We believe we may with confidence take some little credit to ourselves for the result, but in doing so we would carefully avoid throwing the slightest discredit on the official referees, even should their instructions go the length asserted; we rather praise them for their uprightness in avowing a change in opinion, when time and more lengthened consideration had altered their views.

The first award by which this question is set at rest relates to certain new houses in Cranbourne-street, Leicester-square, now in course of completion. The district surveyor objected that a continuous line of entablature had been put up without the interposition of incombustible material, as required by the Act. The builder replied that the houses were combuilder replied that the houses were com-menced last year, and that the plans and eleva-tions approved of at that time, shewed they were designed for shops. The award, dated April 4th, was, "that inasmuch as before the 1st day of January, 1845, the houses to which the about fronts in quartice below were the shop-fronts in question belong were com-menced, and such shop-fronts formed part of the original design for the said houses, the provisions of the said Act which relate to wooden shop-fronts do not apply to the shop-fronts in question." With regard to the costs, 44. 11s., they considered "that as the case was one of reasonable doubt," the same should be paid by the district surveyor and builder jointly.

In another case, as to ten shops in the Nor-land-road, Shepherd's Bush, projected from land-road, Shepherd's Bush, projected from the front wall, the district surveyor objected that the party-walls to the projections were built of bricknogging, and were not carried up above the lead flat; that the cornices and other woodwork had not the required incomother woodwork had not the required incom-bustible materials between each house, and that the water dripped from the flat on to the public way. The builder shewed that the houses were formerly private; that plans to convert them into shops, bringing out the fronts to the line of other buildings, were made in the autumn of last year; that the framework was put up before the 1st of January, and that the cornice and other parts were prepared the cornice and other parts were prepared although not fixed. In this case the referees would make no award except to the effect that the shop-fronts must be supplied with gutters and pipes, to prevent the water from dripping on the public way, and that the costs, 41. 6s. 8d., and 21. 2s. to the district surveyor, should be paid by the builder.

Then again, as to a bow-window in Lynd-hurst-road, St. Giles's, Camberwell, com-menced before the Act came into operation. It was formed of wood, and though not fixed It was formed of wood, and though not fixed before the lst of January, was intended and pre-pared for. The award was, "that inasmuch as the bow-window in question is an addition to a house newly built, or now building, but 'already built,' within the meaning of the said Act, and forms part of the original design thereof, the said bow-window does not fall within the provisions of the said Act, as re-gards the original erection or building thereof." And in this case they did not call for any costs And in this case they did not call for any costs from either party.

We need say no more on this subject.

IMPROVEMENTS AT THE COVE OF CORK.

WE are glad to hear that great improvewe are grad to near that great improve-ments are contemplated at Cove by Lord Mid-dleton, under the direction of Mr. Decimus Burton. The execution of them will be in-trusted to Sir Thomas Deane and Mr. Kearne Deane, and could not be in better hands. We are glad that Lord Middleton has determined to take advantage of the talents of gentlemen who have been engaged in so many undertakings of importance, to employ artisans and labourers, enhance the worth of his own pro-perty, and impart additional attractions to the place.

The work, according to Mr. Burton's plan, will consist of an asplanade 2,000 feet in will consist of anexesplanade 2,000 feet in length, on a new quay in continuation of Mr. Smith Barry's, divided from a new road by chains, &c.—a crescent and several ranges to be laid out for new buildings, with provision for terraces, hotels, baths, and all that can contribute to comfort or convenience

We hope this example may be followed by other proprietors similarly circumstanced. Rumour says his lordship intends to spend 40,000% in the improvements.

THE BUILDER.

THE BRITISH ARCHÆOLOGICAL ASSOCIATION.

IMPARTIAL STATEMENT OF FACTS.

ALL who are interested in antiquarian pursuits, who desire to prevent the injuries with which our ancient national monuments may be threatened, to spread abroad a correct taste for archaeology and a just appreciation of monuments of ancient art, so as to secure a general interest in their preservation, must be grieved to learn that the dissensions in the association are in no way healed. There are two central committees, two societies, and two journals; and if it be true that a house divided against itself cannot stand, the Archæological Association seems doomed to fall.

There are, unquestionably, faults on both sides; great faults: the original cause of quar-rel is trumpery in the extreme, and it is not just, it is not creditable,—that an association likely to effect much good, a large body of in-dividuals bound together to advance an important object which is not at all implicated in the squabble, should be wrecked on such a wind-bag, overset by a sputter, raised entirely by the officers in command, and to meet which they have actually steered the vessel out of the

right way. Mr. Wright, the founder of the association, and one of the sub-committee appointed to edit the society's "Journal," produced, in his own name and irrespective of the association, a work called the "Archæological Album," which was to consist of six parts, and to be published at intervals of two months. This act of Mr. Wright was objected to in the comact of Mr. Wright was objected to in the com-mittee by some members, on the ground that Mr. Wright's connection with the journal being known, and from the similarity of the tille, the public would be led to consider the album also authorized by the society; further, Mr. Wright being *in reality* the editor of the society's journal, although his name did not so appear, it was though the would be likely to use the beat communications for his own work. use the best communications for his own work. and would give more of his time to it than to theirs, for which he received nothing, not even the credit of being the editor, and so that the journal would suffer. And it was therefore suggested, that notice should be given, that no publication but the journal was authorized by the society. When it was shewn on the other side, however (by those who thought the committee had no right to interfere), that this album was to be written wholly by Mr.Wright himself, and would, in reality, assist in advan-ing the objects of the association, by inducing a taste for the study of antiquities in many who before had not engaged in them, a resolution moved on the subject was withdrawn, and the matter dropped.

A few days afterwards, however, the subject as brought up in the Printing committee, at which meeting five out of the six members constituting it were present, including Mr. Wright and Mr. C. R. Smith, one of the honorary secretaries, when the two latter resigned, and a notice in the name of the central committee was ultimately sent to all the members by the remaining three, containing an intimation that the journal was "the only publication issued under the authority of the central committee."

Now to this intimation, if the committee had really resolved to issue it, no reasonable objection could be taken; it was a perfectly legiti-mate notification, indeed seemed to be called for. But that it should be made by a subcommittee of three in the name of the central committee, who had decided, virtually, that it should not be made, afforded very reasonable ground of complaint to those who agreed in that decision, and dissension was of course the result.

Mr. Wright and Mr. Smith had been in-duced to withdraw their resignations as members of the Printing sub-committee, and had taken their places, when a resolution was moved in the central committee and passed, calling on the former gentleman again to resign. This it seems he at once expressed his willingness to do, but ill feeling had been engendered, unanimity could not be obtained, the president, Lord Albert Conyngham, re-

have already said, "a plague on both your houses"), various members of the association out of the committee, aware that the real business of the society was virtually at a standstill, and not well informed of the exact state still, and not well informed of the exact state of things, addressed a requisition to Mr. Pettigrew, the treasurer, calling on him to summon a general meeting of the association. Without submitting the requisition to the central committee (and this was a great mistake), the treasurer prepared to comply with it, and caused the meeting to be ad-vertised in the public prints. In the meantime a special meeting of the central committee, called by Mr. Albert Way

central committee, called by Mr. Albert Way, central committee, called by Mr. Albert Way, the other honorary secretary, was held, and a resolution passed, denying the authority of the treasurer, or any other officer of the as-sociation, to call this general meeting, and declaring any proceedings of such meeting null and invalid. This was assented to by thirteen members of the committee out of twenty two and the association generally the twenty-two, and the association generally then first saw that the *majority* of the committee were opposed to Mr. Wright and his friends.

Notwithstanding this protest, however, very short notice, and an inclement night, 150 members or more met, in pursuance of the treasurer's summons, on the 5th of March; and by resolutions (passed unanimously in fre cases, and with five dissentients in one), recases, and with nee dissentients in one), re-organized the association, and appointed a fresh committee, including a certain number of the old committee, and who have since received a considerable number of subscriptions.

The other section of the old committee have elected new members, making in the whole twenty-one, have issued an abstract of proposed rules and regulations, "under which the as-sociation will hereafter be conducted," and have announced that the next annual congress will be held at Winchester in the ensuing

September. We have thus laid before our readers a brief statement of the principal facts without favour or reserve, leaving them to exercise their own judgment upon them. To establish the right of a minority of a committee to throw the right of a minority of a continities to throw themselves at any time on the general body, would tend to embarrass the government of most societies. And it is probable, even in this case, that several who signed the requisition for the general meeting, would have refrained from doing so had they been aware there was a clear majority of the committee in favour of one course. Still the present is not an or-dinary case, since we find the two founders of the association, one of them the honorary secretary, the president to whom so much was owing at Canterbury, the treasurer, and the most active members of the committee, in the minority.

We have the pleasure of knowing the majority of both committees, and are able to assert, that more honourable men could not be found, but at the same time we know from the constitution of some of them, that unless there be interference from without, no junction will be effected, and the great objects of the asso-ciation will greatly suffer. Already, as we understand, some of the authorities at Win-chester have refused their assistance at the contemplated meeting, and many persons who were warm supporters of the one association, now hold back because there are two. What we would advise, is, that some influential mem bers of the society who have taken no part in the past proceedings, should at once bestu themselves, and by conference with the two committees, endeavour to remove asperities an effect a junction. We are disposed to think they would succeed, for the greater number o both parties must by this time be heartil ashamed of the cause of quarrel. Never wa such a tangled web hung on a more trumper peg.

CATHEDRAL OF NEW BRUNSWICK .---- Con sequent upon the erection of New Brunswith episcopal superintendence of the Right Re Dr. Medley, the bishop elect, a cathedral is be forthwith commenced at St. John's, the s chitectural preparations for which have be intrusted to Mr. Frank Wills, of Exeter. T the president, Lora Albert Convignant, re-signed solely from a sense of what his lordship considered "the extreme injustice done to Mr. Wright;" and, to make a long story short (for doubless many of our readers have watched all the proceedings, and

THE PRESERVATION OF NATIONAL ANTIQUITIES.

" For Time hath not rebuilt them, but uprear'd Barbaric dwellings on their shatter'd site."

