves in literature, science, or art, and have been instrumental in ad-vancing the condition of their own district, or the country at large

vaccing the condition of their own district, or the country at large. In other instances, the chief town of a county might be selected for this parpose; and many will be surprised, when they tokn on the subject, to find what a large number of worthies their neighbourhool can boast of, who might be usefully placed as patterns before the rising generation. Many of the town-halls throughout the country are have of pictorial decora-tion, and nothing could be more appropriate than the bearing of these nublic huildings with portraits of hunging of these public huildings with portraits of eminent townsmen. Supposing this principle to be acknowledgel, care would be taken in the huilding of future town-halls to render them fit for this purpose.

These local collections should, in all instances, be as complete as possible, and easy of access. Some neighbourhoods are more abnuchant than others in the production of remarkable men, and some seem to grow geniuses of a peculiar description : for instance, some famous painters have been reared in Devoushire. From I pewich and the neighbourhood several men of note in both art and literature have proceeded.

[Nov. 21, 1857.

such local exhibitions during a visit to Northumher-land, which can boast of a long array of famous cha-racters. On the banks of the Tyne, in comparatively recent times, the two Bewicks, John Martin, the painter, George and Rohert Stephenson, &c. were born. Lord Collingwood first saw the light near North Shields. Gordener, the author of "England"s Grievances," was born at the same place. The two great lawyers, Lords Eidon and Stowell, were born in a narrow lane leading from the Quay-side, Newcastle, Hutton, the mathematican, who was at an alun-pit, Hutton, the mathematician, who was at an alum-pit, received some education and kept a school in the town received some education and kept a school in the town previous to his promotion to London. Morrison, the Chinese scholar, was a native of this place. The un-fortunate Luke Clennel, with some companions who old not arrive at the same eminence, studied the art of painting in a garret near the Black Gate. Aken-side, the poct, was born in a picturesque bouse in the Butcher-bank, which still exist. Peter Nicholson, who has done so much to spread knowledge amongst the artizans of this country; Fairhairo, the cogimeer; and a large number of others less generally known to fame, have been connected with the ancient borough; and a large number of others less generally known to fame, have been connected with the ancient borough; ; and in different places there are fine portraits and busts of most of these men, which are scattered about to little purpose, for they are but little seen. This matter has been hefore referred to in the *Builder*, hut we deem it advisable to hring it again before our readers.

NOTES UPON IRON.

NULES UPON IRON. THE iron trade has experienced a convulsion since our last, for which few persons out of South Stafford-shire, and not a large number in it, were prepared. Several firms had severely suffered by the failure of Glasgow and Liverpool, superadded as they were to the shutting off of all remittances from America. This latter circumstance had occasioned a somewhat heavy drain to be made upon the resources of the Wolverhampton and Staffordshire Bank, whose direc-tors in consequence began on Wednesday in last week Wolverhampton and Statorushine bank, show and tors in consequence began on Wednesday in last week to refuse the customary accommodation for paper taken by their customers in the ordinary course of business. The effects which followed were of the most taken by the effects which followed were of the mos-serious character. Iroumasters who had been trading largely with hills were brought to a stand, and by Moodaylast three firmshad issued circulars announcing Automay fast three transmad issued circulars announcing that they should be compelled to call their creditors to-gether. The Bank opened on Monday with assistance from the Bank of England to the extent of 50,0007. So heavy a call, however, was made upon them dur-ing that day that in the night the directors determined to suspend nearmont. The compounded to the ing that any that in the injust out outcome of the start matter to suspend payment. The announcement to this effect, placed upon the doors on Taesday morning, was received with the utmost construction through out the town and district, accompanied, as it was, out the town and usarine, accompanion, as to was, with the receipt hy creditors of circulars from two other iron-making firms. The panic which, however, had set in was aliayed by the publicy-expressed as-surance of the mayor of Wolverhampton that the notes would be paid in full, and by the expressed recailed the therehands to receive them. Wedness day hroke with the announcement of another iron-firm being about to call together their creditors; thus minimized a total of six firms so circumstanced. There is no business doing that can be noticed, and prices nominal; maters, if for cash, accepting a surprisingly low figure. The workpeople at nearly all the works have only partial employment.

Books Receibed.

Remarks on Secular and Domestie Architecture, Present and Pature. By G. G. Scorr, A.R.A. London: John Murray. 1857.

London : John Murray. 1857. WE must content ourselves on the present occasion with mentioning the publication of Mr. Scott's book, nucler the above title, containing an elaboration of those views which have been set forth in the author's own words in our pages, and have excited the ire of some correspondents. It consists of 285 pages, and is dedicated to Mr. Beresford Hope. In his preface the writer sets forth his motive and his desire. He savs

" I want to call attention to the meanness of our vernacular architecture, and to the very partial suc-cess which has hitherto attended the attempts at its cess when any interior attends the strings of the improvement I want to point out the abaurdity of the theory that one style is suited to churches and another to houses, and of the consequent divorce be-tween ecclesiastical and secular architecture; to press tween ecclesiances and second interfections, to pieze upon architects who are engaged in the Gothic revival the paramount duty of rendering it consistent by per-fecting it, and that on a systematic principle, in its domestic and secular branches; and, finally, to show of note in both art and literature have proceeded, upon architets who are upseed in the tendering it consistent by per-The city of Bristol might collect a goolly company it he paramount duty of rendering it consistent by per-of celebrated persons. Without, however, mentioning feeting it, and that on a systematic principle, in its a long list of places, it is evident that few, if any, of domestic and secular branches; and, finally, to show the least note, would be unable to get together a table that we sim not at a dead antiquarian gallery which would he an inducement and encouragement to the rising generation. The writer of this particularly noticed the need of will be pre-emineutly that of our own age, and will naturally, readily, and with right good-will and hearti-ness, meet all its requirements, and embrace all its

ness, ince an is requirements, and inventions." This is exactly what we want, and have always worked for. There are plenty of strong words for pponents to cavil at: thus plaster is "an accursed Aing," and there are many excellent observations for friends to quote. "Auon, anon, sir."

Essays upon Educational Subjects, read at the Educational Conference of June 1857; with a short Account of the Object and Proceedings of the Meeting. Edited by ALPRED HILL, Barrister-at-law, one of the Honorary Secretaries. London: Longmon and Co. 1857 Longman and Co. 1857.

Longman and Co. 1857. THESE are important essays, and although they, doubtless, will not of themselves fairly settle the moot question, already so much discussed, and still as far as ever from a settlement, still there has heen much valuable practical information elicited at the Educa-tional Conference, as is testified by the papers now published. The book is divided into six parts. The first contains papers chiefly on the fact of the non-attendance and early removal of children from school in this country; the second, papers on the attend-ance, &c. at schools on the Continent; the third, papers chiefly on prize and certificate schemes; the In this could, it is book on the Continent; the third, papers chiedly on prize and certificate schemes; the fourth, on half-time schemes, and evening and factory schools; and the fifth, papers not falling under the preceding heads. Part sixth is an account of the authors and the authors. precedings at the meetings. Among the authors of the papers are many names well known in con-nection with educational subjects, including Govern-ment school and factory inspectors, and others offi-cially and practically acquainted with the statistics and the routine of schools.

A Hundred Years ago: an Historical Sketch. 1755 to 1756. By JAMES HUTTON. London: Long-man and Co. 1857.

This is an interesting and amusing olla podrida collected by a single dip, as it were, into the life-current of the England of the last century. The miscellaneous and more amusing shreaks and aneedotes of the latter portion of the volume are preceded by an of the latter portion of the volume are preceded by an historical sketch of the political berrings of the time selected for illustration. There is then given some account of the men of the day, and what they were doing; ancedotes of the dark side of society, such as the press-gaug, the foot-pads, suicides, &c.; a chapter or two on the fiviolus classes, and their fiviolities; jo others on the anuscments and pastimes; and these are followed up at the close by a few glimpses of intercommunication without either steam or rail, electric telegraphs, or universal penny-postages. This yolume affords an excellent example of what may be done in our own more especial province towards the enlivemment and instruction of the present by means of reviews of the past.

hy means of reviews of the past.

Miscellanea.

fristellanea. BRIDEWELL HOSPITAL FOR THE CITY CASUAL Poon.—Within these few weeks Bridewell Hospital— at present nutenanted, except by officials, and a large portion of its revenues altogether unappropriated, except to an ever-increasing reserve fund—has heen prominently bronght under the notice of the perplexed guardians of the London City Unions, as a desirable huilding for the housing of the casual poor, if it could he obtained for such a purpose. By diligent research into the original charter of Edward VI and subse-quent ordinauces, this would appear to be only the revival of one of the legitimate purposes of the City Bridewell. A joint committee from the City unions has heen appointed to cenfer with the governors of Bridewell, or the Charity Commissioners, as to its appropriation. Menatime, a memorial on the subject assess that five tenders were received, ranging from K50/ to 501/. and that the tender of M. J. H. Ball, 60/. was accepted. Britewell.

S50/ to 501/, and that the tender of Mr. J. H. Ball 650/, was accepted. BLIFER CENTEREN CONFILTION. --Sir: The Belpere Burial Board advertised a short time ago for designs for creatin works proposed to be done at the new cemetery, to be sent in on Novemher 6th. According to a circular just issued to the competitors, there were "upwards of 100 designs received, and carefully examined by the Burial Board," and returned to the authors within the short space of four or five days. I send you this information for the benefit of your numerous readers, that such a feat of agility and despatch may not pass unnoticed, hut may receive that and ow tell give it. ** Two other competitors complain that their rawings have heen returned to them spoil,--by the packing-paper pasted all over them.

BEDFORDSHIRE ARCHITECTURAL SOCIETY.—The tenth annual meeting of this Society was held in the Bedford General Librery on the 10th inst. The attendance was larger than usual. On the table were coins and various other objects of interest. After the reading of the usual report, and the clection of office-bearers, the Rev. H. J. Williams read a paper cotilled, "Notices connected with the History, Architectare, and Antiquities of Clastonbury Abbey," the Rev. W. Airy one by the Rev. J. Taddy on the etymology of the word "Bury;" and Mr. Monkhouse one on "Recent Discoveries at Biddenbam." A shaft or well, 37 feet deep, has been found, in a gravel pit. The well was contracted by a most expensive shaft into a diameter of 2 ft. 9 in. and has no marks of abra-sure, as if from any use, upon it. The coulents will appear from the following quotation from the paper as reported in the *Bedford Times*.—It may seem strange to us that the Romans should have bestowed so much cost and labour in sinking a shaft 37 ft. deep to receive to us that the variants should have bestowed as inter-cost and labour in sinking a shaft 37 ft. deep to receive the remains of one individual; but there is the shaft and there is the skeleton, there are all the parapher-nalia of sepalture, the altar the states of the deity to whom it was dedicated, and the remains of the victims main or sepiritire, the share the statule of the field of whom it was dedicated, and the remains of the victims offered in sacrifice: so we must seek for an explana-tion of what appears to use so absurd and paradoxical in the character and customs of the Roman people. He then pointed out the points of resemblance between the pit at Biddenham and those at Evell, Stone, and on Monnt Aventice. Mr. Akerman, who was present in its heing opened, remains that this mode of inter-ment was practised by the Romans in Britain, and was calculated to protect the remains of the dead from insult and desceration. The shaft on Moant Aventine, at the very gates of the Imperial City, was 51 ft. deep and about 3 ft. in diametr, and at the bottom was a vault or columbarium, with niches in the side for re-ceiving cinerary urns; the elamher also is stuecoed and painted with the greatest care; so that a clear identity of purpose is shown hetween these three pits and the one at Biddenham. They were all Roman and all sepulchral. and all sepulchral.

and all sepulchral. STRIKES, &C.—While thousands are heing thrown out of employment from failures and sheer want of work at Glasgow, the journeymen joinces in that eity (4428 in numher) are out on strike on a question of wages. We are glad to hear, however, that there is a prospect of a compromise with the masters, who have met their men half way hy offering 5d, an hour, or 0 \frac{1}{2}d. less than the men contend for. Meastime a committee is arranging as to the relief to be given to the unemployed at Glasgow, and it has been resolved to provide work in return for relief, and to give food rather than money for such work as can be give food rather than morey for such work as can be given. At Belfast numbers of skilled tradesmen are walking the streets without employment, and others are proceeding by every steamer to England and Scot-land, where their prospects of work at present are by no means encouraging.

OLD HACKNEY CHURCH TOWER .--Few who travel aloog the line of the North London Railway omit to notice the picturesque grey tower of old Hackney Church. It is an object amongst the masses of Control. It is an onject amongst the masses of modern buildings which is not only pleasaut to the eye, hnt gives rise to thoughts of progress and other times. The hody of the old church was removed, but persons of laste in the parish determined to save but persons of taste in the parish determined to save the tower, which stands amongst trees in the clurch-yard. We heard with regret a short time ago that this venerable remnant of suburban antiquity had fallen so much out of repair, that the police surveyor had condemned it as being dangerous. It appears, however, that the holy of the building is sound cough, but that parts require care. A meeting has hear held with a view of saving the tower, and the lord of the manor has pledged his word that funds shall be forthcoming for the necessary restora-tion. tion

THE ADELPHI THEATRE.—Some romantic scenery has been painted by Mr. Pitt and Mr. Brew, for a piece of giamour, called "The Legend of the Headless Man," wherein Mr. B. Webster plays with his usual power. Some of the effects are very well managed.

DUDLEY DRAINAGE PLANS.—The plaus and spe-cifications for the drainage of Dudley heing com-pletel by Mr. William Lee (but not yet carried out), the Board of Health applied for his account up to the

THE BELLS AT WESTMINSTER AND ST. PAUL'S. —It is a curious coincidence that the great bell at St. Paul's appears to have mot with a disaster like that which has befallen the modern monster bell at St. Faul's appears to have mict with a disaster like that which has befallen the modern monster bell at Westminster, before the building was completed. Allan Cuuningham, in his life of Wren (Lives of English Architets, Painters, and Sculptors), alladed to it, vol. iv. p. 234, as being one of the charges brought against Wren by the Commissioners of St. Paul's, as a fraud from had workmanship, to which, with other alleged frauds and abuses, Wren most satis-factorily replied (see pamphlets on this controversy), showing that the authorities had allowed the great hell to be improperly struck with a hammer by the public for a moncy consideration I—C. C. N. FATAL EFIECTS OF IMPURE AIR.—On a coroner's inquest on a child, at Bedford, according to the local Times, it appeared that the room in which the parents and child step: was very small, heing only seven feet by six feet, and that the chinney was stopped up, and there was no opening whatever for ventilation. Some of the jurymen who visited the house were unable to stand the forlid atmosphere of the room. The jury returned the following verdic t-—Death from convulsions, caused by inhaling impure air in the room in which the descended level

The jury returned the following verdict :—Death from convolsions, caused by inhaling impure air in the room in which the deceased slept. PRINTING FROM VENERES.—A process of venecr-ing by transfer is mentioned with approval in the French journals. The sheet of veneer or inlaying to be copied is to be exposed for a few minutes to the vapour of hydrochloric acid. This novel plate is then laid upon calico or paper, and impressions struck off with a printing-press. Heat is to be applied immediately after the sheet is printed, when a perfect impression of all the marks, figures, and convoluted for an almost indeficite number of times. The designs thus produced are said all to exhibit a general wool-

lines of the vencer is said to he instantaneously pro-duced. The process, it is aftirned, may be repeated for an almost indeficite number of times. The designs thus produced are said all to exhibit a general wood-like tint most natural when oak, walant, maple, and the light-coloured woods have been employed. STEEL--Mesrs, Galloway, of Manchester, are said to have joined Mr. Bessemer, and are constructing extensive works at Sheffield, for the manufacture of steel, under the provisions of his several patents. Mr. Bessemer has also the works of an eminent manufacturer in Glasgow placed at his disposal, for the purpose of earrying out his improvements,— "which," says the Mining Journal, "we are glad to learn, have now proved of practical value. The ques-tion of steel-making," it adds, "has now assumed an importance that must arouse the trade to inquiry ; Mr. Besseme heing enabled to manufacture plates of any diameter, according to the length and breadth of the ordlowed hoyed, at a reduction of cost calculated eventually at 107. to S7. per ton,—dependent, in fact, hos same cost as common iron. The whole of the oals used in the extensive works of Mesrs, Galloway, Manchester, are manufactured James of "Bessement steel," and as physica are at produced at

tools used in the extensive works of Mesers. Galloway, Manchester, are manufactured from 'Bessemer steel,' and we believe are examples of excellence." FIBE AT WORSLEY-MALE.—A fire hroke out at Worsley-hall, near Manchestor, the seat of the earl of Ellesmere, on Friday evening, in last week, and de-sitroyed four servants' bedrooms surrounding the apartment in which it is supposed to have originated. A great amount of damage, however, was caused by the water which was thrown upon the house, and which ponetrated through every room from the roof to the entrance-hall. The amount of damage is esti-mated at 3,000*l*, to 4,000*l*. A view of this mansion, some of our readers may recollect, was given in *The Builder* a few years since. WIMBLEDON, SURBER,—IL is arranged, we are

The Builder a few years since. WIMBLEDON, SURREY.—It is arranged, we are told, to erect at this place a village Club-room, with reading and lecture rooms and library. A residence forms one angle of these, and at the opposite extremity, projecting from a large oricl in the reading-room, there is to he a Church-service room. The designs for these huildings are in the hands of Mr. Teulon, who is oppointed the architet. The whole will be in brick, varied: the style is rather Early Decorated. There is a distinction in the Church-service room from the other huildings: it has a semi-ecclesistical character. It is expected that the work will shortly be commenced. be commenced.

be commenced. A SANITARY COMMISSION FOR THE ARMY IN INDIA.—I have read with much interest your remarks on the important matter of preserving the health of our soldiers in India. Should you have time to look into the late Mr. Buckingham's pamphlet, published hy Partridge and Okey, in 1853, eutitled "The Coming Era," you would he additionally assured of the great importance of your suggestions. S. E. M.

S. E. M.

*. We are confidently informed that our observations have not been useless, and that the Govern-ment is at this moment discussing the necessity of following the course we have urged. We have to add, that the design selected is by Mr. Edward Holmes, of Birmingham. Birmingham,

THE LATE MR. WOOLCOTT.—Mr. Woolcott, of Herdord-street, Park-lane, described as "an architect and builder," destroyed himself last week. At the inquest, his hrother, Mr. George Woolcott, secretary to the Mid-Kent Reilway, said that for some time past he had been in a low, desponding state of mind, which witness attributed to the nuwcarying attention he paid to his profession. There was nothing else that would tend to disturb his mind. The jury returned a verdict of "Temporary Insanity." GAS-LIGHTS.—OIT-GAS FROM THE SUNFLOWER.— It is well known that coal is not the only substance which supplies gas for illumination. It may be pro-eured from oil (and the best for this is the sunflower oil) in sufficient quantities. Some persons prefer the light from "oil-gas," as softer and more grateful to the eye, more silvery and moon-like, but it must be admitted the more achieved and intensity to that procured from coal. However, in distant THE LATE MR. WOOLCOTT .- Mr. Woolcott, of

that procured from coal. However, in distant countries, where coal is not only scarce but extremely dear, the sunflower might be cultivated on an extensive

dear, the sunflower might be cultivated on an extensive scale for its oil, to be hereafter nacd for the purposes of lighting.--J. B. N. BRIDGE TRAFFIC.-The arrangements for passing over London-bridge amswer so admirahly, would you oblige the public by recommending the following rules for passing over Blackriars-bridge :--1. The foot passengers to go over the *left side* to the water.--2. Carriages going at a walking pace, to keep close to the curh.--3. Carriages going at a trotting pace to keep the middle roadway.--4. All carriages to be furnished with full strength to draw their loads up the incline.--5. That no stoppages be allowed on the bridge.--L. SEA-WATER FOR MAIN-DRAINAGE.--It has often

SEA-WATER FOR MAIN-DRAINAGE.—It has often heen proposed to bring the sea to London hy pipes alongida the relikeys. Why should not this be done and keep a constant stream of sait water through our sewers of sufficient volume to liquefy their contents at all times? The gases would, hy this means, be-come innocenous; and when the sewage reached the open channel proposed by the Government referres, it would flow forth on either side the river without danger to the localities through which it passed. To accomplish my scheme the *baik* of the rainfall should find its way into the Thames by natural gravitation. I make my proposition from having seen, for many years, the sewage of nearly 2,000 persons daily poured into a milidam of sait water without offence to the neighbourhood; and I have made other experi-ments that confirm my helief that the "open sewers" jamin Hall and the Board of Works.—A. F. SEA-WATER FOR MAIN-DRAINAGE .--- It has often

need not he a hone of contention between Sir Ben-jamin Hall and the Board of Works. --A. F. CHOWEN'S BELL-BUOY FOR THE GOODWIN-SANDS. --The form of the bell-buoy invented by Mr. G. Chowen, of 49, Burrstreet, St. Kabarine's docks, has heen improved, but we are not aware that the has need improved, but we are not aware that the authorities have done anything as yet in the matter. An experiment is very desirable. The invention is a hopeful one. It is described by Mr. Chowen in a small tract titled "A Voice from the Goodwin," of which we have heretofore spoken,

TENDERS

Messes, Geynne's Tenders.-We have received a com-munication from Messes, Gwynne's architect, wherein he says, in reply to ", J, P, s" observation on the differ-ence in the amount of tenders;-

minimission from Meers. Gwynne's architest, wheren been in the amount of tenders : "Aithough I am practically acquainted with the built in the painters, and have for the last twenty-fire years been in the nabio of laking out quantiles and mesuring out the last twenty-fire years of the last twenty-fire years been in the nabio of laking out and have provided in the paint of the last twenty fire years of the last twenty fire years been in the nabio of up rivises. G. there I dil not approve of hadron a cause of much difference in the amount of years of the last twenty fire years in the provide in the paint is a surveyor, an entire stranger to would another of the last out by a surveyor, an entire stranger to would a notificate paint in the present case I give an instance of the quantities, he considered it nunceessary to put a price to may items i for would have produced a beexy amount been also, if extra, he constanting the proposed work to be also, if extra do to accertain if the quantities were taken her full depth for exervation, including concrete; and have first and the proposed work to be also, if extra width was allowed for the proposed work to be also, if extra width was allowed for the proposed work to be also, if extra width was allowed for the proposed work to be also, if extra width was allowed for the proposed work to be also, if extra width was allowed for the proposed work to be also, if extra width was allowed for the proposed work to be also, if extra width was allowed for the proposed work to be works to width was allowed for the proposed work to be also, if extra width was allowed for the proposed work to be works width was allowed for the proposed work to be works width was allowed for the proposed width works. ADVERTISEMENTS.

A VACANCY occurs for a YOUTH, about A 14 or 15. As a SAW, PLANE, and TOOL MAKER.-Apply by letter, at 64, Crawford-street, Marylebone.

MR. WILLIAM CORDEROY, Surveyor, 89. High-street, St. Marylchone (W.), has a VACANOY for an ARTIGLED POPIL-Application by letter, addressed as above, will receive early attention.

TO CLERKS OF WORKS. **REQUIRED**, a steady Man, to Superintend Additions to a Massion in the north of Ireland. Good general knowledge of coustraction, massary, and joiners, and the vise of material and labour, indispensable. Address by letter only, prepaid, stating qualifications, terms, dc. to Mr. G. A. BURN. Architest, 40.4, Community-termse, Edgewateroad, W.

WANTED, a PARTNER, or an APPREN-TICE, or OTHERS, with 40%, to share the profile of Machinery for Sawing Blooks of Martule, and Makine Marble Chimber-pieces, & for the trade-Apply to H. HEALEY, No. 7, Biolowser-mail, and jung the Field Bull, near the Targnike.

WANTED, a steady Man, who has bad STAINCERFERENCE IN A STAINCE IN A STAINCE ON PRIVING UP AND A PIXING IN A STAINCE IN A STAINCE AND A STAINCE

WANTED, an INDOOR APPRENTICE W about fifteen or sixteen years of age, to learn the SMITH and FARRIERING, and all branches of the business. A small premium required.-Apply to T. SMITH, George-street, York-road, Battersea

TO SURVEYORS AND DRAUGHTSMEN. Marten an ASSISTANT, who is com-petent of surveying, leveling, and mapping.-Apply, bating terms, to Mr. WAKDLE, Stationer, &a Mardis, Survey

WANTED, by a Young Man, a SITUATION with a Builder or Panter, as PAINTEB and GRAINER, or a strainer is an and strainer is an write a little. We Arnor the to a Writer and Grainer is an write a little. We Arnor to a Writer and Grainer is an kingloud, Middleser, N.E.

TO LAND SURVEYORS' ASSISTANTS. WANTED, in an Office, in Town, a thorouchy valided and expeditous DRAUGHTSMAN, to PLOT SURVEYS from Field Books, and prepare first-plans. Employment permanent. No one need apply whose re-freences as to character and qualifications are not necessflor nine--shopk, by letter only, to GAMMA, Messel, Harrison, ag, and inclosing permanence of writing guilding and a salary expected, and inclosing permission of writing guilding.

TO MASTER SMITH, BELLIANGERS, AND GASTITERS, MILL, BELLIANGERS, AND MANTED, by a steady, industrious Man, the description of the same branches, and hot-ware for leaving his present with the above branches, and hot-vers for leaving his present weights. No oblection to both of country, or to take an engagement to go shread—0, 8, 6, Post-ofice, Reights, Nurrey.

TO BUILDERS AND PLUMBERS. WANTED, by a steady and experieboed PLUMBER, seed 38, a STOATION; out all up his time at painting and glaing, if required.-Address to B. M. No. 45, Lover Whitecress street, Oripplegate.

TO GRAINERS, WRITERS, AND ORNAMENTAL PAINTERS.

ANTED, as a permanent hand, a MAN who can undertake the above branches of the trade-ply immediately, per post, stating terms, by the trade-WANSBRUUGH, No. 2, kingstreet, Garmarhem. References entired.

TO BUILDERS AND OTHERS. WANTED, by a respectable Young Man, Pary and a structure of the second second whitewaher, and this required, and think also good second whitewaher, and this required, and principally at jobbing. Wases no object whatere. Good reference from last employer-Advess, F. H. el. East street, Manchester-purgare, Maryleone.

TO JOBBING BUILDERS AND PAINTERS. MANTED, an occasional or constant EN-GAUENENT as working FOREMAN. Oan bring busi-ness worth from 2004 to 500, a year. Can make out estimates and specification.-Address, A.2. Has, Grovepische, Brompton, hack of the Grapes.

WANTED, a RE-ENGAGEMENT, by a soler and industrions FORMAN of URICKLATERS. Hus considerable experience in moulded bridwork, has carried working drawings. Uncounting the orderation and the soler the Hall, Bradfield, Combust, Bury St. Edmunds, Suffolk.

MANTED, a SITUATION as JUNIOR CLERK in a BUILDER'S OFFICE. Can trace draw-ing. Square dimensions, and write a good hand.-Address, A. E. No. 22, Carcuercoad North, Kentish-town.

TO BUILDERS, CONTRACTORS, ac. MANTED, a SITUATION as working series SHOFFNLERAN by a representative working drawing, and to excent fine-data work; or would take chare of a repaining join in town or country. Good reference Adverse, it. S. Gibba's Newspaper Office, it, Sonthgate-termee, Sonthgate-terme, De Beanvoirtorm.

TO PLUMBERS, BUILDERS, &c. WANTED, by an experienced PLUMBER and GAS FITTER, commant EMPLOYMENT. Refer-ences given - Address, J. N. No. 5, Ceditstreet, Strand.

TO BUILDERS WANTED, by a steady, active Yonng Man, or denoted practical steady, active Yonng Man, or denoted the steady of draubhanov, as Shop or QENERAL FUREMAN Determines, A. Good tentimonials, Address, A. B. 35, Arington-street, New North-road, N.

TO AGRITEOTS, SCHWEITWARD, AND BUILDEBS Town or Country. THE Advertiser will be to be received as a CLERK into a will established from . His primary object not sairty that an ultimate periadrahib, Has had several years schulter, and means to carry on this views. Non-pint high long-sectable propaga will be held strictly confidential.-W. C. 8. United of The Builder."

TO ARCHITECTS AND BUILDERS. THE Advertiser, a respectable Young Man, who is competent to assist in preparing finished and work-ing drawings, due hock keeping, is in WANP of a STUZIATION and effect of the faits hock keeping, is in WANP of a STUZIATION and there of the faits hock keeping, is in WANP, and the studies of the s

THE Advertiser, who is competent to prepare Engineering and Architectural Dravines, and to make all encessary conditions and estimates, do, is ready to prepare drawing, do, on the shortset notice, from sketches or descriptions, Address, VETA, Brasington & Uharty, Kennigton.

TO ARCHITECTS. THE Advertiser, who is a first-rate draughts. man, and divorgably understand she practical part of his obtaining a SITUATION in an ARCHITECT'S OFFICE. Address, W. H. Office of "The Builder."

TO MANUFACTURING JUNERS, SAW-MILL PROPRIETORS, and OTHERS.-A first-class firm to observe and hald the materials line is even to transform prepared JUNERS's and BUILDERS' WORK, & A-Apply, in first instance, to JAMES E. BIGGS, 3, Dovesturet, Ringsdone, Britch.

TO SURVEYORS AND BUILDERS. THE Friends of a YOUTH, aged 14, are desired of an INDOW APPRINTLESHIP for bin in respeciable family, where his demestic comforts would be at-tended to, and where be would have an opportunity of countries a thorough involved of the above business in all its headeba-Address, d. S. Post-olice, Wantage.

TO ARCHITECTS, &a THE Advertiser is desirous of obtaining a situation as ASSITANT in an Architect office, in enter town or country, Balary moderate-Address, M. N. Money-Order UME, Commercial Place Kentleh town.

TO ARCHITECTS OR DUILDERS. THE Advertiser, having recently left bis last temporary or otherwise, town or country. Has had long expe-rience in architects offices, can make nearly fulled working and detail drawing, understand perspectre, and can give good reference, if required. Balary moderate--address, F. S. Office of "The Builder."

THE Advertiser, who has had seven years' experience, is desirons of an ENGACEMENT, with an Architect.-Address, J. W. 3, Bernard-street, Regent's-park.

Nov. 28, 1857.

Builder. The

impression, we apprehend, still prevails in the manufacturing districts, that they are not properly appreciated in the metropolis. So far, at least, as the *Builder* is concerned, the idea can have, indeed, no foundation: of the works in our art, which during late years some of the northern towns have produced, the importance has been often recognised, and attention has been recently called to the locality referred to, as to its capabilities for influence in the future. That the im-R pression, however, exists, and that the Lancashire people, in particular, are "touchy" on the subject, we have had many opportunities for observing. Lately, as the world knows, a strong and well-grounded claim has been put forth hy Manchester, to he considered as holding that there are pursuits of interest and value, which may not immediately appear connected with the production of "twist and calicocs, and the amassing of wealth. Not only in art, but in structural and sanitary matters allied to architecture and huilding, progress has heen made; whilst much has been done that would be useful in a comparison hetween the north and the south, from which the rectification of the course on either side might be effected. Much is to be learned on both sides. Whilst it is essential in a national point of view, and important to the south to cultivate a better acquaintance with the manufacturing districts, it is equally the case that there is much that could be derived with advantage in the other direction. During a sojourn in Manchester, or perhaps more so in the thickly-populated country which surrounds it, a stranger observant and unprejudiced, may discover many things that will excite alternately his surprise, or his admiration.

Fresh from the experiences of London, one most remarkable feature of the district is the comparative case of life of the "operative classes." In the metropolis, the working man fiulds every addition to his family a painful tax upon his labour and his endurance, and a sore trial to his ingenuity in the matters of bome comfort and provision of suitable employment for his sons and daughters. In some of the Lancashire towns, the case is In Ashton-under-Lyne, obviously different. every member of a family seems to be readily disposed of,-so that it is rather an advantage to have many children, as in the prosperous colonies ;—every family may have a honse, and the due complement of bed-rooms ; each one is well clothed and well fed ; and in the majority of cases, the cleanliness and the comfort of the habitations, in spite of an unfavourable atmosphere, and varions non-sanitary conditions, is very remarkable. Many of the houses are reuted from the millowners-wbo, it is right to say, have a somewhat higher sense of their duties and interests in relation to those whom they employ, than has commonly been attributed to them-and many are owned by the people themselves. Towards the latter position of affairs, the huilding societies are said to have efficiently contributed : these societies heing, we are told, generally well managed as to the advances,

problem, as we have ourselves regarded it, the a-week. A continuance of such circumstances employment of women, seems to receive, in one grade of society at least, in these districts, complete solution. Doubtless the market for labour here has led to the neglect of children, and, in some cases, even to their destruction by narcotics. On the other hand it has obviated consequences such as have followed from the condition in London lately, as to the employment, and existing at this time. We ought, perhaps, to quote the evidence of Mr. Scholield, given in the course of the inquiry in November, 1856, before Mr. Ranger, preliminary to the application of the Public Health Act to the township of Dukinfield,* in which be attributes "large amount of convulsive disease of a

fatal character among children," to "the fact that mothers go early in the morning to the and monors go carly in the norms, paying from 2s. 6d. to 4s. per week per child," and adds that the practice is "quite general." But this sad condition of things must be altered by the dissemination of knowledge-not hy the interdiction of female employment. It may, indeed, well appear that the girls who are employed in factories, should not be so withdrawn from domestic avocations as to become disqualified for the management of a home; as it has appeared that the removal of children from school at the early age at which their labour can he turned into money, is not desirable. But, penetrated with the impression of the alternative in the deficiency of employment, such as we have alluded to, we must regard that which provides the employment as, on the whole, a favourable condition. The seventh part; in the unions of Barton-on-Irwell, majority of the women who are at work in Chorlton, Salford, Manchester, and Prestwich, weaving sheds and factories, have an appearance of health and comeliness which would imply no privations, and no laborious drudgery. There is no corresponding class in London. The class striving for a miserable existence hy the needle, is in a worse position than its corresponding class in Lancashire, or than the workers in factories, both in every comfort of hfe, and every matter of appearance-unless fashion of dress. At some of the factories at Ashton, the employment of a considerable number of married women, having families, becomes answered that they were generally left in the earc of their grandmothers; a reply which itself night he taken as indicating the exist ence of a hetter condition of the working classes than usually is found elsewhere. In one of the mills, that of Messrs. Thomas Mason and Sons, which is exceedingly well managed by Mr. Hugh Mason, the employment of mothers of families is, on the other hand, disconraged; whilst exertion is made, by attention to the dwellings, and interest taken in the condition of the workpeople-shown by the donation of publications such as the "British Workman" and the "Cottage Economist "--- to contribute to the moral and social welfare. The usual wages of the women are ten or eleven shillings the week ; hut some very good hands will receive thirteen shillings : better wages-the cost of a dwelliug being considered-we fear, than are to be got by the work of the needle in London. † It must also be considered-taking the general rule-that wares, 35 dye-works, 11 hat-manufactories, 61 such wages are those of one member of a establishments for the construction of mafamily.

Of course there are seasons of depression, when the mills work "half-time," and when the carnings of a family may be diminished a pound

* The Report and Appendix (printed by Eyre and Spotiawoode), contain some valuable particulars, espe-culty in the "Statement" and Mortuary Returns, by Mr. A. Agpland.

But it is even more worthy of observation, and more gratifying to notice, that the *female* two relock on Saturdays. The legislative encounce sex is universally provided for : that great | children.

and time to spare, usually bring political agitators upon the scene, -- some well-meaning, some who are in the right, aud some who find in a particular exercise of industry their chief income and most genial occupation. Then the rights of labour, and many other troublesome questions, are debated; and, if the commercial stagnation continues, great excitement may ensue, and occasional riot. Short periods of halftime working, it is believed by persons who are familiar with the condition of the people, though not by us, need produce only a deprivation of luxurics, or slight temporary inconvenience; but they are felt by the shopkcepers. chance of recurrence of these occasions, how ever, makes it very desirable to inculcate saving habits, and the provision of facilities for small investments. Such a period of depression has recently commenced.

Nevertbeless, as we observed, the condition of the Lancashire workpeople is one which contrasts favourably with that of almost every class of artisans in London. In a parliameutary return, just issued, we find some "industrial and pauper statistics of Lancashire Unions," from which we can deduce that, in the area of the Liverpool Union, in which employment in manufactures is small in comparison with that in other industrial ocenpations, the proportiou of paupers to the population is about one-twentieth part of the latter; whilst in Bolton, which may be considered a manufaeturing district, the proportion is about a twentyeighth part; in Bury it is less than a twentyadded together, it is a thirty-fourth part; and in Ashtou it does not amount to even a sixty-The depression which now exists second part. The depression which now exists is attributed to the recent searcity and high price of cotton, and the present dearness moucy. But, in a speech hy Mr. J. R. Coulthart, late the mayor of the manor of Ashton, lately, he mentioned new factories which had heen erected during the last twelve months, viz. Mr. Jonah Harrop's, at Bardsley; Mr. George Taylor's, at Leesfield; Mr. Peter Scville's, at Rhodeshill; Mr. James Adsheads, at Sonraere ; Messrs. Thomas Nield and Sons', at Goe's Gardens; and Messrs Thomas Mellor and Sons', at Sharp's Shrubberics. Besides these, there had heen, according to returns of the rate-collectors, fourteen new extensions of factories; seventeeu new warchouses, workshops, and sheds; one new gas-work, nine new shops, four new villa resi-dences, and 116 new cottages. The marriages had increased in an unusually large ratio, and so had deposits in the savings banks; whilst, although the whole rates had increased to 3s. 1d. in the pound on the assessed property, they were still

The impression produced by a visit to this locality, and other portious of the manufacturing districts, after an absence of some years, is a very telling one. It is stated in Bradsh.3v's lately published "Guide to Manchester," that there are within that eity, without numbering some buildings in different parts of its suburbs, 96 cotton-mills, 1 worsted mil, 10 silk-mills, 6 calico-printing works, besides a large number in the outskirts; 16 manufactories of smallestablishments for the construction of machinery, hesides 55 foundries; 4 lead-works, 4 paper-works, 52 saw-mills, 12 corn-mills, and 1,214 works or factorics designated "miscellancous." The aggregate power of the steamengines is said to exceed that of 12,000 horses, and the goods produced are stored in 1,743 warehouses. In the town of Stockport, there are said to be forty-nine mills, usually giving employment to more than 16,000 workpeople. The establishments enumerated as helonging to two of the towns, however, form a small pro-

VOL. XV.--No. 773.

portion of those which are attendant upon the

staple trade of the district. Oldham, Rochdale, Prestou, Wigan, and many other populous places in Lancashire, hesides towns in York-shire, would have to be taken into account, in shire, would have to be taken into account, in statistics; and the importance of that part of the kingdom in any view of national prosperity, or of progress in science, or art, would still be left inadequately expressed. In 1785, the im-port of American cotton into 1 vierpool was five bags; in 1787, it was 108 hags; and in 1856, it was 1,714,201 hags. According to Mr. T. Bazley, there are not fewer than three-and a-half millions of our fellow-subjects, or one-eighth of the population of the United Kingdom, dependent for subsistence upon the cotton manufacture. We thus see the reason of Dr. Livipeston; the supply of cotton is the of Dr. Livingston: the supply of cotton is the supply of food. It is found profitable to con-vey the raw material to considerable distances, where labour is comparatively cheap, rather than to convert it into thread and cloth within the chief towu: and it is one of the remarkable characteristics of the district, that many of the factories are situated in no close vicinity to railroad stations, and are even placed on steep acclivities, where the difficulty of eartage must be great. Manchester itself seems tending to become more and more a husy place of exchange, and the general capital and mart for the paper lation in the manufacturing towns which sur-round it. Liverpool is the port of the district. Manchester has now gained the chief charac-teristics of a metropolis, and truly, in many teristics of a metropolis, and truly, in many respects, the management of its munici-affairs contrasts with that which prevails in London, to the disadvantage of the latter. Railroads of course form the veins and pulsation of the district; and, not to mention the Man-chester and Liverpool line, many of the achieve-ments, financial and structural, hy which the country has reaped the henefit in a new mode of conveyance, date their accomplishment from the requirements of the cotton manufacture. The factorics in the district arc seen on all The factories in the district arc seen on all sides: their numbers and their dimensions fill the mind with wonder at the immensity of the interests which have accommuted. A visit to the eity of Manchester gives a very limited notion of the circumstances which we refer to. Looking out from some of the railways, or lines of road, the factories, with their lofty chinneys, seen to absorb the field of view; and the stranger hardly detects the houses required for the large number of workpeople that have to he accommodated. This effort regults as well from the smallness of This effect results as well from the smallness of the houses as from the dimensions of the facthe houses as from the dimensions of the fac-tories. The former are built with helter re-gard for the occupation of a family than are the houses of London, — where, from very different reasons, it is difficult at first to see where the poor or the industrious classes live. The effect referred to is, perhaps, most remark-able at Stockport,—or along the branch of the Manchester, Sheffield, and Lincolnshire Rail-way, that connects Ashton, Dukinfield, and Guide Bridge,—especially in the dusk of evening, or at the time when the the used of windings or at the time when the thousands of windows are hrilliant with light. Factories, however, are seen not only alont the towns, hut amidst the hills and vales of Saddleworth, Longden-dale, and Glossop,—amidst scenery as calculating and grand as any in England; along the line of the East Laucashire Hailway; and, indeed, in every direction far and wide. In the towns, where hrick is used, it cannot he said that the proportions and character of the huildings are what they might be. Professional architects do not seem to be usually employed; and the general nniformity of the many stories and numerous window openings, and the common absence of all cornice, or other decoration, are unfavonrable to the effect. We do not think this character is rendered necessary, even by the this character is rendered necessary, even by the trict may have some relation to it. A paper requirements of uniformity in the iron foundor's by Dr. Angus Smith, in the "Memoirs of stone districts the effect is hetter; hut, proba-taly, chieff so, from that association with autural scenery which has heretofore been a subject of inquiry in these pages. The dis-tricts to which we have referred, ahout the junction of the counties of Lancashire, York-shire, Cheshire, and Derhyshire, are of this de-

scription, as are also the most heantiful localities on the other side of Manchester, which we have also alluded to. In such cases, the factoryhaving sometimes an adjacent residence--comhaving sometimes an adjust result result can be a pleasing picture. And in other cases, some attention to the argues and the catrance-way, shows what might be realised with the aid of art.

The chimney-shafts form a hranch of practical architecture in which our Lancashire friends exect. However these erections may have become vulgarized, in the perception of many persons, from their number, and the deleterious and opaque mass which some of them emit, they are in numerous them enit, they are in numerous instances beantiful objects,—not less so than the Egyp-tian obelisk. They are usually octagonal in plan, rising directly from the ground with rapidly-diminishing sides, and are terminated by a neck-monilding and cornice; and what is re-unradiant them for the hear of the increase is the quired in them for the due effect, is a somewhat better character about the base, and careful proportion in the details at the summit. The construction and the materials are generally, as they are required to he, of the first order. As regards the dimensions of mills, and

the quantity of machinery they contain, the facts are marvellous. Take that of Mr. Wood, at Glossop, - a connected series of huildings, extended from time to time, which must now reach to a length equal to that of Waterloo-bridge. A further addition is being made to it. Amongst the machinery are 2,854 looms; and the engine power is that of 528 horses. Referring to Glossop, the cleanliness of the town, with the well-huilt and tidy appearance of the houses of the workpeople, again form matter for remark, accustomed as we are to notice the dwellings of a very different character in other parts of the kingdo n, where houses are huilt by grasping speculators, or are rented of middlemen landlords. Stone is the general material. At Mottram, in Lougdendale, a similar character, though in a somewhat less degree, prevails. The clurch here, which is of late date, was partly restored a short time since, nuder the direction of the late John E. Gregan, of Manchester. From the lofty eminence on which the building stands, the view is of surpassing heauty far off is the Dinting Viadnet of the Sheffield linc. The effects produced by the proportions linc. linc. The effects produced by the proportions; of its stone piers, and the shadows which they east across the vale, when the sun is low down, are worth seeing. The superstructure is of timber, with arches of bent plank, in thicknesses. All along the same line, the scenery is of wild and heaatiful character; and at Broadbottom, in Chashire, from the viaduct where the recent accident happened, the view of the vale, far hemeth, is remarkable. But, perhaps the most interesting scenery is found beyond Mosslev in interesting scenery is found beyond Mossley in Interesting scenery is total depart successly in Saddlework, where the road passes at a great clevation, and discloses at frequent distances new prospects of hills and long-extending valleys, from which, with all the heavity of nature, the industrial element, is never absent. The picturesque features of the locality, how-cver, are little known, even in Manchester. In the more populous parts of the manufac-

turing district, which rank as towns, there is a sad obstacle to the effect of all architectural or natural heavity. The smoke-nnisance prevails to an extent which must he heyond the conception of any inhahitant of London. It seems to he due not to more number of houses, as with us, and not to mere hummer of houses, as which as, much attention seems to be now given to the prevention of excessive smoke from these last. It is due, apparently, to some distinguishing character of the area about Manchester, in the atmospheric conditions—which seem to operate in backing down and interviewing what operate in beating down and intensifying what-ever element of nuisance may exist. The causes of the quantity of rain in the dis-trict may have some relation to it. A paper by Dr. Angus Smith, in the "Memoirs of the Literary and Philosophical Society of

[Nov. 28, 1857.

Manchester," would, we believe, be found, giving information on the subject. It is is said everywhere, as a subject of congratula-tion, that the smokiness of the town is greatly diminished; the corporation have at least the diministred; the corporation have at least the power to interfore, and have, perhaps, used it to some effect. Looking at the majority of the chim-neys, opaque smoke—whatever other noxious exhalation there may he—is certainly not observ-ahle generally and for long periods: yet the atmo-sphere itself seems offensive as ever,—charged with "blacks," and heelonding to the vision as to all architectural heavity. The hasins on the Informary area are covered with a third same of to all architectural heath, The hasins on the Infirmary area are covered with a thick seum of soot, far worse than we have ever seen in Traialgar-square. The particles of cotton which are floating in the air are also a source of annoy-ance. At many of the principal factories, mechanical contrivances to assist the consumption of the smoke, have fallen into disuse; and, heyond the now well-known construction of the fire-place, and the provision of air-holes about the furnace-door, and of a chamber within the latter, to allow the air to be warmed before admission, dependence is placed only upon the manner of feeding with coal, and npon the pro-vision of boilers of ample number, and steamproductiveness. An attentive fireman need make very little smoke. The two-flued holler is in general use : hut to this form it has lately heen objected, that, from the fines heing low down, the resistance to the expansion is unequal over the area of the ends; and other inconveniences tending to danger are discovered. smokiness, however, remains the hlot on the face of Manchester. The exertion of all her energy in practical science, should he brought to investigate the true causes and means of pre-vention of what must for the present, reuder the appearance of the city distasteful in the eyes of strangers, and quite negative the merit of many of her best works in architectural art.

One subject which has still to he attended to in the district, is that of ventilation of the fac-tories. Mr. R. Wood, in the course of the inquiry at Dakinfeld, already adverted to, stated inquiry at Dakinfeld, already adverted to, stated that he "knows of no mill ventilated at all. There are windows; they are made to open, hut are kept closed. There are no means taken to change the air of these rooms. The temperature is often over 90 degrees." The avoid to find the second is often over 90 degrees." The results from such eircumstances must of course tend to ill-health elicimistances must of course tend to in-neatth in the work-people, and adversely to the favour-able conditions which we have remarked upon. Much might be effected simply by providing ventilation to the gas-humers, which are, as now arranged, really the chief occasion of injury. In most of the public rooms in Manchester, indeed this paint is particulate strandadter. In most of the phile rooms in Manenester, indeed, this point is particularly attended to: no similar care is taken in places of resort in the metropolis. Mr. Ranger well remarks on the necessity of "attention to the fact, that it is not sufficient that persons he aware of the canses which tend to impair vitality; hut that causes when there to impair vitality; init that individuals having atthority over others, should be impressed with a knowledge of the fact, that hy their care or negligence, the sanitary condi-tion of those under them may be improved or injured:" whilst, however, the neglect of attention to the admission and change of air, in the news of are durilize them. the case of our dwelling houses, "is generally attributable to ourselves alone," in manufac-tories the case is very different; "in these, both temperature and atmosphere are nuder the control of the overseer, not the workmen, and the latter must he content to inhale the air, however vitiated it may he, which the former admits for his breathing." As to most of the honses in Dukinfield, —a place which, we fear, elsewhere,—he states that most of the windows he has seen "are sufficiently large, hat those of he has seen "are sumciently large, hut those or the ground-floor are, as a general rule, not even made to open, whilst those to the sleeping-rooms, though they seem made to open," he has found "universally closed." "In street after street, and court after court," he has "looked in vain for an open window." We can testify to the correctness of this representation, if applied to the dwellings of the upper classes, where the now general use of gas—and unrea-tilated,—and the practice of keeping up exces-sive heat of rooms by large fires, tend to the injury of the health of the inhalitants. The condition of public places and private houses

Nov. 28, 1857.7

which prevails in London in this respect, is in Manchester reversed. The difficulty of com-bining the mechanical contrivances for conducbinning the increasing a contrasting of contrast-tion, with ornamental obstracter, has not heen overcome in all cases; but in many cases in Manchester, the lighting, by rose lights in the ceiling, is managed with considerable skill, and we should think with economy, and becomes an important aid to the effect of interiors.

an important aid to the effect of interiors. The large hamp-pillars at the principal open spacings and crossings in the city, are anything but favourable specimens of the taste of the district. We may mention one at the end of Mosley-street, near the Infirmary. There is still existent, a very eurious propensity to scleet the ugly form, where two patterns of opposite characters are offered. The point deserves a little investigation from "deep thinkers," meta-physicians, and psychologists. In a certain district, where two specimen patterns, costing each the same sum, were sent for selection—one being of rather superior character,—the prefer-ence for the general order was given to the

being of rather superior character,—the prefer-ence for the general order was given to the lamp-post of the unsightly form. Let it not be supposed,—it surely will not by any of our ordinary readers,—that a regard in every district for the tasteful appearance of the prominent objects, is unim-portant. Every work of art—every beautiful thing in unture—goes to elevate the character of the people,—to render them happier and better, and more worthy members of the social fabric. We care uot now to mark the incidence aud course, and give the *rationale* of the in-fluence: we have before this, attempted to do so, and are prepared, on some other occasion, to offer reasons why the beautiful must ever tend to higher benefit than mere temporary enotion. Claining uone of the extraordinary results The backbox of the set even yet has to be furnished in many localities in the districts under notice! The new supply required has uot kept pace with the doteriora-tion that bas been going on, in the absorption and extinguishment of nature's heauty,—by the growth of building-area, and the accumulation of soot and suffusion of smoke. To all these points, then, let attention be given. Oh! neu of Lancashire! for the same reasons that you provide the intellectual food by cheap literature, and your uoble deeds in the establishment of free libraries,—albeit for a class by whon you expect not to be appreciated the higher flights of poetry or reasonings of philosophy,—recog-nise the fact that the aliment requires equally to be supplied,—though in several forms, for different powers of digestion : but, go on pro-viding it largely amid any discouragement, and seduloally remove every obstacle to the percep-tion or use of what is offered. The cultivation of such latent powers—the spread of such education—the provision of such beautiful ob-jects—will reuder the relations of employers and employed, casy and pleasurable ones, and make impossible those social ontbreaks which, from time to time, oceur, and produce terror and alarm. Such provisions will do something

THE BUILDER.

THE HERALDS OF THE ELECTRIC TELEGRAPH.

least in the adjacent districts. The use of the wealth realised by employers of labor, it is on every ground to be hoped, is such as will advance the general intellectual aud moral standard, and the condition of those about them. And it is induced to the singular advantages they posses. Tousidering the known facts in the prosperity which mainly there has hece during the known facts in the prosperity which mainly there has hece during to be hoped that the operative class are mindful of the singular advantages they posses. Tousidering the known facts in the prosperity which mainly there has hece during to be hoped that the operative class are mindful of the singular advantages they posses. Tousidering the known facts in the prosperity which mainly there has hece during in the defaution. After a tap-party of the Ashtor and Unkinfeld Mechanies' Institution, on the finance and the Town-hall, the Mays in the chair, and when prizes were distributed, complaint was made, that thong the support to the institution had largely increased amongst the institution had largely increased amongst the institution had largely increased amongst the support to farge residences, in costly entertainments, and in sumptuons furniture: often the wealth goes of the gains are speut in the erection of memory—amounting to more than a quarter of million—towards the paymeut of the matified payment of the institute paymeut of the institute extensions. One other farge residences, in costly entertainments, and is sumptuous furniture: often the wealth goes of the game and advancement. Can we be wroug in experiment in the erection of Mathematical the product of a discust and advancement. Can we be avered in the erection of Mathematical the product in a discust of the mathematical in the erection of million—towards the payment of the mathematical on the disposition which the of such latent powers—the spread of such education—the provision of such beautiful di do picts—will reuder the relations of employers and employed, easy and pleasurable ones, and make impossible those social ontbreaks which, from time to time, occur, and produce terror and alrm. Such provisions will do something towards extinguishing the vice of drunkenness, will too obviously prevalent in Laneashire, and the manufacturing districts of England. In Man-chester what has now been done, calls for warmest commendation; but more is ueeded—at

687

The joyful news of corn must have passed from neighbourhood to neighbourhood t orally reached the ears of the patriarch. It seems tolerably certain that, in arranging the late outbreak in India, a cake was used as the medium of communication. In the civilized nations of ancient times a somewhat the evoluted nations of ancient times a somewhat similar method of conveying news was no doubt prac-tised. In some instances "the post" carried his message rulely cut on stones. At other times the letter was written on some frailer material, and at others the communication was verbally given to a messenger, he heing entrusted at the same time with a coal time at each maker which which the re-order Intestinger, ne nong character in the State route which a seel, rinz, or other object which might he re-copized by the parties. In the Roman times letter-writing became sweeshat common, and that great people, by their road-making and improvements in navigation, set the world a good example by opening a compara-tively ready means of communication between nations. To a use to more record times, the measurement of binses To pass to more receat times, the messengers of kings and nobles began to be considered sacred and impor-tant personages, and, sheltered by their office, they were free to pass through hostile armies and troubled lands.

The necessity for the privileges of accredited heralds is evident when we consider even the state of this country thirteen or fourteen hundred years ago, when the land of England was divided into numerous kingdoms, which from time to time were fiercely arrayed against each other

The making of roads and the facilitating of transit where the chief means of stopping these samplingry contests. In like manner the progress of eivilization rather than weapons of warfare effected the union of Wales, Scotland, and Irelaud.

rather than weapons of warfare effected the union of Wales, Scotland, and Irchad. The Pheros at Dover, although showing alterations made at various periods, still retains such distinctive oridence of its original features that we may consider it the most ancient architectural signal existing in England. In other places along the coast (Pyno-muth) for instance) there were in all probability similar warnings to mariners raised, but these seem to bave disappeared. After the departure of the Romans, furtresses and castles increased in number, and formed centres to which the forces of a district might be collected by the fendal superiors, and this was effected by measure of an output of the second peace the friendly bearon blazed npon the hattlements to show where the retainers and wanderers might find the the route the retainers and wanderers might find of the baron the light was put on natil after his fumeral: a varied fire would call the neichbourhood to arms. In some cases a cross painted red by day, or one of fire hy night, was specify borne through the district as a signal for rising, and in other instances the red cross was fixed in the market-places for a similar purpose. Many rare pictures must have occurred in those old times wheat the firey cross reached the towns and villages, and the strong men swiftly armed, and departed from the groups of the advert. Hose what the bospitaler sliphaged from the

aged, women, and children. In addition to the castle signals of the olden time, there were those which hospitalers displayed from the churches and religions establishments. In Durham Cathedral the sametary knocker at the child cutrance is enriously hollowed, and has evidently heen intended for the reception of lights. The effect of this grim face, with glimmering rays from eyes and mouth at night-time, must have been very bideous, though re-assuring to the culprit. A cast of this eurions relie may be seen in the Architectural Museum, at Bromnton. Brompton.

In places along the coast, in the most unsheltered spots, religious men established themselves in rude hermitages, having for a chief object the succour of the sbipwrecked.

shipwrecked. St. Cuthbert, ceaturics ago, placed himself on the island of Lindisfarae, and afterwards removed to the more solitary Farne Island. Wandering in these and similar places, it is not difficult to picture the monks, by some primitive become lights, on the steep elifs overlooking the raging storm. In many instances the hermit's cell gave place to a building, which often, when blazing with light at Christmas time and other festivals, offered a welcome sight to weary

sailors. We ought perhaps to have noticed the mountain signals as the most ancient. This description of beacon-light has been a favourite subject for the poets; and dire must have been the confusion when these harkingers of strife and death were lighted upon the ball. the hills. Campbell sings,-

"Why flames yon far summit? Why shoot to the blast Those embers like stars To the firmament cast?"

Sir Walter Scott's gathering of the clans is too familiar

THE BUILDER. varied import has been horne by these missionaries

of progress. In addition to these, the wandering minstrels did good service by their rounds of visits-by making distant prople acquainted, and drawing them mentally closer togethe

In ancient times the state of the roads prevented any other means of conveyance for merchandise than nules and pack-horses: however, as roads improved, rude waggons and other carriages came gradually iato nse, and something like a regular traffic began to be formed. It is curious now to glance back to bose days when a journey of from twelve to fifteen miles was a matter not to be undertaken with im-punity. As time passed on, the bolding of the Court and assembling of Parliament in different cities did and assembling of Parhanent in different eities did nuch to improve the highways. These movements of royalty were important affairs, the long cavaleades of horse and foot-men, presenting the appearance of a considerable army. In old manuscripts, the particulars given of the extensive provisions required for the feeding of these horse context are not or the feeding of those large hodies contrast curiously with the simple arrangements required by her Majesty during her progress from Loodoa to the Highlands of Seatland. The harons and the diguitaries of the church also moved from their districts with long trains of followers; and in course of time the majority of English people would hegin to know that such places as Newnastle, York, and Conterbory existed. Then swift posts, some on foot and others on horschack, because more common, and the friendly missives of that time were endorsed with instructions to the messengers to "run, run; for your lives run." Stage-waggons began to be familiar objects on the

roads, and suggested the tor laminfar objects on the roads, and suggested the stance-could be stance-could be towards the rapid locumotive post. Stowe says, "that the first sugge-couch statted from London from the Cock Inn, situated not far from Westminster Abbey." Those stage-couches, which were, no doubt, the wonder and pride of that age, were lumbering and unwickly conveyances; and the improved but very slowly from the time of Stowe t improved but very slowly from the time of Stowe to the beginning of the reign of George III. We bave just now before us a print of one of these old multis, which present as great a contrast with the famous coaches which were once on the Dover and other roads, as does George Staphenson's first loco-motive with the compact engines now in use. Of the old-fa-bioned stage-coaches, the "basket," a wicker-work projection, behind, which afforded accommoda-tion to about half a dozen persons, was an important feature. Each improvement in the roads and the vehicles multicle up people of the various parts of the nation more closely together. Canals and increased strength of our shipping also tended to promote more frequent and rupid communication, the rate of Slowe to frequeat and rapid communication, the rate of speedy trivelling on the canals being about as great as that which could have been achieved during the al progresses above alladed to.

royal progresses above alluded to. In the improvements of more recent times it is im-possible to vere-estimate the services of the Mac Adams, under whose skilful management the public roads were greatly improved : our royal mails began to be enabled to keep up a rate of ten miles au bour throughout the chief districts of England, and every one wondered at the "swiftness of the post." While this extraordinary progress was going forward, a system of communication, by telegraphs and other signal-givers, had come into me: we even convey news around the coast, from the Nore to the Ad-miralty, quick as sight; but the particulars of this introduction, the formation of the system of the Post-oflier, and some other advances, may afford matter for another paper. another paper.

ART IN ARCHITECTURE.
(A DIALOGUE.)
Dramatis Personæ.
Iristides A distinguished Professor
Timmins An Amateur.
Rufskinivs A great Critic.
Donaldo Another Professor.

E by correctness he meant the conforming to

purely arbitrary, correctness may be another name for dulness and stupidity."-Macaulay,

Aristides .- If you had said a correct taste and judgment are necessary for the perfect realization of beauty by the architect, I could not have dissented ; but to require a young architect to he possessed of a perfect taste before he begins to design, is simply absurd. He must first make binself acquainted with the principles of art; and by practice learn to appre-ciate them. No one who has not exercised thought bimself can feel the merit of origin hity, for he knows out how difficult it is to very in a single for the knows. Sir Walter Scott's gathering of the class is too inminar to readers to require repetitioa. In addition to these means of communication, and serve to scott it. No one who has not exercised thought and chapmen who visited the fairs, which hegan to he held in all parts of the country, added to the means of spreading information; and many a message of

bour, but perfect taske only comes by years of expe-rience and practice. Timmins.--What you advance in explanation of the difficulty of acquiring a correct taste, seems cer-tainly at first sight to bave much truth in it; but permit me to call your attention to the fact that a person may possess correct taste, and not be capable of lowcriting any combinations of beauty. *Aristicles.*--True; a person of some taste may not he capable of putting on paper a single new idea, or oven of conceiving an originality in imagination; hut that is a merely negative taste. To acquire a positive taste, which is the oue the architeter requires, it is not sufficient for him to compare examples: he must practise design. A knowledge sofficient for a small practice using. A knowledge studied to a simulation of the state of th genue thus those mages requires jungment; and the pro-cess of forming a test before practicing design is more likely to bias the judgment than correct it, for becoming proposessed in favour of some one peculi-arity, he will inseasibly draw his images from that source, and become, if not a copyist, yet certaialy not an original thinker.

Timmins.-Then am I to understand that you do not consider it impossible, but inexpedient, to give an architect correctness of taste, before allowing him to design, by reason of the length of time it would take

design, by reason of the length of time it would take him to acquire it? Aristidas—Certainly not. He can only have his taste improved; but between improvement and correctness there is a wide margin. It takes a lif-time of practice to acquire a correct taste; and though by mere study and comparison he may approach nearer to correctness, he will never arrive at it till he has practised design. He will then gradnally possess himself of such an intimate knowledge of the relation of parts to the general effect, as only trial and experi-ment can give. While he is exercising his imagination and invention, he will be improving in manipulative destretiv. There are also so many points to be condeterity. There are also so many points to be con-sidered in architecture, especially connected with utility and construction, all of which are necessary for the formation of correct taste, that it is impossible to arrive at it in tolerable perfection without going through a process of design.

through a process of design. Timmins.—I fear you have as yet the best of the argument; but you are a professional man,—I am only na mandeur. Are you, however, quito sure that prejudice against the would-be critics has not some connection with your opinions? And, on second thought, I almost think you misunders' ood my mean-ing when I said an architect should first he possessed of correct taste; for I only intended that he should be taught from what source it would be best for him to draw this ideas: whether from the mure Greek the draw his ideas; whether from the pure Greck, the Gothic, or the Italian; or should the rules of correct both of the value, of about the third of the track of the track allows in the choose from any style, to know what examples he should try to imitate, or what forms are the most heautiful.

Rufskinius .- Italian Gothic is the style that should be chosen for a groundwork; none other is so fitted for sculpturesque treatment.

Donaldo .- Nay ; Greek art is the most perfect ; the mind should first be imbued with a love of the most perfect of styles.

perfect of styles. Scotonius—I disagree with both of yon. Four-teentb-century Gothic should be chosen as the *point* de depart. Revive Classic art,—what will be the effect? A rourrection of the dry bones of antiquity, without one spark of vitality. Gothic art is the only one that reflects, even at this day, the lwing senti-ments of the homely English mind.

ments of the homely English mind. Aristides.—Not so fast, gentlemen; not so fast. What yon propose to do is to prijudice the mind in favour of that style of art which best reflexes the predominant seatiments or idiosyncracies of your own brains. (Warming.) Of professional prejudice, I think I bave as little as most men. Criticism often is not taste, but the eart of finding fault. It is an easy thing to say, I don't like this picture, or I prefer that; but before a man cau become an "autho-rity.") he must be initiated into the mysteries of comrity," he must he initiated into the mysteries of comruy, ne must be mutated into the mysferies of com-position, and must have a practical acquisitance with the difficulties which have to be surmonized. It is quite possible for a person so to cultivate his percep-tion of the beautiful by comparison and analysis, as to be capable of selecting the good from the had in general effect. but in matters of divide a rule be general effect; but in matters of detail he will be ignorant, and he liable to fall into theoretical errors, georant, and the most to a minor the sector a errors, which a few mouths' practice with the pencil would have served to show the fallacy of. Far be it from me to deprecate the utility of even amateur criticism. There are often suggestions thrown out which are of

a painter, for he would be as far off being a painter after attaining to critical knowledge, as he was before he began. (Degnatically.) No, depend upon it, you only prejudice the mind when you attempt to make a man of taste before you allow the young mind to exer-duction are incoming.

mail to taske bence you above the young mult to exci-ise its own invection. *Archimedes.*—Sir, taste is all stuff: what we want is, good, cheap, utilitarian architecture, and good work, both of which are, I am ashamed to say, now

Aristides (abstractedly).--Politeness! Yes, true; but it is rather an affected phrase : what a pity it is there is so much of the advertising spirit shown in

there is so much of the advertising spirit shown in architectoral criticisms. Donaldo.—It is certainly very amusin z when one thinks of the number of books which have been written to set up a standard of taste, for all to measure by. Even Hogarth was foolish enough to write a book, the professed object of which was to enable everybody to agree in matters of taste. I think we are quite as far from agreeing own as ever we were; and I hope, Aristides, that you are not going to fallinto Hogarth's error by attempting to noist out how we may agree.

Aristuces, that you are not going to fail into Hogarth's error, by attempting to point out how we may agree. Aristicles - Certainly not 1 nor yet Bucke's, whose great fault by in not defaining the meaning of the term becauly; for he evidently thought only of oue kind, when he said that smoothness and smallness ware assaulid to it. That is a version of the

great half by in ob chamber of the inclusing of the iterm beauty; for he evidently thought only of oue kind, when he said that smoothness and smallness were essential to it. That is a specimen of the vagaries people are led into when they study an art in theory only. Read "Orestead's Soul in Natare," and there you will get so out of your depth in coo-idening the origin of beauty, that it will he a miracle if yout testes are not swamped for ever. *Timmins.*—Let us return to our first topic: what has led you to form so strong an opiniou squinst cultivating and training a pupil's tast, before per-initing him to design? *Aristides.*—Who is to judge for him? who is to show him what is correct taste, and what is incorrect taste? It is in a great measure an arbitrary distinc-tion. As many a sceptic says, it is what I prefer, not what you prefer. All that can be done is to put what you prefer. All that, show the whet here, and when he has made himself acquaited each with their various characters and lines of expression, let him design in each style: he will then, if he possess the index is a partiality for ooc style above the others: let him practise that style; it is built in the should design well in one style han badly in all But ahove all things fingers upon his mind the neces-sity of thinking for himself, and not copying all the furvour of an archeologist, a method too much in vague at the present time. He should be taught to eel that art is a living essence, not an deadyreality. *Timmins.*—Then you are of opinion that the posses ion of correct taste is not incompatible with a wild

Timmins.—Then you are of opinion that the posses-sion of correct taste is not incompatible with a wide divergence of opinion and preferences P

divergence of opinion and preferences? Aristides.—You express my views exactly: and to illustrate my meaning, there are now present several of my distinguished friends, each able in the walk of art he has sketched out for himself. It would cer-tainly ill become me to say Rufskinius is a unn of correct taste, therefore Donaldo is not, or vice versol. No, geutlemen, you are all men of taste. Though you may differ in opinion as to the style best fitted for our adpution, or even in the character of the beauty yon each worship. *Timming*—You are of ominion then that n design

Timmins.— You are of opinion then that a design is in good tasts if the style chosen is fitted for the purpose, and the several parts units in a consistent unmure, forming a pleasing ensemble; or otherwise, as you express it, if the key-note of the style has been evere? struck ?

Aristides.—Yes. That is the usual meaning; and totally irrespective of originality, which, at the same time, should be our aim. "Correct taste" has, after time, should be our aim. "Correct taste" has, after all, been a very insipid young lady, and twin sister to Purity, the lear of whose rebuke has deprived of energy many an ardent mind, which, with proper es-ercise, would have developed much freshness of thought. We most, for the future, try and brush a little of their prudery out of these young ladits; io-deed, I see signs of improvement already, for our young geotlemen, neglecting to pay them the atten-tion they have hitherto deuanded, they will, to pre-vent themselves being forsken, become more moderste vent themselves being forsaken, become more moderate in their demands.

Temmins.--- My mind begins to open as to the mean-ing you attach to the phrase "correct taste." Your object is to show not that there are no men of taste out of the profession : hat that the aims of art have

been cramped up in the very narrow enclosure repre-senting the domain of correct taste. Aristides—Exactly, sir. It is not occessary that there should be invention, imagination, or sectiment displayed, to satisy those self-constituted judges of nrt: in truth, the less thought bestowed on the the design, provided it harmonizes with its adjuncts, the more correct the taste. The better the details of the style are preserved in their original integrity, even to the adoption of a complete order, the more pleased they are, and will exclaim, "How pure!" forgetting that a style is dependent for its vivili jusg element upon the introduction of fresh matter and fresh thought. Therefore I hold, in opposition to all parists, that if the various parts of a design are well adapted to their purpose, and there is a freshness of thought displayed in the details, with due prominence given to the main features of the eding, the design and required, and if the whole details of the design full together in ao harmonious ensemble, every part having been conceived in relation to its follows, and to the general effect; and lastly, if due regard has been given to propertion, not only of linear dimen-sion, hut of light and shade, of mass, of plain sur-inges to wall surface, and of strength compared to the weight to be supported; that design, even if no style the computer to that which is official entropy of open-ings to wall surface, and of strength compared to the weight to be supported; that design, even if there have bas been strictly adhered to,—or even if there have been importations from another style,—that design,

has seen strictly andered to, -or even in three inve-heen importations from another style, --that design, I say, will be in correct taste. *Tannins*.-It seems to me now, that so far from the uniture of styles creating impurity, it is the only way of developing a new oue. *Aristicles*.-Your suggestion is very correct: the leading styles of art have resulted from the fusion of opposite elements; it is only when the combination has heen sudden, that what are called impure styles have been produced; and these, from the quainters with which the combinations are clifeted, and the great latitude allowable in them, are eminently suit d for picturegue architecture, such as the Elizabethan. Of course the purists despise such styles, though I think, with little reason, for each has its beautics, which may be much more appropriate in some situa-tions than those of any other style. *Tomnins*.-Each style expresses some sentiment, than?

then

then? *Activides.*—Still more correct; and it is of the greatest importance that the style which best ex-presses the scatiment most appropriate to the place and purpose, should be the one selected for an in-teoded edifice. Of coarse each style will express, in greater or less degree, most of the semimeot common to the mind of man; but that which expresses it best sloudd be the one chosen. As to this or that style not being adaptible to modern purpose, it is n mere firee; every style in proper hands is capable of doing that. that.

Timmins.—Theu you think that the claim put for-ward by the advocates for the employment of only one style universally, is not in the best taste? All.—Come, Aristides, enlighten our darkness on

that point : we wish you to give your reasons, pro

and con. Aristides.—As I have written a paper explaining my views of the subject, I think I cannot do better than read it; so, with your kind permission, genule-uea, I will now begin, pausing between each division of my paper to bear your comments.*

CONSTRUCTION OF PICTURE GALLERIES. LECTURES AT THE BROMPTON MUSEUM.

THE second of the introductory course of lectures now in progress of delivery at the Brompton Museum, was delivered on Monday evening, the 23rd instant, by Mr. R. Redgrave, R.A. and was "Ou the Gift of the Sheepshanks Collectioo," with a view to the formation of a Natiooal Gallery of British Art. the formation of a Natiooal Gallery of British Art. Pointing out how recently it was that a National Gallery of pictures had been provided in this contry for the instruction and gradification of the people generally, the lecturer traced the rise of the Eoglish school, and then reviewed, pleasantly, some of the principal pictures in the Sheepslanks Collection. He nrged that these works, which nppeded to the affec-tions and home ferlings of the neeple were more neged that these works, which nppeded to the affec-tions and home feelings of the people, were more likely to tonch their minds than the works of the old masters. After a warm culogium of our great artist Turner, and urging the desirability of making a national collection of works in water-colours, the lecturer proceeded to speak of the construction of picture galleries, and this portion of the lecture we give in his own words:— It is well known that the varnished surface of an

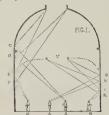

It is well known that the varnished surface of an oil picture forms a sort of imperfect mirror, and unless the light is arranged with proper reference to the position of the spectator in viewing the picture,

* To be continued.

he is prevented sceing the pointing by an unpleasant glitter formed by the imperfect reflection of the source of light upon its surface, as the window or the gas-jet, for instance. This would be made quite clear to glitter formed by the imperfect reflection of the source of light apon its surface, as the window or the gas-jet, for instance. This would have added to be added to be subtracted as itself, would take down the work and substitute a true mirror in its stead, when he would at once see a *perfect* reflection of the window or other source of light. Now, the first question to be con-sidered it, how to place the source of light so that the spectator when at a convenient point for viewing the picture is not annoyed with this imperfect reflection on its surface; and when a gallery is to be built for the preception of works of art, this should be one of the parameter of light and the source of light so that the spectrator when at a convenient point for viewing the aborogchy well-lighted gallery; it is, however, by no means the case; the laws of vision are absolute, and are clearly defined, and the exact places where all these reflections will be troublesome can as easily he baid down by lices, as the plans and dimensions of the gallery; at themselves. But there is another condition to which it is neces-sary to refer in galleries which, like the Shcepshanks Guilery, are lighted from the top (the most usual method, from the much greater hanging space ob-tiond). One of the first requisites is sufficiency of light, but as the simplest way to remedy the evil of reflections to diminish the size of the op-ning for the admission of light, and raiss the roof, this expedient

reneration is to diminish the size of the optimiling for the admission of light, and raises the roof, this expedient is often resorted to (the more that it accords well with the grandinese views of the architect). It thus happens that in shanuing one evil we fail into another i by ruising the roof, it is true that the place of the reflec-tion is which there the numb happing line of the raising the root, it is true that the piece of the reme-tion is raised above the usual hacoing line of the pictures, but, alas! they are as in a well where bat few rays of light can penetrate. I will illustrate this by reference to oue of the most eclebrated galleries of modern Europe, which I have lately carefully studied studied.

Fig. 1 gives yon the section of Baron Klenze's famous gallery at Munich, the Pinacotheck (you will

find the lines in his evidence in the Report on Fine

find the lines in his evidence in the Report on Fine Arts, in 1836). Now if a spectator stands in the wriddle of the gallery of A so as to see the mpper pictures, the window light would be reflected, if the removes to B to see the lower pictures nearer the eye, the reflection would be found between E and F, but still above the pictures which are within his line of the height, as at X, the reflections, when the spec-tator is at A or B respectively, would be lowered to within the lines g and A, i and K respectively, and rould become troublesome to the spectator. In the convention of the sectors. In the convention of the sectors. In the removes the pictures which are within his line of the extreme want of light to see the pictures. In the room containing those of the Early Flemish school (a school of extreme finish, and which is first entered), it was impossible to see the works at all when the sum was shiring, it was necessary to draw the blinds to prevent the admission of its direct rays, and the admitage of n bright day was lost; and, on a cloudy day, the light was wholy insufficient. Yet Murry, who somebow or other is a great authority with travelters, says that Kleuze, " in addition to the praise of having constructed a heautiful edified elserves after the Spearstack Gallery in relation to the rooms of the Pinaetheck, and found them as follows;—amely, the proportion of the opening for light in the Pinaetheck, to the square surface of the splor f found to be about 1-13th, or as 178 feet to 2,310 feet, while that of the new gallery for our windtrus is at 192 feet to 954 feet, or more than one ualf. This is sufficiently different, but when, in ad-dition to his, it is stated, that the light the is merry three times nearer the floor in our gallery than at Mmich, viz. as 20 feet 9 inoles to 52 feet, it with be seen that we have early of the mines as mach value of light on our pictures. By means of blinds was meenabled to regulate the light has we please in sunny weather when the glare might be tog reat, and have

all this, the gbiter point is so managed as to he (at all convenient points for viewing the pictures) quite alove them and out of the way. Moreover, by a nice exclusion we have heen able so to adjust the gas-lighting, that the angle of incidence falls within the same place of reflection as the daylight, and is equally removed from the surface of the pictures. One of the earses of the greater adundance of the light in the gollery here arises from the skylight heing carried quite through, and the coving of the ceiling being only from the surface of the pictures. One of the gollery here arises from the skylight heing carried there arises from the skylight heing carried from the ends abo. Thus a far greater volume of light is admitted, and the pictures in the covers of the rooms are not sacrificed if for, of course, in the Munich gollery, the pictures in the corners or much farther removed from the light, on account of the covings, than even those in the corners of the sides and ends. It must he observed, however, that the smallness of our pictures in the coving is far to be be the eye. The average hanging is 9 feet 6 inches, while at Munich the gallery was expressly constructed to hang to the height of 29 feet. This is far too high. I think no picture (nuless its own size exceeds these dimensions, or it has been com-paced for a high point of vizw) should be hung much higher than 15 feet to the top of the farme. And one fault of the Munich gallery is, that a construction suitable in *some* degree for such large pictures as "The Last Jadgment" by Rubens, though even these are not shoundantly lighted, is carried through-out, and is the same for rooms in which pictures of munute finish are hung; some of the best), while, as I have shown, all are ill and insufficiently lighted. The Salou Carré in the Louver, is another example of insufficient lighting; the source of light in this noble room being far too much removed light the this

The Solou Carré in the Louve, is another example of insufficient lighting; the source of light in this noble room being far too much removed from the pletures to light the smaller works properly when the day is the least cloudy. I have not the measurements of this gallery, but I believe it to be little less than 60 feet from the floor to the glass. The evil is in ereased by hanging the pletures out at the top (which is not the ease at Munich, where they are fixed to the wall wright). From this

is not the case at Munch, wh wall upright). From this banging forward only a part of the light reaches the sur-face of the pictures, on some of which I have seen several inches of shadow thrown hy the formers, and where the the frames; and where the surface of the picture is un-even a new source of anuoy-ance is developed from this practice.

This leads me to remark on this mode of hanging pic-tures as another great obstructures as another great onstruc-tion to their proper lighting, Although by this means also the glitter of their surface may he wholly obviated, and in bring the surfi

the glitter of their surface may <u>b</u> be wholly obviated, and in hanging bigh it is a almost a necessity thus to bring the surface of the picture at right angles with the line of view of the spectator; yet if the light is high, hanging a picture forward at top deprives it of much of the light from above. Pictures, if they are worth preserving in a national gallery at all, are well worth the wall space to admit of their heing seen properly; and I again repeat that works should not he hung much more than half the height of those in the Pinagung forward obviated. hanging forward obviated.

hanging forward obviated. The Sheepshanks Gallery is provided with an outer skylight on the roof, and an inner light of ground glass below it. This obviates all danger from leak-ages, allords ample opportunity for abundant ventila-tion, and sercens the pictures from the direct rays of the sun, so tbut it is only in the extreme brightness and heat of sammer that the blinds need be used.

The galleries lighted from the tag indicates of a succession of galleries lighted from the top, such as I have described, and communicating with a succession of small low exhibits lighted from the side. An opportunity was thus afforded me of seeing how unsuitable are such side lighted rooms for the reception of pictures. Much of each side wall, where the light is good, is

THE BUILDER.

of the building-a succession of cabinets parallel with of the bunding—a succession or cannets provide the min galleries—is a very bad one, for openings into each eabiest from the main galleries (as, I believe, was the intention of the architecty would have led to the loss of a large amount of valuable wall space, for there have been as the second wish to study the works of a master or of a school in their entirety, since the plan of arrangement has been to put the large works of a school in the galleries, the small oucs in the cabinets, thus widely separated from each other. From what I have said, you will infer, what is indeed the truth, that I do not concer in Murray's praise of this gallery. I think it a very handsome architectural erection, but it is very incom-molions and had as a nicture callery, and I hore will handsome arcentectural erection, but it is very mean-modions and bad as a picture gallery, and I hope will not he made the model for anything done in this country, as it already has been at Dresden. Though some of the deletes have heen there modified, yet the

some of the deletes have heen there modified, yet the faultices of the original plan of necessity remains. I must, however, he understood to speak only of the arrangements for the display of the treasures of att in these galleries. As to their architectural fea-tures, they are, as all well know, extremely grand and noble structures.

There is another mode of lighting picture galleries from the top to which it is desirable to refer. I mean eeiling that whereiu a lauthorn treatment of the adopted, instead of hy means of flat skylights, as in the Sheepsbanks Gallery. This method of lighting has been followed in our

wow National Gallery, as well as in that of the Bour-gools Collection at Dulwich. Where only the per-pendicular sides of the lanthora are plazed, there is often a great deficiency of light by this mode, since often a long gallery the pictures on each side only receive the advantage of half the light admitted into the room, and that the furthest removed from them, namely, from the opposite side of the lanthora. When the whole or part of the top is glazzd also, as is the case in some of the rooms at Tratagar.quare, the only advantage is a cumbrous architectural struc-ture, impeding a certain proportion of light, iustead of the simpler one of flat lights.

There is no doubt that the immense improvement There is no doubt that the immense improvement in the manufacture of sheet glass, which we eve parity to the removal of the duties, and partly to the efforts made to meet the wants of the Great Exhibition building of 1531, has enabled us safely to adopt a construction which was hardly available when the Dulwich or the present National Gallery was built,—I mean, by permitting the use of very large sheets of glass without lass. When the Dulwich Gallery was first erected, it need to he quotel as a well-lighted gallery. On a late visit, however, I coold not but feel that it was far too dark, taking into consideration the gloomiuces of dark, taking into consideration the gloominess in co-dark, taking into consideration the gloominess of our atmosphere, and the obscurity of the pictures by the old masters for which it was insteaded. These have been so lowered in tone by time that they demand the fullest anomat of light that can be ad-mitted, while their bighly-polished surfaces, arising fears cardinous arguidburg. requires that all undus mitted, while their highly-polished surfaces, arising from continuous variaishing, requires that all reflec-tions should be carefully avoided, such more so, indeed, than in moderu pictures, which are many of them unvarnished, and their scale of colour much hrighter. I may here advert to the management of the Dulwich Collection as a type of the anti-public feeling that was current balf a ceutury ago, when its regulations were first framed. No one is admitted without a ticket. These tickets are only obtainable at a distance, in one or two places and by narticular without a theset. These thesests are only obtainable at a distance, in one or two places, and by particular application. Thus it happens, as it ever does under such arrangements, that the visits are at the lowest rate, and the public obtain hardly any advantage from what was intended solely for their beucht.

It may he said that it is quite possible to arrange a small gallery such as this for the Sheepshauks pic-tures, and to gain sufficient light, while avoiding any reflections, but that far greater difficulties have to be reflections, but that far greater difficulties have to be overcome in planning a gallery of greater width and height suitable for large pictures. But by eareful attention to the laws of reflection, and to the fullest admission of light in the right situation, I do not think that increased size necessarily implies increased difficulties. It may be asked, what then is the cause that galicries for the reception of pictures have been so frequently failures as to the proper display of the works they contain? I believe it to he simply this. The architect is too often more intent on disolation Side infinite rooms for the feedback provides the rest of the start point of provides the rest of the start point of the rest of the rest

Nov. 28, 1857.

which leave the pictures to the accident of heing seen well or ill, as the chances arising out of the other contingencies may determine. The shrine is clegant, but the pictures are entombed.

clegant, but the pictures are entombed. But is this to be permitted in any buildings that the uation may erect? Are the genes to be lost in the costliness of their setting? Is it right to sacrifice our national pictures to a showy outside or to a palatial clevation? Think of the tens of thousands our national pictures have cost us; think of the value of such noble gifts as this of Mr. Sheepshanks, and the others I have already noticed, and say if we are to be thus deprived of their enjoyment. The first thing to be demanded in a National Gallery of Art, whether of forcign or Britisb pictures, should he the perfect adaptation of the place to their arrangement and display. This is hardly the work

arrangement and display. This is hardly the work of an architect. It should be determined by a painter, of an architect. It should be determined by a painter. The necessary proportions, the height and situation of the lights, the widths, the heights to which the pictures should be hung, the proportions of different compartments or exbinets as adapted to the pictures they are to contain, should he settled first, and by or in conjunction with the painter, and the block, thus absolutely and unchangeably determined, may then be given up to the architect to treat in conformity with the rules of his art. There can he no could that by given up to the architect to treat in conformity with the rules of his art. There can be no doubt that by such means a nobler, because more characteristic, structure would arise, than by the usual method of neglecting the utilities and considering the elevation and decoration hefore the purpose. And if not, are not the pictures the object, to which architecture is wholly secondary. In building a palace, exterior meander and interior magnificance are as much grandeur and interior magnificence are as much requisites as its uses for habitation or residence : such requisites as its uses for habitation or residence : such may be given up wholly to be architect : here he may revel in the display of his art, and earry the decora-tion to any extent that is not inconsistent with requisite amount of contrast : hut in a gollery for art, the art is the one thing to which all should be sub-servient : the pictures, in this case, are not meant to serve as subsidiary decorations to the architecture, bat are themselves the jewels for which the huilding forms only a fitting and suitable casket.

BAPTIST CHAPEL, PRESTON.

THE Baptist congregations have recently in many aces emerged from the small chapels in which they had previously met, and erected structures of size and cost, affording more fitting accommodation for the cost, affording more fifting accommodation for the performance of their religious services. The body in Preston have not been hchindhand. For some time they sought for land, and ultimately they purchased extensive premises fronting Fishergate, at the corner of Charaley-street, and having pulled these down, are now hulding for themselves on that site the chapt represented by our engraving. The exterior, with the exception of the upper part of the tower, is now completed. It is wholly of Longridge stone. The architets for the now edition are Massre

The architects for the new edifice are Messrs. Hibbert and Rainford. The contracts for the masons', joiners', and espenters', plasterers', and ironfounders' work, were intrusted to Messrs. Cooper wards of 2,500%. The entrance to the ebapel is from Fishergute by a flight of stone steps, with palisading in front. The ground-floor of the chapel will seat 460 persons. It is proposed to bave a gallery for the choir only. In the rear of the chapel will be vestries, and a staircase to the organ-gallery. The costs will be even used the next will be: scales, and a surface to be organization. The scale will have open framing, consisting of rafters with enred ribs and spandrils, filed in with decorated iron eastings. Beneath the chapel will be boys' and girls' schools, with separate entrances from Charnely-street, and divided from each other by a moreable screen.

The interior dimensions of the chapel are 40 feet by 72 feet. The style of architecture may he termed "Ecketic," but at the same time it has he termed "Eelectic," but at the same time it has many features in common wibt the Romancsque. The tower at the corner of Fishergate and Charnley-streat will he 110 fect in height to the top of the tiled root, which will cover it. In this tower provision will be made for a clock, which it is hoped will be placed therein by the public, and illuminated at night for the benefit of the town at large. In the exvivue theorement, which is naturalizin on

In the carving throughout, which is naturalistic, an attempt has been made to elicit such skill and ingenuity as the workmen possessed. On a future occasion we shall engrave some of the capitals. Mr. M. Stedman, of Preston, is the carver, and he has heen assisted in the work by William Holden.

INSTITUTE OF ARCHITECTS .- At the next meeting INSTITUTE OF ARCHITECTS.—At the next meeting to be held on Monday evening, the 30th of Novem-ber, a paper will be read, "On the Foundations of some of the Metropolitan Bridges in the River Thames," by Mr. W. A. Boulnois, Associate. The hallot will be taken for nine applicants for admission.

THE BUILDER.

BAPTIST CHAPEL, PRESTON. ---- MESSRS, HIBBERT AND RAINFORD, ARCHITECTS.

POINTED ARCHITECTURE AND ITS WORST Crystal Palace "Christian art." ENEMIES.

-Few persons have a more ardeut admiration for Gothic architecture than myself, and fewer have made it a closer object of study practically as well as hade to be organized of starty practically as years as theoretically; and it is with surprise and pain I have heard and read what has lately been promulgated by some who call themselves its peculiar advocates. A body of men, styling themselves followers of Pugin, have lately thought proper to lay down the most startling and contradictory dogmas on the subject; to villify every one who is master of any other branch to villify every one who is master of any other branch of art; and to arrogate to themselves not only the sole knowledge and understanding of Pointed architeesole knowledge and understanding of Pointed architec-ture, but oven its resuscitation. Well may one say, "Save me from my friends." The Puginites are doing more horm to Mrcdiaval art than all its direct opponents. Reckless essertion, transparent sophisms, and palpable falsehoods are soon discovered, the public are disgusted, and the result is, that the excel-lences and brauties the subject really possesses, are neglected and disregarded. Men feel with the poet, after dedecting several fallacies, that they can helieve nothing from such sonres: :nothing from such sonrees :

"Quodeunque ostendis mihi sic, incredulus odi."

"Quodenome ostendis mihi sie, incredulus odi." Let us examine a few of the dogmas lately put forth by the Pursinites, and see bow far their remarks are just. The first is, that Pointed architecture is "Christian art par excellence," and yet it is eon-ceded that it never existed in the very heart and centre of the Christianity of that period: and, there is something more, it was not the art of the early Christians. The form and type, and the whole sym-bolism of the Christian church, are derived from the basilica, and if men, half a century back, were so wroug-headed or so ignorant as to copy temples in-stend, and put up ox-kulls over church porticos, it does not alter the question in the least. But, says one writer, it is "Christian par excellence," because it was early developed under "the infinences of Chris-tianity." one writer, it is "Christian par excellence," because it was early developed under "the influences of Chris-tianity." Why, two-thirds of the Christian era had rolled away, twelve long conturies had past before there was a vostige of Pointed art in Europe; and when it did take root, it lasted in all its phases little more than three centuries, or one-sixth of the time in which Chris-tianity has blessed the earth; and, of that period, how short a time was it in its pride. Its rise, as Mr. Sharpe has shown, in an admirable article io the Jour-aud of the British Archeological Association (vol. v Sharpe has shown, in an admirable article io the Jour-nal of the British Archeological Association (vol. v. p. 311), occupied about half a century ; it was in its glory, as the geometrical decorated, not quite three-quarters of a century; as the curvilnear, it began to show symptoms of decline through mother half cen-tury; and it straggled on, degraded and debased, during a century sud a half more. So that for only sevenity years, only the twenty-sixth portion of the existence of Christianity, was Pointed architecture in its glory. Surely, after these considerations, we can never call it "Christian par excellence," on account of its co-existence or luration. Nor was the world in that state of Christian excel-lence as to stamp that character on the contemporary

lence as to stamp that character on the contemporary arts. First, as regards the church : it was forn to atts. First, as regardly the church it was torn to pieces by controlling factions; the monks haled and attacked the purcebuil elergy; and were themselves the victims of the unsparing emulty of the frars. These last were broken op into two great parties, the Dominicans and Franciscus,—and at no time in the history of the world was there such interaceing war-fwe between the culture of the basic stars. fare between the religious. Abroad things were woree. There were two, and sometimes three, infallible heads This were too has sometimes three, influince nears of the church at ones, each eccommunicating, and eursing the other and his adherents. Nor was the state of the lasty any more "Christian par excellence" than that of the cheries. The undrass of the erusades had exhausted all the resources of Europe; the vic-torious Turks were about to soize on the fair Byzantine empire. "These was avithes hereithes her empire. There was neither learning arts, nor com-merce. The lower orders were actually slaves, --setf working with collars on their neets. There was no law but the will of the strong, no arbitration but the A fine condition of church and state to he called "Christian par excellence !"

But another writer says, "it more thoroughly arries out its tone and feeling," In what way? Is In what way ? there anything particularly Christian about crock and pinusels, or about anything introduced by Gothic architects, which the early Christian church did not possess? The only difference that I cau see, beyond that of the form of ornament, was the introduction of a number of altars and images, which last, in par-fourter the order observable to did to due to did. ticular, the early church held in deserved abhorrence.

ticular, the early church held in deserved abmorance. But we are now startled by being told it is "modern architecture, the last new original style." In the same paragraph it is commended to us as "Middirend," and in the next it is "the architecture of our for-and in the next it is "the architecture of our for-

THE BUILDER.

Crystal Palice "Christina art." I are next, and wake is generally called modern, is the Italian, which is as much a development from the Roman, as the Per-pendicular from the Lancet, and ps original in its progress and ultimate state. The Pointcol is properly mich a devery progress and ultimate state. The Pointed is properly called Mediava a holding the middle place between this and the Classic styles. How, then, can that be modern which was out of use more cruturies than it ever existed in its prime? If modern, why does it deserve our veneration—why commend it to our feel-ings as the architectarc of our furefathers? But then comes something more slartling still; it is "the modern is the Germanic races." Why, Pointed architecture of the Germanic races." Why, Pointed architecture is no more Germanic than it is Lom-bardic, Venetian, French, or Spunish, in all of which constries it exists; and, if it were, in the name of common sense what is there "Christian pare-accellence" about G-runny or Germanism? Ye divines of Can-terbury I-ye doctors of Oxford! bcar this of the land of Agricola and Kuipperdolling-of Kant and of Strauss, and acknowledge there is something new under the sun.

But there is another question I would ask of the Buginites, —if it be the architecture of our forcfathers, why throw it aside for continental forms? It used to be argued, and I think truly, that the most clegant nd most beautiful Gothic was to be found in England why is this now abandoned for what a facetious friend calls the "streaky-bacon style" of Lonhurdy, or Lonis Ouze French. A church is to be built at Con-stactinople by the English, to commemorate their brave conutymen who fell warring against the aggressions of the great Car of the North, and not a vestige of English taste, nor of the architesture of our forcfathers, is toleraric l. Instand of this we are to have a copy from the north of Italy, and without any more sign or vestige of anything English about it than il England never had an architect. An auti-quary may in a few years stund before a building which he might suppose to have been built by "blind old Dandolo," after his brilliant conquest of Byzan-tium; but never would he think that it was built by English hunds to the memory of the brave Englishs why is this now abandoned for what a facetious friend thing out never would be timine that it was built over English hunds to the memory of the brave English hearts who foll at the Alma or lukermann. Again, there is a competition for an abade for English states-men, and a design is sent in under the Horation motto "Cellbarat domestica facta." Snrely here, with such a title, we should expret something do-With such a thing of our own — something the method. The second only to

"Can such things be, And overcome us like a summer's cloud, Without our special wonder ?"

The fact is that Pointed Architecture is neither Christian, Germanic, nor anything it is said to have heen. It is Moslem-it is Saracenic. This fact has heen. It is Moslemi—it is Saracenic. This fact has been abundantly proved by two great Euglish authori-ties, Sir Gardner Wilkinson and Mr. Fergusson. That it was brought over by the Crusalers is a nuive:sal tradition on the Continent, and proved by Seroux D'Agiucourt, and admitted by one of the Puginite writers. The passage is as enrions and as startling as any of the multificrions *Cours de force* of that party. He says: "Its systematic adoption can with certainty be traced to the suggestive architecture of the East: surely this does not unchristianize the already Clinistian (I) architecture of the soldiers of the Gross, who hrought the idea home among the spals won from their unbelieving foes." How came spails won from their unbelieving foes." How came it to be "already Christian ?" No Christian building had heen erected in any way rescribing it. There is no sort of protence that the style, which Mr. Fergusson no sort of protence that the style, which Mr. Forgusson shows to have existed in the East 400 years before, any similar huilding was erected in Europe was ever used for any Christian edite. It seems to me that the dictum, "The architecture of the Saracens was already Christian," is simply an intrepid assertion, without sbacdow of proof. Dd nut Mohammed vary in every way he could from Christian habits and usages, and not only so, but from those of the Jews? His calendar, mode of fasting, the preference of the left to right, bis plennity of wives, and, not to multiply instances. his observation of the Sabaht...-were not instances, his observation of the Sabbath,-were not every one of these a determined opposition to Christianity, in every outward as well as inward form ?

But to leave this point for a moment, it is stated that Justician was the first who began to "Chris-tianize" architecture, by building the Santa Sophia, at Coostantionple, and it is binted that this fact may have influenced Mohammedan architecture. I have already shown that anything in Christian form was already shown that anything in Christian form was But we are now startled by being told it's " modern architecture, the last new original style." In the same paragraphit is commonated to us as "Midizeral," what way can the Santa Sophia be considered path through life, and far to be preferred to the tem-same paragraphit is commended to us as "Midizeral," which what way can the Santa Sophia be considered path through life, and far to be preferred to the tem-sand in the next it is "the architecture of our for-fathers." What there is "Christian par excellence." The Empress was clearly a Eurychian, the Em-andout it, if "modern," I cannot concive. The "last," the safest of the previous size centures? us with modern architecture," and perhaps the most origical of all, is that of iron and glass; yet no one calls the

Nov. 28, 1857.