THE study of medieval art has increased throughout Europe so much during late years, that there is reason to hope, with the vigorous efforts of societies and individuals, we may be one day spared the wanton destruction of **na**tional monuments, such as now too often occurs. The antiquarian world has expanded and extended its influence; no longer confined to the mere acquiring possession of the old and singular, it rightly estimates the value of its researches, as capable of influencing the future and the present, unfolding the preceptive truths of history, and resulting in an increased admiration of the beautiful and the good. For as the general tendency of man is towards the intellectual and the virtuous, and as his mental efforts are not forwarded by the continued existence of doubt and uncertainty, it seems that the gradual removal of the veil of ages must be attended with advantages, highly conducive to his moral and mental well-being. Let it, therefore, be understood that the antiquary rupudiates the unphiloso-phical pursuit which has no outlet from the pleasure of possession ; he claims for the result of his researches into the condition of the past, that standing as a science, which an age dis-tinctively marked for its consideration of the future has already awarded. Now, associations are formed for the preservation of architectural remains, and money is readily subscribed for the re-edifying of fabrics. Still, though we have gained much, it is only the intelligent half of men who are thoroughly awake to the value of such national memorials; the other portion remain enveloped in a sleep, from which our present efforts are not The false economy able to awake them. which allows no consideration to prevent the destruction, for some immediate end, of an antiquarian relic, is still in full influence, whilst buildings are patched up with insuffi-cient materials, or are entirely left to the inroads of the wind and weather, from which a very small annual outlay would have pre-served them. We will not speak of the restoring of Henry the Seventh's Chapel with crumbling stone, or the west front of Litchfield Cathedral with cement, because those were not things of our day; but what interesting fabrics have we allowed to disappear, and what destruction still goes on, almost unwitnessed, amongst the village and parish churches of England. The senseless demolition, too, of the mave of St. Saviour's, Southwark, is a thing of yesterday, and for which disgrace must always attach to us, and the inhabitants of the parish, in whose hands it more immediately was. Had a Burlington lived, and been imbued with the love of Gothic architecture, he would have transported the very stones of St. Katherine's, Tower Hill, to some more secure resting place for re-erection.* The buildings destroyed without reason, some of which may be seen in the works of Carter, and in the *Gentleman*'s Magezine, would stock a kingdom. The spires of Lincoln entirely taken away, the Ladye Chapel at St. Alban's separated from the church and converted into a school-room, the destruction not many years since of a beautiful chapel on the south side of the Temple Church, and the injury done to the tombs at Westminster at coronations, are instances of what has been allowed to go on unnoticed, and uncared for. There is hardly a church, that does not contain paintings and panels from the rood-screen, inserted in the mo-dern pewing. The interesting half-timbered bosses of the northern and midland counties are lessening in number every year, encaus-tic tiles and monumental brasses are stolen, and stained glass left to drop out, for want of a shilling's-worth of repairs; whilst many of

* Parts of these two churches are illustrated in Pugin's Specimeme of Gothic Architecture," and in the "Gothic Transments." Part of the pulpit, some stall-work, and a omb in the new church in the Regent's Park, were removed rom the old building. The gate designed by Inigo Jones, which Burlington re-suilt, having purchased the materials, is still remaining an Chiswich Gardena, where we last year saw it inscribed rith a record of its history. Its removal occasioned the ollowing lines by Pope :--

"O, GATE, how camest thou here? Gete.-...I was brought from Chelsea last year, Batter'd with wind and weather; Inigo Jones put me together. Bir Hans Sloane Let me alone,--Let me alone,---Burlington brought me hither."

our churches, as in the case of Old Fairlight Church, are menaced with instant destruction. Ely Chapel, Austin Friars Church, and nearly all the Gothic churches remaining in the city of London, are in a rapid state of decay, or crowded with modern excrescences: the crypt of the first mentioned was a short time since occupied by a cooper. In another style of architecture, we have to lament the complete destruction of Wansted-house and Carlton-house; the former, one of the most beautiful examples of Italian architecture in England, and the portico of the latter, a prin-cipal ornament of the metropolis. The pedestal of the statue at Charing Cross, of very beautiful design, is now beyond reach of restoration. We trust that when the remaining portion of the old Treasury in Whitehall is pulled down, the doorway will be preserved, and re-erected in one of the parks, or in some other locality. Such antiquities have often been left to stock the yard of a dealer in old materials, when their value as examples should have preserved them.

The aid afforded to the student of heraldry and costume by stained glass and monumental brasses, should induce their careful preservation, and cases have occurred in which the title to considerable property has been determined by their evidence; but, for want of the timely driving in of a couple of nails, a brass fre-quently becomes detached from the pavement, which is almost always followed by its entire disappearance. The same may be said of stained glass, with this addition, that the rather greater value set upon it has, in order to get one complete window, often led to the union of portions of different design in a manner most puzzling to the antiquary. The traceried windows in the cloisters of

Westminster Abbey are in such a state of decay, that it will shortly be impossible to restore them accurately; and the iron-work round the tombs, which all who have seen it agree in considering of great value, is not to be met with.[†] The fact that our modern metal-work is deficient in that freedom of design which appears in old specimens of the middle ages, and even down to a period as late as the commencement of the last century, is evident, and has been sufficiently set forth in previous numbers of this paper. (V. ante p. 97 and p. 102). At Hampton-court and in p. 97 and p. 102). At Hampton-court, and in theneighbourhood of the older squares, portions are remaining, worked by hand, more beautiful than any amongst the miles of spears and javelins cast by the modern mechanic. If all the old railings from the abbey have not been long since melted down into such weapons, why, we would ask, are they not immediately replaced? But there is great difficulty in getting at the truth; nobody seems to know if any, or what railings are in existence. The imperfect restoration of the screen, by Quentin Matsys, in St. George's Chapel, has been com-mented upon in THE BULDER (p. 97 ante), and no circumstance could so well shew the slight value set upon works of art, by those who un-fortunately have the control of them. In all instances of restoration, every line and mark of the original should be copied, with no deviation whatever; non-existing portions should be replaced with work produced in the spirit of the original, and imitated from coeval examples; one step short of this, and we would rather see the hand of Time work its own course, than that a delusion on the beholder should usurp the place of the beautiful work so falsified and destroyed. An architect well-versed in the particular style should be consulted in every step; he must not be a designing man, but must make originality subservient to exact reproduction. The greatest destruction goes must many or the greatest destruction goes on "remote from towns," where a village churchwarden is the *arbiter elegantiarum*. The nearest mason is the only other person —here oninion is thought of. Thus battlement gives place to plain coping, and cusps and window-tracery to plain mullion and transom, till, little by little, every feature of the old building is annihilated. The best restoration is scarcely so valuable as the original,

† Vide Report of Select Committee on National Mo-numents and Works of Art, June, 1841, in which is most important evidence as to the state of this building, and the preservation of national monuments generally. It was stated that some of the person who first purchased them. No exertion should be spared to recover them, if any where in existence. The grave-stones, which were also removed, should be carefully preserved. They are said to have elegant devices carved upon them. the possi exertion existen sho

though time-worn and despoiled : the former, though perhaps beautiful as a work of art, is though perhaps beautiful as a work of art, is comparatively valueless as an authority; while, if the preservation of the fabric be diligently attended to, the decay is seldom sufficiently rapid and complete to obliterate the old features from those who are qualified to exa-mine. Not that we would be inferred to say, that restoration is never desirable; but, look-ing at the mischief perpetrated by unskilful meddlers, and at the fact, that in so many cases the progress of decay might, with proper at-tention, have been arrested at the outset at a nominal expense, we do say, that any work having the character of an original document, having the character of an original document, and valuable accordingly, should not be inter-fered with in the slightest measure, until the very last moment, and then should be treated with extreme care by properly qualified per-sons. Many accomplished men, who were ranked as Gothic architects only ten years ago, had been would now be ready to confess they comparatively ill-fitted for a work of restoration, and when we think how much progress we are making in the knowledge of Gothic architecture, through the aid of system in the study of it, we must say, that we are all only learners in a style, which, perhaps, presents more "matter to be learned" than any that has ever prevailed. Who would not rather that all the fury of the elements had been exerted against our cathedrals, than that they should have been submitted to the hand of one James Wyatt? On such grounds we are in-clined to deprecate the talked-of restoration of Caernarvon Castle, now an edifice unrivalled in interest, and in an excellent state of repair, compared with many cathedrals and churches, not so generally styled ruins. For every an-tiquarian purpose, the existing portion amply suffices, and we trust, that any extensive scheme of restoration will be carefully considered, or confined to the renewing of such parts as may absolutely require it. From what we have observed, at some of our churches, where the new portions are generally thought quite equal to the old, we fear that the original ornament is often greatly departed from. In such cases, either the ornament is pared down for a new surface, thus becoming at least smaller, or, a new stone being inserted, the mason works without cast or drawing, and can only consult any other portion of similar design, which there may happen to be at some distance. Of course this can hardly take place where an able architect is concerned, but the greater number of repairs are executed without his advice.

Churches are covered with stucco, and mouldings mended with cement; oak is re-placed with deal; and whitewashing, whether of the exterior or the interior, of the masonry, the ceiling, the rood-screen, or the font, is an annual occurrence. The restoration of York Cathedral is rather an exception to the general fate of our antiquities, than an evidence against any thing we have said. The feeling, almost amounting to affection, which every Yorkshire-man has for that matchless pile, has nothing comparable with it in other parts of the kingdom. The new Houses of Parliament, though a great work for this or any age, does not reconcile us to the destruction of St. Stephen's Chapel, which might have been restored to form a portion of the new buildings. To the antiquary, and the lower of the beautiful in art, there can be no more melancholy reflection than that "improvement" and destruction march with equal steps; one by one the most admired relics of former days are annihilated, and often under the very eye of the educated and the refined. Bit by bit our national monuments are altered and destroyed, and the change is not perceived till the mischief is irremediable. Thus, we find that the beautiful cloisters of St. Stephen's Chapel are not to be preserved in their original state, as it has been reported, but are to be intersected by walls, and divided into separate rooms, for the purposes of the legislature. We should be happy to find ourselves in error, but an inspection of the plan is too convincing of the intention. The fragments of St. Stephen's Chapel should be preserved, and freely open to inspection.*

But to free the original fabric from accu-mulated excrescences can by no means be

• It is to be hoped that the improvements in the neigh-bourhood of Westminster Abbey will not interfere with the old conventual buildings. Digitized by Google

171

objected to, and will often be rewarded by the discovery of most interesting paintings and decorations, which have been thus preserved from other injury. Many a fine brass or pave-ment is concealed by modern pewing, and many a timbered roof by a lath and plaster Many a fine brass or pavecoiling. In page 39 unte, we took occasion to argue against the use of paint and whitewash on stone, still too prevalent. Much of the beauty, we are able to obtain by well-executed masonry, results from the well-defined forms of the mouldings, and the sharpness of the arrises. The effect of Time is rather to chip out at intervals the soft parts of the stone, than to wear the whole away at an equable ratio : the general tendency of the lines is unbroken in the perspective, and the decay rather adds to the impression which results. But the brush of the whitewasher mars all that it passes over : for fillets are substituted rounds, and for mouldings and indents plain faces, while bosses, and similar ornaments become very much like door-handles. To the paint-brush is to be attributed the unsatisfactory result of our modern cement and stucco, scarcely less inferior to well-executed brickwork than to stone, and having for its inevitable consequence a feeling of unsatisfaction at its pretension, and the attempt to deceive. The speedy removal of the whitewash, from which hardly two of our churches are free, is much to be desired, and the work is so easy and inexpensive, and the result, with proper care, likely to prove so very satisfactory, that it ought to be every where proceeded with. The superintendence may, in the greater number of cases, be very safely left to those among the clergy who have attended to the subject of ecclesiastical architecture, and we cannot do better than quote from the "Few Words to Church-wardens," of the Cambridge Camden Society, on the subject. Speaking of the removing of whitewash, it says :-

"This may be most easily done by scraping away the outer surface, and then moistening the part by means of a brush with a mixture composed of one part of sulphuric acid (oil of vitriol), and eight or ten of water, and washing it over with water after every second or third time you put it on, till you see the stone or wood appear. If, however, you wish to remove the whitewash from the remains of a painting on a wall, use soft soap with bot water, and a brush not too hard. This done carefully will not hurt the painting. Paint is barder to get rid of; it may, however, be effectually done with strong soap-maker's lye, or, what is quite as good, the following liquid: put one pound of potash or pearlash with half a pound of unslaked lime into a jar, and pour over it one gallon of boiling hot rain-water; wash this repeatedly over the surface, scrubbing off the paint as it becomes softened. Or you may try this way: take a quarter of a pound of soda, boil it with a littlesoap in three pints of water till it comes to a paste, then lay it on what you want to clean pretty thick; two days after lay it on again, without washing the old away; dq this four times, and then scrub the whole off, the paint will come off too. This does either for stone or wood." We suspect that the cleaning of paintings is

We suspect that the cleaning of paintings is not quite so simple a matter as it is described above, and it would be better in such points to have competent advice. At North Walsham, Norfolk, a solution of potash and quicklime, in the proportions of one pound of the former and half a pound of the latter to a gallon of boiling water, was used with satisfactory results. The solution, being extremely caustic, should be used with care, and if the external coating of paint which it may be desirable to remove, be thin, diluted with water; and in all cases the solution should be tried upon a small portion of the painted surface. (Vide Archæological Journal, vol. I., part 3). Mr. J. G. Waller, in giving his opinion, that the paintings found on the walls of churches, and usually called "freesco," are in reality nothing more than distemper, suggests the use of vinegar for cleaning. It should be carefully applied with a brush, alternately with water. (Archæological Journal, vol. I., p. 161).

But we cannot but commend the same useful publication of the Cambridge Camden Society, on the subject of DAMP, and the injury, which it causes to the walls, and the stability of the fabric. The numerous interments in the same small patch of ground during a long period,

have raised the earth round the walls of the church considerably above the floor-line, and no remedy is attainable, short of the absolute removal of the nuisance, which is often greatly increased by the drippings from the roof, consequent on the want of proper watersponts. These should be fixed without delay, and proper drains provided round the whole building. The green mould, which has collected on the inner surface, can then be removed by scraping and washing; and to prevent its reappearance, "mop the walls once or twice well over with a mixture made of one ounce of corrosive sublimate dissolved in a quart of water." To return to the subject of whitewash, we have seen it accumulated so thickly in crevices of ornaments and capitals, that it had to be chiselled away; in such a case it might not be safe to leave the work without close superintendence; and we much fear, if we have to wait till architects are engaged at all our churches, the matter will be postponed longer than is desirable. In the continuation of these remarks, in next week's BUILDER, we shall be able to offer suggestions for the accomplishment of the object.

E. H.

MR. EWART'S BILL TO ESTABLISH MUSEUMS OF ART.

WE mentioned some time ago that Mr. Ewart had obtained leave to bring in a bill to enable town-councils to establish museums of art in corporate towns. The following is a copy of the bill, which was introduced accordingly, and has been read a second time:—

"Preamble.-Town-councils may purchase -Whereas it is expedient to promote lands. &c.the establishment and extension of museums of art in such municipal boroughs as may require the same, for the instruction and amuse-ment of the inhabitants thereof; be it therefore enacted by the Queen's most excellent Mujesty, by and with the advice and consent of the Lords spiritual and temporal, and Commons, in this present Parliament assembled, and by the authority of the same, that it shall be lawful for the council of any municipal borough to purchase lands, and to erect thereon buildings suitable for museums of art, and to maintain and keep the same in good repair; and to accept any gifts, grants, or devises of lands, tenements, or hereditaments (any statute of mortmain to the contrary not-(any statute of mortizatin to not establishing, withstanding), for the purpose of establishing, improving, or maintaining such museums of art; and that the costs and charges of such and, and buildings, and the keeping of the same in good repair, shall be chargeable upou and paid for out of the borough fund of such municipal boroughs : provided always, that for the purposes of this Act no rate greater than a rate of one halfpenny in the pound of the annual value of the rateable property assessed to the borough rate, shall be levied in any one year.

And Borrow.—And be it enacted, that for the purchase of such lands, and for defraying the costs of such buildings as may be erected thereon, or keeping them in repair, it shall be lawful for the council of any such municipal borough as aforesaid, to borrow at interest the amount of money which may be required for the same, on the security of the said rate, to be levied as aforesaid.

And re-borrow Money.—And be it enacted, that in the event of the said monies so borrowed as aforesaid being repaid, and of funds being again required for carrying out the purposes of this Act, the said council for the time being may again borrow such sum or sums of money as may be so required, and again charge the said rate with the repayment thereof, in manner as aforesaid.

Adjacent Municipal Boroughs may unite for the purposes of the Act.—And be it enacted, that where municipal boroughs shall be adjacent to each other, the councils of such municipals boroughs may unite for the purposes of this Act, and contribute in proportion to their respective assessments, or on such terms and conditions as may be mutually agreed upon by the said councils.

Lands, &c., vested in town-councils. — And be it enacted, that the lands and buildings so purchased or erected as aforesaid, and slso all specimens of art or science, and articles of every description which may be purchased for

or presented to such museums, and accepted by such councils as aforesaid, shall be vested in and held upon trust for ever by the corporations of the said municipal boroughs in which such museums shall be situated, and shall be kept in fit and proper order for the benefit of the public.

the public. Rates of admission to public; and regulations for preserving contents, &c.—And be it enacted, that the council or united councils of any such municipal borough or boroughs may, from time to time, fix such rates of payment for admission to the said museums, as they may think necessary for meeting the cost of their support; provided that such rates of payment shall not exceed the sum of one penny for each person admitted; and that they may also make such regulations for the preservation of the contents of such museums, and for the maintenance of order and decorum within them, as may to themselves seem expedient." Great praise is due to Mr. Ewart for calling

Great praise is due to Mr. Ewart for calling the attention of the legislature to matters of this description. His Bill, if efficiently carried out, will produce most important results, both in a mercantile and moral point of view. Much, however, will depend on the towns themselves, and we shall hope to see corporations bestirring themselves on the subject the moment it becomes an Act. The Art-Union for the present month

departments for local manufactures, so as in the course of time to present important records of their gradual development and improvement. Such a collection exists in the Potteries, the property of a private individual; we hope that it will be acquired for the public before any accident leads to its dispersion. We wish that a similar collection could be made of the designs in calico printing : some of those produced by the older printers, which we have had an opportunity of examining, are superior to any that are brought out in the present day. This leads us to notice the importance of connecting such museums with schools of design; we must shew the pupils what they are to avoid, as well as what they are to follow. We are the more anxious to direct attention to this subject, because museums have been too often regarded as mere objects of curiosity, destitute of practical value, and only affording opportanities of whiling away idle hours in innocent amusement. Though we are strongly im-pressed with the necessity of affording opportunities for unobjectionable relaxation to the working classes, we at the same wish the public to know and feel that museums must have a higher and farther effect; they must, and they will be, as instructive as they are entertaining; for there is no branch of British industry that may not be profited by the suggestions which collections of works of art afford.

We may also notice the facilities which local museums afford for the collection and preservation of monuments, records, and other memorials connected with local antiquities. The loss to British archæology, by the destruction of articles affording valuable illustrations of local habits and customs, as well as of local events connected with general history, is incalculable. This destruction has been caused, in some instances, by carelessness, and in others by ignorance; collections, made with great care and expense, have too frequently been dispersed when they fell into the hands of heirs who could not appreciate their worth, or who had no taste for antiquarian pursuits. Local museums will not only afford opportunities for making a collection of such valable materials for history, but will also induce private collectors to form a proper estimate of their value, and bestow some care on their preservation. Those who have visites the collection of Norman antiquities at Rouen must have felt anxious that similar care should be bestowed on the collection and preservation of provincial antiquities in Great Britain."

SALISBURY CATHEDRAL.

As many days as in one year there be, So many windows in this church we see; As many marble pillars here appear As there are hours throughout the flecting year As many gates as moons one year does view. Strange tale to tell, yet not more strange than tru Dr. Heylin.

THE IRON TRADE.