The next, and what no Italian, which is as 1 Roman, as the Per-and as original in its he Pointed is properly middle place between the Eastern and Western Churches. The plan of Santa Sophia is not that symbolized by the Latin Church, — the long " navis," and as original in its he Pointed is properly middle place between the Deluge, nor the "alæ" or wings of the dove. The form is that of the Greek eross, ow, then, can that he ore certurises than it modera, why does it mend it to our feel-that the idea of Sant's Sophia, which is vanuted of as refathers? But then it is 'the ore: "Why, Pointed waie than it is Lom-insh, in all of which

But to return : it is considered on all hands, that the Crusaders brought the Saracenic art to Europe; and that it toole root and hecaue the fashion here. It was not Christian when they found it and adopted it. Did it become so, par excellence, afterwards? Alas! I have shown that neither its duration nor its Alls 1 have shown that nother its duration nor its concontant circumstances entitle it to this distinc-tive epithet. In fact, there is a most singular cir-eumstance connected with it. As has before been stated, a short half-century brought it to perfection, and it remained so about sevently years; but during this time the intercourse wild the Moslem had ceased. St Louis had perished before Damietla, in the sevent crusale; and another short half-century had wrested the has hold of the Christians (St. Jean d'Acre) on the Holy Loud. The sight of Oriental d'Acre) on the Holy Land. The sight of Oriental civilization and art was thus entirely severed from the Europeans; and, strange to say, shortly after this came the decline, and then the debasement and fall

With these patent facts before a series include a series of a contrast and the top deconstruction and the series of the series o ing and letters it had awoke, and had made such strides as amazel the world. Talk of Gothic vaults and the covering large spaces,—arches, the boldest and lightest ever seen in the world, had spanned the noblest mare, and a dome larger than that of the Pauthroo, as its great 'architect said, had been hurled up into the sir If Justiniau in his conceit bad overcome Solomon, the great Michael bad exceeded bin four-fold in extent, and ten-fold in beanty, and without departing from the symbolism of the early Christians. The phrase, Christian architecture, as applied to Gothie, originated with poor Pagin. With the avdent

The phrase Christian architecture, as applied to Gothic, originated with poor Pagin. With the ardent zeal of a fresh convert, he wished to do all he could for his new faith. If conceived the Middle Ages were its palwy days, and he thought if be could revive nothing else of those times, he could revive their archi-tecture. With him for years it was a fixed idea,—so much Gothie so much Popery. How this idea has been seized and worked on by other religionists, we will not puse to inquire; suffice it to say, that it is vanued at Rome that the Ecclesiologist has made more enterest a than any other means of prospecting. Not vanted af Rome that the Ecclesiologist has inade more perverts than any other means of proselytism. Not only so, but it was caperly caught at by the yoang men of that time. Here was a chance,—a royal road to architecture without the labour and earcful study which classic art demands. To be able to draw a few windows, and to cant about Christiao art, was all that which classic art demands. To be able to draw a few windows, and to cant about Christiao art, was all that wis required: with this they started into full-blown architects. In fact, it was a capital cry; and both parties—Tapers and Tadpoles—canghtin pa sgreedily as Prigin expected they would. But it is very touching, and very instructive to watch the later years of this thended man. The scales gre-dually fell from his eyes; little by little the truth dawned on him, and bis honest mind eculd not with-hold his altreed convictions from the public. In his

hold his altered convictions from the public. In his last pamphlet he nawates, in most simple and affecting larguage, how one by one the bright visions be had formed of mediaval purity and hap-mess had faded on nearest examination; in other words, how his life had heen speat in chasing phontoms and shadows. Thiuk and a part in the brain when a mails-daily toil is to endeavour to persuade binself and all around him into the belief of a faiseboood.—to cheat himself into what his better reason must have revolued at, and, though his observed reasons in the more threads any of the particular threads and threads a bystanders thought that bis aspect

"With fear of change Perplexed the nations."

Alas ! it ended in a sad night ; with hroken fortune, and with shattered intellect, he sank into the tomb. May he rest in peace, and may it he aclesson to us all that the pursuit of honest truth is the satest and hest

anything besides Gothie architecture. It is a difficult deserve. We might pass by their arrogant assump-thing to cope with a man who makes it his boast that tions—the only builders of "the temple of the Lord he does not know. But it appears that even in archi-tectare there are Tite Barnacles, who dislike those English school of architectural eriticism a langhing-who "want to know you know," and it has been stock in the eyes of foreigners. VERAX. anything besides Gothie architecture. It is a difficult thing to cope with a man who makes it his boast that he does not know. But it appears that even in archi-tecture there are Tite Barascles, who dislike those who "want to know yoo know;" and it has been remarked, when a man says he is thankful for his ignorance, that he has a great deal more than he is aware of it be thankful for. It any humble indigment, the best Gothie architects are those who are also good Dessic products. La could vaint to many instances the best Gothie architects are those who are also good Classic architects: I could point to many instances, one of them of the very highest standing. There is generally a purity and consisteory about their designs that the Pugnites want. With them there is almost always a straining after effect,—a trying for "some-fhing strong," some "jolly dodge," as is the usual phraseology of the anti-Classies. Let me, however, hint that a little milder language towards others, and less use of such phrases as "an accursed thing" applied to everything which displeases them, would he in better taste. When on earth both sches should not be studied I

Why on earth both styles should not be studied, I ennot conceive. To marrow minds, to the half-edu-cated, to the bigoted, I can understand why one thing, and one thing only, can meet with reception. A few years ago the pre-Inadelites worshipped Schastian Bach, and despised Mozart. Men have been found to say Shakspeare was no poet, beenuse Milton was; and that Claude was no painter, because Turner was. But all this (as was said one evening at Infine was, But all this os was saud one evening to the Institute) is just this argument because turtle soup is an excellent dish, therefore a haunch of venison is not Christian food. No, sir, the true architect is hound not only to make himself strictly moster of all that has gone, but to look forward to that which is coming: there is nothing like the chastened expecoming: there is nothing like the chastened expe-rience of the past to guide and confirm the aspirations for the future.

But there is another matter which the Paginites arrogate to themselves in a way which is ludirous. They assert that to them, and them only, the true re-vival of Pointed architecture is due. They are pictured as devoted young saints, rushing over the country as a sort of architectural missionaries, sketch-ing ensure aburch in their neur, and wronounding the pretured as devoted young samts, rushing over the country as sort of architectural missionaries, sketch-ing every church in their way, and propounding the most sound truths every evening at the iun over their eigars and whiskey-and water. Is not the revival the Work of a century and more? From the time of Horace Wolpole, did Grose, and Benthan, and Dallaway do nothing? Were there not such men as Britton, and Ricknun, and Bloxam, and John Henry Parker? But I will tell the Paginites the new who at last failly and truly developed the secrets of Medireval art. It is due to those who added the quality of the scholar to that of the sketcher and architest,—who not only visited the edifices whose history they wished to investigate, but who have toiled over chartularies, chronicles, ledger books, and other monastic manuscripts,—who have laboured in eathedral, collegiate, and other public litraries— who have explained the elange of style, the addition of ornament, the falling off of effect, the mixture of workmanship, hy showing that at certain periods a fire took place, a large legacy fell in, a hawsii was lost, or that the obbey was visited by some celebrated the series environd. It is the perioders wills and there a sectoment in the foundation three down some works, or that the abbey was visited by some celebrated foreign architect. It is to Professor Willis and thore who have followed his path the credit is due. It is to the union of the knowledge of black-letter and of hlack-lead, and not to Puginism, we are debtors.

hlack-lead, and not to Peginism, we are debtors. I fear, sir, I have wearied you and your readers, but permit me to make a short resumé of the subject. It is stated that for six centuries Christians did uot know how to boild a Christian church, although the huildings they erected gave origin to all Christian symbolism : that at the end of this time an un-orthodox emperor, and still more unorthodox wife, just on the ere of a great sehism, built a large eherch we have use of a great sehism, built a large eherch. just on the eve of a great sensing built a mige built in the style of a Persinn palace, and this was the first step to Christianize architecture: that this style erept on by degrees for two centurities more, some-where in the East, under the patronage of Mahomwhere in the bass, unlet into partoge of amount med, where it was developed as Saracenic, or Pointed architecture: that four centuries after this the cru-sading Christians for the first time became acquinited Pointed sading Christians for the first time became acquinited with this style, and recognized that as Christian which had heen, *par excellence*. Moslem for ages; and that they, poor innocents! carried it home with them in triumph as Christian, and then for the first time for twelve centuries Burope was blessed with Christian architecture: that this pure Christian architecture, accessioned to the hot-bed of Islamism, lasted scaree a centary in chilly Europe, and then faded, became idegraded and dehased, and died. Then we are told recomment chilly Europe this function homesne it is

PROVINCIAL NEWS.

Banbury.-The Corn Exchange, on the Cornhill, is nearly completed. The front is of freestone, and the walls are lined with the asame material. The dimensions of the interior, from front to back, are the walls are lined with the same material. The dimensions of the interior, from front to back, are \$1 feet 6 inches, at the wides point, the back forming a considerable segment of a circle: the width at the end next to the street is 56 feet. The height of the interior from the floor-line is 47 feet; the central portion of the roof, which is partly dome-shaped, being glazed with rough glass. The entire width of the façade is 71 feet 6 inches. The height of the exterior, from the paring-line of the street to the apex of the pediment, is 49 feet 8 inches. The pediestal of the states of Ceres surmouting it, is 6 feet 7 inches ; and the statue, 9 feet; the total elevation being 65 feet 3 inches. Over the central doorway are the borough arms, and on the keystones of the doorway horough arms, and on the keystones of the doorway arches are masks, Biechus, Ceres, and Mars. Attached arches are masks, Biechus, Ceres, and Mars. Attached to the huilding are three waiting or committee rooms, a back lolby, and other couveniences; and beneath are two cellars, one 60 feet by 16 f.et, the other 16 feet square. Mr. Hill, of Leed, is the architect; and Mr. Albert Kimberley, of Banbury, the builder. The contract was 1,808. Cardiff-The "Finker's Devil" of the Cardiff Guardian is of option that "there's not a town so full of dirt throughout the Principality" as the thriving town of Cardiff is; and in humorous rhyme points attention to the state of "Paradise," Edwards street, New-town, St. Mary-street, and Herbert-street, as fertile sources of disease. Carnarcon.-It is stated that the Woods and Forests are making various repairs and excavations

Forests are making various repairs and excavations with the view of beantifying and putting in hetter order the ruins of Carnarvon Castle.

Nederla-green (Birmingham).—The foundation-stone of St. Clement's Schools, Nechells, was hid on Thesiany before last; and Messrs. Brauson and Gwyther are the contractors for the building. Accord-ing to the Journal, out of 2,700/. required for the ing to the Journal, out of 2,700% required for the school, 2,500% have already been got together; 30% of it by a penny subscription amongst the artisans con-nected with the district. The new schools will accommodate 590 children. Mr. Chatwin is the architect.

accommodate 590 children. Mr. Chatwin is the architet. Liverpool.—A new fountain, on a large scale, has been erceted in the Bolanie Gardens-park, from a de-sign by Mr. T. Duncan, water engineer: Mr. Rollett was the modeller; and it has been east and crected by Messre. Macargeory.—Mr. Wells having done the building work. The fountain, as described in the coal Journal, consists, in the first place, of three large shells, which receive the water, as hasins; and they are supported by three livers, with spread wings. They rest noon a pedestal, formed from a comhination of reeds, scaweed, shells, and aquatic plants. In the centre, where the three shells join, a perpendicular mass of reeds rises like a trunk to the height of 12 or 14 feet. Above the shells, at the back, stand-ing amoest the reads, are three more livers, one over each shell, from the backs of which flow a stream of water. Metal cups are provided, one chained to each liver's leg, for the convenience of the thirsty. On gala days large jots of water can be sent from the upper portions of the ornanuculal pillar, which will flow over a series of steps. Leeds.—The Leeds baard of guardiants have resolved

Leeds .- The Leeds board of guardians have resolved Levels -- The Levels woard of guardiants nave resolved upon pin chasing a site for a new workhouse, adjacent to the present Iudustrial School, and asking the consent of the Poor-Law Board to an expenditure of 25,0007, for the new edifice and lands. The latter will consist of 21 acres.

CHURCH-BUILDING NEWS.

CHURCH-BUILDING NEWS. Standground.—A painted window, executed by Mr. Wales, of Newcasile, has been placed in the north aisle of Standground Church. The window, which is of three lights, his, in the centre one, a representation of the propheters Anna, with legend, and beneath is an angel with a scroll. On either side are figured the raising of Jairus's daughter, and Mary at the feet of Leges when Martha is combined about much scruper Jesus, when Martha is cumbered about much serving, with inseriptions.

degraded and dehased, and died. Then we are told
we must admire it heense it is modern, because it is
mediaval, because it is the architecture of our fore-fathers (which architecture practically is to because it is "A past, young, future, new, revived, old piece."
A re these men serious, or are they hanghing at our because? If serious, what reprohation do they not
be and a digacent
Brighton.—The London-road Chapel and adjacent
and air would thus be admitted to the raliway beene schools have recently been enalized, and a cost of 1,500/. The size of the chapel is dopulated: it is now capable of holding 1,000 persons. No alteration has been made in the style, but it has heen carried out uniformly, so as to cover a piece of ground in the return on to roof has been raised, and left open, so as to exhibit the oaken skelcton, instead of being ceiled flat. A Brighton .- The London-road Chapel and adjacent

gallery now runs entirely round the chapel, supported on slight iron pillars. The pews are also changed in character. The architect for the alterations was Mr. Simpson, of Brighton; the contractors, Mesra. Wisden and Anseombe. In close proximity with the chapel, a new Sunday school, nopretending in character, has sprung np, built by Mesra. Goddard and Blaker, Portslade. This holds 300 children. It opens into the infant school, held daily, for 260 children. Up to the present time 8007, have beeu realized by con-gregational and other subscriptions, leaving 7007. still gregational and other subscriptions, leaving 700% still

Hereford.-The restoration of Hereford Cathedral is to be resumed in February next.

is to be resumed in February next. Chester.—The interior of the Lady Chapel of Chester Cathedral is undergoing a restoration. The ornamental colouring is in the hands of Mr. Octavitus Indson, of the local school of art. A considerable quantity of the old colour has been found adhering to the stonework, and this, according to the local Chronicte, will be strictly copied in the new psinting. The stonework in this, according to the local Chronicte, will be strictly explete in the new psinting. The stonework in the selection of the two openings on each side of the Lady Chapel, which seems to have been ent away at the time the sisles were added, will be replaced: the other openings must remain as they are, to give access to the Lady Chapel from the sisles. The cavings and ornamouts which have been broken, or have fauled from the decay of the stone, will he reinstated. There will he more or less colouring given to all the vaniting, the ribs, and the mouldings, &c. so as to extend this kind of decoration over the whole interior. interior.

Terburton (Cheshire).—The old wooden church of Warburton has been restored. The west-end gallery has been removed, and the plaster and whitewash have been taken off the old woodwork of the roof and oak been taken off the old woodwork of the roof and oak pilkrs. Other alterations and restorations of a similar kind have been made, and the editect thrown open its whole length about 50 or 60 feet. The high persy have heen replaced by low open seats. Decorative improvements have been made in the little chancel or transcot. At the east end of the church, a stained glass three-light window, by Mr. Walles, has been put mp,--subjects, the Epiphany, Crucifixion, and Resurrection of our Saviour. The painter of the deco-rations, including texts in old ehurch characters, was Mr. Chandley, of Warrington. The floor of the expense of the alterations has been defrayed by the rector and the parish. rector and the parish.

SUBWAYS FOR SEWERS, RAILS, PIPES, AND WIRES.

AND WIRES. "As improved scheme" for the tunnelling of growded theoroghfares or other streets and reads, and the relief of traffic and facility of pipe-laying and lifting, drainage, &c. is proposed by Mr. Charles Baylis, of the Poultry, Solicitor, from whose com-munication on the subject we shall give the leading features of the scheme, as far as our limits will allow. Devision for tran or ruliwart traffic as well as far

features of the scheme, as far as our limits will allow. Provision for tram or railway traffic, as well as for the laying and lifting of gas and water pipes, and tele-graphic wires, and for the flow of sewage, all without interference with the usual surface traffic, are, on this scheme, made by excavating the ground to a suitable depth, and building three tunnels side by side, and parallel to cach other. In the centre one is placed or constructed the main sewer for the thoroughfare, and is the trac raid tunnels it is upromosed to flace the casa

parallel to each other. In the centre one is placed or constructed the main sever for the throughfive, and in the two side tunnels it is proposed to place the gas and water pipes and the telegruph wires. In order to gain access to these tunnels, apertares, covered with moveable metal or other plates or covers, are made on the top of the tunnels, and if thought desirable, strong shorts or blocks of glass may be let into the tops of the tunnels at intervals, so as to admit light to the interior. Of the advantages of ready access to gas and water pipes, &c. we used not now speak, having frequently and long since drawn attention to this subject in the *Baliller*. On the top of the tunnels it is proposed to con-struct two, three, or more lines of railway, and imme-diately above the railways on the side tunnels, and at about the level of the present roads, it is proposed to while width of the street, it is proposed to leave an open space ahout 6 feet wide, or the horeafther, except at appointed erossings, but covering the space over entimy where the streets intersect cach other. Light and ait would tuns be admitted to the railway brenath. The communication of the water and gas-pipes, tele-works for the ording the size over entimy where the street is intersect cach other. Light and ait would thus be admitted to the railway brenath. The communication of the water and gas-pipes, tele-graph wires, &c. with the streets, &c. would he by taking them throng a piece of iron tube of sufficient dimensions, to he embedded in the brickwork at in-

the

addition to which, the Post-office and other Governauthout to which, the Post-office and other Govern-politan Board of Works, owners and occupiers of premises, water, gas, and telegraph companies, and parochial anthorities, would support and largely con-tribute to the carrying out as well as to the profits of the project the project.

FALL OF HOUSES, CAMBERWELL. A WORD OF CAUTION.

The disaster which occurred on the 14th inst. in De Crespigny-park, Camberwell, where a party-wall between two semi-detached houses, just ready for roofing, fell, and carried with it the greater part of the front and back walls of both houses, should serve as a waroing, and prevent other accidents. Those who ought to know attribute the fall entirely to the re-klessness with which the wall—18 inches in thickness. *Locurembed with face*. — bad been extreme to the interval. to the terretessness with Mona the water to indice in thickness, honegeombed with fires – had been evried up in haste, without a particle of iron hooping as bond to compensate for inferior workmanship. The mate-rials of their several kinds are said to have been good. This of their section knuss are said to have occur good. If the present weather continue, and the mode of building now pursued in several quarters we could name be persisted in, we shall have other falls before long. How some of the houses now being creeted in long. How some of the houses now being creeted in the suburbs stand is a marvel,—the mortar made with loam instead of sand, the hricks the worst of " place," noam instead of stars, the mices the worse of party, and these materials, such as they are, thrown together with reckless band, without boud of any kind. The district surveyors, ill-supported by many of the magis-trates where there is the least obscurity in the Act, are nearly powerless in the matter, hat are neverthe-less visited with the abuse of the public whenever district surveyors. disaster occurs.

Most earnestly we exhort the speculative builders of the suburbs to change their course, at any rate till or inc submrs to enable there course, at any tee th summer course again, or life will prohably be sarri-ficed. On several previous occasions, when we had expressed these works of caution, the ink had scarrely dried before an accident happened. We sincerely bore it way work he can submit the sincerely hope it my not he so now.

THE METROPOLITAN DRAINAGE QUESTION.

QUESTION. We have been appealed to by various gentlemen who have suggested plans for the main drainage of the metropoles, to call attention to their respective claims of priority in the suggestion of such plans; hut in some instances this course would only involve us in long correspondence and reclamation, without the means on our part of determining the questions at issue. We must content ourselves in the meantime by mentioning that Mr. J. Bailey Dentoo, the engi-neer to the General Land Drainage and Improvencent Compaoy, at Westminster, claims attention to the circumstance,—"1. That amongst the designs pre-sented to the Court of Savers in 1849, there was one [Mr. Dentoi's own] which embodied all the govern-ing principles, now accepted as practicable and sound, for the carrying out of that vast and important object, he main drainage of the metropolis, and that no for the carrying out of that vasi and important object, the main drainage of the metropolis, and that no tangible acknowledgment of this fact has heen made. 2. That the credit and advantages which usually follow successful competition have been bestowed upon a gentleman, who candidly admits that he did not originate the scheme he has furnished to the Metropolitan Board of Works." To justice to W. Dentan was must low add that is a communica-Mr. Denton we must also add, that in a communica-tion, dated 29th ult. from Mr. H. C. Saunders, the secretary to the referes appointed by Sir Benjamia Hall, it is acknowledged, on the part of the referees, that the principles cnumerated by Mr. Denton in a previous letter as those on which his plan in 1849 was founded, "are, in the main, those since adopted by the Metropolitae Board of Works, and, with ever-tion madifications are add to (Works, and, with ever-

hy the Metropolitao Board of Works, and, with cer-tain modifications, appr.ved by the referees." The only other case to which we shall at present allude is that of Mr. Charles Mayhury Archer, of Hampstead-road. Mr. Archer, after pointing atten-tion to Mr. Lipscoube's hydraulie scheme, recently introduced to public notice in the columns of the *Builder*, asys,—"The new scheme in question appears to me to be an initiation of a comprehensive plan, which, ahaut the middle of 1856, I forwarded to the eomnissioners appointed to consider the question of the main drainage, and to the commissioners for ascertaining the hest means for distributing the sewage, and both of which desiderata I proposed to accomplish by means of pneumatic or atmospherie power." power.

We may here say a few words as to a scheme pro-posed hy Mr. II. Aluutt; "dramage engineer." Mr. Alnutt suggests the construction of nine sewage Annut suggests the construction of mine sewage of the Thannes, with covered reservoirs near lines of railway, along which the sewage could be drawn off in closed trucks without pumping, precipitation, or decodorization, and sent into the country to timber stages, where it could be simply and at once dropped stages, where it could be simply and stages at the stages of the stages at the stages of th

THE BUILDER.

through the bottom of the truck into heaps of earth laid down for its absorption into compost, to be after-words spread upon the fields as manure. Mr. Aluutt feels obliged to notice the very obvious objection of immensity of work thus produced in perpetuity; but immensity of work thus produced in perpetuity; but with the rain-fall running into the Thames, he does not thick his scheme impracticable, and remarks, that it is by division of labour that great works are accomplished, and that the mctropolis might thus he drained by subdivison of labour, just as it is easily provided with gas or water, by several companies, while any attempt to do so by a single system, might he impracticable, or at least unadvisable.

METROPOLITAN BOARD OF WORKS.

Ar a meeting of the Board, held on Monday, the 23rd inst. Mr. Thwaites, in the chair, further to con-sider and proceed upon a report, made by the chair-man, of the result of the conference with the First Commissioner of her Mujesty's Works, on the main interacting deciman it uses resulted after several intercepting drainage, it was resolved, after several motioos had been negatived,---

"That the reports of the Board submitted to the First Commissioner, and also the reports of the referees, be re-ferred to the engineer of the Board, together with two other civil engineers, and that they be instructed to re-port to the Board as to the best means of carrying out the main drainage of the metropolis, and that in report on the expense of the works proposed they will state, first, the amount necessary for carrying the sewage to B², and, in easy the funds should be provided, the further cost in carrying the sewage to the point of outful at Sea Reach."

Mr. Thos. Hawkesley and Mr. Gco. Bidder were appointed the referees.

Mr. Leslic, in moving previously the rejection of the plan sent by Capt. Galton, Mr. Simpson, and Mr. Blackwell, went into an elaborate examination of it and of the report which accompanied it.

EVILS OF INHABITED STABLES.

WITH reference to the above subject (p. 662), per-mit me to direct attention to the fact that proper mit me to direct attention to the fact that proper ventilation will lessen the great mortality, sickness, and anhealthiness found in Marylebone, and in the 163 inhabited stables inspected during the month. About three years ago, the coachama's house over the mews of Sir S. M. Peto, bart, in Bayswater-road, was as unhealthy as any in Marylebone. When Watson's ventilators were fixed for the stable and the coachman's house, by desire of Sir Morton, two of the children were suffering from chest discass, and ever since the coachman's family had resided there the surgeon had been to attendance upon one or other of them : all looked sickly and had hittle appe-tite. In the morning, when it was time to arise, they felt as if they had not had a full nicht's sleep. I called about six months atter the ventilators were fixed, and asw the children with rosy cheeks, and

I called about six months and the electronic more fixed, and saw the children with rosy checks, and heartily enjoying their sport. The mother informed me, that since the house and stable were ventilated, there had here no sickness in the family, and the air of the house felt as pleasant as if they hved in the country.

I know of very many similar facts that have occurred I know of very many similar facts that have occarred in London and the provinces. The horses require good ventilation as well as the grooms, and wherever stables are properly ventilated with freedom from draughts, the horses suffer less from disease, eat better, are stronger and better winded, are free from coughs, and maintain their money value. It stables and the inhabited rooms over them were

If stables and the inhabited rooms over them were vontilated, not only would there be health and com-fort for the horses, and the grooms and their families, but there would be an almost total absence of stable smell in the vicuity of mews, and a most powerful predisposing cause of fever and cholera would he re-moved. At present the mansions of the upper classes, so near to the mews, are well supplied with stable smells, through windows and olker openings. The effect, on delicate ladies especially, and on those wbo live in the immediate orighbourhood of mews, is not invirious, from the accomutated and concentrated most injurious, from the accumulated and concentrated stench of stahles. AN ARCHITECT ON SALT WATER AND NOT "AT SEA."

In is always interesting to us to see the general intelligence of an architect enabling him to distinguish

intelligence of an architect conabling him to distinguish himself in a matter not connected with his profession. A short time back, in a fog, the barque Ontario, of 631 tous register, ran on the S.W. cuid of the Ply-mouth breakwater. She had remained there nearly two mouths, with only her bows above high water, having still hetween 500 and 600 tons of ber cargo in hold, when Mr. Damaet, of the furm of Damant and Reid, architects, one of whose works (the Devon and Cornwall Bank, at Plymouth) we recently mentioned, undertook to bring her into port with her remaining engo. With the aid of a diver, and the boan of three brigs-of-war, ceded by the Devouport dockyard autho-rities, under a hond for 2002. to be paid in the event brigs-of-war, ceded by the Devoupert dockyard autho-rities, under a hond for 2007. to be paid in the event of the vessel's sinking, Sc. Mr. Damaut, at low water, went to work. Two of the brigs were attached to the wreck one on each side, near the stern, and one to her boxs, by chains which looped the sunken vessel up to the others, and as these loops depended uccessarily from the hows of the brigs, their balast was run aft to aid their leverage. Two steam-tugs were then affixed in readiness to the hull of the wreck. As the tide arose, the hrigs did their expected duty, lifting their hurthen into a floating position ; and, by the light of the moon, this strange mass of counceted crafts moved safely, over a distance of nearly three and a half miles, from the outer side of the Breakwater into Catwater harborr.

the Breakwater into Catwater harbour. Mr. Doman's difficulties wore erent. The har-bour-master's report against the practicability of the scheme had occasioned the demand of the boad; and, without a word against any official, the obstacles of "red tapeism" were likely to he most serions to the undertaker. They have, however, only aided to enhence Dr. Damant's triumph, and as he has so suc-essfully gone out of his usual heat in this exhibition of his knowledge, practical skill, and readiness, and "lauching" just now is on the carpet, we may be excused for coing something out of our ordinary way aunching " just now is on the earpet, we may be excused for going something out of our ordinary way in recording it. He has acother claim to our notice in being a connection of Mr. George Wightwick, to whom, not now in practice, the profession is under many obligations.

many obligations. Mr. Damant was formerly in the employ of Mr Are Diminit was formerly in the employ of all. Readel, the late engineer, during which engagement he received a testimonial from the directors of the Edimburgh Water Company, for his services (in Mr. Reudel's absence), while their Bill was before the House of Commons.

ARTESIAN WELLS AND PURE WATER FOR LONDON.

IT is refreshing to look at the engraving of the Artesian Fountains at Grenelle, Paris, in the *Builder* of the week before last. I make no doubt but the real water display will be fully equal to the pleasing impression conveyed by the engraving. It does great credit to M. Ivon, engineer, for his good taste. The question will no doubt be asked by many,—Is it not possible for such wells and such designs to be constructed and carried out in London and other large twome and eities in England ? I answer deeidedly.

constructed and carried out in London and other large towns and cities in England ? I answer decidedly, yes, if a fair scope be given to designers, and the judges will act with real judgment. But no unpre-judied man of sense, taske, or reflection can say our recent competition designs for "Public Offices," "Wel-lington Moument," and " Sub-ways" have bad any other decision than would have resulted from a battery wheel. The public fund, have heen wasted and mis-supplied. There is no possibility, I am assured, of any of the prize designs being practically adopted, and he public dave only been amused or interested for no purpose but that of bringing out a useless display of patience, perseverance, and wasted energy of architects patience, persoverance, and wasted energy of architects and artists, many of whom must be heart-sick at their fruitless labours and empty pockets, But auother great mischief is the waste of valuable

But another great mischief is the waste of valuable time, as well as energies, of the past two or three years, producing nothing but vague, idle declamation, instead of works such as those which have practically and steadily progressed in France, and which prove the superiority of action over our *talk*. Is this to last? Are we to make no progress? And are we to cou-tinue to pander to, if not to foster, public nuisances, when the remedies are in our own hands, if we will only steadily adopt and use them? These are vital questions. Can the public funds be more appro-priately expended than in employing our working classes and tradesmen in the removal of nuisances, and substitution of social and moral bacefits, by intro-duction of works and constructions which will produce plenty of porce air and pure water,—which, in combina.

election of works and constructions which with produce plenity of pirce air and pure water, --which, it combina-ition with proper dwellings for the poor, must advantage all? The stoppage of the Artesian will at Keufsh-town was a great mistake : 1,302 feet of sinking and boring were left, as a failure, when a few hundred feet more would have given satisfactory and remunerative

Nov. 28, 1857.7

results. Let us hope this work will soon he resumed. As to the sensage, now discharging into the Thames, that will, I trust, some day be prevented, and be applied to its proper purpose for crop-growing; hat this, like "the good time coming," we must wait a little longer for, at the rate we are now slowly dragging along, and doing nothing. PRACTICAL.

EXAMINATIONS IN ARCHITECTURE. OXFORD UNIVERSITY

The delegacy appointed to early into execution the statute passed last term concerning the exomination of persons not members of the University, has agreed upon the scheme of examination for the year 1858. In the list of subjects in which candidates may be examined we find the following :--

examined we not the following :--"Drawing and Architecture. 1. Drawing from the flat, from models, from memory, and in prespective; and drawing of plaus, sections, and elevations. 2. Desire in constraints of the section of th

2. Design in pen-and-ink, and in colour.

 The history and principles of the arts of design.
 A fair degree of skill in free-hand drawing will he required in order that a candidate may pass in this section." The examination will commence on Monday, the

21st of June, 1858.

THE NEW RIVER COMPANY.

This interval to contribute the Solution of the 12th of September last, an article headed "Hertford," in which it is stated that the New River Company are concentrating the sewers of the town in their new deadorring beds, where all the *four lastace* water from the town will be filtered and passed into the Lee From the tool with the introd and piesed into the Lee furst in a clear state. Can it be possible that the New River Company really intend that the indubitats of the metropolis shall drink filtered sewage water ? If so, the sooner this is pat a stop to the better, Hanging would be too good for men who would per-pertate such an abomination. B. JONES, Jun.

PROCEEDINGS UNDER METROPOLITAN BUILDING ACT. EXEMPTED BUILDINGS .- MILITIA DEPOT

BULDING ACT. EXEMPTE DUILDINGS.—MILITA DEPOT. JOIN 3A, AFFELLANT 6. HENRY JOIN HAMNOND, <u>REFORDERS</u>. The was an <u>unders</u> of the second of Queen's point police magistrate, whereby the appellant was en-victed in 1s, and costs, for not giving, pursuant to the 38th section of the Metropolitan Building Act, two days' notice-to the district surveyor before commencing a certain building. The question for the decision of the Sith section of the Metropolitan Building Act, two days' notice-to the district surveyor before commencing a certain building. The question for the decision of the court was whether the building came under the bib clause, which exempted from the operation of the Act all buildings came given for her All-giesy's care of certain by the commissioners of her Landson multis, and for the deposit and asfe custody pursues and the sector of the sector of the carear, run, and exercise the nultist, and also to erect, pursues, or hire premises. THE BUILDER.

Books Receibed.

An Account of Church Bells; with some Notice of Wiltshire Bells and Bell-founders. By the Rev. W. C. LUKIS, Parker: London and Oxford, 1857. This account of church halls was originally read at a meeting of the Wilks Archeeological Society, at Salis-hory, in 1854, and appeared in that Society? Magazine. The rathor has since collected much additional information, and has embeddied what he considered of safficient interest in the account now mobile the the second considered of sumicient interest in the account now published. The volume contains a copious list of founders, a comparative scale of tenor bells, and in-scriptions from nearly 500 parishes in various parts of the country. Indeed, the account itself has been drawn up almost exclusively from hell inscriptions. Some plates are given showing varions modes of haog-ing bells, &c. The author divides his treatise into avander as belien hell founders, and founders, hell ing nears, e.e. In a author divides his treatise into remarks on tolfries, bell-founders, and foundries; bell metal, easting and tuning, hanging, cost, legends, and ringing of hells; and on ancient hells, spoliation of hells in the sixteenth century, and on the comparative bells in the sixteenth century, and on anctein hear, spood of or heals in the sixteenth century, and on the comparative scele of tenor hells. There is thus here a good ded of information to be got upon this (at present) rather prominent and popular subject, although the account does not enter into the history of hells in general, writers, such as the Revs. A Getty and H. T. Ella-corbe. The latter geneleman, by the way, has just had published (Hamilton, Adams, and Co. London) "An Affectionate Address to Ringers' True Guide, contain-ing a safe Directory for every true Churchman," by S. Beaufoy, a dissenting preacher. The fact that there are no less than 70,000 bell-ringers in the county scemes to afford a sufficient apology for the publication of this little tract by one so well known in connection with church bells as our readers will remember Mr. Ellacomhe to he.

ILLUSTRATED BOOKS.

Poetry and Pictures from Thomas Moore. London : Longman and Co. 1858.

Poetry and Pictures from Thomas Moore. London: Longman and Co. 1858. The publishers say, "The demand for illustrated hooks for presents has led them to suppose that a selection from the poems of Thomas Moore would be arcepi-able." We cannot praise the *logic* of the advertise-ment, good Messrs. Longman, but we quite gree with what is meant, and can cordially admire tho book which has resulted from the supposition. Eighteen artists, including Cope, Danean, Birket Foster, Horsley, Maclise, F. R. Pickersgill, S. Read, W. H. Rogers (the Juital Letters and Oranucarts), G. Thomas, Topham, H. Wurren, and Harrison Weir, have co-operated in the Illustration of Moore's world-famous songs; but Mr. Birket Forster plays the chir part, and has contributed some of the most charming inalseapes he ever drew without having them spoilt, as for example, the Illustrations to "As a beam o'er the face of the waters may glow " (simply sky and sea), "Venice," both engraved by J. Cooper, and "When through the pinz.ttay," engraved by W. T. Liaton. The best of the fagure subjects is F. R. Pickersgill's to "Young Love's Dream." Duncan's drawing to "I saw from the heach," W. Thomas's "March, nor heed those arms that hold you," G. Thomas's "Young Jessica," and Cope's "A souce a Greeian muiden wwe," bating the costume, are amonst the best. It is a charming book. <u>VARIORUM.</u>

annually proved in England and Wales alone.— Mr. Toulmin Smith has bad published by Stanford, of Charing-cross, "A Viulication of Common Sense, Human Nature, and Practical Improvement, against the Mauffesto of Centralism put forth at the Social Science Association, 1857," in which this expert local self-government is tisclif ripped up as ably by some special pleader on hehalf of Centralism as Centralism har been by Mr. T. Smith on hebalf of local self-government, neutral and disinterested "putters" will be able to judge belween the content-ing principles, and to decide, failly and finally, which is hest, or whether (as we rather suspect) both he not best,—this is, when cach is stripped of its own special and poenliar superfluities and abuses, and re-habilitated by the amendment of its own short-comings. Meantime, we fair that for every Ro shaud of central unisgovernment, an Oliver of local self-misgovernment would not be difficult to find.—W have received from Sir Richard Mayne the "Pares of Hackney Carringer, and distances within a circle of four miles' radius from Charing-cross, measured by suthority of the Commissioner of Police;" and as by Act of Parliament, in case of dispute, these tables are to be received a scoulaive evidence, the public should know that the list is published by C. Knight, and by W. Clowes and Socs. nnually proved in England and Wales alone.and by W. Clowes and Sons.

Miscellanea.

GAS: THE METROPOLIS DIVIDED AND MONO-GAS: THE METROPORS DIVIDED AND MONO-POILZED BY THE GAS COMPANES. — A scheme, wherehy the metropolitan gos consumers are divided into so many lots, and handed over ench to one special gas company, as a subject for monopolized dealing; and, hence, whereby the consumers are placed entirely at the mercy of the heretofore com-peting companies, has been matured and resolved upon by the Metropolitan Gas Companies; and it is full time the gas consumers of the metroplis were awakened to the uccessive of resisting the snare. Some

present acturely at the intervy of the interofolde com-peting companies, has been matured and resolved upon by the Metropolitan Gas Companies; and it is full time the gas consumers of the metroplis were awakened to the uccessity of resisting the snare. Some of the vestries, indeed, are already up and doing, and an important meeting of deputations of leading parishes was held on the 18th inst. in the Court-house of SL Marylebone, for the purpose of conferring on the subject. Resolutions, in favour of general co-operation to resist the attempt, were unanimonaly passed, and an adjournment voted, to afford time and opportunity for communication with *all* the vestries and district Boards of the metropolitan parishes, and for the ohtainment of powers for further action. Just as the meeting was concluding an important letter was received from the town-clerk of Manchestr, stating that the profit of gas lighting to the corpora-tion amounted to between 30,0004, and 40,0007, per annum, and was applied to local importements—an intination which was received with load applause. Sr. MARS's NATIONAL SCHOLES, NARS, Schoules, O.U.STREET-BOAD.—The opening festival of three schouls was held last week, and the opportunity was availed of to present atestimonial to the architect a large number of ladies and guitchere. The architest was Mr. E. C. S. Black, of Westminster. The builder was Mr. Smith. The testimonial consisted of a handsome clock, on an obony stand, and mader a glass shade, with an inscription on a silver plate. FEARS FOR WELLS CATHEDAL.—Will you permit we, through the medium of your columns, to cell attention to the works lately commenced on the surth side of Wells eathedral. A few years ago irreparathe injury was done to the wonderful west front by the reservation of our venerable churches is a marter of and auctioneer of the town. As the safety and pre-servation of our venerable churches is a marter of antioning importane. I thick it is the duay of every one to endeavour to prevent any mediling with then, scree so-raine restoration would be the arrive assumetion of the exquisite old details. An insertion of this note, or, what would be hetter, a few words from your influential pen, may induce the authorities to consult some architect of known ability in such matters as to whether the work really is going on properly or not, and, should the report prove unfavourable, they can not, of course, wish it to proceed as at present. J. A. C.

THE PRIZE DESIGNS FOR THE GOVERNMENT OFFICES.—We are glad to hear that these designs, as we thought they ought to be, are intended to be further exhibited; the Architectural Institute of Scotland baring induced the Board of Works to allow them to be send to Ediaburgh for that purpose.

Section having indiced the bound of works of anothem to be sect to Ediaburgh for that purpose. INTERPOOL ARCHITECTURAL SOCHET, — At a meeting on the 18th, Mr. S. Huggins, President, in the coair, Mr. F. Horner read a paper entitled "A Plea for the Beautilul in Art." A brief discussion followed, in the course of which Mr. F. Howard remarked that the fine arts were not fine arts unless they interested the imagination, and through the imagination appealed to the higher emotions of the soul. Comic pictures, he said, were only admissible when they were so treated as to elevate the conicality of the subject, and to Wilkie was due the credit of having entirely originated that mode of treating comic subjects, the Dutch comic pictures, so called, though they exemplified the principles of the art, being coards, and frequently indecent. Art was one thing and the application of art another, and all the principles of art might be combined without producing fine art at all. Mr. Picton said he could not help thinking that Mr. Horner had taken in some respects rather too desponding n view of the state of art at the present day. Wilb regard to architecture, he denied that the architects of the present day were greater copyists than those of any former period. They took old styles as their type, as the Greeks took the Egyption for their type, but they were continually creating new features, and were going on in that way insensibly to develope what would he a thoroughly neved.

new and original sigle of Art. Sr. MARTN'S: N. THE FIELDS LIBEARY AND READING ROOM.—A lecture on the "Seven Churches of Asia" was given on the 17th inst. by the Hon. See, the Rev. W. J. Beamont. The rev. the vicar, in taking the chair, informed the meeting that their hon, see, was about to leave them, and eulogised the zeal and promoting the instruction and amasement of the working classes. The lecture was listeaded to with pred interest; the unce so from the rev. lecturer having visited personally the scenes he described. THE APPROPRIATION OF SMITH/FELD.—This important question still remains undecided, and the pre-

The Appropriation or SMITHCHELD.—This important question still remains underdied, and the present position of affairs is as follows:—The committee appointed to arrange this business have, it appears, foiled to agree with the Chancellor of the Evchequer, who will not sanction any plan which does not leave sufficient space in front of St. Bartholoncew's Hospital. We believe that the Government are willing to give up all the ground on the Charterhouse side of Long-lane, and that the committee are not satisfied with this arrangement, and are determined to bring the matter under the consideration of Parliament. Due regard, it is to be hoped, will be paid to the connection of the site with many important national associations, and the value of open areas,

Sr. MICHAEL'S, CORNITLL.—At a vestry meeting of the parish of St. Michael, Cornhill, on the 19th instant, Mr. Herbert Williams, the surveyor of the Drapers' Company, was elected parish surveyor. We hope this may be a move towards getting the new porch of the church finisbed, and the removal of the ugly hoarding that has so long been an eyesore to the rubble.

The DUDLEY DRAINAGE.—In the last number of the Builder there is a paragraph respecting the Dodley drainage plans. As I have never troubled you with a word respecting any works of mine (excepting advertisements for tenders). I am sure you will not deny me space to correct some inaccuracies in this paragraph. It is incorrect that "the Board of Heatth applied tor his [my] account up to the present time." I sent them such an account voluntarily, and they at once referred it to their own officials, whose report, that I was entitled to be poid the full amount of my claim, was presented at the last meeting of the Board, and entered on their minutes. A resolution was passed requesting me to meet a committee of the whole Board, to advise with them, as their engineer, as to proceeding as soon as possible with the sewerage works most necessary; and also, to arrange for payment of what was due to me. This is the correct version of the words, "the necennt was referred to a committee of the whole Board." The greatest inaccuracy is, that after giving to the public my accumar (with, perhaps, an unnecessary amount of detail), yoour informant has placed in juxtaposition with it, "the estimated cost of the sewerage is 40,000t." I heg to inform you that the sun total of the estimates is very nearly 50,000t.

WILLIAM LEE.

*** The paragraph in question was inserted simply as supplying information, and was not intended to foreman to the bricklayers, fell from one of the stages coavey any matter of offence. The estimated cost of of the scaffold into the stone-yard, a height of near 40 the severage was stated at the meeting of the Board feet. Both his thighs were hroken, and his skull was to be the sum named in the paragraph in question, and was so reported in the local papers. fractured, with concussion of the brain. The case is perfectly hopeless.

THE LEEDS TOWN-HALL CONTRACT.—The Town Council of Leeds held a special meeting on Wednesday in last week, when they authorized the town clerk to defend the council against a bill, filed in Chancery by the assignces of Mr. Samuel Alack, the contractor for the town-ball, with reference to the works of that building, in which certain claims against the council, the council against 00 0001 one cert forth

building, in white derian claims against either other, amounting to upwards of 20,0002, are set forth. THE DUPLEY SCHOOL OF AUX.—The second annual examination of the pupils in this school took place last week, and the drawings were exhibited and visited by many of the townspeople. Mr. Wylde, the Government inspector, was present at the examination of Mr. Cochrane, the master's, pupils, and nine medals were awarded to the works in a more advanced stare.

IIGHAM FERRERS CHURCH (NORTHAMFTON-SHIRE).—We are asked by the officials to mention that this formerly collegiate church is undergoing restoration nuder the superintendence of Mr. W. Slater, Higham was the hirthplace of Archbishop Chieheley, who is said to have heen found here tending his father's sheep by William of Wickham, who, noticing his intelligence, instilled into him his architectural as well us his church principles. He has left at Higham, in the bedehouse and school, proofs of his nttachment to his native place; and the fine parish church, though in the main a century older, shows, it is stated, indications of having undergone a restoration in the hands of the Archhishop, whose likeness and arms are to be found in the Perpendicular woodwork of the chancel. There is a curious pavement at the cast end, which has heen drawn and described by Lord Alwyne Comptou. Towards the restoration fund, her Mijesty bas contributed 1057. The parishioners, in number about 1,100, and none of them, with very trilling exceptions, owners of land or houses in the parish, having raised 1,450. By voluntary subscriptions, are appealing to the public for the supply of the remainder of the sum remired.

the sum required. WESTON'S MUSIC-HALL, HIGH HOEBORN.—This is a very handsome apartment, which has been built under the direction of Messrs. Finch Hill, and Paraire. It is more than 100 feet long, about 40 feet wide, and 40 feet high, and the ceiling, divided into ten compariments, is elaborately ornamented, and, together with the front of the gallery, displays a considerable amount of fanciful design. Iron columns, with ornamental spandrils, carry the gallery : the end-wall, next the orchestra and stage, is lined with large sheets of looking-glass, surrounded by drapery. The colour is delieate and pretty, and the decorations, hy Messas. Homan and Beensen, appropriate and pleasing. The approaches are 1-id with Bale's patent mossic quarries, by the Poole Architectural Pottery Company. The hall is lighted by five glass chandelers, the centre one of which is too large.

THE ACHITECTURAL EXHIBITION.—A correspondent says:—"On seeing the advertisement of the Architectural Committee, permitting the exhibition of the drawings for the new Government Offices and Memorial Cunrch, I was in doubt whether the designs for the new Islington Vestry-hall would be admissible, they baving been previously exhibited; but upon making inquiries I have been given to understand that as it was a *local* exhibition, and for *local* purposes alone, it will not preclude them from the fortheoming exhibition; therefore I wish to make this known, through your p.per, to others like myself who may be in doubt, and I tust that competitors will send their designs that a comparison may he drawn between the rejected and premiated drawings." BELEER CEMETERIC CONFERTION.—The successful competitor is Mr. E. Holmes. We stated this last week; but, through a printer's accident, the three lines containing the intimizion (bottom of first column, or other) to the the the the the the delorem

BELIER CENEFRER COMPETITION.-The successful competitor is Mr. E. Holmes. We stated this last week; but, through a printer's accident, the three lines containing the intimation (bottom of first column, D. 633), were shifted to the foot of the third column. The GLASGOW MASONS.-The master masons have conceded the demand of the operatives that their wages shall be paid fortuighty; and this cause of dispute bus heen so far satisfactorily arranged. We regret to state, however, as one of the results of the present monetary crisis, that on Saturday before last 700 operative masons were dismissed from employment in Glasgow, and that the number of unemployed was likely to he very considerably increased at the end of the past week.

SCAFFOLD ACCIDENTS. — Three men were on a sonffold of a building in course of erection in Berlane, Tower-street, when the plauk on which they were standing suddealy hroke, and they fell to the basement, a depth of 60 feet. One of them received extensive bujeries. Another scaffold accident took place last week on the premises of Mr. Hind, an upholsterer, of Tottenham-court-road. William Huat, foreman to the bricklayers, fell from oue of the stages of the scaffold into the stone-yard, a height of near 40 feet. Both his thighs were broken, and his skull was fractured, with concession of the brain. The case is perfectly honcless.

Nov. 28, 1857.

A COVERED WALK.—Cut through Russell-square, and let there be an avenue, gravollod, and covered (arross the garden-ground), Crystal Palace-like, from Bloomsbury-square to Gordon-square. The elimate orbidding garden exercise for several months in the year, this would serve a private advantage, and being a thoroughfare for pedestrians (never numerons), from say is' o'clock am. to eight p.m. for some months in the year. Each path-side to be railed, to prevent secroachments in the gerden. Posts to be placed at each end. The expense to be divided hetween the estate holders and the Government.—C. D. ROMAN REMAINS AT GLOUEESTER.—Some Roman

ROMAN REMAINS AT GLOUCESTER.—Some Romann runnins have been discovered by workmen while making excavations for c.liars in Northgate-street. At the depth of about 5 feet, the bases of two columns, S feet apart, were discovered, resting in their original position on square stone plinths, flanked on the one side by a square pilaster, and surrounded by the baseinent walls of an old Roman structure. At the distance of S feet from the columns, and facing the street, were the remniss of a doorway. A stone tablet or niche was found with its face to the ground, and hearing in bold allo relievo the figures of Ebsculapius and Hygeia.

BINKS'S TRAVELING SCAFFOLD.—At the Hull Public Rooms a machine of simple construction has been exhibited. It consists of a perpendicular ladder supported by a "strut." The ladder poles in this instance are 40 feet in height, the lower bars being 4 feet, and the npper ones 3 feet in leugth, and 19 inches apart: every fourth har sustains a platform about 5 iect long and 1 to 2 feet wide, placed on the inside of a ladder, and an equally wide ledge is placed on the top of the machine, the feet of which are grooved into another ledge, which being supported by iron wheels, becomes a travelling platform.

LOOK TO YOUR COIN DEPOSITES.—The foundation stone of a Lunatic Asylum was laid at Nottingham, a week or two since, when a bottle, containing a parchment record and a number of coins, was deposited under it, as usual. A watch was kept each night, nutil Friday, in last week, when the stone, having been hult noon and embedded in masonry, was thought secure. The thieves, however, had also kept watch. The workmen, on Saturday morning, found that the stone had been undermined, and the coins extracted. The actual present value was only 12s.

CARPENTERS' AND JOINERS' STRIKE IN MAN-CHESTER.—As the turouts have refused every offer of arbitration or mediation on the dispute, the hopes entertained that the strike would speedly turninate have been dissipated. The employers have obtained hands, tired of their uncomfortable position on strike, have returned to work. One of the largest building firms has obtained one-fourth of their usual complement.

POLTECHNIC INSTITUTION.—Mr. Pepper's lecture, entitled "A Scuttle of Coals, from the Mine to the Fireside," enhodying an account of his visit to a nine, and illustrated very fally by dissolving views, is one of the most interesting ever delivered within the walls of the Polytechnic, and may he listened to with advantage by young and old alike. The dangerons conditions under which the mitugations which science provides; and a unmber of valuable statistics are conveyed to the hearer in so pleasant a manner, that after being thoroughly amused, be finds himself considerably instructed.

The CLOCK OF RFE CHURCH.—Presuming that the subject of "Public Clocks" is a legitimate portion of the scope of your useful work, as connected with huildings, I should feel much obliged if one of your readers could furtish some particulars to be depended on respecting the very large old clock in the old church of the old town of Ryc, in Susser, which I saw there some few years ago and I presume is there now. The large dial-plate was placed either over the great cast window or the east face of the tower, I forget which, but the pendulum swurginside the body of the church and was seen in motion through the east window. My reason for making this application is, that in a long and very interesting article in the Times of the 18th instant, beaded "The Tower and Clock at Westimister" (and which the Times of the mext day, under the head of "The Recasting of the Westimister Bell," admits to be incorrect in some particulars), it is stated, "It [the pendulum] is 14 fect long, weighing over 6 evt, and more than double the Largest in the world." If by "size" is usent "length," I eanoth the timery that its an error, and that the pendulum of Ryc church clock is "Larger," that is, "Longer" than either. But, apart from this, the clock from its size and make, is a curicoity worthy a notice in your useful journal. As Rye was one of the ancient cioque ports, with a good trade, perhaps the clock may he of foreign make.—AN INQUIREE. DEC. 5, 1857.

The Builder.

OTHING interferes more with the improvement of the masses of the people than the difficulty which exists of getting rid of old customs; for instance, the practice of keeping the dead 6 hefore interment for a week or more, so hard to hreak down, bas, in many iustances, been the means of destroying the lives and health of the living. For many years infants were "swaddled" and bound up in the remarkable manner shown in old manuscripts and pictures. It would be as difficult to form an estimate of the number who have been killed hy such processes as of those who have died prematurely

from the effects of tight-lacing. At one time, in cases of small-pox and similar discases, every breath of air was carefully exelnded, as though that life-preserving element was an enemy instead of a friend. When this treatment was in fashion the small-pox was about as fatal as the cholera is now. Fever patients used to he closed up in a similar manner, and the beds of the sufferers were piled with blaukets. We cannot wonder, under such circumstances, at the spreading of the disease.

All these evils, and fifty more, have been, to a considerable extent, lesseued. There are, however, a large number of persons amongst the less educated with whom the fashiou of former days is still considered the hest, in spite of its evident ill effects. Many an intelligent artisan and his wife who would laugh at most of the practices alluded to, would decline availing themselves of a home, however wholesome, which did not present the appearance of those built upon the old plan. Thousands who feel the difficulty prefer the fashion, and with their families live iu suhdivided houses, where, in many instances, the benefit of privacy, cleanliness, and comfort cannot exist, in preference to occupying dwellings which, although different in outward form, have the means of family seclusion, and all the necessaries for health. It is a pity that it should he so, hut such being the case it is necessary, in order to do good, to nse means which, while being beneficial, will humour the prejudiced taste which exists; and credit is due to those who devise proper means of coaxing the great industrious multitude into the use of the kiud of houses which are so much required. We have more than once suggested in these pages, how desirable it is to provide houses at a moderate rent which would afford the advantages of separate residences and other necessary qualities, and which would as nearly as possible present the appearance of the dwellings now in use.

We have found in one of the northern towns this principle carried out to a considerable extent in some of the new streets. The houses towards the road present a substantiallooking front, two stories high from the pave-ment, with rooms below looking into a very wide area. In the front of each house are two doors, fitted with knockers; one of these, by means of a distinct passage, leads to the groundfloor, and the other to the floor above, while a railed flight of steps affords entrance to the apartments helow. We have thus in each house three distinct sets of rooms. The back is fashioned with galleries, something in the same age and the accumulation of putrid refuse, manner as the model cottage which was erected caused an atmosphere indiscribably close and by Prince Albert near the Content Facture. manner as the model cottage which was erected caused an atmosphere indiscribably close and its necessity which came before us quite re-by Prince Albert near the Great Exhibition, oppressive. Iu many instances children's schools cently. A lady selected a farm-house, in a

THE BUILDER.

with staircases leading to the back premises. The upper and the ground floors of those houses, which consist of three rooms each, let for 10% a year each (less than 4s. a week), including taxes; the places below for less: and we were told that they are occupied as quickly as they can be finished, hy respectable workmen, and that they pay about 8 per cent.

Every single step of this kind is encouraging, and it is unnecessary to deny that many such have been taken. Notwithstanding the enormous extent of the iguorance yet prevailing, and the amount of work required to be done, all parts of the country show the gradnal admittance of the truth of those principles from which im-provement mnst result. Twenty years ago, the great mass of even the middle and wellinformed classes were not aware of the dangers by which they were beset. Glance back former times, and it seems remarkable how people could live at all. Take, for instance, many country villages : the honses were chiefly planted iu the form of a street, in the centre of which were two rows of "midden steads" and pigsties : stagnant pools of the fonlest description were collected in all directions, and the stale garbage ,and other refuse were left in small mountains in all seasons : there were of course cesspools in the rear, for no attempt at proper draiuage had been made. The interior of the houses might he kept clean, but that did not prevent the breaking ont of postilence, which in a moderate degree was looked for with the coming of the summer leaves, hnt which at times became so scrious as to terrify the people, who were then not able to trace the disorders to their cause. Small silk bags filled with cam-phor were hung round the necks of the children, as if that could usutralise the vile gases which were created around their dwell-ings. And bad as this was, the coudition of the towns was worse. We recollect seeing in an important town a large chnrehyard raised to the height of not less than 12 feet above the proper snrface hy the mouldering dead. It was managed in a way which would perhaps have surprised even the workers in Spa-fields and some metropolitan grounds. People even then used to wonder how room could he made for more. But there was no George Alfred Walker to look in and investigate their "doings." Tt was hy no means nnusnal to drain this ground without disguise, and let it run along the public street to the ucarcst gully-hole. If an inhabitant had at that time lifted up his voice against such a practice, he would have been thought fit for place in the neighbouring lunatic asylum. Lanes thickly surrounded this graveyard, and one narrow turning led to a series of little squares and back nooks. There was no drainage in any part, and yet perhaps not less than 200 or 300 persons inhahited the bouses which were reached by the narrow archway. There was also a loug huilding used as a school, where nearly 200 children were constantly assembled. In front of the school was a place for all the refuse. Behind was a closet, with cesspool, which was constantly overflowing, and which was the only convenience for the boys, and for a large number of the inhabitants. At times the huge dirt-heap would he removed, and the task would occupy two or three days. When cholera hroke out in the town for the

first time, uot a single house in this conrt escaped; in some instances whole families were swept away: then the houses in these confined places were not supplied with water; people had nonc except such as they could catch from the drip of the roofs in rainy weather, or carry from the nearest pump or conduit; and that, added to total want of draiu-

were kept down these courts, and lives innumerable were lost in consequence. Recollect, for another instance, the condition of the for old town of Edinburgh at about the time mentioned ; - the wynds, the lofty houses with commou stairs, without water supply or other means of cleanliness. Descending dust-shafts, such as those in our modern model houses, bad not been thought of; no closets or water-eisterns were placed on each landing. So imperfect were the arrangements, that it was dangerous for the wayfarer to travel towards nightfall. Some of the more thoughtful of the Ediuburgh dames would, it is true, considerately, from their lofty situation, exclaim, as warning to the passer-by, hefore throwing out the dast, "'Ware below ! 'ware below !" This condition of affairs led, as may he imagined, to sad effects. It required no little amount of energy and love for the picturesque at that time to explore the stair which led to the room once occupied by Smollett, and other places of interest. Parts of Edinburgh are had enough now, but it has been greatly improved since then.

It is of the utmost consequence that a know ledge of the laws which govern human life should be given to women. A frightful loss of infant life occurs through their want of this knowledge. In a certain unlicalthy district of London, during one year, forty-four deaths occurred, and of these, twenty-six who died were children under five years of age. The difference in the proportion of deaths amongst infauts in various localitics shows that this loss is unnecessary. Thousands of preventihle deaths which occur, hoth in London and the provinces, from other than sanitary imperfections, are clearly to be traced to the ignorance of the mothers in the simplest principles of healthful management. In the National and other schools in which the future mothers of the next race of English workmen are heing educated, attention should he given to the instruction of the young, not only in sanitary matters, hut as to the structure and functions of the body. To the mothers we "When shall I begin the education of the world. "When shall I begin the education of my ehild?" said a young woman once to a wise mau ; "it is now four years old." "Madam," he replied, "yon have lost three years already. From the first smile that gleams over au infant's cheek, your opportunity hegins."

There is not a more terrible sight in the dark regions of Londou than to see mothers giving tender infauts gin and other strong drinks,-an act of kindness as they think. Their ignorance of the effects of such treatment makes them wonder when the children wither away, and speedily die before their cyes. In niue cases out of ten, amongst the poorer classes, intemperate mothers are ignorant that hy their course of life they either poison their infants, or, at any rate, weaken their systems. If the commou and useful knowledge to which we allude was made a more important consideration, some might thereby he prevented from committing what they would know to be acts of wicked-ness. Quite true it is that "in exalting the faculties of the soul, we annihilate, in a great degree, the delusion of the senses."

In many poor neighbourhoods the quantity of laudanum and other opiates sold is extra-ordinary: hy their meaus the children are drugged, and this canses a considerable increase in the list of deaths ; nor is this dangerous and guilty use of opiates confined to the poorer and more ignoraut classes, as may be seen by the advertisements of elixirs, soothing syrups, and cordials for children, which so constantly meet the eye.

The sauitary laws by which health is pro-moted, should he made a branch of the national education. Take a case to exemplify

Vol. XV.-No. 774.

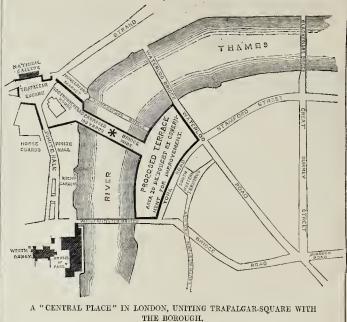

delightful part of the country, as a residence for herself and children during the summer. When there, she found that a horse-pond, which was at a short distance from the honse, had an unpleasant smell; inside the rooms there was also an impure atmosphere, and it was discovered, on examination, that there was some communication hy drainage hetween the cowsheds and the house, and that the drains were all stopped. Men were set to work to put the derangement right, and the result of such auoperation in the summer-heat may be readily imagined. As one fatal consequence, the chil dren were stricken by fever, and in a few days three of them died. Now, if this lady had fortunately been in possession of the proper amount of sanitary knowledge in the choice of a place to which she might retire for a season, she would, in the first instance, have avoided the neighbourhood of a stagnant pond into which refuse ran; and when, heing there, the drains were taken np, she would have escaped with her children from the honse with as much activity as she would have run from a huilding Still, as we said hefore, knowledge is on fire. spreading, and life is gradually lengthening.

In the case of graveyards, a strong evidence of the advancing state of public opinion may he found in the general expression of horror which has followed the statements that have been lately made at the London Mansion-house, in connection with the disinterment of the dead in Moorfields hurial-ground. It was difficult when we lahoured on the subject, nine or ten years back, to make persons helieve in the danger of the London graveyards. Fortnnately, however, the truth was gradually impressed, and then, by the strong force of public opinion, a parlia-mentary enactment was obtained for the purpose of putting a stop to intramural interments. Varions circumstances have from time to time

transpired in connection with closed places of sepalture to cause excitement,—the removal of coffins and their contents, to make room for the ercetion of dwellings; the carrying away of grave-stones and other memorials hy wholesale; and, although vory large sums of money have heen paid for accommodation in those spots, no sooner has the source of profit ceased, than (in many instances) they have been allowed to become scenes of desolation. Graves were hought at scenes of desonatol. Others were holden at considerable prices, on the clear understanding that they were to be treated with consideration, and were freehold. Those who purchased grave-stones and monuments, and who also paid for stones and monuments, and vito any provide the privilege of fixing them over family graves, never expected that these would be carried away, and used for different purposes. Nor did they think that the hodies would be removed, the secrets of the grave fearfully exposed, and even the hones of their dearest sold. This is the private view of the subject. The public health is, however, a consideration of equal importance, and to take the case hefore us, it seems ill-judged to attempt to plant a school for children on ground which has heen shown by Dr. Letheby and others to be one mass of putrefaction.

The account of the condition of the hodies The account of the condition of the hodies which were removed from Moorfields, is sick-oning. We acquit Mr. John Young, the architect, and Mr. Thomas Piper, jun, whose intelligence is so widely known, of voluntary contempt for public opinion, or wanton disre-gard of the dictates of common sense; hut they seem, certainly, to have shown an amount of thoughtlessness scarcely to have been expected from them.

thonguitessness extra subject let us express from them. While upon this subject let us express a hope, that the managers of the cemeteries which have heen recently opened, will avoid the practice of pit hurial, the evils of which have heen already so fully shown. We have had hurst from good authority, that in some had hurst from good authority, that in some have heen already so fund, and that in some had hiuts from good authority, that in some had hiuts from good authority, that in some in stances things are not working as they should in this respect. It must he horne in mind, that ree long London will march to Finchley as it affected the health, traffic, and adornment of the senten at other places, and it would he a scandal ii, with our past experience, we were to produce there that state of things from which we are now but just escaping.

A "CENTRAL PLACE" IN LONDON, UNITING TRAFALGAR-SQUARE WITH THE BOROUGH, ACROSS THE WATER,

ACROSS THE WATER. THE above small plan, for which I request indul-gence, is in reference to my former letters that have appeared in pages 542, 561, 509, 604, and 636. It is restricted, of course, to a small extent as compared with London itself; nor can your readers fully view the hearing of the scheme contained in my previous letters without reference to a map of the whole metro-polis. It comprehends, indeed, little more than the actual area suggested for improvement and its imme-diate neighbourhood.

diate neighbourhoed. This "Central Place" in London, uniting Trafal-gar-square with the Borough, across the water, is indicated by the broad dark line. Its greatest ex-tension, viz. from the National Gallery to the York-road, in the Borough, is somewhat over half a mile. It may be seen that the area on the north bank of the river would be of an irregular form, hut that on the sorough side would admit of a justly symmetrical architectural treatment. This would give variety arch tectural treatment. This would give variety, and the hridge of 100 yards in width connecting and the mroge of 100 yards in which connecting them would afford a magnificent view of London, besides being a very grand feature in itself; and nader certain regulations would relieve with facility the overdegree of traffic that now elogs the streets of

the City. The star in the centre of the hridge indicates the

The star in the centre of the hridge indicates the pivot of the scheme, heing as near as may he the central point of present London, as is to he noticed in the Post-office district maps. I have not indicated any lines of new streets in the Borough, such as would naturally prise out of the execution of such a plan, of a central area in the heart of London, because I desired to avoid emharrassing the simple idea with any details of further extension, especially as such details would naturally be guided hy various considerations that I am macquainted with, or, if I were, that I should not he fitted for dealing with, not having the honour to he, as I told you hefore, professionally an architest, although an enthu-siastic admirer of that art. You have so kindly given space to my previous

siastic admirer of that art. You have so kindly given space to my previous letters on the ahove subject that I feel I should he presuming too much oo your indulgence by a repeti-tion of their contents. It will be, perhaps, therefore hest simply to refer to them for the separate points which they brought under your notice. In any first letter, page 542 of No, for Sept. 19, I set forth the general plan and hearings of the seheme as it affected the health, traffic, and adornment of the metropolis.

beth without detriment to the more aristocratic part of the town.

In my third letter, page 604 of No. for Oct. 24, I set forth expressly the architectural and general art efforts which would arise from such a treatment of the heart of London.

of London. Io my fifth letter, page 636 of No. for Nov. 7, I dwelt on the great importance of the "quadrant space" comprised between the hend of the river opposite Charing-eross, the South-Western Railway, and the Waterloo and Westminster-bridge-roads, being eleared of its present habitations and inhubitants, it being now a centre holted of moral and physical disease, and suggesting the purchase of this area by Government as a first step; submitting also that it would not, in av case, be an upprofitable application of multile any ease, be an unprofitable application of public money.

money. Those of your readers who have been sufficiently attracted by the sebeme, can easily apply to the above plan those letters which appeared hefore, in enume-rating which I feel somewhat aghast at the space I have taken up. Their subject is one on which much more remains to be said, but I am sensible, on the alter hand that thread near here had the other hand, that through your pages I have had quite my proportion of "say," for the opportunity of which I am much indebted to your courtesy. EFSILON.

ART IN ARCHITECTURE.*

Aristides' Treatise "On the Sentiments and Capa-bilities of various Styles,"-with the Discussion thereon.

THE wordy war raging between the Gothicists and Classicists hegins to assume now an unpardonable ferocity. This second invasion of the Goths on Classic ground promises to be almost as hig in fruitful events, as the former was for the time in dire calamity, dismay, and ruiv. The same elemental eauses have, I events, as the former was for the time in dire calamity, dismay, and ruin. The same elemental causes have, I am inclined to think, produced hoth. The Classicists, like the Romans, have cased to display the energy of intellect, which formerly rendered them supreme masters of the world's taste: and some say their morals are sadly corrupted. They must bestir them-selves; they must think and act once more, if they would save their heloved style from the destroying hand of the-1 will not say barbarian, but in-vader; and when they have effected a truce with the energy, they must trut their attention to reform at where is the whee here have energed a trade when the energy, they must true their attention to reform at bome. I have the greatest hopes that much good will result from the strift; for if the combatants do not unite, I think it likely they will gain energy, self-reliance, and natural tastes and feelings on the one side; and on the other, polish, refinement, grace, and dimnity.

* See page 688, ante,

The consideration of the claims of the rival styles, The consideration of the chains of the rival styles, as set forth by their various supporters, together with the practical proof that is everywhere afforded of the snecessful application of what appears at first sight to be opposite principles; and also within the circle of my own practice, baving employed the various styles accordingly as I thought they would meet the re-quirements of the case; and having convinced myself, that in one case one style may he used with ad-vantage and propriety where another would fail, has led me to investigate the capabilities of each style, and I have arrived at the conclusion, that it is mainly the sentiment which the style corresces, that makes it and I have arrived at the conclusion, that it is manup the sentiment which the style expresses, that makes it suitable to the locality and purpose. Of course, there are other points to be considered which may modify the desirability of its employment—such as the materials at command, and the cost of the different descriptions of labour, but that is the principal de-duction I have drawn; and the object of the present paper, is to string together a few thoughts relative to the sentiments which the leading styles in use aro capable of expressing.

GREEK ART.

" Ah! Greece! they love thes least who owe thes most."-Byron.

Greek art possesses in an eminent degree abstract Greek art possesses in an eminent degree anstract beauty: it is the offshoot of singularly exact minds, and is the most perfect realization of the ideal which has yet been given to the world. In it the propor-tions are exquisitely handled. The minutest details are pencilled in, and perfected with such a refined feeling or the heavilied that is seems like the work of for the benintial, that it seems like the work of superior beings. Everywhere there is harmony, grace, and digoity. The vory qualities to which it owes its perfection almost prohibit its use at the present day. It lacks so much pliability and natural-ness, that it is almost impossible to preserve its heaties indact in applying it to modern purposes. We have ceased to think in the same strain as the anniestly without herefore we cannot design in the same style, without hereing liable to fall into the most imbecile copyism; hut where we wish to express graceful dignity-dicatify without presumption, and that it seems like the work of for the heantiful. tame style, without peng hade to fail this the most imbecil copyism. but where we wish to express graceful digniy—dignity without presumption, and elegance without affectation—we should study the heaven-born examples left us by the Greek, seek to discover on what those qualities depend, and then embody them in our design. The membine multi-set of the Greeke

userver on what those quantities depend, and then embody them in our design. The prevaiing sentiment of the art of the Grecks is high intellectuality: their aim was to produce the abstract and the ideal in everything: their imagina-tion was allowed but limited range, from the fastili-tion was allowed but limited range, from the fastili-ousness of their taste; but whatever heauties they produced they perfected with the utmost precision and exactness. They aspired to reach the central essence of benuty: the utmost perfection of external form, and the idealization of the generic nature of things; in a word, they aimed at being gods, not men. They never could descend to the portrayal of homely virtues or vices, or to the simple illustration of the great book of nature: everything; good or had, must needs be tinged with ideal creellence. It was heneath their wisdom to see Nature as she is, they aw her only as she ought to appear according to their predictions. Their philosophy even aims at superhuman effort, for they would not, in their mechanism of life, allow for friction. In everything they sought excellence —all nature cried out aloud to they. For excellence — the taster of the transmechanism of life, allow for friction. In everything they sought excellence—all nature cried out aloud to them for excellence—all nature cried out aloud to portrayal of abstract qualities—in the "Lancoon" lay the representation of intense pain; " Jupiter Olympus" was but the incarnation of godlike majesty; the "Hercules" that of the greatest physical strength; and "Venus" that of sensious beauty. Characteristic distinction of species they in all cases exaggerated; marking it in the most decided manuer. They sought with ferrour abstract truths, but their wisdom at the present day would be considered impracticable. The tree sent out majestic hranches and exuherant foliage, hut of fruit there was none: other elements were required in the soil, in default of which the tree

even as more forms; but beyond that they were dis-covered to have no connection with our sympathies or ideas: very good in a museum, but of no meaning on a modern huilding. The public soon found out that we were copyists of the worst description, devoid of all original thought, and that is a failing above all others that they have the least sympathy with. Art was in truth becoming a deal letter. What would be thought if we imitated to minute mannerism the poetry of Homer, Milton, or even Fope? That would have been much more crediable, for weakould even have had some new thoughts. I think I can only compare the copyism that then prevailed to the reprint of the had some new thoughts. I think I can only compare the copyism that then prevailed to the reprint of the works in another form I or a Bible with illustrations taken from the "Illiad." No more striking illustra-tion can be pointed out of the evil of adopting a style without the introduction of new elements, than the mania for Greek architecture which prevailed some fifty years ago. As the prevailing sentiment of Greek art is the

the prevailing sentiment of Greck art is the emoblement and enthronement of the intellect, expressing simple dignity, it is well fitted for halls of justice, representative chambers, and buildings approennoblement priated to science. But in the application of the style we must not *imitate*; we must enter into the spirit of it—a difficult thing to do. If the artistspirit of it-a difficult thing to do. architect eannot strictly adhere to the style, and be arcmitet ennot structly admite to the scyle, and no original at the same time, he may yet sympathies with it so much as to imhue his work with similar sentiments, and thus ennohle and refine his concep-tions, placing it nearly on a level with the ancient masterpieces. Italian and Roman architecture may in this manner be purged of much of their grossness, and their details corrected and dignified by the intro-surt of the service of the service in the service of the duction of the Greek harmonic excellencies; it heing a most improving style for study, if not for imitation.

The inappropriateness of certain styles, excepting for special purposes, may be forcibly shown by trying to conceive—a Grecian prison, or, still better, a Grecian workhouse! At one time Grecian lodges and wreenan worknouse? At one time Greenan todges and park entrances were common; indeed, I now recollect one which has not heen huilt ten years I a miniature copy of a temple, with rough plate-glass let into one or two of the metopes, to serve for windows, and, oh shade of Pericles I the chimney-stack crowned with slate tops of the chimney-stack crowned with slate tops of the erver for windows, and, on smade of Perfects I the eliminey-stack crowned with slate tops of the usual pattern. Also I could mention an octastyle chapel, of the true Amphiprostylos type, with the compluvium, if it may he so called, filled up with a flat skylight through which the wind and rain play with melaneholy and fonereal coldness. Something certainly might be done exceedingly tasteful, in the way of villas and lodges, if designed in the proper spirit not adhering too strictly to the style. We must conceive the outline of the general arrangement first; and then putting ourselves into the frame of the roughly-conceived design; the details will then work themselves out consistently as a matter of course. The style will, however, harmonize hetter roky masses, and possesses such inflexibility, that it is very difficult to handle with freedom. One of the uglicst features in our modern pseudo-laring the spices the starters in our modern pseudo-laring we might suppose the with freedom.

is very difficult to handle with freedom. One of the uglicst features in our modern pseudo-classic dwellings, and which shows the inhecility and red-tapeism still clinging to us, is our treatment of chimney stacks—no, not shafts, for *they* are ignored. What might be made, if our architects would strike their fetters off, a source of heauty and picturesque-ness, hecomes transformed into the most villanously ugly appendage that the imagination could contrice. The when under the influence of the nightmare. hay the representation of intense pair; "Jupiter of the representation of species they in all eases exaggrated; when under the induces of the nightmare. The sough and "Venus" that of sensuous beauty. Characteristic and the rest of the individual the tries of the arcs o

all the way up, free from eavities or receptacles for cold air, and not of too large an area ; with the shaft earried up well above all surrounding objects, and each carried up well above all surrounding objects, and each shaft distinct, if grouped: am I to be told, with a rueful countenance, that the chimney-doctor will still be needed? Those of frequent failure will give an afirmative "Yes: for the laws by which chimneys smoke are as fickle as the elements, and the uuruly household Lares require frequent coaring." To such I can only answer, try the plan I have here pro-nounded pounded.

Auction great defect in modern Classic dwellings-though not confined to them alonc—is the attempt to keep the roof flatter than is necessary for protection from the wind and raim—for the due fulfilment of its purpose. Everything above the cornice appears to be considered an eyesore, and many are the selemes devised for keeping the roof and ehimneys out of sight; all of which may be summed ap in one word,— failure. Utility is sacrificed to false taste, for the essential feature of the huilding is wanting; or at least we can see that it is looked upon at the hest as an ugly necessity. It is such norecedings as these that have brought Another great defect in modern Classic dwellings

an ugly necessity. It is such proceedings as these that have brought odium upon all connected with Classical architecture : one or two among many of the sharms thought neces-sary to preserve purity and horizontality. The outline of the design should be the first con-identified in the design should be the first con-

The outline of the design should be the prove cour-sideration, for it is the most obvious feature of the whole. A well-developed, firm, and meaning outline gives life to the mass, detaching it boldly from sur-rounding objects. What can be more numeaningly gives net to the mass, detaching it bolds, it has sin-rounding objects. While can be more unmeaningly ugly, or more humiliating, than the mis-shapen, un-sightly heaps of bricks and mortar, under which the ground in our parks groans ? Misnamed Italian archi-tecture. A picturesque skyline is certainly not neces-sary in all situations, the reverse heing the case in many instances, for the tendency of picturesqueness is in opposition to that of Classicality. All I contend for is trath of purpose (a question we will discuss in another place). The Greeks would certainly not have acdapted their art to modern wants, preserving its raling asthetic principles intact, viz. symmetry of parts, simplicity of plan, breadth of effect, and refine-ment of detail. It is that gives mojesty, grace, and matchless heauty to all the productions of their radeat and well-halance minds: which has helped them to excel all others, and give to the world the most perfect style extrat. But it is hoping against hope to expect good architecture when art is a mor-ment of deta tyle extrat. most perfect style extant. But it is hoping against hope to expect good architecture when art is a mor-cenary trade, and the soulless speculative builder usarys the place of the architect : when everything is looked on with mere utilitation eyes, and the pro-prietor cannot distinguish between moderately good and villaously bad, but is willing to pay the same price for hoth.

I an afraid I have said more than the limited applicability of the style will warrant; hat many of the remarks are quality applicable to all styles. I would wish my hear rs, before finishing the first part of my paper, to hear in mind that it is the seatiment of the style which fits it for the expression of purpose. The style chosen must harmonize with the site. A Greeian house in a Gothis garden, or vice versal, would offend all tastes. The ground about a Classic dwelling must be arranged with a certain formality and an attention to the principles previously enur-cluted. I am aware that many will not give to Greek architecture even the limited rugge which I have assigned to it; but to ny mind, nothing can be more characteristic and appropriate to a man of refluement and learning, and nothing so congenial to his tastes, as the residence in a suburhan villa designed on truly Greek principles. I am afraid I have said more than the limited Greek principles.

Greek principles. Aristidas.—Now, gentlemen, what do you think of the first instalment of the subject? Rad/schime.—I think that you have cone a great deal more than justice to it. To ny taste nothing sau be more insipid, nothing so tiresome, wearying, or monotonous, as Greek art. The regularity and

dest indice more insight, nothing so thresome, weary me, or monotonons, as Greek art. The regularity and method so suit-able to you is to me in the last degree oppressive. The constructive principle is had, and the whole utterly false and unture to nature. *Aristides.*—I will not build you a house in that style. I would suit the character of the house to that of the mind; the gramiture of the design should ex-press the tastes of the owner. You should have a more imaginative residence, a more picturesque, quaint shode, with a spice of solemnity about it, but withat ahode, with a spice of solemnity about it, hui withal showing a playful effect of light and shade, cutirely unartificial, without one particle of formality in the

unarithmail, without one partner of formatry in the whole composition. *Donaldo*,—You understand well how to apply the medicine of the mind: there are many who would grunt and growl over their miserable fate in heing compelled to live in an untasteful age, were their clicuts to object to their pet style: such is the effect of the trace

of bigoty. Aristides.—Under such circumstances it is impossi-ble that they could produce a good work; their souls

rebel against it. Far better would it he if the gentle-The against in a been only the first first first of the period mean in question would acquire a little pliability of disposition, and adapt themselves more to the humours of their clients. Every man has a right to a little forhearanee, considering how tastes differ, and the likelihood of his not being much wrong either, as I have been attempting to prove. Instead of setting up their backs and showing their bristles like hedgehogs, would it not he hetter for them to try and dis-cover the inward sympathies of their clients, and give cover the inward symptones of their effects, and give suitable expression to them? They should conceive for the proprietor, but finish for the artist. With your permission, gentlemen, if you are not already weary of the subject, I will proceed.

ROMAN ARCHITECTURE.

ROMAN ARCHITECTURE. Roman architecture is as correct an exponent of the feelings and moving passions of that nation as that of the Greeks is of theirs. Pomp, magnificence, grandeur, luxary, disphay, characterised all their tastes. All that could enouble the warlike and ener-ratic mere was called in to dise it add in percentation tastes. All that could ennoble the warlike and ener-getic race was called in to give its aid in perpetuating the victories gained by them. Worshipping military glory—everything gave place to that ruling passion. Science was cultivated to alvence the art of war; to make roads, to construct machines, to throw bridges over rivers; or, on more peaceful occasions, to balance aloft ponderous vaults and domes, under which the gods were provided or the glorios achievements of the empire consecuted. As the taste for luxury and ease advanced with conquest, then were the spleudid haths, the mighty aqueducts, the colossal amphilhea'res, and magnificent p laces erected. was the summit of their greatness reached : No slowl Wis the summit of their gratness reached: slowly the centrating nature of their snusements and habits sapped the foundations of their already overgrown dominions, and in their fall the eivilization of cen-turies became a thing of the past. With much that is spleodid, superb, and vigorons in their architecture, there is mixed a learce of folly,

in cheff architecture, in a valgarity. Licking the chaste re-finement of the Greek, they yet partly compensated for it by greater versatility of talent and their superior attainments in science, thus colarging the scope of their art. The invention of the arch introduced a lever in the system which the Greeks never possessed, or never appreciated. It is a feature giving power and elegance to their architecture, and placing at the disposal of the artist and man of science increased resources. resources, facilitating those engineering operations which the Romans delighted in,--emboldening the architect in his conceptions, and affording a never-failing resource in structural difficulties. operations

failing resource in streatural difficulties. The vast scale of the Roman works throw the Greek productions into the shade: it is as a giant compared to a pigmy. The grandeur only attainable by size being denied the Greeks, they did all that mortals could do with their limited means, producing, in a vory small edifice, a degree of the sublime far excelling that displayed in a Roman work of the same size. The employment of the arch principle led, by sure slops, to the adoption of the vault and dome, and the solidity, science, and skill displayed in Roman work, have never been excelled. The symmetry dome, and the solidity, science, and said sometry Roman work, have never been excelled. The symmetry of interior effect gained by Roman vaniting is worthy and the science of interior effect gained by Komma vaniting is worthy of all praise, and from which our engineers, with their boasted skill, may yet gain much knowledge in archi-tectural statics. With geometrical symmetry, which our own Wren earried to such perfection, they com-bined sound construction, very different to the thought and money sparing labour of the present day-the works of engineers who have no knowledge, architects who have no taste, and contractors who have no works of engineers who have no knowledge, architects who have no taste, and contractors who have no souls. Geometrie harmony is a study so much neglected, that I cannot do better than recommund its more frequent introduction in our own works: it is this that unites in elegant combination the various parts of a design giving due promotions can be be Is this that there in bregan consonation the various parts of a design, giving due proportions and halance to each; showing at a glauce that it is the work of a man of kuowledge, accuracy, and science-mot that of a presumptions bungler; a completed idea-mot an andigested mass of crudities, fuelty in construction, a dense in design. and clumsy in design. Modern engineers, ertainly, have done woulders in their way, but they are yet only in the second stage of their art: requiring the perfecting mastery of exact clentation and structural elegance, to render their works complete: in elegance tet them take a lesson from the Romans.

The capabilities of the style are much more varied than the Greek: and having many points of re-semblance to the Romans in our wants and tasles, though there are striking characteristic differences, it though there are striking characteristic differences, it is much more suited to our requirements. For public buildings and civic institutions it is eminently adapted: for domestic purposes Italian is better, which is after all but a modification of the Roman. The sentiments displayed most prominently in Roman architecture are puwer and grandeur: senti-ments very supropriate for the expression of the wealth and intelligence of an enterprising commercial country. It also pressers, an public of the results of the senter senter for the expression of the senter of the sente

country. It also possesses an enlarged scope for invention, and for the display of artistic embellish-

ment of an original kind. Notwithstanding, it is essentially an artificial style, more in consource with the occupations of cities than with natural or rural scenery. When employed it should be o large scale, for it has not the innate sublimity of large scale, for it has not the innate sublimity of the Greek, and on the other hand will not bear hreaking np into small masses; a measure necessary for the pleinresque. All good Roman work must sim at richness without exuberance, and grandeur without pretentionsness : while we emulate their magnificence, we must he discriminate in selection, rejecting all meretricious oroament and adventitious aid. Avoiding haldness, we must still not cover every inch of sur-face with enrichment, destroying one of the highest qualities in art, viz.—breadth of effect. That sym-metrical margacement of parts and counterparts dethe metrical arrangement of parts and counterparts de-manded in Greeian architecture, need not in Roman be so strictly adhered to: it is not essentially neces-sary that the two cuds of an edifice should be alike, or that both sides should be similar, or that the plan should be a regular parallelogram, or a complete circle, or indeed of any simple geometric figure: still there should be a crain degree of sym-metrical harmony govering the whole. The several misses of the composition should be grouped in remusses of the composition should be grouped in re-ference to a large and central feature, with an eye to a bold and pleasing play of light and shale; they should be proportionate, not interfering with each other, but helping the general effect. Due emphasis should be laid on the main horizontal divisions of the design, which should again be judiciously embelished und colivened with suitable conventioual ornement and spirited monifaings. The laws of composition require that all the parts matte in guine noncess of and colivened with suitable conventional ornameted and spirited mondings. The laws of composition require that all the parts unite in giving oneness of purpose to the structure; it heing quite incorrect to arrange it so that it may be divided in two, each com-plete in itself. Still more tasteless is it to jumble together a mass of materials good perhaps in them-selves, but having no common connection or homo-peneity of meaning. It's more says the divide of the theory sensity of meaning. It's more says the divide of the divide of the says of the divide o serves, but having no common connection or homo-geneity of meaning. It is necessary for the dignity of an edifice of any importance, that it be placed on a commanding stylobale; that it have a hold base and massive cornice, and, in some cases, a crowning parapet. The pyramidal principle (so strongly insisted upon by Bartholonew) must never be neglected where we wigh to give chargence of context to prove he Boo by Martholonewy must never be neglected where we wish to give elegance of contour to our work; and, in conclusion, I would point out to students in the art that it is of the ntmost importance they should aim at finish in all classic work, and would guard them against heing led away by the sketchy pic-turesquencess prevalent in the designs of many of our young rising architects.

Archimedes .- Allow me to say that you have made correntments.—Allow me to say that you have made a most unwarranted attack upon engineers in general. The worst which can be said of them is that they consider "utility" to be the primary object of their profession, and I am willing to hrave being set down by "men of taste," when I say that they are correct by "men of taste," when I say that they are correct in considering it to be so. I should lke to know in what position the world would have been now if it had been left to the guidance of the so-called "men of taste?" Why we should have been driving to London on stage-coaches, because, forsooth, they are more picturesque; or, perhaps, sending our troops to India in Dutch galliots by reason of their not being so formally constructed as our present clippers, -and look better in a sea piece !

Aristides .- I am extremely sorry if from the tone Aristicles.—I an extremely sorry if from the tone of my remarks they can be construed into such a meaning as you have chosen to put on them. I did not say "utility" must not be considered the primary object of all engineering; indeed, it is so of all the useful aris, as the name implies; but I must insist upon their not totally ignoring the existence of other heantics besides that of utility. My intention was to used the other they middle independent their set conpoint out where they might improve their vast con-ceptions; and I still adhere to the notion, however absurd, that the study of architectonic proportion would enlighten their too matter-of-fact minds, and render their productions more compact and h-autiful. No one can deay that it would be an advantage to the No the can bely that it would be an availage to the public sight and pocket, if those clamary appendages of useless piers, enormous caps, ugly mouldings, and unmeaning columns and entablatures, attached to, hut not having the slightest connection with, the bridges they disfigure, were displaced to make room for more meaning and appropriate embellishment. Though utility is the primary object of such works, beauty is an important secondary one, and perketion cannot be obtained without the study of it.

Gardlenian-Engineers are a soulless race; and bowever I may disagree with you on the point of styles, I most cordially re-echo the sentiments you have just expressed.

this species of structure the Romans were adepts Their tasts in ornament was even more faulty and licentions; and they did not emhody in any part of their architecture that honesty of intention so characteristic of Englishmen; therefore, according to your own showing, it is unfit for our use.

own showing, it is unfit for our use. Aristicas—Pardon me: the civ for plain unvar-nished reality, in material and construction, proceeds from very much the same cause as the "correctness" of style demanded by our accient thors. Both are no doubt very good to a certain extent; but push them beyond their legitimate limits, and they end in dissusting affectation. The absurdities and folies which art critics of the present day have been altempt-ing to thrust down the public throat are uncadarable. The mistakes and inconsistencies they fall into are the result of undue appreciation of some one principle. The instances and nonsecurity of an inclusion of principle, which blinds them to all others. No main in his senses would attempt to practically carry out the principle of trathfulness to the extent demanded by them,-they would not themselves! It has become much too common to write fine things for the sake of writing them -- it ucver being intended that they should he reduced to practice. To carry the principle of truthfulness to the extent fashion demands, would lead to the condemnation of all structurel concentient. Is it consistent to object to support from concealed arches ties, or beams in the case of archittaves, and in the same breath allow chains to be buried in cupolas to same breath allow chains to be buried in cupolas to counteract their thrust? If we examine nature (another thing we are requested to do), we see that in the majority of instances structure is conceiled—in some indicated, but in none bronght out so promi-nently before the cyo as the too scrupulously con-scientious truth worshippers wish us to believe is necessary in good architecture. Another fashion 1-tely in vogue, teaches us that good architecture can be unchange as utilizing manipular carbon without Letey in vogue, teaches us that good architecture can be produced on utilitaria principles only, without attention to æstheties. A roof must only (by this theory) be inclined so much as will hest fût if or carrying off the water falling upon it; and no atten-tion need be paid to the functions it fulfils in carrying out the general outline of the building; this would parability more for this roofs and all distant terms. out the general outline of the building; this would prohibit most Gathie rooks and all stated turrets. On the same principle, it is nuessential to give an arch a greater height than will enable it to support the weight piled above it; or it is equally unnecessary to form a window narrower than can be conveniently excented with due attention to stability; or a door builder the will admit table more arguing the will admit table will admit table more arguing the will admit table will admit table more arguing they will admit table will admit table more arguing they will admit table will admit table more arguing they will admit table will admit a table more arguing they will admit table will admit a table more arguing they will admit table will admit a table more arguing they will admit table will admit a table more arguing they will admit table will admit table will admit a table will admit admit table will admit a table will admit a table will admit admit table will admit a table will admit a table will admit table admit table will admit a table will admit admit table will admit admit table will admit a table will admit a table will admit admit table will admit a table will admit a table will admit admit table will admit a table will admit a table will admit admit admit table will admit a table will admit a table will admit admit admit table will admit ad Extensed with due attention to stability, of a door higher than will admit at shi man, or wider than will allow two hadres to pass, in full critoline dress. A hundred more "cases in point" may be cited to which the principle will logically lead if enriced out to its full extent; and I would ask, what will he-come of the much-vanted Gobie, if measured only we the principle hild days how its own owner added by the principles laid down by its own over-ordent admirers? The merest tyro, who has but once attempted a Gothic church, will see the fallacy of such reasonings as these, if he be not bliedly intent upon supporting the "good cause" at any price. Truthfulness assurelly is characteristic of Gothic structure; but mere ntilitarianism is not; for there is an æsthetic law that must be fulfilled even at the expense of con-venience, and that is the law of verticality; for devenience, and that is the law of verticanty; for da-minading that the leading lines of the edifice should be vertical; prohibits width in the windows, flatness in the roof, and lowness in the arch. In all great works, not alone in the Gothic, but equally in other works, not above in the boond, but equally in other styles, come sarrhive must be offered up to the esthetic principle. St. Paul's possesses an outline of un-rivalled nobility and elogance; but that effect has been obtained by carrying the outer dome up far been obtained by carrying the outer come up hus above the inner one, leaving a void between of no utility whatever. It has, however, been well observed by Mr. Allom, that this arrangement was called for to give effect both to the interior and exterior; consequently, the one has been made proportionate, the other noble and commanding. Who will deny that this is not at variance with utilitarian doctrines? The consists for all variables with unitarial decrines r line errowning point of such philosophy has been sur-mounted by Mr. Fergnson, who half condemns Gothic vaniting for not effecting two purposes— strving for both a ceiling and a roof; to such ex-tremeny ridiculous results does any doctrine lead,

the mey functions feature does any docume lead, when pushed beyond its legitimate limits. Refskinins.--1 cannot agree with you on any one point : if architecture transgresses in truthfulness, as yon have represented it to do in many cases, it is not Gothic, it is a bastard style, and I totally condemn it.

Garblentum.---I also must take exception to your marks, especially with regard to Gothic windows, which I boldly affirm are not the least bit narrower than the strictest utilitarian could desire, if he gave stability the consideration it merits. Are they not more consistent than the great gaping openings in modern buildings, miscalled windows, through which on array might be marched with ease?--and is not a have just expressed. Refskining.—Your" sentiments" regarding Roman art are as wide of the truth as your previous praise of Grecian is sickening. In some respects they may have displayed more science than the Greek ; but 'or constructive truth havy had no feeling. Cray archi-traves, backed up by arches to assist them to corry their own weight, are abhortent in principle ; and in repagnant to all correct feeling.

Aristides .- Then what do you think of the Pompetians using wooden beams for architraves over their arcoslyle colonnades? I think that we have no necessity to resort to such an expedient now, for the same purpose may be effected in a much hetter manner with iron

-All such shams are heneath conte Rufskinius .-Aristides .- Our opinions on art arc so widely divergent that I fear 1 shall only bore you by pro-

ceeding with my paper. *Carblentum.*—Oh, dear not You will presently be getting to the most interesting part of your paper: we wish to hear what you have to say ou Gothic architecture.

Aristides .- That is my next subject, so I will proceed

GOTHIC ARCHITECTURE.

There cannot be expressed two more opposite sentiments than are embedded in the rival styles of sentiments than are choosed at the term of the transforments the day-Gothic and Classic: whereas the last idepends for its effect on our feelings for artificial perfection, without any direct imitation of nature, but rather for its effect on our teclugs for articleal perfection, without any direct imitation of nature, hat rather uniformity and conventional treatment : the latter is, in its inkerent excellences, dependent on, and an exponent of, the principles which regolate natural beauty. It is the unpretentious poetic offspring of uosophisticated nature, disrobed of all artificiality and affected refinement; the homely soul of man laid bare; The genuine effision of the spirit which sees this grent and glorious outer world in a loving, trusting, hopeful, mysterions and imaginative mood. Such an architecmysterious, and imaginative mood Such an architecture must be peculiarly suited for Christian and ceclesiture must be peculiarly suited for Christian and ceclesi-astical purposes; for all is open, all is true-mought glossed over for mere showy effect or flung tawdri-ness. It has not been inaply termed, by some who feel the full force of these qualities, Christian archi-tecture; but there are those that have no sympathy with the style—that do uot understand it, and never will—and are, consequently, disposed to cavil at the interpretation, and call such views orthodoxical. He who has felt the solemn soul-inspiring effect of the iotorior of a Gothic esthedral; who has felt grave, humble, subdaed, and ave-stricken, in the presence of the spirit of our good and true ancestors; who has Intunity, subance, and are stricken, in the presence of the spirit of our good and true aucestors; who has communed with the dead of bygone ages in the gloomy shade of medieval-vanited enappies—Ae will not he disposed to question the fituess of the style for religious purposes, or its power of raising our minds above worldly desires and earthly vanities; freeing us for the time from the subjection of those mean which is explaining in our backets beinging with freeing us for the time from the subjection of those cares which lie cankering in our hearts, bringing with them only desolution and trouble. Show us that this peculiar power exists in Classic architecture, and that it is as capable of exciting emotions as pure and lovely as these; then we shall be at liberty to ridicule the term Christian art, and employ in preference the Classic style with all its so-called superior conveui-ences and modern appliances. Not only is the Gothic peculiarly suited for reli-gious sympathies, but it is a style that harmonises admirably with natural scenery. The unaffected irregularity of outline and varied disposition of messes allowable in a composition in this style,—arising from a natural and conformal arrangement of the several parts, to their respective purposes and objects,

several parts, to their respective purposes and objects, in strong coultrast to the opposite course, which must be adopted in the treatment of all Classic styles, and be anopted in the treatment of all Classic styles, and the duplication of members to preserve symmetry, renders it signilarly in keeping with the works of nature, affording relief to a mind harassed and anapyed with the vexations realities and formal cere-monies of this actificial medies. It is in the second

would he to divert the course of the great ocean cur-ronts. There are searcely two feelings cummon to both styles; and while minds continue to be consti-tuted so differently, and organisations are so various, it is the height of absordity to attempt to mitte the antipedes in taske. A parely demonstrative proposi-may be proved to all by force of analysis, but art is dependent upon the inward feeling of beauty. it is a sentiment, not a mathematical problem. What is the value of art—of what good is it's ay thousands of people: a question difficult to answer when those who ask can never ascend to an appreciation of anything beyond material comfort. Of what use is music, say those who have no ear for it? and to such as they it is of no use, and never ean be. It is the sume with is of no use, and never can be. It is the same with the advocates of one or other of the styles, which their organization and early training fits them best for appreciating; they cannot see beauty in any other-their cars have become so accustomed to listen to one there cars have become so accessioned to instead to one taue that all other aris are thrown away upon them. Argument in such a case is a waste of words; if one man likes pork and another prefers beef, no amount of reasoning will convince either of them that his feavorite dish is not the best. It is the same in art : all deductions are superflows when we cannot agree ment the wearing

all deductions are superflows when we cannot agree upon the premises. If it be said that, notwithstanding all this, I do approximate the various styles for the time, purposes, and plans, for which they were all first employed—but only such a one is now applicable—I answer that our age is retrospective as well as progressive; while we borrow ideas from the pist, we introduce new elements for the future. No style in its integrity is applicable, because in noue do the same circum-stances exist. We must mould, bend, re-shape, and re-arrance the materials we have at hand, and in elements for the furthe. No sive in its integrity is applicable, because in noue do the same circum-stances exist. We must mould, bond, re-shape, and doing so new phases of style will develope themselves in every respect applicable. We may talk, write, dispute, and revice each other, and still the whole status to the same status to the same eircle of the styles will be practical; better to turn our attention to finding out the peculiar fitness of cach than waste our hreath in disputations about the

cach than waste our hreath in disputations about the propriety of employing one. There has heen another fallary walking abroad of late. Those who have folten into the difficulty of out knowing which to chose from among the rival chimants have attempted, io a very loose and usstable manner, to prop up a theory which would teach us to pay no attention to any style. Such a course can only he followed in imagination; to attempt to re-duce it to practice, would he a, hereulean task, and would result in a most unmeaning assemblage of borrowed ideas. It could only he paralleled by attempting to build a pyramid from the aper, or a house without a foundation. The process by which we evolve new forms is too labornos and long to admit of being gone through in the short space of we evolve new forms is to haborious and long to admit of being gone through in the short space of time allotted for the production of oue design, or even of many. So nucli depends upon forthious sug-gestions and flecting conceptions, thet at the utmost we can only hope to effect variations on some style taken as a *basis*—not to produce a new one. If it were not so, we might invent a new style in every design we made; a result so impossible, that every one will see the absurdity of it. Even supposing a genins great enough arose, and invented one entirely new, of what advantage would it be? All the smaller (for would have in a mensure to copy him; where, frew, out data window to be to copy him; where, then, would exist the greater originality? On the other hand, if no style is taken as a basis, we produce a mere jumble—au unfortuitous concourse of atoms.