THE usual monthly meeting of Scottish ironmasters was held at Glasgow a fortnight ago, when the price of pig-iron was nominally fixed at 5% los. per ton. This is an advance of 1% 5s. since the previous meeting, and exactly double the price at which iron was selling in the beginning of December. Although this price was named as the rate under which none would sell, transactions took place as high as 61. per ton; and, notwithstanding this advanced price, buyers were more numerous and more urgent than sellers. An impression generally prevailed that prices would rise still higher when the present contracts of the ironmasters were completed. For bars the maker's price is 10*l*., but sales have been made at 9*l*. 10s. cash. Superior bars realize 11*l*. 10s. At these prices customers were supplied, and considerable business transacted during the week. Boiler-plates are quoted at 134. 10s. At Manchester there has been a pause in the demand for iron, and purchases have been made here and there at a reduction of 5s. per ton. At a meeting of the principal firms in the South Staffordshire iron trade, held at the Swan Hotel, Wolverhampton, on Thursday, the 27th ult., it was agreed that an advance of 40s. per ton in the price of manufactured iron should take place next quarter-day, the orders at present in hand, as well as those anticipated, at present in hand, as well as those anticipated, fully justifying this important step. The price of bar and rod iron, it is expected, will be then 12/ per ton; hoop iron, 134; sheet iron, for shin-gles, 144; and pigs, 64, 10s. to 74. In consequence of the sudden and great rise in the price of iron, much increasing the fact when the price of iron, much inconvenience is felt by the manufacturers and workmen engaged in making bedturers and workinen engaged in making oea-serews, latches, &c., particularly in the district of Wednesbury. The quantity of iron re-quired is very great, and cannot be procured; neither can the numerous orders daily arriving be executed at the recent prices. The small masters are therefore comparatively idle amidst abundance of work, and have as yet derived no benefit from the great improvement in the trade.

In the course of the past month an advance of 1/. per ton has taken place in Welch iron; and although the existing prices are considerably higher than they have been for some years, yet so general is the opinion of their being maintained, and also that further advances may probably soon occur, that orders, both from abroad, and for home use, are making their appearance somewhat fraely. It is with the greatest difficulty the makers are persuaded to take further orders at any price, in fact, some of the largest firms have closed their order books; 12/. 17s. 6d. per ton has been refused for rails, and 7/. is the price for pigs. During the past week it is well known that one party effected the porchase of 1,000 tons of common bar-iron for delivery in June next, at 10/. per ton. The *Liverpool Times* states that a contract was entered into in that town on Saturday last for 21,000 tons of rails, at the price of 12/. a ton, to be delivered at the rate of 1,000 tons monthly, beginning in October. The broker's commission in the transaction amounted to 2,400/. The purchase was made by a Glasgow house.

by a Glasgow house. The rails and chairs for the Newcastle and Berwick Railway, amousting to \$7,000 tons, have been contracted for at 121. per ton the former, and 71. the latter.

LONDON MECHANICS' INSTITUTION.--We regret to find that this, the oldest popular institation for the dissemination of knowledge, is less flourishing than it deserves to be. A meeting will be held next month to consider how to render more effectual the system of popular education there established, and we hope it will be attended by those who appreciate the advantages conferred on society by such associations. The first number of a new periodical called The Literary and Scientific Journal, conducted by members of this institution, has just been published, and is very creditable to those engaged in it.

BURIAL IN TOWNS.—We are glad to see that the House of Commons has come to the resolution that the practice of interment in large cities is injurious to the health of the population, and demands the serious attention of Parliament. This is one step forward at all events. SANATORY REGULATIONS.

A FEW nights since in the House of Commons, Mr. Hume asked when the Government proposed to bring in their measure with respect to the health of towns, and called the attention of the Secretary of State for the Home Department to the necessity of taking precautions in connection with that measure to insure an adequate supply of water.

Sir James Graham said that he could not then undertake to fix any time for the introduction of the measure. With reference to the supply of water, a clusse was introduced into all private bills brought before Parliament for that object, making them dependent on any general measures which might be hereafter introduced with respect to the health of towns.

The same subject occupied the attention of the House of Lords on Monday evening last. the House of Lords on Biomutay evening a The Marquis of Normandy, on presenting a petition from the mayor, aldermen, and citizens of Limerick, complaining of the sanatory state of that city, made inquiries as to the time when the promised measure would be introduced, and the extension of its provisions to Ireland. He was aware that the sub-ject was difficult in the arrangement of its details, and he did not wish to cause any unnecessary hurry, but the noble lord was SWATA that he was connected with an association for improving the sanatory state of towns, and he was daily receiving letters, inquiring when the measure, which had for some cause or other been so long delayed, would be presented. He would ask, therefore, whether it was in-tended to extend the provisions of the contemplated measure to the sister country, and also whether the Government would shortly introduce a bill on this subject into the other House of Parliament?

The Duke of Buccleuch, in answer to the questions put to him, said that he could not exactly state the period when the measure would be proposed; but he hoped it would be introduced before any great length of time elapsed. Since the receipt of the report of the Commissioners to Inquire into the Health of Towns, no time had been lost in preparing the measure; but it required a great deal of research and care, for it involved the examination of 400 Acts of Parliament, relating to different towns and districts. Hetrusted, that at no very distant period the bill would be laid before the other House, allowing not only sufficient time, but ample consideration in both Houses. With regard to extending the provisions to the sister kingdom of Ireland, he saw no reason why the provisions should not be extended to Scotland and Ireland; and on the further consideration of the measure be hoped that nothing would occur to prevent that extension.

The Marquis of Normandy said, that nothing could be more satisfactory than the answer given by the noble duke.

SMOKE PROHIBITION BILL.

On the second reading of this bill, which took place last week, the Earl of Lincoln said that the most convenient course would be to postpone the bill till the Government measure for the sanatory regulation of large towns should be before the house. He was not, however, disposed to resist the second reading, knowing that it was the intention of the hon. mover (Mr. Mackinnon) to send the bill to a committee upstairs. He trusted that hon. members opposite would not throw any unfair impediment in the way of legislation on this subject. Lord John Russell thought the bill ought to be postponed till the Government measure was before the House. He would rather see the subject in the hands of the noble lord at the head of the Woods and Forests, who could command the assistance of those best able to advise.

Mr. Brotherton was in favour of referring the bill to a select committee.

Sir R. Peel hoped the House would adopt the suggestion of the hon. gentleman who had last spoken. He represented a district of the country that was deeply interested in the question, and there was no hon. gentleman in that House better qualified to pronounce an opinion upon the subject. He though it would be very desirable to have the whole of the plan of his noble friend before the House, before they

proceeded to legislate upon one branch of these nuisances. The time that would be spent by a committee upstairs deliberating upon and maturing the measure, would, in his opinion, be well employed in bringing the scheme to maturity. He thought his hon. friend (Mr. Mackinnon) deserved the thanks of the House for the great trouble he had taken in the matter. The services of the hon. member were perfectly gratuitous, and he thought he was entitled to the grateful acknowledgments of the House. He believed it was generally understood that the bill of the hon. member would not be proceeded with until the general measure of his noble friend was before the House.

Mr. Mackinnon replied. He had been appointed chairman of a committee that sat two years ago upon the subject, and they had reported that the smoke nuisance ought to be abated, and that the Government ought to bring in a bill for that purpose, and if not that the chairman should undertake it. He did not see any objection to the committee being appointed to take evidence on the subject, and if the noble lord would incorporate the provisions of his bill in the Government measure he (Mr. Mackinnon) would have no objection to abandon his bill altogether.

The bill was then read a second time and ordered to be referred to a select committee.

PROTECTION OF WORKS OF ART IN MUSEUMS.

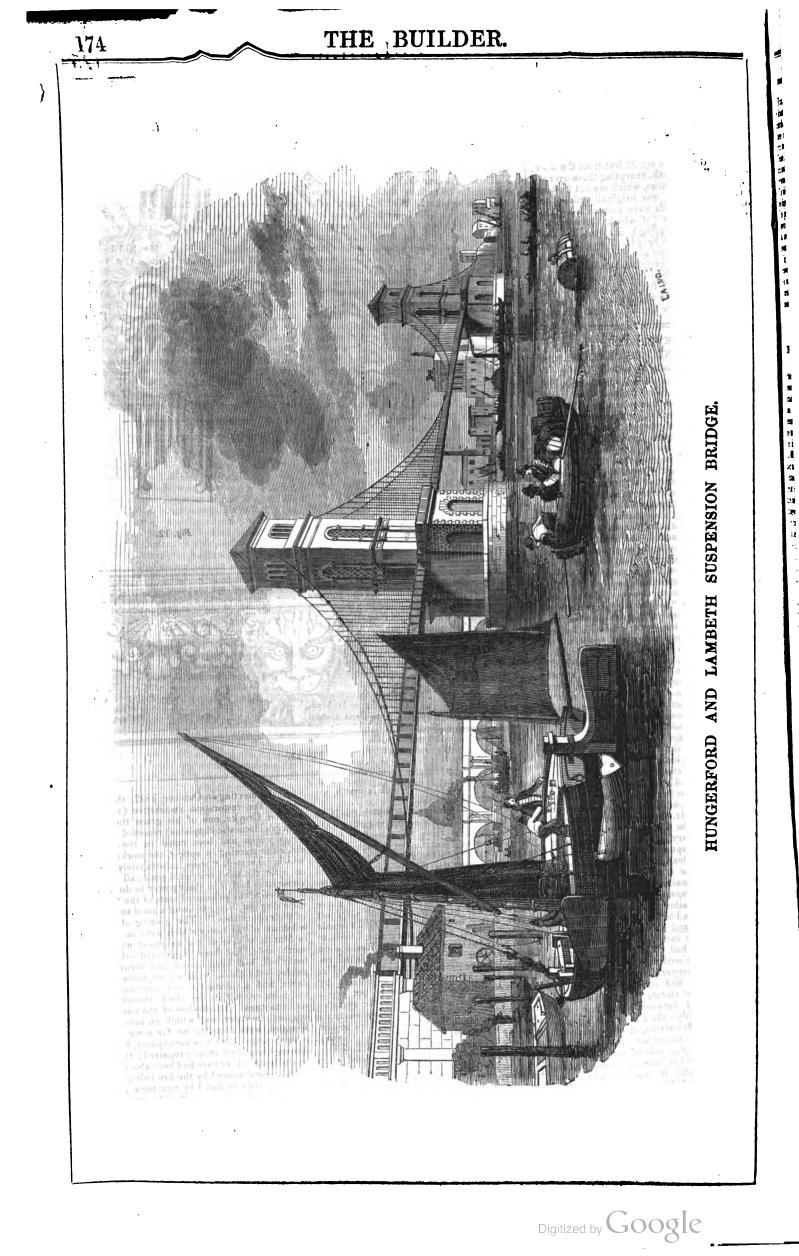

On reading the order of the day for going into committee on this bill a few days ago, Sir J. Graham said, he wished to go into com-mittee pro forma merely. He did not think it right that the operation of the bill should be confined to works of art in any particular locality, and he had therefore considered that it would be desirable to extend the provisions of the bill as it stood at present, and he was about to move an instruction to the committee to effect that object. There were many valu-able works of art to which the bill as at pre-imited would give no protection. For sent limited would give no protection. For instance, the statue of the Duke of Wellington, near the Mansion-house, ought to be brought within the protection of the law. His noble friend (Lord F. Egerton) had most liberally thrown open to the public his valuable and extensive collection of paintings and works of art, and it would be monstrous that any mischief should be done by means of a breach of his noble friend's hospitality without the possibility of due punishment reaching the offender. The painted window of St. Margaret's Church might be broken by a stone thrown at it, and as the words of the bill stood they would not reach such an offence. He therefore wished to give the measure a more extensive operation, and he begged to move that it be an instruction to the committee that they have power to extend the bill to all works of art, wherever situate; and, if the house agreed to that instruction, he proposed to go into committee pro forma, so that the provisions of the bill might be made co-extensive with the mischief.

The instruction having been put,

Mr. Bouverie said he quite agreed with the right hon. baronet so far as he went; he only doubted whether it would not be better to have a criminal as well as a civil remedy, giving the option of adopting either mode, according to circumstances.

circumstances. The instruction was then agreed to, and the bill went through committee pro forma, and was reported to the house, with amendments, and ordered to be printed and recommitted on Monday.

THAMES EMBANKMENT.—At a Court of Common Council held last week, Mr. Deputy Bedford presented a report from the Thames Navigation Committee on the subject of a letter received from the Earl of Lincoln, as Chairman of the Commissioners of Metropolitan Improvements, with a plan for the embankment of the Thames from Chelsea to Vauxhall. The report recommended a copy to be addressed to his lordship, expressing the concurrence to a certain extent of the plan. On the motion of Mr. Ashurst an addition to the effect of reserving to the Corporation of London in any measure introduced into Parliament their right to the bed and soil of the river was agreed to.

GOTHIC ORNAMENTS

FROM THE CATHEDRAL CHURCH OF YORK.

Fig. 11 and Fig. 12 represent two bosses, or knots, in the ceiling of the choir-end of the church. Including the transept, near the altar, there are in the ribs, or groins, 299 bosses, from two feet to two feet six inches in length. Those in the centre are 99 feet from the floor, and are all cut in oak, excepting those over the crowns of the windows, which are cut in stone. crowns of the windows, which are cut in stone. (The foliage of all was originally gilded, and the figures and heads were painted in colours. The principal ribs (of which the section is shown in the engraving), project 13 inches, and are 101 inches broad. The smaller ribs project 11 inches, and are 7 inches in breadth. Fig. 13 is the external cornice over the windows in the aisles of the choir. It is 2 feet deep, and projects 1 foot 2 inches. It is right to mention that the whole of our illustrations of these details were engraved by Mr. Hart. of these details were engraved by Mr. Hart.

YORK MINSTER: ITS FIRES AND RESTORATIONS.+ BY JAMES WYLSON.

Ar the meeting in March, 1842, at which the reports were read, whereof our previ-ous article contains the substance, the Rev. William Vernon Harcourt, senior canon William Vernon Harcourt, senior canon residentiary, in his address stated, with re-ference to the provision against fire, that there was an insurance of 10,000% on the choir, and 2,000% on the organ; but the Dean and Chapter hoped that, "if the above plan for the easy extinction of fire, or any plan similar to it, could be carried into execution, the insurance might be augmented on terms more advantageous :" he also stated that there was another risk to which the Chapter had directed their attention, namely, the chance of the fabric being fired by lightning; the rev. gen-tleman said the Minster had been once so endangered, but the fire was speedily extinguished; he attributed the escape of our Ca-thedrals to circumstances connected with their roofs, and thought " the paying proper atten-tion to the connection of the metallic coverings tion to the connection of the metallic coverings with the iron and lead water-pipes leading to the drains as forming one great conductor of the electric fluid, a point of much importance to their preservation from such accidents." In reference to the Minster funds, he stated that they now differed from what they were after borrowing the 8,000% on account of the fire of 1829, "exactly by the additional bur-then of the annuities on which that sum was borrowed, and the addition of 1,000% to a debt of 6,000% under which they then laboured ;" he then recapitulated the sums required as estithen recapitulated the sums required as esti-mated by Mr. Smirke, and which shewed that to meet the completion of the restoration in to meet the completion of the restoration in nave, the urgent and non-urgent repairs, and the 7,000% debt referred to, about 36,000% must be provided; or if the whole restoration recommended by Mr. Smirke were entertained, the deficit would be 45,500%; such being the case, it was necessary, in the first place, that the Dean and Chapter should mortgage the fabric funds, the clear surplus of which (after allowing 1.500% for burthens independent of allowing 1,500% for burthens independent of repairs, and for maintenance of service, and repairs, and for maintenance of service, and as reduced by the annuities above-mentioned) being 790% would allow of borrowing 12,000% from Queen Anne's bounty, at 4 per cent. to be paid off, interest and principal, in 40 years. To enable them to carry this into effect, the Dean and Chapter had applied for an Act of Parliament: in the second place, a portion of certain leasehold property, called the commons estates, the fines and other proceeds from which are (by royal statute and parliamentary anthority) divided between the fabric and the residentiary body—the former taking one, and the latter five-sixths, it was proposed by the latter to surrender in favour of the repairs; and the sale of one of which, if anthorized by Parliament, would realise 15,500%; this sum, it was intended, the fabric should have to pay no interest for, but the principal to be repaid by instalments in forty years; thus, the succeeding residen-tiaries would enjoy a gradually increasing return, until ultimately its entire value would be restored to them, while the present body may be considered as relinquishing all their as reduced by the annuities above-mentioned

future interest in it, and which is worth, say

874 per annum, individually. The mode of appropriation which the Dean and Chapter had in view in regard to the and Chapter had in view in regard to the 27,500% thus to be raised, was, first, to devote 1,000% to the augmentation of the small vicar-age connected with the property to be sold; which done, and the parliamentary fees and other expenses defrayed, between 25,000% and 26,000% would remain for the uses of the fabric: from this, then, the 7,000% debt above referred to was to be paid; 6,200% set apart for the first class of repairs; 7,000% towards the second class; and the remaining 4,000% to 5000% placed at the disposal of the Restoration Committee for the especial purpose of re-Committee for the especial purpose of re-constructing the groined ceiling of nave. Mr. Harcourt stated that he was authorized by three non-residentiary canons to put down their names for 50% each towards the restoration, and that the ecclesiastical commissione who had in their hands about one-third of the property of the original body of the Canons of York, had agreed to contribute 500% to the same object. In conclusion he stated that there would still be a deficit of 12,000% one-half to complete the restoration of the nave, half to complete the restoration of the nave, the other to accomplish the necessary repairs : he also stated that it was the desire of the Dean and Chapter that the restoration com-mittee "would carry out and complete the work they had so admirably begun," and com-plimented that body and Mr. Smirke bysaying "that the works had been carried on with a beilt and an accompany which desarred not call skill and an economy which deserved not only to be commended, but to be followed as an example."

At the meeting in October, 1842, the chairman of the restoration committee (the Rev. Stephen Creyke, one of his grace the Arch-Stephen Creyke, one of his grace the Arch-bishop's domestic chaplains) reported the pro-gress which had been made in the interval since the meeting in spring, the works during which, he stated, "were unfortunately carried on upon the most restricted scale, all that the committee had it in their power to do in comcommittee had it in their power to do, in con-sequence of the exhausted state of the funds at sequence of the exhausted state of the funds at their disposal, being to avoid a total suspension of their operations." The glazing of the four windows of the tower which were in progress in March, as also of the westmost window of south aisle, had been completed—the great tenor bell had been raised and securely sus-pended—the clock, with all requisite appendages, and a substantial and convenient case, had been erected in the clock chamber, and set in motion. The arches of the nave which support the tower, and which on minute examination were found to be far more danger-ously damaged than was anticipated, had been thoroughly and effectually repaired; the pillars on the south side of nave had been also repaired, every stone damaged by the fire being cut out, and accurately replaced by new ones carefully bonded in ; those on north side were undergoing a similar renovation. Two contracts had also been entered into, one for the ribs and spandrels forming the vaulting of the nave, and spandreis forming the validing of the have, the other for the carved work to the same, the latter consisting of upwards of 150 bosses, which were all to be executed in strict re-semblance of the originals, as fortunately pre-served in Halfpenny's work, and in drawings by Mr. Brown, a York artist of the present

day. The reverend gentleman also stated that the 500% above-referred to, as agreed to be placed at the disposal of the Dean and Chapter by the ecclesiastical commissioners, on the part of those prebendal stalls the revenues of which were under their control, had been so contributed, and had been received by the restoration committee, as had also the arrears of subscriptions, with the exception only of a third instalment upon one of them.

In the speech of the Rev. Mr. Harcourt on the same occasion, the meeting was informed that those intentions of the Dean and Chapter already detailed, and for carrying out which the sanction of Parliament was necessary, had been effected: 6,000. had been placed at the disposal of the restoration committee for the repair of those parts of the minster which were in a dangerous state, and to that sum 4,000. were ready to be added towards completing the restoration of the nave should it be required; but it was to be borne in mind, "that all which they might be called upon to supply towards the repair caused by the late fire, would be so much money abstracted from the fund for the substantial and necessary repairs of the building."