The diphestion of members to preserve symetry in the works of analysis is presented by works of Gothie art, giving zest to nature, after and if no style is taken as a basis, we produce the works of Gothie art, giving zest to nature, after and if no style is taken as a basis, we produce the event of the composition of the men of weath and if no style is taken as a basis, we produce the direct public-au unfortuitous concourse of atoms. The direct and the concentre of the composition of the direct and the concentre of the composition of the direct and the concentre of the direct and the direct and the concentre of the direct and the direct and the concentre of the direct and the direct and the concentre of the direct and the direct and

would be to divert the course of the great ocean cur-ronts. There are searcely two feelings common to both styles; and while minds continue to be consti-lated so differently, and organisations are so various, to the style. I do not wish it to be noderstood that to the style. I do not wish it to be noderstood that I consider solidity of pieces and walks contrary to the spirit of the style; the reverse; rather, is my ophilon, for a certain degree of solidity is absolutely requisite for the repose of the structure; hut it is the repose for the repose of the structure; hut it is the repose due to quantity, a very different quality to the Classic bre dib helper alluded to. I know that the Tudor will be crited against me, showing that it is of little consequence, whether the stores are litdle smooth and regular, or irregular, provided the design is a good one; but I would beg leave to suggest that Tudor can hardly, strictly speaking, be called Gothis, so much formality and carpenters' work having crept into it as to destroy, in a measure, the spirit of the side much hetter in another style. There have been many attempts to get over the

said much hetter in another style. There have been many attempts to get over the difficulty of introducing sashes and preserving the mullions, and nearly all bave failed. Mr. Bartholomew gives an example of how the same may he doe, but it is simply barbarous. Why easements should be so much it does not be as the same the sam multions, and nearly all base failed. Mr. Bachlolmew pives an example of how the same may be done, but it estimates the series of the series of the series of the objected to I am unable to account for. If they can be constructed to keep our the wet-and that they can be admits of no dauti--why should they not be used? Presuming that the object of baving windows to open is to almit air, when it is required for coolness or restifiation, it cannot be disputed but that a system of restifiations, it cannot be disputed but that a system of restifiations, it cannot be disputed but that a system of furniture is to be pulled through the window, all our argoments fall to the ground; but in a gentleman's house that is unnecessary! There is another much-talked-of disadvantyge arising from the employment of multicos, and that is, that it cuts on the prospect; but this is more imaginary than real. The quastion hinges on this; dow prefer call or ostentiation? If the fatter, by no means alont Gothie; if the former, Gothie by all means; for the separation and division of the prospect by the multions allows of a quiet con-templation of it in parts: if we would see the whole, we can approach nearer. To be to the centre of a room opposite an immense window is disadvantages in hoth; all we can do is to choose as our tastes prompt us. Be not afraid of heing called a min of uo taste; that is a bugbear especially reserved for the ignorant. Of what then shall we say Gothie architecture is or to lead us to worship the intellect of man? Not hut do ara we improcentibly to acknowledge the great-ness and goodness of the Go do nature; to lead us to symptizize with the true and unaffected beauties and infinite aviety of effects which are constantly sur-rounding us, colarging the rake of our knowledge, given for us to look upon as so many useless bambles; but to draventicy of effects which are constantly sur-rounding us, colarging the rake of our knowledge, given for us to look upon as so many useless b

ON SCIENTIFIC INSTITUTIONS, IN CONNECTION WITH THE DEPARTMENT OF SCIENCE AND ART.

ings, employed for useful purposes, or from which useful metals were extracted, and that it should be arranged with every reference to instruction," as by the adoption of this course "a large anount of in-formation which was scattered might be condensed, and then its instructed which be how for any and those interested enabled to judge how far our known mineral wealth might be rendered available for any undertaking they are required to direct, or may be anxious to promote for the good or ornament of their country." The collections thus indicated, having commenced

in 1835, had assumed such form in 1837, that the Government gave some rooms in Craig's-court, Charing-cross, for their reception, where they accumulated so rapidly, that first one house and then two houses so rapidly, that mist one nouse and then two nouses became inll and finally, growing in importance and ex-tent much heyond the capacity of the Government houses in Craig's-court, the handsome structure in Jer-myn-street, now known as the Auseaum of Practical Geology and Government School of Mines, was erected. Mining School was described ; the Royal The The Annung School was described; the Koyal Juh-lin Society, and other establishments; and he then traced the establishment of the Special Schools of Science, in aconcetion with this Department, which now exist in London, Poplar, Bristol, Birmingham, Leeds, Truro, Stoke-upon-Trent, Wigan, and Aber-deen, some, in fact all, successful as to the disposi-tion of the methics does to superat them. Let tion of the working-classes to support them; but even those most numeronsly attended and increasing in numbers running the risk of abandonment at any time, because, with one or two exceptions, the ex-penses are greater than the receipts.

The desire of the artisan for a secondary education is not new. He has for the last quarter of a century laboured to attain it through the agency of institu-tions devoted to his own class, but has failed. Let us pause to reflect upon the reasons why he wants it, and why he has not succeeded in supplying his want.

In recent years, the most meritorious efforts have In recent years, the most meritorious efforts have been made by the public, with the co-operation of the State, to establish primary schools; but it has been too much the practice to consider these as sufficient for the clucation of the people. The public have labourd zealonsly to hring together the materials out of which an educational edifice may in future he con-structed, and have well had some of the stones which are to constitute its foundation. Milton describes a structed, and have well laid some of the stones which are to constitute its foundation. Milton describes a complete and likeral education to be that "which fits a man to perform justly, shiftsfly, and magnanimonsly all the offices, private and public, both of peace and war." Whether the primary schools of any country, and particularly of this country, are calculated to answer the objects thus demanded of education, will be seen hy a little consideration. The lecture system, he thought, had failed, and so what had hene, called Working Aurie Collegen hed

what had been called Working Men's Colleges had formed.

The first requirement in the education of the working man is to give him his position as an intellectual being, by enabling him to understand what he is doing, that is, to explain to him the natural laws upon which his labour depends. It is not sufficient that he should be enabled to fulfil his duty: his dignity as a man requires that he should be enabled to fulfil that duty eation be aimed at the first point only, all it does is to fix a handle to a tool, or a framework to a machine: the second aim ensures that the machine is the mos perfect of its kind, adapted to fulfil all that is required of it. You will understand, then, that while I do not of it. You will understand, then, that while I do not undervalue one branch of knowledge professed at these Working Men's Colleges, I think they miss the primary means of elevating the working man, because they do not concentrate their energies on a few branches of knowledge bearing on bis daily life. The most suc-cessful school for working men has probably heat the School of Arts in Edinburgh, founded hy Mr. Leonard Horner: at all events, it can hoast of a larger number of pupils, and a duration of existence not possessed by of pupils, and a duration of existence not possessed of any other secondary school for artisans. Its success has beeu mainly owing to the few subjects which it pro-fesses, — these heing confined originally to mathematical science, chemistry, and natural philosophy; although, at the request of the pupils who found that they were deficient in elementary knowledge. English, French, and drawing bave since heen added. The adminis-trative duties of its council (which, I should mention, consists only of gentlemen and master-mechanics, not workmen) are within control. its teachers are qualified and paid, and the students have within a limited area and paid, and the students have within a limited area a choice of the sciences embraced in the mainfactures of their eity. I have now, perhaps, said sufficient to show wherein I think the cause of failure lay, when the lecture system of the institutions gave way to a school system, founded, however, not on the limited design of a school, but on the wide comprehensiveness of a university. of a university.

versal as is supposed; for in the schools of this department we find men willing enough to take advantage of them, when we are able to found them on such terms of addission as working mer might first be expected to pay. The removal to this obstacle rests mainly with the state, for its present existence is perhaps due to the fact that little or no taste for perhaps due to the fact that infile of no taste ior natural knowledge is given in our primary schools, supported so largely by state endowments. If some of the verbalism of schools were made to yield to the acquirement of scientifie truths—if words were to give way to ides—then the taste far science would he imbued into the boy, and a demand for its further participation would give here he hereme a new open partification would arise when he hearme a man. Our primary schools have a large task assigned to them in the few years which the child of the working man devotes to instruction. The introduction of science, as a special burnch of education, would, therefore, be attended with great difficulties. But it would be an event thing for an ext task man for the mend bir has easy thing for an apt teacher to gather round his lesin geography much that is most attractive in the study of nature, instead of eramming the children with the names of tributaries of rivers, and of mountains, which he is not likely to hear of again after leaving the school. Geography, thus taught, with a thorough discipline in the theory, as well as in the practice, of arithmetic-that foundation of a working man's industrial seience-would soon show their results in the increased demand for further learning, when the hoy hecame a man

The last and greatest difficulty of all to the establishment of secondary schools, in connection with Mceha-nies' Institutions, consists in want of adequate means : first, adequately qualified teachers; and, secondly, ade-quate remuneration for their services. I have already pointed out that the fees of secondary Schools of Science eaonot support them to the extent which they do Schools of Art, because in the latter there is a mixture of rich and poor pupils: in the former, there are poor only. According to the present action and mean ording to the present action and means placed at di-posal of the Department, we have little power the of possible the Department, we have note power to give efficient aid. Before, however, discussing how that aid might best and most economically be given, we are met at the outset with a doubt ou the minds of many, even of men of liberal intelligence, as to whether aid should be given at all to such schools, either hy the state or hy the private efforts of the more wealthy in the several localities. The general argument, as presented to me, is as follows:--This country has attained a high degree of industrial presperity, in spite of the failure of the Mechanies' Institutions and the pancity of Scientific Schools. Our Watts, Arkwrights, and Stephensons are men who have risen from low degree without the aid of such schools. Our mannfacturers, as a body, do not call loudly for them. They are men of money, can pay for science, and im-port it when they want it; and these men of money are the payers of wages to the men of sinew, and don't let us lag behind in industrial enterprise, so that our imports and exports annu ily increase. Though, after all, one could dismiss such a style of reasoning, as heing a negation to the necessity of progress, still its preva-lence demands attention. To say that because a thing lence demands attentiou. To say that because a thing is well done, therefore means cannot he found to do it Is well work, motor, method and the dot and the dot better, is to mean that God's light is to he extinguished hy man's darkness. Though the Roman could write well with a style, the Englishman may be allowed to write better and faster with a quill.

In this mode of opposing scientific instruction, perhaps the most common and fallacious argument is that which points to Watts and Stephensons as reasons against scientific instruction. Call such men as wit-nesses: here the struggles of their life to overcome that & first structure that the structure of the st the d.ficiency of early education; their toilsome ascent in steps cut out one by one in the mountain of knowledge; and I renounce my place as an advocate, and ledge; and I renounce my place as an advocate, and leave the case in your hands to he decided hy their evidence alone. Hear such a man as my friend and evidence alone. Hear such a man as my friend and old class-mate, Dr. Livingstone, the renowned African our class-mate, Dr. hymgstone, the renowned Arrican traveller, who educated himself partly by resting his hook on his spiuning-jenny, and snatching sentence after sentence as he presed at work; but also by taking advantage of the facilities for scientific education in Glasgow, which enabled the brave-hearted young man to acquire a knowledge of science with the small sums saved in the day from his earnings as a cotton-spinner. I class among my addest and most valued friends men I chas almong in these and most valued richas then now in the same social position as myself, but whom I have known as cotton-spinners, weavers, carpenters, and hlacksmiths. Some of these men are in Scotland, and hlacksmiths. Some of these men are in Scotland, and have arisen to emicence through the facilities for scientific education presented there. One or two are in England, and have learned science for themselves, and well too, without any schools to which they could have gone had they wished it. All of them, without exception, are ardent promoters of scientific instrucamong the less successful class of working men. to a university. The next fundamental difficulty is the want of ap-preciation on the part of artisans, as a hody, for instruc-tion in the science of their occupations. No doubt this exists largely, but still not to an extent so uni-A few daring spirits have reached its summit, and must obviously depend not only on the amassing of tion

passed beyond it, hut the great mass of the people remain in the low-loads. It has been well said that we are not called upon to legislate for men of genins, we are not called upon to legislate for men of genins, -mature takes care of them,-but for men of me-dioerity, who require aid to pass obstaeles. The bold and daring man may leap from rock to rock in a forming stream and reach the opposite shore in safety, while a man of less power and nerve would have been deabad expired them would be at the form dashed against those very rocks which gave to the first a footing. The only way to secure a safe passage for the mass of people standing on the brink of the stream is to hridge it over, so that all may travel with little effort. The case should not be argued by stream is to bridge it over, so that an may traver with little effort. The case should not be argued by placing natural talent in antagonism to education. Education does not profess to give the gifts of God, by creating abilities in man, but merely to draw such out as are inherent within him, so that he may be enabled to apply them to his confort and happiness in file. Schools are arenas for mental training, places for mental gymmastics, where, by systematic effort and exercise, the feeble man may become strong. There is still one large class of objectors who exert areat influence in preventing science from being intro-

great influence in preventing science from being intro-duced into the framework of our educational systems They contend, that however useful science may be in promoting the utilities of life, it is neither calculated to discipline the mind (that is to strengthen common sense), nor to enlarge and ennoble the faculties. Such sense), nor to enlarge and encoble the faculties. Such men as my fried Professor Haxley has pinted out, err by scanning science as a piece of mechanism, and not reading it as a poem: they are unable to rise to the generalities of philosophy, and view it therefore as a collection of dry realities, or bard facts unknit together by a common system. Perhaps this feeling has been strengthened by the observation, that science is some-times taught as a mere aceumulation of facts. The trachers are to blance, but in all professions there teachers are to blane; but in all professions there may be persons without either esthetical or philoso-phical equacity. Although there are men who only see pure carbonate of lime in a statue hy Phidias; who eannot see a forest heeause of its trees, or a town because of its houses, or a stately edifiee heeause of its bricks, —yet it is unfair to take their view of science as a just reason for denying its power in educational development. It is no doult true that science gives an exactness to both thought and action which differ materially from the mode of cultivating the faculties through the graces of polite literature. We feel shoeked through the graces of point internative. We real snocked with its provaic character when it tells us that dia-monds are mere lumps of coal, and refuses to admit, although it admires, the faney of the poet when he looks upon them as anged's tears congealed as they fell on the cold and sinful world, or as drops of dew distilled from the sparkling stars. But, while science demands truthfulness as the essence of his existence, actuations truthuliness as the essence of his existence, his philosophy rises also into glorious couceptions of creative wisdom. In coal the philosopher sees, stored up for the use of man, the heat and light of the sun when it shone in ages which have long since rolled away: for when the sun shone upon the primeral forests, now entomhed as coal, its beat and light passed its characted efficient which reached the place to the into chemical affinity, which enabled the plants to extract their solid matters from the transparent aid around them. In the combustion of the eo al the chemical affinity passes again into heat and light, so that actually, and not metaphorically, we warm and light ourselves hy those solar emanations which gladdened the world some millions of years since; and, in the act of doing so, we throw hack into the air the caract of doing so, we throw mark into the art the eart hone act upon which former races of plants lived, and thus give food to the increased vegetation required hy an advancing civilization. What a wonderful and bountiful benerolence is thus shown! Would not the bountiful benerolence is this shown i woun not one knowledge of these hencificent provisions for the well-being of the human race cast a new light upon the gloomy passages in which the miner works when he excensises coal for our use? It would ennoble his work and elevate his mind to feel that be was an agent to an infinitely wise hencelence, which was providing for the well-hency of the whole world. Surely the labourer would then sympathize with the feelings of Hugh Miller, the working stonemason, when he began to understand the meaning of St. Paul, that we are "labourers together with God."

You will find the necessity for promoting and dif-fusing scientific knowledge treated in an admirable chapter, hy Buckle, in his recent work on the "Pro-gress of Civilization in England." He shows that, as man's moral nature remains the same in all ages, and as no new discoveries in morality take place, the as no new discovertes in moranty take place, the ehanges in a civilized people must be dependent upon their relative intellectual condition, and must, there-fore, result from—Jst. The amount of knowledge possessed by their ahlest men; 2 diy. On the direc-tion which that knowledge takes, that is to say, the sort of subjects to which it refers; and, 3rdly, and above all, on the extent to which that knowledge is diffused, and the freedom with which it pervades all

knowledge by its philosophers, but also upon its diffusion among the people. It is not a knowledge merely of natural laws which make a people wealthy; it is the power of applying them to the every-day purposes of life that produces riches. Philosophers very rightly remain with their antaractions, as a formtain remains at its source, or trickles away from its fulness in a narrow stream. If you wish to make that fountain useful to the surrounding country, you construct a reservoir for its waters, and channels hy which to conduct them to the fields requiring irri-gation. gation.

gation. Throwing open the civil service of the Crown to competition is an illustration, he thought, of what the public desire as aids to their education. If all the public offices in the State, except the staff ones, were thrown open to competitive examination, an undoubt-celly great influence on the education of the country would he exerted. But whether that influence would ultimately be good or had must depend upon the kind of knowledge for which the rewards of State employ-ment are offered. ment are offered.

STREET ARCHITECTURE, ROUEN. HOUSE IN THE RUE DU BAC

HOUSE IN THE RUE DU EAC. CONTINUING our sketches in Rouem of the houses which followed those of the Mediaval period, we give one in the Rue du Bae, surmounted hy a vase in glazed earthenware, which is carried np on a leaden base of good workmanship. The vases in "fayence" recall the period in which the ancient manufacture of porce-lain in Ronen flourished, the productions of which, daily more rare, have acquired a certain reputation. The roose of houses of that period which have pre-served the ornament are rare, as much on account of their fragility as of the value horne hy these vases in commerce. commerce.

The staircase, though in a very ruinous state, seemed to merit attention.

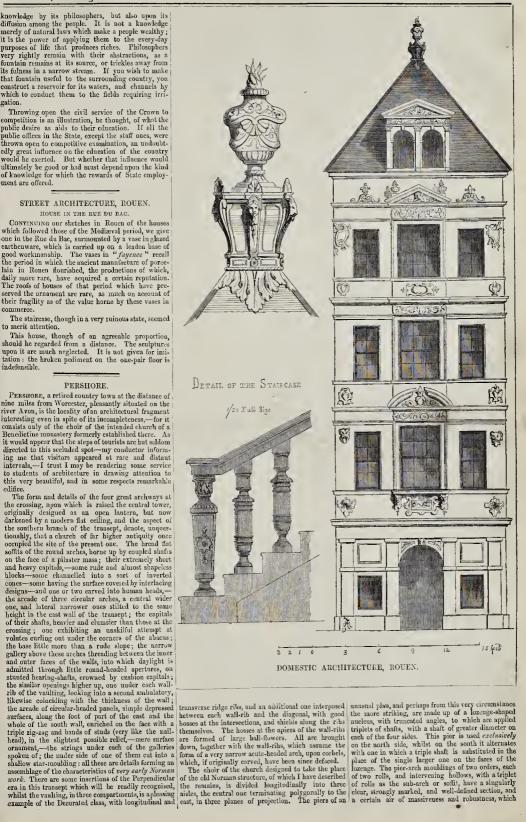

This house, though of an agreeable proportion, should be regarded from a distance. The sculptures upon it are much neglected. It is not given for imi-tation: the broken pediment on the one-pair floor is indefensible

PERSHORE.

PERSHORE. PERSHORE, a retired country town at the distance of nine miles from Worcester, pleasantly situated on the river Aron, is the locality of an architectural fragment interesting even in spite of its incompleteness,—for it consists only of the choir of the intended church of a Benedictine monastery formerly established there. As it would appear that the steps of tourists are but seldom directed to this sechade spot—my conductor inform-ing me that visitors appeared at rare and distant intervals,—I trust I may be rendering some service to students of architecture in drawing attention to this very heautiful, and in some respects remarkable edifice. edifice.

edifice. The form and details of the four great archways at the crossing, npon which is raised the central tower, originally designed as an open lantern, but now darkened by a modern flat eeiling, and the aspect of the southern branch of the transept, denote, unques-tionally, that a church of far higher autiquity once occupied the site of the present one. The broad flat soffits of the round arches, borne up by coupled shafts on the face of a plaster mass; their extremely short and heavy capitals,—some rule and almost shapeless hlocks—some chaving the surface covered by interlacing

THE BUILDER.

703

h rmonises admirably with the character of the piers, and with the general simplicity of the edite. The hood-mould, a plain concentric roll, springs from garved tuits of leaves, as in the choir of Woreseter Cathedral. The capitals, thoogh not displaying the ingenious variety and delicate execution of those in the building just named, are, nevertheless, good and quite characteristic examples of the plainer ones of the Early English period. Thetrijdets of shafts have a circular abacus, common to the claster; the isolated shaft, one of the same form, which all unite: the profle, the usual overhanging filleted roll, and deeply ent hollow henesth. Every roll in the arch mouldings (except nor), and the central shafts of the trip lets, carry in front a square fillet. The base, of its proper section, has a circular outline as well as the plinth on which it is mised from the floor.

There is no Triforian; but I confes the absence of this always agreenble feature in our churches, is scarcely to be regretted in this instance, since by its omission height is obtained for an unusually lofty and clegant clorestory, which thus becomes the puminent feature of the building. The openings of t the screen, formed in the internal face of the wall, drawn arches (the middle one stilted), with three bold rolls carrying pointed in the head. The abscus, hase, and capital offer perfect identity with these members of the lower atory. In the external wall is pierced only a single window, corresponding to the central arch of the arcade in a seeming defect, to he accounted for, perhaps, front. by the fear of an excess of light which three openings would have admitted. would have admitted. The vaniting shafts, arranged in groups of three, under a common round abacus, rest upon richly sculptured corbels in the spandrils of the pier arches, and are ringed by the continuation over them of the elercstory string,—a filleted round. These receive the aggregate of the ribs of an admirable Desorated roof, possessing hesides the usual longitudinal and transverse ridge ribs, one interposed between the wall rib and the diagonal, and hetween this and the longitudinal ridge rib, every intersection being concealed by open-work bosses of foliage of great size and surprising richness.

There is one detail, however, in the vaulting system to which objection may fairly be taken. The junction of the elevestry wall and vault is so managed as to necessitate the use of a rib to cover the intersection, of most un-ightly appearance. An arch formed about an acute-angled triangle is, in this situation, the most plensing and the most usual (we see it in the south plensing and the most usual (we see it in the south case the span of the arch constituting the summit of the wall-rib being less than the interval between the realing adds, there existed no other expedient of bringing down the extremities of the rib apon its supports than the addition of long aloning stilts a comparison may be allowed, of the extended legs of an open comparison the bend the dury; an eud certainly not attained by the novel disposition in question, which must, therefore, be set down as proceeding from more contractional necessity, which I shall presently show may have heen the case.

An arrangement to which much importance is attached by some inquirers—ceclesiological, perhaps, rather than archeological—is that tripficity of grouping observable in the various component parts of the building. Thus, we find triplets of shafts, as members of the pier-arches, in the vaulting shafts, and riks; in the openings of the clerestory screen. I suprehend this prevalent distribution into tri-ds not to have occurred wholly without design: and though we may hesitate to adopt the conclusions of some who, suspecting symbol to hurk under every det il of a Mediaval ehurch, attribute to it a bigher and holice import, it cannot be denied that this tiplicity forms one amongst a numerous class of characteristics distinctive of Burly English architectu eat its best and purest period.

The extreme castern plane of the polygonal termination is pierced with an archway, which formerly gave admission from the Sanctuary into a Lady Canpel, but which at present opens into a recess too shallow and insignificant to be exited to this designation,—an addition made within the last twenty years. The recess prings from a different level, and rises somewhat higher than the one on each side of it. The piers differ not essentially from those already described, though some of the shafts are of Purbeck muble, and stand quite free of the nucleus of the pier. But in the arch mouldings there are evil an signs of progression. For instance, the sub-arch, instead of the triplet of rolls, is formed of aroll and triple fillet, the filtet in front very bored, and this is generally found only in the more advanced buildings of the Early English period: and further: filleted rounds, continuous to the base, are introduced to separate the shafted orders. I think there are clear indications, too, of some change of design having supervened before the completion of the church; first, in the method in which the junction of the extreme castern place, and the one on each side immediately contiguous, is efficied; the latter projecting over and overhapping the former. Secondly, in the outer order of the pier arch-mouldings on one side, not being brought down fairly upon the abacus of the shaft, but truncated at different elevations; the abruptness of this expedient heing softened by concealing the ends with minute floristed cordels. And, thirdly, and most decisively, in the presence of a so rendered positively uscless. The combination of the roof of the polygonal end, and of the adjacent bay westward, forms one of the most skilled and elegant varrangements of vaulting I remember to have seen.

The windows in the side ailes, where the original ones have not been displaced hy Perpendicular insertions, are single Pointed ones, mere perforations, without mouldings of any sort, set behind a shafted arch, sometimes concentrie, sometimes not, pierced in the inner face of the wall. To this disposition the caption, being a triplet, preceded by an arcade of three arches, on single bearing-shafts of Purheck marble, an arrangement identical with the corresponding part of Worcester cathedral. At the cast end of the south aisle is inserted a Decorated window, bounded horizont-ly at the summit, composed of four bifoll-arched lights under eircular segments, all worked with a filted roll. The vaulting of the aisles is plain quadripartite, with groin-rubs of characteristic action, springing from groups of triple vaulting shafts, resting upon the floor, and ringed by the extension over them of the string course at the foot of the window sereens.

In the south transept is deposited a stone coffin, dug out of the adjoining burial-ground within a comparatively recent period. It narrows from top to hottom, and is closed with a heavy stone lid, on which reclines a cross-legged filloy, clothed from head to foot in the mailed ormoor of the thirteenth century : the head resulting on a cushion, the right hand grasping a horn, and the left a shield pointed at its lower extremity. At the end of the south nisle there is one in less perfect preservation, of an ecclesiastic, with hunds clasped on the breast: the sides are relieved by quartefaited circles, which seem to assign it a date not earlier than the fourteenth cectury. Near to this stand two other tombs of more pretensions, probably of the Jamesian era: they are of two stories, the hase supporting columns of classied proportions, with Corintian capitals, which beau to the flat eanopy, under which reclines, in one, the effigy of a keight in complete armour, with Ruceling figures at the head and f.et; whilst on the base of the opposite one, are sculptured in higb relief smaller male and female figures in the same attitude, attired in the primest of all costumes, and of exquisitely ludierous expression.

expression. Having completed my survey of the interior, I was about to quit it, when I was invited by my guide to be witness of his daily attentions to the church clock. Not very sanguine in the hope of noy interesting diseovery revarding my compliance, I nevertheless followed bin up the nevel staircase, and quite unexpectelly found myself in an apartment of spacious dimensions and imposing decoration. Like the tapestried sides of some noble hall, the surface of the internal wall of this bell-ebamber (forit is of this I speak), a quadrangle of 30 feet, and corre pouding height, is covered from end to cud, and from top to bottom, with a continued suite of panelling, of admirable design and careful execution. Divided into five compartments on each side, the central one is a narrow, pointed, trefolix-ed arch, the two on each side taking the form of a couple of ogee-headed lights, included in an equilatend arch, with a quarte/blated circle in the head.* Along the foot of the wall extends a range of trefoil-head.d merkes (upper foil-pointed). Of the parelt, the one on each side, inmediately contiguous to the centre one, is pierced to admit light into head frieze-like faceia, bounded on its upper and hower edgese by the scroll moulding, and ornamented with sunk quartefoils, enclosing b.ll.flowers, traverses the wall, profiling in angular projections over the vectical divisions of the panels. The trefoil-headed arcade at bottom is surmounted by a halte eanted

* I have used the term *circle*, but not with strict accuracy, because the outline of the quatrefoliated space glides at the top into the curve of the euclosing arch, and at the bottom forms a continuous curve with the heads of the loge subdivisions. quatrofoil. The mouldings with which the design is worked out are extremely bold and good, of three orders, and furnish an excellent example of that subordination and continuity of moulding in tracery which characterizes the Decorated in its native land far more strongly than in the countries into which it was thence diffused. The first order, a large circular fillet, traces out the principal arch of the panels, the vertical divisions hetween these, and is returned horizontally at the second smaller fillet divides the primary arch into the weo ogce-beaded arches, and forms the circle between then; while the third, a square fillet, constitutes the foliation hoth of circle and of subdivisions. It has been my good fortune to visit the belfries of not a few continental churches of a more or less ornate character; hut I have never seen one in which so much care and taste have heen successfully employed in converting this ordinarily neglected portion of an ecclesisatical edifice into one of its really striking and conspicouns beauties.

The Tower is, perhaps, scarcely a fair subject of criticism, as the completion of the church to the vest of the crossing might have considerably modified our opicion of its effect. Certaialy, in its comparatively isolated state, its proportions do not atrike one as possessing much of that npshooting and aspiring tendency which we naturally associate with this grand external feature of our churches. Of the two singes above the roof, the lower one is pierced in each face with a couple of two-light windows (occupying only the middle of each side) composed of two trefoilheaded lights, earrying a trefoil under an endosing arch, the unbroken compied by four panels, in every respect identical with those in the interior of the belfry (the two middle ones opened as windows), with the addition of vertical strips of stone hetween the panels, and triangular ones above them, which appear not to have received the last finish, as we can scarcely dont that the one was intended to be improved into a slander buttress with its crowning pinnele, and the other to carry the customary crockets and finials. A string of the hall-lower, surmounted by a battleenorie.

The windows, resting on a filleted-roll string, are simple perforations with double splay, except in one or two instances, where they are surrounded by a continuous roll-moulding. The plain hood-moulds are recorned for a short distance, but are not continued to the buttresser. These, below the aisle-roof, are of undiaminished projection and breadtb; above it they are set off twice, and capped with incomplete square turrets, which stop the lower ends of the firing arches springing over the roof of aisle, and abutting between the elevestory windows. The huttresses at the angle of the north aisle, set cardinally, are of very slight projection, and flanked by a single shaft in a recess at one coraer, by a triple shaft at the other. The central tower is shorted ap at its north-east angle by an enormous sloping mass of wall prolonged from the elerostory parapet quilte down to the ground. There exists only one wricty of the corbet table, under the clerostory parapet of the choit—a succession of pointed arches supported on plain modillions.

arches supported on plan mountons. It may be renuchbered that in describing the interior, the existence of three Norman archways in the east wall of the south transept was noticed. Of these the one adjacent to the crossing opens from the transept into the aisle. The original purpose of the middle one is not likely, perhaps, to give rise to much difference of opinion, an apsidal recess or chapel in this position being a very usual arrangement in eathefard, conventual, and other churches of inportance of the Norman class. It is more difficult to explain satisfactority the destination of the third. An arch of communication 1 think it can never have constituted, insamuch as the lower part is closed by the would apper that subsequently to the completion of the early English choir, the unity of the plan was broken by the addition of a chapel parallel to the south aide. Two of the Norman arches were walled many in width, of which sufficient evidence is afforded by the valid archway of similar character from the aide into the chapel. This in plan is a purallelogram of two compartments in length, and as nuary in width, of which sufficient evidence is afforded by the risponds of the vaniting shafts earrying the spingings of three rink, one transverse and two diagonals. Singularly enough, this chepel includes one of the original laucets of the ai-le, and washesides probably lighted at the cast end by two windows, of cone of which the jami mouldings, both external and internal, still remain perfect, with the groove between for the reception of the glass. The lower part of the wall which closes the outer, that is, the most southerly of the Norman arches, is relieved by a very good arcade of pointed trefointed arches, surmounted by triangular canopies, crocketed and finisiled, the frag-mentary character of which seems inexplicable, unless we suppose it to be but the accurate provide the second s mentary enaracter of whice seems includes, dutes we suppose it to be but the commencement of a deco-ration which it was designed to extend to the entire chapel, and that of this intention some now indis-coverable circumstance prevented the completion.

By how much the roof of the ch ir and transepts one exceeded in height the one actually existing, of so depressed a form as to he completely misked by the hattlemented parapet of the elerestory wall, may the battlemented parapet of the elercitory wall, may be learnt from the gable lines on the south, north, and east faces of the tower. This numerally low pitch of roof in a construction of the period at which Pointed architecture had obtained its perfection (the vaniting below it being of Dreorated character), is of itself a remarkable circomstance; and I cunot but think it affords us a little might into the cause of that some what numerals in its source in a derived a derivattorts us a hitte maint into the called of that some what ungraceful intersection of validing and elero-story wall to which I have drawn attention in speaking of the interior. If we suppose the choir contempo-raneous with the higher vaniting to have presented in its internal elevation the all but noiversal comple-ment of three stories, the hindler of the present one, went of three stories, the huider of the present one, when he determined to conit the triforium stage, must have found it a matter of extreme difficulty, if not impossibility, as a more matter of consistuction, to raise upon the pirsa a cherestory wall of such signatic height as to reach the elevation of the original vanit, and hence arcset the elevation of the original vanit, in enev aulting in a degree adapted to the dimi-nished loftiness of the substructure. The the vanither in mention was raised at a period

mished loftiness of the substructure. That the vauling in question was raised at a period subsequent to the erection of the central tower is plainly proved by the fact that the windows of its roof stage are not constructed without an exact refer-erence to the inclined lines of the original higher gable, the central portion of the window which would be masked by the abutting of the gable being left in-complete, and the jamb mouldings and multious dying off as they descend upon the raking sides. The two western responds of the nave of the old

off as they descend upon the taking start minutes gring off as they descend upon the taking sides. The two western responds of the nave of the old Norman structure are still in their original positiou; ponderous cylinders built up in coorses with heavy quarter-round eaps. These are the piers of the nave of *Muleern* and of *Tenkershury*, and much relied upon by some as clear indications of a mode of archive-ture prevalent before the Conquest. It appears, however, difficult to dissociate these fragments from the cross-ing and the transport, whose Norman origin is loo manifestly impressed on them to be controverted by the most zealous advocate of so-called Saxon archi-tecture; nor do I thick, even if an interval of some low years could he clearly established, that these piers possess sufficiently strongly-morked differences to imply a distinction of style.

I returned to Worcester much gratified with my returned to worester mide granter with my expedition, so much so, that I repeated my visit on two subsequent occasions. Should this slight memo-rial serve to make more generally known the church of the Holy Cross at Pershor, and especially it remarkable -- mry I not write, unique bell-chamter ?--I shall not consider my excursion wholly fruitles.

FIR, DEAL, AND FRENCH-POLISHING.

They bear, and remember outer outernade. I have read with much interest the papers of Mr. Wyatt Papworth, in your last numbers, and also the short directsion which arose thereen. I cannot help feeling much surprised that amongst the many men of eminence who took part in the directsion, the merits and advantuges of "common fir," as an ornamental wood, should have been so completely overlooked.

Is it not strange that the great ulurani of the deco-rative world should still stick to the old absurd fashion of disguising woods, instead of revealing their natural beauties.

Instanto of disguising woods, inscend of revening their matural beamtics. This is a grave charge, and I make it gravity. It is too true, that many of our atists, employed in the internal decoration of bouses, rack their brains to find new means of imilating and disguising woods, instead of studying the hast means of bringing out their natural peculiarities and fitness for employment as decor, five woods. Take-and of wasting time, in perfecting imitations of scarce or dear woods, it would be much better to employ the syme amount of time in fully developing the natural characteristics of many of our ontire woods, new despised for decorative purposes, because, for south, they are cheap and common. This is a sufficient of the bound of our commonest woods are very beautifully grained, but their excellencies for ornamentation are lost, because our decorators have not studied the best made of developing or bringing out their beauties. or bringing out their beauties.

Painting and graining, and imitating, have been carried to a sickening excess. The natural appear-ance of the woods has been entirely ignored. Why

sbould our doors and cupboards be always painted? And how painted? Styles of French white,—panels, rose, pink, or salmm colour! For cheeper houses, the doors and cupboards, window linkings, &c. are generally of two shades of stone-colour,—and vilely excented into the bargain. I prefer the natural ap-pearonce of the wool—whatever that wood may be-well and clearly varnished; but, hetter still, French-polished. Why is French-polish not more used in England? Why confined to cabinet-pieces and fur-niture, except in the houses of the naper ten thom-sund? Clear, colourless varnish onght to be more commonly used to finish off our joiners' work, instead of the common painting now so much in vogue. sbould our doors and cupboards he always painted? of the common painting now so much in vogu

I was much surprised on reading the following I was much surprised on reading the following words in Mr. Papworth's paper:-" As another mode of covering a surface, the board now exhibited hus been prepared to show how deal mr, be employed, without the n-e of oil-painting. The surface having been prepared, it was at once grained, the natural colour of the wood forming the ground of the imita-tion wood: the whole was then varni-hrd as usual." Why paint the lify, or performe the ross? Here we have a really beautiful wood achully spoild by being "erginqu" over. As an experiment in effect, well have a really beauting wood activity spont of comp "grained" over. As an experiment in effect, well and good. But I hope this style of work will avere be seriously entertained. Let the wood ahone,— common deal, properly treated, is very beautiful and rnamental.

ornamental. I am surprised that it has been so long neglected for descrated uses, because its natural qualities for this purpose are of no mean order. It is worthy of more attention than has hitherto here bestowed upon it. I have seen, in my travels over the world, very besulful specimens of furniture made entirely of "common deal," that would not have been despised in a London boudoir.

in a London bouldor. Our eahinetmakers, upholsferers, decordors, and joiners, appear either to be ignorant of the merit of *deal*, for ornamental use, or else they wilfully neglect to employ it, preferring to paint and grain, to their heart's content. Were our joiners and de ordors to form their dwers and window-linings of well-selected to each been then well varnished, or still hetter. form their due as and window linings of well-selected fir-wood, have them well varnished, or still hetter, French p-lished, printing and gratining would soon be superseded. The difference in appearance is im-mense. I have seen rooms entirely fitted with "com-mon deal," well French polished, and for such pur-poses deal, if well selected, is very beautiful, cheap, and pleving. I have seen large wardrobes and diming-tables, made of deat, and being, as before o'nerved, well French polished, they have puzzled more than one learned connoissent to make cut the word, -for, certes, they never dream to greesing they were made of "common deal." Nay, more, I have seen the private rooms of a crowned herd, where the only wool employed was this much-despised "com-mon deal," and his mrjesty was rather proud of his "common deal." than otherwise.

In the Royal Palace at Berlin, one or two of the king's private rooms are entirely fitted up with deal fixtures; doers, windows, shutters, and everything el-e being of fir wood.

The acception-room where the King of Pruss'a nsu dly transa-ts bu-in ss with his ministers, and reusually transacts buckness with his ministers, and re-ceives deputations, \mathcal{L}^{*} , as well as the adjuining calinets, are fittel with deal, not painted and grained, certaisly, but well French paished. The effect is viry good. Fow would funcy that no other material had been used but deal; for the wood is not only in this case on unweatal, but useful; and, like myself, every one is surprised when told that this apparently new kind of ornamental wood is only deal. It is, of course, well selected, er whills wood, and Freech course, well selected, e refully wrought, and French polished secundem artem, which is the great secret

polished scenatem arren, when is the grade brief of the business. If our diore, done cases, shutters, linings, &r. wire mide from well-selected, thorouebly-sensoned deal, eurefully excented, and then well variabled, with a elene, colourless variab, or still bettir, Fwinch polished, I have no besitation in stating my certain conviction that it would very som become the mode, and supersede the present system of painting and industry.

and superside that it would be also be also been been also also be als

expensi e woods. I em glad to find that Mr. C. II. Smith recom-

mends varnish instead of paint,---and am especially pleased that Mr. J. G. Crace took the bull by the here a that set of the second to be a bound of the horns at the very commencement of his observations, by hluntly and honestly stating "that the very best way of treating wood was simply to varnish it, and not to smother it over with paint." To this I en not to smother it over with paint. To this I en-tirely agree, as far as it goes; but from what I have seen. I think French polish is far better, and will amply repay the extra expense. Mr. Jennings stated amply repay the extra expense. Mr. Jennings stated his opinion, that "French p lish produced the best effect." no doubt of that. He afterwards observed. effect : "but if two costs of cond ranks have a spliced, and then polished, the effect would be as good." this 1 doubt; but at any rate, it would be here than paint-ing and graving, however well they might be excended.

For ordinary houses of the middle classes, I strongly recommend our builders to leave the wood strongly recommend our binners to have no wood in its natural state, with the exception of the applica-tion of clear varnish, to develope the colours,—and avoid the present absurd and nusightly system of painting. It will be mach charper in the end, and the effect far more pleasing than is now produced by doubling the woodwork over with common print. I make a strong stand for the *beauties* of common the effect of the strong stand for the *beauties* of common

daubing the woolwork over with common paint. I make a strong stand for the *becauties* of common deat, if properly u.ed. it is really an oranmental wood, juditionsly treated; and I firmly blickwor the time will yet eome, when well Franch polished deal will fight a hattle of extermination against the *red hot* furniture now in common use. It is far more classe in ap-pearance than the glaring red furniture of the pre-sent—Brokers' Alley splic: let it be fuily tried, and its own merits will carry the day. In arranging doors, panels, &e. much will, of course, depend on the skill excreised in selecting the wood, in placing the best parts in the panels, so that when polished the most placaing effects will be pro-dued. Much, too, depends on skilful workmanwhip eare, and using well-seasoned wood; hut this is the case with any other species, and is, therefore, not applicable to deal alone. Tearnesily hope that such of one eminent deco. rators as have the opportunity will give deal *a fair trial*: let them body make the experiment, and I feel assured they will not only be pleased, but sur-prised, and in the end fully satisfied with the result. No point, if yon please, but leastly of good Frende polish, and "c unmon deal" will be despised for ornamental purposes no longer. JOSEPTI LOCKWOOD.

polish, and "common dear ornamental purposes no longer. JOSEPH LOCKWOOD,

ENGINEERING AND OTHER WORKS ABROAD.

ABROAD. On the 16th Angert, and 12th September last, the General Roman Rulway Company (Compagnic Générale des Chemins de Fer Romains), made a lamped-sam (à forfait) contraet with the Industrial Company of Forenee (trading under the name of the Crédit Miobilier Toscane), represented by M. Cozino Ridolfi, and with M. Gulo S.-tti, engineer at Genoa, for the construction and furvishing, all in complete working ordt, of the cagines and rolling-sic-k of the whole line from Rome to the River Pa, hy Anconn, Bologna, and Ferrare. The inauguration of the section from Nola to Palma, has just taken place. This portion, nine kilomètres in length, forms part of the Sanseverin Rulway, which is intended to be ninety-four kilo-mètres long. The king of Naples, following the example of the ancient Romus, wishes to rid hay sonis of the

At the other side of Naples the Government push forward the works towards Rome: it has already signified its intentiou of building the great viaduet

forward the works towards frome: it has already signified its intentiou of building the great viaduet acress the Volurno, at its cost. The locomotives are built at Petrarsi, at which town the model workshops have made a-tomishing progress since their found-tion in 1842. The shops, including a splendid foundry, forges, &c. and all material for any of their largest enterprises, give work to 1,300 men under Lieut-col. Corsi, Royal Nerpolitan Artillery, sided by Capt. Alao de Rivera, under the command of General D'Agonstinho. Thus, marky all the Marine engines for their mayy have been made at Petrarsi. Several others are in band, inclusing one of 400 horse power. Trom Naples to the frontier of the Roman States, the line has been opened for some years to Capua, and in two years it is espected to be open to the eity of Rome. It is astomishing to see these works already completing, with the comparatively small budget, periops the minimum in Europe. The expenditure of the kingdom is not ta caced 140,000,000 of framer, for a population of 10,000,000. Out of this the Minister of Public Works gets only 20,000,000. of f and

The Paris, Lyons, and Mediterranean Railway

Company are occupied at present with surveys, in the neighbourhood of Aix, for a branch line to join Mar-seilles with the Alps. The council-general of Scanc-et-Loire have voted that, with as little delay as pos-sible, the Paris, Lyons, and Mediternaean Company Should have the concession for a branch line from the Moulins railway to the Lyons line, which, starting from Paray, would join the Geneva line at Macon. The some council express a wish that the Nevers and Moulins lines should meet the Lyons line at the town of Chalons-sur-Saône.

The council of the Gironde votes in favour of the The coulde's vite of outer totos in the second seco

For some time past as near engineer has heen occupied in studying several small hranch lines in the depart-ment of the Var. The first is to connect Hydres with Les Salins, hy locomotive traction, starting from La Garde, the first station on the Nice and Toulon line. The second hy horse traction, will start from Hyères to Les Salins les Pesquiers, traversing and contouring the peninsula of Giens, as far as the Tour Foodue, and scommunicating with the shores of the lake hy a small steamer. The third (also horse work), is to start from about the Places des Armes to Pont du Las, and thence to the Seyne, from which a hranch will be made to the Marseilles and Toulon railway. The fourth (horse work also), starts from the Place St. Jean, and abuts at the extremity of Mourillon, following the boulerard de l'Ergoutier. The surveys are to be presented officially during the month of November, hy the engineer, to all the municipal councils interested.

An experimental trip took place on the 15th of Octoher on the Geneva line, as far as the entrance to the Credo tunnel. The directors, engineers, and guests formed the party, and most of them pushed forward by post earriages to Bellegarde, to a hanquet, which was ready for them at the Hotel de in Poste.

The Custom-house,—a new one, at the expense of the Geneva and Lyons Company,—is ready for the roof. The central station, adjoining, advances with

out of 3,950 metres there are only 350 to vault. In a few days the line from Jativa to Valencia (Spain) will have the section from Jativa to Alcudia

(Spain) will have the section indicating the section open to the public. On the 10th of Octoher, the Emperor of Russia approved of the following persons as lessees of the Warsaw and Vienna Railway: -- Count Zanoiski, Count Potocki, Count Renard, Baron Murchwitz, M. Milde, the Bank of Eystein (Warsaw), and Prince Habenche of Prussia. Hohenlohe of Prussia.

The railway from Bregenz to Rheineck is conceded We have a string from Dregen to Interface is sourced by the Austrian Government, and that of Lindau to Bregenz by the Bavariau Government, so that it will not be long before a company is formed for a helt-line, or "Chemin-de-fer de Ceinture" of the Lake of Constance.

THE STATEMENTS OF THE OPPONENTS. OF GOTHIC ARCHITECTURE.

It is not my custom to reply to anonymous attacks, d it would he unbecoming in me to defend unvand it would he unhecoming in me to defend my-thing I bave written, against fair criticism. My object in now writing is not to do either of these, but mainly to be gany of your readers, who may chance to have waded through the tirade in your last number, hear-ing the name of "Verax," to take the further trouble of referring hack to your numbers of March 21, and of referring nack to your numbers of March 21, and April 4, in the present year, where they will find my lecture given at the Royal Academy, and to a more recent number containing another, read at Doneaster, and to judge for themselves how far your correspon-dent's statements hear out the title he has assumed. They will find, if I mistake not, that he has not only heard himselvin a class to which I are forged if where Placed himself in a class to which I referred, " who delight to attach a false and exaggerated meaning to an expression," hat that even to the charge of " pal-pable falsehood," which he does not hesitate to bring pane rateshood, ' which he does not hesitate to bring against others, he has, I am sure inadvertently, rou the risk of exposing himself. Take, as specimens, the professed quotations given in inverted commas, " modern architecture, the last new original style;" " the last madern architecture."

If these are attributed to me, I am unable to find th.

Then, on the much-vexed question, as to whether the Pointed arch was imported by the Crusaders from the East, he first converts it into a question whether

Pointed architecture, instead of merely the arch, Notice architecture, instead of merely the arca, was so imported, and then accuses me of having admitted it (!), deliherately quoting in inverted com-mas from my lecture the following passage:--"The systematic adoption can with certainty be traced to the suggestive architecture of the East;" whereas to the suggestive architecture of the Last, whereas the passage really stonds thus: "If its systematic adoption can with certainty he traced," &c. ! Surgly such a double misstatement is sufficient to turn against him the force of his own quotation—

"Quodennque ostendis mihi sie, incredulus odi !"

I bad in a previous sentence given a corresponding I bad in a previous sentence given a corresponding ij'' in italics, and added the words, "a question which I will not now attempt to investigate;" and further on had repeated for a third time the same $i'j_i'$ thus showing, in the most emphatic way, that I did not make the admission which, in spite of all these precautions, he has the conscience to attribute to mel to me

It would not he easy for me to look through the multitudinous works of Mr. Fergusson and Sir Gardner Wilkinson, to test the correctness of his Gardner Wilkinson, to test the correctness of his similar assertion respecting them; but, judging of the former hy his most recent work, I should conclude that, while knowing well (as we all do) and broadly stating the antiquity of the pointed arch, he does not very confidently hold that our forefathers learned it in the East, much less does he hold that their *archi-tecture* had any such origin: " on the contrary, he speaks of Gothic architecture (round and pointed) as belowing to the Teutonic tribes who had overwhelmed belonging to the Teutonic trikes who had overwhelmed the Roman empire; whose successors I have termed "Germanic," he "Gothic," but both with the same meaning; while the Pointed Gothic, as distinguished from the Ronad, he says, there can he no doubt was "invented in France." He further attrihutes the introduction of the pointed arch to the necessities of vaulting, &c. Its origin he thinks of little impor-tance, and holds that nearly all the other characteria-ties of Gothie architecture had already been attained; and he further holds with me, that Gothie architec-ture was the last in the scries of original styles, at least in this part of the world. Sir Gardner Wilkin-son. I helice, actually endeavours to show that the belonging to the Teutonic tribes who had overwhelmed reast in this part of the world. Sir Garuner winking son, I helieve, actually endeavours to show that the Saracens derived the pointed arch from previous Christian huildings, and Mr. Fergusson distinctly shows that the Saracenic style of Syria and Egypt was dwaland a ut of the Byzantine. so that I fagt these developed out of the Byzantine's ot bat I fear these two champions will not do him more good than my asserted admission. "Veras," however, goes further : asserted admission. "Vera," however, goes further : he accuses me (again having recourse to inverted commas) of saying that "the architecture of the Saracens was already Christian," and actually takes the Surfacens was already Christian," and actually takes the trouble to prove that it was not so 1 I need hardly say that I had made no such statement; hut in speak-ing of the "architecture of the soldiers of the eross," referred not to the Saraeeuic (!), hut to the Romanesque of Western Europe. We next come to the statement attributed to me (or to some one clse), that Justinian was the first to Christianize architecture. On this I need not dwell, as I do not dind that I even alluded to the new

as I do not find that 1 even alluded to the name. as I do not find that 1 even alluded to the neme. 1 will only add on this point, that it is somewhat new to hear the Greek eross stated to be less Christian than the Latin nave and aisles! It is, noedless, how-ever, to enter further into these particulars : the whole letter is one mass of such fallacies. The ages which covered Europe with the most wonderful and costly moouments, both ecclesizatical and civit, are said to have been those in which "the madness of the Concode back particular that the remute of Back 1000 for the theory of theory of theory of the theory of theory of the theory of theory of the theory of theory o Crusades had exbausted all the resources of Europe !" The days of our Gothic cathedrals, of Cimabue, Giotto, the Pisan sculptors, &c. &c. arc said to have possessed *no arts*; those of Abelard, Grossetête, aud

5. possessed no arts; those of Abclard, Grossetête, aud * Since writing the above I have referred back to your report of Mr. Pergusson's paper on the pointed arch, read the sector of Mr. Pergusson's paper on the pointed arch, read the the twice to a kick i alloch he underticably does extent origin of the Pointed arch, but most carching guards himelf against which the asys being misinterpreted to apply to Pointed architecture. His words are as follows : "In adopting such a view of the question as this, there are two things to be guarded against, the first confounding the invention of the Gottine style with that of the Pointed arch,--a mistake too often failen into. The first, however, is a puerly indigenous and native selaboration from Koman art, without any trace of copying or even initiation. The and can all est subordinate characteristic of that style, and can all est subordinate characteristic that it was copied from the East for copying's sake; the truth beinz, if we admit the above view, that the hint was given by the East, but nothing more: it was applied to Gothic buildings in a manner in which it can bue true Gothic. Though, therefore, I do not think if can bue true Gothic. Though, therefore, I do not think if can bue true Gothic. Though, therefore, I do not think if can bue true double. Though, therefore, I do not think if can bue the addition of the Gottide arch is from the East, it would not the base which we all now so fully appre-ciate and so nairersally admire" (Builder for 1849), and on a so nairy and race which we all now so fully appre-ciate and so nairersally admire" (Builder for 1849), abundantly proved by * * * Mr. Fergusson !"

[Dec. 5, 1857.

Danie, no learning: and those of the Italian repub-lies and German free eities, no commerce 1 Those who think differently from your veracions correspon-dent, are accused of doing so from the lowest motives, and to hide their own idleness or their incapacity of learning the verascular style. A design which has here often objected to as heing *Italian* is now discovered to he pure *Dutch* / A style often objected to as Popish, is stated not to he Christian, because not found at Rome! Poor Pugin's death is attributed to his find-ing his theories to he erroneous, and those whom he wrongly charges with styling themselves his "fol-lowers," are accused of all kinds of things of which they are unconscious; and especially of underrating such lowers," are accused of all kinds of things of which they are unconscious; and especially of underrating such men as Professor Willis, a maa whom they hold in the very highest consideration; while the whole is in-terspersed with a mixture of seeming erudition and real coarseness anything hnt ereditable. The only ex-cuse I can make for the writer (in whom I, with much regret, imagine that I recognise a man for whom I have always entertained a real respect), is that he intended if (like his story of the "Young Saints," and their " cigars and whiskey-and-water") only as a pleasant fiction, and subscribed himself "Verax" only in the sense of "*luces a non lucendo*" Gro. GILBERE SCOTT. "Verax" lucendo." GEO. GILBERT SCOTT.

MR. ARTHUR HOLME, OF LIVERPOOL, ARCHITECT.

DEATH has deprived the architectural hody in Liverpool of one of its ablest members, in the person of Mr. Arthur Holme (brother of the present mayor), and who has died prematurely at the age of fortythree.

three. The local papers hear witness to the esteem in which he was held, and give some particulars of his career. He commenced in the workshops of his hrother, and then passed some years in Birmingham studying architecture, as the pupil of Thomas Rick-man. For some time he was in partnership with Mr. John Cunningham. The Daily Post mentions amongst his works, St. Paul's church, in the Prince's-park; 3t. Matthias's church, in Great Howard.stree; All Souls church and schools. St. Aidan's church and amongst his works, St. Pau's control, in the struct -park ; St. Matthia's church, in Great Howard struct ; All Souls church and schools, St. Aidan's church and schools, St. Alban's church and schools, All Saints' church, Great Nelson-struct, and a church of greater ambition and architectural success than these.—St. Mary's, at Grassendale ; the nusic-hall, in Bold-struct; the slip at Eastham, and the waterworks for the military on the Curraph of Kildare. The Courier adds, the church at Croshy, the new façade of Messrs. Woolbright, in Bold-struct, and the seat of Mr. Jona-than Peel, at Knowlmere.

than Peel, at Knowlmere. Mr. Holme has left his children the best of possessions,—a good name.

STAINED GLASS.

St. Nicholas (Scarhy).—A new east window of three-lights has been placed in the chancel of the church of St. Nicholas, Scarhy-cum-Ownhry, Lincolnshire. It was executed by the St. Helen's Glass Company. The centre opening represents the Ascension of our Swingrin measure of the Awardie. The two

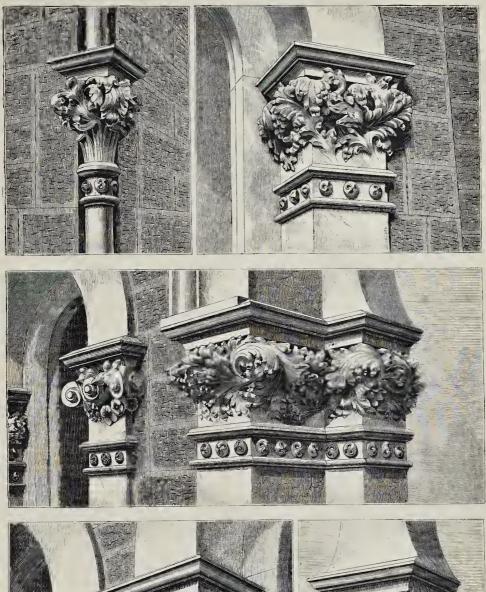

centre opening represents the Ascension of our Saviour in presence of the Apostles. The two side lights are occupied by figures of SS. Matthew and John Evangelists, with their respective emblems heneath. Under the centre subject are the arms of the doner, with the inscription,—" Presented hy Ann, reliet of Richard Roadley, esg. A.D. 1857." The style of the window is Decorated. *Clommore* (Ireland).—A memorial window, accord-ing to the *Carlow Sentinel*, has been creeted in the Honourable Mrs. Stopford. The design, which is Gothic, was given by Mr. J. Welland, architect to the Ecclesistical Board, and the work excented by Messrs. Faircloth and Lynch, of Carlow. The painted glass was supplied by Messrs. Sillery, of Duhlin. *Miscellaneous*.—The following are works excented

Miscellaneous .- The following are works excented Miscellaneous.—The following are works excented by Mr. Warrington in various par's of the country, including Ireland : namely ;—eleven windows in the new church at Lissadill, near Sligo ; the east triplet containing a representation of St. Peter raising Dorcas ;—the west window of Winwick Church, and the east window of the Orphan-house Chapel;—two Norman windows in Newington Church, Keut ;—n series of windows for the chapel of Caeltenham Col-lege ;—the east window of Ashover Church, Derhy-shire, and others. shire, and others.

BAPTIST CHAPEL, PRESTON. SCULPTURED CAPITALS.

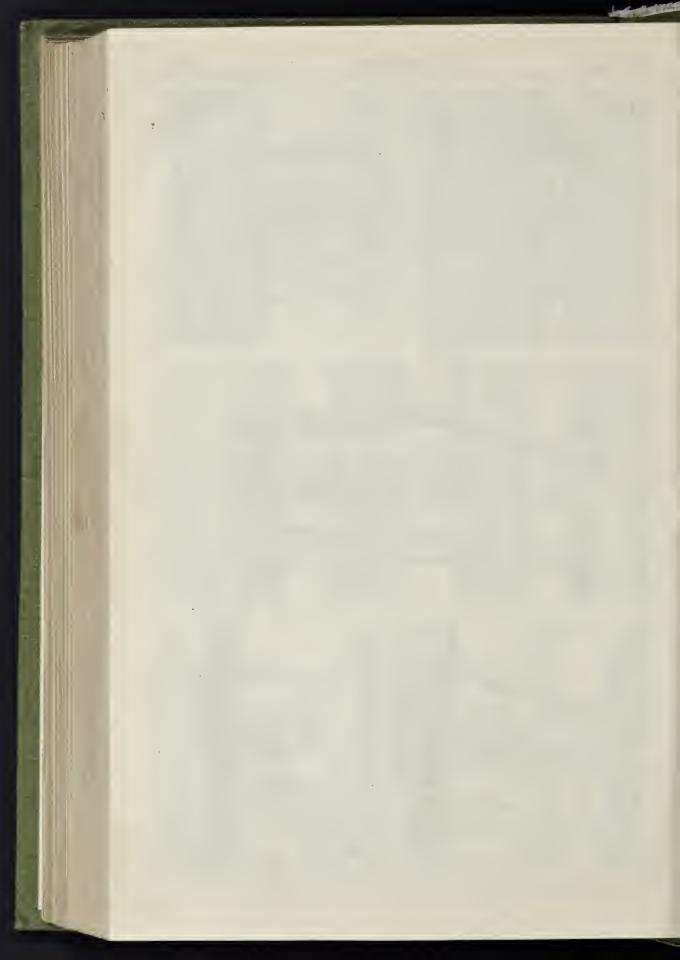

In fulfilment of the intention notified in our account last week of the chapel now being built at Preston for the Baptists, under the direction of Messrs. Hibbert and Rainford, we have engraved representations of the sculp-tured capitals. Freedom was permitted to the carvers in the production of them.

707

BAPTIST CHAPEL, PRESTON: SCULPTURED CAPITALS.

WATERGLASS AND ITS APPLICATIONS. WATERGLASS AND ITS APPLICATIONS. Or soluble glass, or the soluble silicate of potash or of soda, and its varied uses, we have occasionally spoken, especially of its nse in hardening soft and perous stone; in the production of artificial stone, as under Messrs. Ransome's patents; also in the sup-pression of damp in walls, the fixing of line-wash and other colours, the starching of cotton fahries as a substitute for flour or starch; &c. &c. One of the most important inventions in the chemistry of the current century is the application of the silicates of potash and soda to the arts. These silicates, called "waterglass" hecause they are solved or casily soluble in water, though their composition

sinches, chied waterglass methads or composition is nearly similar to that of ordinary glass, were made use of almost thirty years ago, by Mr. J. N. Von Fuchs; but it is only lately that they are manufac-

Fuchs; but it is only lately that they are manufac-tured and used on a more extensive scale. Several improvements made recently in the manu-facture of waterglass by Liebig, Kuhlman, and others, and the hetter acquanitance with its properties, make it possible now to apply it with greater certainty, and at a moderate price. In this country, however, its value has not yet been sufficiently appreciated, while in France and Germany, large establishments are already cogaged solely in its manufacture. In Great Britain, more especially, the varied applications of waterglass, it is helieved, would he found particularly useful and profitable to manufacturers and capitalists.

useful and profitable to manufacturers and capitalists. Waterglass, produced either by directly dissolving silicic acid in caustic potash or caustic soda, or in-Waterglass, produced either by directly dissolving silicic acid in caustic polash or causic soda, or in-directly hy heating a mixture of carbonate or sulphate of potash or soda with charcoal and powdered silica or quartz and dissolving it afterwards in boiling water, forms a tolerably clear solution, which, by ex-posure to the air, partly gets decomposed by absorp-tion of carbonic acid: it is therefore advisable to pre-vent the admission of air by keeping it in well-closed vessels vessels.

vessels. Used as a paint, waterplass is said to combine the properties of a vernish with that of a cement, and to possess forther the advantage of being almost colour-less, drying very quickly, evolving no smell, and rendering the surface of the object ecated with it very durable, and almost indestructible. Another poculiar and important property of it, described by those who have used it, is, that it undergoes a chemi-eal combination with certain prorus substances, rendering the same almost as hard as stone, resisting afterwards the action of air and moisture. A piece of eholk, prepared with waterglass, will get so hard, it is said, after a few days, that it will produce fire on steel. stecl.

steel. One of the carliest applications of waterglass was to prepare wood, paperhangings, lince, &c. so as to project them from the action of fire, water, and air, and this, of course, is very important to theatres, fac-tories, and all buildings more or less exposed to these elements. It is said to he sufficient to ever the object once or twice with a thin layer of the solution, which, in drying, forms a kind of glass, eveninally insoluble in water, and partly chemically comhined with the fibre. with the fibre.

Among others of its alleged applications is its use Anong others of its alleged applications is its use in preserving casks or other vessels employed in the beer or wine trade, and for the hetter cleansing of the same. All metals, particularly iron, are said to be prevented from oxidizing by this impervious prepar-tion. Mixed with "Blanc-fix," according to Mr. Sicherer," it forms, on glass, by exposure to high temperature, a white enamel, which also may be pro-duced in varied colours. It is employed with much alreantage, it seems, in painting on glass, and we may vious centuries mad waterplays, or "oil of fluits," as they called it, in precipitating various silicate colours from the metals, used in shape of salts. Red chloride of cobalt, for example, if precipitated in waterplays, forms a beautiful blue powder, -silicate of cobalt. of cobalt. The chief application, however, of wnterglass, is

of coalt. The chief application, however, of wnlerglass, is based on its powerful chemical attraction to nortar, brickwork, porous sund, and linestones, forming silicate of line, which is very hard, and like glass. For example, a wall or stonework painted with the solution is said to coubine durability with the pro-perty of drying very quickly. Once dry, it does not afterwards discolour; and the surface being like glass, it, of course, can be washed at any time, if necessary. Mixed with powlered chelk, or patent white aud blane fix, it appears to form a good white paint, on wood, brickwork, &c. Any desirable colour may be produced, and the art of producing al fresco pictures in this style, on walls, is called " stereochromy," an instance of which may be seen at the new Mixemo, Berliu, of four pictures by Kaulhach. A stereo-

* It may be of use to these of our readers who desire to become better acquainted with waterglass and its applica-tions if we mention that Messrs. Sicherer and Hausman, of No. 17, Enstcheap, analytical and consulting chemists, state they have given special attention to this subject.

chromic painting by this process has the advantage of not changing its appearance after a time. This not changing its appearance after a time. This method of painting, which is still capable of further improvements, is already adopted in many instances by artists.

by artists. The property of waterglass to combine with powdered chalk, lime, magnesia, sand, gypsum, and other porons substances, so as to form a hard mass, susceptible of a polish, and with unchangeableness to atmospheric effects, renders it useful for purposes of general ornamentation. It is said to form an cxcel-lent cement for stone, glass, and porcelain. Common limestone prepared with waterglass has been used in lithographic processes. Artificial Roman cement of very good quality is said to be produced from it. Waterglass has, also, been employed for prioting in colours ou upace, particularly paperbangings, linen Waterglass has, also, been employed for printing in colcurs on paper, particularly paperhangings, linen and wollen textures, &c. in fixing gold and silver on paper, &c. Ultramorine prepared with waterglass preserves its colour better than with any other fixing agents. In dycing it has been used as a mordant. Another new application of it is that of a substitute for soap. It is very cheap, does not act on the fibre, and is esteemed as a good detergent. There are many other more or less useful or im-portant applications of waterglass which space will not allow us here to mention.

CHURCH-BUILDING NEWS.

Lynn .- A short time ago, the Wesleyan body determined on making extensive alterations in their chapel in Tower-street, Lynn, the architect engaged heing Mr. W. Newham, jun. The tender of Messrs. chapel in Tower-street, Lynn, the architect engaged heing Mr. W. Newham, jun. The tender of Messrs. J. and W. Purdy, builders, was accepted, and the work went on. A committee undertook the manage-ment, and the contract was excented hy Messrs. Purdy. When the whole was completed, says the Norfolk Chronicle, the committee were horrified by the receipt of a "little bill" for 7982, being 3612, in excess of the contract price. This charge they strongly disputed, and the result was an action against them for the 3612, (the 4371, having heen already paid). An amicable arrangement, however, was entered into while the case was mader hearing, by which the contractors, receiving 2752, paid into court, were to be content with this, and pay all costs, excepting 251, which the committee were to pay excepting 257, which the committee were to pay towards their own. In other words, the contractors were to receive 300/, and pay all the costs on both side

sides. Suiton.—The church here has heen restored and reopened. One of the chief improvements in the interior is the removal of a gallery or loft from the west end, which has exposed to view the tower arch, supported by four slender shafts, having embattled capitals. The newly-diressed Norman font, which is and the second statement of the second statement of the second second statement of the second statement of the second statement restrict the second statement of the second statement second statement of the second statement of the second statement second statement of the second statement of the second statement second statement of the second statement of the second statement second statement of the second statement of the second statement of the second statement second statement of the second sta west cnd, which has esposed to view the tower arch, supported by four slender shafts, having embattled capitals. The newly-dressed Norman font, which is approached by new stone steps, bus here placed under the belfry. The new pulpit is worked in Clipaham stone: it contains a series of panels having trefoil pointed arches. The scatts are like thoses introduced into Ely Cathedral. The chancel has been renovated, and the windows have been replaced. The south porch has been refaced: the door is new, as is also here one at the west end, and each contains scrol-work. A new north door is to replace the present old one; and improvements are to be male in the vestry. Red and black square patent tilles, from the maunfactory of Messrs. Moore, of Brossly, are had disgonally in the ailes. In the course of the re-storations several hundred eart-loads of earth, which had been accumulating for ages, were removed from the vicinity of the valls of the church. The whole of the work has been preformed by the cootractors, Messrs, Richardson and Son, of Stunford. Millon.—On the 16th alt, the Bishop of Oxford consecrated the church at Milton, in the parish of Addrehury, which had been previously dedicated to St. John the Evangdist. The balling cost 1,300/. Mr. Butterfield was the architect. The edifice is built of the stone of the country, with dressings from the Bath parises, and it is covered with red tile. It consists of a nave, tower capped with low spire, and sanctanyr. It has a porch and lich-gate. The nave has an open space at its westernmost end, forming a sort of anarbes, in which is set the fout and cover. It is henched for unety, including the children of the school. Audower.—On the 25th ult, two chapels were com-

heing separated internally by a low screen, and the larger chapel has a north aisle. The walling is finished internally in red and huff hrick, and externally in brick and fliut. The roofs are covered with plain titles, and ceiled between the rafters with boarding. The fittings are of deal. The window-heads are cosped and partly traceried, after the style of the Early Geometrical period; and the apses, gables, and bell-gables are furnished with good metal crosses. *Quatford*.—The church of Quatford has been re-paired and enlarged, and was re-opened on Thursday before last. The south wall bas been taken out; and the new aise separated from the now by an areade of five pointed arches in Alveley stone. The aisle is lighted by three side and two cost awall gable win-dows. It has an open timber roof, the woodwork being stained and varnished. The nave is separated from the chancel hy an old Norman arch, and built of tafa. It is conjectured that the whole of the original church was built of this material, as a large quantity bas been found in the old foundations. The wall has been cleared off to the original stone, and pointed. At the west end of the interior, the arch, which was before wholly concealed by the gallery, has been thrown open and restored, and a anneber of new ones added, making in all about 270 sittings. *Restyreh.*—The parish church of Pentyrch has

window. The whole of the seats (which are open) have been repainted and repaired, and a number of new ones added, making in all about 270 sittings. *Pentyreh.*—The parish church of Pentyrch has been rebuilt, and was consecrated by the Bishop of Llandsi on Thursday week. The church consists of a nave 50 feet loog by 26 feet wide, with an octagonal turret at the south-west angle, surmounted by a spire with an open tracerical belfry-stage, a south porch, a chancel 25 feet loog by 15 feet wide, and vestry adjoining. The style is Decorated Gohie, with flow-ing tracery. Advantage has here taken of the rapid fall of the ground to the east to obtain considerable height for the eastern and, which faces the road. The walls are constructed of Pennant stone, with Combe Down Bath-stone dressings. The building rises from a bold spur base, and is bighted by a four-light west window, moulded and recessed with flowing tracery, and by three two-light trace-rise of works in the south wise of the nave, and two similar ones in the north wall. The chancel has also a large three-light trace-rice ass window, and two windows in the south wile of the nave, and two similar ones in the north wall. The chancel has also a large three-light trace-rice dast window, and two windows in the south wile of the nave. They are slated with Bangor slates of purple and blue, arranged in bands of these colours. The whole of the gables are coped with freestone. The turret rises to the height of about 70 feet, and is octagonal on plan, with a buttress on four sides, terminating with a peliment heneath the belfry-stage, which consists of a moulded two-light traceried heads. Staffordshire tiles. The full of the octagon forming a light open crown, whene esprings a tapering spire, banded with alternately several plain courses of masonry, and several with slightly projecting weathering. The headshow due over with wrought iron-work. The passages are prived with red ash black Staffordshire tiles. The enplied is of Caen stone, intended to be carved. The chance

on principals, springing from stone corbels, which will eventually be carved. The architect is Mr. Pugin.

Derb Derby.—A committee, beared by Lord output sources ners, M.P. has been formed for the purpose of carry-ing out the restoration and enlargement of St. Peter's Charleh, Derby. Mr. Place, the architect employed estimates the total cost of the restoration at 2,400. Sherburn.—The charle of Sherburn, near Leeds, beared. It has undergoine some syme syme syme syme syme are supersymptotic. A committee, headed by Lord John Man

baseben ropened. It has indergone some extensive alterations and improvements, in course of which many specimens of Norman architecture have heen brought to light. The roof, which is high-pitched, is brought to light. The roof, which is high-pitched, is cntirely new, and the windows have been filled with eathedral and white glass, in ornamental patterns. The two galleries in front of the tower have been pulled down, and the body of the church filled with uniform pews of oak, and stained deal, with much in-creased accommodation. Some stained glass has been put in the west window of the tower. Much of the old Norman work has heen restored.

ARCHITECTURAL PUBLICATION SOCIETY.

ARCHITECTURAL FUBLICATION SUGARLY, WE notice the recent issue of the second part of the works for the year IS56-7, consisting of thirteen plates in illustration of some of the articles in the letter C of the "Dictionary of Architecture," now in course of publication by the Society. These plates, like their predecessors, are foll of useful and in-structive material : some of them, we may say, are too crowded, hut the subjects in them baving been care-fully discussed, they each bave fair effect. The first induction of the subjects in them baving been carecrowded, hut the subjects in them having been care-fully disposed, they each bave fair effect. The first plate gives us a "Canopy" covering the chair of the Cardinal Archbishop in the Duomo at Naples; a nseful example, but poorly lithographed. Under the title, "Capital," we have two plates, which exhibit twenty-three specimens," chiefly of the Medieval period; these will surfly not be the last under this heading, although some difficulty will perhaps be ex-perienced in obtaining sketches of worthy subjects which have not been already unlead hefore the student hich have not been already placed hefore the student. which have not been already placed helore the student. "Chimneypiece" follows in a fine but greatly dilapi-dated specimen from Liblithgow Palace, presenting three openings, which may be advantageously com-pared with those in Viollet-le-Duc's dictionary. We pared with those in Viollei-le-Due's dictionary. We may say as much of the four other examples of a more domestic character, from Cashel and Kilmallock, in Ireland: these afford very nsofol hints to designers for ordinary purposes. "Cbinney-top" ought to be the last plate (it is the fourth given) devoted to this almost exhaustless subject, but the committee has acted rightly in so often directing the attention of the profession this way. The meson relation to the profession this way. The present selection of twenty-three examples affords ample scope for alteration and improvement : many of the originals, it must not be forgotten, are used only for wood or charcoal fires. "Church," exhibiting an interior view of San Spirito,

at Florence, designed by Brunellesco, is a thirdd facsimile of a very careful drawing made on the spot by Mr. F. P. Cockerell, and affords some interesting bits of marginia affords and interesting hits of perspective effects : it is also good as a whole, Into of perspective effects : it is also good as a whole, and a record of a very euriously planned huilding. We should be glad to see many other examples of these interiors : hey afford a large field for study, if selected with regard to their architectural merits, and not merely for artistic effect. The same obser-vations apply to a following plate of "Confession," the example being selected from Fontane's "Chiese di Roma," an expensive and we being accurate various apply to a barrow of the system of the example being selected from Foutane's "Unlesse di Roma," an expensive, and, we believe, somewhat rare work in England: the plate is filled with the view looking up into the church of San Martino ai Monti. It will be inspected with interest even by those who have visited that great eity, as travellers do not conversily see this out-of-the-way church, which is those who have visited that great city, as travellers do not generally see this out-of-the-way charch, which is well worthy of a careful inspection. The treatment, of the ornamental portion especially, in the lithograph, is, we suppose, the result of a careful initiation of the original Italian print: it reminds us of a style of engraving of former days in England. The plate of "Church-plan" presents unieteen examples of various types, commencing from the old basilica of St. Peter's fifth to ninth century), and ending with St. Stepben's. types, commencing from the old basilica of St. Peter's (fifth to ninth century), and ending with St. Stephen's, Walbrook (1672). It is interesting to note the use of the circular apse from fig. 1 to fig. 13; the examples from Italy, France, and Germany; and the square eastern termination of York Cathedral, and the other churches selected from England. Boston Church, Lincollushire (fig. 15), it will be remembered, has the merit of heing the largest church in the United Kingdom without cross sizes. "Columbarium" re-minds us of the manuer in which many of the Roman has the merit of neing the targest course in the United Kingdom without cross sisks. "Columbarium "re-minds us of the manuer in which many of the Roman houses kept together the remains of their families, servants, and clients. Instances of private mansolea will occur to the memory of all our readers, and something of the same kind is heing gradually reintro-land on writing togethic in our mubile conseteries aontenning of the same kind is heing gradually reintro-duced on various scales in our public cemeteries. "Corbel" gives four very picturesque and suggestive examples for the country practitioner. To give ex-amples of "Cornice" without dimensions, approxi-mate or otherwise, and their height above the surface

of the ground, is unsatisfactory: the specimens, how-ever, are suggestive. The "Cortile" of the great hospital at Milan is shown in the next plate. Many hospital at small is snown in the next plate. Justice the plate of the details of this building will be found in the carlier parts. "Crocket" forms the subject of the last plate, and this we shall hope to see additionally illustrated, those before us heing confined to one style, that of late French-Gothic; but they are charming compute of their also.

style, that of late French-Gothic; but they are charm-ing examples of their class. The materials for these plates have been, like those of former parts, collected and arranged by Messrs. Hansard and Lewis, through the kindness of the owners lending the original sketches. On the present occasion these consist of (taken as the plates occur), Messrs. C. F. Hayward, H. B. Garling, T. H. Lewis, H. R. Newton, W. Lightly, C. Fowler, jun.; R. H. Shout, of Ycoril; J. H. Walton, Professor Donaldson, F. P. Cockwell, Oct. Hansard F. Blatchher, J. M. Shour, of reverly, e. H. Hansard, E. Blatchley, J. M. Lockyer, E. H. Martinean, H. R. Ricardo, Ewan Christian, T. Roger Smith, and from the sketch-book of the late A. J. Green, lent through the kindness of Mr. Tite, M.P. Our impressions, for some reason Mr. Tite, M.P. Our impressions, for some reason, are uot all printed so sharply as usual: in fact, the work on some of the stones is not excented with Mr. Bedford's usual effect: a heavier and uncertain and appears to have worked on many of the plates with a result less happy that that of previous parts. To speak more plainly, they are very ill done.

THE LATE WILLIAM DEANE BUTLER, ARCHITECT.

This gentleman, whose name as an extensive prac-titioner of about forty years' standing is familiarly known to the Irish public, expired suddenly at his residence, Stephen's-green, Duhlin, on Saturday night, e 23th ult.

When Mr. Butler commenced his profession, after putting the office of the late Mr. Beazley, to whom he served a portion of his apprenticeship, the number of architectural practitioners in Ireland was exceed-ingly limited; and, after a comparatively short time, found himself in the enjoyment of an excellent he tout a timsen in the enjoyment of an execution share of husiness, which he preserved up to the time of his death. Mr. Butler was universally acknowledged to he an architect of considerable ability and excellent taste; and has left some perma-ability and excellent taste; but his divergent aminy and excenter taste; and has left some perma-near memorials to his fame behind him. Anongst his chief public works may he noticed the Roman Catholic churches of Roserca and Monasterevan, both important edifaces, in the Gothie style; the terminal buildings at Dublin of the Duhlin and Drogheda Railway. of Italian character, the new schooled as Railway, of Italian character; the new cathedral at Kilkenny, recently consecrated, and the façade of the Palatial Mart, at Sackville-street, Dublin. Independeutly of these, Mr. Butler had an extensive private practice, and designed some mansions for the resident nohility and gentry ; to his skill, too, Dublin is much indebted for some handsome shop fronts.

The profession in Ireland may reasonably be con Ine profession in irreinan may reasonauty be con-sidered to have lost its "father," as we believe Mr. Butler was its oldest member, and certainly he has left behind him a greater number of pupils prac-tising as arebitcets, and of eminence, than did any other.

For many years this gentleman hold the appoint-ment of architect to his Excellency the Lord Lieutenant, hut we helieve the enclument (if any) was very trifling. The immediate cause of death seems to have been

paralysis of the throat, and although Mr. Butler had, paraysis of the virola, and through art. Dutter had, some twelve months since, an attack of that malady, which affected other portions of his body, his call from life was very sudden and unexpected. Mr. Butler has left a wife and thirteen children.

EXTENSION OF THE FOUR COURTS, DUBLIN.

THE new buildings about to he erected for the Courts of Appeal and Incumbered Estates will occupy a site at the rear of the present Four Courts, and at Course of Appen and Incumered Exacts with occupy a site at the rear of the present Four Courts, and at the point where Pill-lane unites with Morgan-place. They will comprise a hlock with two projecting wings, and present a frontage to Pill-lane of about 130 feet, here a both 50 feet. and present a trontage to Fill-lane of about 130 rect, hy a depth of 80 feet. In style the architecture will be consistent with that of the cristing huldings, but of plainer character, having chiselled granite stone fronts with rusticated basement, simple architraved windows, and a continuous entablature of architrave frieze and cornice, with blocking over the same.

In height they will be three stories, exclusive of assument, which is intended to contain court-keeper's apartments, document rooms, urinals, water-closets, &c. &c. On the principal floor will be a grand stone feet; and masters' and examiners' rooms, clerks

feet; and masters' and examiners' rooms, clerks apartments, chambers, &c. The courts are to be carried up two stories in height. All the buildings will he, as far as practi-cable, fire-proof, and the floors of the wide spans will be supported on a series of metal giriers, with hollow brick arches. The cellings in the basement are of arched brick also; and the foundations are to have a considerable quantity of concrete, formed of Medina ecuenat, air slaked lime, clean fresh-water sand, and fue and coarse gravel. Over the commissioners' courts, iron lattice girders of 3-inch hy 3-inch engine iron at to pand bottom, with 3-inch hy 3-inch ension and extension bars, so disposed as to form a series of equilateral triangles, will be introduced. The huild-ings to be finished against the 1st of June, 1859, equinateral transpice, will be introduced. To e fund-ings to be finished against the 1st of June, 1859, under a penalty of 25%, per week. The prohable expense will be 15,000%, or 16,000%, ; and the plans Capitales will of 10,000% or 16,000%; and the plans have hean furnished by the architect to the Board of Works. The commissioners are about applying to Parliament for a Bill to make considerable improve-ment in the locality of these buildings by the con-struction of a new street from the western side of Greek-street to the castern side of Old Church-street, the closing with Constraints and the street street in the street street street in the street st the closing up of Chancery-place, Mountrath-street, Morgan-place, and portion of Pill-lane, and the pulling down of a number of old houses. Should this he obtained, considerably greater huilding works will be undertaken than those now being contracted for, and the frontage to the quays greatly increased.

An iron tramroad is to he laid down from Ste-phen's-green to Round-town, the leading thoronghfare at the south side of Duhlin.

ELM, NEAR WISBEACH.

THE ECCLESIASTICAL COMMISSIONERS.

Some of our correspondents are concerned to hear that in the repair of restoration of the chancel of Elm Church, slates are to be substituted for the old Eim Courch, states are to be substituted for the old covering of lead. If we have heen correctly informed, the facts are these: —The parishiouers of Elm, in a laudable spirit, and at considerable expense, have cleaned, repaired, and restored the interior of their large and interesting church, and they intend to follow up this good work by abolishing the present mainthip require and arbitivities for it which her unsightly pewing, and substituting for it plain but substantial, uniform, and commodions henches. It would appear that the chancel is in the hands of the wound appear that the chancel is in the hands of the ecclesistical commissioners, as appertaining to a "suspended" canonry, from which the commissioners derive an addition of I,2007, per annum to their already conrous revenue. The fittings of the chan-cel were mean in the extreme, and the east window and the roof were modern work of the process and the roof were modern work of the poorest description : still the roof was loaded, which is the case, with hut very few exceptions the district.

The parishioners applied to the commissioners to repair and restore this chancel : the commissioners on repair and restore this chancel : the sum required is but a portion of one year's receipts; and, although we admit that, as trustees of church property, the com-missioners might not be always justified in expending money upon mere ornamed, we are strongly of opinion that they should act faithfully as conserva-tors of the huildings which have fallen into their hands, and not suffer, under any pretence, the lead of a church or chancel to be stripped and exchanged for slates. slates

LONDON DIRT AND LONDON WANTS.

LONDON DIRT AND to Londoners, hy your I ASK leave to point out to Londoners, hy your I Ask neave to point out to Londoners, by your help, a metropolitan peculiarity which never fails to strike me, a provincial, as strange, offensive, and un-necessary. I mean the stupendous filth of London public places. I do not mean houest, necessary dirt, but neglected, accumulated, remediable dirt. I observe that in many districts the dirt of the roadways is left mean the surface from due to due new to weak to upon the surface from day to day, week to week, and month to month; stinking dust in dry weather, and, in moist of mouries, similing dist in dry weather, and, in moist and wet weather, stanking compost, varied, from an adhesive greasy paste, through different degrees of dilution, to the *ne pissuitra* of abomina-tion, a liquid slush, about the thickness of pca-soup. I notice holes and corners,—poor alleys and courts, *culta-de-sac*, ice where this dirit is piled and hastered in masses like drifted and the start of a the distort culd-de-sace, &c. where this dirt is piled and plastered in masses, like drifted snow. I see (to take merely one or two iustances) the staircases and stairs leading from the Loudon-Irridge approach on the City side, to the street below, in a state of dirt uttryl disgraceful. I cannot suppose cleansing has approached those places since they were opened as public ways. I see the pavement of the Plazza, in Corent-garden, caked over with dirt which seems to be never removed. I want to know why all this nastiness need prevail. &c. &c. On the principal floor will be a grand stone over with dirt which seems to be never removed. I staircase, and a corridor running through, of which want to know why all this nastiness need prevail, are situated the various sceretaries and clerks' offices. I suppose rates are paid, or might be levicel, for the commissioners' courts, cach 28 feet hy 28 feet, with and it is inconceivable to me, living, as I do, in a proornamental ceiling and circular dome light; also a proposed court, to he erected hereafter, 39 feet by 38

day by day, that Londoners submit to this hideons nuisance of omainresent, overwhelming dirt. Allow me to offer a suggestion on another subject, occurring to me as an occasional visitor to London. Country people in town, leaving their hotels in the morning, and not returning to them till night, and, I doubt not, many Londoners away from home all day, greatly feel the want of establishments here and there, one of which I will describe as follows, viz.:--- eleen, airy, well-lighted, and comfortable room, where rest may be taken, newspapers read, meetings appointed (perhaps with a private conference-room attached), and letters written, where refreshments may be had of the huncheon sort, more satisfactory than burs and giagor-heer on the one hand, and less costly and elaborate than the chop-house provision on the other, and where closets and washing-basins are at hand. I am disposed to think that a company would he a very profilable speculation, that had for its object to provide such places, thoroughly well-ap-pointed, and atteuded by good servants, at moderate priotes. Other London wants are dining-nalaces or water prices

prices. Other London wants are dining-places, or restau-rants, of a sort very angerior to the present average. After the club, to which comparatively few belong, there is at present nothing hut the expensive hote, the erowide, bustling, overheated, popular faciling place, the detestable gloomy chop-house, or the bad imitation of the Freach restaurant. The cheerful and comfortable restaurants of Paris might be very advantageonesly imported, and the carfus too. Let any one remember the various occasions when, on walking home at night from the theatre, or any other place, a desire has esized him for a glass of beer, or a cup of coffee. Out of certain districts where such things may be had, at places of an uscomfortable and unpleasant appearance, if not of a questionable cha-racter, nothing is open to him but the ginshop.

There is no not the grashop. I fear to have already written more than you will like to print, but I never visit London without noticing the above shortcomings and wants, and this statement of them might set some people to devise and earry out the remedies. A PROVINCIAL.

"BIG BEN'S" ANCESTORS.

THE following extract from the "Repertory of Antignaries" may afford anusement, and be of interest to your readers. It will show that one (at least) of Big Ben's ancestors was eracked like himself, and that to your readers. It will show that one (of less) of Big Ben's ancestors was cracked like himself, and thi the family, and though, of course, every one knows that our courts of law are now so immedulate that the important plaques do not require the same prospi-dity of the same prospin-self and the same so immedulate that the same the voice of Big Ben, congratulate them, sale at that their predecessors did, they may when the same the voice of Big Ben, congratulate them, sale at that the is speaking for an object different to that of his unfortunate ancestor, Turn of Westminster. The bell called from of Westminster half, by Paul's will before the door of Westminster Half, by Paul's will before the experiment. The dool called for such as cramery that as strong and about the beginning of the last courty of the same for the same of the same request of the same for the same the second second second of the sec-ford lag been up before the law stands of the same the dool to the same that and the same of the same of the same standing if the same the same of the same of 15. 4.2, Red thalf is called of the same for the same of 15. 4.2, Red thalf is called of the same for the same of 15. 4.2, Red thalf is called of the same of the same of 15. 4.2, Red thalf is called and the court, some of the same shared is an ending soon at of soon of the order that of the state of the same shared in th

ON NUMBERING HOUSES AND NAMING STREETS.

STREETS. Is a paper on various subjects read by Mr. Verelst last year, before the Liverpool Arcbitectural Society, but not published, some remarks were made on the numbering of houses and the naming of streets, from which, as the subject is again occupying attention, we may make a few quotations. Much of what was read had chiefly a local interest, confined to Liverpool and Birkenhead, but our quotations will refer to what was said as to the points in question in various towns on the Continent.

the Continent. In Paris, the numbers in those streets that are parallel with the river commence and continue on with the current of the stream, whilt these at right angles will the river side and even on the other, always commenced to the the hand. The stream of Maubein, upon the Rhine, was utterly and more receiving agin during the Frace wars, and has been several times ruled : it is therefore quite a modern town, and is rebuilt with all the streets at right angles. This aflorded an opportunity for an effectual system of system adopted is peculiar, for the streets, which are

THE BUILDER.

Nothing can be more inconvenient or absurd than the repetition of the same name for many streets.

the ropetition of the same name for many streets. It is interesting to see how little the French have been rolling of this folly. Karoly are two streets of the same name; but they have, instead, endeavoured to do honour to all classes of men, not even confining themselves to the great names of their own country. For instance, they have the Ruce Watt, Rue Newton, Rue Lord Byron, Rue Marie Stuart. Their naturalists are ropresented by the Rue Builfon, Rue Jussieu, Rue Cuvier, their writers by Rue Voltairo, Rue Molière, Rue Cuvier, their writers by Rue Voltairo, Rue Molière, Rue Cuvier, their writers by Rue Voltairo, Rue Molière, Rue Cuvier, their writers by Rue Voltairo, Rue Molière, Rue Cuvier, their writers by Rue Voltairo, Rue Abolière, Rue Cuvier, Rue d'Arnele, counding are such anness Rue des Pyramitles, Rue Cas-tiglione, Rue de Habylone, though it must be admitted Some of their names are not a litte odd is, as, for instance, Good Children-street (Kue des Hons Erafus), or 20th of Bel Ruepiro), English Gentlemen-street (Ane de Bel Ruepiro), English Gentlemen-street Aneog their des Instances and the one that must he admitted to be instances and the root that must he admitted to be instances and the root that must he admitted to be instances and the root that must he admitted to be instances and the root that must he admitted to be instances and the root that must he admitted to be instances and instances and the admitted to be instances and the root that must he admitted to be instances and the street is in the instances and the instances an

THE CONVERSION OF WOOD BY MACHINERY.

INSTITUTION OF CIVIL ENGINEERS.

INSTITUTION OF CIVIL ENGINEERS. In the paper read on the 17th instant, " On the Conversion of Wood by Machinery," by Mr. G. L. Molesworth, a comparison was drawn, showing the more rapid progress of wood conversion in America than in England. This was ascribed to the greater cheapness of material and the scencity of skilled labour in the former country, which gave a stimulus to invention; whilst in England the case was different, the material was comparatively expensive, and skilled arisans were abundant. Nor was the system of the the material was comparatively expensive, and skilled artisans vere abundant. Nor was the system of the subdivision of labour as yet fully carried out, the con-version of wood heing hitherto in the hands of a class who could not employ much capital in machinery, or keep it constantly at work to the greatest advantage, even when they had it, such at the same time, the was even when they had it ; and, at the same time, the pre-judices of foremeo and the combinations of workmen judices of foremed and the contributions of order that had operated powerfully against the introduction of new machines. Many of the machines of English construction had been of too costly a character, and had operated powertain agricus to the machines of English construction had been of toe costly a character, and in designing them sufficient attention had not heen given to economy of the converted material. The cheap and simple character of the American mechines was mentioned, and some of their characteristic details were described.

details were described. An account of the different kinds of saws, as well as the form of teeth, the modes of setting them, and the velocities adopted in Eogland and in America was given, and the silent friction feed, the Americau "Muley" saw, the author's arrangement of a revolv-ing weige, the methods of cross cutting, the pendulum, the dished saw, the secold and the band saws were briefly described, and mention was made of Mr. Exall's im-provement in the band saw. The author then proceeded to cummerate the

The author the proceeded to enumerate the varieties of planing-machines, which he classified under five heads, viz. ;--

1. The reciprocatiog plane.

* Murray's "Handbook."

- The fixed cutter plane.
- The rotatory cutters, on Muir's principle. Ditto with vertical axis, on Bramah's plan. 3.
- 5. The socket plane.

In describing these machines, the action of the carpenter's plane was compared with that of the machines, and some of the methods were mentioned by which its action had heen attempted to he assimi-lated in the machines.

The plauing machines were shortly described, as well as the different forms and speeds adopted in England and America.

Wen as the dimerical forms and speeds adopted to England and America. It was argued, that in order to produce good work the conditions to be fulfilled were, a high velocity of cutters, not too rapid travel of work, a solid hed to cut against, the working parts well balanced, the hearings steady, and the angles of the cutters properly determined. The author condemned the asual em-pirical method of determining the angle of the cutters, and insisted upon the desirability of taking into con-sideration the nature of the material, as well as the ebaracter of the work, and the diameter of the cutters, in fixing upon the proper angle. He then stated those angles which he considered best for different kinds of woods and varieties of work. Brief descriptions and diagrams, illustrative of the principles of the following processes and machines, were then given :—

ere then given :-

1. The American shaping-machine, with pattern concentrical collar guide, for planing irregular and work

2. The different methods of tenoning with chisels, or with an assemblage of circular saws, or with the

ordinary tenoning cutters. 3. The copying-machine for producing fac-similes of a cast-iron pattern of any irregular shape, b means of rotatory cutters made to recede or advance by the pattern, which revolves simultaneously with by

4. Hughes's spoke-machine with tubular cutter-shaft, and moveable cutters, acted upon by a traversing pattern.

The railway kcy-machine, invented by the or, for entting the taper simultaneously on two 5. 7 author,

author, for entiting the taper simultaneously of two 6. Strel's car-machine, as used at Chalham Dock-yard, for roughing out the car with swirelling circular saws, aod finishing it, by a series of cutters acted upon by a "fect-iron," so as to produce a varying form of blade and "loom." 7. The methods of dovtailing on Wimshurst's plan, by a series of roting cutters, and on Burley's plan, by a series of reciprocatiog chisels and eirenlar saws.

saws.

The method adopted in America of forming the 8. dovetail on the mitre

The different boring-tools were noticed, and an account given of the modes of mortising, by giving motion to the chisel and reversing it, as well as the forms of mortising-chisels, and the devices for clearing the mortise of chips

the mortise of chips. The subject of timber bending was hriefly men-tioned, and a description given of Hookey's mode of bending ships' timbers, Meadows's patent for bending vencers into and around the sharp angles of mould-ings, and Blanchard's method of bending all kinds of timber, by applying end pressure to it, while it was wound round a can of the desired shape. In conclusion, the author considered that wood conversion was not fully developed in this country, and hoped that this paper would direct the attention and ingenuity of engineers to the subject.

and hoped that this paper would direct the attention and ingenuity of engineers to the subject. At a meeting on November 24th, an appendix to Mr. Molesworth's paper was read. After reference to the manufacture of casks hy machinery, Hamilton's machine for sawing curved ship timbers was described as having an inner gate, and the hlade so hung as to allow of a transverse as well as a swivelling motion, for curvilinear work; the log being so arranged as to be turned on its axis whils travelling, and to he cut to any desired bevel. Green's method of adapting an indicator roller to this machine, for cutting variable herels from a small seale diagram, was also meetioned. A description of Jordan's wood-curving machinery was given, with his method of producing a species of foating movement in the table carrying the pattern and the work, nadera frame furnished with a series of drill-cutters and a tracing knob, so as to produce several copies simultaneously from one pattern. The pattern and work simultaneously, was also described. A description was afterwards given of the ingenious machines, also invented hy Mr. Jordan, for making the frames of school shates, at Colonel Pennan's quarries, near Bangor. The logs of American hire were first cut up hy frame saws: the planks were then seasoned for six months, and were afterwards growshead for six months, and were afterwards cross-cut to proper lengths, passed over a series of circular saws and grooving cutters alternately fired on the same shaft: the mortises and tenons were cut in

two other machines : the end mortiscs, tenons, and two other machines: the end mortises, tenons, and shoulders were then cut, and the slates envired by four of these pieces. The frame thus formed was then laid egainst two stops, and a pair of drills de-scended moon the opposite corners, making two holes : it was then reversed, and another pair of holes were made in the other two corners, pegs were inserted, aud the work was completed.

PROGRESS IN THE CITY OF BAHIA, BRAZIL.

A COMPANY has just been formed for the provision A COMPANY has just been formed for the provision of a pattent silp, a jetty, capable of coaling the hargest steamers, bonded warehouses, and stores, for the deposit of coal. Lient. Robert Grundy, C.E. has heen nominsted by the Board of Directors, to act as direct-ing manager, and the works are to he commenced forthwith, and carried on with such activity as ean he compassed in this somewhat sluggish locality. Another company is tabled of the erry out the pro-Another company is talked of, to carry out the pro-ject of horing a tunnel through one of the hills in the ject of boring a tunnel through one of the hills in the city, in order to form a communication between the lower level of the city adjoining the bay, and an iu-land portion, from whence there will be an easy access to the upper level. The city of Bahia varies very considerably in level, and there is now only one very steep and dangerous carriageway, connecting the upper and the lower portions. The tunnel will have to be cut through solid granite rock, and although no very astonishing work in Europe, it will be attended with difficulty in Brazil. Mr. Vignoles, the engi-neer, this pronosed and recommended this plan which here, its proposed and recommended this plan, which, where carried out, will be an important and valuable improvement to the eity. Bahia is shready provided with water-works, and some of the fountains which were purchased at the Paris Exposition have heen placed in the squares. The buildings are well con-structed, and in many instances considerable excel-lence is shown in the design of the fronts of the erections in the commercial parts of the eity. churches are very numerous, some of them being well worthy of notice in an architectural point of view. The Church of the Conception is interesting, being principally formed of blocks of marble, whit sent over from Europe ready worked, marked, and numbered so as to be put together in accordance with design of the European architect. The paving of the design of the European architect. The paying of the streets is excelled; but not so heavy and substan-tial as we are here newatomed to, as they have in Bahia very little heavy traffic. There is abundance of stone, which is admirably adopted for building and paying purposes. Some of the ancient brick Dutch paying may still be seen in the older parts of the city. The population of B.shia exceeds 150,000,

DIFFERENCE IN BUILDERS' TENDERS, AND THE CAUSE.

Is my letter to you on the subject of the difference in the amount of builders' tenders, nothing could he further from my intention than to hring forth any personalities. I am very glad the subject has excited personantities. I am very grau the subject nas exercise considerable affection, not for this particular case, but on a general principle, with a view, if possible, to end a practice which strikes every one as being most remarkable, and only accounted for in one way, that

remarkable, and only accounted for in one way, that some builders must be "rogues," either to themselves their creditors, or their employers. It would be useless for any one to attempt to answer all the "perplexities of some persons," or the sophistries of others. I can have nothing to do with "fulness of quantities".—they orgin to be, and I believe they generally are, correct ones,..." or the mistakes of others," "the pricing of all items," "or only part." My experience tells me, if I have to build a straight wall, it is worth so much a rod ; if it has a circular corner, there is so much more belower to bank a straight wan, it is worn so moch a row; it n has a circular corner, there is so much more labour to pay for; if it has a stone coping on the top, it must be paid for by some one; and if only a hrick on edge in cement, it will east more than if done in mortar.

Now, what are the facts before us ?

Some gentlemen require an alteration or a rebuilding of their business premises: they apply to an architect, and he proceeds with his work, and pro-duces certain plans. Surveyors are appointed, and they take out the quantitics, and it will be to their disgrace if they are not correct, and neither full nor short, as they are to he will paid for their work. In my estimate, the amount put down for them was 671. 4s. 3d. besides "201. for expenses of litho-graphing."

THE BUILDER.

the "bad celenlators and the non-calculators;" but I pounds there, an allowance of 3s. per head upon take an estimate (my own) which is just the medium between the two, heing 24 per cent. above the lowest school teachers, who happen to pass an examination estimate; and agreeably to my promise I have here: in drawing at the end of the year; if, I say, the rewith sent you one of the bills of quantities, moneyed in uneration of the art missionaries of the land is to the "bad ealchlators and the non-calculators;" but I take an estimate (my own) which is just the medium between the two, heing 24 per cent. above the lowest estimate; and agreeably to my promise I have here-with sent yon one of the bills of quantities, moneyed out the same as I had previously moneyed my own estimate, with 24 per cent. off each item, which brings the amount to 2,800.4. I pledge myself they are all on the same scale, and you may judge yourself if I speak the truth, when I say that they are none of them remunerative, large or small, but generally on an average 12 per cent. under prime cost. The labour must be paid for in ful, or the works will stop on the first Saturday night this is omitted, and the labour is generally considered to he about one-third of the smount of the contract--hereby throwing all the loss on the materials, which will amount to about 22 per on the materials, which will amount to about 22 per cent. on their cost. I can perfectly understand how a tradesman, heing a brickmaker as well as a huilder, may sink the merchant's profit to make in himself a sufe market, how a man with ready money may make a cheap market, and how savings are made in many ways, hut I will defy any builder, be he whom he may, to make a profit out of such a schedulc of prices J. F.

THE JOINERS' STRIKE AT MANCHESTER.

DEAR MR. EDTOR, — I bg to ly be'ore you, and the readers of your valuable Journal, the facts re-specting the strike now pending between the joiners and their employers in Manchester. Up to last May, our time of working was sixty hours per week, in summer, and fifty-five in winter, averaging fifty-eight per week the year through. In May, after much be/dring and natified stikes, the avolutions candidate summer, and fifty-five in winter, averaging fifty-eight per week the year through. In May, after much bickering and partial strikes, the employers acceded two hours per week; that was, to leave off at one o'elock on Saturday; but on the 5th October, the employers issued new roles without consulting us, that we must work fifty-seven hours per week, winter and summer alke, to commence on the 10th. After allowing us a week's grace, and we coming to no definite settlement (we having offered to work fifty-sit hours new week or fifty-eight in summer and section sector and the number of filly-eight in summer, and fifty-three in winter), we were turned out on the 19th. Since then we have been offered the arbitrafrom of three architects, which we have refused. The mayor has kindly offered to interfere. We have re-fused that also at the suggestion of a letter in the Guardian. Altering the time to fifty-eight hum the week in summer, and fifty-five in winter, averaging fifty-six hours and fifty-one minutes, the year through, our employers offered us that which was treated with contempt.

Now, in the name of common sense, or bumanity con you, Mr. Editor, or any of the unmerous renders of the *Builder*, point out any other rational mode how such unfortunate disputes can be settled ? By so doing you will oblige, with many more,

A JOINER UNWILLING ON STRIKE.

The rational mode of settling a dispute is that * The total more of secting a displace is that which the joiners have refused, --manely, a reference to importial third parties, in whom all have confidence. As to the "common-seuse" to which our doubless well-intentioned correspondent appeals, we are forced to confess that we find very little of it in this unfortunste affair. Is this a moment, when hulding ope-rations are heing discontinued, when capital is not to be obtained but with the greatest difficulty, and a dark winter threatens all of us, for men to give up dark winter threatens all of us, for men to give up their employment on a question of one hour's lahour their employment on a question of one hour's lahour a week? A joiner, or any other workman,-engi-neer, elergywan, or prime minister,-has the fullest right to take his lahour to the best market, to obtain the full worth of his special skill, which worth is of course materially influenced by the amount of that bill deamhere definished, but conclicit mendle at the skill elsewhere obtainable; but surely it would not be contrary to "common sense" to learn, hefore rejecting the offer of one customer "with contempt what its real value in the market is, and to feel tolerably assured that a better customer could be found elsewhere.

THE MACHINERY FOR ART-EDUCATION SIR,-The thanks of all parties interested in a wide-spread art-churación are due to you for your able and impartial article in the *Bailder* of the 21st ult. on the remuneration of masters of schools of art. There can be no doubt that if art itself is to be 677. 4s. 3d. besides "207. for expenses of litho-graphing." The bils of quantities are delivered to the builders, if it is ever to ge hand-in-hand with our and each contractor is at liberty to examine the drawings, and make himself master of the builders is to commerce jif ever, as an integral portion of the works to be performed. Now, all starting fing the works to be performed. Now, all starting fing the works to be performed. Now, all starting fing the works to be performed. Now, all starting fing the state event is founded upon the minimum on which a man of going to draw any inference hetween these two tenders, as it would be placing myself in the power of those gentlemen whom I have repudiated, respected in this country ; if it is ever to he wedd

[Dec. 5, 1857.

be provided in this precarious way, can the contry expect that art-education will, after all, result in becoming anything more than a delusion and a snare ?

There is hut one portion, perhaps, of the article to which I have alluded, from which I must heg leave to dissent; that is, the part that suggests that a con-siderable allowance should be made to an art-school for a year or two, and then be discontinued. I am afraid that, like many theories on this matter that look well enough upon paper, this would never auswer in practice. I think those who have had any experience in provincial schools will agree with me, that the third and fourth years of a school's existence are those that are just the most trying to it : I mean a school that is working fairly and honestly under the same master ; not one of those that arc always found under under a new name, and seem to be ever writhing under the spasmodic convulsions of continued fresh starts

Before a school is opened, care should be taken that ere is next to a certainty of its affording a respectable and increasing income to a master; that there shall be a fair field for the exertions of a clever and active man; and that there should be no fear, if he does his duty, of poverty or overwork preventing him from holding np his head in the town in which he is placed.

he is placed. It is very well in theory to say the people should manage all this for themselves; that if they want art-education, they will pay for it, &c. The opposite theory is now pretty well established; and as Mr. Cole states in his, lecture, reported in your number of the 21st nft, p. 666, --"As the people have fold their the state have bed power to express them in Parliawants, and have had power to express them in Parlia-ment, so the central authority has been called upon the daminister to these works; and it is the Govern-ment itself, rather than the people, which has ender-voured to obtain and preserve as much local co-operation as possible." And since it is now pretty generally conceded, that a useful function of the Government is to aid in the

art-education of the people, it merely becomes a question how this desirable object is to be effected. The Department of Science and Art, when it came iuto power, found, no doubt, iu the schools of design, into power, found, no doubt, in the schools of design, amongst much that was genuine and good, some aluaces: it found some men (they were, however, only exceptions) in the receipt of considerable salaries, who were not devoting themselves to their duties with zeal and efficiency: and it is searcely to he wondered at, that looking at ahuses of the old system, the mea-sures of the new one should be too sweeping; there-fore, from psying masters foir salaries, with consider-able carelessness, it came to paying them none at all, or only such an amount as should secure their con-nection with the Department from being entirely the Department from being entirely nection with hection with the Department from being entirely thrown off. It would not be doing the Department justice if it were not added, that an unifing energy was at once directed to the reform of abness, and a system of training and examination instituted, so as to scence masters fitted for their work.

Much credit is also due to the Department for the recognition and adoption of parts of the scheme of the Committee of Council, such as the pupil-teacher system, which may he the means, in provincial schools of obtaining a maximum amount of instruction, with a minimum cost; and what is chiefly re-quired now is, that the Department should adopt some of the hetter aud holder, as well as the more *petile* portions of the committee's scheme. For instance, under the Committee of Council on Education, any master of any training college in the kingdom may come up for examination in one of various subjects come up for examination in one of various subjects, such as history, literature, geography, &c. and on passing a successful examination, heccure possessed of a lectureship on his own particular subject, which carries with it an augmentation of salary of 100/, a year, to which (I believe I am right when I say) the college to which he is attached is bound to add at heat 1500 the approximation of the subject the relief. least 150, per annum. Now, I trust the nohicinan and geatlemen at the head of the Department would meet with no contradiction, if hy adopting this arrange ment they asserted their conviction, that the time had now arrived when art is hy all considered worthy of now arrived when art is hy all considered worthy of ranking high in our educational arrangements, and

breaking through it the next; or in inducing men,

breaking through it the next; or in inducing men, on certain conditions, to go through a halorious course of study, to ohtaio cerlificates that shall carry certain money payments with them, and then changing these conditions for others that in some towos it is impos-sible for them to fulfil. If the whole question is re-opened before the country and Parliament, as it is not unlikely it may be, the injustice of the alteration will surely be insisted on. Another matter in which the Department might safely follow the Committee of Connell, is in the assistance rendered to local effort, in the erection of suitable buildings for earrying on schools of art. If a common clementary or national school for poor chil-dren is required, under certain conditions, a large portion of the expense will be met by the Committee of Connell: why should not this he the ease with Schools of Art? Way, fa local committee are ready to guarantee, say built the cost of building, to sub-mit the plans for the approval of the Department, and provings to provide the greater part of a mes-ter's income, — why should not the State step in and give the requisite assistance? It surely would not he an unworthy outlay of a portion of the educational grant, and what is fair at Brompton cinn saaredy be false at Birmingham, or other pro-vincial towos. vincial towos.

The Department of Science and Art deserves sc-cess, and with men of talent at its head, and esta-blished firmly as it now is, might throw off some of those ultra-conomical shackles that at first restrained it, and by a wise and discriminating liberality (not confined to the metropolis), consolidate itself in public esteem and support. A CERTIFICATED MASTER. esteem and support.

THE WATER SUPPLY OF THE SUBURBS. LEA-BRIDGE.

It has been already stated that a portion of the Hackney marsh has been visited with fover and other preventible diseases, a circumstance not to be woo-dered at when it is considered that the dwellings are preventible diverses, a circumstance not to be won-dered at when it is considered that the dwellings are iplanted without care on the damp soil, and have no thorough means of drainage. I would, however, just anow direct attention to the water supply of this lalready considerable number of houses, which pro-misses shortly to increase. It has been remarked that the East London Water Company have formed a remain from the Leariver at a distance of several miles mearer to its source than this poind, it having heen ishown that the large quantity of sawage discharged from the rapidly increasing district near this stream whad rendered it unfit for human use; and notwith-tstanding this, and that the clear filtered water of the recompany is within a stone's-throw, and could be laid non to all these houses at a small annuel cost, the in-hahitants of the Lea-bridge take their water from the "polluted part of the river, or from doubful wells. The matter of the water supply, if provided for the spoor of the metropolis, still requires great care, and it is bould he borne in mind, although the fact has not the no equipare water supply and the shorek-sing out of the last attack of cholern at Newcostle-on-tions of the set on supply in short and econsing out of the last attack of cholera at Newcostle-on-Tyne, the ordinary water supply ran short, and a conwiderable part of the town was supplied from the PTyne, which was then little better than a buge sewer.

In connection with Lea-hridge, why should the poor people there be obliged to drink water which has heen distinctly shown to be unfit for household isuse F

anse? It is difficult to deal with properly already built, and which is often so fettered with ground-rents and other charges, that it is not a source of much profit; but people's lives must be taken eure of, and certainly prompt measures should be carried into effect to prevent the growth of such neighbour-choods as Canning-town; and in order to effice this, ano time should be lost in extending the circle round London which will come under the sanitary law? Some will say, "Why make a limit of any districts. But render it unhawful, in any part of the kingdom, also erect groups of dwellings which cannot be pro-eperly provided with the means of health." LOOKER-ON.

THE APPRENTICESHIP SYSTEM.

Ar the annual general meeting of the Royal Scottish Society of Artsheld last week, Professor George Wilson isociety of Arts hild hat week, Professor Goorge Wilson Mellivered an address, in the course of which he reformed os a paper on "the Appronticeship System," read re-cently by Mr. James Robert Napler at Dublin. The byleet of Mr. Napier is to urge, in the plainest and wallest terms, that the system of long apprenticeships is a total mistake, wrongful alike to the apprentice, the sourneyman, the master, and the public. He discusses the system from many points of view, and, before an-amouncing that he has totally abandoned it, states that [# it is evident that apprentieships or long engage-ments are quite nunceessary, and that a husiness is genraed much more quickly without such." He

THE BUILDER.

quotes, in special proof of this, two facts-namely, that the unrivalled tools of Mr. Whitworth, of Man-chestor, are made by men who at one time were common laborares, and that the engines on board all the vessels built by his father since 1852, when a great strike occurred in the engineering establish-ments of Glasgow, have been made by "men who were originally house-carpenters or joinces; that many of the hest workers in his ship-yard were hand-loom weavers, and that half-starved nailmakers from St. Nuians, near Stilling, made passable riveters in ahoat a month." It is impossible not to be startled by such a statement. If Messrs. Napier and Whit-work can procure fit hands for their nice work, said Mr. Wilson, by subjecting intelliguet men to a few Mr. Wilson, by subjecting intelligent men to a few weeks' or mouths' remnnerated training, instead of weeks or monus reminerated training, instead of passing hoys through five ond seven years approxide-ships, then the sooner—so far at least as the master is concerned — the Initier are abolished the better. Mr. Wilson's own experiment in the medical profes-sion went with Mr. Napier.

COMMUNICATION ON RAILWAYS.

COMMUNICATION ON RAILWAYS. For years we have urged the necessity of enabling passengers to communicate with the guard. The want of the means to effect this is a blot in the system. Numerons suggestions have been made, but railway directors have not felt impelled to adopt one of them. Will Mr. W. Symons, of Danster, he more fortunatetham those who have preceded him? His plan is simple, and have more deliving any passenger to com-municate to the guard, whilst a train is in motion, a reason for wishing to stop the train. Two methods are provided for. The apparatus is simply a coid passing along the centre of the carriages, under the stations or addition of carriages in under the stations or addition of carriages in under the carriage from which he has received the signal. This arrangement consists of a mil which when not in use, have at the side of the carriage, and only projects a leave to site or the carriage, and only projects a leave to site or the carriage, and only projects a leave to barve or the carriage, and only projects a leave the site of the carriage, and only projects a leave the site of the carriage, and only projects a leave the site of the carriage, and only projects a carragement consists of a rill which, when not in use, hangs at the side of the carriage, and only projects a few inches, but may he extended to about 18 inches, so as to admit of the guard walking with perfect safety between it and the carriage; and it may be applied to all existing Dalghish carriages at probably a smaller expense than the French method. The second plan dispenses with the outside rail, enables a presenger to send a note to the guard, who, if neces-sary, may reply without leaving his seat, and should be see sufficient cause be can then communicate with the driver to stop the train. The appeartum for this could be applied to any carriage for a very small sum. Objections may he saggested, but we are very much disposed to think they could be obviated: at any rate lines.

NOTES UPON IRON.

Sourn Staffordshire is not now that fiery pandemon-Souri Statordame is not now that dery patternon-ium-looking place that it is when money is che-p and commundiate is good. Between thirty and forty blast furunces that a month ago were during forth monster tongnes of flame, each one apparently vicing with his neighbour in the foreness of his endewour for the section start have block spectra to fire the welkin, now stend huge black spectres metamorphosed by the offended gods into monuments metamorphosed by the offended gods into monuments of their ovar folly; if not of that of some of their ovarers also, in fancying themselves millionaires by being permitted to use a partion of the money of these who are such. Taking the number of the forences recently put out at thirty, that number would be a decrease of those in fare in Soptemuer to the extent of one-fifth; and, reckoning the make of each formace at 110 tons, no less thum 3,500 tons of pig-iron per week are now being manufactured in the great isomenation district of South Staffordehire short of

iron per week are now being manufactured in the great iron-making district of South Saffordwhire short of that which was being made two months ago. A further reduction will take place. In manufactured iron a much greater diminution in the quantity made must be noted than in the case of pig-iron. We think that we should be quite within the mark is asting down the malleable iron works as being arealy out to the scent of only half their emanti-pigaron. We thuk that we show a capite within the mark is setting down the melleable iron works as being employed to the extent of only half their capacity.
 sy that there are 2,080 pudding furaces at these for y 94 f ct by 50 feet, two siles to he constructed and their to set and the mark of the rend to mark every werk, we have a werk?
 the and firm mark every werk, we have a werk?
 the solution of 8,120 tons of pudding iron, or half the setablishment, at the back of the Gray's innurform and glass, by Messre. Cubit, the builders, for Messre. Ely. The factory is situated near to Messre.
 the is evident from these figures that the mark of pigs the number of hast furaces must he put out.
 The is evident from these figures that the mark of pigs.

 Approval was given for construction of a vinter sheller or the Aduntic telegraph, at East Green-

support to sixty families, we have, in the putting out of thirty blast-furnaces, 1,800 mble-bodied men un-employed, who, with their families of four in each, hecome 6,400 persons without bread. Then, if upon each pudding furnace in work there are employed four adde-bodied men having families, and two able-bodied upon without families, whave a total of 6,090 able-bodied men, who with the families indi-cated, number 18.270 persons,—in all 24,670 de-prived of the ordinary means of support, in connection with the immediate manufacture of pig and malleable iron in South Staffordshire. There are very few malleable iron works in South Staffordshire in full operation; we do not know of more than three or four. four

Nothing was done at Wolverhampton or Birming-ham on Wednesday and Thursday in the way of buy-ing and selling; and scarcely any orders have been received during the week.

At Wolve humpton, the association of coal masters in that district resolved to reduce the wares of their men—the thin coal workers—from 3s. 3d. to 2s. 9d. a-day from the 19th December.

ROYAL INSTITUTE OF BRITISH ARCHITECTS

ON Monday, 30th November, the ordinary general neeting was held at Grosvenor-street, Mr. G. G. Scott, V.P. in the chair; when the following Fellows and Associestes were halloted for, and duly elected — Mr. Gihert R. Blonnt, Mr. D. Addington Coblett, Mr. Thomas Cundy, jun. Mr. Rohert Kerr, Mr. John Norton, and Mr. W. Haywood, as Fellows; Mr. C. B. Arding, Mr. Francis Edwards, Mr. F. Hyde Pownall, Mr. Robert Willey, and Mr. W. Lightly, as Ascociation. Asso

Associates. Professor Donaldson, *s foreign corresponding member, presented a work entitled "Iconographic des Chapiteaux de Palais Ducal à Venise, par Mr. Burges, Archéologues." A bird's-eye view of the purt, docks, and garrison, at Kingston apon-Hull, was presented by Mr. Dighy Wyatt. A newly-invented lock, called the "Innaccessible Lock," was exhibited and explained by Mr. Blacket. A paper, copionsly illustrated, was then read hy Mr. W. A. Bouluois, Associate, "On the Foundations of some of the Metropolitan Bridges of the River Tianues;" and, after a short discussion, with thanks to the reader of the paper, the meeting separated.

to the reader of the paper, the meeting separated.

ARCHITECTURAL ASSOCIATION.

Are inference of the second se had been unside to return an answer to the request for a copy of the plan and particulars of the competi-tion, in consequence of a resolution of the towa-council, passed on November 9th, directing proceed-ings to be suspended for further consideration. The elerk also stated, that the subject had again hear considered at a meeting of the council, held on the 18th, and he was instructed to state that it had been resolved to waitone, without surface, that the subresolved to postpone further proceedings for the present

present. A long discussion took place relative to the desir-ableness or otherwise of locating the Association at the proposed new buildings of the Architectural Union Company, in Conduit-street. Ultimately, a resolution was passed empowering the committee to meet the promoters or directors of the Union Company, with a view to an understanding of terms. Mr. Wigley read a review of the "Instructions on E elesistical Buildings," by St. Charles Borromeo. The Chairman annonced that at the next conser-szione a paper would be reid on the "Progress and Development of Gothie Architecture," by the Rev. C, Bantell.

Boutell.

METROPOLITAN BOARD OF WORKS

At the last meeting of the Board, some architec-tural and building matters were considered and disposed of.

wich, hy Messrs. Glass and Elliott, 850 feet long by 30 feet wide, and 12 feet high, to contain two by 30 feet wide, and 12 feet high, to contain two coils of cable of 200 miles each, so as to protect the sall from frost and snow. A special committee of the Board has been ap-pointed to consider and report on the course to be

A special committee of the Board has been ap-pointed to consider and report on the course to be pursued with reference to the provision of suitable premises for transacting the business of the Board.

A committee has also been appointed to take into consideration the "Amendment of the Building Act," and also to report with a view to dealing with the matter in the cosuing session, whether any, and what alterations may he desirable in the local management and Building Act.

Mr. Leslie has given notice of motion to the effect, ART. Lesite ans given notice of motion to the category that the Metropolitan Board of Works do offer three premiums, amounting together to 1,000% for the best plan (by public competition), for the surface drainage of the metropolitan area, and conveying the rain directly into the Thames, or its tributaries.

THE STAGE AND MUSIC.

" Richard II." at the Princess's.—A crowded andi-ence assembled at the Princess's Theatre on Monday but assembled in the Finlers's limit of Monay night toweldown theresuscitation of "King Richard IL" after rivit of "The Tempest." We were glad to see that during this short recess the second bad neither lost its brilliancy nor the actors their energy; but still more gratified were we to observe that the audience evinced as thorough an apprecia-tion of this most successful combination of archi-tectural and costamic display, in strict accordance with period and precedent, as when the first of those grand revivals, that have conferred so bright on *éclet* upon the managerial career of Mr. C. Keau, proved bow greatly artistic impersonation might be enhanced by rigorously correct seconic accessory, and how strongly public taste was inclined for the innovation. The same scenes that formerly riveted attention, still seem to rotain their acres-tomed influence over the beholder. Neither the innnight towelcome theresuscitation of "King Richard II. riveted attention, still seem to retain their accus-tomed influence over the beholder. Neither the im-pressive solemnity of the bedroom in Ely House, with its "storied" walls, hay window, and capacious chim-ney, nor the effective simplicity of the room in the Duke of Lancaster's Palace, with its equilateral vanit, and coloured accessories ; neither the decorated arches and claborate panelling of St. Stephen's Chapel, nor the format and chaoraic paneling of St. Stephen schapel, hor the Norman valking of the crypt at Pombroke, nor the grandeur of the Casiles of Fint and Pembroke, nor the smilling landscapes that form so strong a contrast with them; beither the gebled streets of old London, nor the quaint characteristic representation of the Duke of York's garden at Langley ;—none of these have yet lost their admirers or their freshness. Mr. and Mrs. Kean's reappearance in their old parts was greeted with that genuine applause only accorded to artists of the first rank. Of Mr. Kean's conception of the trying character of the most unfortunate of monarchs, we need only say that it contained all those nice gra-dations of emotion,—hope, surprise, majesty, humility, rage, and resignation,—according to the alternations of his feelings and his fortanes, which have rendered his inpersonation of the fallen king one of the greatest triumphs of his long and ardonous career. the quaint characteristic representation of the Duke of

his impersonation of the fallen king one of the greatest triumphs of his long and ardonous career. Jultien's Promenade Concerts.--We confess we have held the present series of these popular enter-tainments in less estcem than any that have preceded it. A thinness in the occupants of the private boxes, and a cold apathy in the audience generally, may have conduced to our unfavourable impression, but a dis-passionate view of the case may easily prove to the most obdurate that such apathy is a result, and not a cause, and that the remedy may easily be found in a *better programme*. The interest in concerts, that cause, and that the remedy may easily be found in a better programme. The interest in concerts that are not hased upon the works of the great masters must ever be but ephemeral. The "Indian Qua-drille," too, has done more harm than good, and if it has drawn at all, it nust have been from curiosity and not from merit, being lameotably and infinitely the worst descriptive piece of writing that ever fell from the pen of its dever anthor. A week's ever fell from the pen of its clever author. A week's Ferlina, and from the pen of its clever author. A week's festival, comprising the works of the great masters, Hayda, Mozari, Beethoven, Weber, Mendelsoha, and Spohr, now, we believe, in progress, will go far, it may he hoped, to redeem the coldness of this year's and a more than the contains of this year of the second and also produce a golden harvest for the entrepreneurs. It is in combination with the immortal works of such writers, that the lighter music

THE BUILDER.

Vocal Association, consisting of 300 voices, will sing, and Madmue Conlon, Herr Goffrie, and the Distin Family, will play. The object of the society, which has now been established fourteen years, is so good, that we should on that ground alone invite our readers to give their aid, but beyond this the concert promises to be an excellent one : so that on marchy older, compute their side more soft to take. selfisb grounds tickets may safely be taken. Mr. George Pitt, of 3, St. Stephen's terrace, Bayswater, is the secretary.

Books Receibed.

Galleries and Cabinets of Art in Great Britain; being an Account of more than Forty Collections of Paintings, Drawings, Sculptures, MSS. &r. Fisited in 1854 and 1856. By Dr. WAACEN. Murray, Alhermarke-street, London. 1857.

This fourth and supplemental volume of the "Treasures of Art in Great Britain," by the Director of the Royal Gallery of Pictures at Berlin, is acknowledged by the author not even yet to complete his voluminous account of the art-treasures in this country. If described those contained in his first three volumes as "almost incredible in amount," but the vista rather reases upon this instead of algeing as he progresses. opens upon him instead of closing as he progresses and doubtless, although he does not promise it, we shall in good time have yet another supplemental volume, containing "a considerable harvest," and much that is worthy of notice," but admittedly not yet recorded.

In spite of his foreign origin, and the occasional but excusable blunders into which on this account he here and there fulls, Dr. Waagen has really done worders in making our art-treasures known to our-selves; and though it is perhaps questionable whether a native art-awant would have been allowed such access to them as be has had, what has already heeu done eannot hut show us what might be done hy one possessing the advantage of being an Englishman, added to such art-learning and powers of rescarch as Waagen possesses.

Dr. Waagen possesses. Meantime, we have not only to thank this gentle-man for the ability and perseverance, as well as the success, with which be has forreted out, and fixed on record, so many of our art-tressures, but also, to some extent, for the grand exhibition of these treasures which has just been closed at Manebester; and it is to be hoped that the British public will repay him by purchasing expises of the fruits of his labours. The methic increase of the relation provides the public of the section of the sec

by purchasing copies of the fruits of his labours. The most important of the collections mentioned in this fourth volume are: --The British Museum,-its additions and changes; the National Gallery; Lord Yarborongb's pictures in Arlington-street; Marquis of Hertford's; the late Mr. Morrison's; Sir Charles Eastlake's; Lord Overstone's; the Duke d'Annale's; Lady Warwi-k's, at Gaton-park; Lord Folkstone's; the Prince Consort's, at Keusington Palace; Lord Amherst's, Knole-park; Mr. Baukes's, Kingston Lacy; the Duke of Northumberland's, at Almwick and Sion; the Duke of Newcastle's, at Clumber; the Duke of Portland's, at Webeck; and additional Notes inpon MSS. both at Sir John Soane's Museum and University College, Cambridge.

Home Pastime; or, the Child's own Toymaker, with Practical Instructions and Illustrations. By E. LANDELLS. Griffith and Farran, corner of St. Paul's Churchyard.

WE have here an ingenious and by no means nuuseful development of the card-castle science. It will teach children of ten or twelve years old something teach children of ten or twerve years old something like a constructive use of their hands, which may he of practical service to them in after years when the stern realities of life take the place of childish fancy and annuscment. How many handless, helpless mor-tals do we see grow up to be niterly dependent on others, in every little trifling hand's-turn or petty is better the reasoning the horder into four the job that may require to be done, jost from want of a little constructive education of the hand in childhood. The objects to be ent out and put toge-ther in Mr. Landel's amusing "Home Pastine," ther in Air Lacets's annexity from rashing, are engraved in outlies shapes ou cardboards, a num-ber of which are enclosed in an envelope, along with the little tract of instructions. The forms are various, from Prince Albert's model cottages to a wheelbarrow, and comprise even such articles as railway and other carriages, engines, tenders, omnimortal works of such writers, that the lighter music of lighter pens may be combined, and a delightful buses, and perambulators, windmills, sledges, hed-result obtained; but without the former ingredicatis steads, &c. By help of a sharp-pointed kalit, a in full proportion, audicaces may be brongtit toge-ther, but will never be throughly satisfied. *Tron, Hardware, and Metal Trades' Pension* for the benefit of the Iron, Hardware, and Metal Hane for the benefit of the Iron, Hardware, and Metal dells, and, indeed (it being an ill wind that blows Trades' Pension Society, when Madame Bassano, no one any good), to the illoces of his own little Miss Messent, Mr. Montem Smith, Mr. Frank Bodda, Mr. Chapel, Mr. Eliot Galer, and the members of the provement on eard-castle building was invented.

[Dec. 5, 1857.

Miscellanea.

SHORE PREFENTION.—Messrs. W. B. Wilkinson and Co. of Newcestle, writing to the local Corrard, thus state their experience in smoke prevention:— "As regards common hakers' overs, which we use for calcining gypsum, we have just made what we think a very manifest improvement, at a cost not exceeding five shillings. We have formed the roof of the furnace, two foet in length from the door, of a fire-day lump, pierced its entire length with two apertures, opening above the furnace door, through which there passes a strong current of air over a red-hot surface this, hecoming heated, impinges against a vertical surface opposite the apertures, and is driven down on the top of the fire, improving, as we think, very much its heating power. We use small cools, and although a little smoke is made at the time of SMOKE PREVENTION .- Messrs. W. B. Wilkinson and although a little smoke is made at the time of and although a little smoke is made at the time of firing, it passes away in a few seconds after the closing of the door. The perforated fire-clay lump we have used is simply a sewer bottom, or invert hlock, turned upside down; and as this is now an article of commerce, and easily procured, we hope this commu-nication may induce others to try it. We don't know that there is any originality in the plan." ALMSHOUSES FOR INFORMER RESPECTABLENT.—

Every almostors founded by the benevolent in the course of time becomes a home for many who would either have to bear the greatest privation in their old age, or find an asylum in the workhouse, which, from the ignorance and depravity of many of its inmates, must he a wretched abode for those who have been in superior circumstances, and trained in moral and refined habits. Por the small sum of 500% or 600% such a home could be erected and endowed, and I wish there was such an asylum, or a pension society, in every parish, for the aged of good character in reduced circumstances .- the scum of society being inmates of circumstances,--the scum of society being immates of the workhouses, which are not, I repeat, fit homes for those persons of good character who have the mis-fortune to he destitute in their eld age. In Wales there are very few. Were the gentry of the princi-pality to unite to creet some, under the presidency of the Prince of Wales, for the natives of the twelve counties, it would be a great comfort to many aged persons in the decline of life. In the Isle of Wight, persons in the decline of life. In the Isle of Wights, too, some might be founded for decayed natives, or resi-dents of that part of the kingdom, her Majesty and Prince Alhert being respectfully solicited to become patrons; and I should like to see some erected in every county as a county institute, irrespective of the local institution of the same description. With your per-mission, I would respectfully entreat the support of the ladies of England and the decrey to increase such believing believing them to be useful and in

the ladies of Eugland and the clergy to iccrease such institutions, believing them to be useful, and, in common with other undertakings, to improve the comfort of our poor suffering brethren.—A. RAILWAY MATTERS.—On the Corwall Railway, at Saltash-bridge, the hydranlic presses are said to be most successfully employed in lifting the span of the hridge recently fonted across the Tamar. The west end was raised 3 feet in about two hours, and the means were set to work in building on undereast hit Integer terting nomed across the Fahnt. The west call was raised 3 feet in about two hours, and the masons were set to work in building up underneath it. The second span is making progress.—The traffic returns of the railways in the United Kingdom for the week ending November 21, amounted to 421,6707, and in 1856 to 419,4307, showing an increase of 2,2407. The gross receipts of the eight railways having their termini in the metropolis amounted to 169,8597, and last year to 173,1417, showing a de-crease of 3,2527. The decrease on the Great Northern amounted to 2,4057, so the North-Western to 1,8197, on the Blackwall to 274, or the South-Western to 2147, total, 4,4687. But from this must be deducted 1167, the increase on the Easter Com-ties; 8527, on the Great Western; 1827, on the Brirbhon; and 367, on the South-Easter of, 12646,2597, showing an increase of 3,4927, in the re-ceipts of these lines. ccipts of these lines.

DRAINAGE SCHEMES.—Mr. Lipscomhe denies that his hydraulic plan can have anything to do with the atmospheric system of a correspondent of last week, hat we are unable to go into the question.

THE MARYLEBONE CEMETERY AFFAIR.-THE MARTLEONE CENETERY APPAR.—Sir: Observing in your paper of the 14th November date, under the head of the "Burial Board and the Con-tractors for St. Marylebone," that I am one of the *contractors* in the joh, I beg to inform you that I have nothing whatever to do in the affair more than being one of the unfortunate securities. My sur-more attend that he would write to you on the order veyor stated that he would write to you on the sub-ject : should be have done so, please not to take any notice of this ; otherwise, please to insert this, as it stands to do me a considerable deal of harm in my business .- J. CULVERHOUSE.

Mr. Culverhouse is in error. He is described in the article in question simply as one of the sureties. To make the matter clear for him, however, we print his letter.

CHELTENHAM SCHOOL OF AET. - On Tucsday CREATENTIAM SCHOOL OF ART. — On Thesday versing, the 24th, a joint conversatione of the School of Art and the Literary Institution was held in the rooms of the latter Institution, the chair helg occu-pied by the Rev. C. H. Bromby, principal of the Cheltenham Church of England Training College. The large room of the Institution was hung with paintings and drawings by the School of Art pupils, emgravings, photographs, &e.; while on the tables were exhibited an extensive and interesting collection of detenoscening views a series of schemes presences of ivery. were exhibited an extensive and interesting collection of stereoscopic views, a series of specimens of ivory iturnings, galvanic and electro-magnetic apparatus, and microscopes, with a large assortment of micro-scopic sildes, and objects, including those minute triumphs of photography which, almost small enough to be covered by the point of a large pin, and almost invisible to the naked eye, become, under the micro-scope, perfect portraits, and groups of figures. During the evening a paper was read by Mr. James P. "Knight, the master of the school, "On Schools of Art," the object of which was to set hefore the public the advantages to he derived from art caluaciton, and Art," the object of which was to set hefore the public the advantages to he derived from art education, and the facilities offered for the acquirement of it, in the present schools, reference heing made to the establish-ment of the Schools of Design, and the extension of the scheme into the present Schools of Art, under the Department of Science and Art. A vote of thanks to Mr. Knight, for his paper, was proposed, in flattering terms, hy Mr. W. M. Tartt, J.P. A paper was also read by Mr. Pottinger, "On Photography, in con-mection with the Floe Arts," for which a vote of thanks was proposed by Dr. Wright. "STEAK SURPERFOR", "Defenser B. Benergy"

"STEAM SUPERSEDED."-Professor R. Ramsay "STEAM SUPERSEDED."—Professor R. Ramsay Aleinagle's application of atmospheric power is thus muthusistically described by himself, according to the Oxford Journal:—"I resolved to get made a rude model of a two-yard pca-shooter, with a trumpet mouth-piece, and a large open conic emission-end. I prepared a piece of deal hoard to act as a roller on four wheels. At one end of this rude car I nailed a piece of wood as a head-hoard, against which the conic mouth at the end of my pca-shooter could come in close contact. My experiments electrified me with in close cost at. My experiments electrical come in close cost close the second of the second cost of moment, as if struck by a mallet or a cricket-bal! I when placed about 26 lbs, in the form of a large mention of costs, and blew the car so weighted over a Furkey carpet ahout 16 inches almost momentarily. * * This was the heginning of my inven-

* * This was the heghning of my inven-cion of a compressed arisengine eighteen years ago. (It is now greatly simplified. In an apparatus, con-disting of a cylinder, 12 loches in length, with a hore of 1 loch, when the piston, at the last twelfth of an meh, shall have compressed the 144th part of a foot, the density will assume sity atmospheres, and will upport or raise 630 lbs. Now, suppose I submit this ast compressed quantum of air to rareflection up to 450°, which is equal to 21 times, then it follows that as 21 & 630 = 13,230) 13,230 lbs. are raised. If, by orderalite pressure. I submit that uninuum portion of (50°, which is equal to 21 times, then it follows that as 21 \times 630 = 13,230 13,230 10s. are raised, 14, by rydraulie pressure, I submit that minimum portion of fir to a compression of 144 atmospheres (the density blopted by the Portable Gas Company twenty years ge), then, without ony rareflection, the small quantify f air will fir or support 70,720 10s. : when rarefact p to 750°, or 21 times, the increase is that i \times 79,720 co = 1,674,120 Hs. This my engine can flect in half a second, which equals in a minute 00,834,400 lbs. At 200 atmospheres (casily ob-himed) the total amount raised in one minute will be appresented by a much greater amount. My invention are gives upwards of 3,352 horse power. When my engine is at work, I can guarantee that it shall work sight and day for centures. It takes thirteen hours refore the piston reaches the last inch in the cylinder, id it will cost only half a minute to revolve and set a motion again. Let us suppose that to propel a sinp of 2,600 or 3,000 tons hurden, globes or linders be charged with 200 atmospheres, and kept i the hold. This amount of noiscless, quiescent, arrific power, can be taken to any part of the world [THE ROYAL MUSEUM AND LIBEARY AT PEET's

Total..... 147,814 , rass issues exceed those of 1836 hy 5,330 volumes , 11555, by 32,357; of 1854, by 82,452; and of the gregate issues of 1850 to 1853, by 39,143 volumes ; (d, taking the present extent of the volumes in the drary actually available for readers at 20,000, it fol-res that the whole of the books have circulated, into the volume monoto, where more threas from taking the excite monor, which may be crediting the sectre monor, which may be a security average of 493 volumes, from all departments of the Library.

IMPROVEMENT OF PUBLIC TASTE.—There is no branch where bad taste is more prevalent than in household furniture, &c. In the theatre of the School household furniture, &c. In the theatre of the School of Design at Brompton there is an excellent plan of placing pieces of earpet, printed calico, wall-papers, pot-tery, ginas, plate, &c. of bad design with tickets attached, explaining where the false principles exist. Now, I think there ought to he something of this sort in the Museum, thrown open to the public, with patteress of good design beside them, in order that the public taste may be gradually improved, which is at present at such a low chb, that even those people who do go into the Museum go as a sight,—they are not im-proved in taste. The public of the nincteenth een-tury is so iscorrent of heating that they must be tangent tury is so ignorant of heanty that they must be taught very rudiments hy examples and tickets. C. DE VAUGIER. RESTORATION OF MANCHESTER CATHEDRAL-

RESTOLATION OF MAXCHESTER CATHEDRAL-The churchwardens propose a complete restoration of the whole huilding, and appeal, not only to the parish-ioners of Manchester, but to the inhabitants of the whole dioces, for assistance. They state that they are desirous the work undertaken should he strictly a re-terior in a fit a pariot a diffice. The works processary storation of the ancient edifice. The works necessary to eomplete restoration of the exterior are the rehuilding of the tower upon its present site, renewal of the stonework of north clerestory to correspond with the south, renewal of the pinnacles, and extensive repairs of the stonework of the walls and multions of the windows, and renewal of the lead roof upon the nave windows, and renewal of the lead roof upon the nare and side aisles. The interior, also, requires thorough renovation, the free pews in the nave re-arrangement and renewal, and the unsightly wooden galleries in the nave and aisles should be removed. The plans have been approved by the hishop and the dean and chapter. The estimated cost is 18,0000, or 20,0007. GREEN WALL PAPERS.—In reference to a subject on which some discussion lately took place in several of the journals of the day, including the *Lanced*, which had urged attention to the injurious effects re-sulting from the use of green papers, coloured with

which had urged attention to the injurious effects re-sulting from the use of green papers, coloured with some green salt containing arsenie, usually the arsenite of copper, or Scheele's green, the same paper now states that after experimenting on the subject, it appears that "green papers containing arsenic, when earefully manufactured and well-sized, may be employed with safety in the papering of rooms. There is one carefully manufactured and well-sized, may be employed with safety in the papering of rooms. There is one precaution, however, which ought to he observed; that is, not to make use of the room for a few days after it has been papered, and until it has been well ventilated, and this for the following reason, during the operation of papering, some of the arsenical pig-ment becomes mechanically detached, and is uspended for time, it has the stores of the room and is of

ment becomes mechanically detached, and is suspediad for a time in the atmosphere of the room, and is, of course, inheld by those who occupy it. We are in-clined to attribute to this cause some of the injurious results stated to bave followed the papering of rooms with certain descriptions of green paper." "THE KINKENNY ARCHEOROGICAN SOCHTY--The November meeting of this very active and thriving association was held in the Tholsel at Kilkenny, on the 4th nit. the Dean of Ossory in the chair; when twenty new members were elected, and two societies also received into the community of membership. A received into the community of membership anso received into the community of memory and number of donations were presented, and various oh-jeets of interest exhibited. Several papers were read, including one of a series on the topographical depart-ment of the Ordnance survey of Ireland, by the Rev. J. O'Hanlon, the present subject being the county of Wexford, A paper on "The Scandinavians in

J. O'Hanlon, the presect subject being the county of Wexford. A paper on "The Scandinavians in Leinster," by Mr. II. F. Hore, was presented. DAMPNESS IN HOUSES.—The great evil seen and felt from the damp walls of most new bouses, might readily he preveoted by adopting a course I witoesed at the village of Cowden, and said to be carried out by abuilder, I think, of Penshursi, in the county of Kent. It is to unit hot line and sand as mortar, with the addition of coal tar, and put one layer of the said composition to receive the course of hricks previous to be plate for groundhoor joists.—ANT: DAMPER. SHOULD ANCHITECTS SOLICT?—I want to know whether it is customary for architects to solicit

whether it is customary for architects to solicit orders from "persons about to build ?" After a fire orders from "persons about to build ?" After a fire which lately occurred at Wolverhampton, an enter-prising firm took the earliest opportunity next morning of "requesting the favour," &c. &c. 1 don't think this is neared amongst professional men, because I have seen in your papers complaints ogainst archi-tects making their art to omneh of a trade; but as the above firm make a frequent practice of doing it, even when other parties are engaged, 1 may be mistaken in wy notions, so "I want to know you know."--TIRE BARNACE.

as the above firm make a frequent practice of doing it, even when other parties are engaged, I may be instaken in my notions, so "I want to know you know,"—Thre BARACLE. GAS.—Will the Builder kindly submit the following facet, while between the share and the following by adding merely es,—gases,—in accordance with the in the state of the state share sound of the addings, as the word gas has the share sound of the doubles, the sein the plural is all that is required.—J.B.

NORFOLK AND NORWICH ARCHENCIOGICAL SOCIETY.-The quarterly meeting of this society was held on Tursday in week before last, at the Guildhall, Norwich, Sir J. P. Boileau, hart, in the chair, when the Rev. C. R. Maoning read a communication from Mr. A. D. Bayne, on "The early settlers in Bast Anglia," a subject illustrating the connection of ethnology and archecology. After some dis-cussion on the subject, the members inspecied a variety of curiosilies on the table, and Mr. Filch ex-hibited a curious British vase. The Rev. C. R. Manning exhibited a drawing of the font at Ran-worth, dated 1705, which then had a lofty pyramidal cover, painted in red and other colours. Mr. Daveney contributed a drawing of a Latin inscription upon a hell in Plumstend ebnerch: the letters presented gro-tesque figures. NORFOLE AND NORWICH

hell in Primstena content: the netters presented gro-tesque figures. Ma. MOREWOOD'S GREAT TUNNEL SEWER.— Notice has heen given that application will be made to Parliament in the coming session for leave to bring in a Bill to authorize the appointment of commis-sioners, or to incorporate a company, with power to construct the intercepting tunnels proposed by Mr. J. J. Morewood, for the conveyance of the metropolitan sware into the marshes cast of London for deodoriservice of the conveyance of the interpoplitan sewage into the marshes cast of London for decodri-zation and utilization, and also to obtain the necessary funds, either from the Consolidated Fund, or by levying rates. Mr. Morewood calculates that he can thus dispose of the whole question of the metropolitan sware. at our schild of the cost of the State. sewage, at one-third of the cost of the B* plan. It seems very doubtful, however, whatever he the relative merits of the proposed plan, whether, in the present state of the question, Parliament will pass such a Bill as this.

as this. OXFORD ARCHITECTURAL SOCIETY.—A meeting of this society was held on Wednesday, 25th ult. the Rev. L. Gilhertson, B.D. of Jesus College, in the chair, when the Rev. E. Hohhouse, B.D. of Mcr-ton College, read a memoir of Walter de Merton. The lecturer regretted that no architectural remains of Walter de Merton's works were now in existence, except the choir of bis chapd and small portions of his college. His little hospital at Basingstoke has eutirely disappeared. At Maldon, ucither in the chorch nor manor-house is there anything to revive the remembrance of the great and bountiful man who nursed his infant institution there. THE ROYAL SOCIETY.—At the auniversary meeting

the remembrance of the great and bountiful man who nursed his infant institution three. The ROVAL SOCHEY.—At the anniversary meeting held on the 30th ult, the balance-sheet showed that the receipts for the year, including sale of 1,500?. (Consols, had been 4,841/. 18s. 4d.; the payments (iochding cycness of removal to Burington House, 1,209/. 19s. 104.) 4,5144. 12s. 3d. The principal point in Lord Wrottesky's address was one made by Farahay in a lecture at the Royal Institution a considerable time ago-mannely, setting forth how ono set of observations are being the standard of the subservation of the subservation of the subservations of the subservation of the subservation of the subservations of the subservation of the subservations are known to our readers, received the Copley medal. ON RETAINING THE SEWAGE OF THE METANOTIS FOR AGRICULTURAL PURPOSES.—May I suggest that, if no plan has yet been proponaded, or out of the many plans no compreheusive and satisfactory scheme has conference, to be held either in Loodon, Manchester, or Birmingham, to consider the different methods purposed, and to discuss the whole question in all its various bearings; at which meeting all the maps, sections, plans, and other documents should be produced, in order that some conclusion may be arrived at which held to the agriculturist and the inhabitant of the metropolis?—T. G. D.

Inhabitant of the metropoles 7-7. G. D. MENONTAL IN GATESHEAD CLURCHYARD.----[It will be remembered that the church of this town suffered from the effects of the terrible fire and explo-sion which swept away an immense mass of huildings, and destroyed many lives. The opcu space on hoth eides of the Tyoe still remains, and presents the deso-late appearance of a town which has suffered a long bombardment. Like the Great Fire of London, this visitation followed closely upon the ravages of pesti-lence, and has been the means of demolishing many lence, and has been the means of demolishing many unwholesome places. In order to preserve the memory of this event, a number of blocks of gravite, of large

IMPROVED SLATE WORKING .- An improvement,

IMPROVED SLATE WORKING.—An improvement, intended to supersede the dangerons system of blast-ing out the 81-it masses, bas been introduced into several of the Welsh quarries, and hitherto the opera-tions are sid to have been successful. Long square labs, a yard and a half wide, can be worked out at the rate of 21 inches an hour, without waste. CONSECRATION OF ST. PAUL'S CHURCH, WEST-MINSTER-ROAD.—The newly-creted church, dedi-cated to St. Paul, and situated in the Westminster-road, St. George-the-Marry, Southwark, was conse-ter. The church will hold 1,200 persons: 460 sit-tings are free, and 200 are to be let at nominal rentals. The architect was Mr. W. Rogers, of Ca-non-1ow; and the builders, Messre. Myers, of Lambeth. Lambeth.

non-row; and the bullets, press. — Apple, or Lambeth. "ROTTEN ROW," HYDE PARS. — The following etymologies of this name have been suggested in the pages of Notes and Queries: — 1. "Routine Row," from processions of the church passing is that direc-tion. 2. From its passing by buildings that wree old, or "rotten." 3. From the Latin word "Rota." 4. From the woollen stuff called rateen. 5. From rotteran, "to muster"—rother, rots. Another writer in that periodical says.,—"I had imagined that Rotton Row was so termed simply hecause its gravel is always kept rotten or loose, so that horses are able to gallop over it without the least danger of falling. However, in some extracts from Souvenirs of Travel, hy Madame Octavis Walton le Vert, in the Critio for October 15, the American lady sopplies us with the following definition of the word ..." Rotten Row (from the French "Route da Roi") is reserved for those on horseback. The Queen's carriage is alone permitted in this erclusive place."

Engravings, with protect and discounts to builders and the trade forwards on application posifices. Dec. 12, 1857.7

The Builder.

VOL. XV.-No. 775.

N the notice of the manufacturing districts, lately given in these pages,* reference was made to the general merit ohservahle in reccut works in our art, and to the suggestive value of the particular steps taken in those localities, in the direction of sanitary improvement. Our readers will prohably feel interested iu some account of the features and points of importance iu the matters in question. In the

present state of sanitary science especially, it should be serviceable to look at the conditions in many separate districts, and to note the

measures which are adopted. It may be diffi-cult or impossible to apply the means in one case, to the wants of London; but the inquiry and comparisou should have some valuewhether in affording the model for our application, or only the timely lesson as to a course which we should here avoid.

Our reasons for seeking to draw attention to the circumstances of the manufacturing districts of the north, were very obvious oucs arising from the still extending growth of their industry, and their now vast capabilities towards any object, whether in art, science, or general social ahout seventy years, one eighth of the population of the United Kingdom are dependent upon the cotton manufacture, -would show the importance of very frequent attention to a locality where there must be so great a power for making or retarding national prosperity, or exerting influence on any tributary object. Tt is stated that there has been an increase, between the years 1838 and 1856, of 411 cotton factories, in Lancasbire and Yorkshire. The magnitude of many of these buildings may be inferred from what we before stated. Of the whole number erected in those districts, during the same period,-as of the buildings appro-priated to woollen, worsted, silk, and other textile manufactures,-we have no account; but the importance of these last, numerically, as structurally, must be considerable. They would include the mill of Mr. Titus Salt, at Saltaire, near Bradford, of which we gave a view some time ago. Although, in the opinion of those who are best acquainted with the subject, the manufacturing districts have never passed through such a crisis as that which they are suffering from at this moment, there is no probability that the growth of the interests and capabilities which we have alluded to, will be diminished. The facts, then, that there are being added to the buildings of onr country-in factories, warehouses, or offices-so large a number as may be inferred, and that wealth has accumulated which there is the dispositiou to have applied to the purpose of architecture, or other branches of art, are important in several different aspects.

As to art, in some of the classes of buildings mentioned, great progress has heen made ; iu others, it has yet to be effected. As regards house decoration and furniture, perhaps in no part of the kingdom has the same liberal expenditure, and, indeed, good taste, been manifested, as in Manchester and its immediate neighbourhood. But, the circumstances of the

population and industry of the districts are important, no less in relation to sanitary science than to art. The very prosperity to which we have referred, is attended with results in addition to the gradual encroachment on, or extinctiou of, the heautiful work of unture. London has been called a collection of towns, rather than one city; and there is much that is analogous to the metropolis in the populous part of Lancashire : the vicinity and intercommunication of its towns heiug practically the same as in the case of the districts of London. It is to the condition of the locality as to sewcrage, and the disposal of refuse, that we are about to direct primarily, attention.

The population being distributed in towns five or twenty miles apart, -- with many intervening mills ; print, dye, or bleach works ; and groups of babitations, -oue "area of drainage," viewed on the principle shadowed forth in Report of the Referecs on the Draiuage of the Metropolis, would include the greater part of South Laucashire, and considerable portions of Cheshire, Yorkshire, aud Derbyshire, or of all portions of the country draining into the Mersey and its tributaries. The proportion to number of huildings and population, of houserefuse which would have to he dealt with by sewerage, must, however, for reasons which will shortly appear, be now cousiderably less than that of the sewage of London. But, ou the other hand,-assuming the application of the present metropolitan principle of drainage, and of outfall and disposal of sewage, - the difficulty in the case of the area of the manufacturing districts would be much greater. That is, on the plan of collection into main outfallchannels, or cjectment into streams-methods which it is not shown would be departed from in fact, by cither of the proposals for the Loudou sewerage now under discus sion-the length and sectional area of constructed outfall-channel, or stream, or both, in Laucashire, would be required to be enormous in dimensious; whilst, we apprehend, uothing is more elearly shown by evidence, than the fact that the hulk or concentration of sewage-matter itself creates au evil, or that length of sewer permits decomposition and the uoxious influence which it is the object in future to avoid. We have felt compelled to refrain from positive recommendation of either of the schemes for the scwerage of London, feeling that ueither of them offered the real and satisfactory "solution of the difficulty." This we may at least say, that if the principle of main outfall channelsassuming the proper discharge from the point of outfall iuto the sea-he the correct one, it should he capable of being applied to the large area of South Lancashire, now fuding its drainage emission at the mouth of the Mersey. Our readers will not have failed to notice that there are opinious, from medical officers, tending in favour of the outfall by numerous sewers, even those into the river Thames, in contra-distinction to the principle of interception and main outfallchannels ; and, could the various difficulties in the rise of the tide in the sewers, or the storage of the sewage, and the deposition ou the banks, be overcome, it is not clear that, with the immense volume of the river, the principle of numerous places of emission would not now manifest itself as more advantageous than the other plan. The object, however, is to find the correct principle. Such principle, when arrived at, like all good principles, will be remarkable for its simplicity. It will be applicable to the case of all populous districts, like the metropolitan area, or the area of South Lancashirc, --although subject to required modifications in plau and contrivance. But, if it be taken as decided that the great volume of the river Thames requires to he freed from sewage, what must be the necessity arising from the present, or the possible, * See P. (85, ante,-also "A Day in Liverpool," p. 631. | condition of the Lancashire rivers and water- question of disposal of refuse is a national one?

courses, which, although the houses are drained very partially on the London system, are now charged with filth; and whose shallow streams often have little perceptible flow, or never, except in time of flood, fill the width of their channels. The sanitary coudition of the mann-facturing districts would be worse than it is, and far worse than the condition of London, were the same system of honse-drainage in operation as that which has during late years here been introduced, -or were the disnse of the midden-steads, or ash-pits, enjoined, as the abolition of cesspools has been in the metropolis. Towns like Manchester, Ashton, Stock-port, Rochdale, Bolton, Wigan, and others, would have only this non-prejudicial condition, -that their drainage would be not into a tidal river.

It seems to us, the question of principle to be decided is, whether the sewage of all *populous* districts is to be conveyed to sea, irrespectively of distance. That would be assuming, as we said, that the sewage, when got to the coast, could be mide to engulph itsell in the ocean, instead of banging about the shore,-a result which we have lately regarded as possible in the case of London, and as actual in the other case, at the mouth of the Mersey. We have not pursued the chemical question, which we suggested might deserve to be inquired into; but, we think it very probable that difference of specific gravity, or other mechanical conditious of the fluids-without reference to peculiar tidal currents,-would operate so far as to involve present subject-matter for consideration. We would reiterate that the condition of many populous sea-port towns should be looked at, and would urge that the question as to them belongs to that of the sewcrage of Loudon.

Though, in the Lancashire towns, the houserefuse is got rid of ou a principle different to that adopted in London, the condition of the streams is not sensibly better than it might be expected to he from the larger amount of pollution. What it would be hy the adoption of the metropolitan, and, as it would he deemed, more advanced, system, we could scarcely ven-ture to think. The present condition may be compared with that of the Fleet, the Effra, and streams of a like nature, rather than the Thames. In each case, the streams are no longer to be called rivers : they are sewers ; and unless they could be restored to their original purity by complete interception, require to be treated according to the existing eircumstances. The "conservaucy" of such rivers especially should be maintained, and should be in the hands of proper authorities; aud we are glad to sce that the town-council of Mauchester are now applying for the requisite powers, by the exercise of which, owners of property on the banks of the rivers Irwell, Irk, and Medlock, will he prevented from ejecting rubbish and refuse iuto the stream, or otherwise altering the régime of the river, or volume of the water, for their own purposes. On this subject, however, a few points of information may be supplied in a future article

The official Referees in the "Conclusions" in their Report ou the Drainage of the Metropolis, express the opiniou, "That the pollution of streams by sewage, throughout the whole country, is an evil which is increasing with improved house-drainage; and that it is very desirable that the attention of the Legislature should be directed to the subject with a view to devising means for remedying the evil." Bnt we have referred to the circumstance of excessive pollution where there is, we might say, no "improved house drainage;" whilst, such that house drainage were now introduced, the streams would reach to a state to which the pollution of the Thames supplies no sort of parallel. Could more be needed to show that the

Some methods of "deodorization," tion of solid constituents, or direct utilization, answer, to a certain extent, in the case of single small towns, at least so far as to of single small towns, at least so that as too free a stream from pollution, and yet render unnecessary any outfall to the sea. It is asserted that similar methods are inapplicable to the case of larger places, like London,—even divesting the question of the interference of the commercial considerations. As to these last, it would be well to put them altogether aside, unlil the uain questiou—that of getting rid of the refnse innoxiously—can be settled. It may remain a proper question whether outfall or ejectment of the sewage or refuse on to the land, would not still be the true "solution of the difficulty." The commercial considerations are virtually abandoued in the scheme of the Referees; it is even apparent that a large outlay in working as well as primary expenses is coutin-gent upon the adoption of that scheme : it scems gent upon the andpicon of that sectors, it scenas to us exceedingly probable that a concentrated nuisance at the points of outfall wherever decided npon, and one of serious character along the lines of sewers, covered or uncovered, would he attendant ou the realization; therefore, it is with these probabilities, that those involved in the ejectment on to the land, ascertainable after the collation of non *data* which have found no place in the recently published documents, should be contrasted. It may be uccessary and politic, even, to calculate, at least for some de-scriptions of produce, upon deterioration of the and,—hardly shown to arise, but which, accord-ing to the major part of those practically con-versant with agriculture, might result from the application of sewage at all times and seasons, —the necessity of such application heing in-volved in the rejection of another arrangement for outfall.

We fear that in the controversy as to covered or uncovered outfall channels, the real question has heen misuaderstood. If channels, mainly uncovered, be considered, the point is, whether the engineering arrangements will allow the flow to be maintained, and the sewage to be so ahundantly diluted with water, as to render the noxious exhalations of uo moment. For, it scems to he admitted that on those occasions at pre-sent, when the sewage is largely diluted —as on sent, when the sewage is largely influctual as of the ten or twelve days of storm waters, in each year—no prejudicial effect could acerne, unless at the first finshing out. If, from the plan of the outfall, or the nature of all sewage water, this refuse must always be a source of disease, the cvil will not be remedied by the arching over of the methy language analysis. the outfall elannels or main intercepting severs The covering, without means of ventilation, will hat increase the cvil. Decomposition, favoured by the great length of severs, will he going on; the gases will force for themselves exits at numerous points in the course of the sewerag or more probably by the house-drains them-selves; and we once more call for more prominent attention to this element of the ques-tion-ventilation of the sewers-than it has received.

In the Lancashire towns, the course de-liberately chosen as the alternative from the further pollution of the rivers, or experi-mental and prohlematical undertakings, is the relevation of the old plan—the use of privices and asl-pits,—only under strict regulations, aud careful provisions as to clearance and removal. This is the system retained in Manchester,-a town where great attention has been energy-at low white great attention has been given to sanitary questions. The regulations of the "Building and Sanitary Regulations' .Committee," in pursuance of the Police and Improvement Acts, not merely permit, but enjoin the construction of such conveniences and recep-The construction of such conveniences and recep-tacles; and closets are allowed only "under special arrangements with the committee, and hy the owners or occupiers agreeing with the Water-works' Committee for water,"—"also defraying one-half of the cost of removing the ashes,"—all which would seem to imply that asnes, —an which would seen to mply that the construction of conveniences of the moderu and more approved character, is not encouraged,—though the water-supply is now ahundant. The "Hegulations" cujon that every dwelling-house to be huilt within the horough "The money out of pocket for the past year, we believe, moderu and more approved characler, is uot "The money out of pocket for the past year, we believe, mode to about 6620 Ms. The extincts of expenditure over receipts by the Scarenging Committee, for the year dwelling in 1353, is 3637.53. The receipts from 33,000 long, with sundrise, are here set down at 2007, whist he ex-shall be provided with a privy and tash-pit (the existing houses), " constructed in a yard at 3,7637.53.

tached to the premises, hut not in front of " the house: over these conveniences, no sleep-ing-room is allowed to be built; and " the pre-mises" are to be "so arranged that *valer shall* not flow into the ask-pit." It should be stated that there is a proviso as to draiuage of the

Reliance appears to he placed on the ashes as a deodorizing agent. Such an effect would, undoubtedly follow, from the use of carth. Farth is the best natural deodorizer; and in dependence upon it, it is only necessary that it should not be supercharged with the refuse, as hitherto has been the case in populous distriets. Mr. Austin, in the slight reference which he makes, in the "Report on the Mcans of Deodorizing and Utilizing the Sewage of Towns," to the midden-steads of Liverpool and Manchester, though he thinks that the rate of mortality in hoth these towns supports "the conclusion of those who contend that a high standard of mose who contend that a high standard of health is not to be expected until the water-closet has been generally substituted for the midden-stead," regards ashes as forming an "excellent deodorizer when properly used." To have the same effect as earth, the ashes, we apprehend would be required in acceleration. To have the same effect as earth, the ashes, we apprehend, would be required in considerable quantities,—or such quantities as they are seldom found in, except in the case of the Lanac-shire houses. Coals there are a third or a fourth of what they cost in the metropolis; and they are used, as a London honse-wife would think, somewhat lavishly. Laneashire coals, however, appear always to produce a large quantity of ash.

The dimensions and construction of the conveniences are particularly provided for, and the Acts, in some respects, admit of even greater precision and stringency than is attempted in the "Regulations." In one Act, the provision, if precision and stringency than is attempted in the "Regulations." In one Act, the provision, if required by the Council, of a proper funnel or flue for carrying off any offensive stench, is mentioned, hut the applicability of such a con-trivance to open ash-pits is not very clear. The removal of the soil or refnse, by the most recent regulations, is in the hands of the authorities; and the practice is (baying used decolorizing regulations, is in the hands of the authornes, and the practice is (having used deodorizing agents where thought necessary) to cart it to a central depôt—where, however, it is not long allowed to remain, and to remove it thenee, and convey it in covered receptacles hy railway, to initiate where it can be disposed of for districts where it can be disposed of for what it may fetch. A similar system is adopted in the adjoining horough of Salford; and in this case, from an Account of Expcuditure and Receipts, we are able to see that so far from there being a profit realized, there is a loss -viewing the subject in the commercial aspect. In the year ending August 31st, 1857, 21,239 tons of soil were collected from about 16,000 pits in the chief township. The value of this in the yard was 1s. 6d. a ton: this was after the expenditure for getting out of the achiefts and active to the word of the ash-pits, and earting to the yard, hesides several items to be taken into considera-tion in any other case. The sale of the manure, including carriage, would not realise more than 2s. 6d. a ton, —instead of over 3s., which would be required for the return of the merc outlay on the operation.* Of course this by no means proves that a better commercial result would not follow from other methods of utilization. But it must not be supposed that other means have been uneousidered in Mauchester. The question of utilization of sewage by irrigation Arrows and the second of the s some time ago, pursued a scheme for the irriga-tion of land adjacent to the Bridgewater canal, but of this adjust to brogen care to par-ticulars of the early operations, which augured pecuciary success; but for some reason or other, the scheme appears to have here ahandoned. The use of nuddensteads or ash-pits leads to the provision of hack-passages and eutrances.

These have frequently been allowed to gct into a dirty state: they are not cleansed by the town except in nrgent eases. They can hardly recom-mend themselves on considerations of police. The Lancashire principle is that of dividing

the nuisauce hy the receptacles over as large an area as possible, in preference to concentration of it in a sewer-river, or outfall-channel; and to trust to the slight advantage from the best con-struction of the receptacles, with constant supervision and speedy removal, for mitigation of the effects. The system would not he defended as a perfect one, and is considered to be inapplicable to the houses of the metropolis, on account of the space which it requires in the plan; but this does not form the true objection to the system, or to any aualogous to it, in general cases. The houses in London are hardly more confined at the backs than the houses of Manchester. The objection is the sanitary one. This makes it as much incumhent on the people of Laneashire, to pay attention to the question of house-drainage and sewerage, as the people of London,—if uct more so. The requirements, and consequent difficulty, are even greater in their case than with us.

with ns. Under the existing system of sewerage, —that is, with the advantage in one point of view, of the non-introduction of the closet system, —the ontfalls are in a dangerous state. To this point we shall again refer; hut, taking the case of Dukinfield as an example, the "Report" alluded to in a former article shows that the sewage is ejected chiefly into the Tame, partly into the canal, and partly into "the lake." One outlet, at Dog-lane Station, is,—

"about eighteen feet above the level of the canal; the sewage is allowed to find its way down the bank and upon its surface. Opposite to this ontfail, or rather immediately above it, there is a range of houses."

The river follows a meandering course, skirting the more populous part of the township: it is spoken of as "in foul condition, very offeusive," and requiring great improvement. The popuand requiring great improvement. The popu-lation is rather over 14,000. The stream in many parts is a mere hrook, and there are four weirs within the district. Mr. Aspland is reported as saying :---

"If tempted to explore the valley, he discovered that the river, dammed up hy a weir, instead of pass-ing cowards the sewage impurities, is converted, daring many months in the year, into neither more nor less than a huge cesspool, distilling from its patrid bed the most noxicore vapours and gases. These eircomstances afford abundant explanation of the high rate of mor-tility * * 1 is impurities are considerably altor abundant explanation of the high rate of mot-tality * * * Its impurities are considerably augmented by the sewage from Staley-bridge district and town, situate immediately above Dukintield."

Below Ashton and Dukinfield, the same narrow stream passes Guide Bridge, and reaches the populous town of Stockport; and what is the state of the solid and liquid compound that gets into the Mersey, might he supposed,-but, it would he well if the deleterious matter were would be well it the activations will be activated where passed on, rather than deposited, or retained, festering, within the populous districts. Other towns are not so favourably situated as to streams. The mortality of such places (in the case of Dukinfield it is shown to exceed that of the case of Dukinfield it is shown to exceed that of the stream is more than the stream is more than the stream is more than the stream is a stream of the stream. Whitechapel in London) is of course in great degree due to insufficient number and mal-con-struction of the conveniences and receptacles of the sort in use, and to many other causes. But the result from the immediate and general intro-duction of the closet system, in opposition to the best arrangements of the other sort, would, it scens clear, be most disastrous. The question, what should he done with the sewage of houses, what should be done with the sewage of houses, is not answered by the metropolitan recommen-dation of outfall-channels to the sea. How would the work of applying these to the Lanca-shire district ever he surmouted? or how can the proposed outfalls for London, secure more those are inclustration secure more the sea of the set the proposed outfails for London, secure more than a partial oriemporary result — the real object being the entire dispollution of the Thames—so long as the "area of drainage" does not include prospectively every town and district draining into the river?

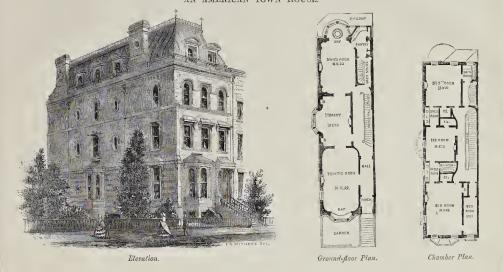

We must pursue the subjects which are hefore us, in a future number.

* Dukinfield, in fact, is in Cheshire; but is separated only by the river, from the town of Ashton. Stockport is similarly situated in Lancashire.

Dec. 12, 1857.]

THE BUILDER.

AN AMERICAN TOWN HOUSE.

AN AMERICAN TOWN HOUSE.

IN addition to the examples already given from Mr. Vaux's "Villas and Cottages" (see p. 658, aute), Mr. Vaux's "Villas and Cottages" (see p. 658, aute), we add a view and plans of a town bouse, about to be built in Fifth Avenue, New York, on a plot 25 feet wide, adjoining the grounds occupied hy the Church of the Ascension. It is thus more open and airy than is the ease in the majority of house lots in New York. It is to be huilt of brown stone and brick. The re-cess formed at the end of the dining-room, and the pantry adjoining, project from the main hody of the house, to give increased space on the principal floor. The main staircase has a skylight in the roof. This house will cost about 20,000 dollars when finished.

THE "LEVIATHAN" STEAM-SHIP.

Insee will cost about 20,000 doilars when numerous the second sec

the first day, it will be remembered, the ship moved but once, about 4 feet at the head and 6 feet at the stern ; and those who saw the advance will not soon forget it the expansite benuty and grace of the novement with which shic hurded two souls into eternity was a thing to think about. The word more to the Company, and to some who have said to as, "Will the ship pay?" If the line of policy indicated in Mr. Yater's observation, already quoted, he pursued, we reassert with strong counci-tion, that the scheme will be a failure. But we will magine the prevalence of better counsel in that respect, and even then we do not hesitate to say, that to obtain success funancially, one of two things must be done; either there must be three or four more *Leviathans* built, and worked by the same bond and staff, or its management and agencies must be nudertaken by parties who have other duties, also, to occupy them. In other words, if the *Leviathans* is to have her own board of directors, scretaries, port and superintendent at that, all to herself, there will be very little difficulty in buying shares chap-this day two years. It was a grand work to do ;-dastined, probably, to produce a revolution and bring wealth to the country,-mud those who did it will have earned honon; though they may not get a money return for their capital. We offer these observations, however, with the view of aiding them to get hoth. to get hoth.

ART IN ARCHITECTURE.* Aristides continues to treat of Gothic Art.

Arstitutes continues to breat of Goline Art. Ir has become very common to employ Gothic for school huildings, and properly so 1 think; only if we adopt the style for schools, we should be very careful not to fall into the usual error of giving a gloomy ex-pression to them: such a corres is quite uncalled for, and very improper. It is astooishing what an effect the expression of a huilding has on the youthful mind when it is at all imaginative. Gloominess is a

* See page 698, ante.

in diameter. Just imagine this enormous work, the conception of Brauel and the production of Secit Russell, completely fitted up with every necessary of the an adisput to the place, and associated with that beings on board, at a continuous speed and with an beings on board, at a continuous speed and with an beings on board, at a continuous speed and with an beings on board, at a continuous speed and with an beings on board, at a continuous speed and with an beings on board, at a continuous speed and with an beings on board, at a continuous speed and with an being so most extraordinary result of engineering science and constructive skill that the world has yet scen. Of the formation of the launching ways, restling for pushing the vessel down these ways, and boling ber in when she slips too fast, the public are tolerably well informed; saffice it to say for the present that the resed, which was originally about 300 feet from the line of low-watter mark, is now about 100 feet nerve and that the operations are continued day after day. On the first day, it will be reasenbered, the ship moved but nor dooled, he oursed two souls into corrity was a this to think khot. The world more to the Company, and to some what see doole, either there and and 6 feet at the start, of policy indicated in Nr. Yate's observation, alrady updated, he pursued, we reassert with strong count inging the paralenee of bettre counsel in the to dotaiu success fluancially, one of two things mants to dotaiu success fluancially, one of two things mants to have he paralenee of bettre counsel in the to have he paralenee of bettre counsel in the to have he paralenee of bettre dise, also, it in esting there are certain forms of expression of purpose in an ediace result? Is it the abstract quality of a certain traingenerat of lines and forms, or does it arise form what is commony termed the sentimet of associa-ting disert, if we are cond an degicies must to dow the paralenee of botter counsel in the to dotaiu success fluancially, one of two things mant

surely as a contraction of the Invest and compression of the lips indicate determination; a curvilinear con-tour gives elegance with as much cortainty as a smile betrays the joyfulness of the inward feelings. On the other hand there are associations which are merely artificial, having no real existence, and therefore are not general, only expressing local feeling, such as conforming Classicality with copyism, or Guticism with bacharity. These being ialse, are the most difficult to he disposessed of, and are, in lact, pre-judices imbibed from early partiality or lack of know-ledge. We should, therefore, be cardful to draw a distinction between individual tastes and essential qualities; to therwise we are unable to perceive whequalities; otherwise we are unable to perceive whe-ther we design or compose on lasting principles or evanescent partialities.

There also exist other sources of pleasurable feel-ings, open to the imaginative mind, when contem-plating an edifice, be it Classic or Gothic, such as that derived from a perbaps undue appreciation of the race who have perfected it; or if it is a ruin, from the romance of its history: but all associations of this kind depend more upon the disposition of the observer,

than any actual quality in the example; and are, therefore, evanescent, having no existence in asthetic laws. Though memories like these frequently heighten laws. Jougn memories has these requirity her other our pleasure, they oftener confuse our understanding, and lead us to set a value on a design which it other-wise does not deserve. We should rather try to basish such impressions as these, and study a design from an esthetic point of view our ideas must be cosmo-politan to be appreciated by all. One who has been contemplating the majestic grandeur of ancient art is very likely to attribute excellencies to it which it does other style. We appreciate best that which we study most; an additional reason for not confining ourselves to the study of one style; for il will always appear super-excellent to the exclusion of all other becauties, Super-scretter to the excession of all other becautes, Association of ideas, in the sease popularly understood, is a most fruitful source of error; flough much espa-tiated upon in architectural " chit-chat papers," and described as the fourt from which most art-pleasure described as the fourt from which most art-pleasure is derived. All asthetic beauty—as the use of the term implies—is totally unconnected with extraneous aid: it is, in reality, self-existent. In a general sense, association is the cause of all the pleasurable emo-tions of the mind, excited by the contemplation of beauty io any form, and does, in fact, constitute that beauty; but they are associations existent in nature and ouly discovered in the design,—not of that loses and score charges which they are used to the provide the sense. and vague character which they are usually described as being, and which none can understand or explain, as other and the source of the this is not a fair explanation of what is usually under-stood by the term, what do they mean? Why attri-bule our sensations of delight in beauty partly to that our sensation of a refragably proved that it is cause, when it can be irrefragably proved that it is the only oue? The simple truth is, that the matter is little uuderstod; and their ideas being confused, they give explanations which only serve to myslify. Whether the expression of purpose in a building, properly speaking, arises from au abstract power in the lines and combinations themselves, is uncertain; but it is sofficient for our purpose to know that nature expresses qualities invariably by the same meaus; and we must copy her principles if we would succeed in giving *purpose* to an edifice, -- as with angular masses, she expresses power; with curves, elegance; with mass and gloom, solemnity; and so on, through with mass and gioom, social systems is only through all the tones and phases of sentiment which exist. On the proper selection of these qualities artistic expression depends, independently of that which arises from the suitability of the plan to meet its require-

What has all this to do with Gothic architecture ? What has all this to do with Gothie architecture r many will ask. To which I reply, that it simply proves what this paper seeks to establish : that each style has a sphere of expression peculiar to itself, from which hounds it cannot treepa-s without io-truding on another's province. If we do not dis-tinguish between the capabilities of each style, we shall be likely to reverse the order of harmony, and introduce them in insppropriate situations. Gothie sharh to have be been a like outer of harmony, and bitroduce them in inappropriate situations. Gothic could not be improper in any situation when England was comparatively shut out from the infla-ence of the rest of the world; hut now things are so changed, and we have adopted so many new ideas, to have become so essentially cosmopolitan, that this style, though excellent in itself, is inadequate to satisfy our modern demands. Our field of view is now so much larger than it formerly was, that we are compelled to introduce new scenes, and more various landscape, to preserve the whole from dull monotony. laussape, to preserve the whole have have been have by Undoubledly, our advantages and knowledge have vasily increased; then why not use that which a boundinf Providence has thrown in our way? Why resolutely refuse to work up the new material, which modern research has opened to us, from the great mine

I know that thorough going mediævalists will a I know that information going when the solutely solut "This is all trash." for those who resolutely solut themselves up in a little island of their own persist in thinking it is the only habitable spot on the

Much as I admire Go'hic art, for its manifold heaties and flexibility, I cannot shut my eves to the existence elsewhere of equal beauties of au entirely

existence elsewhere of equal beauties of an entirely opposite chracter. Having touched upon the leading features of the three principal styles, I shall conclude my paper with a few remarks on the mixed styles, or Renaissance, now so much in use.

by any same man, he considered to embody modern -catioents, excepting that it is structurally unscien-tific and fai-e, full of disguise, and in its totality a shamele-s sham. How opposite is the unpresuming the and false, null or argunse, and he are resuming standers share. How opposite is the unpresuming truth, the scientific elegance, the unvaroished reality, the natural and easy beauty which distinguishes the Gothic, where the ornamentation is as appropriately distributed and elegantly designed, collected in tra-side window and commond niches, which shine as ceried windows and conspied niches, which shine as puli-hed gems set in frosted gold, so different to the laboured effect and high-pressure system of art dis-played in pseudo-Classie designs. If Rennissance, or played in pseudo-Classic designs. If Renaissance, or any other such lastivious style, is so suited to our present wants, it argues badly for the morality of age.

Aristidos You still run away with false impres-Aristates.— Fon star run away win raise impres-sions, and induge in unitantional misrepresentations. The objections you have urged have been refuted a handred times. Do try and look at the question in a broader light, and be not so wedded to the style of beauty in one woman as to deny the existence of equal interview matching.

structions in another. Scotonius.—Your simile is plansible, but false ; in genious, but untrue; far be it from me to deny the quistence of great beauty in such works as St. Paul's nl's. Grecowich Hospital, or St. George's Hall; but these are the highest efforts of art, and the highest efforts of all styles are good; but to come to the real test, let us examine the vernacular, through which the genius of a style should speak to all beholders. What has been produced ? Look at our cottages, our town dwellings, our warehouses, and even our villas. Was there ever anything so ugly, so imbedie, so art-less and so contemptible? The vertracular style should The vernacular style should and so contemptible? The veroncular style should, in all coses, be an exponent of the straightforward, hooest feelings of the English people. Certainly it is not now; and so far from elevating the taste of the uncellured classes, it destroys all their innate percep-tion of beauty, plunging them into such a dark abys of hourses and corruption that it will the neutrino of horrors and corruption, that it will take generation for them again to acquire the natural, healtby tone of mind of which they have thus foully been robbed. Providentially, there has arisen a school of art fitted eventually to rescue them from the slongh of despond which they bave fallen into; for say what you will, it cannot be disguised that we have succeeded in restoring Gothic ecclesiastical architecture. Wince at it though you may, we shall, as assuredly as truth is greater than falsehood, introduce Gothic as the secular style of the land.

Aristides - It appears to me that the plan adopted by you Gothicists, when comparing the rival styles, is to coutrast the good of the Gothic with the bad of is to contrast the good of the Gothic with the one of the Classic: the cathedral with the pattern row of cottages. It is incredees to say such a comparison is unfair. You have not the boldness or the unfairness deny that there is some *little* merit in a structure e St. Paul's; hut that we are told is a "high pressure like St production": we must see what the style produces in the vernacular. Before that is done, I should like to have explained to me what the Gothic vernacular was. vernacular was. have explained to me what the voting vertacular was. Where are the fourteenth-century dwellings, so artisti-cally superior to anything modero? or who informed you of the innate sense of beauty possessed by, not only the good old Englishman all of the olden time, hut also hy his retainers? When that point is settled then it will be time to compare the two styles. At present we can only compare modern works with modern works,—Gothic with Renaissance. Builders' Gothic and Builders' Italian are both had: the Italian Counce and Bulleer's Italian are both had : the Italian may perhaps he passable, hat the Gothic is intolerably villanous. This fact does not certainly arise from their "*laster*" being destroyed by Renaissance; for they never had any: it is simply the effect of specu-lative building; and with productions of this class you would compare the carnest work of our true old free magnets. would compare the caroest work of our order at taken masons! Compare the hest efforts of modern Italian with those of modern Gothic; where is the disparity you sneak of? One snits best with grassy lawns, the masons! you speak of? One suits best with grassy lawns, other with more picturesque scenery. One, having a being with more pictures due scenery. One, having a heavy sky-line, requires a background of trees; the other, in its quaint puniedness, requires such aid less. Speculative buildings ought not to be considered expo-nents of British feeling, except it he for the pocket; but the villa residences of our merchant princes, when designed by skilful hands, are. It is a mere piece of imagination to suppose that verything mediaval was necessarily pretty, hecause many of the examples left us are so: nothing can be more false than such a sup-position, for it is the natural effect of time to desiroy that which is poor and mean, and invest with greater now so much in use. Rufskinus.—Your paper has not done justice to row the least doubt teat the vernaular style of the fourteent event event yeal that is originally good and firm. I have not the least doubt teat the vernaular style of the fourteent event yeal that is originally good and firm. I have not the least doubt teat the vernaular style of the spectrag its good points, I most contaily coincide vertice the vertice the vernaular style of the vernaular which at first called it into existence, canuot, surely, style, for they are bigb-pressure productions, and

[Dec. 12, 1857.

superior modern works could be easily pointed out. If you admit the foregoing to be true, why complain that St. Panl's is a high-pressure work? For of Gothic there is little left that was not at the time of erection considered to he sumptuous. The manners of the ancients approached much nearer to ours in refinethe ancients approached much nearer to ours in refine-ment than ever did those of our Golhie encestors : then why complain of the unfitness of classic to our character? Golhie ecclesiastical architecture, you say, is now an "established fact," wince at it as you may. Who winces at it? "It is also providential that a school of Golhisite have across to grown as the Who winces at it? "It is also providential that a school of Gothicists have come to rescue us from the quagmire of despond." I am glad to he rit! and if they should be the providential instruments for re-placing speculative building by a better system, so much the better. *Domaldo.*—A long speech, but a good one: wby, indeed, should we give up a style that has been so great and glorious in results, hecause, forsooth, in the vernacular longue, there are some ugly words ? If St. Paul's is a bitch-ressarre production is it not

St. Paul's is a high-pressure production, is it not merely a proof that the style requires only talent to work it out? and is not, therefore, the credit greater where the difficulties are so many? To give the sume St. Paul's is where the difficulties are so many? To give the sense dignity to a Gothe esthedral would be impossible, from the vast size it would require to he made. If the difficulties in the way of heing original are greater, so are the results more magnificent; and this of itself, if believed, disproves the great pies of a celebrated Gotbieist regarding the laviah expenditure, which he saws is required to effect an thing eased in the share says is required, to effect anything good in the shape of Italian. Teere may be and no doubt are, advan-tages peculiar to cach style; and these, as my friend Aristides seeks to impress on you, should be well belied by the second sec looked into.

Aristides .- The united aim required to create a national style cannot be obtained till all our at present divergent ideas flow into one channel. Such a style will be the result of the fusion of two opposite elements. Already I think I perceive a tendeucy to-wards that consummation. Gothic will never, in its integrity, be universal: still, no doubt, it will constitute one element, and that not the least, in any new style that should happen to become universal.

Scotonius.—"Jerry" building is the accompaniment of a false style of art; of an architecture that admits of structural concealment-sneer at the fact though you surveiural concessiment – sneer at the tact though you may. If we had followed in the steps of our good old ancestors, we should have advanced instead of cretorgraded. What a lack of thought and original conception there is in all the boasted works of the modern Halian school-rif school it can be called 1 What beavy, ugly, square, monotonons creations—not content the start of the start of the start of the start works and the start of the start copics — are they ! How different to the varied, graceful, and aspiring Gothic; which being as truthful as it is beautiful, seems as though a spirit had come down from heaven to clothe truth in vestments by angels

of angels i Aristides.—The great charm of original thought cannot be elaimed by Gothic architects, with any greater fairness than by the so-called Classicists. Show me the porch, the window, the spire, cauopy Show me the porch, the window, the spire, cauopy or roof framing, in fact, any portion of a modern Gothic church, and I will cargage to find a counter-part in some old example. It is true the members may he more varied than is possible in Classic: that is a beanty peculiar to the style: but of real originality there is very little to he found. Instead of adapting the style to our hahits, which it is frequently capable of, the tendency of Gothicism is to adapt our ideas to the old-fashioned nugainly contrivances of our ancestors. Nol originality can never surcly be claimed by your party; they are too servilely Gothic in their notions. Perpendicular architecture was the result of a want felt, of a tendeucy to modernism which could not them be met in a satisfactory manner by employing pure Gothic. If we had gone on in by employing pure Gothic. If we had gone on in the steps of our forefathers, we should have been in the steps of our forelations, we show any series approximate the same position as they; hut such a supposition is an absurdity. We must, in order to advance, from time to time abandon a traditionary line of proceeding, to adopt new ideas, as ites h lights varies, from time to time available a traditionary fine of proceeding, to adopt new ideas, as fresh lights hreak in upon us. The question has, however, here gone into so often, and heen so thoroughly ventilated, that it is waste of breath for us to discuss it.

Garblentum .- Your theory of expression in architecture coincides with my own opinion; but the con-clusion you draw from it respection the employment of several styles is a fallacy : however, we will, though we cannot agree, hear what you have to say respecting

we cannot agree, hear what you have to say respecting the devisable Renaissance. Aristides (sarcastically).—Thank yon for your kindness: perhaps a little dissant may give activity to the f-cuelties. Rufskinins.—We wish to be guarded on all sides

in an impregnable mail of argument. So show us in an impregnable mail of argument. So show us the way you handle the weapons wherewith you pur-pose slaying the valiant Goth. *Aristides.*—Far be it from me to slay so helpless a creature: I only wish to teach him how to fence. *Scotonius.*—Then measure your ground and begin.

ARCHITECTURE OF THE RENAISSANCE. Italian architecture, in its capacity for expression, holds a middle position between the Gothic and Classic. While it partakes of the regularity of oue, it combines with it, in a great degree, the picturesque effect of the other. It is more flexible than Classic, and possesses greater dignity than Gothic. These gualities point it out as being peculiarly fitted for street architecture, and for general domestic pur-poses. A large amount of original design may be displayed in the grouping of the masses; and also much freshness of invention in the details. Witb a little belp from the Gothic, the style is capable of embodying very varied conceptions. We are not tied down to the employment of base, column, and eatab-lature, as we are in the pure Classic, which renders it of such limited applicability; nor are we debarred from the use of those beautiful members, if we require them, for we are at liherty to introduce them where force or prominency is required in the design, or to mark the several ranges of floors. The windows may also be tracted with great freedom; and the *ensemble* of the edifice may even receive its effect entirely from ARCHITECTURE OF THE RENAISSANCE. also be treated with great freedom; and the ensemble of the editice may even receive its defect entirely from fenestration. It is a style which admits of greater breadth than the Gotbic; allowing of the introduction of large sheets of plate glass, which in Gothic would be quite inadmissible: indeed, either plate-glass manu-facturers or are bitecture would suffer if Gothic were universal. This again is an additional inducement for the analyzement of fully is in the state of the sta the employment of Italian in towns, where as much light and as little dirt is required. Again, it may appropriately be used where great uniformity is wanted, as in a formal row of buildings, which would, in Gobic, appear very stiff and prim. A hold pro-jecting cornice (not held in halance by rods) takes off the baldness which in a line of Gothie houses would off be exhibited.

know many will shrug their shoulders, and truthful people will grin, when I express my deli-berate conviction, that it is one of the advantages of the style, that it may be executed in coment. Stone is a batter material, no one will deny; but the ex-pense prohibits its adoption in nine cases out of ten. The erv against cement is one of those virtuous. pense provided is adoption in mine cases out of ten. The cry against cement is one of those virtuous, puritanical notions, which everybody re-echoes and all practically disregard. Gothicists will shudder at such sentiments; and in their style its use would indeed be monstrous. True, all the nations of antiquity used it; even the Mexicans used it, and also the Chinese use it now: then why not we? It gives a lively and It; even the Mexicans used H, and also the outcome use it now: then why not we? It gives a lively and cheerful appearance to streets, which otherwise would be direfully gloomy if left to the depressing influence of dirty red brick: legitimately employed, no one ought to object to it as a sham, for it is not. Is the coat a man wears on his back a sham? Then why a end of secure 1.2 Inside it is a "incessary covering;" coat of cement? Inside it is a "necessary covering;" outside, we are taught it is a "sham." By the same outsue, we are taught it is a "sham." By the same logical reasoning we migbt prove that the *inside* of a honse ought to have the bare brick exposed, and the ceiling ought to show the timber joists—such are the absurdities to which a false standard of truthfulness will lead us. will lead us.

assimints to which a line standard of runninduces Will lead us. French Renaissance is still more picturesquely treated than Italian; and if not too profusely covered with decoration, which satiates the mind, and has led to its being called *lascicious*, it may also be employed with good effect in town architecture,—in places where a hroken sky-line is an object of importance, as in a position where it will be viewed from a dis-tance, towering above and giving variety to the usually monotonous borizon of a modern eity; the oullines of which are generally all but neglected. Elizabelhan is purely an English style, and, though much abased by "the hest authorities," is still well worthy of our notice. It should be very sparingly used in citics, and, together with the Trench of the same period, should always be employed with great caution. It offers great inducements to unskilled hands, from the case with which it may be copied, and

santion. It offers great inducements to unskilful hands, from the case with which it may be copied, and it is the bad architecture so produced, together with it is the bad architecture so produced, cogether win its worse application, that bas rendered it so com-pletely a workhones style,—hence its disrepute. What style is so suitable for a baronial residence, surrounded as it is with such thoroughly English associations, and harmonising so well as it does with English land-

Italian is a style fitted for the expression of eom mereial properity, and the display of accumulated weatth. French Renaissance is partly fitted for the same purpose; yet possesses less Classic taste; and is more extravagontly egolistical in display. But Elizabethan, with its secluded yet cheerful and func-file abethan, with its secluded yet cheerful and func-the residence of a nolheman or gentleman prigot. Weats of affluence, wealth, commerce ; and withat notions. It is intrinsically a Sbakesperian style, pos-sessing the attributes of his gag, and partly those of his genins. Vivid and forcible, hrilliaut and fantastic, bornely and cheerful, it is far from being the demos ralized bastard offspring of the two styles, which people who ought to know better are never weary of Italian is a style fitted for the expression of com-

representing it to be,---and proving it to their own full satisfaction. In advocating the employment of several styles, I would wish to disabuse my hearers' minds of the impression they may insensibly form, that it would be correct to place opposite styles in justraposition : no-thing is further from my intention; for though in styles which bare an affinity this may be done from thing is further from my intention; for though in styles which have an affinity this may be done fre-quently with good effect, yet the transition should not be too rapid, or the contrast too great. If the sur-rounding structures he not very ungraceful in outline, attention should be paid to the laws of harmony; working up the whole into a pleasing ensemble, as if it were part of a general design, which only required earrying out and completing. Nevertholess, there doubt with the light in the structure are not seen to be a set of the set of th arrying out and completing. Nevertheless, there should exist an individuality, distinguishing each from its neighbours, though the whole should form a com-position, or a picture. There should be no inelegant position, or a picture. There should be no inelegant junction, or knuckle-joint, if I may be allowed the expression; no unfinished heak—waiting to be con-tioned bines until the state of expression; no unfinished break—waiting to be con-tinued in our next—hut the union should be easy, graceful, and complete in finish; combining them as parts of one composition, yet distinctly marking the extent of each design. A gradation of ideas is necessary to preserve the effect of the sentiments impressed on the mind, hoth in architecture and poetry; for where the sentiments conveyed are of opposite characters, they destroy each other and hercome latent, like nega-tive and positive electricity. A Classic building in proximity to one in Gothie taste, will, contrary to the valgar notion of improvement by contrast, injure it, by giving it an apparent toyishness of appearane; and the Gothie will, in return, re-att and produce in the Classic a certain bard, cold, and formal effect, tober wise not noticeable. I often think that the Gothicits destroy the fine sentiments exhibited in a Classic building, by placing an imeginary edifice in taber of it. Such a course will as effectually destroy its bearties, as a comic song will drive away all the pathos of a sentimental one. It is impossible to using hand to cry at the some moment—nless it be during hysteries or madness: so to preceive and tinued in our next-hut the union should be easy, hadros of a scinimental ones. It is impossible to longh and to erry at the same moment—nnless it be during bysteries or madness: so to perceive and appreciate fully the beauties of each style, we must detaeb one from the other, and survey them sepa-rately—a difficult operation if they adjoin. Some will, perhaps, ask what is to he done, if the adjoining buildings, according to the rules previously pro-pounded, are required to be of opposite styles, es in a hall of justice and a church; to which I answer, something must be sacrificed to each style, if utility says that they must go together. In every scheme there are some disadvantages; some convenience or some beauty must be sacrificed just we should choose that scheme which meets most of the requirements of the case; and I confidently assert that the proper and legitimate use of several styles, in preference to one, will meet our wants much more effectually— sneer, as many will, at the assertion.

one, will meet our wants mien more effectually— sneer, as many will, at the assertion. Nothing to my mind has proved the superiority of a modification of Italian for civic purposes more than the late competition for the Government Offices. There were several able Gothic designs submitted; but they were, without exception, uniformally inappropriate. Indeed, Gothicists seem to ignore all attempts at giving a suitable expression of purpose to an edifice— that is left to chance. They are so taken with the beauties of Mediavalism and precedents, that expres-sion is generally disregarded; though the style, with proper treatment, is capable of a much greater range than they generally give it. Monastic devices, epis-copal attributes, or collegiate conventionalities, are not the things fitted for giving expression of purpose to a range of national offices for the transaction of the business of a great commercial kingdom such as Eogland. Yet, what else is there to give these Gothic designs expression? Nothing! How strangely inapprothe business of a great commercial kingoom sonk as Begland. Yet, what else is there to give these Gotbic designs expression? Nothing! How strangely inappro-priate those mediateral figures and strangely inappro-template the purpose of the intended structure, viz. the transaction of the extremt business of the realm in its relations with foreign powers! How one, irresistibly reminds you of the past! The other of the present! Such a contrast of ideas serves to degrade an otherwise meritorious design into a halp-house for old men in their dotage. There may be extravegances and flagrant copyism displayed in many of the Renaissance designs; but how much more appropriate is the feeling conveyed by that style to the prosent [ine, every bit of decoration, speaks of affluence, wealth, commerce ; and withat they posses a cortain systematic and business-like distribution of parts, not unaccompanied with dignity and stateliness of carringe.

meagre architraves, Palladian windows stack in be-tween five-story pilastere, like Tom Tbumb between the legs of the American Giaut, and gaping shop-fords with no apparent support. Bnads and string courses filled with patere of the most approved form courses filled with paterie of the most approved form of conjectiouery rosette, occasionally diversified by the spaces between the stories being filled in with border panels, some 14 feet high. Such efforts as these (if they can be digmified with the title) are a standing disgrace to the age we live in, and it is almost sufficient to make one concur with those who think it one of anught but tasteless abominations, till a little patch of real artistic worth brings us back to the knowledge that art does still exist. The true till a little patch of real artistic worth brings us back to the knowledge that art does still exist. The true aim of architecture bas been saily neglected; but the faint streaks of light in the horizon permit us still to hope that the mid-day of art is approaching, and that its san will yet complete one more cycle. In this slight review I have introduced little tech-nical matter. My object has been rather to give voice to that part of our art which appeals to the general sympathies of the buman mind, for most people have sufficient taste to appreciate a consistent

general sympathies of the burnau mind, for most people have sufficient tasts to appretiate a consistent design, though they may not have enough to protect them from adverse and corrupt influences. If we try to place before them some new beauty or appro-priate form in everything we do, no matter how small it is, we shall insensibly raise to a higher tone their taste for the heatiful and true.

it is, we shall inscensity raise to a higher told there task for the heatiful and true. I have attempted to draw a line of demarcation between association proper and arbitrary association. One is drawn from the everlasting and pre-existent principles of natare; the other is the result of a blind following of rules or theories, without once turning round to inquire or to investigate. The laboratory of nature is locked to such as these: they mistake local feeling for aniversal law. The opinions I have expressed are not mere visionary analogies, suddenly discovered for the support of a theory, or the refuta-tion of an opponent, and as suddenly thrown on ore side as useless when they have served their turn : but the accumulated experience of a life devoted to art, and of much patient observation and investiga-tion. As such I hope they will be taken; and I sim-cerdy trust that the blind partizansbip and mistaken zeal evinced by many members of the profession, will zeal evinced by many members of the profession, will give place to more enlarged views of the comprehensiveness of art.

siveness of art. Rad/skiniar.—Are you alluding in your last sen-tence to the earnest efforts of the party whom I have the bonour to represent? If so, I can only say that it is an uncalled-for and illiberal remark. Aristides.—A liberal wish, though.