After many excellent addresses, evincing throughout the devotion which inspired the inhabitants of this great county for their cathedral, the chairman of the restoration committee proceeded to read the list of additional sums which had been subscribed, and which, with those up to October 29th, amounted to 5,7571. 10s., a sum which, considering the large amount of previous contributions, must be considered handsome, but which was still inadequate to the completion of the desired reparations."

Since the meeting last referred to, much has been done in pursuance of the reports of the architect; the restoration of the nave and southwest tower has been completed; the roof of south aisle reconstructed with iron castings in lieu of timber trusses, and covered with lead; the vaulting and repairs of masonry and pav-ing have been finished, and the whole cleaned down, and handsome new doors with elaborate tracery and ornamental hinges hung to central and south doorways in west, front, in lieu of those destroyed, which if like that to north tower, were of a very plain description; a new door is likewise in preparation for the latter, like the south one; a new roof with iron trus-ses and covered with copper has also been constructed over the north transept. While the works in nave were in progress, the great arches at its east end were bricked up, in order to prevent interruption to the service, and to confine the noise and dust of the operations from extending eastward: when the restoration and repairs in the west were finished, these temporary walls were taken down. On Friday, the 5th of July, 1844, the nave was partially opened to the public, and on the Sunday following, the opening was formalized by the presence and preaching of the very rev. the Dean.

On the 26th of December, 1843, Dr. Beckwith, physician of York, died, bequeathing his ample fortune in aid of the various charities and public institutions; amongst the bequests being one of 5,000% to the Dean and Chapter for a new peal of bells, the remainder of the sum to be applied in repairing the Chapterhouse. In accordance with the intention of the munificent testator, the restoration committee commissioned the eminent bell-founder, Mears, of Whitechapel (now succeeded by his sons C. and G. Mears), to complete a peal of twelve musical bells, that number being two more than the old peal consisted of. The new or Beckwith peal first burst upon the delighted ears of the inhabitants on the 11th of July, 1844; and though heard under the several disadvantages of the ringers being out of practice, and unused to a peal of twelve; the bells not having yet adjusted them-selves to their bearings; the ropes having to stretch; the clappers to accommodate them-selves to the sides of the bells, which always want some sharp practice to consolidate and bring them into perfect tune, and the bells yet to attune themselves into perfect harmony with each other, their tones were pro-nounced to be of fine quality. Another supposed disadvantage that was talked about was the steepness of the new slate louvres in the belfry windows, which it was thought pre-vented the free passage of the sound; upon

inquiry, however, it appears that no alteration was made in their pitch. Respecting these louvres it may be mentioned, that an effect has been produced which was no more anti-cipated than that of the whispering gallery of . Paul's; being a material of ringing hard-SI ness, in windy weather they send forth a sound which at night is heard over the city, of course particularly in the direction of the wind, and which is dreary in the extreme, and to those residing in the vicinity of the Minster Yard must be far from enlivening; the melancholy unmusical wail seems to proceed from some imprisoned ghost -the spirit of the departed chimes perhaps, and who as the storm drives more furiously through the bars of his cage, raises his voice to a howl which is heard above it. With a view to obviate this, s piece of stout quartering has been fixed upright in the middle of each opening, notched so as to halve the inner bear-ing of the louvres, since which the ghostly music has been less loud and less frequent, although not altogether put down; this, how-ever, it is confidently expected will be accom-plished. The 11th bell of the peal, which is described as being of a very fine mould, bears the following inscription :--" Soli Deo Gloria, Anno Domini MDCCOXXXVII. Regina Victoria, Britanniarum Regina Septum. Archiepisco-Britanniarum Regina Septum. Archiepsco-patiæ Edvardi Archiep. Ebor MDCCCXXXVII. Stephanis Beckwith, Medicæ Doct inter. Ebo-racenses Primarias Testamento I egavis. Card-ley Es. Georgia Mears, Londini. Fecit. Rud., 1844." The weights and dimensions of the several bells in the peal will be found detailed in Vol. II., page 364, of THE BUILDER; their entire weight including the two small ones entire weight, including the two small ones added to the old number, is 16 cwt. 2 qrs. and 18 lbs. more than that of the former peal. An amusing idea of the deafening din while up amongst them when in full peal may be formed from the fact, that the writer of this, on an occasion of his being there with some friends, endeavoured at the loudest possible pitch of his voice, while standing close to them, to make himself heard, without being at all audi-ble. In the ringers' chamber is the following inscription engraved on a large brass plate, and which was rendered necessary by the name of Dr. Beckwith being omitted to be inscribed on each bell:-" This peal of twelve bells was given by the will of the late Stephen Beckwith, M.D., senior physician of this city, in the year of our Lord, one thousand eight hundred ond forty-three.

C. and G. Mears, Bell-Founders, London, July, One Thousand Eight Hundred and Forty-four.

Barnard Price, Thomas Price, Faril James Copsie, Executors."

The ringers' chamber is immediately under that containing the bells; under the ringers' is the one appropriated to the clock, which strikes the hours upon the tenor, and the quarters on one of the smaller bells. This clock, it is considered, would not be sufficiently strong for the great bell, which is to be placed in the north-west tower, and a new one of more powerful mechanism is accordingly proposed to be placed there in its stead. An account of "The Monster Bell" will be found in Vol. III., page 83, of THE BUILDER (the current year). In addition to the bells there mentioned, by way of comparison, we may state that although our "Big Peter" is unquestionably the greatest bell in this kingdom, he would play but a second fiddle amongst the bells of the continent, not to say any thing of Russia:--

St. Stephen's bell, Vienna, is stated to weigh upwards of 17 tons.

The people of Rouen estimate their largest at 16 tons.

Our great Tom of Oxford is 71 tons, or perhaps rather more.

The great bell of Antwerp Cathedral, weighing about the same as this, is said to have taken sixteen men to ring it; from this we find, supposing the circumstances to be similar, that Peter would require the united strength of twenty-six men to bestir his metal; but this estimate probably far exceeds the truth, and much must depend upon the care and nicety exercised in the hanging.

The old Tom of Lincoln, mentioned in the paragraph referred to, having been cracked, was broken up on the 18th of June, 1834.

There may sometimes be great mistakes as

to the weight of large bells: in a clock-house at Westminster hung a bell which was usually rung at the coronations and funerals of princes, and bearing this inscription :---

King Edward made me Thirty thousand and three,* Take me down and weigh me And more you shall find me.

When it was taken down at the doom's day of abbeys, it was found, even with the help of two more, not to weigh 20,000.

In further observance of Dr. Beckwith's will, a thorough restoration of the interior of the Chapter-house has been going on for the last six months, and which, when completed, will render this part of the Minster a perfection of architectural beauty of its kind. The masonry of the surrounding stalls has undergone a re pair of the most perfect description, many of the canopies being in front entirely new, and the whole, including the carvings, reworked and made good. In this part of the masonry, before these operations were begun, the destruc-tive effects of the use of iron cramps were most strikingly exemplified, many stones being shivered to pieces, the work thrown out of its proper bearings, the joints in every direction an inchor two in width, and the cramps themselves in such a state of decay, that had the Chapter continued to hold their meetings there, and this restoration not have come soon about, the lives of Dean, Canons, and Prebends would have been involved in one common danger by the impending masonry. In the restoration, cramps of iron, encased and brazed in copper, have been used where necessary, but wherever possible the front parts of the masonry have been dovetailed into that behind, and joggled together, and dowelled with slate plugs, so as to render foreign adjuncts unnecessary. In this stall-work, the most beautiful carvings were found wedded to the most clumsily-constructed masonry, such as the artisans of our day would be ashamed of. In the interior angles of the stalls, the Purbeck marble shafts, many of which were much decayed, and some entirely worn through by time, have been made good with new, and the whole highly-polished, senting a fine contrast to the clean Huddlestone masonry, and setting off with increased effect the exquisitely carved caps and pen-Besides the usual process of polishing dants. to which such work is subjected, these shafts received, in a hot state, a coating of some waxen mixture, part of which they imbibed, thus rendering their pores less pervious to the atmosphere, while it enhanced the brilliancy of their polish. On polishing the old shafts, they were found to be generally much superior in beauty to those obtained at the present day, being less confined to the dark grey tone, and presenting pleasing variegated patches, approaching a flesh colour.t

To accord with this part of the works, arrangements have been concluded with Mr. Willement, who executed the beautiful decorations in the vaulted ceiling of the Temple Church, for performing the like office for that of the Chapter-house, the symmetrical combination of which affords favourable scope for his ability. It has been determined also to lay the floor with Minton's encaustic tiles, which, when such reinstatements as are necessary in the beautiful glazing of the windows have been effected, will render the coup d'æil complete. On the stall-work and clustered shafts between the windows were plain traces of the masonry having formerly been decorated in party colours, and which is also apparent in the vestibule, but upon mature consideration it was judiciously resolved to confine this branch of art to the groined ceiling, thereby securing a relief which would not otherwise have been obtained. Preparations are in progress for heating the entire Minster with hotwater; four large slate cistorns are also about being prepared for the lantern-tower, as suggested by Mr. Smirke, and which will collect the water from the roof; they are to be placed in the corners, between the groined ceiling and the external roof, and will be three-sided

accordingly. Other provision of a like nature is also to be made, as well as the description of lightning conduction adverted to by the Rev. Ir. Harcourt in his address to the meeting of March 31st, 1842, and which, when completed, will enable the Dean and Chapter to effect an insurance at a much reduced premium.

In the summer of last year a considerable sum was realized by a two days' sale of relics, Sum was realized by a two days' sale of relics, consisting of dilapidated stone and charred oak carvings, surplus materials, &c. On the 23rd of January, in the present year, the restoration committee resigned their trust, having ex-pended 22,450%. The repairs now proceed under the Dean and Chapter, as of old. In conclusion, it would be doing injustice to those conducting these important works were

those conducting these important works were we to pass unmentioned the approbation which their efforts have invariably commanded; and whether we regard the judgment and taste of the architect, whose name is a guaranty of sound professional skill, the unwearied co-operation of the Restoration Committee, or the efficient superintendence of Mr. Allen, the active and intelligent clerk of the works, we feel that while a duty of no common order devolved on them, abilities were brought to bear on it fully equal to the occasion. In regarding the noble structure itself, we are led to admire the wisdom of that cruciform arrangement which the piety of the ancient architects prompted them to adopt, a plan which must often have preserved to them a refuge in one portion of their edifice, while it was desolated in the other by some visitation such as those to which York Minster has twice within so short u period been a prey. Such at least has been the case with the latter ; while a furious conflagration raged in and consumed one end, the lantern tower stood like a protector be-tween, and intercepted its approach to the other. Now the visitor may stand under that great tower, and whether he look towards the east or the west, north or south, sublime grandeur and sacred order meet his gaze; and in that long and lofty nave, with its matchless vistus, if his breast heave not with emotions superior to his best wordly aspirations, he is an anomaly, and belongs to a lower order in creation.