"I would affend none: Those who think the cap will fit Let them try it on."

The party now breaks up, some betraying great disgust, and others with "smiling countenauce screne." As but little hepefit might he bested for from the discussion of the last section of the paper by the able Professor A. it is the less to be regretted by the able Processor in the reader. by the company-or the reader. THOS. M. READE.

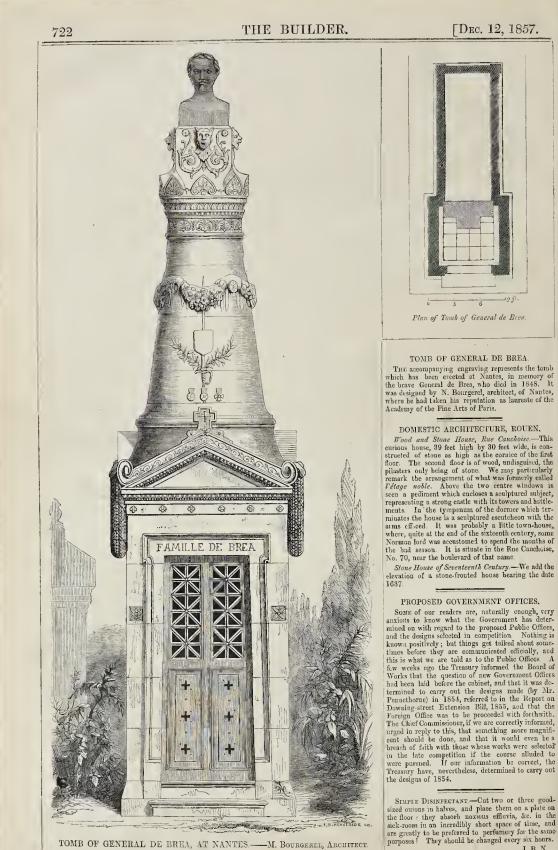

THE ARCHITECTURAL MUSEUM, BROMPTON.

Our advertising columns have already made known the subjects of lectures proposed to be delivered here during the ensuing three mouths, but we repeat the list during the ensuing three mouths, but we repeat the list to emphasize it — Wednesday, January 13, evening meeting, Mr. Cockerell, R.A. in the chair. Award of prize by Mr. Ruskin.—Wednesday, January 27, "O a Ancient and Modern Architecture of nament contrasted," by Mr. John P. Seddon.—Wednesday, February 10, "On the Domestic Architecture of the Middle Ages," by Mr. John Henry Parker.— Wednesday, February 24, "On the Rivel Use of Ancient Examples," by Mr. Gorge E. Street.— Wednesday, March 10, "On Ancient Timber Framing," by Mr. Raphael Brandom.—Wednesday, March 24, "On the Schection of Objects for Study in the Architectural Museum," by Mr. G. G. Scott, A.R.A. A.R.A.

There are but two candidates for Mr. Ruskin's

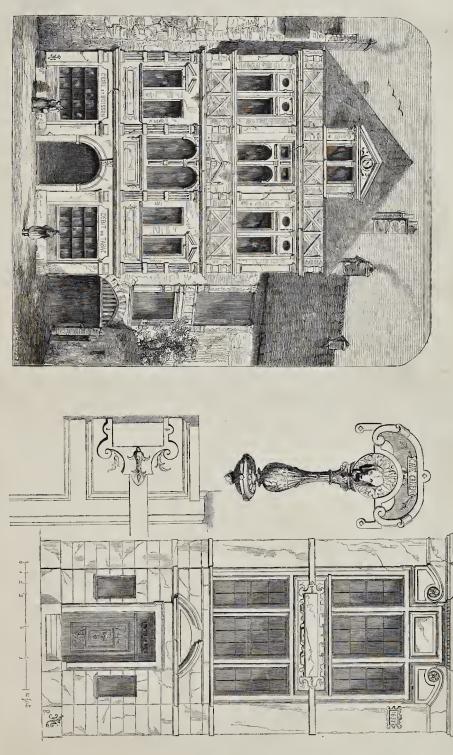

There are but two candidates for Mr. Raskin's prize, and their merit is sold to be nearly equal. We may mention that the new catalogue will be ready in the beginning of the new year, and that a large collection of photographs is being made to illus-trate the casts in the Architectural Gallery.

HINTS AS TO PRICE LISTS: DISTRICT MAR ---- Would it not he very much more convenient for reference if the different manufacturers could arrange to print the afterent manuacturers could arrange to print their price lists on the same size paper, so that they might be kept together, and, if thought necessary, bond and indexed? Also, would it not pay to publish a coloured map (like the new postal), showing the portions under the jurisdiction of the different district surveyors? It would he found very convenient.—W. T.

TOMB OF GENERAL DE BREA, AT NANTES .---- M. BOURGEREL, ARCHITECT

J. B. N.

DOMESTIC ARCHITECTURE OF SIXTEENTH AND SEVENTEENTH CENTURY IN ROUEN.

723

THE CHÂTEAU OF CHAMBORD.

THE buildings in the dchased Italian style of architecture, or that of the Renaissance, as it is more com-monly called, are not so well known in this country as they would scem to deserve to be, and it is with the view of directing attention to them that I bave heen induced to pen the following letters. A residence of about fifteen months in the immediate vicinity of some of the finest monnments of the Renaissance

of some of the fixest monnments of the Remaissance which are to be found in France, or, indeed, in the world, has, I trust, along with a sincere love of the study, to some extent qualified me for the task. The object I have in view will, I hope, be more readily—at any rate more pleasantly—attained by a particular description of a few of the finest examples of this school, than by any attempt at a scientific de-scription of its distinctive features; and it may not he altogether nuintere:ting, even to the purely pro-fessional reader, if these descriptions are accompanied by brief notices of the historical associations con-nected with the buildness described. Nor will it. I by brief notices of the instormal associations colu-nected with the buildings described. Nor will it, I think, be out of place to inquire into the circum-stances which gave rise to the introduction of this style. As the feudal system began to decay in France, and the nobles, instead of warring against their sovereign, began to submit themselves to bis rule, and to attend use him at this careful the uncessity of the to attend upon him at his courts, the necessity of the royal residences, at least of those of the interior of If an infrared set and the set of altrong, also continued to the future future future of military strongholds. There was yet another motive which gave impulse to the stride made by the fine arts in the fifteenth and sitteenth centuries. During the twelfth, thirteenth, and fourteenth enturies, an exclusive monopoly had been excreteed by the priest-hood in building fine edifices, as attested by the mag-nificant orthogene building and some transhood in building nice cances, as accessed by use mag-ufficent catchedrals, churches, and monasteries, which arose in every part of the country. A desire to withstand the power and influence of the Church led to a feeling of rivalry on the part of the nohility. They were actuated also, by a desire to entshine in

They were actuated, also, by a desire to cutshue in magnificence other foreign princes, whose degent and handsome palaces they had visited in their travels. Accordingly, about this time we find the *chidtau* forf giving place to the maison de campagne. Charles VIII, Louis XII, and Francis I, were all men of highly realizated texts and make hand to rationize of highly cultivated taste, and who loved to patronize artists, sculptors, and men of letters. During his campaign in Italy, Charles VIII. had made himself acquainted with all the finest buildings of that country; and, on bis return to France, in addition to a large collection of autiques, he took with him a large a gem of its kind, and of which I shall have occasion

a gem of its kind, and of which I shall have occasion to speak by-and-by. The style which prevailed in Louis XII's time, and which is sometimes called *his*, sometimes the Flamhoyant, was florid to a degree. It abounded in exquisite details,—the work on the eanopies, for ex-ample, resembling lace-work, but it was greatly wan-ing in general effect. It is to Francis L institu styled the father of act

It is to Francis I. justly styled the father of art and letters, that we owe that dehased Italian style, and ectors, that we owe that densed Italian style, which is more commosly known as that of the Renaissance, and which will form the principal sub-ject of the following letter. Encouraged hy the liberal patronage held out by this prince, numerous foreign artists, sculptors, and architects of celebrity, were induced to visit France. Among others we may mention Primaticcio, Vignola, and Leonardo da Vinci, the latter of whom for a number of verse occupied a the latter of whom for a number of years occupied a small château in the neighbourhood of Amboise. Owing to her Italian education and tastes, Catherine de Medici no douht also contributed in a measure to the progress made hy the arts in the sixteenth progress made hy the arts in the sixteenth nry. These remarks will serve as an introduction century. to the subject I have in hand, and I now proceed to describe in the first place the royal Château of Chambord

Ahout twelve miles from the ancient town of Blois, in the department of the Loir et Cher, stands the Châtean of Chambord, one of the most splendid the contacts of the Renaissance. Its site is unfortn-nately quite unworthy of this magnificent pile. The surrounding country is a dead flat, the only relief to the eye being the deer forest which encircles the chilean. The atmosphere, owing to the humidity of the soil is dark and gloomy. Notwithstanding these detracting circumstances, Chambord, once seen, can never he forgotten.

Its erection commenced in the reign of Francis I. who employed no fewer than 2,000 workmen, under the superinteudence of Primaticcio;* was continued

Some doubts have of late been started by M. Baillargé, as to Chambord being the design of Primaticoio M.
 Bailargé is hallned to ascribe it to an architect of Blois, whose name has not come down to posterity. Others, again, attribute the design to Vignola.

by Henry 11. and Charles IX. and brought to a con-

by Henry II, and Charles IA, and brought to a con-clusion by Louis XV. Chambord, however, was not destined to escape unscathed through the fiery furuace of the Revolu-tion, and its walls yet hear the marks of the defacing hammer and chisel. At the same unbappy time the hanner and chisel. At the same unhappy fine the art-treasures collected during three certuries werein a few days destroyed, or dispersed for ever. Its pre-sent proprietor, the exiled Duke o' Bordeoux (to his ent proprietor, sent proprietor, the exited Dike of Dordenia (uo his bonour be is aid), expends the whole of the rental which the estate yields, in the restoration of the building, which is done in strict accordance with the original design. The Château of Chamhord is so little like any other

The Charcae of Chamhord is so little like any other building I have ever seen, that I have some hesita-tion in attempting its description. In England, Woolaton Hall, Longleat, and Burleigh House, are, perhaps, the only huldings which in the least re-semble Chambord. These helong, however, to the Elizabethan style of architecture, which, though nearly contemporaneous with the debased Italian style, yet differed from it in many essential features. The priorical part of the building forms a square with four large round towers at the corners, which have high conical sater cords surmouncid by a helfry.

with four large routed towers at the contents, which have high contrast latter or a summanifed by a helfry. In the centre of the square is another tower, known as la tour de la flear de is, which fouk its name from an immense stone bly, which formerly erowaed it. It was thrown down by the mob during the Revolution, and has not yet been replaced. The top of this tower forms an open lantern, which, with its flying buttresses, is very similar to St. Giles's Cathe-dral in Edinburgh, and of St. Nicholas's in Newcastle, dral in Edinburgh, and of St. Nicholas's in Newcastle, with this difference, however, that its details are Italian, while theirs are Gothie. Which this central tower is a double spiral staircase, so contived, that two persons may ascend it at the same time without stories, each of which comprises four compartments. These compartments being at right angles to one another form a cross, so that the light is thrown from all sidea upon the staircase. Above these four stories the staircase opens on to the roof, the whole area of which, with the exception of the towers and the open lantern, is paved; the chambers beneath it being open lantern, is paved; the chambers beneath it being arched to sustain the weight. A little below the eaves of the towers, and running

all round the centre building, is a beautifully belus-traded burtism, supported by corbels. The dormer traded burthsap, supported by corbets. The dormer windows, with their Corinthian or Ionic pilasters, small uiches, and little flying buttresses, are parti-cularly elegaut: cach of them, io fact, is of itself a study for marchitect. The chinucy-stalks rises from a basement of a very similar design to that used for the dense windows: the dormer windows

I must not omit to notice a species of ornament I must not omit to note a species of orunnent employed here, which is to be found in many of the buildings in Pisa and Florence, and which has a peculiarly striking and effective appearance. I mean pieces of black slate or marble, in the shape of circles, ovals, and other figures, inlaid in the stone, which re-tains much of its original cream colour. They are generally, hut not always, surrounded by a moulding. From either end of one of the sides of this square From either end of one of the studes of this square extends a wing, which terminates in a large round tower, the whole forming a long and imposing range of building. The centre part being considerably higher, hecomes more prominent, and with its forests of towers, belfries, chinneys, and dormer windows, has a most striking and beautiful effect. In front o this side is the ground formerly employed as the tournament lists. It was originally inclosed by a

tournament lists. It was originally inclosed by a moat, with a balastraded parapet. On the opposite side of the building is a courfyard, round which there is a low range of buildings, istended for the accommodation of retainers, which was built by Louis XV. This court is entered by a fine arched portal, which has been the principal entrance to the château

The interior of the hoilding is hy no means equal in detail or architectural feature to the exterior. ' whole internal decoration of English houses of Ťhe same period is of a much higher stamp. Many of the apartments have on their panelled roo's the "F." and crown of Francis I. alternately with his arms, the salamander. The fireplaces are all large, with a broad salamander. The fireplaces are all large, with a broad projecting chimneypiece, which runs no to the celling or arch of the spartment. It is worthy of notice, that the staircase and the halls are finished with stome on the walls and panelling of the roots. I cannot better anyplement this description than by quoting one or two passages from the pen of M. Alfred de Vigny, the secomplished author of "Cinq-Mars:'--- Between two miry marshes and an oak forest for from any nuble road the traveller

ond stars: — Detween two mry masses and an oak forest, far from any public road, the traveller suddenly comes upon a royal or rather a magic château. It seems as if some Eastern genic, con-strained by another wonderful lamp, had built it

* Lady M. W. Montagu, in one of her letters from the East, gives an account of a triple staircase of this kind, which she saw in a mosque at Adrianople.

during one of the thousand and one nights, and had stolen it from the country of the sun in order to con-ceal it and the amours of its gay prince in that of the mist. This palace is buried bke a treasure; but those blue domes, those dependent entry of the set of mist. This palace is buried bics a treasure; but those blue domes, those elegant minarets crowning the lofy walls or towering in the air; those long terraces commanding the woods; those light arrows moved by the slightest breath of air; those erescents interlaced on every colounade, would make you believe yourself in the kingdom of Bagdad or Cashmere; if the hlackened walls, with their earpets of moss and ivy, and the pale and melan-choly colour of the sky did not attest a rainy country. It was, in truth, a gay primee whose amous were conwas, in truth, a gay prince whose amours were con-cealed there; but he was a king, and was styled Fraueis I. Everywhere his salamander spouts its cealed there; but he was a king, and was syncu Francis I. Everywhere his salamander spouls its flames. It glitters a thousand times on the vaulted roots, as do the stars in the vault of beaven. It sus-tains the capitals with his hurning crown. It colours the glass with its fires. It winds along with the secret staircases, and everywhere seems to devour with its flaming looks the triple creasents of a mysterious Diama,⁴ twice a goddess, twice adored. But the hasis of this strange monument is, like

But the basis of this strange mountaint is, like itself, replete with elegance and mystery. It is a double staircase, rising in two spirals, which are inter-laced from the lowest foundation of the edifice, till it towers above the bighest belfries, and terminates in a lantern or *cabinet à jour*, crowned with a coloseal *fleur-de-lis*, which can he seen from an immense dis-Two mea may ascend it at the same time tance. without seeing one another. This staircase by itself seems a little isolated temple. One would fancy that the obedient stone had bent bencath the finger of the the obedient stone had bent bencath the finger of the architect. It appears (if we may so express our-selves) kneaded according to the caprice of his imagina-tion. The beholder has difficulty in comprehending how the plans were drawn, and in what words in-structions were conveyed to the workmen. The whole seems a passing thought, a brilliant idea, assuming, all at once, a durable body, a realised dream." dream.

" Souvent femme varie; Bien fou qui s'y fie."

The story goes that his sister, Margaret of Navarre, entered the room as he was writing it with a diamond on one of the windows, and that she retailated for the libel on her sex by saying she could quote twenty instances of man's fickleness. Francis answered that her reply was not to the point, and that he would rather bear of one instance of woman's constancy.

rather bear of one instance of woman's constancy. • Can you mention a single instance of her incon-stancy ?" asked the Queen of Navarre. It happened that a few weeks before this one of the gentlemen of the court bad been thrown into prison, accused of some neglect of duty, and his wife, who was one of the Queen's ladies in waiting, was reported to here advand with his more. Certuin it was that to have cloped with bis page. Certain it was that both the page and the lady had disappeared, no one could tell where. Francis triumphautly appealed to this case; hut Margaret warmly vindicated the lady's cause, and maintained that time would prove her innocence. Her brother shook his head, but promised that, if within a month her character should be reestablished, he would not only hreak the pane established, he would not only hreak the pane on which the couplet was written, but also grant his sister whatever hoon she might ask. A few days after this conversation it was discovered that it was not the lady who bad fled with the page, but her hashand. During one of her visits to him in prison, they had exchanged clothes, and he was thus enabled to deceive the jailor, and effect his escape, while she devocedly remained in his place. Margaret cloimed his pardon at the King's hand, who not only granted it but celehrated this instance of conjugai affection it, hut celebrated this instance of conjugal affection hy giving a great *fete* and tournament. IIe also destroyed the pane of glass, hut the saying has survived

Auother version of the destruction of the pane is that Louis XIV. sacrificed it to please Mdlle. La Vallière.

The visitor is also shown the room where Molière first brought out on the stage his comedy of "Le Bourgeois Gentilhomme" hefore Louis XIV. and his

It was at Chamhord that Francis I. confiding in It was at Chamhord that Francis I. conduing in the promises of a man who had hene bis enemy for tweuty years, entertained the wily Emperor Charles, while returning to bis own kingdom after quelling the insurrection of the Flemings. Although it coa-tinued to be a favourite residence of royalty, it was not (at least so far as my memory serves me) the seene of any other remarkable historical incident. In

later times it was inbabited by Stanislaus, the deposed King of Poland, and afterwards by Marshal Saxe. The former filled up the most which originally encircled the châtcan, a proceeding which, while it was dicta

the cumcas, a proceeding which, while it was included by motives of prudence on account of its insulubrity, detracts from the appearance of the building. After the revolution, Chambord was purchased by public subscription, and presented to the Duke of Bordeaux, its present proprietor.

CHURCH-BUILDING NEWS,

Cambridge.-The restoration of the church of St Mary-the-Less is about to be commenced, by the erec-Mary the Less is about to be commenced, by the erce-tion of a new oak roof, at the probable cost of 1,300. *Maidenhead*. —All Saints' church, Boyne-hil, usar Maidenhead, Berks, has been consecrated. The build-ings, which are wholly of brick, together form three sides of a quadraogle, on the north being the church, on the cast the parsonage, and on the south a school. The oburch comprises a nave, with two aisles divided by clustered columns, and a chancel separated by a screen. The columns are of stone, the arches being of stone and brick, serrated at the edges, and placed in alternate courses. The walls are of red brick, in-terspersed with black. The chancel presents a com-bination of colours by the use of bricks and atome of various bues; and the east end has albaster and in-laid marbles, of which the prevailing colour is white. The church was designed and maioly built at the cost of the Misses Hulme, daughters of the Rev. W. of the Misses Hulme, daughters of the Rev. W. Hulme, a clergyman well known at Reading. All the Manue, a trengy new with known at iterating. At the windows of the church are of stained glass. The architect of the buildings is Mr. G. E. Street, of London, who also contributed as well as designed the stained glass, a picture of our Lord surrounded by angels over the obanced arch. The contract was carried ont by Mr. Joseph Mills, of Stratford-ou-Avan Avon.

Avon. Eaton.—Christ Church, Eston, near Congleton, was consecrated ou the 1st inst. The edifice, which is built of Yorkshire stone, in the Eurly Eoglish style of architecture, consists of nave, chancel, vestry, porch, and square tower, with broken battlements, surmounted by a vane. The site was the gift of Mr. G.C. Antrohus, of Eaton Hall, who has also subscribed 5002. towards the erection : his brother, Sir Edmund Antrobus, subscribed 5002. towards the same object. The entire cost has been about 1,4007. The church will hold about 250 persons. The large cast chancel The entire cost has been about 1,400?. The church will hold about 250 persons. The large cast chancel window represents the aposites and the following sub-jects :—St. John baptisning our Lord, with the text, "Repent and be baptised;" in the centre, our Lord holding an orb, the emblem of bis power; the Cruci-listion, and the Last Supper, with the text, "Do this in remembrance of me," &c.; the Freemasons' em-blems are displayed, the window being the gift of the Freemasons of Congleton, Macclessfield, and Crewe. The two south chancel windows the present the birth of our Saviour, Christ disputiog with the Doctors, and Christ blessing childrem, with texts. These windows were the gift of the pupils of the Rev. J. P. Firmin, of Daue Bank, the incumbeot. The north chancel window is a representation of the Resurce-tion, heing a memorial to Mrs. Brown, the wife of the Raffles Brown, of Liverpool, the architect of the church, by whom it was presented. These stained glass windows were extende by Mcssrs. Edmondson and Sons, of Manchester. "*Wheaton-Aston*,—The church here has heen re-built and consterned. The edifice, which is of stone, has been creeted by Mcs. Gulfrey, of Birmiogham, from designs prepared by Messrs. Bilake and Lovatt, of Wolverhampton. It consists of nave, north aide, north and sonth transpets, and chancel, with vestry between the latter and north transpet. On the north side of the west front is a bell-tower, and on the south side a porch, hoth of which form eutraces to the interior. The pews, which will accommodate the south aide a porch, hoth of which form eutraces to the interior. The pews, which will accommodate the south aide a porch, hoth of which form eutraces to the interior. The pews, which will accommodate fasts window in the chancel, from the works of Messre. Chance and Co. of Smethwick, bas been pre-sented by Mr. John Hartley, of Wolverhampton, who also subscribed likerally to the building frud. Lizerpool.—The foundation-stone of a new church, it be gealed Holy Trioity, was haid on the Li will hold about 250 persons. The large cast chancel window represents the apostles and the following sub-

Liverpool .- The foundation-stone of a new church, to be called Holy Trioity, was laid on the 1st inst. in Parliament-street, hy the Rev. Dr. M'Ncile. been made up by sub-criptions. The contracts for the exevation, brickwork, and masonry, have been taken by Mr. Tomkinson; for the joiner-work and carpentry, by Messrs. W. Leyland and Co.; and for the plumber-work and glazing, by Mr. Edwards. *Glasgow*.—The notice Presbyterian Church in St. Vincent-street, is in progress. The masonry, asys the *Gasette*, of the wings (corresponding with the aisles of a Gothic eathedrai), is now all but completed, being carried up to the height of the carblery works:

being carried up to the height of the gallery roofs being carried up to the height of the gallery icols: the two portaces, forming the north and south ends of the central portion of the building, and which cor-respond to the nave in Gublic architecture, are now considerably advanced. Coosiderable progress bas also been made with the tower, which occupies the north-cast correct of the site. The architects are Messrs. A. and G. Thomson, of Glasgow.——At the Dean of Guild Court, according to the same paper, authority has been given to West Nilestreet Con-gregational Church, for the creetion of a chapel at the north-cast corner of Cambell-street and Waterloo. gregational Church, for the creetion of a chapel at the north-west corner of Camphell-street and Waterloo-street. The designs were furnished by Messrs. Bar-clay and Watt, arcbitects. The style is Roman Dorie, adapted to meet the requirements. The principal front is towards Waterloo-street, and the outracce is by a flight of broad steps leading to a portice of four columns, which stands in advance of the staircase wings extending on each side. There are no windows behind the calleries but the sance hove the calleries wings extending on each side. There are no windows behind the galleries, but the space above the galleries is contracted in width, and forms what in Gotbie would be the elevestory, along both sides and ends of which lunctue windows are carried. The ceilings over the galleries are segments of a circle. The pul-pit end of the chapel is formed into what may be termed a recessed portice with square pillars and platform behind communicating with the vestries. The church will accommodate nearly 1,000 sitters, and in the basement story there is a lecture-room, seated for about 200, and a large hall for Subbath schools. The cost of the building, including the price paid for the ground, will exceed 10,0007. *Kells* (Dropheda).—A Roman Catholic chapel is in course of ercetion in coonection with the range of

course of erection in coonection with the range of course of creation in coonection with the range of buildings comparing a covent, schools, parochial resideoce, and church, at Kells. In the chapel, asys the *Drogheds Argus*, one of the first objects that strikes the eye is the large circular space or stucco enopy on the ceiling over the sanctuary, which is divided into sixteen compartments, radiating from a smoll ceotral circle. All these radiating spaces are decorated. The prevailing colours are green, gold, and soffrou, forming the ground for passion-flowers and showneeks intervined. The central circle and and soffron, formlog the ground for passion-flowers and shamrocks intervined. The entral circle and the mouldings are all gilt. In four spaces at the corners of a square, within which the large circle is formed, are the four Evangelists, paioted in full size. Four panels, running along within straight lines above the altar, are filled with metallions of St. Peter, St. Paul, St. Patrick, and St. Columkbill, in life colours. The silles and bordering spaces are en-ciched with seroll-work. The grand altar and the surrounding parts are decorated in the florid Gohine style. Red, blne, white, and gold prevail, and the mouldings are brought out in gold. The space about the tabernacles of the side-altars is painted initiation of Caen stone on paper, after designs by Fugin (?) The of Caen stone on paper, after designs by Pugin (?) The mouldings and stucco work around the altar-piece, representing the Assumption, are gilt. Mr. H. Maguire is the cootractor.

STAINED GLASS.

Winchester Cathedral.—The stained glass memo-rial window to the officers and men of the 97th regi-ment, who fell in the Russian war, is now fixed in the western end of the south asile of the cathedral. the western end of the south aisle of the cathcdral. The window, which is a perpendicular one, and was huit by Bishop Edington, io 1366, consists of ten openiogs, hesides nice small spaces in the apex and sides of the arch, the top one of which con-tains the heralitic insignin of the Duke of York, who was colonel of the 97th, and from whom it derived its name—"The Uster Regiment," the duke heing Earl of Ulster. The small compartments on each side con-tain roses. Below the duke's arms are the figures of the Michael the Archael who is represented yan. taiu roses. Below the duke's arms are the figures of St. Michael the Archancel, who is represented van-quishing the Prince of Darkness, and St. George, the patron saint of England, overcoming the dragon. The openiogs on each side of these saits cootain angels, beariog the emblems of peace and victory. In the spaces near these is introduced the shanrock, the 97th having been raised in Irelaod originally. The middle series of lights are filled with representations of Joshua, Gidcon, David, and Jonathan, four of the warrior kings of the Israelites; the lower series with four figures of Saxon monarchs, in the following order: —Ethelbert, Eghert (the founder of the English monarchy), Ethelred, and Alfred the Great. The hack-ground of the figures is a disperde golowr, and each of

period." In the Gothic panelling nuder the wiodow are fixed four tablets of Carn stone, in which are carred, in perpendicular black letter, with coloured capitals, the inscriptions. Mr. Charles Gibbs, senior, of New-road, London, was the artist. *Christ Church, Macelesfield*.— Another stained

Carst Charca, Alaccience, Another standed glass window has here added to those already in this church. This wiodow has replaced the one on the south side, formerly filled with stained glass of an inferior description, which has been taken out. The style is a mosaic, with large medallion in the centre cootaining "the good Semaritan." The priest and containing "the good Semaritan." The priest and Levite are represented as passing by "oo the other side," while the good Samaritan, who is pouring oil into the wounds of the "man that had fallen among thieves," or caupies the foreground. The window is a memorial one. The work was excended by Messrs. Educations and Son, of Manchester, making the fifth window put up in this church by the same firm.

Gloucester Cathedral,--We understand, says the Gloucester Chronicle, that the Rev. ". Murray Browne, honorary canon, has addressed a letter to the Browne, nonorary canon, nas addressed a terter to use Deen and Chapter, stating that it is proposed, with their couseot, to remove the dingy glass with which the great west window at the cathedral is at present filled, and substitute for it stained glass, as a memo-rial to the late Bishop Monk.

DISEASE AND THE BOARD OF HEALTH, AND HEALTH OF TOWNS BILL.

The toes in of alarm has been sounded very judi-ciously by the Board of Health. The approaching cholera has given us due warning, in the same manner that it has invariably and unterringly done before: its advent (and that before long) has heen proceed by severe diarrhea all the automa, and unequivocal cases of cholera have shown themselves in London as well

as in the country. It has twice invaded us from the shores of the as in the context, It has twice invaded us from the shores of the Baltic, and will do so again. If we neglect the pre-cautionery measures which ample experience has demonstrated that we possess—the effectual means of the disease. —the condemonstrated that we possess—the effectual means of che-king the earlier forms of the disease,—the con-demnation for our neglect will be a just retribution for our indifference to the greatest calamity which has ever afflicted the buman race. It is the duty of every may to arge on the public anthorities the fulfilment of their duties and powers which the Government has liberally placed in their hands to avert or mitigate an impending and great scourge. Under the provisions of the Health of Towns Bill, there is eiven to heard of grandings the nower to

Under the provisions of the Health of Towns Bill, there is given to boards of guardians the power to appoint medical inspectors over the whole kingdom,— over towns and bamlets; whose business should be to ferret out the sources of danger ond poison which infest, in a thousand forms, our towns and villages; io alleys, and holes and corners, in gutters and drains, io ditches, and stagnant pools and pools, which breed malaria, and thus unsuspectingly poison thousands of our fallow creatures our fellow creatures.

our tellow creatures. A large amount of these distressing evils may be averted. This is not the time for a heartless and frigid economy to nullify the means of doiog good and saving the lives of ourselves and neighbours : we must averted. This is not the time for a heartless and frigid economy to multify the means of doing good and saving the lives of ourselves and neighbours: we must he up and doing. The appointment of medical im-spectors by the hoards of guardians of towns and unions should be at ooce determined upon: their duties are concrous and most responsible. It is not enough to constitute parish surgeoos as local inspec-tors: their hands are already too full io visiting the sick. It is competent for guardians to provide medical gentimen as inspectors who are not burdened with other engagements, and who could investigate large districts of country, and hring to light the causes of epidenies with a view to remedy them. There are oot more than twenty to thirty iospectors as yet in the whole country, owing to the ignorance of hoards of guardians in not comprehending their daty, or to their extreme selfsbness, if not wickedness, in saving a paltry tax,—the salaries of the inspectors. Thus the lives of thousands are perilled rather than use the means of averting the avrill apread and mortality of cholers. The humanity of the legislature is com-pletely ignored and thwarded by the crued and ill-timed economy of those public authorities who have refused to carry out, or have very imperfectly carried out, the henevolent means at their disposal, in the several Acts of Parliament,—in the Act for Removing Nuisances, and the Headth of Towas Bills, and other Bills. Bills

As he ore, the old adage will he realised of shuttiog

sources of epidemics, and adopting the means of checking them,--means which useful are within our reach if duly pointed out and liberally are within our parishes by diminishing the mortality of those heads of families whose dependants may be thrown on the rates

Coincident with the necessity of averting cholera, Coincident with the necessity of averting cholers, I would beg to advert to a great public want,—the great want of public conveniences. London is the least commodious place of any large town: all the expitials of Europe are better provided, and especially Paris, where common sense and utility bave prevailed over a ridiculous modesty. The powerful press is the best friend of the people, and their strong advocacy of an universal wont will bring them a grateful, though silent, thanksgiving. In the hone that the subjects to which I have referred above will be admitted to have a strong claim upon

above will be admitted to have a strong claim upon the journals of the country, I have not besitated to plead for their prompt co-operation.

Paris. R. W. M.D. F.R.C.S.

WREXHAM MUSIC-HALL.

ON Wednesday evening, the 2od, Mr. Davidson, of the Chester Government School of Art, delivered a lecture on printing, in aid of the funds of the Wrexham Literary Institution. In closing the lecture, Mr. Da-

⁴⁴ And now let me sgain urge on the attention of all present the claims of the Institution, through whose instrumentality these lectures are given. I have spoken of the days wheat books and papers were scarce, and ohtainable only by the few. Thank God, that day is past, and public reading-rooms are numerons: but they want support, not only from the rich, but from the working classes, for whose special benefit they are intended. Let me beg of all present to bear it unind that, whilst schools under government and clerical inspection are established, these must fail in accomplishing their altimate end, if the great work is not taken up and continued when the boys and girls become men and women. In towns has this, for become men and women. In towns like this, instance, where there are few, if any, amusements for the people, is it not our bounden duty to provide for their moral and intellectual culture? The tavern, their moral and intellectual culture? The tavern, with its plate-glass windows and glaring gas-lights, with its singing-room and its sporting paper, holds out *its* attractions, and lures especially those who "have nothing class to do," for illeness is the source of all evil. Ought not we then to gird on *air* sword and take up achieved the source of all terms and interve our shield to war with ignorance, idleness, and intemperanee?

our succes to the third geometry includes in a latent persnee? Ought we not to provide places where the hetter qualities of a mar's heart and mind are broughd out, and from which he can carry to bis home, not hlas-phemy and passion, but instruction and peace?" On the following evening the public distribution of the prizes gained by the students at Wrexham under the tuition of Mr. Davidson took place. The mayor (Mr. T. Edgworth) took the chair, and opened the meeting with an address, in which he urged the use-fulness of drawing either in basiness or as an accom-plishment, and earnestly hegged the rising generation to avail themselves of the advantages of the drawing classes now established in the town. Mr. Davidson next addressed the meeting at some length, firstly next addressed the meeting at some length, firstly detailing the origin of the Wrexham hranch School of Art: he next illustrated on the black board the iuflu-ence drawing has had on our manufactures; sketched the jug of the past and the jug of the present day, onr toys, the dog of former days and the toy-dog our toys, the dog of former days and the toy-ang sat-children now have, our nursery pictures, &c.: all have their influence in educating the eye and cultivating

CONVERSION OF WOOD BY MACHINERY. INSTITUTION OF CIVIL ENGINEERS.

AT the meeting on the 1st instant, Mr. R. Stephenson, M.P. president, in the chair, the discussion upon Mr. Molesworth's paper "On the Conversion of Wood by Machinery," was continued througbout the evening

Exception was taken to the author's preference for Exception was taken to the author's preference for the wood framing generally used in America. It was admitted that whils it was new it might be suffi-ciently steady, and might absorb, or neutralize the vibration; but it was asserted, that the screws soon worked loose, the joints became slack, and the framing tremhled. On the other hand, bowever, cast-iron framing was more durable, the joints con-tineed firmly attached, and the whole fabric re-mained steady; it was easy to neutralize the vibra-tion by inserting beneat the planmer hlock, sheet lead, or strips of wood, which prevented any jarring, and the shafts continued to run evenly, for a greater length of time.

length of time. Great difficulties had been originally expericoced in sctting circular saws, so as to make them run truly ;

but since a soft packing had been adopted, they could be run at much higher speeds, and the large plates could be made much thinner. It was asserted, that none of the American circular saws could produce such a good surface on flooring hoards, as could be such a good surface on nooring nourds, as could be given to them by the fixed planes, under which the boards travelled. It was only necessary to keep the phanes in good order, and to make the boards travel sufficiently quick. Straight-planing could be per-formed at the rate of 50 leet to 60 feet per minute, by fixed planes; whilst the edges of the boards could he worked off square, or he ploughed and tongued by circular cutters. The speed of the circular saws in this country rarely exceeded 7,500 revolutions per minute: at that speed thin saws were worked, whilst those used in America were much thicker.

At the large establishment of the late Mr. Thomas Cubitt all the sawing was performed by circular saws, and beautiful specimens of work were exhibited. The and beauting periods of work where the same fixed in rising and falling spindles, some of which made as many as 6,000 revolutions per minute: the men, however, generally prelerred about 3,000 revolutions.

Smart's circular saws were originally about one Smart's circular saws were originally about one-cighth inch thick, thus wasting nuch timber. The late Sir Isanhaid Brunel then introduced the large vencer saws, put together in segments. Holland in-vented the system of packing the saws, and now they could be worked at very high speeds, when 36 inches dimenter and only L4 genera, in thickness. It was could be worked at very high species, where no incluse diameter, and only 14 gauge in thickness. It was found advantageous to leave a space of 2 inches be-tween the tech, when the saw had its full diameter of 36 inches, and when by constant sharpening the diameter of the saw decreased, the space between the teach diminished in a revuler proparation

diameter of the saw decreased, the space however the teeth diminished in a regular proportion. It was urged, that the production of high finish by machinery was a difficulty but not an impossibility. Hitherto the study had been to produce quantity; and quality of work had heen sacrificed to it.

ROYAL ENGINEERS versus MILITARY ARCHITECTS.

CONDITION OF BARRACKS.

It is pleasing to find that your admirable observa-tions relative to the sanitary condition of our Indian army have received the attention of Government, and that it is probable your suggestions will be adopted. The experience gained during the late war anopton. The experience gained during the late war should be put into practice. We cannot forget the fearful havoe that was made in the ranks of our proudest legions hy the rarages of disease, accelerated, if not in a great measure produced he instruction if not in a great measure produced, hy inattention to sanitary measures; nor can we forget the great improvements which followed the successful operation of the sanitary commission subsequently appointed : we therefore exernestly hope that similar results will reward the labours of those who seek hy sanitary reward the labours of those who seek hy samilary measures to promote the health of our countrymen in India. But while we sympathise with all such under-takings, let us not be unmindful of those nearer home. The present state of many of our military establishments calls for the special attention of Go-veraument: in fact (as Mr. Rawlinson suggested at Birmingham), every harrack occupied hy British soldiers should be inspected, with a view not only to content to their inspected. sanitary, but other improvements; for, notwithstandsamtary, but other improvements, ioi, now inscala-ing the large sums of public money annually ex-pended on these establishments, through the medium of the Royal Engineers, urgent wants are unsupplied, of the toy at Digitation is a start of the start of the outlay, and improvements, naturally expected in proportion to the outlay, are sought for in vain; no general plan is laid out, or permenent improvement aimed at; old defects are perpetuated; changes, involving considerable expense, are made to suit some present purpose, which is no sooner answered than a further alteration is unade for some new requirement; and so, year after year, buildings are changed, altered, and nodified, and left in no better state than they were ound. Married soldiers with their families, perhaps found. to the number of fice or six, have, in some instances, no other "quarters" than one common harrack-room, without even a single division or sercen, which ordinary decency itself would demand.

Lavatories, or wash-honses, are often placed at inconvenient distances, so that the soldier to reach them must cross his barrack square for the purpose of washing, and he will 6nd the house provided for that purpose so hally drained, that he is obliged to that ou an inverted washing howl, or some such article, to keep his feet from ver, while he washes in the water as it flows directly from the cock. Surely these things as it hows intectly from the cock. Surely these things cannot promote either the moral or physical welfare of our army. Defects, we know, are common to all, or most, large establishments, but there can be no or most, large establishments, hut here can be no scrues for many that now exist in our harracks, par-ticularly when the country pays so dearly for their removal; indeed, so long as the care of these places is intrusted to engineer officers who have no interest in intrusted to engineer officers who have no interest in tion and of encouragement, so that more interest, the work, or, nt least, rest satisfied so long as the could have here excited; and, after a long illness, he

[Dec. 12, 1857.

mere formal routine of the duty is gone through, it

is to be fared no great improvement can be expected. Where, may we ask, are our military architects 7 Are they not required as well as military surgeons or engineers? Let fasts he considered and allowed to engineers? Let facts he considered and allowed to answer, and they will show the many evils resulting from the present system; the vast expense of all works undertaken by the Royal Eugineer d-partment, not excepting the mere ordinary harrack repairs, which in some cases cost more than with judicious manage-ent would be sufficient in a show it must be remadel In some closes cost more than with judicious managed-ment would be sufficient in a short time to remodel the entire structure; and these facts, speaking louder than words, would farther show the benefits which would result to the public service if each military district was placed under the charge of an architect who would constantly reside in that district and he solely responsible for the proper maintenance and efficiency of the several barracks under him, and wbo would, at the same time, be independent of all other local military anthorities. He would thus he enabled to devise and adopt for bis guidance some general improved plan of each barrack, subject of course to the sanction of the luspector-goceral of Fortifications; and, baving this plan before him, all changes and improvements should be made with a view to the perfecting of it : our barracks would then become objects of national pride, and not be, as at present, objects of national disgrace.

THE NATIONAL GALLERY OF PORTRAITS : SCULPTURES AND PAINTINGS.

THE portraits of celebrated and historical characters have got a temporary bome in Great George-street, Westminster, hut what precise degree of progress has been made in the collection we have not very lately been made in the collection we have not very lately heard. Our purpose at present is twofold, —first, to draw attention to a suggestion of M. Delpeche, the reducer of senlptures, that a gallery of sculptured portraits reduced from origical husts, &c. to a certain uniform standard—and of which copies might readily be multiplied for local or provincial galleries, public and private—would be preferable in many respects to painted portraits. This is too obviously a good idea to require much expatiation in detail. M. Delpeche is an excellent authority as regards the practicalibility of panted potraits. This is too obviously a good ides to require nuch expatiation in defail. M. Delpeche is an excellent authority as regards the practicability of faithfully reducing such potraits, having already made himself favourably known in Loadou by his own system of reduction, whereby, for example, the bust of Clytie, in the Britisb Museum, was reduced for the Art Union of London, and of which reduced copy, rendered in Parian hy Alderman Copeland, the Art-Union of London has distributed no less than 500 copies to its members. M. Delpeche is also well known to have reduced various other sculptures, such as Marcehetti's Princess Eizabeth and Prince Alhert, Mary Thorayeord's Dachesses of Kent and Gioncester, Wyon's Engineers, and Monit's Louis Blanc. The superiority of sculptured over painted portraits in some respects is unquestionable, and espe-cially so in the multiplication of portrait-galleries ; but why not combine the respective excellences and advantages of both, even in the same gallery? The other purpose we had in view was to point attention to the fact (which scems, so far as we are aware, to bare here operlonced) that already there is a fair to the fact (which seems, so far as we are aware, to heen overlooked) that already there is a fair have beginning of a national portrait-gallery of paintings hid away in the dark, on the walls above the ornitbo-logical aud other collections in the British Museum-Why should not some of these portraits he added at once to the collection in progress ?

THE DUNFERMLINE SCHOOL OF ART.

THE DOWERMENT School of Art will perhaps be worth your attention, now that the public are taking a little more interest in such matters; and, in my opinion, the non-success of Dunferm-line school should not he allowed to die away unand, in my opinion, the hallowed to die away un-noticed. Its history is soon told. In 1854, efforts were made by the local committee, and a sufficient sum collected to justify their building, and getting all the etceterss required—at a cost of nearly 700/, or 800/, : a school-house, and examples, &c. were obtained. The Department appointed a master (Mr. Loonard Baker) to open the school. The committee obtained everything that could be wished: there was, then, no cause of complaint on this head. Unfortunately, though, a good cause for complaint did exist: no one on the committee understool anything about the management of an art-school; and what was even worse, the fact of a school being connected with Government does not scene to hea oy recommendation in Scotland. Without entering into any munte par-ticulars to explain what took place, I will only inform yoa, "leaving the rest to known facts," that after you, "leaving the rest to known facts," that after two years' bard work, the master found it impossible that after to make the Dunfermline school succeed, unless the committee agreed to introduce a course of instrucnuless

felt it his duty to resign. An inspector was sent down hy the Department. Great efforts were made, and for a time things looked pretty well, but it had not heen rightly arranged, and all 1 need say is this, that on the 3rd of last month everything was put up for sale. Ooly one person attended the sale—a very aged gentleman—who had been persuaded that all the examples and fittings would be useful to bim for completing a scheme for an institution which he in-tends leaving to the Bridge-of-Allan people. Every-thing, independent of the huilding, was sold for 50%. No person attended to bid for the building. There is something not quite right in the system, depend on it. Oxfe with warcmes Ir. ONE WHO WATCHES IT.

SCHOOL OF ARTS, STIRLING.

SCHOOL OF ARTS, STIRLING. MR. LEONARD BAKER, of the High School of Stirling, delivered a lecture on "Art" to this Institu-tion on Wednesday evening, the 2cd lust. The chair was occupied by Sir Jobn Hay, bart, and the audience was large. At the close he said .--Since I have been in Scotland, I have not found that interest taken in art which I could have wished. Art-clucation is not yet appreciated anywhere in Britain, and it is only among a few that we observe any progress. I an exceedingly desirous that everyhody should seriously among a few that we observe any progress. I am creeckingly desirons that everyhody should seriously take into consideration the propriety of establishing an art-school in Stirling. I am sure it would succeed well, and I do not say so without having fully con-sidered the subject. I know that many look upon art simply as an anusement. Why is this? It is he-cause all they know of art could not suggest any-fung else hut its being an amusement; and many when they find it more dilicult to learn than they auticipated, throw it up in disgust, and make no attempt to overcome the difficulties in the way of the acquirement of a thorough knowledge of its princi-ples. It is all settled in this way—that they have no one can attain such perfection without close and careful study. We are accustomed to hear that, anless we have taske, art is of no use tons; that I conjecture it might be as well said that unless the child has a taste for it, there is no use learning the sliphabet or multiplication-table. You will, perhaps, say that the cases are not similar, because in the latter it is a neces-sity, and taste must no the consulted. I think it ought to be the same in regard to art, because at a time ot very far distant reading and arithmetic were not chought any more necessary than art is now as a branch of denation; and I have no doubt that in the ray in which art was looked upon in the nineteenth eventry, to conforce the teaching of some other branch of human knowledge as of universal use.

RYE CHURCH CLOCK.

IT IS CHORCH CLOCK. HAVING seen in your interesting paper a letter from "An Inquirer," wishing to be informed of some particulars, to he relied on, respecting the old clock of the old church of the old town of Rye, and heing an old inhabitant of the town, I hasten to satisfy his curiosity, as far as I am ahle. In the first place, I mast premise that "Inquirer" has made a slight mistake as to the nosition of the clock he think must premise that "Inquirer" has made a slight mistake as to the position of the clock . He thinks it is placed on the east face of the tower, over the great cast window; instead of which it is placed on the north face of the tower, and over the north window, through which latter the pendulom, which is, as he says, withinside the church, may he seen in motion. The pendulum heing the principal object of inquiry 1 will first speak of this, and ioform "In-quirer" that our pendulum is 18 feet in length, being 4 feet more than that of the great clock at Westminster, hut the weight falls considerably short of that of the latter, which is over 6 ewt.; whereas ours is only § cevt.

Fowt. Having disposed of the pendulum, I will next proceed to an examination of the antiquity of our elock. On reference to the article, "Horology," in the "Eney, Lond." I find it mentioned that the first pendulum-clock made in England was in the year 1662, by Mr. Fromanti, a Duchman. Had we no other evidence to adduce, this would decide the age of our clock not to exceed about 200 years; but some iew years ago Mr. Octavins Morgan, a gentleman who has devoted much time to the study of old clocks, came to Ryc for the express purpose of examining on who has devoted much time to the stady of old clocks, came to Ryc for the express purpose of examining our clock, when he did me the favora to call on me, to ascertain what information, if any, I could give him; when, in the course of conversation, he said that our clock was not originally a pendulum one, as was apparent from many of the works still remaining, and that he was of opinion that the Ryc clock is the oldest clock in England now going. Of this feet I will give what additional proof L can. There has long been a tradition in the town that onr clock was taken in the Spanish Armada, and presented to the

0

N.B. The extreme lightness of the pendulum is accounted for from the shaft being of wood, with a slight piece of iron on either side, the ball alone being of lead. The sexton tells me that a few years ago the pendulum was shortened, previously to which it was 25 feet long instead of 18 feet.-W. II.

LIVERPOOL ARCHITECTURAL SOCIETY.

LIVERPOOL ARCHITECTURAL SOCIETY. A MEETING was held on Wednesday, the 2nd inst. Mr. Huggins in the chair, when a letter was read from Mr. R. Rawlinson, re-urging that while there was no memorial foundation stone under St. George's Hall, a stone with coin and tablets was huried on the site originally intended, and ought to be taken up. The proceedings of the Liverpool Academy, especially in connection with the favour they show to one partien-lar school of painting, bave displeased some of the ecommunity, and Mr. Bouit gave notice of a motion he intended to hring before the next meeting, calling mone the town ecouncil who erant aid to the Academy.

upon the town council, who grant aid to the Academy equivalent to 2004. a-year, to require from th Academy a detailed report of their proceedings. Mr. Picton then read a memoir of the late Mr. A from the

II. Holme, architect, of whom a short notice appeared our last number.

GLASGOW ARCHÆOLOGICAL SOCIETY. GLASGOW CATHEDRAL.

GLASGOW CATHEDRAL. THE December meeting of this society was held on Monday, the 7th inst, Mr. Robert Hart, in the chair. Several candidates for admission were balloted for, and duly cletch. Mr. A. Beil read a paper entitled "Notices, Historical and Antiquarian, concerning Glasgow Cathedral," in which he threw some new light on the carly bistory of the see, and criticisad the various opinions regarding the age of the build-ing, which have been advanced by writers on that subject. Upon the whole, he was inclined to think that Mr. Honeyman had set that matter at rest, though he still thought it possible that the crypt may

that wir. Honeyman had set that matter at rest, though he still thought it possible that the crypt may have been commonced in the twelfth century. An animated conversation followed the reading of Mr. Bell's paper. Mr. Rochead subled attention to examples of early architecture in Scotland which hence papers here described arcticular meters. examples of early architecture in Scotland which have never heen described, particularly referring to several small chapels on the cost of Kintyre, which, he had no douht, were crected by the Culdees, at the same period as the ancient chapels in Ireland of a similar character, so ably illustrated hy Mr. Petrie. He objected, however, to these heing called specimens of Neuron problems on the molecular to a particular sector.

He objected, however, to these heing called specimens of Norradar architecture, as they belong to a period anterior to the conquest. Mr. Honeyman exhibited a drawing of the only part of the eathedral belonging to the twelfth eentury. It is a small respond in a dark corner of the crypt, displaying the characteristics of the Transitional period,—a rudely sculptured expital with massive heave. period, — a rulely sculptured capital with massive nhaus. He contrasted this with one of the other capitals of the crypt, which are most exquisitely moulded, and showed that they were evidently about seventy years later.

Mr. Gildard considered the hypothesis of Mr. Bell satisfactory, that the cathedral was reared over the spot where the cell of St. Mungo stood, and that this sufficiently accounted for the selection of such a peculiar site, and the consequent erection of the crypt. The society resolved to hold a meeting in the cathedral on Saturday first.

THE ROYAL ACADEMY MEDALS.

ON Thursday evening, the 10th inst the award of medals made by the Academy was announced, Sir Charles J. Eastlack, presiding. The following is a list of the successful candidates :--8 0

Gold medal for the best historical picture in oil colours : subject, "The Good Samaritau,"-Philip Richard Morris. 8 8

Gold medal for the best composition in sculpture : subject, "The Good Samaritan." — George James Miller

Gold medal for the best finished design in archi-ture : subject, "A Design for a National Gallery." 6

UNC: subject, "A Design for a National Gallery."— Francis T. Gompertz. The Turner gold medal, for the hest landscape in oil colours: subject, "An English Landscape."— Neville O. Lupton.

Neville O. Lapton. Silver medal for the hest painting of a figure from the life, in the Life School.—Alexander Glascow. Silver medals for the hest study from the living draped model, size of life.—James Waite, Henry Garland, and J. M. Barher. Silver medals for the hest dr.wings of Academy figures, done in the Royal Academy.—Ebenezer Bennett and Somuel Lung.

figures, done in the Royal Academy. — Ebenezer Bennett and Samuel Lynn. Silver medals for the hest accurately figured draw-ings of the West Front of Spencer House, with de-tails.—Thos. Vaughan and Henry M. Eyton. Silver medals for the hest drawings of a Statue or Group in the Antique Academy. — Wm: Hollyoake and Frederick Graves. Silver medal for the best models (in clay), in the round of a Statue or Group in the Antique Academy. —John C. Worman.

- John C. Worman. Silver medals for a Perspective Drawing in Outline, applied either to a known huilding (exterior or in-terior), or to a design.—Thos. Vaughan and Geo. Atkinson.

Silver medal for a specimen of Sciography .- Thos. Vaughan.

There were three candidates for the gold medal, which the president regretted on the part of the conneil was not more responded to; and four for the silver medal, in architecture.

NOTES UPON IRON.

NOTES UPON HRON. THE quotation for small lots of the ordinary pig-iron of South Staffordshire is now 3/. 10s. Sales are, however, made in certain instances at 3/. 5s. and in some few eases as low as 3/. 2s. 6d. A statement has been circulated to the effect that "an eminent firm has purchased 3,000 tons of pigs at 3/. per ton, which were quoted a few weeks before the panie at 4/." The statement, however, if founded upon fact, used to be locked upon as representing the condition Al." The statement, however, if founded upon fact, must not be looked upon as representing the could iton of the pig trade generally. If, however, the existing relative proportion between the supply and demand should coultime, the period cannot he far distant when in many, though not all eases, pigs will be sold at 3/. The demand for manufactured iron, as we have initianted, is not equal to the supply of pig-iron. A vigorons effort continues, however, to be made to produce more similarity hetween the two, and to keep pigs from receding below their present level. More blast-furnaces have been put out since our last, and yet stokes are not kept worked in that were summed up thirty-five hlast-furnaces unlit that were in fire bofer the paire, and more are to go out. The reports of malkoble-iron makers, announced on 'Change at Wolverhampton on Wednesday, and st Birmiogham on Thurgday, were of a more cleerful

on 'Change at Wolverhampton on weathersty, since we Birmiogham on Thursday, were of a more cheenful character than last week. The advices from America show a rapid progress towards a restoration of prosperity; and more remittances are to hand from thence this week than last. Monetary affairs at home also are evidently improved. With these thence this week than last. Monetary affairs at home also are evidently improved. With these "signs of the times," makers appear disposed to be satisfied, even if, as is the ease, they are not accom-ponied with orders from either the home or the foreign market. From some directions at home there have been inquiries in the week, which it is hoped will lead to orders being given out; but, with this exception, no alteration can he noted upon our hast notice of the state of the iron trade of South StateWorkite Staffordshire.

INFANT SCHOOLS .--- Infant schools are to be built in Weymouth-terrace, Mr. Charles Laws, architect. Tenders have been received, ranging from Wood and Sons, 583/. to Smith, 418/. The latter was accepted.

Books Receibed.

VARIORUM.

A PROSPECTUS, in form of a tract, bas been issued by Mr, John W. Papwortb, architect (Great Mari-borougb-streed), of "An Alphabetical Dictionary of ahout 50,000 Coats of Arms, belonging to Families in Great Britiah required, forming an extensive Deliverse of British Armspiles upon an entirely new Ordinary of Britisb Armorials, upon an entirely new Plan." An example of the new scheme is given. Or Plan. An example of the new scheme is given. Of this plan the arms are systematically subdivided throughout, and so arranged in alphabetical order that the names of families, whose shields have been placed upon huildings, painted glass, sends, plate, brasses and other sepalebral monuments, sculptured or painted portraits, See, whether medieval or modern, or he medile acceptioned At present any family or painted portraits, &c. whether medieval or modern, can be readily ascertaiced. At present, any family name being given, the appropriate coat of arms may be easily ewough found; but by the new plan the reverse process will become practicable, so that any cost of arms, or beraldic symbol, or combination being given, the family names to which they are appropriated may readily be ascertained. An arrange-ment such as this cannot hat bo of great and general fulity.—In treating of the smoke of towns ques-tion, we have occasionally drawn attention to a colla-teral question well worthy of consideration, namely, teral question well worthy of consideration, namely, how far the conversion of smoke into earbonic acid gas may militate against the sanitary objects in view, even in spite of the law of the mutual diffusion of gases. In a tract titled "Coal, Smoke, and Sewage, scientifically and practically considered, with Sugges-tions for the Sanitary Improvement of the Drainage of Towns, and the beneficial Application of the Sewage," Mr. Peter Speuce, of Manchester, purges the importance of this question in a sanitary point of view, and proposes a system of *atmospheric* or *gaseous severage*, and the complete removal of all gases to a safe distance from our towns. The original suggestion of a mode for effecting this object, Mr. Spence observes, is not his; but be is not aware of its having ever heen given to the public in a pracgas may militate against the sanitary objects in view, of is having ever hear given to the public in a prac-ticable shape, and there are some views of the matter, he adds, which may be safely presented as new. If c would combine this gaseous sewerage in such a form would combine this gascous severage in such a form, with our town drainage, as would bring all the liquid sewage into contact with the gases from our furances and our houses fires, the liquid sewage being kept, as now generally proposed, separate from all surface drainage. "The semi-liquid and fetid moss," be con-tinues, "being krought into contact with the sulphurous acid gas (the result of our perfect combustion), would have its purchastic process arrested, and the foul combined thus nermanently fired, and all the sulphite and thus permanently fixed, and all the sulphite and thus permanently fixed, and all the sulphiteride hydrogen and other unwholesome gases decomposed. When concentrated in this innoxious form from varions districts to a convenient place, it might with perfect safety be manufactured into manure more valuable than the richest guano, as I shall afterwards attempt to show. All the gases from our coal combustion would bave to be conveyed along the same tunnels to centralizing conduits converging to a point, where an immense chimney, at least 600 feet high, where an immense enimaley, at least out let ing, should be erected, to discharge these gases into the atmosphere,—the ascenaive power being obtained either from the retained heat of these gases, which would probably be found quite sufficient, or if not, artificial beat could then he supplied to effect that object."— In a "Special Report of the Medical Officer of Health a the Strengt Distribution Should heat hences." which pubto the Strand District on Slaughter-houses," lished under the authority of the Board of Works for lished under the authority of the Board of Works for the district, the medical officer, Mr. Conway Evans, after treating of the abominations of slaughter-houses in and about the crowded dwelling-houses in the Strand, calls upon the local Board of Works to oppose the grant of every license for slaughtering in a kitchen, cellar, or area under an inhabited house,—or helind such bouse, might have been added. We bappen to know of an instance in which a Strand slaughter-house, in a narrow and close area helind the street houses, must put could have here an abominable street houses, must not only have been an ahominable nuisance to the lodgers in the bouse itself to which is attached, but was so to many other houses, the windows of which are close to it, and the stench from the slanghter-house drain was so intolerable inside an adjoining house that the drains bad to be overhalled adjoining house that the drains bad to he overhaaled and renewed, bat without amending the evil to any extent. Moreover, from the constant incursion of animals, even this adjoining house was indested with troops of various kinds of fleas, and particularly a very small black species, of which more complaint was made by the inhabitants than even of that won-derful species of the bay tribe, "the Temple Bag," with which the same nnfortunate dwelling was in-fested. Why the practice of slaughtering beasts in the midst of crowded dwellings is still permitted one can hardly imagine.—The "Toll Reform Associa-tion" (10, Stand) hare published a "Statement of Committee, with map and case," transmitted to Lord Palmerston, in which reasons for sweeping away all

tolls within six miles of the metropolitan centre are urged, and good reasons they are too. As the Government is believed to give their good-will towards the very desirable end in view, it is to be hoped that Parliament will not see another session close without putting an end to the metropolitan toll-bar nuisance.

Miscellanea.

VICTORIA SEWER. - The consideration THE THE VICTORIA SEWER. — The consideration of this unfortunate work has been again brought hefore the notice of the Metropolitan Board of Works, and it is recommended that the sewer, from a point near the United Service Institution and the Penstock-chambers, be re-constructed, at a probable expense of 6,000*l*.; and that, from the peculiar nature of the work, three contractors of high obsracter he invited to tender for its execution, on a schedule of prices and predictives formed by the expires. The motion to tender for its execution, on a schedule of prices and specifications framed by the engineer. The motion gave rise to some discussion, and it transpired that the cost of this work up to October, 1857, was 60,3154. S. 23d. Mr. Bazalgette statch that this sever was constructed in a quicksand, and the ground was honey-eombed, and was constantly being washed away by the tidal water forcing its way into the 'sand. It would be necessary to make a solid foundation for the bourse to stand unon. The parties of the saver would be necessary to make a solar foundation for the bouses to stand upon. The portion of the sewer under discussion did not form part of his main drain-age scheme, although the northern part of it did. He thought that any further delay would be exceed-ingly daugerous. An amendment, "That the Board ingly daugerous. An amendment, "That the Board should abaudon the sewer altogether," moved by Mr Leslie, was rejected.

COLDBATH-FIELDS PRISON .- At the usual meeting of the magistrates of Middlesex, it was moved by Lieut.col. Elsey, "That the plans for the enlarge-ment of the House of Correction, Coldbath-fields, laid before the Court on last Court day, whereby it was proposed to provide additional accommodation for 600 proposed to provide additional accommodation for 600 prisoners, be approved, and the Clerk of the Peace be directed to transmit the said plans to the Secretary of State for his approval; and that, subject to such au approval being received, the Visiting Justices of the said House of Correction be authorised to carry such plans into excention, at a cost not exceeding 40,5007. plans into excention, at a cost not exceeding 40,500." The motion was carried.—[It is poindh to witness the continued increase of our prisons;—in this instance, at a cost of close upon 50,000/L and an annul expense for prisoners (allowing 20/L per annum each) of 12,000/L per annum for the new concers. The cost of keeping people out of goal, and doing so in it, is not yet properly considered.]

LIABILITY TO PAY FOR SPOILT WORK. LIABLITY TO PAY FOR SPOLT WORK.—M.Y. W. Cox, a statuary and mason in the City-road, having received an order from a gentleman for a vase with wreath round it to be sculptured in marble, employed Jacob Harris, a Pole, who had previously worked for him, to exceute the order on Mr. Cox's premises, marble being supplied to the Pole for that purpose. The agreed-for price payable to the latter was 54, 10s.— the work to be done in ten days. Though Mr. Cox had refused to allow the marble to be taken off his premises, the Pole was allowed by the wife of the former to take it away, and the work proceeded at a mason's yard near Bow, where, as alleged by Mr. Cox, the work was cutirely spoiled. He refused to pay, and was summoned after the customer himself had condemned the work. The magistrate's decision was, -Mr. W. Cox condemned the work. The magistrate's decision was, that Mr. Cox employed the Pole, and must pay him, with costs. Doubtless the decision was based on the with costs. Doubtless the decision was based on tue ground that before giving work to a man to do, the employer ought to have satisfied binself that the workman was capable of doing it. Had not Mr. Cox conscientiously refrained from insisting on his eus-tomer fulfilling *lis* agreement, another question might have been started—namely, whether the enstonmer was a started and a supersonal with Mr. Cor on still liable to fulfil his agreement with Mr. Cox on the same grounds; for the vase was fulished, though not well done, and might have heen pressed upon the enstomer.

HOW THEY ACT TOWARDS PROFESSIONAL MEN IN HOW THEY ACT TOWARDS FROPESSIONAL AIRS IN ROTHERHAN.-The election of surveyor to the Local Board at Rotherham, took place on Wednesslay week, when Mr. Hartley (a mason), of Sheffield, received the appointment. There were fifty-six caudidates, and out of them three were selected, one engineer and two memory forms of them board below and integrand all bord masons (one of them heing also as iunkeeper), all local men, so advertising was a mere farce. I am in-formed by a member of the Board, that the testi-monials of the fifty-three rejected candidates were not movials of the fifty-three rejected candidates were not even read by them; therefore they had their trouble and expense for their pains. I think, in strict jus-tice, they are entitled to some compression. I am told the present bapy surveyor will not bold office long, as he cannot possibly work with the materials of which the Board is composed. I trust, in fairness to the candidates, you will publish this statement. I forward you my card as a guarantee of good faith. A LCOKER-ON.

SURREY ARCH.#OLOGICAL SOCIETY .- Nearly forty of the members of this society met at the Bridge-house Tavern, Southwark, to reconsider the proposition made by a number of their body to extend the limits of their society, and annalgamate it with the county of Kent. Mr. Crosby opposed the resolution, it which he was seconded by Mr. Corner. After a discussion of about two hours, the meeting proceeded to a division, when there appeared twenty-six for the amendment, against thirteeu; so that the resolution was rejected

SOMERSETSHIRE ARCHEOLOGICAL SOCIETY .-SOMREMENTSHIRE ARCH.2010GIGAL SOCIETY.—The first conversacione meeting of this society for the senson 1857-8, took place on Monday before last, at the Muscum, Taunton. There was a large attend-ance. Mr. W. F. Elliot read a paper "On Photo-Flemish Paiuting," in which, says the *Taunton Courier*, be claimed public attention for a new style of pictures, some of which were exhibited in an ador pictures, some or which were errinned in an ad-joining room. A paper was also read by Mr. B. Pinchard, "On Dartmoor," Next followed a lecture by the Rev. W. A. Jones, "On the Geology and Antiquities of the Mendip Hills."

OXFORD ARCHITECTURAL SOCIETY. --- The last meeting of this society for the current term was beld in the society's rooms, in Holywell-street, on Wed-nesday before last. Mr. Freeman, M.A. gave an account of a visit to Toulouse and Alby, illustrating bis lecture by drawings of churches and huildings of interest. It is proposed to read, in course of next term, a series of papers on the history of Oxford, as illustrated in the architectural features of her build-ine ings

CAMBRIDGE ARCHITECTURAL SOCIETY .- The third CABRIDGE ARCHITECTURAL SOCIETY. — The toru meeting of this society for the October term was held on the 26th ult. at the rooms of the Philosophical Society. Mr. Laard, of Trinity College, read a paper on the Cathedral of Orrieto, in Etruria ; in which he described the front as being of marble enriched with meeting. Scared whetemake were build rough described the front as being of marble enforced with mossies. Scretal photographs were hunded round, one showing the general elevation, and the rest por-tions of the sculpture in detail. A few remarks were afterwards made by an boursery member, disapproving of certain galleries which are about to be creeted in marking the scretcher and the scheme scheme scheme scheme scheme. inity eburch.

BELFAST BANK COMPETITION.—A correspondent, under the signature, "First Gem of the Sea," com-plains, as a competitor, that a perspective drawing of plaus, as a compettor, that a perspective drawing of has, of nuch labour, and all perciect when sent in along with ten other drawings, by rail, was returned to him, after repeated demands for it, by post, doubled up, crushed, and completely spoiled. Compensation, he remarks, could only be got by suing the Ulster Bank directors in Ireland. The premium was given back to Glasgow where the breach bank is to be erected. Our correspondent concludes by observing that the competition system must break down unless conditions be issued from authority. Some trades, as heremarks, bave a common fund for the protection of their members

THE VALUE OF THE BAROMETER: KNOWLEDGE THE VALUE OF THE DARGAETER: ANOWLEDGE IS POWER.-It is a circumstance that cannot be too generally known, that before the commencement of he late storms on the northern coasts, which caused the loss of a large number of brave fishermen, one village avoided the disaster through the inback while a solution of the sustain through the in-habitants being better educated than in ether places, near; they maderstood the working of the harometer, and believed in it. In consequence of the aspect of this instrument, the men determined not to venture to see, and if "would here, here word!" to see: and it "would have been well," says a northern contemporary, "if they had also taken the presention to drag their boats ont of danger," and then they would have escaped without the destruction of either property or life.

PUBLIC FOUNTAINS IN MANCHESTER.-In the Manchester conncil last week there was some discussion on three experimental fountains erected by pri-vate benevolence in Manchester, respecting which, according to the Courier, there has heen a good deal of unpleasantness and mismanagement. A letter was of unpleasantness and mism-anagement. A letter was read from Mr. Barnes at the council meeting, to the effect that he thought, if he gave the fountains, the council nnight reasonably be expected to supply the water freely. So thought the m-jority of the coun-cillors, but Ablerman Filling, the deputy ebairman of the water committee, held that his committee must have entire charge of both the fonntsins and the supply of water; or they could not furnish the latter, The fountains, it appears, have been placed in incom-venient positions, causing interruption to foot passen-gers, and for want of proper drainage with two at gers, and for want of proper drainage with two at least, the flags have been constantly wet with the waste water. The following not very elegant lines have been placed above Mr. Barnes's fountain, near the Victoria station :

Here, traveller, you may quench your thirst With that which never harms; But while you quadf the gracious draught Think well of Robert Barnes. Mr. Barnes deserves a better poctaster.

DEC. 19, 1857.

THE BUILDER.

N the subject of stained glass, as regards its ancient and modern characteristics, able pens have from time to time contributed observations in these columns; and in other quarters such views of the subject have been discussed almost to exhaustion. The battle of styles, too, has been fought with warmth and energy, leaving the issue in a truce, unless, indeed, the reasoning of Mr. Powell, of Birmingham, as lately printed in these pages, turn the scale. We are disposed to believe that, in the zealous inquiries into the archæology of the subject, and in

the carnest champiouship of its principles, this way or that, the incomparably most vital point has been utterly lost sight of, uamely, the causes hy which have been brongbt about the almost entire absence of health in the present condition of the art, and the urgent necessity and means for its reformation.

It has been declared that our artists on glass have as yct exhibited but unfavourably in coutrast with the ald masters, to whom the world is iudehted for the painted glories of Chartres, Canterbury, and Fairford ; moreover, they have been said to compare unsuccessfully with the Germans of the present day.

Notwithstanding the scenic trickery the German artists, and their efforts to neutralise the finest, -- *i.e.* the most natural elements of stained glass in its material and individuality as an art,-the new windows for Glasgow Cathedral are to be commissioned, not of English artists, but of those of the Munich school, by whom were lately erected the academic though vapid transparencies of Peter-house College Chapel, Cambridge.

Despite the boncst opposition which has been evinced by those of deeper knowledge of the subject than was exhibited in the dictum of the Glasgow authorities, it cannot be denied that there now exists such wide-spread disease in the English system of stained-glass work, that the conclusions referred to may possibly he explained on the forlorn principle that the nost mistakeu application of art is preferable to the ignorant hurlesques upon it which mark eight out of every ten of the windows crected

position, no power of expression, draughtsmanship, or invention, that may not in glass be legitimately wedded to its materials, and the true principles of its requirements in design. If, then, these premises are correct, we have to point out one of the strangest auomalies of the day.

With few exceptious, modern windows, pur-porting to be of high character, emanate from establishments in the names of men whose artskill does not reach even to a miscroscopic proportion, and whose existence in the assumed authorship of even the degree of art produced in their pay, depends wholly upon their scrupulous avoidance of giving to their patrons the most trifling evidence of their own handiwork.

Thus it is, and has long been. By a general absence of due discrimination and selection on the part of those who dispense the patronage of the subject, men of purely trade instincts and commercial adventure have started up, craving the "favour of orders," succeeding abuudantly in their speculation, and finding upon the fair field in which such art as Durer's was once fostered, a fruitful areua for per-centage calculations and husiness enterprise. And this bas existed, nay, flourisbed, in the name of art !

" Can merchant-anthors-they who range Between Parnassus and the "Change, Sole denizens of neither-Who seek to play a double game, To grab for gold and fly at fame, In truth, be blessed with either ?"

In trade matters, the position of the vendor of stained-glass work, as a producer, may, of of standd-glass work, as a producer, may, of course, be paralleled *as a producer*, may, of remembered, the most powerful element of commerce may be the deadliest poison to art. Were the great works bequeathed to us by former ages created under this " cold shade" of Mammon? Will an artist, whose works are worth having, and who (like his art-brother that controls the stone vault, or imparts hreath to the marhle hlock) finds in reputation the best part of his reward, give warmly the full flow of his invention and aspiration, at so much per diem f

Can such a one sink his name and lovingly pursue his art nuder the paymaster whose interest in him is represented by pounds, shil-lings, and pence? Can, indeed, anonymous art long remain art at all?

The only one who can, in fairness to a patron, consistently hold himself responsible for any art (but especially for that all-important phase of it which embraces the illustration of the sacred books), is the artist himself.

We do not criticise a poem in favour or disfavour of the publisher, nor are poetie conceptions in architecture or sculpture attributed to the authorship of the mason or of the quarry

most mistakeu application of art is preferable to the ignorant hurlesques upon it which mark eight out of every ten of the windows creded in the present day. In so far, this charge and practical demonstration against our own artists approach the point upon which the attotion should he drawu of those who still evince some solicitate for a true art, sickening, and unable to conceal its plague-spots, yet capable of cure so inconsistently spurned. The great question which should present itself to those who would pass judgment in the staffs, in the true seuse of the term, can be said to have had, or the en encouraged to have anything to do with the subject at all; and thus, bow fair it may be to arraign for senteuce those, who can so obviously prove an *allit*. The practice of stained-glass work, in its nature or education, for colonr, poetry, or com-

dern glass, in one of its most abject forms, been bolstered up and encouraged.

This is no exaggerated statement of the condition of stained-glass work in this ninetcentb century of ours; but the evil, deep though it bc, is not past cure. Let those to whom art is sometbing, and who at once regret and deride its position in relation to glass, who hy their purse and influence would encourage it to better things, not despair of its easy emancibetter things in the merche the matter deeper than they have yet done, and seek the artist on glass as they would bis brethren of painting, architecture, or sculpture. Let them, in simple justice to those who devote to the art their best years and warmest studies, thus open the doors of trath to true autborship. Let all evidence of the miserable print plagiarism and trade system be sought out, as a wholesome preliminary in determining the choice of him who shall commit to future centuries a thing of beanty or a chromatic evesore.

Pursuing such means glass-painting will not long remain what it now is-a reproach to English art. Those few true men who are steadfastly devoted to it, will, under fairer encouragement, he joined in art-brotberhood by others who are now scared from the pursuit; and the present trade of glass-painting will give due place to the banished *art*, which has so long yearned for the day upon which the veil shall fall from the eyes of those who, with good intent, bave sought it in darkuess and in error.

POLYCHROMATIC DECORATION. BOYAL INSTITUTE OF BRITISH ARCHITECTS.

DOYAL INSTITUTE OF BRITISH ARCHITECTS. ON Monday evening, 14th December, the ordinary general meeting was held at the Rooms, in Grosvenar-street, Mr. J. B. Bunning, V.P. in the chair. Mr. R. Kerr and Mr. Norton, attending for the first time, were admitted as fellows, and Mr. C. Arding, as associate

associate. Mr. Digby Wyatt, hon. see, announced a long list of donations, including from the Minister of State, Paris, "Archives de la Commission des Monuments Historiques, Livraisons 19 et 24," Paris, 1856; "Observations on Metallic Art," hy Mr. Wyatt, ez-traeted from the Art Trensarrs of the United King-dom, edited by Mr. J. B. Waring. 4to. London, 1857; from the author, "L'Art moderne, par Theophile Gantier;" from the author, "Nineveh and its Palaces," by Joseph Bonomi. hy Joseph Bonomi.

hy Joseph Bonomi. Professor Donaldson said, amongst not the least important presentations of the evening, was the dona-tion by their president, of two noble medals. The first was a medal struck hy the corporation of the City of London, on the occasion of the visit of the Emperor of the French. It was a medal of large size, and did honour to the City. The other medal was struck to commemorate the visit of the King of Sardinia, in 1855. They gave the portraits of the imperial personages, had heautiful reverses, and were excented by Mr. Benjamin Wyon. It was a gradify-ing thing to the Institute, to find that their chairman, n that occasion, had arreged the City of London to take

VOL. XV .--- No. 776.

find the opportunity of doing so scized by Government; and when it happened to be otherwise, the execution of them was confined to oue family,—that of Wyou, undoubtedly a man of great talent and worth: but was it not a shame that, in the production of these works of art, only one family could be found capable of executing them? The Art-union of London had of executing them? The Artunion of Loadon had heen anxious every year to strike a medal in comme-moration of the history of the fine arts; one year striking the portrait of a painter, another of a sculptor; and another of an architect. But the great difficulty was to find artists to produce these medals. It was, he thought, disgraceful to our Government that they so rarely soized the opportunity of striking medals of the size of those hefore them, and he could not help suggesting that the approaching auspicious union of the Princess Royal would he a fit and fice subject for such a commemoration. such a commemoration. Mr. Wyatt announced that the Britton memorial

had heen completed, and was erected in its place in Salisbury cathedral. Mr. T. H. Lewis, fellow, then read "A Brief

Account of an Experiment made upon Concrete, ex pressly for the Committee of the Architectural Publi eation Society, and of some others," which we give in full on another page. After a short discussion, and a vote of thanks for the communication,

Mr. George Aitchison, jun. read a paper, polychro-matically illustrated, "On Colour as applied to Archi-tecture," to which we shall return. At the close of it,

Mr. Burges was afraid he coold add very little to what Mr. Aitchison had told them. Ilis (Mr. B's.) studies had been confined to Medieval and Pompeian buildings. When at Pompeii, he though B's.) studies had been counted to memory among Pompeian buildings. When at Pompeii, he thought the style of buildings exceedingly agreeable, and rather forcible. The natives of hot elimates were fond of rich colours, hecause their windows were so only of the blocks, because their which we would be a constructed that the light ponetrated very little. Mr. Aitchison classed the Mediaval system uoder the white, the blue, and the gold ground; but they would likewise bcar heing classed under the finished and the unfinished. When a cathedral was built they put stained glass in the windows, and obtained colours that means. There was so little wall space that th by was no room for pictures. The consequence of this was, they left it white, each of the piers being exceed-The consequence of this ingly small, and then they continued the colours of the windows hy picking out the hollows of the printhe windows hy picking out the hollows of the prin-eipal mouldings with red, the only parts strongly de-corated heing the bosses and the mouldings of the rins, for about 1 foot from them. This system was found at Chartres, Beauvais, and Ely. Occasionally, hut not very often, the capitals were coloured and gitl, as at Cologoe, where, however, they adopted strong colonring, as at the Ste. Chapelle, and coloured the space between the windows: the effect was exceed-ingly bad. As regarded coloured decorations, how-ever, he thought the Ste. Chapelle was something borrible and that it would not hear commarison with horrible, and that it would not hear comparison with the Lower Chapel at Assisi. The western and southern the Lower Unapei at Assist. In the western and soundern systems could not go together. If you wanted colour-iog in a building, you must give up moulding, or vice versa': and for his own part, he would always give up the mouldings. In the case of the chapter-honese at Salishory and Ely they went further than in the cathedrals. At Salishary they gave very little colour is the cales. It was early all critical the theory the in the glass. It was nearly all grisaille. They then coloured the hollows of the mouldings, richly deco-They then rated the hosses and the space immediately surround-ing them on the vaulting, the rest of the vaulting was covered with red lines in imitation of stone was covered with red lines in initiation of stone-joiots, a very common system of decoration io the lower coloured buildings of the Middle Ages. On one occasion he was in the little church of Mullinct, near Romen, and found that it was almost in the same state it was in during the Middle Ages, and mearly every square inch of it was covered with some deco-rition a them. In the case of Subject Churchen every square men of it was covered with some neco-rative p-ttern. In the case of Salisbury Chapter-House, the colour was gradually brought down from the hosses hy means of a httle white, red, or yellow on the ribs, until it reached the wiodows. These had the circles in the tracery, and a hand of shields running along, horizontally, through all the lights in full light checkenered lass. The borders continue Finding along, holizoitarly, though at highs in full lined rich-coloured glass. The borders continue this colour to the hottom of the windows, where the arcade that rons round the whole of the hulding was most richly and fully decorated. It was the same in the Lady Chapel at Ely. They brough the colour This colour to the hottom of the windows, where this sorry to user Air. Attension general contentiation of the hottom, how wanted to carry different and graceful manner, we adopted the desired material area to the mind of the hotholder. In the elassical times of the material area the solution of the windows were all of statue grass, on heing deprived of its coatings of whitewash, discloared rich specimens of polychromatic decorative hulding—that it was not carry to apercelate such discoveries, that mand, they took carre not to deaded to the other hand, they took care not to deaded ot the received, and he was glad to see it taken up by hus, and light red, and white, shaded with research, as well as being so ably illustrated that the purposes of art, and in the Medieval and Renaissance works, or area to the mind and the purposes of the material strategrass.

differcut tones of hlue and red; and sometimes they even used a searlet figure to vary the effect. At other times they used a beautiful high purple, which was so great a favourite with the artists of the Middle Ages; and all these colours were to be seen in perfection in Van Eyck's picture of the Adoration of the Lamb. Then when they used gold grounds, as at Palermo, they still used light colours, but separated by means of darker ones, only in much smaller proportions. After all, the effect of a huilding would depend a great deal upon light. The Upper Chapel at Assis looked nearly as bad as the Ste. Chapelle, because there was too much light nit; on the contrary, one of the reasons for the Lower Chapel looking so heautiful was, that the light ody penetrated into it through the windows of the side chapels. As to the future of architecture, in regard to decoration of build-ings, we must have figures and employ the paioter, different tones of hlue and red; and sometimes they we must have figures and employ the paioter, ings. for all decorations without figures and employ the paroter, for all decorations without figures always appeared to him to be exceedingly tame. We must get the painter to treat the building as an architect would, and put an architet over him to look after him; hut it would he better still, although we might have to wait for two or three generations, if architets turned painters themselves. Let them erect the building, and then decorate and paint it, and so leave a thoroughly perfect good work behind them.

Mr. Penrose questioned whether, in the present state of polychromatic knowledge, it was possible to lay down many dogmatic laws. A few, perhaps, might he pointed out, such as the necessity of placing delicate white or thin black lines between certain colours, the immediate opposition of some colours producing discord, if it can be pointed out and asserted; but it was daugerous, he thought, in their present state of polychromatic knowledge to assert anything very strongly on the subject. Many more experistate of polychromatic knowledge to assert anytoing very strongly on the subject. Many more experi-ments, and much more research, were necessary, and he helieved that many persons were deterred from approaching the subject by reason of its very great difficulty. The study of flowers, of the colours of skies and landscapes, of hutterflies and birds, would a more for them than the study of scientific books. do more for them than the study of scientific hooks. He believed that the great success of the untutored nations in colour rather surprised ns, and was refer-able to the fact that they looked to Nature in the first instance as their guide; hat commentaries on the higher applied laws of specimens in colour drawn from the great huildings of antiquity, were of the utmost importance. From thinking on the subject generally, he had heen led to the conclusion, that on the particolar purpose of the building depended very much the key in which it should be coloured. Io some cases a white ground, or nearly white, was to he selected as the hest: in others, where a moderate light was admitted, the very strong colours. Ihe deen natious in colour rather surprised ns, and was referselected as the nest: in others, where a moderate light was admitted, the very strong colours, the deep hlues and deep reds were used, and he believed that in all cases the deeper colours were better for adoption, always excepting mosaic, which, from the brilliancy of its gold ground, and the peculiarity of its reflection, which did to have most proving writings of light. enabled it to hear much greater varieties of light; hut, at the same time, it would not beer a very strong light. Hence, the apse of the Triclinium of Leo

light. Hence, ite apse of the Internation of Leo certaioly bad an unsatisfactory effect. Mr. Lockyer could imagine nothing finer than the large mossies at Orvieta and Sienoa. At surset they displayed a perfect floating sea of gold and colour,

displayed a perfect floating sea of gold and colour, which told out in the most beautiful manner. Mr. Baker would not discuss the quastion as to whether the white lice or the hlack line affected the appearance of colouriog, but it was of considerable importance to insare that the various colours should be in light and shade, as it were, duy proportioned, as in a picture; and, as in the specimeos before them, effect depended on hrilliancy of contrast. Were any one to paiot on a piece of paper a series of colours of very nearly even depth, it would surprise them to see how difficult it was to distinguish one colour from how difficult it was to distinguish one colour from another of nearly the same depth of colour. One would be hright, and another dark, and the contrast was most beautiful. The specimens of coloured mosaic showed a beautiful effect when the dark blue mossic showed a becautil effect when the dark bile background was brought out iots good outline. He was sorry to hear Mr. Aitchison's general condemna-tion of the Pompein painting; for although the con-trast to the general outline was occasionally dis-agreeable, the toocs of colour were very beautiful, and gave us delightful hints for its adoption in our own

evening. Whatever might be said about the Sainte Chapelle, the thought they must give the French credit for having, at immense lahour and expense, worked out a very striking experiment. For his own part, he thought the experiment uosuccessful, but still it was valuable as fact to refer to. Some people might think it was over-done or under-done, but there it was as a matter for speculation. If he might express bis own opinion, he should say it was exceedingly over-done; and it was nofortunate in the effect where decoration was spread over the integral effect where decoration was spread over the integral parts of a structure which ought not to be interfered with. Decoration came in, and told well subsidiarily, hat the structural parts of a building should staud out in their integrity. It was a mistake to imagine that the column should be diapered and scrolled over, or covered with what he would term impertinent decorations. In the case of the Monreale at Palermo, which they had become familiar hy means of the productions of their late worthy member, Herr Zanth, it appeared to him to make one of the most Herr charming instances of polychromatic decoration, aod, charming instances of polychromatic devolution, and as he conceived, one of the most successful and geouine. But he could not form a decided opinion, not having seen the original, but he mentioned it as one of the successful instances of art-colouring when was better understood and more extensively used than it had heen since.

Mr. Lockyer protested against the condemnation that had been indulged in both as regarded the Pompeian and Gialio Romano decorations. Any one who had seen the Villa Papa, the Villa Madama, and the works at Mantua of Giulio Romano, must feel that he was a thorough master of his subject, knew what he was about, and used no colour or form iojudiciously. He (Mr. L.) might he impure, perhaps, in his taste, might he impure, perhaps, in his taste, hnt in upholding his works, it was from a conviction that there were few works in Italy that struck him so much as the performances of that artist, hoth as to design and arrangement of colour. Mr. Aitchison seemed to find fault with the deep masses of red, but Section 45 that rank with the deep masses of red, out in that elimate your ather required masses of colour. They were very well lighted by the subjects painted atmosphere of Italy seemed to require those masses of colour which are dispensed with the Eogland. With regard to mosaic decoration, Mr. Aitchisco mentioned the hetter effect of gold when produced on a green ground. Now it struck him that in the case of most of the mosaics of Italy the gold was on a reddish ground, and very few on green. In the San Lorenzo was on green, hut there the effect was poor.

Mr. Wyatt.-The earliest mosaics in the Santa Sophia are on deep white ; in later ones they became

red. Mr. Kerr was quite of opinion that polychromatism was one of the principles of their art that ought not to he passed unnoticed. He understood Mr. Aitchison to say that the art of colour was a matter of justinet and not of rule; that it was not a matter of science but of intuitive and instinctive knowledge, under the but of infuritive and instituctive and versely a mater the correction of an experienced eye. Now, nothing, in his opinion, could be a greater mistake in the abstract. If he were called upon to define colour in relation to architecture, he should say it was the music of their art. Nothing could be more correctly weighted, estimatcd, or definitively reduced into system. Not that he would say that it had been so weighed and esti-Not that ne would say that it is determine so weight reduced into system; but the work of Chevreul on the subject was exceedingly mathematical in all its processes for the determination of principles ou which every onc might very safely rely. The interior deco-ration of a building in modern times with colour must ration of a balancing in molecular links with coolar mass he a peculiarly interesting subject of negative to the architect. When he spoke of colour as being the music of their art, he was not speaking allogether figuratively, for he fancied that the interior of a build-ing might be decorated in any one of many ways, just in the same meaner as a piece of music might be set to any one or many expressions or sentiments. When we wished to decorate the interior of a structure in a hold and striking manner, or if, on the other hand, we wished to carry out the work in a smooth and graceful manner, we adopted the desired material

which were governed by principles almost entirely by Mediaeral examples, we found that colour began to be adopted and used, not only with profusion, but with something more than gusto—with success, with intui-tive success. Now, the colouring that was to be found in Mediaeral buildings, successful as it was, was not successful by accident, or by the application of rules, but the existence of rules may be easily dis-covered. Chevreul discovered a great many, and laid down remarks on position. If Mr. Altchisou needs entry collect the sneedment that were hanccovered. Chevreul discovered a great many, and laid down remarks on position. If Mr. Aitchison would only collect the specimens that were bang-ing about, and assort them in various classes, be would find that certain principles governed one class, and certain principles another, which must inevitably he, and without which colour decoration could not be successfully employed. It was different with form, the other great principle and department of their art. successfully employed. It was different with form, the other great principle and department of their art. They could not weigh form, but they could, as it were, weigh the music and poetry of colour, and so lay down fixed principles of action. Indeed, there was no subject in the present day more describing the attention of scientific men in relation to architecture than colour.

than colour. Trofessor Donaldson was of opinion that the great principle that should guide an architect in the deco-ration of his building, should he its character and its object. When he had gone into a building decorated to any extent, he really ofttimes could not appreciate what the intention of the architect had been. It appeared to bim that primarily in a building, archi-tecture should take the leading position,—that is, the place of prominene and hoown, and that all decora-tions should be subordinate to its members, in order to eall up the plain spaces, and give effect, by decora-tive contrast, to the sever features of architecture. Mr. Burges had very well said that he perceived very frequently in the Medieval buildings, that the colour was in the hollows, which threw out in greater relief the small shafts of the piers. There he (the professor) thought that colour was very admirably introduced. But when they found colour usurping the proper place of architecture, and architecture, instead of itself being represented in natural materials, relieved, as it The shift aim is also be pick way a admirably introduced. Is But when they found colour usurping the proper place of architecture, and architecture, instead of itself i being represented in nataral materials, relieved, as it when he saw the white surfaces of buildings them-selves coloured by artificial pignents,—colour usurp-ing a place it ought not to possess, and architecture put in a secondary position,—he could not help it thinking that it was degrading to art. If archi-tecture was to he decorated, it should be by varieties of material, that is, by different tones of coloured marbles and stone, of which the shafts and frizzes should be constructed, and not to admit of artificial decoration. When they went into the Temple of Jupiter, at Pompei, and noticed the podium, with its horizontal cornice, and then the colours, it is used above, which were all of different to gressent material, and you did not see anything to justify it. But here the colour should be made to represent material, and you did not see anything to justify it. But here the colour should be made to represent material, and you did not see anything and so it should be orher there is miple dinger, or other colours, or other ornamental decoration; and so it should be whether it the simple dinger, or other colours, or other ornamental forms, like those given in the illustrations. When they talked of the architect in the decoration of the building (be had not recently seen it himself), in covering with an artificial costing the whole of the bautiful architec-ture there? About forty yeers ago, he saw a repre-sentation of the decoration of St. Stephen's Chapel, Westminister. It was altogether eovered with colour, which had a very gorgeous and magnificent appear. Westminster. It was altogether covered with colour, which had a very gorgeous and magnificent appear-ance, hut to his (Professor Donaldson's) mind, the proper, legitimate, and sober effect of the architecture proper, legitimate, and sober effect of the architecture was lost, and it seemed to be more an adapta-tion of more tapestry hanging than a proper mat-ter of architectural effect. These, he thooght, were the principles on which huildings should be decorated, i.e. what should be the proper pur-pose and appropriate interest of the architect. He differed with Mr. Aitchison in his condemnation of Pompeii, but it should be remembered that where these decorations were placed, rather in the shade than exposed to the sun, nothing was more proper than the introduction of brilliant titus. Mr. Aitchison satted that he noticed there were little columns and dimi-nuitize entablatures, and eaprietous decorations introthat he noticed there were little columns and dimi-nutive entablatures, and expricious decorations intro-dated, for which he could see no use; bat it should be remembered that these objects doubtless represented a class of architecture of which no remains have surviced as the present time, and that the domestic details of their huildings were of a small and delicate kind; and the optications would appear to be harmonious. He (Professor Donaldson) was not pleased with what delighted when he studied the villas in the neigh-bourhood; some of the paintings were on a white

THE BUILDER.

ground, and told out with very beautiful effect; while others were on a dark ground, and brought out the colours even more brillantity than those on a peacock's tail. Among Mr. Aitchison's draw-ings, the black spots were in very small masses, else they overpowered; and they were used sub-ordinately, so as not to produce a heavy effect. With respect to the white lines, the Egyptians understood the value of them. We should find this in the Egyptian paintings in the British Museum. We should there see that a white line separated the greens, the blues, the reds, and yellows, and gave to each tone its true and proper quality. When he thought of the Palazzo T. he could not go the whole way with Guilo Romano. The decoration appeared to him in many parts to be puerile, and the result of caprice rulter than of geoits. There was so much extravegance of contrast and proportion, that be left the Palazzo with dissponitement. He thought that Balassani Pertuzi da Sionua had designed great works in this style, as with contrast propersion. ground, and told out with very beautiful effeet : dispppointment. He thought that Baldassari Peruzzi da Sienna had designed great works in this style, as welt as Giulio Romano, who had a heavy hand, und was frequently capricious; and most beautiful works were also designed at the Villa Caprarola by Vignola, who perfectly understood these decorations. Professor Donaldson coucluded by moving a cordial vote of thanks to Mr. Aitchison for his paper.

Mr. Aitchison briefly replied, with much spirit and effect, to the observations that had been made; and the meeting adjourned for the holidays.

EXPERIMENTS ON CONCRETE.

THE experiments here described were chiefly made The experiments here described were checky made with a view of verifying some facts meationed in the description of "Concrete," in the Dictionary of the Architectural Publication Society. But I have incor-porated with these the results of some other experi-ments previously made by me. The general idea with ments previously made by me. The general idea with respect to this material is,—1st, that there is a sen-sible loss in hulk of the ballast, independently of that respect to this material is,—1st, that there is a sen-sible loss in halk of the ballest, independently of that of the line; and, 2od, that the materials, on being mixed together, expand considerably. So much is this idea prevalent, that a respectable huilder,—one, I am sure, quite ahove stating anything that he did not believe to he true,—required, in calculating the price of the concrete, that I should allow him one-seventh more ballast than the concrete cubed to, he depending on the published statements of the loss of ballast being thus great. If was this demand that first led ue to experiment. The following trials were all made in the same manner, and, with one exception. I was pre-sent at the whole process from beginning to end. Several of the committee of the Architectural Publi-cation Society also attended at the trials. A wooden box was made, holding excely one cubic yard. This was filled with a fair sample of the ordinary Thames hallast, and such as is used for concrete in Londoo. To this was added ground Medway grey stone lime, in the proportion of one of lime to six of ballast. The ordinary way, the cube yard taking about forty gal-tors of water. The whole holk would thus circular ordinary way, the cube yard taking about forty gal-lons of water. The whole bulk would thus stand as follows

The concrete, thus mixed, was thrown into the box from the level of the ground, so that the lower part would have a fall of about 4 feet, and the upper part of I foot. The experiment was also made of throw-ing it in from a platform, 10 feet above the ground. In each ease the result was the same, viz. the whole mass, made into enercie, occupied precisely the same space as the dry ballast, viz. one eubie yard, all the built of the lime and water, being about two-fifths of that of the ballast their lost, but none of the ballast itself. built of the lime and water, being about two-fifths of that of the ballast, being lost, but none of the ballast itself. The surface was carefully levelled, and thin boards tacked over, so as to ascertain if there were any ex-pansion in the setting, but nose could be perfected. The weight of the mass was 27 ewt. I then had some more ballast mixed with a similar proportion of suground lime, broken into small pieces, and wetted

of unground line, broken into small pieces, acd wetted for a quarter of an hour. It was in that time pretty well slaked, but there must have been a good deal in the centre of the lumps not so. We know, from our overy-day experience of the bilstering of plastering in internal work, that a very long time is required to slake lime thoroughly, and I thought that, as this operation mas going on to some extent after the concrete had been mixed and put into the box, a scasible expansion would take ables.

the lower, although the difference in the fall was 3 feet

A portion of it I put into water. I examined it in A portion of it I put into water. I examined it in a fortnight, but it bad not then set. I am sorry to say that I omitted to look at it again for a consider-able time, so that I cannot speak as to the exact time of its setting; but when I took it out of the water, seven months after, it was quite hard. I mention this, in order to show that the concrete was at least a good average sample. In order to try the matter more in detail, I bad a hox filled with very clean sand, such as is need by masons. The box was then well shaken, and the sand settled down so as to lose about one-fifth of its bulk. The box was then filled up, so that, in fact, it was made to hold about one-fifth more than its ordinary quantity of sand.

quantity of sand.

quantity of sand. This was turaed oot, and well mixed with water. After this it filled the box, but on being shaken sub-sided down to the same level as before, thus losing, in addition to the hulk of water, one-fifth of its hulk as before.

This wet sand was then mixed with one-third of its

This we sand was then mixed with one-third of its bulk of ground lime, and made into mortar, which just filled the box. The surface was levelled, and carefully tested during the setting, but neither expan-sion nor contraction could be perceived. Another experiment was then tried, at the sag-gestion of Mr. Wyatt Papworth. A box was filled with coarse ballast, and occ-seventh of unground lime added to it, the lime being broken up into smaller pieces, but not very earcfuly, and then mixed with the ballast. Water was poured on, and the mass thrown into the box when only partially slocked, the object being to see the effect of this process, which might be considered a tolerably fair example of what the men might do if they had a certain portion of work to do with unground lime, without proper inspection, and careful ooly to get the wide done as econ as possible. The result was a slight but a decided expansion.

soon as possible. The result was a slight not a decided expansion. I then had another box filled with ballast, which was mixed up dry, with rather more than one-sixth of its hulk of ground lime. On being put into the box again, the two together occupied a rather larger space than the ballast did separately. The mass was then levelled, and about as much water poured over as would be used ordinarily. The result was, as before, a decided expansion. One other experiment I should be glad to mention,

One other experiment I should be glad to mention,

One other experiment I should be glad to mention, as it is a carious one, and bears upon a part of the subject very little, I think, understood, viz. the setting or hardening of the concrete or mortar. A friend of mine, who is a first-rate chemist, sug-gested to me some time since that the addition of a carbonate to the mass would enuse it to set more quickly, and for this obvious reason; that as the line is supposed to be hardened by the absorption of car-bonie acid, any substance in combination with that acid would offer to the line its bardening medium in predace namities than equid he procenter from the air acts would oldr to the time its caraceoug medium in greater quantifies than eould be procured from the air in the same time. He further stated, though he could not procure me the details, that the experiment had been tried, on a somewhat large seale, with earbonate of sola mixed with concrete used under water, and with complete success. I, therefore, had some more concrete made, and

1, incretore, had some more concrete made, and mixed with earhoante of soda as directed. It was put ioto water, and, in sixteen days, was fually set. Similar concrete, but without the soda, was not set at that time. I tried some mortar made in the ordinary that time. It tried some mortar made in the ordinary way, and some also mixed with earboaste of soda, way, and some also mixed with earbonate of soda, but in a larger proportion than with the concrete. This experiment was, however, not encouraging, as the mortar on setting arumbled to pieces. I think this artificial bandening might, as the process is a eheap one, be experimented on further with advantage.

T. HAYTER LEWIS.

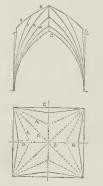

THE POINTED PENDENTIVE DOME AS A RIBBED VAULT.

In making the remarks to be found at page 465 of this volume, on the pointed pendeutive dome, I merely considered it as a simple shell; hut with this mercay considered it as a simple steer, he with this vault, as with others, the greatest economy of ma-terial and the greatest structural efficiency are to be attained by the application of a system of framework or ribbing

In applying ribs to this vault, we shall find them In applying ribs to this want, we shall find them to be of several different kinds,—farsh, main ribs, being the arches in which the chief strength of the vault is placed. These spring from the angles of the plan, and spread over the surface of the vault. Secondly, ridge ribs, which spring from the spices of the enclosing, of activities termed forming or wall-arches, and meet in the central boss of the vault. Thirdly, we should name the horizontal ribs which some to riftee the mein ribs strats. these of focurse. Thirdly, we should name the horizontal ribs which serve to stiffen the main ribs, struts: these, of course, not being absolutely necessary, or not so in all eases. For the main ribs to be in equilibrium it is neces-

their central planes should be vertical; thus, of all the ribs springing from one angle, only onc can have its central plane normal to the vanlt surface. The contral planes of the ridge rids will, of course, he vertical. The number of main rihs one of these vanits might need, depends, as well as their dimensions, on circumstances. It is quite certain that few on circumstances. It is quite certain that few things can be more simple than one of these domes, in a case in which only a single main rib springs from each angle. But when several main ribs spring from each angle, the matter becomes more complex. As all these ribs will be close toge-ther at the springing, I conceive that a very ill effect would be produced if their intrados did not coincide with a spherical surface, concentric with the surface of the voult. A little consideration will show that the main ribs would in this case he somewhat greater in main risk would in this case he somewhat greater in depth than the central or diagonal main risk of the vanit (those which alone are normal to the vanit sur-The main rib nearest to the central rib would face). he a little deeper, the one heyond that somewhat deeper than that, and so on : this difference of dimenaceper than that, and so on: this otherence of anneal-sions, however, is a more nothing. But the result would be not only the greater grace from the preser-vation of the geometrical figure, but that the joints or meetings of the ridge rih and the main ribs would wirre fairly, as well as the joints of the latter with the struts. I should think the mitred joint more suitable to this vault than the boss-concealed junc-tion : either mode is applicable, however. By these arrangements the arched ribs transmit the thrust of the vault only to the angles of the plan. But it may the vanit only to the angles of the pind. Dut is may be seen that the ridge risk descending upon the apices of the inclosing arches, exert outward pressures on these points. The way of resisting this thrust which has suggested likel(to me as the most simple, is that of extending the wall arch into the vanit, and giving is sufficient solidity to have an inclination to fall in-wards, the ridge rih pressing outwards, and thus at the same time that its own outward tendency is restrained, restraining the inward tendency of the strained, restraining the inward tendency of the overhanging wall areh. In this manner these forces tend to the strengthening of the whole construction. This member, which might he named the hanging wall areh, is not needed where another ridge rih counteracts the thrust of the first, as in the length of a ranked areas. a vaulted avenue.

It may be remarked, that it is by no means difficult to make many modifications in this vault. Various circumstances would suggest these, such as the eases of Circumstances would suggest these, such as the cases of the dome having to support a superincumbent vault or lantern, or in its heing finished with an open eye (which, perhaps, constructional reasons would dictate to he of a starlike form), &c. I give a modification of this vault, which might not he unsuitable at times.

A.A. Main rihs. B B. Ridge rihs. CC. Hanging wall arches.

The plans to which it is applicable are ohlongs' hexagons, octagons, decagons, &c. which are not per-fectly regular figures, but which have every alternate side longer than the others; so that there would he such longer that the others, so that three would he two dimensions of sides, an equal number of each di-mension. The longer sides being spanned hy semi-circles, pointed arches would span the shorter ones. These vaults would consist of haff the number of Finds values would could be that the finitumer of sections of which there are sides on plan, *i.e.* two to an oblong, three to a hexagon, *&c.* of a sphere, the radius of which is the same with that of a circle which would circumseribe the *regular* oblong, hexagon, which would extermise the the paymar onling, here on, &c. (as the case might hc) having its sides equal to the longer sides of the plan. In the case of an oblong, the radius is $s_{\sqrt{2}}$; s equalling the longer sides on plan. Any plan that can he covered hy this valit may he likewise covered hy the ordinary pointed pendentive. pendentive. ndentive. As compared with other vaults, the pointed pen. Association, held on Friday, December 11th.

dentive dome possesses, like the fan groin, the great practical merit of all its ribs heing portions of circular eurves, and in common with fan and other groins, that the whole thrust is concentrated at the angles Over the fan groin it has the advantage of having all its enclosing arches, as well as its diagonals, of the same figure, whether equilateral, higher, or lower. The same figure, whether equilateral, higher, or lower. It has the advantage of affording greater spaciousness of effect than any groining can have. It has the great advantage, *above* other pendentives, of its loftiness. Over the various groinings it has the advantage of possessing a smaller extent of surface thau any of these, if pointed in section, as well as the advantage of the spandrils requiring much less loading, because containing much less cubic space. The less extent of yould surface focures recovers The less extent of vault surface of course requires fewer ribs than that of groins: one result of these circumstances is the smaller weight of this vault, ared with others.

I almost thick that a sufficiently strong case has been made to induce some architect, of geometric attainments, to take this wandering vanit into his protection,—this offspring, shall I say, of the systems of groining and of doming, partaking in so large a degree of the nature, as well as assuming the decoration of both,—the paternal rih, ramifying in strength over the surface, and the maternal grace of panelling and interlacing works, spreading in elegance over the space between the rihs, basiles its own more particular adornment, which might be richly earved with folinge, or with geometrical patterns—the hang-ing wall arch. I wish, then, so some one would, and work this almost or altogether untried form into something which, while altogether our own, might be worthy of British architecture in the inateenth century. S. C. R. I almost think that a sufficiently strong case has century. S. C. R.

EDUCATION AND PROFESSIONAL LIVES OF THE EARLY ITALIAN ARCHITECTS, PAINTERS, AND SCULPTORS :

AS CONTRASTED WITH THE EDUCATION AND PRACTICE OF MODERN TIMES.*

TEACHING and illustrating by biography has always been a favorrite means of incidenting and enforcing good precepts, and we have the highest authority for good precepts, and we have the highest authority for its use in far more important subjects than that which I am about to hring before your notice; and it seems to me that, in treating of particular professions and occupations, the consideration of the circumstances, clucational helps, obstacles, and early influences in childhood, friendships, antagonisms, affections, and patronage of manbood, and the honours, the repu-tation, the hardly-carned independence, or the unfor-tunes decordence the results of the training of tation, the hardly-carned independence, or the unfor-tunate dependence, the results of the training of the child, and the habits, whether good or had, of youth, to he traced in age, and the final tri-bute to a life well spent by their survivors, with the consideration of modes of practice of their par-ticular hranch of their profession, brought about by their particular education and influences, is especially valuable to the living and working sta-dents of these particular professions who have present dents of those particular professions who have present with them many of the great achievements wrought auid encouragement and discouragement, sickness, auid encouragement and discouragement, sickness, pain, and anxiety, in spite of obstacles, misappre-heorsion, and even ridicule, hy their predecessors. Therefore, at the present time, when, though the profession abounds in able men, greatly skilled and highly educated, especially in certain attainments, yet considering the many advantages possessed by us, the considering the many advantages possessed by us, the number of works of every preceding age open to us, and brought home to us by the great modern inventions of printing, and every form of illustrative engraving and photography, the perfection of manufacture in almost all branches, and the great facility of conveyance for materials, and also for the concentration of all required taleut to any point of our land required, the art produced is not of that standard of originality and heatly attained by the men of old, and certainly not of that proportionate standard that might be expected from our marvellous advantages,-I trust it will not be deemed lost time to eudeavour to consider what important differences exist hetween the education, professional lives, and practice of those who, in days past, produced works which we in the present time look upon as worthy of admiration and imitation and make long pilgrimsges to foreign lands to see, and those of modern times; and whether the same order of men practised architecture in those days as

With this view I shall give some hrief sketches of With this view I shall give some hrief sketches of those particular points, in the lives of the early Italian artists, as related by Vasari, that I consider clacidate the subject in question. I choose the early Italian, the subject is a start we are hetter acquainted because, thanks to Vasari, we are hetter acquainted with the lives of those who bave produced celebrated works, and because their mode of practice is that which I particularly wish to bring under your con-

DEC. 19, 1857.

sideration, my main point being to show that in those days men were selected to give designs for huildings, in consequence of their artistic acquirements, they often heing men that up to that period had not turned their attention particularly to architecture, hat were considered competent from the imagination and powers of drawing, shown in the sister arts of either sculpture or painting (and often hot) up to that period; and it will be my object to point out, though the existing examples of the various periods render it in consequence of their artistic acquirements, they The charge examples of the various periods render to scarcely uccessary, that as long as this state of things lasted, thehuildings produced were remarkable for origi-uality of thought and heauly of design; hat when men erme to give their attention to architecture alone, their imagination was less exercised, and a less amount of knowledge of drawing was considered necessary, whereas the other arts cannot be practised at all without them; and the architects being no longer artists in the same degree as formerly, the practical, or rather scientific part of their two-fold characterized to have the pre-eminence, and the consequence was, that gradually precedent took the place of originality, and measured proportions, and forms copied from ancient works, and composed principally of straight lines, took the place of the free lines of the penel and the artistic emendation of activation for works. reproduction of natural forms. In going through Vasari, whose work I have found sufficient for my purpose, one of the first passages that arrested my attention was in the life of Cimahue, a painter alone, and which is as follows :-

" By these and other works, Cimahue had acquired "By these and other works, Cimatue had acquired a great mane, as well as large profits, and was appointed, together with Arnuipho Lupi, at artist then greatly renowned in architecture, to superintend the building of Santa Maria del Fiori, in Florence ;" those that had the direction of the work evidently thisking that his tasts call experience in art, though in a different branch, would be of great service to the work. The first architect we find uotieed is Bnono, who was sculptor as well, a list of his works being as follows.

The Castel del Uovo and Castel Cupoano, panile of St. Mark, Venice; St. Andrea, of Pis-toria, the marble architrave over the door of which toria, the inscribe architrave over the cool of which containing many figures in the Gothic unamer, name and date 1166, was sculptured by his own hand; the enlargement of Santa Maria, at Florence; and the Palace of Arrezzo, showing that those who the Palace of Arrezzo, showing that those who were skilled in sculpture were nevertheless entrusted were skilled in seulptore were nevertheless entrusted with important architectural works. But to see more fully the way in which they managed these motters in those times, and the gradual change that took place in the mode of practice, and consequently in the works produced, let us inquire with this view into the lives, education, and practice of a few men whose names are well known in the history of architecture, and many of whose works are at the present time the object of admiration and study. * * * *

Let us first take Arnulpho, horn 1232, died 1310, architect of Sta. Maria del Fiori, and of the Or San architect of Sta. Maria de Fiori, and of the OF San Michele. We do not know much of his education. Vasari says that he acquired the art of architecture from his father, Jacopo IV. (note this), studied design under Ginahne, for the purpose of employing it in sculpture; he was also a pupil of Niccola Pisano, altogether an education not often considered necessary iu the present time, heing as though a student of architecture were now to learn composition and constructive architecture with an architect, as at present and, in addition to that, the art of design from Eastand, in addition to that, the art of design from East-lake, and that of sculpture from Gihson. And what was the result ? Two of his works are Santa Maria del Fiori, and the heautiful huilding, originally de-signed by him as the corn-market, and thus called the Loggia of Or San Michele. This education did not, however, spoil his practical usefulness, as it was by his advice that the Florentines issued a decree that no huilding should ever after he erected on the river hanks, when they had sunk; and much ruin would have heen saved, says Vasari, had the decree always been adhered to: In 1285 he founded the Loggia and Piazza of the Prior; rebuilt the princinal chanel been adhered to: In 1285 he founded the Loggia and Piazza of the Priori, rebuilt the principal chapel of the Badia of Florence, the campanile of the same church, and the church of Sta. Croce, after which eame his great work of the Duono, or Santa Maria del Fiori, "in which," says Vasari, "he proceeded with so much care and judgment, making his excava-tions wide and deep, and filling them with excellent materials, such as fint, and lime, and a foundation of immeme stores they have proved could as we inderrans, such as hith, and hine, and a connection or immense stones, that they have proved equal, as we still see, to the perfect support of that enormous con-struction which Filippo di Brunelleschi erected upon them, and which Arnulpho had prohably not even

them, and which an analysis are possibly as thought of placing thereon." His next works were the eity walls and gate towers, after which he designed the Palazzo di Signori; after which many other works, among which Signor; miler which many occas works, among which was the tomb of Cardinal Bruye, in the church of Sau Dominice, at Orvieto, where he displayed equal power as an architect and mosnic worker. At length, at an advanced age, he died, ladeuwith honours, in 1310.

His original model for Santa Maria, showing the manuer in which he intended earrying the dome in-mediately above the piers, was lost, with those of Brunclleschi, they being apparently not more careful of the original models of their great masters than we of Wrea's of St. Paul's. Having traced the career of one who, though well skilled as a sculptor, yet applied himself almost exclusively to architecture, and whose greatest works are in that ert, we uow come to one who was edu-cated and practised as a sculptor, and whose great work is in eculpture, he was, from his fame in that art, chosen to design and superintend works of architec-ture; manely. Niccola Pisano, born 1205, and died 1278, who is celebrated as having opened a new read to sculptors, and hy his practice and influence led the way to truth and nature. He was born at Pisa, and according to Vasari, his first lessons were from Greek or Byzantine sculptors at work at the figures and other ornaments of the Duomo and the Baptistry; hut, according to other Italian writers, from Pisan artists; plut his choir instruction was derived from the diligent study of antique sarcophagi, then at here, in which were Vesseri. "The node as well as artists; but his chief instruction was derived from the diligent study of antique succophagi, then at Pisa, in which, says Vasari, "The onde, as well as the draped figures, were perfect in design, and exe-ented with great skill." This, of course, in the then axisting state of scalpture, gave bin such a correct-ness of outline and finish that placed him above all others of his time. "His first work," according to Vasari, " was a tomb in marble to San Dominico, founder of the order of Praching Friars, and in 1281 he completed the construction of the tomb, with the grant fill." many figures still to be seen upon it, to the great extension of his fame, the work being considered one of extraordinary merit, and superior to anything One of extraordinary inert, and superior to dury daing that had then been seen. While engaged on this work, he also prepared plaus for the re-building of the church and the greater part of the convent." I take this opportunity to point out in the works of take this opportunity to point out in the works of Niccola and others more particularly given to sculp-ture, an advantage the inverse of that which I am advaceting as applied to architecture of the same man uniting the twoarts, that while thearchitecturehecomes sculpturesque and artistic, on the other hand, those works, such as monuments, tomhs, &c. generally entrasted to sculptors, and in the present time generally consisting of one status, and the pedestal neglected, or if attempted to be decorated, harharous in the extreme, become architecturel in their chaneglected, or if attempted to be decorated, harharous in the cxtreme, become architectural in their cha-ractor, meriting the term construction, and euriched in the present instance with many figures; for as long as the architect lacks power of drawing, and the sculptor the art of architectural composition, no perfect work can be excended in either art. To show that the sculptor and artist is not neces-sarily a bad constructive architect, note that Niccola was the first to found buildings in Pisa, where the soil is so bad for foundation on arches raised on pirsa, which in their tura were supported by piles-for,

Sou is so bail for item reasonable on a press raised on press, which in their turn were supported by piles—for, says Vasari, "where this was not practised, the whole edifice was frequently ruined by the sinking of the foundation, whereas the piles rendered all entirely secure, as experience fully demonstrates." One work noted is a deposition of our Saviour on the forgade of the church of Sau Martino at Lucca, it is found to be a sourced by the same other

on the lagage of the church of San Martino at Lucca, which is full of admirable figures. After many other works, we come to the well-known church of St. Antonio of Padua, of which I have a sketch, and also the church of the Frari at Venice, sketches of which are in Sireet's "Brick and Marble Arobitecture." are in Street's "Drick and Martine Artometeuric. Another interval of ucknown works, and we come to the marvellously beautiful pulpit in the baptistry at Pisa, and that at Sienna. Thus we see in these few notes what seems to us a singular mode of practice. notes what seems to us a socquiar mode of practice. At one time we have a man diligeatly studying classic figures, and showing the result of bis studies in a tomb noted for the heauty of its many figures (not one, remember). At another we find that his skill in compositioo, as shown in this, has, as we should now say, got him a joh in architecture. It is success in this gains him many others, which cause him to travel to Rome, Naples, Venice, and other places. We next hear of him, chisal iu hand, at Lucca, at a deposition, and fundly achieving his creat (timomakin sculature and finally choice in hand, it backs at a subjection, and finally achieving his great trimmphs in sculpture — i.e. design and excention—in his native eily and at Sienna. Soon after which we find him retiring from his labours to Pisa, and leaving his two-fold practice to his son,-

Giovanni Pisano, sculptor and architect .--Now let Giovanni Pisano, sculptor and architect.—Now let ns mark his education : Vasari asys, that heing cou-stantly with his father, he attained early proficiency hoth in sculpture and architecture, so that in a few years he not only hecause equal to his instructor, but, in some respects, surpassed him; and what was the result? A tomb was wanted at this time at Perugia, to Pope Urban IV, who had just expired. What did ns mark his education : Vasari says, that heing cou-stantly with his father, he attaiced early proficiency hoth in sculpture and architecture, so that in a few years he not only hecame equal to his instructor, but in some respects, surpassed hims at was the result? A tomb was wanted at this time at Perugia, bit Pope Urban IV, who had just expired. What dat including, Vasari says, "the figured of the Dismost that or a few in some respects, surpassed hims at was the Pope Urban IV, who had just expired. What dat including, Vasari says, "the figured of the Dismost the tornaments in relify the Niccola had indeed retired, but Giovanni was employed, and, as is sure to he the case when a man has really

qualified himself for his work, this first work immediately led to another: a water-course had been ju made to the city, a fitting fountain was required f it, "they now, therefore," asys Yasari, i.e. hel satisfied with his first work, "confided the erection a water-course had been just the fountain ms met work, counded the erection of the fountain, with all its ornameets, whether in marble or hronze, to Giovanoi Pisano." And now let me ask, how many of our existing sculptors would make a titting, harmonious, and architectural desigu, how many of our architects would successfully design and correct the details execute the details, figures, &c. and why? I think from the want of Giovanni's education; he, while qualifying himself for his profession as a sculptor, which secured the detail, bore in mind that he would which secure in the dealt, pore in initial that he would some day or the or be called upon to design huidings, which secured the composition and constructive know-ledge. This undertaking heing completed; mark this, as he was a sculptor, executing the stone carving himself, and making the casts for the bronze work, ledge. This undertaking heing completed ; muck this, as he was a sculptor, executing the stone carving thinself, and unking the casts for the bronze work, he could not leave till it was finished. He left Perugia for Pisa to see his father, who was lit; but passing through Florence he was compelled to delay some time there, for the purpose of assisting with other archi-ticets at the mills on the Aroo, which were then in conse of construction. "Hearing of his father's death," asys Vasari, "he departed for Pisa, where, in consideration of his talents, he was received with great honour by all the eity, every one rejoicing that although Niccola had passed away, yet Giovanni re-maioed to them, the heir to his virtues as well as his abilities." Do we ever hear now of an architect being received in this way on his return to his ualive eity after exeening two or three works in London, or any other place; and why not ? I do not mean to the same extent, for we are not so criticalic or enthusisatic on any matters as the Italians of the present day, much less as the Italians' of those days in the matter of art. We do not, you will asy, take any works of our great painters in triumph through the streets as the Floren-tines did that of Cimabue; therefore you cannot ex-pect that they will accompany any of our great archi-teets through the streets of his native eity is hat I will remind you that a great soldier is received with as much enthusians as we are capable of; and more-over, a great painter or scalptor alone is also tracked with the asme honours if he happens to visit his native place; but when did we hear of a great archi-teet heing thought so much of, or tracted in the same manner? And why is this ? you will perhaps say. Partly hecause comparative excellence is not so learly defined, and partly because the public do not value architecture so much as they do the other arts. True; but we must go deoper. Why is comparative excel-lence difficult to define. May is comparative excel-lence difficult to define, do wh igoored; the extent of drawing is confued to a small power of sketching buildings. The other knowledge required to raise works of architecture to works of art is left unlearnt. A little archaeology and a large supply of works on old huildings may, perhaps, account for the difficulty of defauing comparative uncit, which is never the ease when men are alone dependent upon their imagination, power of drawing, and study of nature. Moreover, the public know, to a certain ex-tent, the amount and difficulties of the attainments considered necessary, and respect the profession nature: Moreover, the photo know, to activate at test, the amount and difficulties of the attainments considered necessary, and respect the profession accordingly. But to return to Giovani--the Pisans did more than *fille* him, for the men of those days were greedy to possess the works of their great artists. As his first work had been in another city, and had proved his talents and acquirements, they resolved that their city should also be enriched hy his works, for, says Vasari agaio, immediately after recording his triumphant reception, "Nor were the Pisans disappointed when the occasion came for put-ting them (nis abilities) to the proof, for, resolving to make certain changes in the small, but richly-adorned church of Santa Maria della Spine, the charge of these was cutrusted to Giovani, who, with the aid of his disci-ples, brought thedecorations of that oratory to the perfec-tion we now see." His success in this last work caused the Pisans to condite to im the design and execution

the marble with great nicety and carc." While enthe marble with great nicely and care." While en-gaged in restoring a convert, he received a com-mission to execute a pulpit for the church of Sant Aodrea, similar to what Niccol'(had executed for the enthelral of Sicina. This took Giovanni four years. At this time, having executed so many famous years. At this time, having execute so many famous works, like a true artist, considering that he was always a student, he resolved to proceed to Rome, that he might profit, as his father had done, by the study of the few antiquities then to be seen there; but this the few antiquities then to be seen there; but this design he afterwards abaodoaed, and returning to Fisa, he was commissioned to exceed the pulpit in the Duono: he also excented figures on the tympana of two of the doorways of the same building. His last work was a small chapel in the church at Prato, to contain the girdle of the Virgin, which, having been stolen, the people, as usual, resolved to put it in a safe place. He died in 1320, and was honourably in-terred in his own work, the Campo Santo. Besides heing an architect and sculptor in marble, Giovanni was also a worker in ivory. We next come to a moster-mind, one who has pro-

We next come to a master-mind, one who has produced one of the world-known treasures of architec-ture, yet who nevertheless, under the present system, would not have turned his attention to architecture at would not have turned his attention to architecture at all, and the world would consequently have heen de-prived of his work, for during many years of his life be was a painter alone,-meed it he said that I allude to Giotto (born 1276, died 1336),---thanks to the system of those times, styled hy Vssari, in the heading to his life, painter, sculptor, and architect; and do you think his work in architecture would have been so heantiful had his mind, eye, and hand not been previously trained by his long course of painting, and consequent long study of nature? I am sure not.

so heaving had his mind, eye, and hadd hot been previously trained by his long course of painting, and consequent long study of nature? I am sure not. It is the only way. You eacout get water out of a dry well; and even the study, *i.e.* the knowledge got hy the study of nature, is of no use if you have not the power of hand and eye to reproduce her forms and those with which the mind hecomes filled; and this can only he attained by years of practice. So that in Giotto's care, his education as an archi-tect, *i.e.* a designer of architecture, was his practice as a painter. But you must always hear in mind that it was the system or custom of combining the arts that rendered it practicable. I would not pretend to say that at the present time any one of our great painters, after ten or twenty years' practice in painting alone, would make a good architect, or even perhaps turn out a really good design. Though he would possess thes of the great designation, and continual study of nature, he would lock fourth even to practice archi-tecture as an art, viz, the power of applying these consistions to architecture. but the artist at these or and art of partice in the private of these Three of the grant desinitions, with point a training experience in compositions, and continual study of nature, he would lack a fourth even to practice architecture as an art, viz. the power of applying these acquisitions to architecture; but the artists of those days, whether painters or sculptors, knowing that their fome in their special art would very probably lead to employment in architecture (a first-rate artist of any kind heirs] looked upon as the best designer of the day, and consequently, the most fit man to whom to confide any work which it was wished should posses peculiar heauty), took care in their lesioner time (which was not much in those days when church walls were not of white-wash or colourless plassie) to qualify themsdives for such an emergency, and often to such a degree that, as we have seen in the life of Nicoda Pisano, a sculptor, that their works are noted as models of construction as well as of heauty. With regard to Giotto's early life, all are well acquiring the works of Giotto-a painting which may as fittingly come here as anywhere elsentat opportunities of studying cotemporary architecture, and the their works, relation shad sculptors had great opportunities of studying cotemporary architecture, and and the dirity works, noted of being exceeded in their own studios, were done on or within the walls of the churches, religious houses, and other public buildings; and I can well imagine that the artist's minds were eccupied during may a spare live inninks of rest from their labours in admiring and observing the huildiogs whose walls they were carriedure the sufficiency are and the artist's minds were exceeded when the opportunity occurred.

occurred. It is not my intention, nor would time permit me to make mention of any of the extraordinary numbers of paintings executed hy Giotto, or to endeavour to trace the events of his life, which would, indeed, be much the same thing.

as well as chief of the Ghibellini party in Tuscany, as well as chief of the Ghibellini party in Tuscany, should be raised to bis memory. They wrote accord-ingly to Giotto, requesting him to prepare designs for a very splendid tomb, adorned with whatever might most worthly enrich it, and, sending him the required measurements, they prayed him at the same time to procure them a sculptor, the most excellent, according to his opinion, that could be found in Italy, they refer-ring the whole affair entirely to bis judgment. Giotto, ring the whole aniar currery to ons dougnent. Glotto, who was very obliging, made the design and sent it to them, when the monument was erected accordingly, as will be related in its proper place," *i.e.* in the lives of the selected sculptors, Agostino and Angelo, of Stennos. Here, then, is an instance of what I re-marked above, viz. that the greatest artist of the age, whatever his special profession was locked wrong as whatever his special profession, was looked upon as the greatest designer, and therefore called upon when any work more than usually beautiful in design was required, whether in his peculiar province or not. After this we hear of no more works in sculpture or years old, and only two years before his death). Giotto commenced the campanile of Santa Maria del Fiori. The foundations were laid on massive stones, suuk The foundations were fail of massive stones, suffic twenty brachia; be caused the remainder, namely, eight brachia, to be formed of masonry. The hisbop of the eity, with all the clergy and magistrates, were present at the foundation, of which the first stone was proceed at the obtaination, or which the first stone was solemally laid by the hishop himself. The editect the proceeded on the plan before mentioned, and in the Gothie manner of those times; all the historical repre-sentations which were to be the ornaments being designed with great care and diggence by Giotto himself (would that the architects of the present time would do so, and not leave so much work to the carver), who marked out on the model all the the curver), who marked out on the model all the compartments where the friezes and sculpture were to he placed, in colours of white, hlack, and red. The lower circumference of the tower is of 100 brachia (25), that is, one each of the four sides. The beight is 144; and if that which Lorenzo di Ghibert has written be true, as I fully believe it is, Gotto not only made the model of the campaoile, but even executed a part of the sculptures and reliefs— those representations in markle, namely, which exhihit the origin of all the arts. Lorenzo also afirms that be saw models in relief from the hands of Giotto. those representations in manney manney, "which are the origin of all the arts. Lorenzo also affirms that he saw models in relief from the hands of Giotto, and more particularly those used in these works,—"An assertion that we can easily believe," contioues and more particularly those used in these works,— "An assertion that we can easily believe," contioues Vasari: "for design and invection are the parents of all the arts, and not of one only. This eaupaoile, according to the design of Giotto, was to have been erowned by a spire, or pyramid, of the height of fifty brachia; but as this was in the old Gotbie manner, the modern architects bave always advised its omission, the building appearing to them better as it . For all these works Giotto was not only made a is. For all these works, Giotto was not only made a eitizen of Floreoce, but also received a pension of I00 efficient of Floreoce, but also received a pension of 100 goldan florins yearly—a large sum in those times— from the Commune of Florence. He was also appointed superiotendent of the work, which be did not live to see finished, hnt which was continued after his death by Taddeo Gaddi " (also a painter), so we see now the connection between the shepherd-boy and the Cittle Communic See low the control in even the subplicture of an the Gotto Campanile. Years have gone by--educated by a painter as a painter, and living and practising as a painter, almost exclusively, till he was fifty-eight years old, we now see his powers of drawing, subtley of composition, his long experience as a designer, his long study of nature, and his matured and full imagitakes study of matter and his matter and in impor-tation at last concentrated on a work of architecture, as if it was intended to be a lesson for us, that it is not a light thing when we sit down, penel in hand, to design a work intended to last for centuries; that they are not light acquirements that the art requires; that it is an injury, rather than a henefit, that our knowledge of construction and building is good and that the walls will stand for ages, if, at the same that the wails will stand for ages, if, at the same time, our preparation of our powers of design has not been commensurate with the importance of the art, and with our skill in making our work permanent; if, in fact, our art is not worth pro-serving, for the pleasure, the instruction, and the benefit of succeeding ages. Do not for a moment minuderstand me: I do not say, know less of con-structive skill,—yon cannot know too much, how priseous, for instance, would it have been if there had here the skibeter flow or size of meal-anen is the previous, for next new work it nave been it there had been the slightest flaw or sign of weakness in this building, non which so much at has been lavished by Giotto, if bis parting gift had perished from bad construction. No; the constitution should be good, and the hone and muscle stroog, where the form is so heautiful,-but still the form should be worthy of the beautini, — but shill the form should he worthy of the bure and muscle. But, mark the way in which this great artist set to work: from his previous life perhaps it might have heen imagined that a doshing sketch would have been the way in which his imaginative design would have heen communicated; hut, no. Should we then bave had the full henefit of all bis

koowledge and experience ? No ; he himself must make Roowiedge unit experience r voi ne finise inner mass mass the model, or the proportions would not have heen sufficiently considered. All the detail must he marked out hy binself, or the design would not have profited by his powers of composition. The coloured decorations must all he designed by him, or we should not have derived all the full banefit of his having been minime word bather of the the designed by him. painter; and, lastly, all the detail itself must be esigned by him, and, as far as he was able, modelled by his own hand, or of what avail to the work would bave been the marvellous power of drawing possessed by its designer? Only two years after the first stone of this great work was laid, Goitot died, in 1336. I cannot better conclude my few notes of bis life than by quoting, with your permission, the last few lines of "The Lamp of Beauty," in "The Seven Lamps," expressing, as it does, all my views in so much more glowing words.---" And if this he, as I believe it, the model and mirror of perfect srebitecture, is there not bave been the marvellous power of drawing possessed growing words :- And if ins be, as I beneve it, here not model and mirror of perfect arehitecture, is there not something to be learnt by looking hack to the early life of him who raised it? I said that the power of the human mind bad its growth in the wilderness; much mane much the lows on denomeries of the heath. burnan mind bad its growth in the wilderness; much more must the love and conception of that beauty, whose every line and hne we have seen to be, at the best, a faded image of God's daily work, and an arrested ray of some star of creation, be given ehicdly in the places which He has gladdened by planting there the fir tree and the pine. Not within the walls of Florence, but among the far-away fields of her likes, was the child trained who was to raise that head-area a function and a star to remay a field and and nnes, was the child trained who was to raise that head-stone of heauly above her towers of watch aod war. Remember all that he became; count the sacred thoughts with which he folled the heart of Italy; ask those who followed him what they learned at his feet; and wheo you have numbered his labours, and received their testimony, if it seemed to you that God had recent resumpty, it is seemed to you that God had verily ponred out upon this his servant no common uor restrained portion of his spirit, and that he was indeed a king among the children of men, remember also that the legend upon bis crown was that of David's :-- 'I took thee from the sheep-cole, and from following the sheep.''

As Taddeo Gaddi-born 1300, died 1366-was the successor of Giotto in the superintendence of the works of the campanile, we will next consider a few passages from the life of this master, who was his passiges non the file of this instead, who was no godson, and who was with him for twenty-four years; "and, after his death," ary Vasori, "was considered the first in his art, for judgment, genins, and other artistic qualities, heing superior in most of these to all his fellow-disciples." After enumerating many works on guining we come to this passage are all his fellow-disciples." After enumerating many works on painting, we come to this passage:---"Having returned to Florence, Taddee continued the works of Orson Michelle for the commune of the city, and refounded the columns of the Loggia, for which ho used stone, dressed and hewn, instead of the hricks of which they had previously been formed, but without altering the design left by Arruipho, who and directed that spacious magazines should he prepared above the Loggia, with vaults for storing the servers of crain laid on by the needle and commander of the set reserves of grain hid up by the people and commune of Florence;" and that you may see in how much earnest the authorities and people were in their prac-tice of the art of architecture, as well as the artists, allow me to read the following passage, which I am the more induced to do, as I hailed as a sign of hetter the more numeral to do, is I halfed as a sign of retter times the revival to the letter of one of the modes of proceeding here alluded to. Hear Vasari—" And to the end that this work might be completed, the guild of Porta Sta. Maria, to whom the charge of the fabric had been entrusted, commanded that the tolls of the Corn-market, the tax of the Piazza, and other imposts, should be made over to ine pullatory, and and, and of more consequence, it was further ordained, and with great judgment, that each of the guilds of Florence should construct a column at its own charges, and should furthermore place a statue of its magnetic in a niche of the same. It was, more patron saint in a niche of the same. It was, more over, decreed that every year, in the festival of cach saint, au officer of the respective guilds should saint, au officer of the respective guilds should make a collection, standing each by his own column, during the whole day, for that purpose, with standard clevated and ensigns displayed." The revival I heard of the other day, when in Ox'ord, was, that each of the principal heads of colleges and others had con-tributed a column to the museum. In 1331, he was ealled upon (Giotto beiog at Milan) to prepare a model aod design for the Ponti Neccheo, his instruc-tions, heine to construct it with all nessible beauty noue aod uesign for the Font Neccheo, his barne-tions being to construct it with all possible beauty, as well as solidity. The hridge of San Trinita was also built by him. "While all these architectural works," says Vasari, "were proceeding, after the designs and under the direction of Taddeo, he did not neglect his paintings"—he painted whole chapels and other works. He died at Milan.*

ARCHITECTURAL EXHIBITION.—The opening con-versazione will he held at the Gallery in Suffolk-street, on Saturday, the 2nd of January. Professor Cockerell will preside.

* To be continued.

[Dec. 19, 1857.

ON THE ARTS CONNECTED WITH ARCHI-TECTURE IN TUSCAN

THERE IN DISCANT." THERE is no district of Europe entitled to greater respect from all who honour art than was that portion of Italy, during the thirtcenth, fourteenth, and fifteenth enturies, which we now recogoise as the Duchy of Tuscany; tested indifferently hy the excellence and variety of its monements, the spirituality of its artists' productions, or the honourable consideration in which their works were held by all ranks of society. This high distinction uses in a great dorse down to a This bigh distinction was in a great degree due to a fortuitous union of elements in the constitution of Forenee in the thirteenth and fortreenth entries such as may never again recur. The favourable posi-tion of the eity for commercial pursuits, and probably some congenial sympathy on the part of the citizens, some congenial sympathy on the part of the citizens, early made it the seat of a prosperous trade in, and manufacture of, woollen goods. Its association with the Ghibeline cause nourished aristocratic feelings of the relies with which its carliest religious structures were codowed, fostered, more particularly among the democracy, a fervent devoional respect for everything ceclesiastical. Through these three sources,—an enlightened oligareby, a proud nobility, and an ever-active Church,—ample patronage was provided for artists; and, as has ever been the case, genius sprang to life in profusion at the all-powerful summons of wealth and honom. There was, however, yet one more ebarm of great

weath and honour. There was, bowever, yet one more ebarm of great potency at work to aid, and which indeed mainly generated the particular class of excellence to which I propose to draw more special attention. I allade to that particular veneration for technical excellence and honest work which the numericality expressly and honest work which the municipality expressly desired should characterise every work of art for which they gave a commission. Men whose fortunes which they gave a combision. Men whose fortunes had heen made by the reputation of their skillal weavers, and of their storling florin,—the only pure gold coin of its time,—coald searcely totrate, in those magnificent structures which were to be the outward inaginineeri strictures when were to be the outward aod visible embiem to foreigoers of their state, either bad work or dishonest material. Handieraftsmen of all kinds were honoured each in their several degrees : guilds and confraternities were created with special privileges ; and the services of all were embied to heighten with every external magnificence the pageants of the service of an external constitution of the service of the service of an external magnificence of the pageants of the community, and the monuments of architecture aod its sister arts, which were to be produced for the and its sister aris, which were to be produced for the public enjoyment, and yet more for the public honour. The trimmph of the arist was to Florence the trimuph of one of its skilful children, whose taleat was the manifest source of ense and prosperity to all. Hence the public rejoicings in the "Borgo-Allegro" over the strides made in painting by Cimabue; the public gratulations over the exquisite manipulation of markle work and mosaic hy Oreagna, in the Or San Michele, over the brilinant ability of Donatello, Gbiherti, and Luca della Robhia, in sculpture, and over the origin-ality of Giotto, and the daring of Brunelleschi in architecture. architeeture.

The public buildings in those palmy days of art were looked npon as demanding the co-operation of all; and as each man who hrought of bis hest to the work received, at the bands of his fellow-citizens, hoth in moncy and good esteem, the full value of whatever be added to the common stock of beanties, neither the greater men were permitted to appropriate the bonours of the less, nor were the less permitted to fileh the credit due to the loftier spirits. Hence arose a co-operation among artists and artizans of all kinds such as has been scarcely ever known in the world's history, and hence is derived much of the peculiar excellence and interest of the principal structures time bas spared to us upon the almost classic banks of the Aro

It had been my intention to dwell upon many of the technical arts which contribute to this excellence, but heavy and unexpected cogagements have curtailed the time at my disposit, and I have been forced to limit my attention to three of special interest;—viz, stained glass, which has not received the attention it deserves at the hands of art students; painting in freeco, which is so eminently characteristic of all Early Iresco, which is so eminerity contactoristic of an Early Italian architectore, and Tuscan in particular, and narquetry, of which Tuscany appears to have been at least the European nursery. Amongst all the arts connected with architecture,

Amongs all the arts connected who incontents, there is not perhaps one so capable of imparting splendour to a building as that of stained or painted glass; a fact which appears to have been known and practically applied from the earlier period of the practically applied from the earlier period of the Christian era to within the last century or two. In the first recorded examples nothing more appears to bave been attempted than filling in wiodows with a species of mosaic-work of different coloured pieces of stained glass; nor is it until the eleventh or twelfub century of our era that we have satisfactory records

* The following is part of a paper read at the general meeting of the Royal Institute of British Architects, on November 16th, by Mr. J. B. Waring, already referred to.

of the application of figure-subjects in this method of decoration, —a system which reached its apogee, with all the other decorative arts, in the fifteenth and six-teenth centuries. There are three methods of exeteenth centuries. There are three methods of exe-cuting these glass pictures, which may be termed the Mossic, the Enamel, and the Mossic-Enamel. In the first, the composition is formed of small pieces of stained glass, or glass coloured throughout by metal-lie oxides, termed pot-metal, welded together in small pieces, and producing all the required tints in local colour: the shadows, which are slight, are produced by the application of mound colour work the produced by the application of enamel colour upon them with a brush, and then fixed by burning in a kiln : the hest Grash, and then fixed hy burning in a kin: the best examples of this class are, perhaps, those of the twelfth and thirteenth centuries. In the second, or Enanel method, which was most in vogue during the sixteenth and seventeenth centuries, the artist painted his subject entirely with enamel colours on a ground of white glass, sometimes on one side only, sometimes on both; the entire design being welded together in pieces of much larger size than those neual in the Mossie method; and, when complete, fixed by ex-posure to heat in a kin. In the third, or Mossie-Enanel method, we find a comhination of both the former: it was the most in vogue, as might naturally be supposed, at a transitional period hetween the first former: it was the most in vogue, as might naturally he supposed, at a transitional period hetween the first and second methods, and is, indeed, characteristic of the works of the filteenth, and of the early part of the sixteenth century. In this method, the use of pot-metal for the large masses of colour imparts all that hrilliancy and power which is peculiar to the mate-rial, whilst the use of cnamel colour for the more delicate portions of the picture, as the flesh, the hair, the ornaments, and the general accessories, permits a delicer and minuteness of finish otherwise mattain-able.

parison with the best works of the fiftcenth and si-teenth centuries in Tusseny. This arises principally from an insufficient adoption of pot-metal in the masses of colour, the false idea that the numerous lead lines of the small pieces of glass in the mosaic method are antigonistic to the general effect,—the eontrary, I helieve, being certainly the case,—the insufficient use of large masses of shadow, and too minute attention to hlending the several local colours: such were the defects which struck me in the otherwise heautiful works of Capromier of Brussels, and of Bertini of Milan, in the Great Exhibition of 1851, and in those of Petit Gerand of Strasburg, of Lafaye, Gerande, and Lasson, of Paris, and of Nincent Lardver of Troyes, in the Paris Exhibition of 1855. The notices of the magnificent stained-glass win-

The notices of the magnificent stained-glass win The notices of the magnificent stained-glass win-dows of the Daomo of Florence are very meagre : some of them are merely stated to have been exceuted in 1434 by a Florentine artist, Domenico Livi da Gamhassi, at Florence, who had learnt the art at Lubeck. This may apply to the series of which an example is given, though that even appears impro-hable, and some of the subjects in the npper windows of the transcript, of which St. James is an example, are certainly of much earlier date. The entire series is remarkably rich in colour, and consists of the pro-tlest and Saints elad in most picturesque and striking costumes, such as Freiligrath describes in his " Pic-

phets and kines of the Oil Testament, and the Apes-lies and Saints elad in most picturesque and striking roottunes, and has Freiligrand describes in its "P field torial Bible," presenting a fine example of these "storied windows richly dight" which Milton has "clebrated in verse. They are formed of small and irregular picces of clebrated in verse. They are formed of small and irregular picces of the diffect being obtained by a rich combination of being obtained by a rich combination of of a hold and effective character. The faces and the formet though in source at the distance the practice of working in several kinds of wool. They are flow which with entry and thing (well he entry appears to be on the practice of working in several kinds of wool. "expirite first (*mortun*, face the article of the seven examples of other mind. The Milton Phale are most prominent. It will now bring under your anotice the hast division of a hold and effective character. The faces and the formet, though in source exact, sai in Moses and the formet, though in source exact and the distance they occurred with the scientific principle with which we are acquaited are to he form to the irrey boxes, ornamentated with inlay of variant the fourteenth or the commencemental with inlay of variant the fourteenth or the commencemental with inlay of variant the scient whe fact a Bynelle as an adjunct; and it is and util the clear of the fourteenth or the commencemental with inlay of variant the individue an attry. In these the at the saint artis, or a predicted on the fire previce and tarsis, to architects and others, of which the individue an attry. In these the at the saint artis, and the same and the severe the different bead in the distance they beak more of this pro-prestive and tarsis, or intaristication the fire there who this an adjunct; and the content of the fire thand attracter solidity and a much stronger effect of the fourteenth or the state that Brunellese in gark in a precision of a daministion of the propolition, which, if not

axiom, that the hlending of tints, nuless in subjects very close to the cyc, should he avoided in stained glass as simply labour thrown away.

Proceeding now to fresco as an ornamental adjunct to architecture, we find that hetween the Byzantine epoch, when mural decoration could hoast of the rich and solemn effect produced by the nase of mosaic inlay, and the revival of the art of painting in the fiftcenth century, there extends a long period, embracing the works of the Romanesque and Gothie styles, neither of which has been illustrated in the manner they de-serve; an omission arising chiefly from the few re-mains which exist at this day in a perfect state, at least in the Cisalpine countries. As regards the first-named style, we have frequent records that painting was extensively applied as an internal decoration, where mosaic-work could not be obtained; and we covered with painted subjects, illustrating the Sacred Proceeding now to fresco as an ornamental adjunct

twelfth centuries, of the walk of churches being covered with painted subjects, illustrating the Sacred Writings or the lives of particular saints. * * The general characteristics of this Italian Gothic, or Giottesque skyle of mural decoration arc,--a dado, or base, panelled with imitations of various marbles, contained within borders painted in imitation of the glass mosaic-work usually known as Opus Grecamicum, having at times central designs of intricate geome-trical and leaf ornament. About 6 feet from the fear is a cention with small broadchis or consells all treal and leaf ordanical. About o leaf thom ale floor is a confice with small hreakets or consoles, all radiating in perspective to a central point of sight : above this the wall is divided into large compart-ments, containing historical or religious figure subments, containing historical or religious figure sub-jects, the figures heing strongly outlined, and the colours flat and distinct, with hut a slight use of chiaro-oscuro. These compartments are also enclosed in painted mossic borders, and beneath each there is a description of the subject illustrated, written in peculiar Gothie letters of a very good style. The vault-ing of the roof springs immediately from above these interest the only actual projection being one harce pictures, the only actual projection being one large central rih, ornamented with winding foliage and central rn, ornamented with winding ionage and mosaic borders, and painted mooldings to carry it more agreeably on to the flat surface of the vaulted compariments, which are almost always painted of a deep hule, studded with gold stars, and in the centre of each of which are painted figures, usually holding written serolls descriptive of their meaning. Some-times the names are written on the cloads broacht times the names are written on the clouds heneath, times the names are written on the clouds hencetth, from which they frequently appear to rise. The in-tersection of the rih is marked by a gold boss, carved and gilt, hut not of great size, having a ring in the centre, from which a lamp was suspended. The orma-ment is generally a mixture of mossile-work, Roman reminiscences, especially in the pointed mouldings, and transcripts from nature; the two first, however, being predominant. The colours are well arranged, and the ornamental accessories, such as dresses, huild-iom themes armous fe are of creat variety and

and the ornamental accessories, such as dresses, huild-ings, thrones, armours, šc. are of great variety and bearty, and very earefully excented. Such are the general characteristics of most of the mural decoration in vogue up to the close of the fifteenth century, as seen in the works of Organa at Pisa and Volterra, of the Lorenzetti and Bartoli at Siena, and in the several Italian schools of Italy. And otherwork the works of Paolo Livello. Masarcia Stein, and in the several ranks schools of hady. Index although the works of Paolo Uccello, Masaccio, Ghirlandaio, and Signorelli, present many points of divergence, the principal feature heing the greater importance attached to the historical subjects, and a

divergence, the principle feature heary points of importance attached to the historical subjects, and a very superior skyle of excention, yet it is not until the time of Perugino that we find a completely different system adopted; and to him appears to be certainly due the introduction of a style in every way superior, which was extended and improved by his contemporaries and pupils, amongst Whom Pinturicehio and Raffaelle are most prominent. I will now bring under your notice the last division of my subject, which is the art of marquetry, or inlay in wood. Although a passage in the treatise of Theo-phikas on Painting (twelfth century) appears to bear on the practice of working in several kinds of wood,— "cupri, ferri, *Lignarum*, lapidamque,"—yet the earliest examples with which we are acquainted are to be found on the ivery hoxes, ornamented with hinds of wood,— "cupri, terni, *Lignarum*, In these the art was only employed as an adjunct; and it is not until the close of the fourteenth century. In these the art was only employed as an adjunct; and it is not until the close of the fourteenth century. In these the art was only employed as an adjunct; and it is not until the close of the fourteenth century. In these the art was only employed as an adjunct; and it were termed by the lanzi state that Brunelleschi gave lessons in per-spective and tarsia, to architects and others, of which Massaccio, in painting, and Benedetto da Maiano, in his ialidi works, arviicd themselves. Vasari ays that masters, "da nostri vecchi," and were termed by theom works in "tariar," or intaristian. In his life of Benedetto da Maiano, he states that this practice

these, buildings in perspective, foliage, and various fantasies of different kinds." The earliest artist in this manner mentioned hy Vasari, is Giuliano de Miaino (1432-1490), architect and sculptor, who commenced his artistic life with works in *tarsia*, and executed, as his first work, the seats and presses of the sacristy in the Church of the Annunziata at Florence, with Giusto and Minore, two masters of tarsia. *

The moral that may be deduced from these few observations on some out of the many arts associated in the production of the great monuments of Tuscany, is the following :— It has been the great misfortune of architecture, from the last century up to the present time, to be considered as a study *per se*; as an art perfect in itself, and requiring no adventitious aif from the sister arts of sculpture, painting, &c.; hut if we search antiquity through, we shall find no example of such a disconnection of the one from the others; and those huildings are the most interesting, the most heautiful and satisfactory, which have sough the aid and guided the aim of all those varied and ingenions methods of ornament, which the skill of mankind has discovered and brought to perfection. The moral that may be deduced from these few It is true that constructive science is of primary im-portance to the architect; yet it can do no more than form the skeleton which it is his duty to render, not form the skeleton which it is his duty to render, not merely useful, but agreeable to the eye; and in order to effect this, he must of necessity call in the aid of the artist in stone, in colour, in metal, in wood and mosaic work, and possess the knowledge and good taste requisite to apply them effectively to his subject : the useful should never be separated from the beau-tiful; the last is the complement of the first, of which every work of the Divine Creator, the great Architeet and Artist of the Universe, affords striking and invinitable proof. inimitable proof. To one deeply penetrated with this feeling, the

study of architecture is no longer confined to the few years spent in an office to obtain a knowledge of the different styles, and the usual methods of professional Jears splith in a longer to some a known a known some and different style, and the usual methods of professional husiness, hut demands long-continued attention to alt the arts of design, with a view to their general appli-cation to architecture. And here let me say a word on the subject of servite limitation—an evil almost necessarily attendant on the reviral of any style or manipulative art. Novelty and beauty excite admira-tion, and naturally produce initiation : but this will be only for a time; for we should not he human beings if finally we did not endeavour to strike out a new path for ourselves; and then it is that we shall bring to hear our knowledge, not for the purposes of initiation, but of progress. With all just deference to the studies of our predecessors, with all our admira-tion for the styles of the past, our present object should be to consolidate and arrange the information should be to consolidate and arrange the information we now have; and from the lessons thus gained, the cramples thus given, strike out a new path for the powers of the architect, and bring back the art to its normal state, which is one of gradual but sure pro-gress, founded on scientific and artistic knowledge; we should perceive that merit exists more or less in all styles, and is irrespective of fashion, which is mutable and often unjust; that the *principles* of our art are fired and certain; that however much long-movined while more he altered as circumstances may art are fired and certain; that nowever much long-received rules may he altered as circumstances may require, they are not to be despised or disregarded without eareful consideration; that true construction is the vital principle of real progress; and that, hesides the excellent and numerous examples of orna-

contentedly at his own improvement with the certain assurance that the better he succeeded the wilder and deeper his studies were, in that same measure he might count on the applance and appreciation of his fellow eith-zens. After all, to the generous mind, what reward in money, what payment, however great it may he, for ser-vices as a man employed to do a certain work-as a servand, in fad-cone compensate for the want of appre-clution as an artist? But not for this lef us falter or he east down, the good work must still go on, and though the task be a thankless one, though the seed he cast on a stony and rough soil, yet it is necessary to proceed, trusting that in the future such studies contentedly at his own improvement with the certain to proceed, trusting that in the future such studies will bear fruit, and be of service to our country.

SOME RECOLLECTIONS OF THE INTRO DUCTION OF ILLUSTRATED LITERATURE INTO ENGLAND.

AT the end of our former notes on this subject* we alluded to the large increase in the number of artists and engravers caused by the improved means which have from time to time been discovered, of rendering their talents available to the multitude, and have no doubt that movements which are in progress will, to an anazig extent, itercase the ranks of the army which is engaged in diffusing knowledge by means of illustrated literature. Witbout further specula-ting on the coming wonders, we will glance briefly at the system by which, at the time of the publication of the annuals, and the illustrations by the Findens and others the pumerous back anoranize were weedwedd others, the numerous book engravings were produced. others, the numerous book-engravings were produced. In Hogarth's early days he was wont to execute his book-plates with his own hands, carry them when finished to the publisher, receive his money, and then come home, don his sword and better suit, and sally forth to study life; and it is probable that the chief part of the numerous cupravings which were produced by this great painter and moralist was the work of his own hands. Woollett, the famous master of honderane cupraving greenells had his cablest the Insown hands. Woollett, the inmous master of landscape cupraving, generally bad bis subject etched on the copper by Browne and other celebrated etchers, reserving for himself the task of working this skil-fully laid in neutral tint, by means of the graver and varied corresions or " hitings," into those rich and varied tints which no engraver has equalled.

As the demand for book plates increased, engraver of eminence began to gather around then assistants and pupils, who, under superintendence, worked ac-cording to their peouliar skill on various parts of the plates. At one time the Findens had a staff of about Corang, to ther packate the Findens had a staff of about thirty assistants, many of whom were paid high salaries. It cannot be said, however, that this system of manufacturing led to the improvement (in an artistic point of view) of this description of art. At the time to which we refer, the demand for wood engrav-ings was gradually increasing, and the facilities for time to which write the trian to work tights in ings was gradually increasing, and the facilities for printing and the quality of them were nucle improved. There was, however, great difficulty in proming artists of sufficient skill to make drawings on the wood suitable for the kind of printing then in use; in fact, most of the artists of name would have considered it as an insult had they been asked to make drawings for as an insuit had they been asked to make drawings for such a purpose. William Horvey, an apprentice of Bewick's, afterwards a pupil of the unfortunate Haydon's, Kenuy Mesdows, and occasionally George Cruckshank, by turning their attention to this de-partment of ark greatly improved it in delicacy of finish and brilliamery of effort. aud brilliancy of effect. Hervey's drawings of animals, engraved by Baukster and others, Kenuy Meadows's " Heads of the People" and illustrations of Shakspeare. to the merits and utility of engraving on wood, and most rapidly the tasts for books illustrated in this way spread. The school-books, works on natural history, scientific publications, &c. hegan to he extensively illustrated in a manner which coutrasted curiously managed in a manner which contrasted curiously with the blocks in Catnach style, which were for-merly in use, and various serial publications began to be offered to the public; amougst the most remark-able of these were Charles Knight's "Penny Maga-zine," and the "Saturday Magazine." These works were looked at with wonder at the time of their com-mencement both for their alconacter in the state. mencement, both for their cheapness, and as was thought the merits of the engravings, and truly there thought the ments of the expravings, and truly there were so many difficulties to be overcome by the con-ductors of those journals, that they are entitled to our hest thanks. Amongst these was that of providing blocks of bowwood of sufficient size, -m eircumstance to which we have before alluded. In Mr. Knight's illustrated "London," a great step was made, and the writer of this remembers at the commencement of this work, the difficulty there was in getting admis-sion to pherea in the metronolis rivers of which were sion to places in the metropolis, views required for that and other works. of which were Churchwardens d custodians could not readily nnderstand for what thee views were needed, and frequently much more time was occupied by formal applications to get access for this purpose than in making the sketch and

* See p. 498, ante.

THE BUILDER. drawing it on the wood. Many who now cujoy the facilities which are so generally afforded to those engaged on the illustrated press, would feel surprised at the particulars which could be related of the per-

as the particular which could be reasonable to be a seasion and patience required in former days. In this briefly glancing at salient points in the progress of book illustrations, we must not pass over without notice, the introduction of lithography, which for a time came much into use. The improve ments in wood engraving have, however, to a con siderable extent superseded this for small works.

subtractile extent supersedera fais for small works. Besides the publications just mentioned, and some others of less note, most of our readers will remember the hench of our contemporty, *Pauela*, who, with so much wisdom, under a merry mask, has done such so much wisdom, under a merry mask, has done such good service in many paths. At the time of the commencement of that periodical, various illustrated weekly publications of an inmoral tendency, were in the market, and several earnest men joined together for the parpose of providing a source of anusement, which the part of providing a source of anusement, which. by refined wit and pure intentions, should, by which, by refued wit and pure intentions, should, by the contrast, make the dangerons works just men-tioned contemptible, and well have they succeeded in their undertaking. The commencement of the *Ulas-trated London News*, in 1843; the *Builder*, in 1843; and some other works, form a point in the progress of illustrated literature for the multitude; and in the former of these publications, amongst other works, we would mention the large illustrations of the Duke of Welliveria's former dearn by Lobe Gilbert as of Wellington's functal, drawn by John Gilbert, as marvels both of the art of engraving on wood, and surface printing. Thomas Bewick could scarcely have anticipated the extent to which wood engraving, and rapid and clear printing from wood-blocks, have been carried. We still look for advance. At the present moment the art is standing still. Amongst the various attempts to improve the art of angraving on wood, we must not omit mention of the volumes issued by the Art Union of London, which are illustrated by a number of our best artists, some of whom were thereby led to draw on wood for the first time.

At the present time there are very nearly tweety After present that offer are tary hardy theory illustrated papers, which issue weekly from the metro-politan press; and yet the great masses of the people, both in the country and large towns, are scarcely reached.

The nrt of photography has come largely into use and by its means we may expect many subjects will be transferred to wood blocks without the aid of a draughtsman. One of the chief obstacles in the way of effecting this at present is the difficulty of finding engravers able to work on other forms than The product of the second seco artistical engravers capable of excenting high-class engravings on wood with their own hands very scarce. engravings on wood with their own hands very scorec. One of the wilk which will result from the system to which we have alluded will be the loss of the characteristics of the artists' drawings, for the sky man will get into the method of ruling all his skies, in the same way, and the "entire" of foliage will acquire a concasting of etch erbic will method be are as a second conventional style, which will render him careless of

copying peculiaritics. It is admitted that increased artistic instruction amongst our engravers on wood is desirable ; and it is to be hoped this desideratum will be supplied to the rising generation.

An illustrated paper, published in Paris, has recently cently given some examples of surface printing, which are well worthy of attention. Some of these being given well worthy of attention. Some of these subjects consist of figures drawn with much character and cnergy, and are as they sponger before the public, the work of the artist himself, untouched by the engraver on wood. A short time ago a postal district map of London, about 4 feet in length, and of proportionate height, excented by this means, was published at the office of the *HUstricted Times*, at the cost of $2\frac{1}{2}d$. The streets und other places are very distinctly lettered. If this map had been produced on a copper or steel plate, one printer could not have turned off more than fifty or sixty impressions by a day's work. By means of lithography, a few hundreds of copies might have been obtained in the same time or copies influe have been obtained in the same time; such a har: in het, the writers of in must be influence but by the new process between 20,000 and 30,000 guides. So conscious, indeed, is Lord Lindsay of copies were thrown off in one night. We are not sufficiently acquainted with this process to be able to give any opinion upon it, but if by this or any other these who, with him, practise and almire Christian

means we could get bold and characteristic sketches by our great artisis, produced at such a price and in such numbers, and of such size, as would cause them to be extensively spread about, they would he useful for schools and for the adornment of the dwellings of the poor, and would effect much good.

CHRISTIAN ART IN PAINTING. SCULPTURE, AND ARCHITECTURE.

ONE of the most popular, and also one of the most UNE of the most popular, and also one of the most favourably criticised, of living English writers appears to consider that the title of this note applies to "all the productions of art from the time it has been diracted and developed by Christian influences;" and that it may be regarded moder three different aspects. These seem to be the *artistic*, which is the individual point of view; the postical, which belongs to all (modes of faith ?); and the purely *religious* aspect, which belongs to one mode of faith. Mirs. Jameson and her admirrs, will, it is homed not be offended by this slish: admirers will, it is hoped, not he offended by this slight transposition of her expressions. The dilemma for that lady's advocates is the fol-

lowing :-

Does the one mode of faith mean the Roman Ca-tholic Church, semper cadem, and consequently, for-merly as now, heratical in the cyes of Protestants, i. e. Mrs. Jameson and her critics? Or,

Does the one mode of faith mean the Catbolic and Apostolic Church, which embraces all those who acknowledge as their symbol the shortest creed, while differing on essential points of doetrine?

differing on essential points of doctrine? If the first position he the truth, what Mrs. Jameson calls Christian art would be quite as much represented by the works of Battoni and Canova as hy those of Nicolo Pisano and Fra Angelico. That of course will be repudiated in favour of the second position. But, although the second position is preferable, because it opens the door of Christian art for the admission of the later Byzantine works, it also opens the door to those very works of Battoni and Canova, which that lady and her followers most assuredly repudiate; and would also force them to admit the asima'ed later works would also force them to admit the animated later works ald also force them to admit the annua or taken by our Sir Charles Eastlake, and the landscapes by our by Sir Charles Eastlake, and the landscapes by our best painters, into the ranks of Christian art. There is only one way of escept from this dilemma; and it has practically led Mrs. Jameson to bun the charches above named, and to say pretty clearly that Christian art is the reflection of the literature of the sixth to the teath centuries, which literature was "the Legends of the Saints," and, as Mrs. Jameson says, was taken up at a time when "the reverence for those who endured matrydom gradually grew into venera-tion, worship, advartion; a line too fine and invisible not to be transgressed by excited popular feeling." But these who are not content to hear that Christian art is only to be found in pictures drawn from the Legends of the Saints may oppose that purely Roman Catholic restriction; and, after first suggesting to Mrs. by Jameson that it does not seem to be the province of Christian art to tempt an excitable popular feeling to a breach of the first commandments, may say that they are yet waiting for a reason why any of the following classes should or should not be considered alone or with others as Carissian art. These are,—

1. Ornamentation (by diaper or geometric patterns, painted or sculptured, or botb), in which it is assumed that uo resemblacec to any previously existing thing occurs

occurs.

 Ornamentation in which monograms, emblems,
 Consumentation in which monograms, emblems,
 (invented or appropriated by the Greek or by the
 Roman Catholie priesthood hefore the present time)
 S. Representations of subjects from the Old Testament;
 or from the New Testament;
 or fourth of England as by law established;
 or of persons enconized by the Popes;
 or of personsers of such subjects
 as the Day of Judgment, Paradise, &r.;
 or of personsers of any class not encared in minacles or matyre. ages of any class not engaged in miracles or martyr-

And, finally, for the proof of the religious condition of the painter, the sculptor, or the architect, at the time of his conception and execution of the work, time of insconception and extension of the works because, of course, a practically irreligious man, or a leretic, could not produce a work of Christian art : indeed, it is doubtful whether any, unless engaged in the sacerdotal profession, could be such

This is the most tender point in the discussion. Either we must accept all the works by any persons Indic we may adopt an one works by any persons professing to be Christians, as Christian art; or we must ask Mrs. Jameson and her friends to draw up an anthoritative list of the pictures, seulptures, and buildings that were conceived and executed under the influence of inspiration, and nothing less than such inspiration will be requisite to those who draw np such a list : in fact, the writers of it must be infallible guides. So conscious, indeed, is Lord Lindsay of this, that he endeavours to obviate the difficulty in a .

rt, "it is not symmetry of form or beauty of colour-g, apart or conjoined, that constitutes our preroga-tive, but the coaception by the artist, and expression o the spectator, of the highest and holicst spiritual ruths and emotions,"—e.g. landscape is not Christian atl depends upon the spectator, there would be no work that was really Christian art unless there was a pectator to recognise in it the expression of these ruths and emotions. Now, if Lord Lindsay was not criting nonsense, will he, or any one for him, acquaint he public with those cancers of criticism which inform tim and his disciples when the highest and holiest piritual truths and emotions are conceived by the artist and expressed in paiating, sculpture, and architecture The public with esciples when the bighest and holiest piritual truths and emotions are conceived by the artist and expressed in pniating, sculpture, and architecture o the spectator? Of course, no one will attempt such i defence of the passage just quoted, becanse it involves i statement of two things; first, a list of the truths that are to be considered the highest and holiest piritual truths; and secondly, a list of the cruotions. Nath are to be considered the highest and holiest piritual rentions. Nothing less than the conception and expression of these being Christian art, it would seem that the books produced by the two distinguished writers whom we have cited are mis-maned, and that they should have been cuited. "Collections of the chief instances of pictures pretending to be works of Christian art." be so obliging as to explain, by any process of reasoning, whether Daule's vision is a work of Christian art on to, and to give an answer to the same question in regard of Millon's Paradises? It is a great comfort that, in theory at least, Lord thade's later pictures to be as true works of Christian art as the best productions that initiate the Madonna di S. Luca:, and that he would do equal justice to such pictures as "The Governess" and "The Needlewonan," provided always that the spectator be truly a Christian, brease, of course, Mirs. Jameson and Lord Lindsay must he assumed to be canable, even when unsuccessfully put before other crities. But the matter gets much more simple when we

when unsuccessfully put before other crities. But the matter gets much more simple when we approach the subject of Christian art in architecture. Here we have a list of negations. It will probably be conceded by those who use the term Christian architecture that it does not mean any particular style at all, provided that the building fulfils an intention of eonverying to the spectator (being a Christian) the expression of the highest and holiest truths and emo-forms, this are style which folls to moduce such a expression of the highest and holiest truths and emo-tions; that any style which fails to produce such a building, when required, does not belong to Christian art; that the architects since 1500 have signally failed according to their crities and their owa admis-sions, in producing such a bailding in any style; that Christin architecture does not include any style; and that Christin architecture does not include any suilding, merely because the style and the building are used for an editice which is called a church; that the mere fact of a style arising, if it were possible, amongst a people professedly Christian, would not make that style Christian art; and that Christian architecture does not mean the style or succession of styles prac-tised from the sixth to the sixteenth centuries for Christian purposes.

does not mean the style or succession of styles prec-tised from the sixth to the sixteenth centuries for Christian purposes. And, what is still more to the purpose, we should have some assertions—that the bighest and holiest spiritual truths and emotions are only to be exhibited in one style in architecture, though in many styles in painting and sculpture; that this style is still Christian art, even when applied to scendar objects, although painting and sculpture when applied to scendar objects, second a sculpture when applied to scendar objects, second and sculpture when applied to scendar objects, one force, or all the forms, of Pointed architecture which were practised in the Christian parts of France, Spain, Italy, and Germany, in the sense of Northern Europe, and in England and the Lew Countries during the period 1200-1500; and that this style, or these styles, if practised elsewhere, were not Christian architecture. Besides all which, we should have the startling, half-century, the Roman Catholic prices-thood (cousidered hereined by Protestants) possessed while present in these localities, but lost on removal, the power joined to the will of making their buildings threat and in fature express those highest and holiest truths and emotions which are essential for art or architecture. We christian art or architecture. With truths and emotions which are essential lot art of architecture to be Christian art or architecture. With overy respect for present architects, we hege their attention to their condition as it may be inferred from the words of (an English Protestant elergyman) the Rev. Thomas Hago, M.A. :—" The forms of Gothie architecture are those in which men of old aspressed their holiest, deepest, sublimest thoughts" (perhaps Mr. Hugo has slightly exaggerated; and we omit the next passage, which occurs in the *Builder* of this year, 1857, page 77); "these men possessed and venerated

the faith, and they wrote it in every detail of the buildings which they reared as that faith's material abode; " a faith which, as abore shown, was miformly in certain places, at a certain time, and in certain hands, sure to produce a work of Christian architec-ture, whether or uot (and this line should have the particular attention of Mr. G. G. Scott) the practi-tioners or architects had large means, and had ever learat the grammar—if indeed one existed—of their art. ANON. ANON.

HERALDRY IN ARCHITECTURE.

HERALDY IN A MINIMUM THE TOWN HERALDY claims a long and very ancient connec-tion with architecture. All nations who have made different arls minister to the decoration of their dwellings and public edifices have used it as an arcessory. By it is indicated the rank or station of the proprietor or the designer of them: as an his-torical record, as a sourcent of the dead, and as cou-ting the source of the dead, and as coutorical record, is a solvenir of the dead, and as cou-veying information of the manners of different conn-tries, heraldry is a nasúni seinece; but it has not always beeu judiciously employed as a means of de-coration; sometimes it has interfreed with and marred the effect of lines and members of importance in buildings. It ought always to be made subordinate to the seine line of est

buildings. It ought always to be made subordinate to the principles of art. Heraldic oraanneats sculptured on the temples of antiquity arcse from the common habit of dedicating the armour of the cnew mad suspeeding it in temples. This is alleded to by the Greek poets. The Illad (vii. 81) describes the victor as bearing the armour be had won to Troy, and hanging it up in the temple of Apollo; and Virgil describes, in Encid (vii.), a temple burg round with hung round with-

"Helmets, darts, and spears, And captive charlots, axes, shields, and bars, And broken beaks of ships, the trophies of the

Dryden. The shield of Agamemnon and the shield of Acbilles, to full hy which was considered, ia those heroic times, as the greatest calamity; the quantity of military en-signs borne by the Greek eavalry; the rich baoners and standards, were objects too magnificent not to be represented by their best sculptors on the friezes of their temples. From the times of the Greeks and Romans, though we might add to these the Persians and other nations, the sculptured stone and the em-blazoned shield have been generally applied as archi-tectural decorations to civil and religious cilifices. Adultion or vanity, and not a love of art, has

biazoned shield have been generally applied as archi-tectural decorations to civil and religious cliffices. Adulation or vanity, and not a love of art, has sometimes heen the cause of overloading a building with herddie hearings. Some mouments in Italy exhibit this fault to such a degree that, as a French writer says, they night be taken for archives of herddy. The Doomo of Orvieto is, perhaps, one of the most remarkable instances of the extent to which the passion for decoration, and the excessive love of eolour, may be carried. Its whole surface was covered with saylects from the Old and New Testiment. Many façades presented the sculptured elligies of the holy protectors of the city, of the benefactors of the church, of the architects who had designed them; and the Domon of Sienan was decorated with that illustrions republie. If our memory serves us, the Uffizi of Florence had a collection of arms painted in compart-ments, underneath, its coraice, in the façade fueing Armorial bearings were first brought into Eagland by the Neuron of the transition of the factors of the city the florence had a collection of arms painted in compart-inears.

the Figza. Armorial beariags were first hrought into Eagland by the Normans at the time of the Conquest. The number of armouries received a considerable aug-mentation from the splitting and subdividing of lunded property, and were still further multiplied by those used in tilts and tournaments^{*} In the ages im-mediately subsequent to the Crusades, the symbols of heraldry began to be promiaent features in architec-tural works. The shields upon which they were first represented were in the form of an isosciles triangle slichtly curved on its two equal sides; but soon after-wards they began to assume that of the Gothie arch reversed, a shape probably adopted with a view to such decoration, as harmonizing better with the great choracteristics of the pointed siyle. Painted glass, jou-that powerful auxiliary to architecture, which invested the interior with tims of such eachanting splendour; which diffused such life and glory around by the reflection and refraction of light,—painted Armorial beariags were first hrought into Eagle splendour; which diffused such life and glory around by the reflection and refraction of light,—painted glass, in its earliest application, was employed to represent military portraits, and arms with serolls containing short senteaces, from which family motioes may have originated.[‡] Warton places this gorgeous originanted.[‡] Warton places this gorgeous remarked at an era earlier than the reign of Edward II. Encennatic tiles, also, which were introduced in the early days of heraldry, afforded another means of displaying the insiguin of warriors. They are still found in the pavements of many of our eathedrals and face old parish churches. The ornaments burnt into them are of infinite diversity. The zodiacal sigus

* Edmundson's "Complete Body of Heraldry." † "The Curiosities of Heraldry," by O. A. Lower.

sometimes appear as an ornament on pavements, as they were also sculptured on the doorways of several cathedrals. Leaves entwining among esculteons were common ; and animals that denoted strength, courage, sagacity. Among fish, the dolpini, which is coasiltered by heralds the belief of fish, and assumes a relation to naval affairs more than any other fish, is found frequently depicted in heraldic bearings.* it is an distinguished on account of the heauty of its form and its successful adaptation in numerons examples of sculpture and fourtain decora-tion. We find, in many of our eatherdars, shields of various sizes placed on the point of their arches in a succession of square compartments sculptured in the store, isometimes paired and sometimes not; insuccession of square compartments sculptured in the stone, sometimes paiated and sometimes not; in-serted in the spandrils; on the boses of vaniling; and of several different dates, so that they give a clue to accertaining the periods of various portions of the breaklic artist) gives, of heradary in different (the heraklic artist) gives, of heradary in different cathe-drals, are interesting to the student.⁴

We see that the masons and carvers of the Middle Ages, in addition to the great quantity of symbolical figures which they wrought out of their fertile fancies,-"Aussitöt main fécond en réveries Inventa le blazon, et l'art des armoirics" (Dépreaux)-

(Depress.)— availed themselves freely of the stores of heraldry which the pomp of power, the spirit of rivalry, the love of distinction, and the ostentation of wealth had readered very considerable; for every haron or prince hal his arms; svery county, city, borough, and town corporate and guild had its arms; every abbey, monastery, college, and school, founded in England and Wales, bud its arms. The reigns of Edward HI. and Richard H. were the " palmy days of heraldry." He-reditary arms were perhaps scarcely used by private families before the beginning of the thirteenth century.⁴ ceulury.t

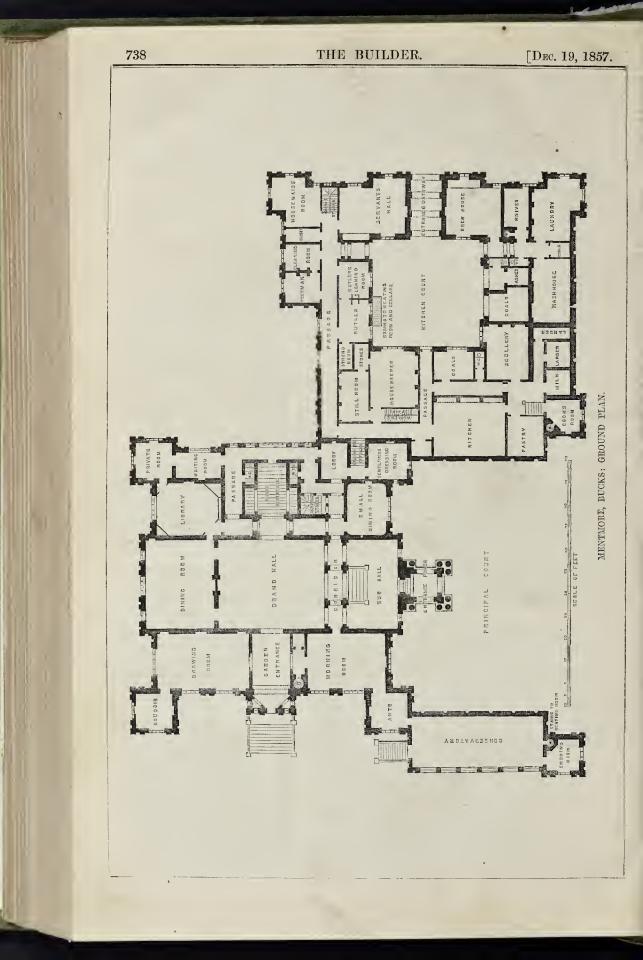

families before the beginning of the function century.¹ Quatermère de Quiney says on this subject (Die tionnaire, alt. Armes et Armoiries), that heraldry which, after all, is ouly an accessary, often plays too principal a part; doors sometimes seem as if they had been made expressly to support a mass of these gro-tsque ornaments,-ridiculous trophics raised by bad taste to vanity. They are not inherent to architecture, though sculptured in the stone; they should be treated as a hors-d'acurre, and never hreak the uniformity of a building; whereas we often see in some of the grander building in Europe pediments and raking mouldings broken up, and an aperture leit in the middle pur-posely to admit a hust, a medallion, or an armorial bearing. Whatever heauty the ornaments and details we have been apenking about posses in themselves, they should increase our admiration for the higher and superior been aty of the object they adorn : that should be tree great centre of attraction. Where good taste presides they may be most aiventageous, and contri-bute greatly to the effect of a building, though not essential parts. F. L.

CONSTRUCTION OF FLUES AND VENTILATION.

VENTILATION. Mr. GEORGE JENNINGS, to whose ingenuity and spirit we owe many useful thiags, now in great demand, has lately patented some fresh matters relat-ing to construction and realilations. He proposes to employ a light iron trimmer in front of chimney openings, instead of the wood trimmer now used; also, hearth holeck, perforated, instead of the half-brick trimmer arch.—the perforations in the "holes" to correspond with air spaces in the iron trimmer joist. He then, in combination with these matters, proposes to use earthenware flue-pipes, having air spaces or chambers round them, so shaped as to make the circle into a square. These air chambers are to serve as extractors of vitiated air, and are so made that they bond in with the brickwork, and take the undinations peculiar to flues in buildings. "Suppose a two-roomed house," says the pateatee

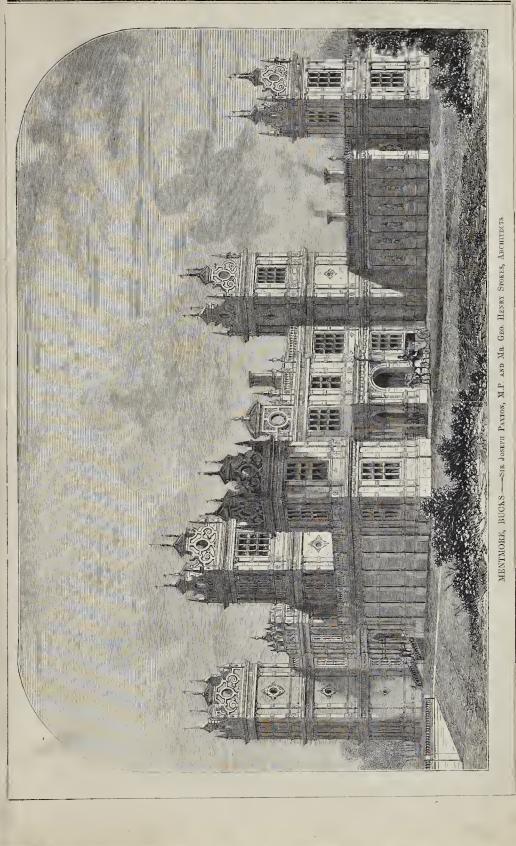

inclinations peculiar to flues in buildings. " Suppose a two-roomed bouse," says the pateatee " the lower room only having a fire-place, but the chimacy formed with my flue pipes, if the upper room, wanting the fire-place, be connected by a junction holes, with my extraction chamhers, the sleeping-room would be continually changing the air. Of course, I have also a simple plan for supplying air for respiration, and to support comhustion." In a larger house, the kitchen chimacy only being built with the flue pipes, and the extraction chambers com-municating with erery room, at or near the ceiling line, vitiated air, from the hast imparted from the smoke flue, would he drawn off without any commu-ication with the laterior of the snoke flue, as is the case with the Arnott ventilator. We must take an opportunity to look at these arrangements.

THE BUILDER.

MENTMORE, BUCKS,

THE SEAT OF BARON M. A. DE ROTHSCHILD. THE SEAT OF PARON M. A. DE KONTAND. MENTMORE, of which we this week give a ground plan and view, is the seat of Baron Meyer Auschel de Rothschild, lately erected from the designs of Sir Joseph Paxton, M.P. and Mr. George Henry Stokes. It is about 1¹/₂ mile west of the Cheddington station on the London and North-Western Railway.

station on the London and North-Western Railway, and is situated oo an emineoce which commands a fine view of the vale of Ayleshury, the Dunstable downs, and the Chiltern and Barham hills. The style adopted by desire of the haron for the exterior is that which prevailed during the carly part of the reign of James I. and of which Wollaton Hall, Notts, is perhaps the flocest example. A difference in the combination and arrangement has contributed to produce grouping of a microscope character and out. the combination and arrangement has combined to be produce grouping of a picturesque character and out-line, and the details and ornameotation are understood to be the result of a careful study and examination of the works of Joho of Padaa. The massion is huilt entirely of Ancaster stone, of

finc quality and colonr: the cornices are highly co-riched; and the frieze of each order is filled in with earved panels and heads.

enred panels and heads. The approach to the mansion is by a court, flanked on one side by the wall of the conservatory, and on the other side by the screen wall of the servants' offices. Niches are formed in each of these walls, for Onces. Alones are formed in each of these wais, for the reception of statues. The entrance-porch is of suffi-cient width toadmit of carriages passing through, and has a ground stone-ceiling chownelly carved. From the sub-hall, which is lined with Caen stone, and paved with Sicilian and Rouge Royal mathles, o flight of mathle steps leads to the arched corridor, which forms means of communication hetween the suite of apart means of communication hetween the suite of apart-ments on the ground-floor and offices. The grand hall is about 48 feet by 40 feet, and 40 feet high, and is separated from the suh-hall by the corridor just mentioned. At this end of the hall are inserted three arches, the whole height of the ground-floor, filled with polished plate-glass. The extrance to the in-terior is through the ceotre arch which forms o decomme doorw

At the level of the chamber-floor the grand hall is At the level of the chamber-thoor the grand hall is surrounded by corridors, and an open orcade of great heauty and richness; each arch of which is filed with a balastrade of alabster and green marble. This arcade, with its richly-moulded arches, earving, and orcaments, is striking and effective, and imparts hoth character and variety to the interior.

Immediately alove the metric is the main cornice, from which spriog the coved ceiling and walout rits, which divide it into compartments; stone heads, carved by Monti, are placed in the frieze bucach each rit, and the compartments of the coved ceiling are alled with ornamental shields, scrolls, and

ener filed with ornamental shields, serolls, and foliage. The hall is lighted from the top, the roof being constructed externally on the ridge and furrow prin-ciple. This ridge and furrow roof is supported in wrought-iron riveted girders, to which also is fixed the framework of the celling, consisting of moulded walnut rink, filled in with glass manufactured ex-pressly for the purpose. The grand stairness occopies the side of the hall opposite to the vestibule of the garden-entrance, and consists of oose wide ceotral flight of steps of solid Sicilian marhle: on either side of which is a deeply-recessed arch with coffered ceiling; a flight of steps on each side leads from the landing to the corridor, surrounding the grand hall. The ceiling is divided into panels by moulded walnut ribs, the soffits of which are enriched with guillocke ornament.

surrounding the grand hall. The celling is divided into panels by modiled walnut ribs, the sofilts of which are enriched with guillocke ornament. Some departure has heen made from the style of the exterior, in the decoration of the principal epart-meois, the dinice-room, drawing-room, &c being elaborately fioished, and decorated according to the styles which prevailed in Fronce during the reigns of Francis I. and Lonis XIV, XV, and XVI. The servants' offices are also huilt of Aneaster stone, and are in the same style as the mansion. They form four sides of a quadrangle, the entramet to which is through an arched gateway. The whole of the fronts are fitted with every requisite. The kitchen is provided with all necessary appur-tensuces, which were supplied and fitted by Messra. Temple and Reynolds, Fricees-street, Cavendish-square. Direct communication is obtaiced with the mansion by steps leading from the passage near the kitchen; the kitchen, scullery, and other rooms The scutter is provident from the rooms apperious to it, being thus placed in a nearly central position.

apperious to it, being thus placed in a hearly central position. The mansion is warmed throughout hy hot-water pipes, and provision is made for ventilating each room, by the admission of fresh, and the removal of vitiated air. The whole of the windows are filted with copper casements, and glazed with plate-glass, supplied by Mr. Alfred Goslett, of Scho-square. The hot-water apparatus and bell-haoging were executed hy Mr. May, engineer, Dean-street, Holborn.

Myers, of Lamheth, hy whom the whole has been executed in a most excellent and substantial manner, uoder the able superinteudence of Mr. John Jones, the clerk of works.

SIR,—It may be convenient for some people to sneer against according to the source of the source of the proper to reprehend it if it be made the vehicle of personal attacks; but in matters of scientific or asthetic iovestigatioo, where there is, or ought to he, but one object in view—the search of truth.—it is both desirable and coovenient to conduct the discussion without mentionice means on either side. In the ution in the order of the second of the seco is truth, whether the discussion hie between Mr. X. aod Mr. Z. or between Cato and Poplicola. But in the former case every keen observation is felt as a personal reflection. Mr. X. takes the strong language as aimed at himself, not at his theory; and Mr. Z. fancies there is always some lurking shaft aimed at his own defects or misfortuncs. It is from these causes the rules of Parliamentary debate prohibit the causes the rules of Parliamentary debate prohibit the mention of any member's name, ond that yoo, sir, and every conductor of any leading public journal, I. It is found more convenieot aod more courteous. It leads more directly to our argument, and we are less liable to fall into personalities. But if gentlemen who have placed themselves at the head of a party are determined to make o personal matter of it, and will rush ioto the conflict, eatching an energy scall ean they full and multime it on their

up every skull cap they find, and, putting it on their own heads, ery out, —" What a wretch this is who has made this for me!" all that can be said is this—if they will fit on the eap, they must take the chances of the blows that may light on it. But why should aoythiog of this sort occur in matters of abstract taste or art? If Mr. Scott chooses to rush into a con-

The cootractor for the works was Mr. George tyers of Lamheth, hy whom the whole has been couted in a most excellent and substaotial manner, the period, and was not the architecture of the carry the period, and was not the architecture of the carry the period, and was not the architecture of the carry the period, and was not the architecture of the carry the period, and was not the architecture of the carry the period, and was not the architecture of the carry the period, and was not the architecture of the carry the period, and was not the architecture of the carry character of the order of the carry the period, and was not the architecture of the carry character of the carry the period, and was not the architecture of the carry character of the order of the carry the period, and was not the architecture of the carry character of the carry the period, and was not the architecture of the carry character of the carry the period, and was not the architecture of the carry the period, and was not the architecture of the argument, the assert of the remet to it? Permit we for a moment to the period was a set of the argument, the period was a set of the argument, the period was a set of the argument the architecture of the argument the the period was a set of the argument the period was a set of Rome." This is all he bas to say. Is this attempt at a sneer either a fair representation of the argument, or any answer to it? Permit me for a moment to state it in the words of the Roman antiquaries. "Here," they say, "are the huildings wherein, if not the holy Apostles themselves, certainly their immediate successors, have met and worshipped,--huildings hallowed by the footsteps of saints, and the blood of martyrs, where the great champions of the faibt, the fathers and doctors of the church, have maintoined the sacred truths of Christianity,--build-ings which are, doubless, the spots on earth most to be reverenced, except Jerosalem itself, by any Chris-tian of whatever persuasion,-- and you hmod them with the odious title of Pagau. You might as well say the New Testament was heatben, because it is written in the heatheo Greek tongoe. And then you cite your northern Gotbic, which is nothing but Saracenic mought over by the Crusaders, and tremontanized, and yow that is the only Christian architecture, and for no reasoo, or no ground, hut your bare assertion." Instead of succring at "Verax," will Mr. Scott he so kind as to answer the Italians? I can assure him the expression Pogan, as opplied to their huildings, is regarded by them with horror, as the reekless appli-eation of an opprobrious term to some of the most sacred places on earth. "Yerax" next goes on to plead that Pointed art' eran searcely be called Christian are excellence, as the

sacred places on earth. "Verax" next goes on to plead that Pointed art can scarcely be called Christian par excellence, as the Charch had existed twelve centuries before such art was known; that it no sconer took root and got to maturity than it showed symptoms of decay; that it occupied only one-tweedy-sixth portion of the cristence of Christian events, including its dehasement. He goes on to show that the world was not in that state of Christian excellence as to stamp such character on co-existent art; that the Church was in a frightful state of achism, dissession, and corruption; and that of the and the stages, including the definition of each of the world was not in that state of the stages including the definition of the stages, including the definition of the stages, including the definition of the stages including the world was not in that state of the stages including the definition of the stages including the stages and the marger of the stages including the stages and the marger of the stages including the stages including the definition of the stages including the definition of the stages including the stages inclu

projectile-ergo, it was the age of gunnery,-and it is not impossible Philip Augustus used the Minié rifle 1

No, sir, attempts have been made to show these were ages of faith, because people believed whatever they were told-for the best of all reasons, they had they were told—for the best of all reasons, they bad no power to examine; and ages of bappiness, though the world was full of violence. But to endeavour to go further has heen reserved for the present day. I fear we must sum the matter up in the worlds of a Ter we must sum the matter up in the words of a licely Freueh writer, who says,—"In those times there was no science, not even in that which touches us all nost nearly—our heilth. The king's physician was invariably a Jew or an Arabian; the king's fool mea dimunication?"

was always a native." On the next point, I find "Verax" is accused of having made sad mis-statements : he has said "the last new original style," "the last modern archi-tecture," instead of "the latest original style of archi-tecture," and "the architecture of the modern as dis-tinguished from the ancient world." he has also stated that the very same thing is called by the same writer "Mediceal." and "the architecture of our fore-father." "Medieval;" and "the architecture of our fore-fathers" in the next paragraph, when, in strict trath, it is only in the next page. All sorts of hints are thrown out to lead people to believe that much turns on all this, and that "Verax" is perverting quotations and mis-stating facts. Can anything be more petty, more ungenerons? It would have been much better if Mr. Scott had answered "Verax's" question, how its being the last new style--I beg a thousand pardons, "the last new original style", -made it, par except "the last new original style" – node it, par accol-lance, Christian. A newer style, then, it seems would depose it from its virtue and diguities. But "Verax" denies it is the last new original style of architecture: this he asserts to be that of iron and glass; and that the Italian (as much derived from the Roman as the Descrated from the Lancet) was another original intermediate to the state of the intermediate style.

But now comes a really serious accusation of "a double mis-statement; " here are the words: "On the much-vexed question whether the Pointed arch was imported by the Crusaders from the East, he (' Verax ') Imported by the crusalers from the Last, he (Verax) first coverts it into a question whether Pointed architecture, instead of merely the arch, was so imported." This "Verax" does not do, for he does not see how they are to be separated : the other half of "the double mis-statement" is, that "Verax" makes out Mr. Scott admitted this, by purposely makes out Mr. Scott admitted this, by purposely leaving out an ij in transcribing the passage. In many instances there is much virtue in an ij_{r-1}^{r-1} but in this there scens to be none. These are his very words,—I hope by an error of the press or transcriber these letters may not again f_{all} out :—" if its [the Point larth's] systematic adoption can with certainty be traced to the suggestive archi-tecture of the East survey this does not unchristianize tecture of the East, surchy this docs not unchristianize the already Christian architectuse of the Soldiers The arready Christian architecture of the Solders of the Cross, who brought the ider home among the speils won from their unbelieving focs." In the name of "conscience," as Mr. Scott talks so much of it, what is this but an admission,—ay, and that in spite of the *if* that he is so extravagantly anxious for ""*if* of the *i*/ that he is so extravagantly anxious for: ψ I did so and so, I did it with a good motive." Is not this an admission that something *was* done? "If I he brought home the statue, I did not break the fugger $\pi^{(n)}$ Is not this an admission of a fact? "If the Crusadirs brought home something, they did not unchristianize it. Is not that an admission something was bronght? But, probably Mr. Scott thinks he can blow hot and cold, and, if folled in one part of his argument, can jump round his if, and take up new position. This will not serve; there cannot new position. This will not serve; there cannot be two truthhil defences. It will not do for a thief to say, "I did not steal the horse, but if I did, I meant to send it back next day." It's if would be con-sidered an admission of the fact hefore any " con-scientious." magistrate, and would infallibly send him to the sessions. It comes to this, the Crusaders brought something home or they did not. If they hrought nothing home, what noncense it is to talk of what hangened to it by the way. The Americans are what happened to it by the way. The Americans are very for 1 of sual jokes about *nothing*." Infl no-thing," "the small end of nothing whited down;" but of all strange ideas the strangest would be to "undvisionize" nothing. If they branch score, "unchristinge" nothing. If they brought some-fling, what was it they brought? The passage under examination is certainly as obseare and involved as anything I ever read, and is probably intended not to be too closely semtimized; if so, Mr. Scott has breached to broad the second second second second second breached to breached second se brought it on himself,-he forces us to try and muravel it.

But, before doing this, it will save time and smooth the way to have a word or two about Mr. Fergusson's the way to have a word or two about Mr. Fergusson's book. Mr. Scott says it would not be easy to look through all he has written; it seems, however, he has gone as far back as 1840. It is conclusion is, that the search does not belp "Verax." Let us see what, in "Verax's" own words, Mr. Fergusson "shows."

architectural critic wrote like Mr. Pergusson, as careful and as candid in speaking of a Hindu Vimana as of a Roman Basilica,—as unprejudiced in treating of the Parthenon as of Salishary Cathedral,—and pur-suing the only philosophical way to arrive at truth by collecting all his facts hefore be begins to deduce in-ferences. Now let us thus to new 92% of the second Now let us turn to page 383, et seq .:-Vour readers will perhaps remember the year of the Hejra was 622, and that of the first Crusade 1096. Well, what does Mr. Fergusson show of undoubted Moslem or Saracenie architecture? The mosque of Caliph Omar, at Jerusalem, was built A.D. 637; the mosque of Amrou, at Coiro, 642; the mosque of El Aksah, at Jerusalem, 691; the mosque of Caliph Walid, at Damascus, 705; the mosque of Ebn Tonloun, at Cairo, 876; the mosque of El Azhar, at Cairo, 981; the mosque of Sultan Barkook, at Cairo, 1149; several others, also, of later date. Of these he gives five very elever illustrations; and I am sure, to any unprejudiced mind, a few glances will show these to be the models or precursors of our Pointed architecture.

But let any one go through his hook, and after that look to any other work wherein views of Moslem architecture are contained, and there cannot be a doubt of the resemblance. I remember once standing before the magnificent west front of Peterhorough Cathedral in company with an old Indian officer, when he said, "Why, this is just what we see throughout the East: huge pointed portals running up to the top of the building; spires, pionacles-ever thing like the minarets-the aspiring character Mussulman architecture." And this style came in nacles—every And this style came iuto general use very shortly after the great Crusade. do not say that the dogma post hoc, ergo propter hoc is always correct, but surely it is in this instance.

is always correct, but surely it is in this instance. Again, let us look at this probability. Mahomet and his followers steruly refused to follow or copy anything in use either by Christians, Jews, or their Hindoo neighhours. Is it likely, then, they would copy the architecture of either? The reigning Caliph would probably say, "I will uot have the round arches of those Christian dogs, nor the level archi-traves of the Hindoo idolators. If we are to have arebas, make them of other forms,—horse-shoe, or stilled, or pointed. We copy nothing from unbe-lievers in other matters, why do so in their architec-ture ?" ture ?

And now, begging pardon for kcoping Mr. Scott waiting, we will return, and put a few questions to him; for, unless we get him into a corner, it is clear there is no knowing where to have him,-

"We'll keep him to the question close, And argue διαλεκτικώς.

First, then, we would respectfully ask,-and Mr. bring any style of architecture from the East to the West or not i

the West or not? If they did, what style was it ? What the gentleman means by "the suggestive architecture of the East"—was this Pointed or not ? What be means by trying to set up a difference hetween the Pointed arch and Pointed architecture ? How is the one to be separated from the other? The arch is not a form of ornament, but an essential part of construction. Perhaps he will also kindly inform what Pointed architecture would or could be with out the Pointed arch?

out the Pointed arch? What he means by "the *already* Christian archi-tecture of the soldiers of the Cross, who brought the idea home among the spoils," &c. If it were theirs before, they could not hring it back with them as oils. His sentence, and all its its, cvidently allude Pointed architecture. spoils

Is there any proof, or presumption, or the most remote prohability, that any Christian building was ever erected anywhere in the Pointed style before A.D. 642?

If not, will he explain how the Crusaders found it among the Saraeens, as a sort of Christian foundling Now will he kindly turn to his letter of the 5tb of December last, and tell us what he means by saying it (the imported architecture) is not referred to the Saracenic hut to the Romanesque of Western Europe: And will he explain how this Romanesque had crept and with the explain how this itomanesque had crept all over Enrope in various forms, from Lomhard to Norman, at least a century before there ever was a ernsade or crusader? And will be explain why the lecture and his letter differ? Clear, definite, and succinct answers to these questions would he a great bean to 'Verre'? hoon to "Verax." Then "Verax" wishes to know how it is "the

enties tyte which may faily he called Christian is the Byzautine?" In his iunocence, and hacked by the authorities of Procopius (who wrote a separate treatise on the buildings of the day), of Agathias, of "Verma's" own words, Mr. Fergusson "shows." And here it is really a relief to take mp a book seed on forts and dates. It would he well if every learn that the first who male any change in the jeen destroyed by fire, like the church itself.

architecture of Byzantinm was Justinian; that he prided himself much upon it, and hoasted he had van-quished Solomon himself; that his flatterers told him from the palace of the Persian emperor. Mr. Scott's non up paake to all this is, he never "even alluded to polite answer to all this is, he never "even alluded to the name of Justinian." Does not know the gen-theman I Prohably not. But will he explain when, how, or in what way the Byzantines hegan, and fairly succeeded in Christianizing architecture for the first time, which he has not only alluded to, hut asserted P

Will he also show how, or in what way it was on the ecssation of intercourse with the Moslem world,

be ecsation on intercontree with the Mosien world, Pointed architecture first declined, and then became debased, and shortly perished? Will he also explain the seemingly great inconsist-eacy of always crying out for "the architecture of our forefathers," and yet always designing in some foreign style; the more especially when the architect present takes for his mosting "Collegend amosting" openly takes for his motio, "Celebrare domestica facta," to a design for an English house for English Statesmen, and what justification it is to answer when under this motto we find a Dutch market-honse, "it has often been objected to as Italian," and whether Italian is nearer the "domestica facta," than Dutch?