" When silent gliding through the sacred aisle,

To join the throng on pious ritual bent; The organ's solemn peal our thoughts can wile From ways profane to virtuous intent; And teach the vengeful bosom to relent;

Each cadence wakes a dormant sympathy ; Each swelling symphony makes penitent : Such thy celestial power, oh harmony !

In holy fane attuned, to man on bended knee."

SOCIETY OF ARTS.

APRIL 2nd. Dr. Roget, Sec. R.S., V.P., in the chair. The following were elected as members:--W. H. Ashurst, H. T. Harrison,

and E. Gibson, jun., Esqrs. The secretary read a description of Mr. Riding's index-machine for weaving silk goods, which consists of an adaptation of the cylinder of the dobbin (with moveable instead of fixed pegs) to the wires of a jacquard machine, doing away with the cards, levers, pulleys, &c., of the dobbin, and with the cards of the jacquard machine. Mr. Henry Lawson's Reclinia for astronomical purposes was next described, which consists of a frame 6 feet long, having a foot-bracket at bottom. The frame is suspended by two leather straps to a horizontal triangular frame, which rests on two large wheels and one small one; the large wheels are in such a position as to be under the control of a person using the reclinia; the small wheel is under the back part of the frame. A light chain or cord is connected with a pedal attached to the foot-board, which cord leads to a catch, by which the position of a racked arch attached to the foot-board is regulated, in order to set the inclined frame at any given angle; the inclined body frame at is filled in with cane-work, as also the pillow-frame, which is attached to the former by means of any other than the former by means of springs. This observatory reclinia is especially useful when large telescopes are used, in which the sweep of the eye end from the horizontal position of the tube to the zenith, or vertical position, forms an arc of several feet. When the observer wishes to

me one happily said, on visiting the nave, and in ce to its beautiful windows, that "it was like being a kaleidoscope."

remove his eye from the telescope, he has only remove Lis eye from the telescope, he has only to press down the spring pillow-frame with his head, which can be done without injuring himself, or unadjusting the telescope. The machine above described is used by Mr. Lawson in his private observatory at Bath. The model of a new fire-escape and portable scaffold, by Mr. J. Clarke, was next intro-duced to the meeting, which is an improve-ment on Mr. Wivell's fire-escape, for which he was rewarded by the society in 1839. Mr. Wivell's invention may be seen every evening Wivell's invention may be seen every evening at the different stations (in the metropolis) of the society for the prevention of accident by fire. Mr. Clark's improvement consists, 1st. In the mode of raising the upper ladder, which runs between the sides of the larger ladder, thus giving firmness to the whole; 2nd. In the facility of using the small ladder alone; 3rd. In the introduction of a balcony alone; 3rd. In the introduction or a baloony instead of the canvas bag, which forms part of Mr. Wivell's escape; 4th. In attaching the carriage to the main ladder with a different arrangement of the springs, whereby the jerk-ing motion of Mr. Wivell's contrivance is ing motion of Mr. Wivell's contrivance is obviated; and 5th. Its adaptation as a port-able scaffold, either for the interior or exterior of lofty buildings.

Correspondence.

PUBLIC CEMETERIES.

SIR,-The late exposure of the disgraceful proceedings in burial-grounds will probably lead to some new system.

I beg to send you the following rough hints for forming large picturesque cemeteries, with appropriate, profitable, and attractive buildings, with the hope that the attention of the parochial authorities may be called by these means to the subject, and that parishes may be led hy combining together to have them on a grand and liberal scale.

The whole of the city parishes would form one large and rich company, and if they pur-chased from 300 to 400 acres of land on the bank of the river Thames, might lay it out in serpentine walks, clumps and groves of trees, plantations, &c., frequently shutting out the views, interspersed with the tombs, monuments, monumental statues, &c., so that the visitors might come suddenly on to a more extended view, thus giving as much variety as possible. Part of the land might be laid out in small woods, with underwoods, which would be growing fast into money, would give the whole a park-like appearance, and when required for burials, be cut down and sold; parts might also be devoted to the culture and growth of flowers and shrubs.

With regard to the arrangements of the funerals, there should be a building for the reception of the corpse in some central situation close to the river, with suitable rooms for the mourners and attendants, with a proper landing place: and as there will be many bodies each day, a large galley would be re-quired, and also others for the mourners.

As to the buildings for the performance of the service of the dead, they should be of such size and grand proportions, forming one complete whole, as to impress the greatest so-lemnity on the minds of the mourners and visitors; at the same time, to have arrange-ments in the internal cloisters for the accommodation of the tombs and monuments for individuals, and mausoleums for separate families.

I beg to suggest a church in the form of a complete cathedral in the early decorated style, being the simplest form both for the economical use of material, and that of the right sort, (stone), and space, the accommodations and ornamental forms in the decoration arising (not encumbering, like some other styles of architecture, but assisting) out of the very skeleton of the building, giving the utmost amount of strength and durability with the least quantity of material.

The plan I beg to propose would consist of two towers at the west end, with archways between them and a carriage-drive through the centre of the whole building, which would form the nave, leading under the central tower and space, with two chapels on each side, forming the transepts, and cloisters on both sides of the carriage-drive, representing the aisles; also similar cloisters beyond the central tower and chancel, thus giving externally the general and grand outline of a complete onthedral, which might be either on a large or moderate seale,

The carriage-drive is intended for the passage of the hearse or galley, which might be drawn on a car by horses, and, with the choir leading and the numerous mourners following, would make at times a grand and impressive procession. The aisles, towers, and other parts, would be divided into stories of cloisters, Sic. &c. for tombs and tablets, to the extent of about eighteen times the length of the whole build-ing, and the chapels for the services of the dead.

I have sketched out a plan, section, and description of the shove more in detail, and shall be happy at some future time to lay it before your readers, if you should think it worthy of a place in your excellent journal. I am, Sir, &c., Lambeth. WILLIAM J. SHORT.

The buildings of the West of London and Westminster Cemetery, in Old Brompton, in the Italian style, are disposed somewhat on the plan suggested by our correspondent .-- ED.]

PRATT'S CARVING MACHINE.

SIR,-In your last number, I find an article relating to Pratt's patent carving machine, which I am afraid has a direct tendency to mislead a great portion of your architectural readers, more particularly the junior members of the profession. As an ornamental draughtsman, and an enthusiastic admirer of decoration generally, I am induced to offer a few remarks on this subject, and trust you will deem them worthy of insertion in your useful and popular publication. I am under the necessity of quoting from the article mentioned, it being stated therein that by means of Pratt's machine "the most elaborate tracery can be carved out of the solid wood or stone with great rapidity, and for about one-third of the sum it would cost if executed by hand." This estimate is wrong in every respect; and with all due deference to Mr. Pratt's discernment, I shall now endeavour to shew the falsity of his assertions. On applying to Mr. Pratt for information respecting his process, he offered to take any description of work, and execute it equal to specimens in his window, at a lower price than by hand. On shewing the draw-ings, however, for the work required (a Gothic screen perforated and worked on both sides), this (pointing to several parts of the tracery), "as there was not enough of it alike to pay him;" and those parts which he offered to dehe remarked that he could not do that, nor him;" and those parts which he offered to do for 11. (perhaps for 15s.) each were, on his refusal to do the whole, eventually put into the hands of a first rate workman, and by him completed at 14s. 6d, each—so much for price. The reason Mr. P. cannot take a small order is that the necessary metal patterns (for the cutters of the machine to work by) are suf-ficiently expensive in themselves to prevent their being kept in stock; and even if such was not the case, every design being different, a new set of patterns must still be made for a new set of patterns must still be made for each job previous to its commencement. The cost of these patterns must be considerable from the care which is required not only in casting, but in giving them a true face after-wards, and the necessity which exists of shifting them frequently, renders the process throughout tedious and irksome in the extreme; and although the cutters act very well, and cut clear with the grain of the wood, still, against it they are quite the reverse. When the machine has done its portion of

When the machine has done its portion of the labour, the mitres, eyes, &c., not being touched by the cutters, must be finished by hand, and taking into consideration the cost of the wood pattern in the first instance, the delay caused in casting and filing up the same, the fitting of the patterns in the ma-chine, previous to the work being commenced, the necessity which exists for shifting the sutter every the fillers for more full to another. cutters over the fillets from one foil to another, and the incompetency of the machine generally to finish its work, must, I think, convince any reasonable person that Pratt's patented process is not a cheap one. Again, as Mr. Pratt does not consider it worth his while to take small orders, I do not see how his plan can he productive of any good result as regards the interests of the architect. That the machine is capable of "working any form, however ela-borate," is incorrect, for if such was the case. it would work the mitres, and as it does not do

so, it cannot properly be said, that Mr. Pratt, by means of his machine, can produce Gothic tracery, the beauty of which depends entirely upon the accuracy of the mitreing. Having, upon several occasions, had an opportunity of carefully examining work executed by this process, I have invariably found it rough and inferior in every respect to that done by hand, and am also of opinion, that instead of "calling into operation a school of carvers," it will have a contrary effect. My reason for it will have a contrary effect. My reason for arriving at this conclusion is, that the present race of carvers are sadly wanting in their knowledge of, and, in fact, seem to have no conception of *relief*. The carver of wood or stone, if he works upon material prepared by the machine, thus literally throws away the best opportunity he has of acquiring freedom in execution, combined with taste, the "rough-ing out" being the most essential part of his art.