Will he also tell us why a man cannot he master of Will he also tell us why a man caunot he master or two styles of architecture, Classic and Gothie, as well as of one, and why those who confessedly are masters of both, should be branded as enemies of the latter, against all truth and reason? Why the Puginites should alone arrogate to themselves the knowledge of Pointed architecture? Why, when "Verax" and his friends are doing all they can to save Pointed archi-tecture from the consequences of the blundering and oversitatements of others, and wish to hring them versiatements of others, and wish to hring them hack to the only safe path, that of truth and sober-ness, an answer should he put forth, headed in capitals, "the statements of the opponents of Gothie architecture f

Will he also tell us what he means hy "young saints?" for "Verax" never used such an expression. And here it gives me the greatest pleasure to say, that anong the rising young men both of the Institute and Association, there is quite as much a desire to get out of the tranmels of "Pugninsm" no of the old "the orders" school "The state of the same school of the sc out of the tranmels of "Puginism" us of the old "five orders" school. They wish as the world pro-gresses that new forms of beauty should develope gresses that new forms of beauty should develope themselves, to meet the varied sentiments that every day arise, —not as the *Eelecticisti* of Italy attempted to make a hodge-polge of different heauties, and stick a peacock's tail to a leopard's head; nor to put a hit of Newgate below, and York Minster above; but to get more weapons to their armoury, more instruments to their observatory, more colours to their paletties; so that different and more varied sentiments might he better represented hy the increased means afforded to them.

In conclusion, I will now venture to relate to Mr. had left their homes and travelled so many long miles, and wherein they, the Moslems, had offended them, that they sought their blood in such a vengeful way? The Crusaders said,—It was because they, the Saracens, were unhelievers; they had put to death our Saracens, where idelaters, and in particular worshipped two great idels, called Mahound and Terma-gunt. The Saracens answered that they were most sadly mistaken; it was the Jews who had put to death Issa Ben Mariam (Jesus, son of Mary) 600 years hefore bet narran (denus, son of Mary) 600 years motor there were any Mahomedans; that as to images they abhorred them; so far from worshipping them, they never suffered the likeness of anything to he made, not even in a pieture; they worshipped Allah, and him only, while the Christians had images in all their churches, bowed down to them, burnt incense hefore them, lighted eandles in their honour, and worshipped them ; and they entreated the Christians to come nto their mosques and houses, and see for themselves whether there were any idols there or not. It was all of no use. The Christians were so blinded hy and of no like. The Caristans were so induced my prejudice they would not heliver the evidence of their own senses, and they went on deronuly cutting the Saracens' throats hecause they had killed the Lord of Life, and because they worsbipped two great idols,

Mahound and Termaguit. Are there not in the present day some people as much blinded by prejudice as those Crusaders were? Your readers will prohably think so. VERAX.

HAWARDEN CHURCH: MORE BURNING. - By a eurions fatality, the new pulpit, reading-desk, and other woodwork and patterns, at Mold, in Flintshire,

LECTURE ON THE MUSEUM OF ART. ON Monday, the 14th, Mr. J. C. Robinson, F.S.A. read an address in the Theatre of the Department at read an address in the Theatre of the Department at Brompton, on the Museum of Art, in which he traced the growth of the collection, and urged its value in popularizing knowledge. After answering some objections, and pleading for museums in general, he proceeded to describe the classes of objects con-tained in the collection. With reference to the increase in the value of fine specimens which has taken place, Mr. Robinson said,-

Blace, Mr. Robinson said,— "Specific instances, in any number, might he adduced in support of what has been now advanced; time, bowever, will only allow of the briefest possible allusion to one or two: the rise in value in one class, in which our collection fortunately possesses a most important series, has been so sudden and remarkable, as to be worth special notice. Fone of five years ago the most beautiful specimeos of Italian majolica ware might have been purchased at dealers' shops and London auctions at from afew sbillings to at most a few ponds, say 5*l*, or 10*l*, at the highest; whilst in Italy a few scalio rollars would purchase the finest piece. Now these same pieces will sell for 20*l*. 50*l*. 100*l*. 200*l*; nay, I dare scarcely place alimit to the value of the finest specimens. As an instance, the most scennigly extravagant price ever heard of ontil theo was given in Italy, not four years ago, for a fine scemingly extravagant price ever heard of until then was given in Italy, not four years ago, for a fine majolice plate. After being refused by dealers and amateurs without number, on account of its sup-pored exorbitant price, 12%. English, demanded by its owner, this long-coveted specimen was purchased by a Freuch dealer. This year this same piece was publicly sold by anetion in Paris for the sum of 450% and brought in triumph to this country by its pur-chaser, a celebrated English amateur; and this Museum bas, in times not long gone by, made an-merons acquisitions in the same direction, which, if now brought to the hammer, would yield a similarly fabilous incresse. The Bernal Collection, which two short years ago was offered latect to Government, and nautous increase. The Bernal Collection, which two short years ago was offered intact to Government, and declined, for 40,0002. and subsequently realised up-wards of 60,0000, by public auction, would now pro-bably be worth 100,0002,; and the pirchascs made for the Museum of Art on that occasion, as they were the choicest treasures of the collection, would, without doubt, yield a still higher rate of profit." The lecture is published by Chapman and Hall, at a nominal price.

PROVINCIAL NEWS.

Maidenhead.—The new county police-station here is nearly faished. It is built with red and white bricks, pointed black, and inclosed within a wall of open brickwork, with freestone coping, nearly 5 feet high. The court where the divisional petty sessions will be held is 28 feet long, 18 feet wide, and 18 feet will be need is 25 toet long, 15 teet wide, and 15 feet high. The cells for prisoners are 11 feet long, nearly 6 feet wide, and 10 feet bigb. Each is supplied with a water-closed, and is warmed and ventilated. The building was received by Mr. James Dormer, of Reading, from a design by Mr. J. B. Claey, the county surveyor.

county surveyor. Devizes .-- The new corn exchange has been opened. Decreas.—The new corn exchange has been opened. The building is 142 feet long by 42 feet wide, and will accommodate 3,000 persons standiog, or 1,000 scated. The cost will be about the original estimate, or 3,505%, towards which 2,500%, have been raised by voluntary contributions, the remainder by mortgage on the borough rates, to be repaid hy instalments of 100%. a-ycar. Cheltenham

-The new casualty wards of Chelten-Cheltenham.—The new essually wards of Chelten-ham General Hospital bave been comjulcted. The de-sign was furnished by Mr. D. J. Humphris, and the contract was taken by Mr. W. Saüsbury. The new wards, one for male and the other for female pstients, are beated by steam, and ventilated. There are a reception-room, bath-room, and other apartments. The new wards were set in progress by a subscription of 1 000/ of 1.0007.

The new wards were set in progress by a subscription of 1,000. Pontypridd.—The new bridge here was inaugurated on Friday in last week. It consists of three arches (40 feet span each), on the lower side of the original bridge, in the parishes of Llanwonno and Eglwysilan. The width of the roadway is 20 feet, length of bridge, 172 feet. The stone was from a quarry belonging to Mr. Morgan Edwards. The bridge cost altogether 1,5751. On the centre of the bridge is the following inscription:—"This hridge was creeted a.D. 1157, by public subscription.—Designed by Robert Higgles, district-surveyor; and built hy Thomas Jenkius." The work was paid for by instalments as the building pro-gressed, viz. the first instalment of 4500. when the ahatments and piers were ready for fixing the curves; 4500. when the last key stone was driven; and 3754. Unree months afterwards. Birmingham.—A new temperance-hall is being preceded at Birmingham capable of seating 500.

persons.

Newcastle.—The new corn-market was opened on Saturday week. It forms the centre portion of the corporation buildings in St. Nicholas-square. It is 164 feet long, 64 feet in breadth, and 22 feet higb; 10% refer fong, of refer in breadin, and 22 refer ingo; and is lighted on each side by deven windows, at an elevation of 20 feet from the ground; and by the same numher of entresol windows, placed directly over these side windows, at a 12-feet bigher level. Above the market is the music-hall, 170 feet in length Anove the market is the indust-rank, 1/O test in brackit by 6.5 feet in breadth, and 4.5 feet high, approached by 5 or separate entrances, having stone staircases, to the hall. It has been suggested that the best mode of lighting the hall by night will be by sonlights, the method adopted at the Free-trade Hall, Manehester. The new music-hall will accommodate ahout 3,500 persons

persons. *Clevedon.*—National schools are evecting at Cleve-don, a small and healthy watering-place, 12 miles from Bristol. They have been much wanted, and are being built hy private subscription; Sir Artbur Elton, bart. M.P. for Bath; the Rev. Mr. Braikenridge, Mr. Jerdone Braikenridge, and Mr. Conrad Tinzel, of Clevedon, each subscribing 1000.; and by a grant from the Committee of Council on Education. Each of the schools (which are for boys and grids), is 45 feet by 19 feet; with a residence for the master and mistress. The materials are the fine magnesian limestone of the vicinity, with ornamental tiles, in colours, for covervicinity, with ornamental tiles, in colours, for cover-ing. The style is Early Decorated Gothic. Messrs. Pope and Bindon, of Bristol, are the architects.

CHURCH-BUILDING NEWS.

CHURCH.BUILDING NEWS. Cheshunt.—The new Congregational Chapel in Crossbrock-street was opened on the 8th instaut. It is built in the Decorated Gothic style, with tower and spire 85 feet high. The interior of the chapel is about 60 feet by 40 feet, and will seat about 400 persons; and there is a gallery under the large win-dow which will bold about 100 more. The roof is open, the rafters coloured and varnished; bays in the length of the huilding, each bay having a pointed stone window in the centre. The organ is placed in an arebed recess on the south side of the chapel. The publit is of stained deal on a stone base, and stands on an arebed recess on the south side of the chapel. The pulpit is of stained deal on a stone base, and stands on a pillar, surmonned by an ornamental communioa railing. Bebind the pulpit is an arch, forming a re-cess, across which is a carved sereen, and above the screen a small trefoil window in stained glass, repre-senting the Rese of Sharon and the Lily of the Valley, the floral emblems of our Saviour. Above the arch is a wheel window with stained glass of deep blue, relieved by orange and ruby. The architects are Messres. Landor and Bedlt; and the builders, Messres. Dove (Brothers). The total cost of the new building is about 2,000/. 1,000/. of which has been paid. paid.

building is about 2,000% 1,000% of which has been paid. *Tanstall.*—The new chapel of the Mcthodist New Connection body at Tunstall has been opened. The front of the structure is of stone. There is a receased colonnale, with a main and side entrances; and two pillars, 2§ feet in diameter, of the honic order, sup-port a pediment, enriched with frieze work and cor-nice. In the interior there is a gallery at the end opposite the pulpit; and at the back of the pulpit a window, filled with strined glass. The chapel, which will seet hetween 500 and 600 persons, is heated with hot water, and lighted principally by two sun-lights in the ceiling. The designs for the building were prepared by Mr. J. T. Fairbank, of Bradford, and the work has been executed by Mr. F. Batty. *Linthewy Yach* (Monmouthshire).—The parisb church of Llandhaff. The charce had failen into a state of decay, and has been restored in accordance with the original style, which is Gothie of the perpen-dicular period. Such of the old work as would allow of it has yourn replaced, and the additions made to of it has yourn replaced, and the additions made to

dieular period. Such of the old work as would allow of it has been replaced, and the additions made to correspond therewith. The church consists of a nave correspond to control. Locate and such porch and chan-ecl, with open timber roofs covered with stone tiles. The external and internal dressings are of free-stone, and the galdes are coped and surmounded by crosses. The east window is of three lights, with stone, and the galoes are coped and surmounted by crosses. The east window is of three lights, with arched traceried bcal, and the rest of the local square-headed character. The nave is fitted with loose benches, polpit, and font, and the chancel with stalls for the edergy, lectern and altar table. The cost of the whole of the works has been about 4007. The restoration has been effected from the designs of Messrs. Pricebard and Seddon, the diocesan architects, by Mr. Thomas Williams, builder, of Croesycellige. Sheffield.—St. John's Church, the foundation stone of which was laid on the 20th November, 1856, is approaching completioe. The building is creeted, the contract, and all that remains to he done will be the plastering and fitting up of the interior. A stone-

of which was faid on the 20th November, 1856, is Mr. Bodkin, in support of the summons, stated approaching completion. The building is erected, that the building was commenced in Seytember, 1856, the contractors for the masor's work bave completed hut the notices required from the builder were not their contract, and all that remains to be done will be supplied until some time after, and, upon the district the plastering and fitting up of the interior. A stone-surveyor viewing the premises, he observed iodications gabled bell turret has been creeted over the chancel in the party-wall running from the basement to the arch. The building, it is estimated, will cost about ground-floor, which induced him to suppose the wall

2,000/. of which about 1,800/. have heen collected. The site was presented by Mr. Edw. Newman. The style of architecture is the Geometric Middle-Pointed,

The site was presented by M. Law, Newman. The siyle of architecture is the Geometric Wilddle-Pointed, and the total internal width of the edifice is 45 feet, while the length is 106 feet; the height of the nave, to the apex of the roof, being 56 feet. Accommoda-tion will be afforded to 600 persons. Barnsley. — The successful competitors for the several branches of work in the crection of a new church, in Worsbor' Dale, near Barnsley, are Mr. Taylor, stonemason, Mr. Hunt, joicer and carpenter ; Mr. Wm. Brown, plumbing, glazing, and slating : Messrs. Jenkinson and Hall, plastering; and Mr. Charles Rogers, painting and slaning. Ediolargh. — The foundation stone of Dr. Alexan-der's new church, in Merebant-street, has been laid. The building is designed by Messrs. Hay, of laver-pool. According to the Caledonian Mercury, it will have a tower and steepie of an altitude of 120 feet, and the main building will be of Byzantine character. The cost of erection will be about 10,0004.

THE JOINERS OF MANCHESTER AND LONDON.

HONDURED SIR,—Having seen in your impres-sion of last week a letter from a Manchester Joiner, complianing of what be calls the injustice of the builders of Manchester, I have been so forcibly struck with the wide difference between their case and ours, I could not withhold making a few observations rela-tions to the source of their struct.

with the wide difference between their case and ours, 1 could not withhold making a few observations rela-tive to the eause of their strike. I am a London joicer, and twenty years a journey-man : I might, therefore, he supposed to know some-thing of the state of trade, and also the mind of Lon-don joiners respecting the Manchester strike. I do hope that you will, through your valuable and widely-circulated journal, tell them that we think it per-fectly ridiculous to dispute with masters about one, two, or three bours' work in a week, but in the name of (to use the works of the Manchester joiner) com-mon sense, let them accept of any reasonable offer, and go to work. In the name of bumanity, I would say, do not bring your labour to London. To give our Manebester fellow-workmen some idea of the present site of the building trade in London, I will mention a case in point where lam now employed. I bring work is a t prices so low, that we are obliged to work from six in the moring till eight at tight, not earning more than one yourd to under a foreman in the usual way, and the property is first-class. The work is let a t prices so low, that we are obliged to work from six in the moring till eight at uight, not carning more than one pound four shiftings per week. What will our Manchester Joiner think, when I tell him we have to make a 2-incb double-moulded door, 7 feet by 3 feet, for five shiftings; also, 2-incb circular sashes and frames, of large dimensions, at eight shiftings per opening; boxing shutters, &c. equally low. 1 will not further infringe upon your valuable sbulters, &c. equally low. 1 will not further infringe apon your valuable

space, but subscribe myself your humble servant, THOMAS PREEDY.

THE STRIKE OF JOINERS AND BRICKLAYERS AT MANCHESTER.-We are glal to learn, that shortly after the insertion of the communication in our columns from one of the workmen on strike, to which columns from one of the workmes on strike, to which we appended a ucte on the subject, the joiners agreed to submit the matter in dispute to arbitration, and named Mr. Alderman Heywood as their arbitrator. The masters named Mr. Alderman Baueroft on their part; and the arbitrators sbortly thereafter decided that the men should accept the offer of the masters, namely, the resomption of work on the understanding that fity-ciplt hours in summer and fity-five hours in winter be the weekly time given to work. This unfortunate strike, it is to be hoped, is therefore at an end, as the men are said to have resumed work on the above nuderstanding. the above understanding.

PROCEEDINGS UNDER THE METROPOLITAN BUILDING ACT. BUILDING ACT. DIVISION OF WAREHOUSES CONTAINING MORE

THAN 216,000 CUBIC FEET.

THAN 216,000 CUBIC FEET. Art Guildhall, a few days ago, Mr. Jobn Jay, the coultractor, was summond to answer the complaint of Mr. George Smith, the district surveyor for the southern division of the City of London, for omitting to comply with the Metropolitan Building Act of 1855, in the erection of premises belonging to Messra. H. E. and M. Mosse, uncreabati, situated in Cannon-styeet West, after due notice bad been served upon him, requiring bim to do certain things in compliance with the above Act. Mr. Bodkin, in support of the summons, stated that the building was commanced in September, 1856.

was intended to be carried up to the top of the buildwas intended to be carried up to the top of the top of ing, and if that had been done there would have been no complicit, as the builder would then have com-plied with the Act of Parlianent, which requires that no huilding used na a warehouse for the purposes of trade should be allowed, where the number of cubic feet exceeded 216,000, without a party-wall. But, by the omission complaided of, there was an undivided space amounting to about 350,000 cubic fect, which was clearly an infraction of the Act in question.

Evidence was then given of the service of a notice by the district surveyor upon Mr. Jay, the huilder, requiring him to build up the party-wall, the date of that notice heing the 12th of June last, and of his non-compliance with the Act of Parliament np to the present time.

present time. Mr. Hawkins, in reply, contended that, as the huilding was completed, Mr. Jay's coutract was at an end, and consequently be was no longer "the build,r engaged in creating" the premises, within the mean-ing of the Act. The premises were completed in May last, and the notice from the district surveyor was not strided until lung end the surveyor was not served until June, and the summons was not taken out until nearly six months after that notice. It was Taches on the part of the surveyor, and it would be a hardship if Mr. Jay was to be liable at any time to the peudlies of this act for any irregularity in any huilding he might have erected, when it was the duty of the surveyor to point out such irregolarity at the time, and before the completion of the building. If time, and before the completion of the building. If the magistrate made an order upon him, it would be requiring him to do an act which the law forbids; requiring him to do an act when the law iornis; for, it called upon to make the necessary alterations, Messrs. Moses would not permit it, and Mr. Jay woold commit a trespass, for which he would he liable to an action, if he obeyed the order. Alderman Challis said he had read the Act carc-

fally, and after giving bis most considerate attention to the evidence and the arguments advanced, he felt it bis daty to dismiss the summous, and he did so on the ground that proper notice had not been given while the building was in programs. He could not help remarking, also, npou the time allowed to elapse hefore the summons was taken out. An application for the expenses of the defence was refused.

District surveyors are in this unfortunate position, Distinct surveyors are in this unfortunate position, that if they act rigorously in accordance with the words of the Act, they are termed tyrannical, and abused by those who are not acquainted with the law y while if they seek by repeated requests and long wait-ing to avoid harsh measures, they are upbraided for writed of data. negleet of duty.

OUTBUILDINGS.

At Lamheth, some time ago, John Wood, a jobbing carpenter, was summoned by Mr. Stow, the district surveyor of Camherwell district, to show cause why an order should uot he made on him hy the magis-trate, compelling him to take down a certain huilding which he, as a "huilder," had ereated, the same not heing in conformity with the provisious of the Build-ine. Act

The building in question (alleged to be a pigstye), The building in question (alleged to be a pigstye), measures on plan 14 feet 8 inches by 8 feet 6 inches, and in height to the naderside of ridge (of span roof), 7 feet, to caves, 5 feet 9 inches. The huilder, it was stated, availing himself of the boarded fences, melaning the end and sides of carden at the rear of enclosing the end and sides of garden at the rear of honse, raised two gables, constructed the roof, covered noise; raised two gaues, constructed the root, covered it with shtes, and enclosed the front or side, next the dwelling-house and offices, with quartering and board-ing, in which were left a doorway and opening for small sub-frame. For default of notice, district sur-veyor had summoned Wood, and he was fined by ma-cristrate 20s, and 2s, costs gistrate 20s. nnd 2s. costs.

On appearing to answer summons for irregularity, ood professed willingness to amend, and stated that Wood on applying for leave to enter the premises, the huilding owner objected, and threateoed that legal huilding owner objected, and threatened une to so proceedings would be taken, in the event of his so doing, for trespass. Thereupon the magistrate expressed doing for trespass. unwillingness to make an order on defendaot, and sug-gested that the building owner should he proceeded against (no powers arc given by Metropolitan Building Act), or that the district surveyor should proceed to

ause compliance in person, and recover from owner. At this stage of the proceedings, the magistrate gave the district surveyor to understand that in cases where due notice of hnilding had not been given to the district surveyor, he entertain a doubt as to power of the district surveyor to presed where the tick the case of the district surveyor to proceed, under the 45th section of the Metropolitan Building Act, against defendant, giving it to be his opinion that such notice should be given to the huilder, "whilst engaged in erecting," &c. &c. and that notice of irregularity served on builder, after completion of works, would not hold good. It estated his opinion that the whole Act was a "liandaring piceo flegislation," and event-ually the case was postponed for a fortnight to give his worship time to consider the matter. Ultimately the magistrate determined that the structure should

THE BUILDER. be pulled down ; and the building owner, still objecting

to allow Wood to come on the premises, undertook to remedy the irregularity himself. We have received some somewhat barsh comments on the proceedings of the district surveyor in this case. A little further consideration would probably case. A little further consideration would probably show our correspondent that the district surveyor would have neglected his dury if he had acted other-wise. If buildings of wood, 14 feet by S feet, or 4 feet by S feet, were permitted, it would not merely be in contraveniion of the law (notwithstanding the absence of any definition in the Act of what is a "building "), but would lead to a very dangerous con-dition of things, and render the provisions of the Act. "building "), but would lead to a very dangerous con-dition of things, and render the provisious of the Act

COMMUNICATION ON RAILWAYS.

to a great extent nugatory.

In a recent number, we noticed a means of communieation between the guard and driver of a railway-train proposed hy Mr. Symons, consisting of a sliding foot-rail, to be worked along the side of the earriages whilst in motion, and a string signal. Wishing much to see railway officials brought to a sense of duty due to the public and the millions of human beings that annually hurled along these mighty causeways and the millions of human beings that are intercourse, in adopting a proper means of securing safety transit, we now call attention to a mode of ommunication afforded hy Messrs, Myers and Askew's Railway Signal Brake." The invention consists of a self-connecting oral communicator or phonie rotary tube, which is fitted under the carriages, with spring connecting spring mouth-pieces, together with a whistle and alarnms at each end. The spring mouthpieces placed in the intermediate carriages enable the passengers to converse with the guard, and the guard to answer. When the tube is rotated by the guard. it strikes the alarums, and raises before the driver it strikes the alarums, and raises before the driver a sigoal or semaphore, directing him to stand by his engine, or the driver can do a similar act to the guard. Should the guard be asleep, and not hear the alarums, hy an attachment from the signal it will pull bim to-wards the hrake-wheel. The rotating is then a topped, the whistle sounded, and the conversation between the one and the other takes place. The whole of the apparatus is worked off the brake screw, which is like the ordinary screw now in use, only working horizon-tally, and putting on a very rigid hrake, which acts on three-fourths of each wheel, and its retarding power can extend throughout the train, if required. Surely, from the numerous inventions relating to this matter, railway managers would have no difficulty in niatter, railway managers would have no difficulty in selecting one to meet the existing exigencies.

WANT OF SANITARY KNOWLEDGE ASHORE AND AFLOAT.

THE public are greatly indebted to you for keeping The public are greatly indexed of you for keeping the saultary question constantly before them, for by that means you will indoctricate the rising generation with sanitary knowledge, so necessary for their health, the want of which is greater than many persons have any idea of; for whou one sees servants taking the hells off the traps in sinks and areas to let the water news on the traps in sinks and areas to let the water run off faster, and hy that means allow the stench from the drains to penetrate into the honse, I think the public will agree with me that they are indebted to you for keeping the samitary question constantly before them.

In reference to sanitary knowledge on board ship, I can speak from personal experience of the want of even the slightest attempt at ventilation; and when 1 even the slightest attempt at ventilation; and whea 1 recollect the dread'ul stench there was hetween decks with 500 emigrants on board, it almost makes me sick. And what is the condition of ships' crews in the merchant service, with the ship laden to the beams, and the forecastle half filled with eargo, in which filted or twenty men have to cat and stye, without any ventilation hut that which they get from the south-hatch, which is almost lawy see closel? If the scuttle-hatch, which is almost always closed? It is, therefore, not surprising that fevers are on board ship, when there is uo ventilation. And what would the consequence be of a number of men sleeping in such an atmosphere, if it was not for the bountiful such an anosphere, in *w* so hot for he bound in supply of fresh air they in bale when on deck? And although the strong and hardy sailor may not feel it at first, yet I think it must in time undermine his constitution. But what must be the effect on a poor fellow stricken with fever, and who is confined to his hences will make him here at the fresh air every four hours that his more hardy shipmate can? And when he wants to moiston his levered lips, the water in the hecket will make him heave at it, through heing slung to a beam, and having absorbed the effluria which is generated in such a confined atmosphere ; if a bucket of water placed in a fresh-painted house will absorb the effluvia arising from fresh paint, I think water placed in a ship's forecastle as I have described, will become saturated with the effluvia, and not he fit to drink.

of ventilation and pure water--arc very easily remedied. Those gentlemen who so kindly provide sailors' homes ou shore should tura their attention to sailors' homes affort, where the greater part of Jack's life is spent, and insist upon ships being provided with ventilators, which might he easily done if they were compelled to have them. Soppose it was a perforated iron pipe running from the ship's quarter the whole length of the ship round the forecastle, that would admit the freesh air without any draught; and an np-shaft over the lamp, so constructed as to prevent a such over the hamp, so constructed as to prevent a down-draught, to earry of the smoke and any smell. Aud for the price of a few shillings a ship could he provided with a filterer, with an air-tight cover, made to dip into a flange filled with water, which would trap the cover, and might be slung in the place of the backet, now in use; and then the errow would drap thure and tachese water A WORKMAN pure and tasteless water.

THE COMPETITION DESIGNS FOR GOVERNMENT OFFICES.

ARCHITECTURAL INSTITUTE OF SCOTLAND. THE rewarded designs for proposed Government offices are now being exhibited in George-street Hall, Edinburgh. At the annual meeting of the Architec-tural Institute of Scotland, held a few evenings ago, Mr. Matheson, of her Majesty's Board of Works, read a paper with reference to them. In the course of it he read a letter from Mr. Burn, one of the judges, which gave some little information as to the proceedings of the jndges. Mr. Burn said, "Out of the 218 designs, the jndges

selected sixty-seven for further consideration and for a report upon them by the assessors, Mossrs. Angell and Pownall, to whom they were remitted to ascertain how far they had complied with the instructions issued how far they had complied with the instructions issued by Government : and during the period of this remit, nine other designs were added to the sixty-screen, making in all seventy-six designs in the selected list, which, thereafter, the jndges examined in detail, accompanied by the assessors, and ficially out of that number made choice of the designs which appeared to them entitled to the premiums offered. I have no means of ascertaining whether any designs were re-jected as being too late of arrival. The designs were all bung and exhibited to the multiperiod hadron the indexes jected as being too late of arrival. The designs were all hung and exhibited to the public before the judges were appointed, who had nothing to do with the arrangements of the Board of Works; and as no estimates were required from competitors, and none accordingly were given, it was no part of the duty of the judges either to consider the cost of the buildor use parges enner to consuder the cost of the build-ings, or offer an opinion as to their probable expense. In fact, neither competitors nor judges were in any shape required to make the probable cost a matter of consideration."

Mr. Matheson said at the conclosion of his paper, "These designs have now become the property of the country. Whether they he carried into execution or country. Whether they he carried into execution or not, we bighly appreciate their merits, which do in-finite credit to their authors. They will be preserved to the preserved Inite creat to their authors. They will be preserved as valuable memorials, testifying to the present ad-vanced state in this country of the true principles of architecture in its most admired styles and orders, and which it is our privilege, our duty, and interest diligently to study."

It has been suggested, that during the exhibition of the drawings, separate papers on the style of archi-tceture of each design should he read hy various members of the council.

INSTITUTION OF CIVIL ENGINEERS.

Ar the meeting on the 5th instant (Mr. Robert Stephenson, M.P. in the chair), the paper read was "An Account of the Steam Ferry over the River Nile, at Kaffre Azzayat, Egypt," by Mr. T. Soywith, This ferry was situated on the line of railway ex-taine from Alexandria to Cairo and mae short

This ferry was situated on the line of railway ex-tending from Alexandria to Cairo, and was about midway hetween those places. It was intended to convey, temporarily, until a more permanent and fixed structure, now in course of erection, could be completed, the railway trains and engines between Kuffre Lais and Kuffre Azzayat, towns situated on opposite banks of the river Nile. In the discussion, the cost was stated to have been 8.0001 including the initia at hoth ends corried on

18,000% including the jettics at hoth ends, carried on Mitchell's serew piles, with protecting cylinders at the extremities. The method of sinking the cylinders was by Hughes's pneumatic plan of using a "plennm" iustead of a vacuum. The mode of attaching the chains on the two shores was hy having weights rising

chains on the two shores was hy having weights rising and falling within a cylinder, at each extremity, to compensate for the drag upon the chains. As an illustration of the mode of menagement of the line, it was stated that at one period there was only one train each way every other day, although the natives had evinced a great desire to travel, and the line convecting towns containing large populations. A hope was expressed that contact with the energetic envinces: the service of the Pache would in due Now, sir, I think these two great evils,-the want engineers, in the service of the Pacha, would in due

time break down such dilatory habits and perverse adherence to antiquated customs, and that the hencfits anticipated from the establishment of the railway would be realised.

In the construction of the machinery of the ferry, great credit was awarded to the late Mr. C. H. Wild and Mr. Dempsey for the details of the machinery; to Mr. George Robert Stephenson for the method of lifting the platforms; and to Mr. Rouse and Mr. McLaren for putting together and erecting the whole, and making it work thoroughly well.

GLASGOW ARCH. ZOLOGICAL SOCIETY THE CATHEDRAL.

<text><text><text><text>

In these views. In the choir the chairman gave a brief historical sketch of that part of the building, and commented on its more prominent architectural beauties. He also adverted in culogistic terms to the alterations recently completed ander the direction of Mr. Matheson, archi-tect to her Majesty's Board of Works for Scotland. Mr. Baird delivered an interesting address in the nave, in which, *inter al'a*, he called attention to the gradnal change which took place in the style of Gothie architecture towards the close of the chitechard, and the gradnal development of tracery as exhibited in the windows. The meeting then made a survey of the crit

ndows. The meeting then made a survey of the exterior and its of the ancient archieviscousl palace, which the site of the ancient archiepiscopal palace, whic seems to have been a place of considerable strength.

DRAWING-ROOM ORNAMENTS.

As the chief object of your journal is to improve the public taste in everything connected with dwell-ings-from digging the foundations to foisibing the apartments,—I forward you a few bints on drawing-

sitting-room, often serves as an index to the mind and character of the individual to whom they belong. mind Our appreciation of heanty entirely depending upon our education, the amount and general tendency of that education may be as unmistakably traced in our that education may be as unmistakuhly traced in our homes as in our conversation. One individual will think it necessary to have ornaments either costly in material or elaborate in workmanship, while the eyes of another will as satisfactorily rest upon the simplest of Nature's works. If the amount of pleasure afforded by these two extremes could be necurately preponderate over the former. Why ? Because the resources for contemplation are more extensive, and of a higher character. The mind that would dwell with delight upon a fresh-cut cabbage-leaf with a dev drom elistening on its way bloom, would indeed he with delight upon a fresh-feit caloage-ten with a dew-fore glistening on its wary bloom, would indeed he envied hy that which sought to display the best selection from Soho Bazaar, could it for a short time investigate all the phenomena which combine to form that commonest produce of the kitchen-garden.

THE BUILDER.

Money will not purchase the power of doing this; but it is the rich reward of the labourer in the field of science. Let me, therefore, recommend those who are entering life, and expecting some day to want "drawing-room ornaments," to choose the cheepest and most delightfal mode of proenting them; and, although they may not exactly select the cablege-leaf, the same course of study which teaches them to appre-ciate that, will secure to them an endless variety of beautiful things to eharm the eye and delight the understanding. MATER. understanding. MATER.

DECIMAL STANDARD FOR ADMEASURE-MENT.

HAVING noticed in a life number of your paper some remarks on decimal calculations, it brings to mind some ideas that I have entertained for several years of the great desirability of adopting a decimal standard of admeasurement. It would save much trouble to suracutesaterement. It would save much trouble to sur-veyors, engineers, and other scientific men. The fol-lowing plan seems calculated to meet the purpose: if not, some member of the profession may probably suggest an improvement. To interfere as little as possible with the present scale, 1 take the inch for a standard.

1.000 rods, 1.00 feet.

1.0 inches, or, 10 inches, 1 foot; 10 feet, 1 rod;

and, to assimilate this with the present measures, one foot, or one yard lineal, would he 1.2 of decimal wessure; or a running measure of any number of feet, say 30, could be reduced to old measure by adding a cypher and dividing by twelve, thus:--300 in. ÷ 12 in. = 25 ft. duodecimal measure.--S. J. BARNEN

THE SUFFOLK-STREET GALLERY

THE SUFFOLK-STREET GALLERY. THE advertisement of the Architectural Society in the Builder of the last and preceding weeks contains an error, which I trust you will do me the favour to correct. It states that "the *repairs* of the large room (the Gallery of the Society of British Artists) seem likely to he incomplete by the lst of December." This is searcely just towards the architect and the society. There have heen no repairs of the gallery. The roof bas been entirely rebuilt (a portion of the walls also), and upon a principle, both as to its con-struction and mode of lighting, totally different from Mr. Nash's work (the former roof), which, although raised with a cost nollmited, both as to lahour and material, was as essentially defective in the first prin-

Mr. Nasb's work (the former rol), which, although raised with a cost nollimited, both as to lahour and material, was so essentially defective in the first prin-ciples of construction, that it was found unadvisable to attempt to repair it. The subject of construction, in respect to the light-iog of galleries for pictures and sculpture, has of late acquired an interest and attracted public attention, from the general defectiveness of our public galleries in this respect, and their inferiority to most of those of the continent, as well as from the papers upon the subject, published of late years by Sir Charles East-lake, the more clahorate ones by Mr. Pyne, and the recent lecture delivered at the South Konsington Museum by Mr. Redgrave. In exciting attempted to be carried out. The Government building at South Kensington exhibits an advance in the right direction as to the mode of lighting, although, in respect to architectural symmetry or heauty, it is not apperior to ordinary railway stations. F. Y. HURLSTONE.

F. Y. HURLSTONE.

DAMP HOUSES.

In looking the other day at some dwellings which had not been long erected, in a comparatively day and lofty portion of the metropolis, the ravages of damp were seen to reach even to the first hoor, and after hearing the complaints in consequence, we ware told how papers and books became mildewed, that the paint and other covering of the walls peeled off, how the inite and other terroring of an instruction of the aged, and indeed those not so of all shifts smells, the aged, inits of rbeumatism, children constantly catching colds, and other troubles.

colds, and other troubles. There are not many worse things than a damp and mouldy honse. It is an ancient evil, and although damp is one of the chief destroyers of house pro-perty, it has not yet, in many cases, found a remedy. When thinking of these matters, we remembered the particular signs of leprosy in a house, and the means of ener mentioned in the 14th chapter of Levilieus, begioning at the 34th verse, part of which we conter---

I give yon for a possession, and I put the plague of leprosy in a honse of the land of your possession,"-

The owner of the house is ordered to tell the priest, ying, —"It seemeth to me there is, as it were, a saying,-

Plague in the house." The priest issues a command that they empty the house briore he goes in to see the plague, "that all that is within the house shall not be made unclean." If when the priest looks upon the walls he finds "hollow strakes, greenish or red-dish, which are lower than the wall," he then shut up the house for seven days; and if, on his return, he finds the "plague he spread on the walls of the house," be commands ibst all the stores in which the plague is shall be taken away to an unclean place beyond the city. " and he shall cause the house to be scraped within round about, and they shall poor out the dust that they scrape off without the eity, into an unclean place, and they shall take other stores and put them in the place of those stores, and he shall take other mortar, and shall plaster the house." After this precaution, if it is found that the plague emess again, the priest shall again cramine it, and if it is found that the plague has continued to spread, then "it is a fretting leprosy in the house—it is un-clean, and he shall break down the house and the stones of it, and the timber thereof, and all the the house shall wash his clothes, and he that lieth in the house shall wash his clothes." We have net with instances at home in the present thyrof direaed dwellings of various sizes and conditions, which very nearly approach the accounts of the house from which it was ordered according to the Sacred Writings that all the inheriat should depart. We have notice the effect of the one the "dyrot," it is sollar in age structures, the removal of the it is one the effect of the one of the removal of the vert of the due the one of the accounts of the house show which the solered accounts of the house remove high it was ordered accounts of the house remove high it was ordered accounts of the house remove high it was ordered accounts of the house remove high it was ordered accounts of the house remove high it was ordered accounts of the house.

from which it was ordered according to the Sacred Writings that all the inhabitants should depart. We have noticed the efforts made to cure the "dy rel," as it is called in large structures, the removal of the diseased and introduction of fresh materials,—all this, however, without certain effect, until the house and neighbouring ground bave been deeply and thoroughly drained. A few years since, as was reported at the time, although the old Church of St. Paneras had not long hefore heen restored, the place was attacked by a rot, which rapidly destroyed the wood-work and dis-figured the wall: the flooring and wood cesings were covered with long mould and fungi; and the whole interior was pervaled by a deadly and offensive smell. It was in time found that the church was not fit for occupation, and on search being made for the cause, it was discovered that the surrounding ground was damp; the ground had been raised, by the inter-ments of the deadl, to a considerable height above the floor of the edifice. The drip from the roof had not heen thoroughly carried away; and on opening up various parts, the vaults were found filled with water, which had drained from other graves. It is evident that, onder such conditions, it was as an eces sary to close Old St. Paneras as it was the deellings in the East. Effective drainage, however, did its useful and certain work; and but for that, this church in the East. Effective drainage, however, did its whether the set useful and certain work; and but for that, this church must soon have become a ruin, unfit for nse.

TRIFORIUM.

On the meaning of the term Triforium, Mr. James Parker writes as follows in the November number of Notes and Queries :-

Notes and Queries: — Seeing in a late number a communication on the origin of this word, reminded me that in the year 1852 I had occasion to collect notes upon the subject for a paper which I read before the Oxford Archi-tectural Society. The derivation was evidently a nystery. One author only had used the word, namely, Gervase. He either invented it, or, as is more probable, received it from the workmen engaged on the cathedral. Ducange I found held to the theory of *tresfores*; hat infortunately the *triforia* Gervase was describing had two or four openings. In taking a survey of all our cathedrals, three openings are the exception arther than the rule. Ducange also, are the exception rather than the rule. Ducange also, are no exception rather than the rule. Decaye also, as I conceive without atthority, gives as the Greek equivalent $\tau_{P0}\theta_{P0}\omega_{P}$, a word used by Macarios, but with a very different menning. It was the antiquary Summer who suggested the notion of the Latinization of 6t thermorphing." thoroughfare.

First, I attempted to determine to what Gervase First, I attempted to determine to what Gervase applied the name. In a careful exomination of his account of Canterhury Cathedral, he evidently alludes, in the description of the fahrie as it stood be-fore the fire, to what we now call the "clerestory galtery." He speaks of "obscurae fenestre" above the arches, but again, above these, the "Via que Triforium appellata est, te fenestre superiors." In other words, he describes a "blind story," and above is the "clerestory." In the description of the esthedral, as rehuilt after

In the description of the eathedral, as rehuilt after the great fire, he says, "the architect intermingled the lower triforium from the great tower to the aforethe lower triforum from the great tower to the horse said pillar with many marble columns, over which he adjusted another triforium of other materials, and also the upper windows." In other words we have two trifora. What was the difference in construc-tion between the two fahries ? I presume, judging from other early Norman examples, that the "obscure fenestra" afforded no "via," but that in the new building (the same as now standing), there was a perfect passage in the *lower* as well as the upper *triforium*. So far as to the application of the word : beyond the is earlier to be application of the word :

perfect passage in the lower as well as the upper triforium. So far as to the application of the word : beyond this is conjecture. The suggestion which I then threw out (the five years which have elapsed, I admit, have somewhat diminished my affection for it) was that the tri was but the scribe's contraction for turri, and that forium, as has been shown by Mr. Phillott, might will mean a passage: moreover, that Gervase particularly mea-tions that it was a passage, and that where there was to passare. I himdle tous and it was a passage, nut tout where there was a passage. In Jaid a passage, he implies there was no *triforium*. I laid stress upon his speaking of "the triforium *from the great tower* as far as a certain pillar,"—that, in coa-clusion, all *triforia* lead from the different staircases cusion, an *ergoria* real model in a university satisfies to the tower, and nowhere else (or certainly all elere-story passages do, which I consider, according to Gervase, to he the triforia par *excellence*); and that in the case of central towers, with aisles and transepts, as in nearly all our cathedrals, there is no other way to the tower but along the tower-passage, or triforiu

I will not trouble you with the uses to which hoth upper and lower *triforia* have been at different times applied, as 1 am afraid they throw no light upon the origin of the word. At the same time I think it a subject well worthy of investigation; and perhaps, if you insert this, some of your numerous correspondents may be able to afford information as to their cuploy-ment, and if any are used for practical purposes at the present day.

ST. JAMES'S-PARK: THE ORNAMENTAL WATER AND THE STEAM-ENGINE FOR PUMPING WATER.

THE metropolitan public and the general public Great Britain must he greatly obliged to Sir B. Hall for the excellent improvements made in St. James'spark, and the metropolitan parks generally. But what can have induced Sir Benjamin to place au ahominable para, and the incomposition processing generally between can have induced Sir Benjamin to place au abominable puffing, substitution, smoking, high-pressure stem-engine, on the ornamental island, at the east-end of the ornamental water? "To pump water from the new well for use in the lake," may be the reply. That fresh water is necessary all must allow, and lew will find fault with any saving of money hetween the present cost of pumping and the former cost of pur-chasing water from one of the water companies, if the pumping can be carried on without noise and without smoke: the present turmoil and filth never can be sanctioned for a continuance. Fortunately, neither the noise nor the smoke are necessary. A compound engine (high-pressure and condensing) will double the power of the steam, work without noise, and save half the fuel; and coke should be used, not cost. If Government will not attend to cleanliness and com-fort in such a place as St. Jame's-park, how can the fort in such a place as St. James's-park, how can the public be asked to ahate the unisances of noise and smoke in manufacturing little in formation of the state noke in manufacturing districts ?

CIVIL ENGINEER.

WELLS CATHEDRAL.

SIR,-Seeing a letter in the Builder, of Novem-SIR,—Seeing a letter in the Dataset, or rather what is ber 27, respecting the alterations, or rather what is almost facetiously called "the restoration " of portions of England's proudest price of symbolism, and most exquisite work of art.—Wells cathedral; and having re-sults of the symbolism of the symbolism of the symbolism. explisite work of art—wells cathedral; and laving re-cently spent a few weeks in this quice city, "The drip and tickle of whose fountain may be heard on the Mendigs," I am in a position to know something of the state of the parties referred to in the said letter, and I very much fear that the protest therein is not strong enough, and will require to be repeated before it is taken notice of.

Will it be believed that the surveyor employed hy the Dean and Chapter, is no architect at all? Ye shades of Britton and Pugin, arise! Ina and Giso, shades of Britton and Fugin, arise! Ina and Giso, come forth! and once more enlighten thy supine descendants. Give ear, ye Society of Antiquaries, and hear the wai! of art mal-treated by barbarous hands! Will ye stand supinely by, and see that glorious work of Joceline de Welles—the world-removened west from, tortured by a tailor? Incredible vevor, to which was also added auctioneer. Yea this this must appear to your readers, such is the artist as this must appear to your readers, such is the aristy to whom the very delicate work of restoration is com-mitted by the Dean and Chapter, to whom he is a salaried surveyor. I have myself examined the work of restoration when in progress under bis supervision, and was, indeed, much grieved by the despolation going on, arising of course from the ignorance of the architect on such matters. The masons were doing their work the contract and were cidently mobiling their work hy contract, and were evidently making the best of their bargain. The Dean and Chupter seem to be following the very questionable wisdom of the next the poet,-

"Nor proudly untaught sentiments reject."

I do sincerely hope, that though Beauty sleeps in easy repose on this relie of the past,--

" In which the architect built his life, And with him toiled his children, and their lives Were builded with his own into the walls,"-

she must be roused hy one in whom lives the awakening breath of thought and knowledge; and I also hope that the Dean and Chapter will not, in their retrenching mania, cause any more Portland cement monstrosities to take the place of stone, in the exquimonstroatties to take the place of score, in the exper-site west fagade, much of the restoration heing done with that material. I beg, therefore, to suggest (through your columns), that the Society of Antiquaries (of which I am a member), bestir themselves, and address a memorial to the Dean and Chapter on this very the solution of the Dean and Chapter on the serve important subject. F. S. A. Knowsley-park.

BRICKS, ANCIENT AND MODERN.

The art and practice of brick-making arc, no douht, as old as civilization. A full history, with diagrams of the several forms and dimensions, would have special interest,—will no one take up the subject? Egypt, Assyria, Judia, Persia, China, and Europe will farnish splendid examples of bricks and brickwork. There may also be something gleaned from Mexico and from Peru. There have heen solid bricks, and even hollow bricks, from a remote period. The Romans carried brickmaking to great perfection, and probably first introduced the art into Great Britain, as also on the Continent generally. They made hollow bricks on block moulds, and used them for hot air for rooms and haths. There are samples in the Museum at Rouen, and at Newcastle-upon-Tyne. There are also radiated (that is arch) bricks, of the Roman period, at Newcastle.

Roman Bricks at Newcastle. $6\frac{1}{4}$ in. $\times 3\frac{1}{4}$ in. $\times 1\frac{3}{5}$ in. $\}$ Red brick clay, very rough, 8 in. $\times 4$ in. $\times 1\frac{1}{4}$ in. $\}$ and bent in digging.

TRADE PRICE-LISTS.

THE current number of the Builder is not the first which it has been suggested that trade price-lists, In which it has need suggested that trade processes, and circulars relating to building matters, should he issued of a uniform size. Might not the idea assume a more practical shape if the Architectural Exhibition committee required exhibitors in the "Materials Department," in the forthcoming exhibition, to comply usity a suff formed for the numbers?

Department, in the fortheomorphism of comparison of comparison of the purpose? Small quarto, say 10 inches by 8 inches, leaving a margin of 14 inch to the left of the paper for binding, if desired, would be a convenient form. E. B.

THE WORD "GAS."

SIR,—I am glad that your correspondent, "J. B." (in a late No. of the *Builder*), has publicly put the question with respect to the spelling of the plural of the word commonly written gas, hecause it affords me the opportunity of pointing out what I consider the anomalous hetcrography of this word. If there is one rule with respect to English ortho-ranhy which is clearer than another and which

grapby which is clearer than another, and which admits not of exception, it is that all nouns substantive ending with the sound of s, preceded by a short accented vowel, double the final letter. Such words are, lass, class, glass, grass, stress, dress, redress, ercess, mass, and hundreds of others. In-deed, there is searcely an exception to this rule in the whole English vocabulary.

The only reason I can conceive for deviating from the general rule in this instance is, that probably we derived the word from the German chemists; and it derived the word from the German chemists; and it being regarded, on its introduction, as a foreign word, was consequently spelt as in the original. But as it has now become completely naturalised, it certainly ought to be made to follow the analogy of our own lacquage, in conformity with other words derived from the same source; for the words grass and glass are bath only in German with one is and precisely are hoth spelt in German with one s; and precisely for the same reason they spell gas with one; and for for the same reason they spell gas with one; and for the opposite reason we ought to spell it with two; namely, they pronounce the preceding a long, while we pronounce it with a short quantity. I hope that it is not quantity.

I hope that it is not yet too late to see this alter-ation universally adopted, especially if it should have the sanction of the *Builder* and other influential the sanction of the Builder and other influential journals. The public eye would soon get accustomed to the alteration, and one anomaly, at least, would be crased from the long list which at present disfigures-our language; and thus would "J. B.'s" question be practically and consistently answered. B. J.

RECENT PATENTS.*

RECENT PATENTS.* THOMAS ROBERT WINDER, Dover.-Constructing Submarine Works. Dated April 11, 1857.-This invention relates to a mode of simplifying the con-struction and the placing of large blocks of concrete or masoury to form the foundation or underwork of piers, harhours, and other like submarine structures. To atlain this end the platentee forms a floating cais-son of plates of east or wrought iron bolled or riveted together, and this floating vessel (which is open at the npper part) he brings over the spot which is intended to receive a large block of concrete or masoury. Having moored or otherwise secured this floating vessel in the required place, he dis-charges concrete therein, or the builds on brick or stone work therein as required, and by the accumula-tion of such hoilding materials in the vessel, the latter is sunk to a given depth in the water. He next builds tion of such huiding materials in the vessel, the latter is sunk to a given depth in the water. He next builds up the sides of the vessel by adding plates of iron to the upper part of the vessel, and thereby increases the capacity and depth, the upper edge of the vessel heing raised considerably above the surface of the water. When this is effected, he continues to throw in conrecte or build up masorry within the vessel, repeat-ing the building up of the outer iron casing as the vessel sinks by the accumulating weight placed in it. In this way the caisson or vessel is charged with masonry or concrete until it sinks to the hottom, where it will hy its own weight remain fixed and immovable, and form a secure artificial foundation for any subsequent superstructure; or the superstructure be formed by continuing the building up of the may vessel or caisson.

vessel or caisson. JAMES BIRD SPARKE, and ALFRED SPARKE, Thoralane Foundry, Norwich.—Saving Machinery. Dated April 8, 1857.—The first part of this inven-tion relates to that part of sawing machinery which is employed to give motion to the timher under opera-tion, for the purpose of bringing it up to, and keep-ing in contact with, the saw during the cutting, and of withdrawing it from the saw when the cut is com-pleted. The second part of the invention relates to the mode of driving reciprocating saws, or saws which act upon the material to be cut by successive strokes. Grooger WHITE Largence Ponutry-lang Can-

GEORGE WHITE, Laurence Pountney-lane, Can-non-street, London.—*Glass Furnaces*. A communi-cation. Dated March 20th, 1857.—This invention consists in heating glass-houses, or furnaces for the manufacture of glass, by means of the complete com-hustion of the gasses derived from wood, coal, peat, ligatic, antracite, or any other suitable fuel, the full comhustion of the said gasses taking place by means of a blast of bot air, the injection being thus regn-lated that the full combustion of the gasses, and consequently the highest temperature, takes place in the central part of the furnace towards the melting-pots. This system of heating is applicable to glass-furnaces of any size, the fire-grates heing entirely done away; thus offering an additional space for the melting-pots.

[DEC. 19, 1857.

BENJAMIN HORATIO PAUL, Torrington-street, Tor-rington-square, London.—Preservation of Stone, either natural or artificial, also of Cements and other similar compositions. Dated April 1, 1857.— This invention is effected by applying to the stone, &c. solutions of the aluminates of sode, potash, or of other aluminates, also of the zincetes of sode or potash, or phosphates of alumina, or zine in solution by alkalis; also similar preparations of lead or molybdenum. These solutions are employed either alone or (for the purpose of more effectually filling the interstices or porce at the surface of the stone, &c.) mixed with finely-powdered substances, which are little liable to he affected by the atmospheric influences caisting in towns. The substances to be used for this purpose are silica, carbonate of magnesis, barytin or zine, sulphate of baryta, French elable, or other BENJAMIN HORATIO PAUL, Torrington-street, Tor-

In the hable to be affected by the atmospheric infinitences existing in towns. The substances to be used for this purpose are silica, carbonate of magnesis, baryin or zine, sulphate of baryita, French ehalk, or other similar substances. The material thus introduced into the pores may be coloured by the addition of oxide of iron, plumhago, or other suitable pigment. CHARLES PASCALE, Norwood, Surrey.—This investion relates to the shaping of the ends of tiles, and entitig the off, when produced in lengths, from the squeezing-box or other expressing or forming apparatus forcing and forming the tile material in lengths is the same as usual. The length of the tile material when expressed or formed is received in rollers, or other-wise supported while being cut off in proper lengths, and at the same time having the ends of the tile shaped. The patence effects this by means of two wires, suitably stretched hetween two solides, which cause the wires to traverse in eurors or lines, so as to describe and cut the tile of the tile inguides, which the ends of the form required. There to the Straverse in eurors or lines, so as to describe and cut the tile of the corpore length, and with the ends of the form required. There of Knobs, Roses, and Escutcheons, used for malleable iron and the remainder of sheet iron, and the roses and escutcheous soley of sheet iron, and the roses and escutcheous soley of sheet iron, and the rose and cesutcheous soley of sheet iron. The invention also comprises improvements in ornamenting the same, and also in ornamenting the ordinary description of articles of the same kield which are made of cast or sheet brass, or both combined, by japanning, ensmelling, painting, or inlaying. Estad, May 4, ison LESLE, Conduit-street, Hanover-squeen.— Apparatus for Fentilating Buildings. Bated May 4,

japanning, enameling, painting, of inlaying them. Joint LESLE, Conduit-street, Hanover-square.— Apparatus for l'entilating Buildings. Dated May 4, 1857.—In carrying out this invention, an air-shaft is fixed to the ceiling or upper part of a building, in such manner as to rise through the roof, and on the exterior of the air-shaft is formed an enclosed elemeter, open at hottom and closed at top, by which combination of parts the heated atmosphere of the building will enter the enclosed chamber around the air-shaft au al notion and existing parts the heated atmosphere of the building will enter the caclosed chamber around the air-shaft and keep it warm, and will thus induce a rising current through the air-shaft.

force shall operate the deill in rock drilling machines. GEORGE A. GARDNER, City of New York, Assignor to self and LEMUEL P. JENNS, Boston, Mass.—An Improvement in Rock Drilling Machines.—Claim : The peculiar combination and arrangement of the devices, whereby the rotation of the mandril and drill, as well as the gradual and proper advancement of both drill, mandril, and frame, or either of them, is effected by means of a single eccentric on the eam shaft. WILLIAN VAN ANDEN, Poughkeepsie, New York. —An Improved File-cutting Machine.—Claim : The arrangement of a bed on which the file blank is cut, having a forward positive feed motion, and an inde-pendeut forward motion against the edge of the chisel, in consequence of the pervession of the hammer, and

pendeut forward motion against the edge of the chisel, in consequence of the percussion of the harmer, and the difference of the recuision of the harmer, and the difference of the recuision of the harmer, and the difference of the chisel, wedging if forward at the back edge of the chisel, wedging if forward at the time of cutting the teeth of the file to cause their upsetting. Also, the combination and mrangement of the bad on which the file blank is cut, with the triangular feed-gate and side rails of the machine frame. Also, the combination and arrangement of the ratchet wheel spring, and detent pins, or their equivalents, in combination with the pawls for ope-rating the same. Also, the nee of the compound self-adjusting chisel bolder stock, in combination with the chisel, whereby it is hadd rigidly in its place under the

Table till state. Also, the me of the combination with the chisel, whereby it is held rigidly in its place under the chisel, whereby it is held rigidly in its place under the blow of the hanmer. Also, the use of the triangular gate as a feed motion to my compound held, in combination with the apparatus for operating the same. HEXEKLAN B. SMITH, LOWEL, MASS.—An Improved Mortising Machine.—Claim: 1st. The adjustable compound treadle, when used in combination with a mortising nuchice. 2nd. The pawl, or its equivalent, in combination with the table, to prevent the netion of the chisel from jarring the foot, not intending by this to conface myself to the exact form represented, but adopting any other substantially the same. HENRY F. WILSON, Assignor to self and HENRY T. WESS, Elyria, Ohio.—For an Improved Torss-cut Satering Apparatus.—Clim: The radius hars, in combination with the vibrating bars, for the purpose of straining the saw as as to cuable m to give the saw

bination with the vibrating bars, for the purpose of straining the saw so as to enable me to give the saw a reciprocessing motion without guides. Also, placing pins at a greater or less distance apart than pins for the purpose of giving a rocking motion to the saw while reciprocating, said motion to be gradaated according to the kind of wood to be sawed. "THOMAS D. WORMATL, Lowell, Mass.— For an *Expressed Science" Places.*—Claini : 1. The employ-ment of the clamp lever for securing and bedding the bit. 2. The clamp lever, as arranged in combination with T strap and nut, for the purpose of regulating and adjusting the bit for cutting, when firmly bedded and secured.

and secured. GILDERT BISHOP, City of New York.— For an Improved Rotary Veneer Machine.— This iovention consists in cutting veneers and other thin stuff by a koife, with a circular or curved edge in rotation in the liue of its edge, while the log from which the veneer is to be cut is vibrated or turned towards the vener is to be eut is vibrated or turned towards the knife edge as it passes, so that the koife progressively covers the whole top surface of the log, and cuts the veneer by n continuous rotary drawing, thrusting and varying stroke of the edge from point to beel, as the log is presented to and brought in contact with it. JOSEPTI H. GOODELL, Bridgeport, Connecticut.— For an Improved Machine for Straightening Femeers. Claim: The reduction or removal of the curve or scroll shape given the veneer in its cut from the log or stick, by the introduction and feed of it endwise,

hy the introduction and feed of it endwise stick, that is, transversely to the general direction of the eurve assumed by it in the cut between a roller or curve assumed by it in the cut between a roller or rollers, and carrying and pressing apron, arranged for operation together and on the veneer. Also, in com-bination with the several rollers and calless earrying and pressing apron, when the same are relatively arranged, the ndjustable frame to the one roller, to give increased or diminished pressure to the apron against the back of the pressing roller, or interposed veneer. veneet

GEORGE W. BISHOP, Brooklyn, New York .-The object of this invention is to have a parenter for streets of blocks of iron, so formed on their upper surface as to effectually prevent horses from slipping, and permit water with accanulating dirt to run of to the side gutters, and, at the same time, of securing rails thereto for n railroad. Claim: Making castrails thereto for n railroad. Claim: Making essi-iron paving blocks with a series of transverse draining grooves, which, when completed and luid, will form grooves, which, when completed and luid, will form the side gutters or severs. Also, forming the surface of iron paving blocks with a series of inclined planes and shoulders, to prevent horses from slipping, while, at the same time, carriages will roll over the surface without series is impediment or coccussions. Also, the said series of inclued planes and shoulders, in

combination with the lateral grooves for draining, but which also answers the purpose of preventing horses from slipping. Also, the manner of uniting the iron blocks in laying a pavement by the alternating over and under lapping of the scries of blocks, whereby and under lapping of the series of blocks, whereby the blocks are enabled to sustain one another, and thereby more effectually maintain the required grade.

Books Receibed.

Many Thoughts on Many Things :-being a Treasury of Reference, consisting of Selections from the Writings of the Known Great and Great Un-known. Compiled and analytically arranged by HENRY SOUTHARE. London : George Routledge nnd Co. 1858.

nod Co. 1858. THIS really is what it purports to be, a Treasury of Reference, and will be found worth its weight in gold by literary men, and those who want materials for thought. As Mr. Southgate justly says, too, it " is not only adapted for occasional reference to any par-ticular subject, but, from the variety of interesting topics, both in prose and verse, which it comprises, it may also mford many an hour of agreeable and in-structive reading. We are here conducted, as it were, through a picture-gallery of the first masters,— through a graden of the choicest flowers,—where the social virtues may be promoted, the pleasares of resocial virtues may be promoted, the pleasures of re-fined intellectuality cultivated, and some of the purest delights of which the human heart is susceptible cely enjoyed." Classification and analysis bave been closely obfree

Classification and analysis have been closely ob-served to give facility for reference to any general subject, and this the searcher will find illustrated in its various phases by, for the most part, distinguished writers. Here and there an anonymous quotation occurs, which might have heen omitted without damage to the book; but of this, the little too much, one ought scarcely to complain. It is one of those hooks in which there is always something to discover. The extent of the collection says much for Mr. Southgate's reading and industry; and the arrange-ment of it speaks for his taste and acuteness. The dedication to "' His Friend and Partner, Joseph Bar-rett." will serve to remind readers that they have tt," will serve to remind readers that they have eard of Mr. Southgate before in another capacity,— ngaged in "knocking down," rather than building rett. engaged in

chagage in "knocking down, renter that balance up, books. What he has now put together is a massive volume of nearly 700 pages, of which the index alone occupies thirly-four. The hook is beautifully printed, and does great eredit to Messrs. Cox and Wyrman, at whose establishment it has been produced. The type is good, and the arrangement of the pages elegant.

Rudimentary Treatise on the Marine Engine, and on Steam-pessels and the Screve. By ROBERT MURRAY, C.E. Third Hedition. London: Weale, High Holborn. 1858.

Trues very excellent treatise by the Engineer Snr-veyor to the Board of Trade has been revised and considerably altered and improved since its last edition was issued. The practical remarks on the serve and propelling power as used in the royal and merchant navy are especially ioteresting. Much new and useful information is also compressed into tabular and other forms in the Appendix, and the volume is illustrated by various engravings. We cordially recommend it.

Divide et impera;"-Statistical Book-keeping; Divide et impera: "---Statistical Book-keeping; being a Simplification and Abbreviation of the common System by Double Entry; together with Suggestions for the Prevention of Defalcations and Frauds in Barks, 3y- By F. C. KHEPP, London: Longman and Co. 1858.

Frands in Banks, 5c. By F. C. KEEPF. London: Longman and Co. 1858.
Thrs is certainly, to all appearance, a very elaborate work on "Statistical" book-keeping; but it must be for regular business-men-merademm, mnunfacturers, and others,—by affording it a fair trial, or, at least, that consideration which it seems to deserve, to say whether it be sufficiently practical to induce them to discard the system on which they have heretofore gene. The new system, however, does not appear to be so much an antagonistical scheme to that of book-keeping by double corty as a centralisation of that system itself, an abstract and index superadded to it, and over-riding it, as it were; or a master-key to its more dutalled and disconnected contents. By means of what has the aspect, at first sight, of a somewhat formidable complication of the ordinary system, we have thus, in effect, a simplification arising out of there-arraogement. It is for pructical book-keepers to test the merits of Mr. Krepp's statistical system, which it may be also said to comprise within the compre-tensive sphere of its operations. It is said to be the result of fifteen years' personal observation and prac-tical experience, in Eoglish, American, and German counting-honses, and we can well believe it to he so.

The book of statistics, or centralized epitome of the husiness, appears to bring the whole of its transac-tions within a comparatively small compass, and to be "altimately made to contain the very essence of a "intimately make to contain the very essence of a large pile of other books, kept during a period say of ten years, or longer, if required." By keeping out of sight all distacting details of secondary importance, a sort of bird's-eye view of the whole range and drift of aflairs, however extensive and complicated, is thus pufcessed to be obtainable.

Miscellanea.

FROM BROMPTON TO BAYSWATER, vid PARK-LANE.—The necessity of skirting round all Hyde-park to reach Bayswater and other districts north of the Park from Brompton, Knightsbridge, Chelsen, &c, to the south of it, and vice verse, either on foot waith the value of all times is a great distribution. &c. to the south of it, and vice versă, either on foot by night, or by vebicle at all times, is a great grievance of which we have often complained. The crossing of Hyde-park by a public road, open at all times, has been urged; but interference with the privacy and the integrity of the park formed one main diffi-culty in the way of such an arrangement. To obviate this difficulty it has heen proposed to sink the public road helow the level of the park, and this might he done probably whatever note, were proposed to be the provided of the park of the park of the public road helow. done, probably, wanterer tow-taken. A matured plan has been laid before us by Mr. Risdon, of Bayswater, who proposes to open such a road along by the sunk wall of Kensington-gardens, from near Victoria-gate, and opposite West-bourne-street, to the present bridge across the Serpen-tine, close beside which it would pass by an additional bridge, whence it would puss by an additional bridge, whence it would run to the Kensington-road, a little to the east of Gore Honse, and opposite the new road leading to "South Kensington" and the new tood leading to "South Kensington" and the the new tood leading to "South Kensington" and the new tood leading to "South Kensington" and the the new tood leading to "South Kensington" and the done, probably, whatever route were proposed to be taken. A matured plan bas been laid before us by is wanted to obviate the very great nuisance referred to

SLIP AT CARDIFF .- About three weeks since, notice SLIP AT CARDIFF.—About three weeks since, notice was given that after a certain date no more vcsels would be allowed to enter the East Bute Dock, as the contractors intended clearing away the embankment hetween that portion already in use and the ortension just completed. For this purpose the water was turned out of the dock, and the inner gates of the lock were taken up, not being considered sufficiently strong to bear the pressure of water upon them, and another pair was ready to be laid down. The contractors, Messrs. Hemmingways and Pearson, put on a large number of hands in removing the bulk, and it was thought that the work would have been completed in ahout a month to the satisfaction of all parties. We regret, however, to state that about one o'clock on anout a mount one satisfaction of all parties. We regret, however, to state that about one o'clock on Tuesday (the water heing out) a large portion of the eastern wall gave way, carrying with it the foundation, the transvay, and a quantity of iron ore, which was alongside. The wall for at least sixty or seventy yards is completely gone, the angle where the slip occarred projecting some ten or fifteen feet beyond the level, the stones heing separated from cach other, and some of the large blocks of forest stone, ahout and some of the large blocks of forest some, anoun three feet thick, being completely smashed—some of them into a thousand pieces. We are told, however, that no fault can be laid to the contractors, but that the heavy weight on the banks, and the support sndderly withdraw by letting out the water, have been the sole cause. The damage is estimated at between 11,000/. and 15,000/. but it is feared that, if another slip should occur, the whole of one side will have to he rebuilt.

CAMBRIDGE ARCHITECTURAL SOCIETY .---At the last neeting of this society, the report of the com-mittee was read, which said, amongst other things :----

THE SMEDLEY VIADUCT .- Signs of instability have shown themselves in this structure, according to the Manchester Courier. At the last meeting of the city automaster Contrast. At the task including to be day council a report was presented, while hatted that the extra cost for strengthening the viaduct, in conse-quence of previous failures of bad work, would be 1,450?. A larger sum than this, adds our authority, sight all distracting details of secondary importance, 1,4597. A larger sum than this, adds our authority, a sort of bird's-eye view of the whole range and drift will in all prohability he sunk upon the work hefore it of affairs, however extensive and complicated, is thus is pronounced safe, and it may possibly have to come professed to he obtainable. The author's suggestions with reference to the pre-vention of defaleations and frauds in banking and other companies also seen to merit attention. to strengthen the principal alutimeta. Humber was added, and the bridge seemed likely to stand in security. These further enacks, however, caused grave doubts to be entertained whether the viaduet will last long.

Energance whether the vaduet will last long. DAMAGES FOR INVERT BY A SCAFFOLD.—At the Manchester County Court, last week, judgment was given in a case of some interest. The action was brought to recover damages for a serions injury caused to the plaintiff's wife, by the falling of a boarding in front of three houses in Oldhau-road, Manchester, helonging to a Mr. Gregory, a watehmaker, one of the defendants. The judge was of opinion that the scaf-fold ought to have heen of sufficient strength to have withstood the effects of wind. It noneared that it withstood the effects of wind. It appeared that it was Edwards, one of the defendants, who applied at the Town-hall for permission to put up the boarding, but be did not crect it himself. The owner of the property let off the work to various persous-excavator, a bricklayer, and a carpenter. It did It did not excavator, a bricklayer, and a carpenter. It did not appear to have been the business of anyone in par-ticular to put up the boarding securely ; but it was a fact that Mr. Gregory was the owner of the property, and he paid the joiner by whom the boarding was created as his servant. This he (the jodge) thought was evidence sufficient to make Mr. Gregory liable, and the verdict must, therefore, be against him for 40. for 407

THE AGRICULTURAL IMPLEMENT TRADE. THE AGRICUTURAL INFLEMENT TRADE. — A sion paper was read on the 9th inst, at the Society of resig Arts, by Mr. S. Sidney, "on the progress of the agricultural implement trade during the last twenty press." The paper, with a discnssion which followed, good is published in the Journal of the Society, of the 11th enst. Mr. Sidney, in the outset, stated that his adm object was not to instruct agriculturists, but simply to give that large class who got their meat from design mon the bakers, with out troubhing themselves about the origin of either commodity, some idlea of the vast amount of mecha-whit out troubling themselves about the origin of either commodity, some idea of the vast amount of mecha-nical ingennity and agricultural experience, which has been devoted daring the last twenty years, to making inferior soils fortile, and fertile soils more productive, to economising time and labour in every operation of hashandry, so as to keep pace, as far as soil and climate would allow, with the daily increasing demands of our town population. After the discus-sion, in which several agriculturists and other gentle-men took part, Mr. Sidney, in conclusion, maintained that the time had come for reserving prizes for great and much-needed inventions or improvements, such and much-needed inventions or improvements, such

and much needed inventors of improvements, such as steam ploughing. PUBLIC DECORATIONS.—We are told that great preparations are being made for the approaching mar-riage of the Princess Royal, and that the Chapel Royal is to be re-decorated for the occasion. In glancing the is to be re-accontact for the occasion. In ginneing the other day at records of some of the state marriages of former days, we were struck, if we may say so, by the ngliness of the decorations. On the marriage of *George* II. the interior of the sacred edifice was fitted George 11. the interior of the sacred editice was fitted with large crowns, stuck over with wax candles and chandeliers of the most questionable shape. We hope, however, that matters will be managed in a more artistic manner. Royal marriages during the Middle Ages, celebrated in our fine old catbedrals, were splendid affairs, and the city was made gay with largestry and other rich bareings. We have discussed

Inst moeting of this society, the report of the com-mittee was read, which said, amongs to other things :--"It is gratifying to observe the gradual prevalence of minproved tasks in the next of domestic architectural We allowed tasks in the next of domestic architectural of Mr. It. R. Howe, the town surveyor. We are placed to the town surveyor. The accuracy of the formal prevention in interest and beau, Thus the accuracy of the architectural Publica their enther allow which bid hair to reads window has been filled with tasked glass by Mr. Walles, which for brilling and the of the tasked prevention in the result of the sheep filled with the exception of the figure of Christ on the central new respensive to not the source the sheep filled with the source the source of the fitting source of the fitting several new yrders and lever contrast of collective and their enther and to the last of the last beach will soon the figure of Christ on the central new respensive filled with the south are write the members, represent would be prefectly just; hut so far from such being stores, or from source accident in the preparation of the stones, or from source accident in the prefaction of the instruction of the figure of Christ on the central new these of the obtaind the stalls, which are thore have been placed behind the stalls, which have so multice disgn to that of the last one of the new source and the south are south to conside the south source or from source accident in the prefaction of the stones, or from source an artis, which will soon glased behind the stalls, which are thoreased the south are south to south an extent as quite to printing, and some members of the committee, who as an artis', which attinded glass windows and freecoses : nor is this all-it is will soon glasm to for the charge, age account the scolety, and some there on, under the checker of the stall allow whick descred, I wenture to torohole point there at Hildesheim, in the kingdom of Hanover, which is now wundergoing restoration."

Dec. 19, 1857.

LATING SUBMARINE CABLES .- Messrs. C. and G. LAING SUBMAINE CALLES.—Messrs. C. and G. Johnson, of Wandsworth, have described to us the model of an apparatus specially designed for laying down wires for submarine telegraphs, now in their hands. They say within a frame about 14 feet long, 8 feet high, and 8 feet wide, are arranged three dis-tinct hreak-wheels, representing three points of a triangle. Each wheel is provided with a lever and roller, so placed as to act on a point in the eircum-ference, and exert a power opposed to the motion of the wheel, by which its revolutions may be retarded or regulated with precision. The end of a cable once passed through this machine, is taken firm hold of by a peculiarity in the construction of the break wheels, passed tarbuga this interime, is taken thim hold of by a peculiarity in the coastruction of the break wheels, and may either be handled in or paid out without a single coil. It is self-acting, the strain imparted being correctly indicated, and can never exceed the prescribed bounds. In laying down a cahle in deep water, the unicker the concertion is performed the water, the quicker the operation is performed the better, as then the wires would not have time to drift away, and consequently nunceessary slack will be prevented. They say their machine could be made to work perfectly well, going 15 knots an hour, or more if required.

"ART IN ARCHITECTURE."-SIR : My good friend Commonsensius" is desirous, through the medium of your columns, to propose for the consideration of "Aristidse" a few remarks npon the opinions he has expressed on the subject of "Good Taske in Architec-ture." He would speak to "Aristides" as follows :--You say that, 'irrespective of any question as to tyle, that design must be in good taste which, whestyle, ther viewed in mass or in detail, produces a pleasing, harmonious *ensemble*. Now, sir, you must permit me, with all deference, to remark, that your definition is a complete follow. It is the enter of the set of some harmonious ensemble.' Now, sir, you must permit me, with all deference, to remark, that your definition is a complete fulure. It is true, as for as it goes, hat it does not get to the root of the matter. Both 'Donaldo' and 'Rafskinins' would readily give their assent to the truth of this proposition, because they could do so without therehy making any admis-sion adverse to the cause they have in band, without resigning that undivided sovereignty they have so ably claimed for the style of their adoption. The question is not 'whether or no that style is in good taste which produces a pleasing, harmonious ensemble,' for the affirmative of that proposition is admitted by all, without one dissentient voice. The real point at issue is, 'Whether such and such a design does, or does not, produce an effect that all men ought to call pleasing.' And this is where your definition fails, for combinations of form before which 'Rufskinius' would stand entranced-chilvious of the toils and troubles of this work-day world-wrapned in ecstatic contemplation, and scaring on the wings of harmony to the seventh hence of delight ; these combinations would, in the mini of 'Douado,' produce uo other enotion but that of unmitigated disgust. Where 'Rufskinius' found nought but 'Music that gentler on the spirit lies Than tird egrides upon tired eyes,'

" Music that gentler on the spirit lies Than tired eyelids upon tired eyes,"

Than tired syclids upon tired eyes,' he would only be conscious of a borrihle discord, enough to set his very teeth on edge. Still, I should think, sir, as far as I can gather from the general tenor of your argument, that your opinious are in the main perfectly just and orthodox; and I would, there-fore, entreat you to bring your powerful mind to bear once again on the question at issue, and I feel sure you would then be able to furnish us with a definition that may be of real service to us." If, Mr. Editor, you should think it worth while to give insertion to this "mild remonstrance," you would oblige.--R. M. TUE SOULAGES COLLECTOR --Lord Genzulle

THE SOULAGES COLLECTION .- Lord Granville, the Lord President of the Committee of Council on Education, received a deputation from the Royal Institute of British Architects, with reference to the purchase by Government of the Sondares Collection, on Wednesday afternoon, at the Privy Council Office.

THE DISEASES OF TRADES: BAKEES .- On reading The DISLASE OF TRADES: BARERS.—On reading Dr. Letheby's annual report and statistics upon disease and death, I find from his investigations nul classes bave their peculiar diseases, phthisis bein; the malady of bakers; and the *Times* observes,—"But surely the fact that particular complaints can he so easily appor-tioned among particular trades justifies the hope that, with ordinary care, their prevalence can be very much diminished." After reading Dr. Lethehy's report, I calculated how many journeymen bakers have died, who had worked for me, within the last ten years : the result was to me saddening. My men bave gene-rally lived with me some years, but I can count filteen young men (none forty years of age) who have fallen rally lived with me some years, but I can count fitteen young men (none forty years of age) who have fallen victims to this hakers' malady, in one form or other of the disease. Now, sir, I know that if hakers would do away with the present unhealthy, dirty, and har-barous manner of kneading bread, our trade, for one, would soon show a more encouraging account in the future reports of the City's chief medical officer. I sincerely thank you for the encouragement you have given me in favourably reviewing my endeavours to promote the sale of pure hread in this metropolis. C. STEVENS.

Builder. The VOL. XV.-No. 777.

> HERE are many points in the position of the draiuage queswe have uoticed, * that are inte-Bridgewater Caual is supplied by the river Medlock; it is stagnant, and more offensive for miles than one of the London sewers. The "entire volume" of the Manchester streams The "entire volume" Altrincham, about the year 1850, as "one mass of fermenting corruption for fifteen or twenty miles down their course." The water is used by hleachers,

refuse from streams. used for condensing and other purposes in and papers. The experiments seem to have steam-engines, and is discharged, heated, back beeu suggested subsequently to the reading into the open or covered water-courses which of a paper by Mr. F. Crace-Calvert, in receive the drainage of the town; "so that a semi-which he put forth a method for facilitating receive the draiuage of the town; "so that a semiliquid compound is formed, an accurate idea of which no written description can convey." Mr. Rawlinson continues,---"A thick senm coats the snrface, upon and over which birds walk; the pntrid carcasses of dead animals, dogs, eats, &c. float and rot in the midst; fermentation takes place rapidly, as large hubbles of gas may hc scen escaping, and a thick vapour constantly hangs over the entire area." * * "When a water-supply is carried out, and waterclosets have become general, some terrible loss by disease may certainly be anticipated, should the present condition of things be continued."

This description, though, as to the worst features, applicable chiefly to the Bridgewater Canal, gives a fair representation of the state of the streams, and as they are to this moment. Indeed, the water in the Irwell appears much less in whether the true one in the case or not-seems to be well deserving of consideration. It is that, by improved land drainage, water now reaches a stream quickly, causing a sudden rise, -instead of gradually, so as to maintain the stream at an equable level. The rainfall soouer gets to sea, and the stream remains low, for a longer period. Further reasons are given for the extraordinary rise in the water of the Mcdlock, in August, 1856, and August, 1857,-when great damage was done to property, leading to legal proceedings against the corporation of the borough. The Manchester and Salford Sanitary Associatiou, to whom the thanks of the inhabitants are due for the diffusion of much information, recommend that the conrse of the Medlock should be modified from the present circuitous channel; that augles in the side walls should he avoided ; that the bed of the river should be paved, with a dip to the centre; and that a certain weir should be removed, or re-constructed, to facili-tate cleausing; and they refer to the raising of the beds of the rivers by solid refuse thrown therein, and to encroachments on the banks, as amongst the evils which could be remedied were he conservancy in the proper hauds. As to the sewage question, they consider they have demon-not leave au increase of mineral matter; but it strated by experiments which they performed at removes portious of the substances which form the Bridgewater Canal, near the month of the incrnstations in boilers.

* See page 717, ante.

THE BUILDER.

Medlock, at a foul place to which reference has heen made, that the sewage matter in suspension and solution in a running stream, can be precipitated by the lime process, at a comparatively trifling cost; and that much of the injury arising from the use of the rivers as common in the "Minute," of October 26th last, whilst their committee "have no doubt as to the vast importance of preventing the admission of sewage tion at Manchester, other than matter into rivers ;" they say they had "recommended the precipitating process, both from carried on and deposited in the still-water line, resting and important. The ceonomical considerations in relation to an evil already existing, and from regard to the urgency of the subject in a sanitary point of view." On such recommendatious, the town conneil seem to be now seeking from Parliament the powers referred to in our former article.

of the Manchester streams It way, therefore, be presumed that the was correctly described by Mr. intention in Manchester is to carry ont a parti-Rawlinson, in his Report on cular application of the lime process ou a large scale; and there are many points of interest as to the mechanical contrivances apparently contemplated, that will call for the attention of those who are interested in the general question pertaining to London. It does not appear that printers, and dyers; and the the Manchester experiments have attracted their works is ejected into the much attentiou from the Government Referees; Thus, the tainted water is again at least we find no evidence of it in the Report deposit from the Medlock, in the curves in its course, using lime as the precipitant.

The chemical part of the investigation and laboratory experiments were conducted by Messrs, R. Angus Smith and A. M'Dongal, and Mr. Calvert, at separate periods ; and the apparatus used at the canal, consisted principally of a trough with perforated bottom, extending across the stream, at an elevation of several feet above the water. The full effect of the application of lime was not ascertained-owing to unavoidable defects in the experimental arrangements; but it was found hy Mr. Calvert, that taking the organic matter in suspension and solu tion as 12 11 grains per gallon, there remained, after treatment hy lime, only 3.5 grains per gallon in solution, — " a quantity less than exists in many river waters which are used for do-mestic purposes." The line process, it certainly appears, would put a stop to the putrefaction going on in the Medlock aud canal, and remove the noxious gases which are evolved. On the occasion of the experiments, this was strikingly shown by the change in the atmosphere of the warehouse over the deposit hasin. As to the proportion of lime, three hundred-weight per million gallons were sufficient ; hut it was found that the same lime would do duty four successive times, with little difference of effect. Mr. Austiu, in bis Report on Deodorizing Mr. Austin, in the representation of the second state of the secon "no criterion of the quantity" of lime required for "ordinary scwage water." The precipitate has a certain value as manure, but would not bear much cost of carriage; yet it is more valuable and agreeable to use than the town's refuse,-at present sent as far as Lincolnshire. It is observed by Mr. Calvert, in a paper in the *Chemist*,* that the plan could be easily applied to smaller streams, such as those flowing through Boltou or Oldham,-a con-sideration of particular moment, bearing in mind the facts referred to in our last article. The

* June, 1856.

The eoutrivance which Mr. Calvert has proposed, consists in the provision of small tauks—the size and position of the beds of natural deposit near the angles and curves; aud, at several huudred yards higher up, in placing across the stream, barriers, with openings to allow the flow of the water, whilst the barriers would retain a layer of lime, the thickness and renewal of which would he regulated. The matter in suspension in the water, after coming in contact with the lime, would be or in the subsiding tanks in that position. The idea obviously occurs, that a process recom-mending itself as this appears to he doing, to the people of Manchester, might be nsefully applied to the existing sewers of London,-not with expectation of commercial gain, or as a perfect measure, but as some alleviation of the cvils that are now endured, or which await correction from works that will he some years in course of executiou. The Manchester Associatiou consider it as proved, that the canal could he purified at an annual cost of 300% or 400%. It would he confessed that the plan of removal now adopted in Lancashire, is in its nature, not the most scientific that might be devised.

The expense to the city of Manchester, of all cleansing operations, we are told, is about 7d. a-head, or, for 250,000 inhabitants, a total of about 8,000%. In the Dukinfield Report, we observe several references to the difficulty of getting the pits emptied, and of finding parties willing to take the soil. In Manchester and Salford, the circumstances may he more favourable : market-carts which would be returning to the country empty, are able to carry back a portion of the refuse ; yet, we have seen that there is no gaiu commercially. In London, in the case of one particular district, a similar circumstance as to the carriage of the stable manner, was found to diminish the value of refuse in the liquid form; and the Stauley-bridge Works for irrigation by sewage, hecame a failure. Yet, as perceived in all the recent reports and documents, utilization in the liquid form, offers the ouly pro. speet of meeting the difficulty. Fortunately, the causes of the ill-success of the works just referred to, are understood, though the question has suffered from the discouragement of other attempts.

Mr. Samuel Brooks, in 1854, heing anxious to have the question of utilization cleared np, wrote to the Town Council of Manchester, offering 1,000% to he expended in premiums, plans, and inquiries; hut we have not heard whether any advantage was taken of the offer.

The laud of Mr. Carus Worsley, at Rusholme, near Manchester, is irrigated with part of the sewage of the village; where, however, the house-drainage is very partially on the metro-politan system. Mr. Austin considers "these works are interesting as an example of how small a place it may he worth while, as a profitable investment, to lay down pipes upon, and even to crect cugine-power, for the purpose of getting this manure on to the land," adding that the quantity of sewage delivered "was equal only to the ordinary discharge from 150 bouses." We have found at Rusholme that the outfall into the brook is still preserved for nsc,-as the irrigation does not go on in frosty or wet weather. A similar cessation in the work takes place elsewhere (except at Edinburgh); therefore the question as to Loudou, and entire dependence upon outfall on to the land, is scarcely answered.

It would be well to inquire carefully into the effect of the soil and grass as deodorizers. Mentiou is made hy Mr. Anstin, in several cases, of the smell arising where laud was in process of irrigation, though hy him it is attributed to mismanagement, or faulty contrivance in the

Mr. Caird, in the article, "Irriopen ditches. open mitches. Air can't in the article, inte-gation," in the lately published volume of the new edition of the "Encyclopædia Bri-tannica," appears to us to show that the irriga-tion, on proper soil, must involve decodorization. Land in the neighbourhood of Manchester, manured in the ordinary way, is, we believe, found more offensive than that which is irrigated with sewage, whilst the former mode of application is costly as to lahour, is inferior in the mechanism of application to the grass, and permits the use of that is mere rubbish, found in the contents of ash-pits.

The object of future works of sewcrage Manchester should be, not only to free the streams from the present filth, hut to provide sufficient outfall for house drainage on the approved principles. The work to he done is in many respects peculiar to the district, and will be attended with difficulties as great as those of the drainage of London. We have thought that some hints, useful in one case or the other, might accrue from a comparison of the circumstances aud requirements of the separate localities.

FONT COVER, FROM THE CHURCH OF "ST. ETIENNE DES TONNELIERS," ROUEN.

A CENTURY has not elapsed since the church of "St. Etienne des Tonneliers" was still crect, and displaying in its exterior the marvels of its architecture-fine florid Gothic of the end of the fifteenth century,-and sheltering under its graceful vault, in the mysterious light of its stained windows, a large

the mysterious light of its stained windows, a large number of decornitive adjancts. In 1793, this church, like many others, submitted to the terrible necessity of the moment: its doors were closed, and its furniture put up to auction, to increase the treasure of the union. Afterwards the edifice, become inscence, disappeared itself. Three is in the Library of Rouen an old print, well detailed, which disduces the originality, of this huild.

detailed, which displays the originality of this build-ing. De Jolimont, also, in his "Edifices de Rouen," ing. De Jolimont, also, in his "Buillees de Rouces, in the sixteenth century, gives a drawiog of the church.

church. The font cover, of later date, is, perhaps, the only object of art remaining of this huilding, and is now in the Baptismal Chupel of the Church of St. Romain, which abuits upon the Kouen Railway. It is of neta-gonal form, made of corved oak, and iu perfect pre-servation; is composed of a spherical pyramid, upon a rectilinear base, each face of which is filled with a subject takeu from the life of Christ. All these subjects are well composed, and executed with great delease of chiselling delicacy of chiselling. Above is a quadrangular lantern, consisting of four

detached columus, forming an order of architecture, terminated above the entablature by a little dome, crowned by a pelicau. In the space between the columns the artist bas carved a representation of the columns the artist was carred a tepretorial tepretorial and the artist of the whole shows great spirit, is in most excellent preservation, and bears the impress of the sixteenth century. The Archeological inpress of the sixteenth century. The Archaeological Museum of Rouen possesses a cast of this font cover, very skilfally exceuted.

A PEEP AT PARIS.

PARIS is decidedly one of the most beautiful of modern cities. Since the last revolution, the pulling down of old, uarrow streets, and building new oncs i their stead; the planting of more trees in the fre ones in their stead, the planting, chu a bhinning we does in their stead, the planting of more trees in the fre-quented avenues; the completion of the mono of the Lowrew with the Tulkeries; the addition of squares; the placing of more statues in the niches of edifices and in public walks, have quite changed the face of things, astonished foreigners who knew Paris a few years ago, and surprised even the Parisiaus them-selves. Animated by this movement, the eity has acquired a new degree of interest. In this movement there were needed great men, and works directed to really useful and ornamental purposes; and under the empire of Louis Napoleon, progress has been the order of the day; tast projects which for some years had hain dormaut, have heen achieved; a strong tendency to advance has shown itself in many sanitary improve-ments, whils the example set hy Paris, several other cities of France have followed. It is most interesting to observe the perservance with which artesian wells are worked; to see the monumental fountains creeted to observe the perseverance with which artesian weaks are worked; to see the monumental fountains creeted over them. Artois, Chaillot, Austerlitz, Bolleville, Grenelle, and Passy are celebrated for these costly works. The engineers and surveyors of hridges and highways have many difficulties and embarrassments

are levelled, and as quickly replaced by others more suitable to the character of the present epoch, is almost incredible. Few of the chatelets and castle-palaces of the ancient kings of France now remain however, these vestiges of Old Paris are seen bere and there offering a striking contrast to the arebitecture of the New Paris, and looking as if Time spared them for posterity, and made them too venerable for modern improvements to destroy. Many of the antiquities of this country bave heen preserved in the Musée des Monumens Français, founded in 1793, chiefly with the view of doing service to art, and of illustrating, hy means of the monuments, sculptured tomhs, and has-reliefs of different ages, arranged in chronological assigned to discover a second choose the Ilc-de-France as the cradle of Gothic archi tecture. But it is a more general opinion that the arts were imported into France from the East. The seme forms of arcnes, and the local in monuments still ments are found in the East in monuments still existing, and which date several years before the great church constructed in the He-de-France. Thus the famous Sainte-Sepulchre, built by Arabian workmen, dates nearly two centuries before the great Gothic church of France, and has been cited by many as a more heantiful type of Gothie architecture. The French, this style of same forms of arches, and mouldings, and curich-ments are found in the East in monuments still very beautiful type of Gothie architecture. The French, however, have done much to promote this style of late years, by building a number of Gothie churches in different dioceses. With them at the present day, as in our country, it is the popular, the universal, the religious art. We shall look at two or three of those rengious art. We shall look at two or three of those ancient edifices in Paris Which have been restored, are still heing restored, and which it will take an immense expense of labour and material to complete. Among the religious edifices in the ancient Gobie style of Northern France, Note Dame claims our first atten-tion, as one of the finest specimens of the architecture of the Middle Age. When we have examined the construction of this eathedral, which was the unin-terrupted lahour of nearly 300 years, and which is avoid the source of th terrupted lahour of nearly 300 years, and which is entirely built upon piles; when we have examined the general disposition of the plan which is just and noble; the proportions of the different parts to the whole, which are satisfactory; when we have seen how admirably all the essential parts have here em-ployed according to the principles prescribed for them; how perfectly the means are adapted to the ends intended; how much diversity without confu-sion, consequence being given to important parks, and inferior or smaller being subordinate; when we see what a rich imagination bas embedlished the ediffice, making it at once pleasing to the eve and instructive what a rich imagination has embellished the edifice, making it at once pleasing to the eye and instructive to the mind; giving real beauty to the eurvilinear forms and lines which naturally arise ont of construction, as the rihs and bosses of the vanit-ing, the pendants, the pinnacles of the buttresses, the crockets and fluials to the pinnacles, the tracery to the windows, the ridge ornament to the roof; when we see every niche, canopy, tabernacle, and hollow moulding in the arches of the door-ways and calleries filled with states emblems and notion mounting in the arches of the door-ways and gallcrics filled with statues, emblens, and Scriptural subjects; when we trace the num-ber of ornaments and reliefs bestowed upon it, within and without, calculated by their arrange-ment to produce the greatest effect; the variegated dyes of the interior, heightened by "storied windows robby diot" when the and how weiting with united richly dight," blending and harmonizing with united splendour over the whole; we feel the chief object of spiciation over the whole; we receive the enter onject of the architects of such a pile, after it had been well constructed, was to carry it to the utmost perfection, to engage all the powers of form and colour for it to attain a high expression of beauty; to render it, by all the means of decorntion, as splendid as possible. Some persons do not approve of this profusion of form and colour, but as the other head the ache some persons to not approve of this protonom of form and colour; but, on the other hand, the eccle-sisatics, who in former times were generally the archi-tects of churches decorated in this manner, and the nonks, who devoted nearly the whole of their lives in illuminating the missal, thought it ouly proper to render glorious hy similar means the edifice devoted to worship. We shall find that the system and prin-ciples which they pursued, subject to improvements the result of experience, have been to a greater or less degree adopted in the most beautiful churches in the world. Besides, can any one invent a better method, or improve on the plan of fahries so perfectly adapted to every requirement of the church? We need not go farther into history than to remark that the taste for colouring the monuments of sculpture may be traced to the first cpocks of monarchieal government in Prace, and was propagated until the six-teentb century. It was but an imitation of the Greeks borrowed from the Egyptians. Ia truth, it is to these ingenious decorators—to the freecoists, highways have many difficulties and embarrassments (tenuto century. It was out an initiation or ore to overcome in penetrating to the required depth Greeks borrowed from the Egyptians. In truth, it through numerons hard substances, through quarries of fint and stone; but all these exem trilling compared mosaicist, polychromists — of those early ages, to the success with which their operations are gree. that art in relation to religion is so much indebted, rally crowned. The steadiness, yet the despatch Many of the wondrous stained-glass windows of Notre

Dame have been repaired more than once; in 1752 by Pierre Leviel, who wrote a treatise on the art of glass-painting. At present M. Lassus bas been charged to repair them, and to adhere to their original character. When the restorations are completed, Notre Dame may look like what it did in the thirteenth and fourteenth eentaries. The façade, or west front, is restored; the kings have resumed their places on the pedestals from which they had dissuperated the them postole from which they had disappeared; the three portals are again surrounded by a zone of crowded sculptures. If we examine the mystical character of this and other cathedrals on account of the ornaments that were em-ployed symbolizing the doctrines of the church, as the vine, the ivy, tigers, lions, serpents, and the signs of the zodiae, we shall find that these figures form the The 2004ac, we shall not that these lights form the principal decorations of all the anient basiliess and churches. The western doorway of Notre Dame is charged with a zodiac, as is that of Rheims and S. Denis, without extending the list by mentioning other great churches on the Continent. But, whatever the nature of the figures sculptured in the stone of these piles, they were not the creatures of mere fancy or caprice, but every one had a meaning, an aim, and expressed some religious thought, although to ignoration many of them were enigmas. When the ancient chiscilling, fine incrustations, and colour are restored in Notre Dame, it will no doubt exhibit polychromic architecture as in the glorious days Mediæval art.

The Sainte Chapelle, not far from the cathcdral, and user the Quai-aux-fleurs, is one of the wonders of Paris. It was begun about the year 1245, from the designs of Pierre de Montreuil, the architect of the castle at Vincennes, and the refectory and chapel of the Virgin of the Abbey of St. Germain-des-Prés, which for its size and beauty nearly equals that of Sainte Chapelle. Sainte Chapelle is not great, but it Same Chapter. Same Chapter is not great, but it is much admired, and affords a proof how much sub-limity may be attained even with small dimensions. It will not yield in beauty of its kind to any of the most famous churches of Frauce. Its construction is not a little remarkable. It consists of an upper and lower chapted; the latter at present is an *atelier* for the metarem conductor and also maintened for the restorers, sculptors, and glass-painters; but a spiral staircase in one of the towers conducted us to the celebrated chapel, where a profusion of splendour almost dazzles; where very magnificent painted glass windows, of the thirtcenth and fifteenth centuries, throw their magical tints over the interior, exceed-ingly rich with colours and gold; the rils and stars of the groining are picked out in vermilion and gold, of the ground grace picked out in vermilion and gold, on a blue ground; much of the surface is sown with *Meurs-de-lis* in gold, as was a common hahit at the tinuc in royal and religious hritidings. Nothing can be imagined more elegant than its golden spite, most carciully claborated, rising from the high roof and glittering in the blue sky.^{*} It has all the delicacy we see in goldsmiths' work. It has been thought that Raoul, the goldsmith, directed the excention of the ornaments. However, we cannot observe the the ornaments. However, we cannot observe the finish of its details without appreciating the taste aud the degree of perfection to which in those days they bad brought architecture and sculpture. This architectural gcm St. Louis purchased for placing in it certain relies he collected in Venice and Pales-tine. They had not yet begun the mossic pavement. The restorations directed by Ledue and Lassus evince great care, patience, and skill. To pass from this edifies to its neighbour, the Palace of Justice, built from the designs of Antoine, in the plain, robust character of the Dorie, is very striking, from the different impressions which each produces. The sudden transition from one to the other is extrame. It was in it certain relics he collected in Venice and Pales transition from one to the other is extreme. It was erected in 1622; a previous one having been de-stroyed by fire. Its character is imposing and well-sustained, consisting of a large hall or court, vaulted sustained, consisting or a large and or contr, ranke in solid stone, surrounded by corridors, supported by columns, and lighted by well-placed lunctes; the arcades, starcases, and courts of law, are all well constructed in solid stone. The whole has that grand and lofty appearance which the Dorie always has well treated, and which, more than any other order, rethe treated at which, investigation of the primitive simplicity. The masses are kept large and unbroken, and the superiority of the workmanship and material (the former surpassing the latter) excuses some little faults that occur in the details. A simple, regular, and but little adorned structure like this cannot have much attraction for exclusive admirers of the beauties of the Gothic as exemplified in the Sainte Chapelle. Contrasted with the latter, the architecture of this palace, cast in a sterner mond, is, perhaps, seen at a disadvantage: the one is composed chiefly of curvilinear forms, the other of rectangular; though each has its peculiar merits, its own principles; and all that eriticism has to do in such a case is to see that the priociples which should govern each are duly applied. We do not see any points of resem-hlance hy which these two productions can be com-

Illustrations have been given in our pages of this and other buildings named.

and important end, unity of style, but have sacrificed it to the vanity of their peculiar fancies, in conse-quence of which, the pleasure and improvement that might be derived from such edifices are much diminished. It would seem that some architects tried as much as It would seem that some architects tried as much as they could to alter or to distort the first plan and order adopted by their predecessor. This is ob-served in many of the old churches in Paris that from time to time have undergone reparts. The Roman arch or the horizontal beam is found alongside the Gothie. Saint Endache offers an instance of the Gothie and Renaissance in close and ill-assorted juxta-position; a number of d tails from the Greek and Runnan orders, and oroancents very fine and addingte hut not Gothie, obtrude themselves the Greek and Roinan orders, and oroanents very fine and delicate, but not Gothic, obtrude themselves amidst the ancient Gothic. Some of the sculptured works of the sixlocath eentury, as seen in the tombs of St. Denis, by Richier, and Germain Pilon, opened a new era for the staluary art in France. The French school was founded by Jean Consin, in 1540; but it was towards the middle of the cipiteenth erange from the France divised greet alwantages from To so to but It was towards the initial coff the eight each century that France derived great advastages from her wars with Italy; and Paris became enriched with monuments of art, the spoils of Rome and Italy. These wars gave her a knowledge of the principal works of that artistic country, and had a powerful influence upon the archi-tecture of Paris. To be convinced of this we tacture of Paris. To be convinced of this we have but to acquaint ourselves with the best works of Perrault, of Pierre Lescot, Levan, Bullant, Philibert Delorme ; and, later, those of Antoine (the Hôtel des Monnaies); Jacques de Brosse (the Luxembourg Pa-Journaley; Jacques de Diose (the Laxemborg Pa-lace); the Sorbone, by Lemercier; the eupola of Val-de-Grace, by Lemercie; the triumphal arch of St. Denis, hy Bloudel; Versailles and the Invalides, hy Mansari. Among these are some of the finest edifices in Europe. Q. de Quiney, in his account of the ehurch of Ste.-Geneviève, calls it a monument o its kind, —the greatest of the eighteenth century. I of its kind,—the greatest of the eighteenth century. It was the work of Soufflot. The church of the Invalides also is considered by Edibien, de Quiney, V. Cousin, and others as one of the most beautiful of modern Europe. Numerous artists were employed in constructing and ornamenting it. Brant superintended the building at its commencement; Mansard raised the dome; Girardon, so much praised for his bas-reliefs and sculpture at Versilles and the Trianon, directed the seulonner. Martin the Bank ones N directed the sculpture; Martin, the Boulogues, N. Coypel, Jouvenet, &c. painted the principal parts. The idea of Napoleon was to remove all the infirmaries to a greater distance from the church, adhering to the original designs of Bruant and Mansard ; to The original designs of Bruant and Minsard ito proloug the edifice into one vast cross, presenting four façides, like the existing great faende, having the donue in the centre. The Invalides had then been *ux et autique*. Visconii, to whom Paris is ind-hted for some of her most graceful fountains, superintended the decordious of Napoleon's tomb. Though we have but followed at course of the worth but if in site decordions of Napoleon's tomb. Though we have but glauced at some of the most besutiful objects in Paris, they will yet he ever engraven on our mind and we say of them as to a friend on parting, the source of the set of the F. L.

HACKNEY AND HOMERTON.

THE Rhine and Switzerland are more familiar to the dwellers in the western parts of the metropolis than are the lands which form the eastern districts of the same great eity. It is a pity that such should be the case, for if but a small part of their spirit of investigaliou and travel were diverted by those of the west to the opposite parts, heueficial results would be the consequence. We have from time to time directed attention to parts of London which to many were as unknown as are the partially explored regions of Africa.

Africa. Let us now glance at Hackney, Homerton, and the other neighbourhoods which adjoin the marsh-hauls. A line of railway skirts the north-eastern borders of London, and any visitor to the district to which we are hound may start from the City, or from Chal-farm, Camden-town, Islington, or other statiuns, and the "iron horse," as the old locomotive was first called, will, in a very short space of line, convey the travellet to the Hackney station. The grey old tower of the church which formerly stood here is a pleasant-looking object, and tempts us towards the pleasant-looking object, and tempty stola here is a pleasant-looking object, and tempty us towards the graveyard, which contains numerous memorials of the dead who have here integrated here show the stolar tempt dead who have been interred here about a century Some of those stones are illegible, and yet there are in Some of those stones are inegroid, and yet there are main dications of the ornamental sculpture, which also is fast vanishing. Here and there it may be noticed that all traces of lettering have disappeared, and nothing is visible except a faint indication of sume family creat: such objects remind one of the "vanity of vanities" of the "Preacher." The groups of trees, with perpathrough of the dil here will lace artists. It was a notice. Traces of lettering have disappeared, and nothing is such objects remindees of the "vanity of vanities" of the "Preacher." The groups of trees, with peep-through the "Preacher." The groups of trees, with peep-through of the oli belfry, will please artists. It was a prusse worthy feeling which caused the people of Hackney to preserve this portion of their church, for already have nearly all the picturesque features of the buildings been removed. In the main street the gabled houses

been altered into more fishionable shapes Plate-glass and other descritions have been brought into use. The building of shops on what were once the gardens in front of dwellings, and other usual works of progress are going forward. This neighbourhood is generally very open and there are planty of ex-tensive green places left in all directions. The streets and squares have no architectural heanty. Many of the ouses are of the unadorned style of the early George the Third's reign: they have a comfortable look, and convey a fieling of unpresuming respecta-Mixed with those are a few dwellings of date as old as Charles the First or Second's time, nice iron railing and pollard-trees in front. I are also the City of London Union, the Has with There the Hackney Union, churches, and some charitable buildings in this district which will attract notice.

Substantial and snug as is the general appearance of Hackney, it is, like other localities, unfortunately not without poor, neglected, and dangerons spots we would mention, lluidle-street, Abbott-street, and Fairey-street, as places which require very great im-provement: the drainage is bad, the closets are bad, the payment had ... "The houses none in fast ein" the parement had. "The houses were, in fact, sir," said a tenant, "hult with a prospect to sell:" and here is the sure result—small-pox very prevalent, and typhus fever common. We had some d fiently in finding an "old in-

habitant," many of the persons to whom we applied for information having only for a short time resided ere. The general impression seemed to be, that the there. The general impression seemed to be, that the place was remarkably he-lthy. A genuleman who had resided in a coofined part of Whitechapel, said that during his residence there he was serredy ever out of the doctor's hands, and that since his removal here his health had wanderfully improved. After a careful inquiry amongst various persons, we hear of no particular cases of agne. In the llackney Union, which contains the poor of a population of 63,000, there was hat one case at the time of any visit there was but one case at the time of our visit which at all approached towards this complaint, prevalent in parts of Bedford-hire and Kent. One of the medical attendants of this scenningly well-managed institution, stated that the neighbourhood had a high character for health : the water-samply from the E st-Lendon Company was good ; and that as regards the exhalation from the marsh, he thought that the clevated position of Hackney and Homerton might in some degree cause it to esample the injurioueffects. However that may be, it is certain that pre-ventible diseases here are rather to be trared to the ill-drained spots than to mists from the marsh. In making this statement it must be borne in mind that the neighbourhood is open, and that even most of the courts of which we would complain are open towards

"We are getting on here, sir," said an intelligent shopkeaper: "we are putting a new face upon things; hut would you please to step to the back of my premises, and look at an old-fishioned nuisauce, which I would be glad if you cruld asist me in getting rid of." Accepting the invitation, we proceeded as di-rected; and, over a paling, sw the Hackney Brook flowing amougt the honess, much in the same fashion as the Fleet Ditch did formerly at Clerkenwell. Into this "fronck," or ditch, a considerable part of the drainage of Hackney and other places is passed. The condition of this stream should be considered, far according to present appearances, it may be loug beaccording to present appearances it may be long be-fore the great scheme of the drainage of the mctropolis will be executed.

In passing over this neighbourhood, it is a pleasant sound to one's ears the brar that music of progress, the puffing sound of the locumotive, the breathings of which indicate wonderful and speedy changes in this and other metropolitan suburbs. Ere long we hope that the railways, and the advanced intelligence of the that the railways, and that the railw-ys, and the advanced intelligence of the industrious classes, will lead to thousands of homes being made on open ground,—well-drained and whole-some places. Here, however, straight bifore us, spreads the marsh,—lawere fields of cabhagrs, oaions, and other vegetables form the foreground, which is hroken by trees, palings, and dung-heaps. When looking at this view, we through that both De Wint and Cox might have pieled up nice bits of seenery here, that would have caused many to exclaim, "Have we such pretty quiet seenery as close to London ?" At the time nt our list visit a slight fog hung over the hand, and thunder-clouds rolled up in over the land, and thunder-clouds rolled up in the distance. Seen under such eircumstances, this large level space, leading towards the Thomes, and reaching far in the opposite direction into the country, had a heautiful effee

[Dec. 26, 1857.

hricks and mortar seem struggling to meet the inclusion and more scenn studgeng to meet the neighbourhoois of Cauning town, &c. which are far-ther east. Amongst the unhealthy districts, Lea-bridge was mentioned, and to this spot, so well known by many a bunble disciple of honest Isave Walton, let us move on. This place is increasing, and hefore many years pass it will contain a large population. Independent of any matrix from the mursh, the posi-tion of this group of bonses is such, that fever and other complarus may be easily accounted for. The Leariver, which passes through the place, is in its ordinary suffice very little below the ground-floors, in which families sleep. The drainage is not cared for although the steem where aleas to many of the for, although the stream runs close to many of the but a distance in the stream runs close to many of the buses. At the last attack of cholern, there was only one futal case at Lea-bridge, and that occurred in a house where the dwellings are placed back to back, and neither well drained nor ventilated.

and neither well drained nor ventilated. The absence of hedges or walls is a peculiar feature of the marshes. The hand is, however, divided by numerous shurt wooden posts, which separate the pro-perty. This large tract of "Lammas land" belongs to the parishiourers of Hackney. The high lord, as he is called, hus certain privileges, but from August to April the land is free to any inhabitant for the purpose of grazing cattle. During the remaining months the property is claimed by certain individuals who grow large erops of hay upon it. If our readers will take the map, they will perceive that several streams of considerable volume flow through : the ebief of these is the river Lee. A few years since ebief of these is the river Les. A few years since this river, into which a considerable quantity of sewwas delivered unfiltered to the dwellers of E st London.

East London. Now, however, the water supplied by this company is brought by a canal, which draws the water from the river Lea at a considerable distance from town, where the water may be considered as pure as most country streams. The sewage of Tottenham, &c. is now intercepted; the river Lea passes through Lea-bridge; the other stream is received at the large works which have been recently put up by the water company for filtering and sending it to London as pure as may be. A yerv intelligent person whom pure as may be. A very intelligent person whom we met with here directed attention to the difference of the water in the river and the canal, and remarked that he had formerly for many years been acquainted with the nature of the water supply delivered to the unfortunate dwellers of Lamheth and Vauxhall. From the Thames he has known the water which was pumped up to be so foul with the sewage that the smell was so had that it was difficult to keep the men at work. It appears that it was diment to keep the first at work. It appears that by an enactment of Parha-ment they were obliged to pump at low water. Respecting this our informant said "Nothing could be worse than this plan; the water was little better than the Fleet-ditch, and this, with very little refin-ing, was sent for men, women, and children to drink." Truly the water supply of a great eity is a most im-portant business — a matter of life and death to thousands; and it was with no small pleasure that we saw the means which are being used at Lea-hridge for tbe purifying this important necessary of life. Here the water of the canal flows in continual stream iuto the large filtering tanks which are at work night and day, and it is a henutiful and most pleasant sight to look into the receiving chamber, in which the water is con-stantly in a condition fit for use. So clear is it, that the little fish may he distinctly seen at the depth of several feet. From hence the water is conveyed by pipes to London. A sterm-engine of immeuse power assists in this operation : this is constructed on Bolton assists in this operation : this is benchruced on borton and Wat's most improved principle; and there is in most eyes something exceedingly grand in the slow, yet secunigly irresible force of this monster, which, by the ponderous movement of a ram weigh-ing over 50 tons, forces the water amongst six or serven hundred thousands of people.

ON THE FOUNDATIONS OF SOME OF THE METROPOLITAN BRIDGES.*

Waterloo and London Bridges, which were both built hy John Renaie, have both the same kind of foundations. Waterloo-bridge, built in 1809 to 1817, has nine equal semi-elliptical arches of 120 feet has note equal semi-emploted arenes to 1.20 they span and 35 teet rise; and Londou-bridge, built in 1825 to 1831, has five semi-elliptical arches, two of which are 130 feet spon, two 140 feet span, and the centre arch 152 text 6 inches span, with 37 feet 6 inches rise; it is 52 feet wide, none of the other bridges, the state of the span set of the state of the state of the twint of the state rise: it is 52 feet which note of the other indiges, meluding Waterhoo, being more than 45 feet wide. The foundations of both these hridges were con-structed in coffer dams. Into the construction of coffer dims it is not now proposed to enter, their object, their purposes, and their delails being well under-

the country. We nre getting on here, sir," said an intelligent THE BUILDER.

stood in this room. The entire area of the bases of the piers is piled with elm piles, about 20 fect long and about 3 fect apart, and which penetrate the Lon-don elay, in the esse of Wat-rioo-bridge probably to a depth of 18 fect, and in London-bridge about 18 fect 9 inches or 19 fect. On the beads of these piles were haid sleepers, and the loose earth between their heads was replaced with rubble concrete, on which blocks of Branley Fall stone and brickwork filled up the spaces between the pilo-heads, immediately below the platform of oak planking which carried the first course of granite masuru v. The entire area of the bases of stood in this room.

The pastern of one pointing when carlied the first course of granite massin y. The p essare upon each pile in London-bridge has been estimated at eighty tons, or about five tons per foot superficial on the entire area, and this is considerfoot superficial on the entire area, and this is consider-ably below what the piles would actually earry. The difficulty of applying sofficient dead weight upon piles, to ascertain their bearing powers in equilibrium, has always prevented the formation of any formula or data on which conjencers can base their experiments. The piles are driven, and the pressure they must be sustaining is then calculated after the load is on, no maximum having been ascertained. At the border-bridge on the Newenstle and Ediuburgh Railway, the elaulation aboved that cook nile must be sustaining orige on the reversite and Europin garmana, see calculation showed that each pile must be sustaining a weight of seventy tons. The pressure on each pile of Waterloo-bridge is probably somewhat less, but still it must amount to at least sixty-eight tons.

and it has a mount to at lease stay regit to as. London-bridge has a close pile sheeting all round the platform, which penetrates about one-third of the distance of the main bearing piles. Waterloo-bridge does not appear to be so protocol, yet London-bridge ages not appear to he so protected, yet homoteching after the removal of the coffer dams settled in every pier from 6 inches to 10 inches towards the down stream : this was attributable to the entire area of the river substrata finding their proper bearing after the disturbances to which they had been subjected by the disturbance of the continues of the continues the disturbances to which they had been subjected hy the piling of the coffer dams and of the centrings. The coffer dam above bridge was in 35 feet of water helow low-water mark, and the piles were conse-quently very deeply driven, and though those which were near to the piers, or could apparently affect them, were not drawn but ent off, the mass of the clay had received a disturbance which settled itself probably once and for ever, and if the bearing areas and the tenacity of the piles are sufficient for the superineumbent pressure, no further settlement need be apprechended. need be apprehended.

need be appreciented. Southwark-bridge, also built by John Rennie, was creeted in 1814 to 1817: the spans are 240 fett in the contra ereb, and 210 feet each side arch. The arches are segmental in eight east-iron ribs, and rise about 22 fet. The two piers are each 24 fett wide : they were hult in coffer dans upon piles which were lower 8 fet include rate of correct data on closer and 20 they were hull in coffer d uns upon piles which were about 2 feet 6 inches apart, or even closer, and 20 feet deep: the drawings, which 1 have been enabled to examine, represent about 286 piles under each pier: the platforms for the first course of unsoary were made in a similar manner to those of London and Waterloo Bridges, and no settlement has taken place as far as I can learn, nor has any repair of moment to either sub or super-structure ever heen necessary. necessa

Nauxhall-bridge, hy James Walker, was built in 1811 to 1816: it consists of nine segmental iron arches in ten ribs of equal spans of 78 feet, the rise being 11 feet. The foundations were laid in caissons, which were sunk down to the Londou clay, the river being dredged I believe in its entire breadth for that being areaged 1 beneve in its entire breadth for that purpose: the footings are in stone, no subsidence has been recorded. I have not been able to learn the precise means taken to prevent the scour from under-mining the caissons, but I believe the Kentish rag and hallast were thrown down around the piers in vast emanifies. quantities.

Hungerford-bridge was huilt by I. K. Brunel in ⁴ Hungerford-bridge was huilt by I. K. Brunel in 1844. The foundations of the two piers which earry the chains, rest on a bed of gravel which is stated to be as hurd as a hed of artificial coverte. No piles were used in the foundations, a coffer dam being formed round the piers, and the ground was exca-vated down to the hard gravel which was found about 6 feet helow the then bed of the river. Below the mud (and until the hard gravel was met with) gravel of a looser kind was encountered. On the Hunger-end Machet ain of the bridge at the monting Birts. mud (and until the hard grave) was mee wind) grave of a looser kind was accountered. On the Hunger-ford Market side of the bridge at the mooring piers, the ground was very bad: piles were here driven to the depth of 30 feet. Mr. Brunel terms the beds on which the bearing piers rest, two cases of hard gravel (as nard as concrete) forming a neutral formation, situated in the midst of a looser soil.

After this description of the different foundations of the pirer of the bridges which are in existence in the river Thames, it will be seen that the conclusions which must be drawn from the practical experience of those foundations which have failed, and those which have not, are very limited, but they are at the same time very clear and simple: the bed of the river have failed were built—a fact occasioned by the in-

creased scour produced by the removal of tan dam which old London-bridge afforded--the contraction of the waterway hy the projection of embaukments, and though last, not least, the hallasting which for a long period constantly proceeded above the hridges, and though not a screat creater are added to be affected. period constantly proceeded above the involge, and though now to a great extent prevented, yet sufficient from the dredging operations as well below as above bridge to deepen portions of the waterway by some inches annually. This deficiency is not mode up again by the deposit of gravel or ballsat, for the deposit of the Thannes is silt, sand, and mad, and the original gravel-bed of the Thames has been so reduced by gravel-hed of the Thannes has been so reduced by dredging, and by the secur consequent on changes in the waterways, as to be now only existing in sofficient thickness to be built on in cases as they were termed by Mr. Brunch, such as the parts on which the Hangerford-bridge piers were constructed. Wherever, therefore, we find the foundations have been made to depend on the gravel, and have not been taken deep into the London chy, failure has taken place. The piers of Hungerford-bridge, the only exceptions to this rule, are solightly weighted, and situated so fortu-nately for avoiding secur, and have heen so recently this rule, are so lightly weighted, and situated so forti-mately for avoiding scour, and have heen so recently constructed, that they cannot be said to disprove it. The rule of experience is, that in the clay only can a sure foundation be found, and no easings have yet been added to defective piers which have held the enclosed gravel into a sufficiently compact mass to prevent its sinking by loss of substance through the joints of pilings. Down to the clay, then, we must no for a sue foundation, and the different methods of effecting this are the only monits for discussion. is are the only points for discussion. The old snecessful examples in London are all of

The old successful examples in London are all of one class: they are coffer-dam examples, with the exception of Yauxhall-bridge and the new bridges designed by Mr. Page. Yauxhall bridge, as has bet a shown, was a caisson foundation earried to the London elay without piling, and the weight of the bridge is not sufficient to need piling. All the other sound bridges are piled deep into the blue elay. The shoul-ders and sides of these piles, and the surface of the elay between them at their tops, are the ultimate bearing points upon which presses the superstructure, whether of granite or stome conrese, or of compound concrete and wood, or of iroo. Theory would say, upon this foundation make the superstructure as light as is consistent with even pressue and avoidance of concrete and wood, or of iron. Theory would say, upon this foundation make the superstructure as light as is consistent with even pressure and avoidance of jarning which may cause motion: every pound you place on the shoulders of the piles, or upon the earth's surface at their heads, beyond what is required for incritum, is useless and superfluous. To maintain the piers in perfect inertion, and immovable nuder the pressure of water, floating ice, or drifting sniling barges, or unskiffally directed steam-boats, and the heavy road-traffic over the bridge, requires a much less weight thau would result in an equilibrium be-tween the bearing surfaces and the pressure of the vonssoirs for equilibrium, and almost any mate-rials the vonssoirs for equilibrium, and almost any mate-rials the an he used are in the tidal currents of our river sufficient for this purpose. It is perfectly true that London and Waterloo bridges would be abso-lutely stronger constructions theoretically, if their Intely stronger constructions theoretically, if their piers were not so enormously beavy, and were built of brickwork, or hollow. * *

With regard to the destruction of the foundations of piers in the river by scour, I think the ultimate depth of the secar will never, under any possible eir-cumstances, extend sufficiently for down the piles of either London, Southwark, Waterloo, or New West-misster, to cance any apprehension on this secre, and simply remewing the casing and filling round the piers with concrete will be enough to prevent their injury, shuild a tendency to scour be observed. The river has decpened only in pieces for some long time since its great decpening by the removal of London-bridge. When embankments are carried through on each side, as we must all hope they will be, and the channel narrowed, the equalisation of the depth will at that the prevent any serious increase of scour. With regard to the destruction of the foundations

show, us to interpret of the depth will at that time prevent any serious increase of scour. The methods proposed to connteract this effect by Mr. Cubitt and Mr. Hosking, would also prove effective to preserve bridges founded so deep as those piled into the Loudon elay, though they would out probably bare preserved either Westminstr or Bluck-trins. Mr. Cubitt proposed to pave the hed of the river with stones for a distance above and below the bridge of some 60 feet. J believe, as well as under the arches; and Mr. Hosking proposed a sub-weir of piles across the river to a height which should pre-vent the rush of water degrading the cristing bottom of the river, and he showed that ample water would

having, on the whole, very stendy tides, it is not probable that unforeseen and unpreventible injury should occur to deep-scated foundations, well protected in its bottom.

The inquiry into this subject has led me to seek in-The inquiry into this singlet has not the to seek in-formation as its any failures from scour which have occurred to bridges abroad, and I cannot find an in-stance of a deep-piled bridge while has failen : many have needed repair, nut most of them have of late been strengthened by throwing in concrete round the been strengtbered by throwing in concrete round the piles, and no question seems ever made of the stability of this enclosing modium, or of its tenacity to the wood piles. Indeed, the employment of conarcte by the French in hydraulite works is far in advance of our application of it litherto. They do not scraple to use it without any consenent whatever in the beds of swift rivers subject to violent toirents during

or switt rivers sougcet to violent toirents during floods. Upon the subject of the durability of the encess-ments of the piers at Westminster and Chelsea bridges there exists some difference of opinion: for myself, I think that if the hollow piles are filled with cement prout, they will, as respects the buried por-tions of the structure, and will be, as coopared with past constructions, whether Pelasgian Creations, and the structure, and will be, as coopared with past constructions, whether Pelasgian Creations of the day, unless some preservative is applied to them, they will not codure, probably, more than 300 years. It was Mr. Hawkshow, I believe, however, in bis evidence before the committee of the House of Commous on this point, who said that by the time that any decay of moment had occurred to the irou easing, the condition of the other portions of the structure would be so stable as to admit of its removal and replacement without danger, and when we con-sider what bits been done both at Blackfriars and Westminster, in the way of cutting at the old founda-tions, I have little doubt that these piers could be, with eare, re-encased without any danger to the found-tions with it much balavers promendencement balavers in the founda-tions with it much balavers promendencement balavers in the out with eare, re-encased without any danger to the founda-tions, which it must he always remembered are deeper tions, which it miss her average to have here, as we are the case at those defective bridges. Screw pilos might at any time be placed a short distance outside them without any risk from vibration or concussion in the strata

THE GREAT CASE OF STUCCO v. BRAINS.

SIR,-It is a great pity that writers like "Aris-des" will waste so much time and ingenious argutides tides "will waste so much time and ingenious argu-ment, through not first acquainting themselves with the most accessible and ensity learnt facts; and though, as one of the butts of his mistaken attempts at with, I might maintein a digmified resolve not to help him, I will, if you please, assist him to correct a fact or two, that will quite alter his whole data.

will, if you please, assist him to correct a last or two, that will quite alter his whole data.
I. He must be quite a stranger to England to sup-proached, as I believe all those of "Aristides'" have, in your pages before, and seems thought a capital comet-maker's erv. A little stay in any of our towns, however, will show him that if any of their 'e cannut architecture' approaches liveliness of colour, it is he-cause it has received within a year or two a cost either of pain to some other Juitzburg constite, without which periodical sloughing or monking (so 'good for trade,' and for some other Juitzburg constite, without which periodical sloughing or monking (so 'good for trade,' and for some other Juitzburg constite, without which periodical sloughing or monking (so 'good for trade,' and for some other Juitzburg constite, without which periodical sloughing or monking (so 'good for trade,' and for some other Juitzburg constite, without which periodical sloughing or monking (so 'good for trade,' and for some other Juitzburg constite, without which periodical sloughing or monking (so 'good for trade,' and for some other Juitzburg to good constitution of the source of the source of the theore one or porter owners may have left as long to its own numited cheer fulces. Now, whatever the object of these universal costs of drab or our national sacred ''stone-colour'' (a tint, by the way, that 1 do not be-livev people ever y et house for cheerfulnes, for 1 never say that is wood and plater houses of every light that the unthink of errorge this—even Rushin's aversion, buf, but not this holy drab): whatever their object, 1 suppose ''Professor A.'' as a professor of the noble seicace of mud-spreading, knows that they might possibly be applied on other materials than ecneat; and even if they could not, if this ground for them must further of necessity cover the whele building, with every appurtenance required by its structure, and also every one proper to another whole inaginary stone building, and be 'jointed

2. "Aristides" talks of stone as "the hest material," and "cement" as another, as if these were somehow interchangeable, or both fit for some coamon purpose, for which he mentions no other. New, I believe that among the endless eccentricities of our great architets, there is one piece of work, a medical college in Line-int-sinn-fields, where this substitution of *cement* to stone, as a building material, has been tried; but the coumon practice of mankind in every place where stone is not at band, has minformly continued the old choice made at Babel, of brick for its substitute, and not cement. I am quite ready to admit, on valid proof, that all this is overturned hy the above innovation, or hy Paxton's; but our friend is arguing about present material.

admit, on valid proof, that all this is overturned by the above innovation, or by Paxton's; but our filend is arguing about present materials. 3. There is no "cry against cement" that I an aware of. 'The "puritableal" cry that "Arisides" and his whole craft will yet find too strong for them, is only for the right thing and person in the right place, and no mimicry of one by another; a designer at the drawing-hoard, for instance, and not a smeaking mimic of a man-milliner, with stone and brick for lace and crinoline. 4. Whether "the cont on a man's back is a sham"

4. Wbether "the cost on a man's back is a sham " depends on whether it is so designed as to pass for a cost, or for something else. We appland in their right place, costs that represent well a suit of armour, or a man's skin, or a dragon's; but I never heard of a gentleman wearing then, and in the street. Now, just as little does any Englishman, or body of Englishmen (except perhaps the Pusepite elergy) desire their huilding's cost, when it has one, for a building. But this, our poor deladed Mr. Bull is ohliged to have all neighbours (seve his own child Jonathan) and the illimitable absorption of degraded lahour into the algorithm of the illimitable absorption of degraded lahour into the algorithm of the illimitable absorption of degraded lahour into the algorithm of the illimitable absorption of degraded lahour into the algorithm of the illimitable absorption of degraded lahour into the algorithm of the illimitable absorption of degraded lahour into the algorithm of the illimitable absorption of degraded lahour into the algorithm of the illimitable absorption of degraded lahour into the algorithm of the illimitable absorption of degraded lahour into the algorithm of the reference that even in "per-centage-on-the-outlag". *Laking* agents are fine-artists. This is the only down and bleck either with the "architects" or the public? Costs on huildings have been used everywhere 5,000 years, without its ever courring till the last 50, or perhaps 100, to pass them for no coats, but for huildings, whether in stone or cemment, as at Fiorence Cathedral, S. Sophia, or even a medieval plastered in, required some, however little, of the designer's cone work shut is seried of the designer's cone work shut form men paid not by their own work, but a per-centage on other people's. Is it a very singular coincidence that this is all poor Mr. Built can get, form men paid not by their own work, but a per-centage on other people's? Is it at all singlar that from snch a "profession" the fidals he can get nothing claes, fret and f

puritanical to cry against cement. 5. We are told this is "one of those virtuous notions which every one re-echoes, and all practically disregard." Will Aristides he pleased to show us where the faic Pugin, or Messrs. Street, or Woodward, or Seddon, or Scott have disregarded it? If not, here are three facts he mistook in a breath :--(I) There is no such "cry :" (2) though none re-echo the "notion," many do practically regard it; and (3) it is no "virtuous" notion, being the easiest possible to earry out by good or had, real or unreal, designers alike.

by good or had, real or unreal, designers alike. 6. The "ery" might nettally lead us to a ceiling "showing the timber joists. Such are the absurdities to which," &c. Oh! absurd world and miscrable mankind, to have lived some 50,000 years in such absurdities! Happy nineteenth century, to be delivered at length from the perpetaal sight of absurdity! And yet those dolts, the painters, actually still imitate this, expect us to take pleasure in the disprace of our ancestors, and joists! No wonder the Royal Academy excludes architecture: Aristides explains it all. 7. What Goth can have todd him that the 't was (of

7. What Goth can have told him that the "use (of ement) in their style would he monstrous"? In their style indeed, if the middle ages are any authorities in it, all cement had the harbarity to show itself openly to be cement (and that managed by an original designer), and host stone, masoury, mouldings, curvings, and huildings. Which is the more "moustrons" may

about the function of the state bolding's light, from that the distribution that has chiefly, or perhaps solely, given it its peculiar solemn beauty, as the only dignified church-interior in Lon-don, and I believe the most so in England. That decided predominence (as in a Freiche athedral) of the central light over that of all the aisles was gone, and the latter glaring as in a modern church, as if the aisle window so have hence we time so if the aisle windows, so long before our fine eleared of all beauty and art (to the adaission of ahout four times the light they were intended for), were now even enlarged. However, I saw no change were now even enlarged. However, I saw no charge in *their* shabhy casements, hut fir overhead in the "elear" story, found five windows filled up with either deep and heavy-coloured glass pictures, or Turkey encycl designs (for you must mount at least to the triforium to ascertain which); hut apparently claho-rate pictures, which, if fit to be seen, would be the recepterates, waire, if it to be seen, would be the exact things wanted in the aisle windows: so that I presume they are not worth much, or would not be put (in a building only 30 feet wide) just 100 feet above the spectator, where they can be just as well understood as in the lattern of St. Paul's, nor need as sup-blicks, a permose screed as well by a little us sun-blinds, a purpose served as well by a little rough plate-glass (to say nothing of the light artistic mosaics of the Cologne and other clear stories); nor access of the object has bonne that some for which the said clear story was built; and, if they are continued, to reduce the poor old building at last to the valgar English type of a church, *lighted from below*, which is utterly fatal (as Mr. Pergusson says), to all digni-fied effect. I looked again at the world aisle winand effect. I looked again at the world laste win-dows, and thought life is really too short to he squan-dered in perusing men's optimions who can do such things as these; so I came out wiser, and have not read Mr. Scott, any more than I should go to learn mechanics of the engineers of the Leviathan. His works would prohably yield me new and valuable truths; and so may any fragment of print that we tread into the mud, but it hecomes impossible in these days to earry out the Mussulman rule of leaving no scrap unread that may contain some word of Allah. Assuming that Mr. Soch is rightly quoted then, I should say he ought to have looked more than whitewash-deep for the "accursed thing." Whatever materials, or practices either, you may proscribe, others as vile and delusive will immediately arise in a subtler form, and you will find only false and delusive design is to be had after all from a delusive profession, from outlay-paid (that is, paid for other men's work) designers. E. L. GARBETT.

INSTITUTION OF CIVIL ENGINEERS.

On the 15th inst. the general annual meeting was held, Mr. Stephenson, M.P. President, in the chair. The report of the council for the past session, which was read, referred to some of the more important engineering works in progress or recently finished. Among the works in an advanced state, the thridge erecting by Mr. Brunel, V.P. on the Cornwall Rail-

Along the works in an avanced state, the hindge erecting hy Mr. Brund, V.P. on the Cornwall Railway, for carrying the line across the River Tamar, at Saltash, near Plymouth, was prominently alleded to. This bridge, including the land openings, would be about 2,200 feet in length, and would eonsist of nineteen opening, two of 455 feet span each, and the others varying from 70 feet to 98 feet in span. The latter were formed of simple wrought-iron girders, but the two main openings were to he spanned by longitudinal heams, suspended by long-linked tension chains, rendered rigid by vertical stutts and disgonal hracing, from arehed tables of wrought-iron plates. The horizontal axis being 16 feet 9 inches in length, and the vertical axis 12 feet. Each tube with its chains and suspendic roadway would weigh should 1,050 tons. The first was floated on the 1st of September of this year, was conveyed upon pontoons to its site, and was placed upon the piers in about two hours. It was now being filted by hydraulic presses, and the process was progressing very satisfieldily.

placed upon the picrs in about two hours. It was now being lifted by hydraulic presses, and the process was progressing very satisfactorily. The Rivington Waterworks of the Liverpool Corporation, constructed by Mr. Hawksley, M. Inst. C.E. were brought into operation in the early part of the present year. The works consisted of several impounding reservoirs, two of which had embankments of nearly 100 feet bigh, and two others with embankments of about 50 feet bigh. These reservoirs held about three thomsand two hundred million gallons, and were intended to deliver about fourteen million gallons gallous per day to the mill-owners and others whose

[Dec. 26, 1857.

admit two opinions. Perhaps, however, those ages are not so great an authority as Mr. Scott, for I herr ramours of his discovering in poor barmless-looking silicate of lime "an accursed thing," Now I must apologize for quoting this once, io Aristides's own way, at second-hand. I had promised myself the placeur of reading Mr. Scott with eare; but a certain late sormon or lesson in Westminster Abbey changed building's light, from that fine distribution that has ehiefly, or perhaps solely, given it its peculiar solem beauty, as the only diguided church-interior in Londo, and I belive the most so in England. That and reided predominene (as in a Freich enthedral) of the cartal light orry that of all the aisles way is if the aisle windows, so long before our time leared of all beauty and art (to the admission abit four junction that has if the aisle windows, so long before our time (*learr*' story, found five windows filled up with either mit *four* stacky, found five windows filled up with either mit of the corner enlarged. However, I sawn ochang. In addition to Livourg sopplied with water, lard anouuted to about 550,0007. Hence the total cost, about four times the light they were interded for), their shably easements, hut fir everhead in the "clear" story, found five windows libel up with either there and heavy-coloured glass pictures, or Turkey wat more that 30, Perhead. The two works togeenred designs (for yon mist mount at least to the "thorman to accertian" which), but apparentily claho-

The statement of the receipts and expenditure showed that there was a belance of upwards of 700?. in the hands of the treasurer.

After the reading of the report, Telford Mcdals were presented to Messre. D. K. Clark; R. Huat, F.R.S.; G. Rennie, F.R.S.; and W. B. Adams; and Council Premiums of Books to F. R. Wiudow; G. B. Bruce; A. S. Lakin; C. E. Conder; W. Bell; F. R. Couder; and T. Duan.

Council Premiums of Books to F. R. Window; G. B. Bruce; A. S. Lakin; C. E. Conder; W. Bell; F. R. Couder; and T. Dunn. The following gentlemen were elected to fill the several offices on the Council for the easing year :=-Joseph Locke, M.P. President; G. P. Bidder, I. K. Brunel, J. Hawkshaw, and J. R. McClean, Vice-Presidents; W. G. Armstrong, J. Cubitt, J. E. Brinigton, J. Fowler, C. H. Gregory, T. E. Harrison, T. Hawksley, G. W. Hermans, J. S. Russell, and J. Whitworth, Members; and S. Wood and M. D. Wyatt, Associates.

ANCIENT BRICKS.

As a *pendant* to the article on ancient and modern hricks in last week's number, perhaps a few particulars, which I have gathered from the account of Lord Macartney's emhassy to China, regarding that stupendous piece of brickwork, *the world*, might have some interest.

some interest. The dimensions of the bricks seem to vary (according to their use); those in the front of the walls heing 15 inches by T⁴₂ inches by S⁴₂ inches, and those for paving, 15 inches square. The bricks are fire-hurnt, and of a bluish colour. The faces of the wall (which batter) are timished with moulded, not cut, bricks. The quoins of windows, doars, embrasures, and salient angles "in" the towers, are of strong grey granite, containing but little mica. The joints of morther are about half au inch thick. London thrickwork, with its - niches, festoons,

Londou hrickwork, with its niebcs, festoons, pilasters, consoles, cornices, architraves, its pauellings, and its unique windows, heads, such as at No. 5, Bow-churchyard, is a study in itself. S. C. R.

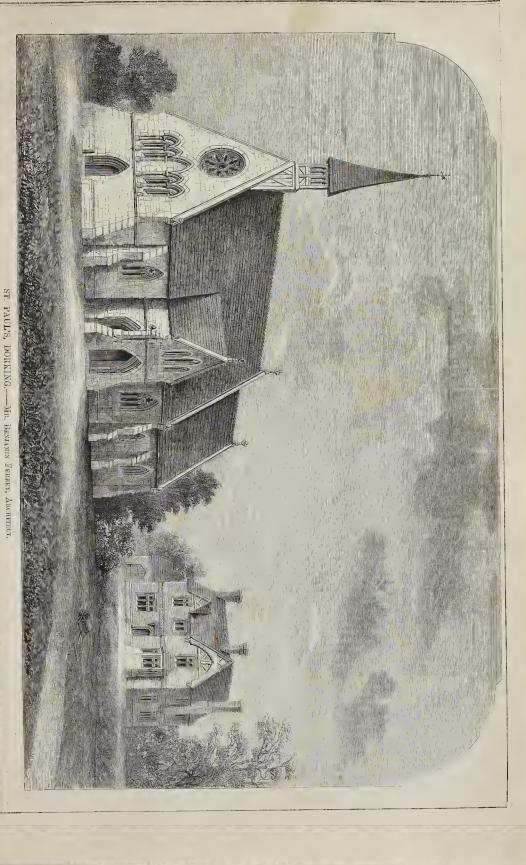

ST. PAUL'S CHURCH, DORKING.

The church and parsinge, represented in our engraving, stand on a sloping piece of ground, in the outskirts of the town of Dorking, near the Deepdene, the residence of Henry Thomas Hope, esg. by whom the site was given. The church is built of Bath stone and finit: the roofs are covered with tiles. In style it is Early Decorated, or Geometrical. The interior is fitted up with open stained deal seats, accommodating between 500 and 600 people. There is a small western gallery, forming part of the solid construction of the huilding supported on stone areading. The east and west windows are filled with painted glass, by lindson. The walls of the interior are ornamented by eccelesiastical devices, in stamped stucco. The west gable terminates in a hold oak shingled bell-eot. The church and fences cost about 2,7007. The parsonage adjoining is of new briek and stone dressings, and cost 1,5007. The church and parsouage are built at the sole expense of John Laboucherc, esg. of Broomehal, who has also liberaby endowed the church. Mr. Ferrey, of London, was the architect. The contractors were Messrs. Shearbarn and Son, of Dorking.

READING-ROOM AT A MANUFACTORY.---The workmen at Messrs. Mandslay, Sons, and Field's, engineers, Lambeth, have voted an address to their employers for plaring at their disposal a comfortable reading-room and mess room.

THE BUILDER.

755

THE ATTEMPTED LAUNCH OF THE " LEVIATHAN.

Str.-It is very satisfactory to unany of us who were watching and wondering, to find that your judicious and well-uncrited observations of Friday, the 11th, have changed the tone of the daily press. Up to that time they had believed what they were told, and taken everything for granted. They have since the have ideation consider their own indement and taken everything for granted. They have since then, I am glad to see, exercised their own judgment more upon the matter. Mr. Yates's avoval of his ntempt for the press has probably aided in opening cir eyes. The doings at Poplar have been anything their eyes. there eyes. The dougs a replace has been any time but need to English reputation. The Mechanics' Magazine, following your lead, says,—" Was ever such a spectacle witnessed as thousands npon thou-sands have for works past heheld on the Thames an English engineer, at the head of multitudes of mechanics and labourers, breaking ponderous engines, rending enormous eables, crushing solid masses of timber, bursting strong iron vessels, foreing up the timber. timote, birsting strong from results, fording by the soil, tearing up the very bed of the river, expending vast sums of money, impoverishing shareholders, rain-ing the vessel herself, spreading terror around, im-perilling life—keeping this up day after day, week after week, and even month after month, and all in order merely to *lower* a ship from the shore to the shore life.

Much misinformation has been given to the public is gradiloguent terms: compare, for example, the description which has been circulated, prohably from official sources, of the "lanachiog ways" and the "check-tackle," with what is actually the case. Of Of the former it has been said,-

the former it ins been said,---"The arrangements for langehing her were directed by Mr. Brunel, who has planned two inclined ways from beneath her, to a distance of 300 feet down the bank of the river, on an inclination of 1 in 12. These ways are about 120 feet wide: the distance between them is also 120 feet, and the substructure, which carries the rails, and npon which the cradles are to slide, are of im-mensestering th and solidity. Under each way are driven seven rows of piles, the four outside rows having piles at the distance of every 3 feet, while the three inner rows down to the gravel heid of tha two. The pulsation of the ability bottom, and extending to low-wider mark on the bank. On each side of every row of piles, are timbers the ability of each way. The whole is covered with concrete, to a thickness of 2 feet; and above are longi-tioning the whole is securely boiled together, forming the present inters of great strength, running the entitie length of the way. On the top of these, placed trans-versely rate induces of secure bolted together, forming which the ship is to be overed of the Three the the ship of the the site is the owned on the Great Western princh the ship is to be overed of the Three two security prince the ship is to be overed of the three there former to the theorem and extremely the owned of the the these here the ship is to be overed of the Three tweethy of prince the ship is to be overed of the three tweethy of the distorement.

The difference between the manner in which these ways were constructed and that described above, is very great, as the following account of them will sh

snow. The first step in preparing for the launch was to elear away the mud and dirt to a regular inclination of 1 in 12 from the ship down to low-water mark; after which, the five rows of piles forming each way, and varying from 25 feet long near the ship, to about 6 feet near low-water mark, were driven; the two other nears on each side of each way were pitched 6 feet near low-water mark, were driven': the two outer rows on each side of each way were pitched 3 feet apart, and at a distance of 20 feet inside them, another row; but these inside rows, three in number, were pitched 6 feet apart, so that the bereadth of each way, viz. 80 feet, was divided into five stripes, of 20 feet wide, extending from the bottom of the ship down to low-water mark. To the sides of these piles, just helow their tops, halks of timher, called waling-pieces, each about 12 inches square, were holted, ou the outside of each row only, by 14-inch from holts, and the surface of the nud over the area of 80 feet wide, was then covered with a layer of enoreste wide, was then covered with a layer of concrete, harely 1 foot thick, upon which other halks were laid, about 2 feet apart, and in lines parallel to the rows of piles; these halks were also about 1 foot square, and concrete was then put into the empty space between them, and levelled to an even surface with their tops; so that instead of the ways being constructed on "2 feet of concrete," the whole super-structure is carried apon only "1 foot" of this ma-terial, and the support derived from the holts in the volume increase.

waling-pieces against the heads of the piles. As an instance of the amount of calculation and As an instance of the another of this famous lanching exploit, it may be mentioned that when the ways were completed it was "found" that they were not wide enough ; that is to say, that they were not suffiwhile enough; that is to say, that they were not sum-cently strong to carry the great weight about to be "lowered" down them, and the consequence was that each way was increased in wildlib by an addition of 40 feet 11 which was done by driving a row of piles on each side of each way, at a distance of 20 feet from each outer ooe, thus making the rows of iles in each way each way each and be appendent. The from each outer ooe, thus making the rows of hoth in freseo and distemper, in which he received instruction from his brother Bernardo. He soon the constructing the part already completed. What addition this made to the first estimate for the launch See p. 732, ante.

THE BUILDER.

We find from the above that the "check tackle and machinery were found to work admirably, and showed how completely the movements of the monster could be courbilled, and that their necessity and effi-eiency in controlling the descent of the ship, were fully proved at the first attempt to launch. This, Tuny proven at the first attempt to faunch. This, No doubt, reads well, and looks remarkably grand; but so far from their efficiency having heen proved, or their having in any way been shown to he of the slightest utility in checking the ship, the contrary is satisfactorily proved by the fact, that when the ship stopped after her first morement, and at the moment is war smoothed, that the ways held but this, "check it was reported that she was held by this " check tackle," there was, at least, one foot of slack be-tween each cradle and check-dram.

Another circumstance has proved the complete Another circumstance has proven the compact usclessness of these costly appendages, viz.—that at every renewed attempt to launch, and with everything slack, and nothing to stop her but "friction," it has heen found nearly impossible to start her, or keep her in motion with the overwhelming power applied to get her along.

Instead of carrying on a set of vagaries (dignified the title of "experiments") with a couple of pieces balk, some rails, and a few tons of iron, in order "discover" (?) the amount of triction of metal of balk, some rails, and a few tons of iron, in order to "disenver" (?) the amount of triction of metal upon metal, which, by-the-by, I remember was done some therty years since by Morin and others, it would have heen far better to have profiled, io this instance at least, by the experience of others. I should think Mr. Svott Russell must feel happy in having no share of the reponsibility of this dis-acteons encineer, in lanceling resting mon his

astrons experiment in launebing resting upon his

The scientific public have already obtained an idea from your pages of the sort of secretary possessed hy the company, and it is unnecessary therefore for me to say anything on that head. AN ENGINEER.

EDUCATION AND PROFESSIONAL LIVES OF THE EARLY ITALIAN ARCHITECTS, PAINTERS, AND SCULPTORS : AS CONTRASTED WITH THE EDUCATION AND PRACTICE

OF MODERN TIMES.

WE now come to one of those masters of three-We now come to one of those masters of three-fold practice, of which the history of modern art-practice has produced no example, viz., --Aodra Orea,na-dioi, 1376-printer, sculptor, and archi-tect. In the introductory liues of this life, Vasari makes the following remark:--- We seldom find a man distinguishing himself in any hranch of act who

nan distinguishing himself in any hranch of art who cannot readily acquire the koowledge of others, more especially of those more immediately connected with that to which his attention was first devoted, and which proceed, so to speck, from the same source." Andrea was hore in Florence: his father was a goltsmith, of whom he probably learnt drawing and modelling: he then went to sindy senlpture, under Andrea Pisano. He then made attempts at painting, hoth in freeso and distempter, in which he received instruction from his brother Bernardo. He soon

would be an interesting item; but there can be no doubt that the *total cost* will form a valuable record for the ar-hives of the Institution of Civil Engineers, where they might be cruched as a sort of thing to be avoided, with a salutary effect. We now come to the "ultra scientife" "check-tackle," which is thus described :--began to excert painings. From the hale sequence ay these he was appointed to paint in the Campo Santo at Pise. During this time we have of his executing certain scalptures in marble; then relurning to Florence, he was employed as a painter. During this time he used to prepare designs for a hrother, who was a scalptor: he then took to studying scalpture was a sculptor: he then took to studying sculpture cornestly; and after this he (mark this, as in accordance with what I have said to be the secret of the success with what I have said to be the secret of the success of the working of the system of the times) took also to studying architecture with the utnost dilgence, "believing," says Vasari, "that he should find this also useful at some future day, as he did; for about this time the commune resolved to erect a building in which the eitizens might assemble during the winter. A competition, which was a favourite method in those times, was set on foot. Oregand's plans were found to be the hest, and the building, commouly known as the Loggia de Lauzi, was immediately erected under his superintendence." Vasari meutions rather au important error in the plasing of the Loggia, viz. that it faces the nowh, and in winter no one can remain in it for the sharpness of the wind, so that its primary purpose was furstrated. After liss he returned to painting; hut soon after it was resolved to creet the tahernacle in the Or San Michele; and resolving also that it should surpass all works of the The resolving all shalls have in the of this works of the kind hefore creeted, in design, workmanship, and mato-rial, they, in accordance with the principle of selecting the greatest artist of the age, whatever may be his peculiar walk, says Vasari, "confided the charge of the whole to Orengno, as being the most excellent artist of the age." He prepared several designs of the work, of which one was selected, after which those in authority gave up the carrying out of the work entirely to Orenagna. He then selected the first soulptors out of different constrints to do the other parts of the work, reserving the figures for hinself and his hordher Bernardo, the painter. Thus we have a striking example of the pratice of those times. Orengad's work was couply good, whether in painting, as shown in his selebrated works in the Campo Sauto; his skill adesign in the heautiful Logia de Lonz; --showing that the entitivation of the sister arts greatly assists in the culturation of the sister arts greatly assists in bringing out the powers of a man of genius in any one of them in which he may be engaged. We next come to one entirely given to sculpture, hut whose works were so connected with architecture, and whose life throws so much light on the practice of the times, that I accept the plea that he was eagged with Brunellesch in the works of Santa Maria, and include him with the architects to whom I allude.

Lorenzo Ghiberti (horn 1381, died 1455, whose works I consider the models of architectury whose ture for the present day, and the casts from whose works in the Architectural Museum and at the Crystal Palace I particularly recommend to your notice as objects of special study) was born in Florence. His father-in-law was a goldsmith, and from him he acquired his art, in which he speedly surpassed his rits fainter-in-new was a goussmot, and nou min de acquired his art, in which he specify surpassed his instructor; but his delight was in design and scalp-ture, and he soon hegan to employ himself in easting small figures in hronzy, which he finished very gracesmall ugures in monzy, which its instantiating ancient fully, in took pleasure elso in initiating ancient coins and medals, and taking portraits of his friends. After this we find him, having left the city on account of the plaque, working in Rimini, after the indiscriminate manner of those times, as a painter, in conjunc-tion with another in decorating a church. He, tion with another in decorating a clurch. He, however, still worked at sculpture, executing re-lievi in wax and stuceo and other materials, well knowing, says Vesari, that such relievi are the drawing exercises of sculptors, without practice in which they cannot hope to bring any great work to perfection. When the pestilence had ceased the signori and the Guild of Merchauts resolved to pro-ceed with the two doors of San Giuvanni. To select a master to design and earry out these they had re-course to rather a singular mode of competition, the object kent in view heime not directive to obtain the course to rather a singular mode of competition, the object kept in view heing not directly to obtain the best design, but to find out the best man, in all respects; and consequently, in all probability, in the end obtain the hest design also. To effect this they did not ask for the designs for the door as in an architectural competition, or for easts of the whole as in the late competition for the Wellington Monn-ment; and, indeed, as in the sculpture conpetitions generally. but a large number of fourien and other generally; but a large number of foreigu and other artists heing assembled in Florence, they hegan by selecting seven to compete; then selected a subject to he executed in bronze, and giving each artist a sum of money, they gave them a year to execute it in, and waited the result. When the time arrived, the screen specimens were given to the Guild of Merchants. At this time there were a large number of foreigners in this time torie with a large some semption, others gold-smiths. The Syndics, setting an example that might well be followed by all competition committees at the present time, invited these artists to give judgment on the works. The number of these with those of the same callion in Florence who were also invited, was thirty-four, all experienced in their several arts. These reduced the number to two, Ghiberti and Brunelles-thi; but the final decision forms one of the most honourable records in the history of art, and will alw oys shed a hister on the two cuinent artists, Brunelles-thi and Donatello, both competitors, more than all their eclebrated works. It shall be given in Yasari's words: "When Donato and Filippo saw the care and success with which Lorenzo had completed his specime, they drew side torethur, and conterring care and success with which Lorenzo had completed his specimen, they drew solide together, and couldring with each other, decided that the work ought to be given to him, because it appeared that the public advantage, as well as individual benefit, would be thus best secured and promoted; since Lorenzo, heing very young, for he had not completed his twenticht year, would have the opportunity, whilst exercising bis telents on that magnificent work, of producing these nolle fruits of which his the hield year, which have the opportunity, which, of producing those noble fruits, of which his beautiful story gave so fair a hope. They de-lared that, according to their judgment, Lorenzo had executed bis specimen more perfectly than any of the other artists, and that it would be a more obvious proof of eavy to deprive him of it than of re-tiltde to accord it to him." And would that the feelings with which all men looked upon the collected works of their fellow competitors were such as influence d these great men : zeal for the public advantage, that it should be served in the best manner possible; zeal for the art, that the man should be selected likely to carry out the work with the greatest beauty and perfection; and, finally, zeal for justice, that the premions should he given for the hest work. If such were the feelings of competition committees, would there he any per-isality or giving the work to relations of felow-thownstiality or giving the work to relations or fellow-towns-folk? For the considerations would be, will this fok? For the considerations would be, will fulls design early out most efficiently the purposes and intention of those who pay for it, and for whose use it is intended?—will this design further the art more than the others?—is it the most beautiful and com-plete, and will it reflect the most credit and fame on the architect employed, and the eity or community for whom it is huilt? Then, if these facts are granted, for whom it is huilt? Then, if these facts are rranted, it becomes uo longer a matter of choice, but an ohli-gation and matter of necessity, that this one and no other should he selected, or, to use Branellosch's words, " it hecomes a more ohvious proof of envy to deprive the artist of the charge and reward of carrying it out than of rectilude to accord it to him."

it out than of rectitude to accord it to him." This is the only code I would have binding on com-mittees or competitors. When Lorenzo had com-pleted this work, the Guild of Merchants gave him one of the statues on the Or San Michele, viz. of S. John the Bapits, but I shall not follow his works. Of his second door we have a cast in the Crystal Palace: he was continually employed in sculpure, hut even he showed some of that versatility which seems to he a nuarked characteristic of the elder masters. We find he prepared a model in wool for the charch of San Lorenzo, and that he gave his attention to various branches of art, and took delight in paint-ing and working on glass he made the windows round the cupola of Sta. Marin, and the three windows above the principal door; and, as I have previously mentioned, he was associated with Brunelleschi, his former competitor, in superintendence of that chirch, his former competitor, in superintendance of this chines. This, however, was an act of injustice, as Brunelleschi was the sole investor of the way in which the work was to be carried out, and, therefore, alone capable of conducting it, while Gniberti had never thought of it ill appointed his colleague. He died at the age of sixty-four.

We have next to consider the education and prac-We have next to consider the aducation and prac-tice of a great constructive architect, viz. Filipo Brunelleschi,—boro, 1377; died, 1446. We all know his great work, his great inventive skill, his great con-structive qualities, hut I think most people would imagine his early education to have been other than what it was. Let n see. His father wished him to be a notary, but seeing that his mind was constantly heat, on various incremions questions of art and wint it was. Let us seen this mind was constantly bent on various ingenious questions of art and mechanics, but seen jutter this more was constantly and then placed him in the Guild of Goldsmiths, that he might learn the art of design of a friend of his See how important this was thought in those times. No man was expected to rise in any hranch of art of constructives science that had not heme previously grounded not merely in the art of drawing of on some special useful practical branch such as sculpture or printing. He soons showed as in dasyne di Pistojia. He seems, however, always to have had a considerable mechanics lucture in his which his own hand. He was then saized with and of the stores with his own hand. He was then saized with a earnest desire to attempt the art of sculpture, which

led to his intimacy with Donalello: he then, says Vasari "gave his attention to many professions; nor had any hong time clapsed before he was considered by many good judges to be an excellent architect. At that time a statue of Linden Wood was required for the moste of San Spirito. Brunelleschi, being demany good hoges to be an extended was required for that time a state of Lindea Wood was required for the mooks of San Spirito. Brunelleschi, being de-sirous to prove that he could execute large works as well as small, undertook this. He then gave con-siderable attention to the study of perspective, the rules of which he mucb inproved. We next find his active mind busy studying the Scriptures, and the works of Daute. At this tune it was that finding fault with a ernedix of Donatello's, he received the answer of "Take wood, then, and make one thyself." which he did, and Donatello confessed himself beaten by the one produced, which is now on the altar of the chapel of the Gondi. We next come to the com-petition for the doors of San Giovanni, he also at this time made a design for the marble pulpit in the chareh of Sta. Maria Novello. But the study of architecture was now becoming predominant with him, and, selling a farm which he possessed, he set out with Donatello to study at Rome. And now we begin to find the infance of the change from Golitic to Classie, from picture-queness to measured proporhum, and, scling a term which he possessed, he set out with Donatello to study at Rome. And now we begin to find the inflamence of the change from Gothic to Classic, from picture-squences to measured propor-tions, from artistic design to mechanical imitation. "For," says Vasari, "they instanty made prepara-tions for measuring the cornices, and taking the ground plans of these editics, Donatello and himself abouring continually, and sparing neither time nor cost: no place was left unvisited by them either in Rome, or without the eity, or in the Campagna; nor did they fail to take the dimensions of anything good within their reach." Again he says, "Filipo had two very great purposes on his mind, the one to restore to light the good manner of architecture, which, if he could effect, he should leve no less a memorial of himself than Cimahue and Giotto had done; the cupla of Sta. Maria del Fiori, in Florence, the diff-cuities of which were so great, that after the denth of Arrulpho Lapi, no one had ever heen found of suff-cient courage to attempt the vanting of that cuppal, without an enormous exposes of saffolding. He did not impart his purpose either to Donalo, or any living sonl, bit he never rested while in Rome, until he bad well pondered on all the difficulties involved in vant-ing the Pantheon, and had maturely considered the means by which it might be affected." We have also from Vasari an instance of the value of poasessing a handieraft in the milds of his studies, we find, like many an artist-traveller in the present day, "that the money of Filipo falling short, he supplied the want by setting precions stones for goldswiths who were his friends." And now enne the occasion for which Brunelle-schi had so diligontly prepared himself. An assembly of architects and engineers was gathered in Florence hy the superimendents of the works of Sauta Maria del Fiori, to consult on the best means of raising the dome. I have not time to emerer into the difficulties, the disconregement, the ridicule of his schedes, t the disconragement, the reductic of his scheme as im-practicable, and other obstacles that Brunelleschi met with hefore he could pring the authorities to cutrast him with the work that he had so long set his mind on. We all know the result, and the details you can read for yourselves: sufficient has been quoted to show the character of the man and the practice of the times. One more ancedote I will, however, give, to show that his love of at was as great as his me-chanical skill. Donatdlo having described an antique vase at Cortona, "he became," says Vasari, "inflamed with such an ardent desire to see it, that, impelled by the force of his love of at, the set off as he was, in his mantle, his hood, and his wooden shoes, without say-ing where he was going, and went on foot to Cortom for that purpose. Having seen the vase, and being pleased with it, he drew a copy of it with his he had degried—all beliving that he uost be occu-pied in drawing or inventing sumething. Having the head enterident herewith to Florence before Donato or any other person had perceived that he had degried—all beliving that he uost be occu-pied in drawing or inventing sumething. Having cticable, and other obstacles that Brunelleschi met Donito of all believing that he must be occu-pied in drawing or inventing something. Having got back to Florence, Flips showed the drawing of the vase, which he had executed with much patience, to Donrho, who was not a little astonished at this evidence of the love that Filipo hore to art." To show his great zeal and activity in his long-cherished work, I will quote the following ont of a lengthened desarip-tion. "Perceiving the huilding to proceed rapidly, and finding all his undertakings happily successful, the zeal and confidence of Filipo increased, and he laboured perpetually: he went himself to all the ovens where the hricks were made, examined the elay, proved the quality of the working, and

same thing for the men who prepared the ironwork. During the time that this huilding was in progress he made models with his own hand for many works. He dict at the age of sixty-nine, and was buried in Sonta Maria del Fiori. Let us pass on to his friend Douatello, burn 1386

died I468; who, though he studied architecture with him in Rome, still continued to practise principally as a sculptor.

Vasari says "that he devoted himself to the arts Vasar says "that he devoted ministr be too the of design, and was not only an excellent sonlybor and admirable statuary, but was besides very skilled in works of staceo, well versed in the study of per-sective and highly estermed as an architect. Like works of stucco, well versed in the study of per-spective, and highly esteemed as an architet. Like those of Ghiherti, his works, as shown in the few casts in the Crystal Palace, and also in his works I have seem at Fiorence, appear to me to be especially valuable as models of modern architectural sculp-ture, and, helonging to a transitional period, thy arc precisely of that lype of perfect s-adjuter which harmonizes with Gothic architecture, and yet eventy with Itelian - and I would specially recomwhich harmonizes with Gothic architecture, and yet equally with Halian; and I would specially recom-mend the easts in the Crystal Polace to the notice and study of yong architects and architectural sculptors. Nothing is specially known of his educa-tion, nor is there anything particularly worthy of note in his practice, except his extraordinary and unceas-ing industry. The sumber of his works is extra-ordinary. The St. George, at the Or San Nichele, is one of his most beautiful works, a cast of which is in the Crystal Palace.

is one of his most beautiful works, a cast of which is in the Crystal Palace. An example, and the other of the theory of theory of theory of the theory of t

That is to say, like many of the present day his knowledge of art was more that of the scholar and That is to say, like many of the present day like knowledge of art was more that of the scholar and antiquary than of the practical excentral, such as the sculptor or painter, and even the architect conversant with these arts; and, according to Vasari, his practice showed his wat of this sort of knowledge, for we find the following passage:—"Leon Batista would not have fallen into this error if to the knowledge he possessed and to his theories he had added the practice and experience acquired by actual working: another would have taken pains to avoid this difficult, and sought rather to secure grace and benaty to his ciffice." That is, that when a man is tangkit the theory of architecture alone, and the manner in which those of hygone times worked, and to this adds learning, know-ledge of construction, and mathematical skell, his work is nat to be more scholarly than artistic, as in this instance to which Vasari allades, viz, the apse of the Ningiata in Florence, in which Albert i thought more of the different intricacies of the plan and the correct-ness of the proportions, according to the antique than to the heauty and happiness of the cifferet of his building. Bramante, painter and architect, %c. hergan his

The set of the proportions, secording to the antique than to the heauty and happiness of the effect of his building. Haramate, painter and architect, &c. hegan his education by studying the works of Tra Bartolomeo, but heing more inclined to the study of architecture, he moved from Urhino to Milan, for the purpose of examising the Duono. His first work in Rome was to paint the arms of the Pope in freeso over the door of San Giovanni Laterano: he then studied the anti-quities, making accurate measurements, and in no long time had examined and measured all the huildings of antiquity in Rome and in the Carapagon, also in Naples, and wherever ancient buildings were to he found. He thus attracted the notice of the Cardinal of Naples, who appointed him to rebuild a cloister in Travertine: he was thus introduced to the Pope, and facily prepared the first deisga for St. Peter's. We see that by this time the mode of education and prac-tice had much altref and that, though we find this farchitet brought up as a painter, yet bis subsequent education did not differ much from that considered necessity a few years ago. The change that was fast couing over the practice of architecture is seen in the education of Antonio Stan Gallo, who, brought up as a carpeter, studied architecture under bis nucle, an architet, and afterwards hecame assistant to Bra-mante, who used to give him sketches and descriptions of buildings, which he left him to carry out. He suc-oeeded his mater in the works of St. Peter's. The faftaelle, painter, architect, and serolptor. We find that the more exited geniusce, eve os this time the such the more exited geniusce, eve os this time the suc-

tectural works were designs for the ornaments is huilding; while the others not only learnt the princi-stoneo for the Loggia. He also gave designs for a villa ples, but the practice of all the decorative arts, and then for the Poge, and a pole-ee for the Bishop of Trois, in learning the science of building heame practical pro-the Via of San Gallo, in Florence: he gave a design for ducers of original buildings, never satisfied unless the stahls of the Chigi Palace, and for the chapel of that family in the clurch of Sta. Maria del Populo: huildings from all that preceded them. But to return the stands of the only I wave a start of the property of the start smills in the clurch of Sta. Maria del Popolo: he was employed to superintend the works of St. Peter's; and was much interested in the elearing and discovery of the autique remains of Rome, in measures for the restoration of which he was much occupied at the time of his death. His popil also,-

Giulio Romano, being his favourite pupil and assistant, though first educated by him as a painter, followed his master's mode of practice; for Vasari says, "Proceeding thus in the service of Raffaelle, his master, and acquiring a knowledge of the most intricate difficulties of his art, which were taught to him hy Raffaelle with the utmost affection and solicitude [to how few masters can these terms be applied], Giulio soon became to be able to draw perfectly in perspecsoon became to be able to draw perfectly in perspec-tive, to measure edifices, and take plans of buildings: Rafiaelle frequently designing and sketching certain inventions after his own fashion, which he would then leave to Giulio, to the end that the latter might complete them on an enlarged scale, and with the exact measurement and proportions, so that they could afterwards be used by bis master in his architectural undertakings. In these last-men-tioned behavior more particularly Guilio Romano com its attineed about supervision of the second tion thereto in such sort that, when at a later period he exercised the vocation of an architect, he proved himself to be a very excellent master." Raffaelle's himself to be n very excellent master." Rafaelle's mode of practice in giving rapid sketches of his designs was rather different to that of Giotto, who prepared models, even to the details and sculpture, with his own had. Yet both were painters: Raffaelle, indeed, excerted more works in architecture thau Giotto. What made their practices of different? In the first place, the old Gothie habit of extreme care was fast discipating; and, in the second, the imita-tion of the antique, and the prevalence of measured proportions, rendered the completion of the master's first ideas by another hand more easy, when they were peculiar arrangements of known proportions, the when they were burning thoughts from the mind than the master, so connected and influencing the whole structure, that another hand could not complete them.

The practice of Giulio Romano was peculiar, as he designed many huildings, and decorated them with frescoes by the hands of himself and his disciples, as we may gather from the following quotation:----"This artist produced so many designs, both in Mantua and other places, that their smount appears incredible, but as we have sold there will be Mantua and other places, that their emount appears incredible; but as we have said, there could be no palace or other building of importance erected, more especially within the city of Mantua, unless it were constructed after a design by him. Ho rebuilt the church of San Benedetto, in Mantua, a very large and with edites, belowingst the Black Evices and civited church of San Benedetto, m Mantua, a very large and rich edifice, belonging to the Black Friars, and situated on the old walls, near the river Po; after his de-signs, also, wrs the whole church embellished, and adorned with heautiful pietures and fine paintings in freeso." We also find that designs for "inpestry nud eloth of arms" were made by bin : indeed, he would never, says Vasari, refuse to set bis hand to the most triflug matter, an example which, if followed work trilling matter, an example which, if followed by artists at the present time, would cause our com-mon-place and every-day things of life to he much

How protect and very buy bridge of the to be much better designed than at present. His master was carnestly solicited to return to Rome, and undertake the works at St. Peter's; hut while the negotiation was pending he died. As an illustration of the different works then given to the for his reception, by order of the duke: these consisted of arches, perspective scenes for dramatic representa-tions, and various matters of similar kind; for never was there any man, who, in the mrangements of masquerades, or the preparation of extraodinary habilments for jousts, festivals, and tournaments, displayed fancy mat variety of resource such as he possessed: this was acknowledged with astonish-ment and admiration at the time to the Emergence processes in this was acknowledged with astonish-ment and admiration at the time by the Emperor Charles, and by as many other persons as were present."

San Micheli, the great architeet, hut greater military engineer, acquired the first principles of architecture under his lather and uncle. There is a architecture under his lather and uncle. There is a difference in the words used by Vasari in speaking of these later masters in the key under the first principle of architecture :" in the lives of the carlier ones, it is "acquired the first principles of art," a verte good distinction, as the later masters principlely studied the autique huildings, in learn manented, with the study and practice of architecture. studied the autique huildings, and combined a view to produce similar huildings, and combined this knowledge with the science of construction or the science of construction or the science of a science of the principal science of the principal science of the principal science of the science of the science of the architect science of the principal science of the science

to San Micheli : he completed his education by visit ing Rome, for the purpose of studying and measuring

e antiquitics. Michelangelo Buonarroti, sculptor, painter, and drametangeto Buomartou, scantou, panter, au architect. I have said that all the men of extraor-dinary genius, even in the later times, adopted the cus-tom of a three-fold practice: thus we find that Michelangelo, placed with a master to learn painting. Muchangers, paced with a masser to team pairing, was induced to study setulptore by his admiration of the antique statues in the garden of Lorenzo de Medici; and after long practice in these arts, he erected the sacristy and new library of San Lorenzo, at Florence; that be was also much employed in re-building and strengthening the fortificatious of that eity; and that finally he was invited to undertake the superintendence and sole direction of the works at superintendence and sole direction of the works at St. Peter's. He was, however, loth to undertake so great a work, saying, "that architecture was not his vocation;" but being commanded to do so by the Pope, he prepared the model. (I suppose his relued-ance aruse from the lahour of so large a work at so advanced an age, being over seventy at the time, and also from its leaving him so little time for his other vocations). "At length," says Vasari, "the Pontiff issued an ediet, hy which he appointed him super-intendent of the fabrie, with full authority to do and undo, decrease, extend, or change, as it should seem good to him; and furthermore commanding that the whole government of those who were employed under whole government of these who were employed under him, should he in his hands. Hereupon, Michel-angelo seeing the coofidence which the Pope placed in him, desired to prove himself worthy, and placed in him, desired to prove himself worthy, and had a clause inserted to the effect that he per-formed his office for the love of God, and would accept no reward;" though, according to Vasari, his means were very limited. What a glorious end for a great man—what a heautiful finish to his extror-dinary and active life! At seventy-fur we find the veteran artist giving all the skill, art, and experience decived from a long life of three-fold practice, to erecting a church wholly to the glory of God. During the last fifteen years of his life, he erected many works in Rome. And now we come to one of the last works in Rome. And now we come to one of the last of the artist architects.

Sansovino, in whose works there is au artistic spirit which, when I was abroad, delighted me more than any other work of the same period, was brought up as a soutport with Jacopo, of Monti. Samsorino was a sculptor and an architect. It is worthy of note, in a sculptor and an architect. It is worthy of note, in possing, how many great men were hrought to light, or ohtained honour, by working at the states and other decorations of the Or San Michele. Sansovino attracted notice by a model that he prepared for one of the statues, as, though another ohtained the commission, as the clder master, Sansovino's was the most heautiful, in consequence of which he was taken to Rome hy Giuliano San Gallo, architect of Pope Julius 11. Now, when Jacopo eame to Rome, what charmed him most; and what did he earnestly set, binsoft to do? To measure all the autione buildings ? himself to do 7 To measure all the antique buildings ? No! Vasari ags, "when," that is to say, when he had been hrought to Rome, "the statues of the Belvidere attracting him beyond measure, he set himself to copy the same. Now Bramante, who was also nrchiteet to Pope Julius, holding the first place, and having rooms in the Belvidere, chanced to see the designs of Jacopo, with a nude figure of clay in a recumbent attitude, holding a vase for ink, which he had also made, and these things pleased him so much that he began to favour the youth, and ordered him to make a large copy in wax of a certain subject, which he was also having copied hy other artists, inlending to cast it in hronze. When all had completed their work, Bramanie showed the models to Raffaelle Sanzio, inquiring of him which he thought the best. It was then judged by Raffaelle that Sansovino had greadly surpassed the others, wherefore, by the advice of Supassi in bounds, whether is a super-bound of the model of Jneopo cast in hronze." After several works in sculpture, he made designs for several triumphal arches to celebrate the arrival of Leo X. at Florence; and, in company with Andrea del Sarto, he was employed to decorate temporarily the unfinished façade of Santa Maria, after which he was almost constantly employed in architecture. * *

We have now considered how the architects of some

[Dec. 26, 1857.

Campo, a sculptor; also that the Giotto campanile was the work of a painter, at the end of a loog life devoted to painting; that it was carried on to comple-tion under the superintendence of a painter; that the same hand that covered the walls of the Sauto Campo, at Pisa, with frescoes, designed and superintended the state. erection of the Loggia de Lanzi, and designed the beautiful tahernacle in the Or San Michele, even to a new method of fitting and joining the stones; while at the same time he executed the chief and most heautiful of its sculptured ornaments. That the same man who defeated the far-famed Donatello in his own art, and was second in the celebrated competition for the doors of the San Giovanni, conceived and executed the holdest thought of constructive skill that the history of architecture can show; while the first architect of St. Peter's was educated as a painter; the second was the greatest painter that the world had produced; and the final director of the works, and anthor of most of the present building, was equally a king among painters and sculptors. Thus we see wherein is the difference between the education and practice of those days and that of our own times. It seems to me to iu the simple difference of opinion as to amount of knowledge of the sister arts is requisite to make a good architect. Now, I will put it to you: you have both systems hefore you; you see how our present one has gradnally arisen, from the observance of filed rules and measured proportions in the study of the revived Classie architecture. The results of of the revived chaste architecture. The results of which of the two do you prefer? Is there not in the pre-sent time, and has there not heen for ages, a greater lack of originality than formerly? Are not any two huildings in the same styles you can point out more alike and less stamped with the individual mind and coming of their second in earliers of Them area in do genius of their respective authors? Then, again, do not the merits of unany of our buildings rest more npou their display of autiquarian research and archaeological knowledge, than upon the grace and heauty of their proportions dependent upon the long and carefully-trained eye of the artist, or than upon the heauty and richness of their sculpture, which only masters in the art could produce, and only the same hand that planned the huilding could design and arrange with harmony? It is true that there is a greater move-ment in that direction at the present time; hut towhom are we principally indebted for that? Is it not to those young architects who at the time they helonged to our class of design, showed a greater power of artistic drawing and colouring than had been seen for many a long year in the profession? But the im-provement is as yet with the few. The many are divided into the designers—shall we call them rather the arrangers—according to the precedent and old models in both Gothie and Classic styles, and these who, for the sake of apparent originality, sacrifice good taste. Now what remedy for this state of good taste. Now what remedy for this state of things do the lives of these great men suggest? To see this, let us begin at the starting-point of a modern architectural career, and see what practical additions and antidotes the consideration of their education and practice would suggest to the present usual mode. The young architect comes from school, - a fair The young architect comes from school, -4 a law amount of school knowledge, and prohably (or cleabe would not have chosen the profession) with a small amount of skill in copying drawings, into an office where everybody is busy, and nobody has much time to attend to him. Well, what is he first set to 0.7According to the office he enters, he may either he set to copy "Pugu'as Examples," or "Chambers's," or other measured representations of old works of dif-form to region. Now the is in school in two ways. ferent periods. Now this is useful in two ways, if properly taken advantage of. It teaches geome-trical drawing, and, at the same time gives them a knowledge of the buildings of old time, and whether the same time gives the multiis only hurtful if it gives him an idea that he will have attained the height of architectural excellence, if have attained the length of areameterial version and the case in a first-fife reproduce these huildings, or even buildings adapted to his purpose. With these details let him, therefore, work at these with all his might if he is to copy them, let him copy them with all havy of us, I doubt not, now regret we wasted time which would have perfected our power of east divide the intervention of an entropy to be a set of the set. geometrical drawing, excreised our mind in correctness geometrical drawing, excressed our mind it correctness and precision, and given us an intimate knowledge of those valuable examples of ancient art, which never can he lost time as long as we keep in their real use. But while at work at them, we should always re-member that it is the general principles of taste and height included in the vacuation of these worksdesign involved in the production of these works-not their actual proportions or details-that ought to be useful to us in after-life. For instance, that in the

Pogin's or Collings's Gothic ornaments is the use of natural foliage when designing capitals for your-selves. From the Greeks you can derive the general principles of purity, of vast and perfect sculpture, and from the Romans the general principles of richness of ornament and profusion of sculpture; but I would advise the young student as speedily as possible to make himself useful in the actual practice of the office, for that after all is the legitimate caching of the office, and that which at the present time it is principally capable of imparting, and in this let him imitate the masters whose lives I have hrought before your notice, for we see that they speedily learnt all that their for we see that they speedily learnt all that their masters could teach them, and soon raised themselves Inserve could deter them, and soor raised themserves from pupils to disciples or assistants. But I have said that the practice of the office is all that can be learned in it, as if there was still something more to be learned. It is because we must remember that while we are eopying engravings of ancient buildings, while we are making drawings from the direction, or from original drawings of our masters, we are not exercising ou imagination and invention, taste, or faculty of choice

Then what is to be done ? Let us consider what the Then what is to be done? Let us consider what the men did whose lives we have been considering, and we find that, although they, like ourselves, were placed with masters to learn the different arts with which they began their professional lives, they were after all principally self-taught. I would, therefore, advise those who are still in an office to exercise in the evening those faculties that have not been used during evening tobse menutes that have not been used unring the day with some different art or occupation : for instance, while they are at their elementary work during the day of learning geometrical drawings, to exercise themselves in the evening with the freehand drawing from leaves and other natural objects and from casts, as in the Architectural Mussum, which I particularly recommend to their notice. While engaged during the day at copying such works as Pagin's or Collings's Gothie ornaments, let them get some elay or a piece of Gaen stone, and try to produce, in full size capitals and other normanical (baving natural leaves by them), similar to those which they have heen drawing during the day, and this for at least an hour each evening previous to beginning the study of the necessary books on construction and other subjects, without which they can make no progress. While copying at the office any of the outline engravings of Greek sculpture, they should try in the evening, while studying books on the pro-portion of the homan figure, what sort of a figure they can preduce in elay of the like proportions of their day copies. When they have got into the regular work of the office, they should vary their evening's excretises by availing themselves of the power of modelling they will by this time have engagued in at the time in the office, practising the prespective they have learent in copying them, and studying them in different positions. Then in wisiting the hnildings of their makers in town or the neigh-hourhood, they would do well to watel carefully the corvers at their work, and in the evening, and concer-the construction and ornament, while in the course of construction and ornament, while in the course of constructions and ornament, while in the course of construction and ornament, while in the course of construction and ornament, when in dome, endeavour to make models of building and obser particulars can be seen; when at home, endeavour to make models of hem in wood drawing from leaves and other natural objects, and from casts, as in the Architectural Museum, which I and other points of construction and aromator, while in the course of construction and while their mode of joining and other particulars can he seen; when at home, endeavour to make models of them in wood and other materials, and also plans, drawings, and models of designs of their own. In the vacation and other leisure time in the snumer, they should still their sketch-book with the works of nature, rather than the works of man. They should seek to know all the leaves of the forest, and all the curves of the forms of the birds on the hranches; and upan their return home, let them endeavour to reproduce them in their clay or stone. Let them learn outline from the monatain, and colour from the heaths and the mosses; and they will, to a considerable extent, have supplied by the evening and vacation study the de-fetened. And let me also point out that they will have qualified themselves for profitable employment in designing for manufactures, and also the smaller objects of atchitectural design, such as monuments, memorial designing for manufactures, and also the smaller objects of architectural design, such as monuments, memorial crosses, and many other works, while they are yet deemed too young and inexperienced to he entrasted with the creation of large buildings. Perhaps the elder members and those who are no longer pupils, will allow me to remind them that the masters in question were always learning. If they consider that any of the nequiprements thought necessary of all guestion were always learning. If they consider that scription to hil the west winnow in the lower, by any of the nequirements though necessary of old Lavers. A memorial window, by Willement, has also begin at once, and that it would he in accordance with their principles if we each of us took stock of our qualifications for the art we are practising, to is built with York flag, in narrow course, bammtr-keeps to practise; and let him who is accomplished in dressed and the art representation, but deficient in practical knowledge, not he the least ashamed of ridge stone, which, from its colour, is said to give the

and improve their hand in drawing. We all of us have our weak points: let us, that the art of our age may be of the best, each of us hegin to fortify our weak places, and supply our deficiencies. And there is one branch of our art that we have all ucglettd, viz. the study of sculpture and use of models, for the remedy of which I will conclude by proposing that, in our new quarters at Conduit-slrect, two new classes be formed on the principle of our present class of design, viz.,—an architectural sculpture class, or class of design in the "Round," and a class of con-structive modelling; also that steps should be taken for establishing in the rooms, and in connection with the Architectural sculpture. As in the well-kaown, and I hope much-loved, words of the poet;— "Lives of great mea all remind us,

"Lives of great men all remind us, We can make our lives sublime; And, departing, leave behind us Foot-prints in the sands of time;-Let us then be up and doing, With a heart for any fate; Still achieving, still pursuing, Learn to labour, and to wait."

CHURCH-BUILDING NEWS.

CHURCH-BUILDING NEWS. Wells, Somerset.—St. Thomas's church, which has beeu crected to the memory of the late Dr. Richard Jenkyns, Master of Balliof and Dean of Wells, at the cost of bis widow, who died also in June last, is just completed, and was consecrated on the 21st inst. by Lord Auckkand, the diocesan. The last is a parallelogram, the cast can determinating in a five-sided apse, a north sisle, gabled, and a north-western tower and spire. The casternoos bay within the agse is appropriated to the chancel and sancetary, with a treast-wall of stone dividing it. There is a south trausept for the children of the schools. The materials employed are the local stones, heing cream-coloured, horwn, and grey, which are alternated in the walling, and all the freestone work is of Doulton stone. The interior of the walls is ashard with Harc-hill stone, und the shafts of the arcading are of blue lias. The exterior presents an Early Deconted church, with is the school are the bide met bide worth worth word will bide the school are bide need to bide lias. and no snars or the arcanung are of bine has. The exterior presents an Early Decorated charch, with its mave and gabled north aisle, north porch, and lich-gate; a tower, with its enamelled clock face beneath a eanopy, and its high beliry windows, treated after the manner of the Western eburebes, surmounted with an early, and is ingli being windows, iteated after the manner of the Western eburches, surmounted with an octangular spire, gabled on the cardinals, and pinnacled at the augles, all richly carved and decorated. On a lower stage the huitresses are terminated with scalp-tures of the Evangelists. The apsilal end is para-peted in talernacle work, and the roof rising there-from terminates with a netal cross. The interior has its five apsilal windows occupied by stained glass, by Wille suscented by the warehouse of David y Wailes, presented by the members of Balliol ollege, the subject being five types and anti-types; College, the subject being five types and anti-types; and the next window westward, on the south side, is by Clayton. All the others are glazed with a florinted glass of colour, by Wilmsburst. The reneated is con-structed of stone and Devonshire marble, enriched with mosaies, and the empanelling is executed in gold and colour by Fisher. The pulpit is of stone and marble, and also the four, both by Forsyth. Parts are enriched with gold, and the pulpit has a hook-tray of wrough brass. All the futings are of oak. Mr. Teulou was the architect; and Mr. Davies, of Lang-nort, the builder. port, the huilder. Broxbourne.—The interior of Broxbourne church

Brozbourne.— The interior of Brozbourne church has now heen restored, as well as the exterior. The chancel, North chapel, and South chapel, or aisle, have been restored at the expense of Mr. G. J. Bo-sanquet and Mrs. O'Brico. The cost of restoring the nave and aisles has been defrayed by means of a rate, subscription, and grant. The works have been ear-ried out from the planes of Mr. Clatke, the dioersan architect. All the scats are low and opeu. The eban-architect. All the scats are low and opeu. The eban-eat wall is diapered and painted, the first bay being enclosed with screens. All the works with the plastering has been restored and renewed. The work has been performed by Mr. Ringhau, of Ipswieb, and Mr. Pulban, of Broxbourne. Two we painted wia. phastering has been resorted and relevant. In work thas been performed hy Mr. Ringham, of Jawieb, and Mr. Pulham, of Broxbourne. Two new painted wia-dows, by Powell, bave been planed in the Saye chapel by Mrs. O'Brinn; and it is intended to raise a subcription to fill the west window in the tower, by avers. A memorial window, hy Willement, has also

beginning that study at its very beginning, while those that on the contrary arc well skilled in con-struction, but as it is often the case, deficient in design, begin at once to exercise their imagination, and improve their hand in drawing. We all of us cast window, of five lights, which terminates in tra-have our weak points: let us, that the art of our age carry; four side windows, of three lights each, with have but the hest each of a heart is for the cast of a contral concluded integrations. two encristics, confessionals, nave, ailed, south porch, and central vestern tower. The chancel contains an east window, of five lights, which terminates in tra-cery i four side windows, of three lights ench, with wrought and moulded shifts. The chancel is separated from the nave and transcripts by a moulded arch. The Lady Chapel contains three windows, arranged to har-monize with the reredos. This chapel is said to be too small and unimportant compared with the rest of the church. The nave is divided into five hays of 15 fect each. Above each arch rise two clerestory windows, which are connected with and connect the windows with the corbels, sapporting the principals of three nave rod, the legs of which run down and sub-divide the clerestory wall. The aisle windows are of three lights, each of the transepts containing a large window of four lights each : a similar window also occupies the west cal of the church. The western tower rises to the height of 124 fect. A spire would tend to remove the somewhat stilled effect of the angle pin-nacles. Almost the whole of the windows, Barnett, and Walles. The if is the author of the east window, which is of a later date than the rest of the huiding, setting at definance all true principles of glass stabiling, save the *Gearclian*. The side chunced windows as the which is of a fater due what here rest of the finding, solve the *Guardian*. The side chancel windows, by Wailes, it adds, possess neither truth of drawing nor taste in colour. The circlerstory windows, by the same artist, are designed with more care and judg-ment. The side windows are by Mosses Bernout. same artist, are designed with more care and juog-ment. The aisle windows are by Messrs, Baraett. The edifice is in the Decorated siyle of Pointed arebitecture, measures 130 feet in length, and is 54 feet broad across the transcepts. The nave is 50 feet high : the choncel is 24 feet by 18 feet. The rest of the courch is in propertion. It is situated in rest of the courch is in propertion.

54 feet broad across the transpits. The nave is 60 feet high: the chancel is 24 feet by 18 feet. The reat of the church is in proportion. It is situated in Talbot-road, Blackpool, leading directly from the railway station. Mr. Yates, of Liverpool, contracted for the catire building, which has cost, independently of the internal fittings, the sum of 5,5004. *Sheffeld.* — St. Stephen's church, Netherlhorpe district, has been opened. It is situated at the junc-tion of Faweett-street and Bellfield-street. The edifice, according to the *Independent*, is in the Gothis style of architecture, of the geometrical period, and is in the form of a cross. A tower is placed at the intersection of the area and the transpits, supported by four internal arches. There are no asiles, and the transpit, and at the end of the nave. The pulpit, reading-deck, and chancel fittings, are in carved oak, and, along with the fort, have been manufatured by Mr. Shaw, of Saddleworth. The roofs are of open timber, which, as well as the stails and galleries, one chapel opening into the chancel and transpet by an arch. There are the chancel and transpet by an ender opening into the chancel and transpet by an arch. The whole fabric, with its organ and internal fittings. Its effort, Henry Witson af Sharerow coupled opening into the content and transpip by an arch. The whole fabric, with its organ and iuternal fittings, is the gift of Mr. Henry Wilson, of Sharrow, and has cost about 4,500/. The architect was Mr. Floekton, and the builders Messrs. Dutton and Heald.

STAINED GLASS.

Cork .- The chapel helonging to the community of Cork.—The chapel belonging to the community of Christian Brothers here has been decorated, and the whole of the windows, six in number, have been filled with stained glass. There are twelve medallions, each containing an emblem of the Passion. The ground is of ornamental quarry work, each having on it a symbolic pattern, and the whole is surrounded with coloured horders. The stained glass was executed by Messrs. Edmundson and Son, of Manchester. *Parsname* — A threadiloid window here just here

b) MESST. Enhances and Son, of Manchestr. Persones.—A three-light window has just been completed by Mr. Wilmsburst, for the church of Madron, near Penzance. It coutains three subjects benerath canopics,—Eliph raising the Wildow's Son; the Resurrection of our Lord; and Mary speaking to Christener the Derdy of Largens. Research is a bergen. the Main et al. and the start and sharp and speaking to Christ after the Death of Lazerus. Beneath is a brass, with iuscription, showing that the window was erected to the memory of Major Rohyns.

PROVINCIAL NEWS.

Bawtry .- A new infant school has heen opened Bauetry — A new miant senool has neen opened at Bawtry. It is a very plain and napretending erection, and has heen huilt at an expense of 3527. The architect was Mr. J. G. Weightman, of Sheffield ; and the builder Mr. Howard, of Bawtry. Loddon (Norfold).—Tenders for new schools, at Loddon, Mr. James S. Benest, of Norwich, architect,

Loucon, Mr. James S. Benest, of Norwich, architect, have been received. There were seven tenders, rang-ing from R. Steward, of Yarmouth, 9117. to Griffin, of Norwich, 7197. The last-named was accepted. *Worcester*—The new water-works, at Pope Iron, will be opened in a week or two. They consist of engine-house, boiler-bouse, and cottage for engine-driver; two subsiding tanks, with strainers; three saud-filters, a pure water-taok, &c. The engine-

house, boiler-house, chimuey-stack, and cottage, are hrick structures, with Bath stone dressings. The subsiding tanks and filters are of hard bricks, and the walls coped with Derbyshire grit stone. From the leading through the city to a reservoir on Rainbow-hill, by which the pressure will be kept up constantly during the night, and at such times as the machinery may not be in motion. From the engine-main, hranch mains, extending to about 17[‡] miles in length, are laid throughout the whole district. The vanited reservoir is placed at Rainbow-bill. The contractors by whom the works have been excented are—Fror engine-house, filters, & e. at Pope Iron and house, boiler-house, chimney-stack, and eottage, are are-For engine-house, filters, &e. at Pope Iron and Rainhow-hill, Messrs. Chambers and Hylton, of Bir-Rainhow-hill, Messra. Chambers and Hylion, of Bir-mingham; engines, boilers, pumps, aud machinery, the Haigh Foundry Coupany, Wigan; iron pipes, Mr. Barrow, of Staveley. The bydrauts and valves were supplied by Messrs. Simpsoir, and the pipes, &c. were laid hy Mr. Aird, of London. The whole of these works were designed by Mr. Hawksley, of London, and carried out under the superintendence of his resident engineer, Mr. Purchas, Mr. Henry Lucy acting as clerk of the works. The brickstetters' work was at a stand for a time in

The bricksetters' work was at a stand for a time u coosequence of the strike. Salford.—A new clock is being placed in the tower of Trinity Church, Salford. It will have four dials, 5 feet 8 inches diameter: they will be illuiniated with gas at night. The town council are defraying the expresses. Mr. Bailey, of that place, is the maker. South Shields.—The South Shields Cemetery chapels are approaching completion, and will be ready for use by the commencement of the new year. Then here number and snire. Each chapel has a tower and spire. The upper part of each tower is an open lautern, having twelve lights, and finished with a panciled parapet; and the lower part forms the entrance porch to the chapel. The angles of the towers are surmounted by crocketted pinnacles, from which spring flying buttresses. The punaces, from when spring hybrid outfresses. The carving is all from natural types, comprising initi-tions of the maple, ivy, convolvalus, vinc, lity, &c. and is well excetted. The style of the buildings is Decorated Gothic. The architet is Mr. Robert Lamb, of the firm of Oliver and Lamb, Newcastle-on Tens on-Tyne.

SCRAPS FROM AMERICA.

SURAPS FROM AMERICA. A new church át West Philadelphia, built at the instigation of Thomas Allibone, is now about being finished. The new bank, in Chestnut-street, is also rapidly approaching completion, and its erection up to the present has cost 250,000 dollars. It is said to be a magnificent structured, to have a granite front, most elaborately ornamented; iron doors of rieb de-sign; a counter of the sime material, and enved in the most costly manner; i huge vault, of chilled iron plates, erected in the ceutre of the banking-room, and covered with designs, displaying rent artistic plates, erected in the centre of the banking-room, and covered with designs, displaying great artistic becasty; ceilings richly eubellished in fresco, floors inlaid with marble, and everything displaying, in fact, a lavish expeuditure of money for such a purpose. In the manager's-room, which is approached by a magnificently wrought spiral staircase of iroo, the decorations are said "to haffle description," and the style of the furuiture and fittings displays the greatest hxury. The new hank of Nicholas Biddle, immediately opposite this, alchough an establishment of a much more important nature, is comparatively a plaibuilding. It may be well to mention, as an evidence of how banking matters are sometimes managed by pent outputs, it may be were to mention, as an evidence of how banking matters are sometimes managed by our Transatlantic brethren, that while this outby was going on, the whole capital of the bank, amounting to 1,875,000 dollars, with a surplus of 400,000 dol-lars, had been, utterly sunk, and the directors stadi-outly heat in increases of the fact but the second lars, has been utterly suns, and the interformed and the interformation of the field by the manager, the aforesaid Thomas Allibone, who has absconded, leaving the bank to close its doors, and heaping ruin on multitudes who fancied themselves in affluecce.

on multitudes who interest interests in mindece. The La Crosse railroad will be opened to Mauston immediately, and shortly also to Lisbon. This road is steadily progressing, and must become oue of the best thoroughtares in the north-west.

The Baptists are building a church in Portage ei

The Dapusts are building a cutton in Forage 60%, and nearly all the outside work is finished. It is plain, but of appropriate character. The works are stopped on the railway hetween Fond du Lac and Oshkosh. About eight miles, or half the entire distance, of the rails have been laid.

"QUANTITIES" FOR TENDERS.

WILL you allow me to say a few words on the

I think you another by a few where of a few where of the subject of quantities? I think it contact be denied that in all cases where contracts for work are to be let by competition, the traders should be severally based on one certain datum.

pantities supply this. But quantities are not to be abstracted unless an expense; in addition to the cost of preparing the drawings and specification, he incurred. The mode of arawings and spectnearion, he meurred. The mode off charging this extra expense appears to be settled by general consent, hut still there is one question which remains open, viz, --tbe hest mode of charging for the copies of the quantities, and which, it uppears to me, it is anfinit to add to the cost of the work to be done at the expense of the client of the architect. I would suggest that in accounting to the architect. the expense of the client of the architect. I would be the spessore of the client of the proposed "I think there is no thought, on the Board of guars works, each builder tondering should pay a sun upon deposit on receiving the quantities, and which sun of the said quantities; these dropsits to be returned, poing architects should be disastified with the decision upon sending in tenders, to all but the successful which num be made by the Leeds guardinas, they and will competition, who would thus have to be ar at his own only by the blame on their own shoulders, and will expenses the expenses incurred in preparing the ecopies of the start of the successful whole numbers and will competitor.

[Dec. 26, 1857.

cases, builders apply for and receive bills of quantities cases, puncters apply for and recove bills of qualifies apon which they never soud in a teuder; but were the course above suggested pursued, it is not too much to assume that tenders would be received from all to whom 'quantities were furnished; and I also believe that a healthy action would result from the adoption of such a course, which would exclude many when while they are not adopt and the course of , while they can obtain quantities gratis, or at a who who, while they can botam quantities grains of an a charge of hulf-aguine or so, furnish teuders at prices far below cost. Such men, could they command it, would bardly care to risk a deposit for quantities; and in their place would, I expect, be substituted many respectable builders, who now stand aloof in contracts let by public tender.

Then as to errors in quantities! Would not a clause similar to the following have prevented all the recent disagreement and expose at Braintree, if inserted as a condition upon which the builders receiving quantities were to frame their estimates ?---

The quantities will be assumed as correct unless "The quantities will be assumed as control and the contractor, previously to sanding in his tender, points out an error, should such exist. The plans and specification will be open for the inspection of the con-tractor at the office of the arebiteet until _____, and uo allowance will be made for any error that may be discovered after the tender is delivered."

Surchy some such protective clause as this is hut mere justice to the arebitect, surveyor, and contractor, and certainly no less so to the client whose money is expende

expensed. Just allow me to add, by way of inquiry, whether the system of receiving open in place of scaled tenders as a rule is not worthy of consideration, and whether, if such a course became general, important and hene-

If such a consected by general, in portion was near ficial results would not accrue to all parties? I trust, however, that the day is not far distant when the profession will universally adopt one general code of regulations on these and all other matters for which some recognised mode of dealing is now considered necessary. H. J. BROWN. new con

LEEDS WORKHOUSE COMPETITION. .

THE subject of architectural competitions has The surget of architectural competitions has already occupied so much space in the columns' of the 's *Builder*, that you may, perhaps, consider that your readers have had enough of it: it is, however, one of such real importance, both to the profession and to the public at large, that I think it should not be allowed to rest in its present very unsatisfactory state. But to rest in its present very unsatisfactory state. But to effect any improvement, the profession must do something more than make speeches and write arti-eles. every individual member of it must bonestly and consistently abatist from sending drawings in competition, unless the conditions proposed are fair and honourable: this would be a much better course than that of abusing committees for decisions, the in-justice of which ought to have been expected, either from the information or unfairness explicited in the from the ignorance or unfairness exhibited in the instructions. I will not, however, occupy your space by reiterating general statements, the force of which all admit, hut which few, if any, act up to; but will ask your attention to the conditions contained in the and you attractions to architects purposing to send designs for the new intended workhouse at Leeds, viz.—" Architects are required to furnish a complete set of plans, sections, elevations, explanatory comprise set of prans, security, lever ross, espanning y and norking drawings, accompanied by a general and minute specification of the manner of executing the works, sufficient for contracting for the same, and an estimate of the cost in detail " &e.; or, in other words, architects are to furnish all the documents and information necessary to enable the clerk to the making of the same a language to when bind and information necessary to channe the carlo to integrations, who is, of course, a lawyer, to make a bind-ing contract with a builder to erect the building required, and thus, with perhaps the assistance of a clerk of the works to superintend the erection, the worthy guardians have no doubt shrewdly calculated that there may save the expense of an architect, and there of the observations to appendicate the control, in worthy garadians have no doubt since vily calculated that they may save the expense of an architeet, and even lay claim to a character for liberality, by offering, as premiuma, about one-fourth of the amount which the architect legitimately employed would be entitled to. It may perhaps be thought that the above con-ditions are framed in igoorance, but I have reason to think that such an excess cannot be offered in externa-ation. In writing to inquire as to this competition, I took the opportinity of asking whether, in making a selection from the design select the guardians would avail themselves of professional assistance; also whether the author of the design selected as the best would be employed to carry out the work. The reply to these questions from the elerk to the Board ig-"I think there is no thought, on the Board o guar-dians' side, of adopting the course you refer to in time tede is to under, or the output of the first dime's side of adopting the convex you refer to in refe ence to superintending the building of the new workhouse." If, after this candid awayal, the com-peling architects should be dissertisfied with the decision and will