As regards the specimens alluded to at Ravensworth Castle and Malvern, they are at too great a distance from town for those who are most interested in the matter to visit, but are most interested in the matter to visit, but fortunately the machine decoration to that splendid ecclesiastical edifice, Camberwell New Church, may be seen and admired by any person who may feel inclined to trouble him-self by walking or riding that far, or by calling at Mr. Pratt's establishment, in New Bond-street. I beg to apologize for the length of this communication, and am, Sir, &c., F. M. 8 Great College-streat Wastminstor

8, Great College-street, Westminster, March 26th, 1845.

JAMÁICA LUNATIO ASYLUM.

SIB,--Not having seen in your very excel-lent work any account of the competition for the Jamaica Lunatic Asylum, I presume you are not aware that it is decided ; and knowing you are anxious for information upon those subjects, I avail myself of this opportunity to state that Mr. Jos. Harris, resident engineer of the Hanwell Asylum, was the successful competitor.

I feel much pleasure in saying that no influence whatever, either directly or indirectly, was used by that gentlemen or his friends to affect the decision, which, under such circum-stances, must have arisen from the merit of the design.

The following notice is from a Jamaica paper, dated 14th Feb., 1845:--"The Lunatic Asylum.-There was a meet-ing on Wednesday last, at the King's house, of the Commissioners appointed to carry out the Act for Building a new Lunatic Asylum, his excellency the Governor in the chair. It is said that the object of this meeting was to receive the report of the committee, which had been previously appointed, to select one of the numerous plans and models submitted to the numerous plans and models submitted to the commissioners for examination and ap-proval, when that of J. Harris, Esq., the resi-dent engineer of the Hanwell Asylum, in England (which is the largest and best of the kind in all Europe), was approved of." I am, Sir, &c., Notting, bill

Notting-hill. J. R. CROFT.

COMPETITION -- CLIFTON UNION.

SIR,—A letter, signed "Thomas Allom," appeared in THE BUILDER of the 29th of March, in which it is more than insinuated that in the choice of a plan for a new work-house, the guardians of the Clifton Union had sorted with martiality, no other proof heing acted with partiality, no other proof being adduced than the bare circumstance that the plan, which has been chosen, was prepared by a Bristol architect.

Mr. Allom cites the opinion of a professional gentleman, who was engaged to assist in the examination of plans, as having been favourable to his; it is readily admitted that the opinion referred to was favourable to Mr. Allom's plan architecturally considered, but it should be remembered that the chief requisites in a plan for a workhouse are, sufficient space for the inmates, and proper arrangement for their classification and inspection, to which require-ments the architectural design of the building unable to be aphendiate. ought to be subordinate. In citing the opinion already mentioned, Mr. Allom omitted to notice two important features in the report which contained that opinion, namely, that Mr. Allom's plan shewed a deficiency of space

for several classes of the inmates, and that to carry it out would cost 3,600*l.* more than Mr. Allom's estimate. To this it may be added, Mr. Allom's estimate. To this it may be added, that the same professional gentleman alluded to estimated the cost of carrying out the plan which has been chosen (similar materials of every kind being taken into the calculation for both plans) at 1,902*l*. less than Mr. Allom's plan. Now, admitting the two plans to have possessed equal merit (which was not the case, the plan chosen being superior in the three chief requisites of space, classification, and inspection), surely there was sufficient and substantial ground for giving the preference to a plan which a professional adviser stated would cost 1,902*l*. less than Mr. Allom's. It might very easily be shewn that of all the

It might very easily be shewn that of all the architects who sent plans Mr. Allom should have been the last to complain of partiality having been shewn, but the object of the writer is not to wound the feelings of any one, but simply to record one or two incontro-vertible facts, in order to prove to the pro-fessional gentlemen who sent plans that the guardians have acted towards them with perfect good faith .-- I am, Sir, &c.,

A GUARDIAN.

Bristol, April 4, 1845. ** A correspondent desires to know who is the successful candidate: the name has not yet reached us.

THE FLOATING DOCK.

SIR,-In THE BUILDER of 15th March, it is mentioned, that a Mr. Lennox has invented a floating-dock, and that the directors of Woolwich Dock-yard have been ordered to pre-pare detail drawings of the scheme.

pare detail drawings of the scheme. I most respectfully ask to be informed whether the above-mentioned floating-dock means a dry floating-dock. If it means a dry floating-dock, I am pleased to know that some person more competent than myself has for-tunately step forward for so laudable a pur-more. Not only our own merchants and so pose. Not only our own merchants and government, but merchants of other nations will feel its beneficial effect, to say nothing of the many lives of our bold and adventurous tars it will probably be the means of saving. If it does not mean a dry floating-dock, you will hear further from me.

I am, Sir, &c. W. R.

EXHIBITION OF WORKS OF DECORATIVE ART, &c.

SIR.-You have doubtless heard of the various projects on foot for the establishment of galleries for the purpose of exhibiting me-chanically-factured and decorative works of art,-places to bring together such matters as were exhibited lately in St. James's-street.

There can be but one opinion as to the utility of such exhibitions when properly conducted. They offer the means to the artist and artisan of communicating directly with the public, of coming before them, in fact, without the intervention of a third party — an advantage of no little consideration; and this must most evidently tend to promote the taste and in-crease the demand for works of this nature.

Although the exhibition in St. James's-street made no great impression on the public, neither was it to be expected that it should, for most of the decorative instances were attempts of persons not regularly educated in the principles of ornament, but emanations from hitherto untried hands, evincing the skill and perseverance of an emulation just beyond the workshop. An artist, in the accepted sense of the term, could but in few instances be said to have exhibited at all. Take that exhibition under its true circumstances, I think you will agree that it was satisfactory; for though a smile may have been excited at an ambiguous attempt here and there, scarcely any one could pass through the room without respecting the united efforts.

Such an exhibition is a school for the exhi-Such an exhibition is a school for the exhi-bitor; he cannot compare his attempt with the attempts of others without learning many important things, one of which, and a very material one, will be his own value. It is very difficult to judge of the respective value of two matters extremely remote in quality, but the "little-better" is always easily observed, and has a more encouraging effect.

and has a more encouraging effect. The main things wanting to such an exhibi-tion, is to give it a good place and permanency. Now, Sir, without disparaging any of the pro-

jects in hand, I would submit, with your permission, to the interested public, through the sgency of your effective journal, a single suggestion on the subject, and that is that some portion of the vast area which forms the site of the British Museum should be appropriated to a purpose of this kind. The able superintena purpose of this kind. The able superinten-dence under which the Museum is now so admirably conducted, would ensure success. There are many reasons which will readily occur why institutions of this kind, got up by private individuals, should fail. There ought to be in my opinion but one place of the to be, in my opinion, but one place of the kind, and that the most public that can be found. Trusting that the importance of the subject will be my sufficient excuse. I am, Sir, &c., Bedford-square. W. A. HOFKINS. l

Bedford-square.

BURIAL-GROUND OF ST. SAVIOUR'S, SOUTHWARK.

SIR,—On perusing your journal of the 5th instant, I find a paragraph referring to the state of the burial-ground of St. Saviour's Church, Southwark, and what the parishioners

had done in consequence. Allow me to draw your attention to a few particulars connected with this matter, and then I will leave it with your sound judgment to determine whether much has not been sai l in the public journals on this subject that might have been well spared until they had better information, or at least until the committee to whom it is referred had investigated

mittee to whom it is referred had investigated the matter, and reported thereon to the vestry. You know that there are two days in the year when vestry meetings are held differing in their power to any of the others that may be held, viz. Easter Tuesday, and Michaelmas-day. On these days any parishioner can pro-pose any resolution without giving previous notice thereof, and if carried, need no confir-mation by a subscenario vestry much was the mation by a subsequent vestry,--such was the case on Easter Inesday. What the vestry really did was to refer it to the wardens and a committee of six inhabitants to investigate the matter and report to a fature vestry. The churchyard in question contains 1,603

ards superficial, from which a deduction of yards supernetas, non which taken, leaving 233 yards for paths may be taken, leaving 1,370 yards free for burials.

1,370 yards free for burials. The whole amount of burials therein in three following years just passed, was 245, of which 91 were infants, 33 under thirty years of age, 121 above thirty,—being not quite an average of 82 per annum, and consist of 30 infants, 11 under thirty, and 41 above. The committee's first meeting to investigate this matter was on Thursday afternoon last

this matter was on Thursday afternoon last, after which probably you may hear again from

A SUBSCRIBER TO YOUR JOURNAL, and an Inhabitant of St. Saviour's, Southwark.

HISTORY OF A LONDON WORKSHOP .--A man begins by employing a few hands in a house often but ill-adapted for an ordinary dwelling-bouse, and, as his business increases, he contrives to add one low apartment to another, by knocking down partition-walls, and making such alterations as suit his immediate purpose. He contrives by this means to accommodate an increasing number of men, and the only practicable limit to that number is the want of mere standing or sitting-room, as the case may be. He warms these rooms by a stove, by steam, or by hot air, and lights them with gas: the consequence is, that the work-men are exposed at the same time to a high temperature, and a fouland stagnant atmosphere. This combination is carried to its highest degree in tailors' workshops, and I have been told more than once by the journeymen tailors themselves, that they have been obliged to strip to the very skin, that they might be able to bear the intense heat to which they are ex-posed. In buildings intended for workshops more space is given to the men, but they are usually space is given to the men, but they are usually constructed on very bad principles; the whole building often forming one space, divided by floors perforated by a common staircase; if a steam-engine is employed, it is generally to bo found in a lower apartment of this building, so that the heat rises from this into the upper rooms, and, mingling with the foul air of the intermediate floors, ascends to the highest flat, where the hot and foul air collects in great abundance.—Medical Times.

Aliscellanea.

OSBOBNE ESTATE, ISLE OF WIGHT .- This costate, recently purchased by her Majesty from Lady Isabella Blatchford, is considered one of the best situations in the island, being placed on a spacious lawn sloping to the sea, affording some of the most beautiful and extensive views of the Solent Sea, Cowes, the New Forest, and the South Sea, Cowes, the New Forest, and the Southampton water, with Portsmouth and Spithead in the distance. Including the park, Osborne great wood, and New Barn Farm, it contains 376 acres. But to this is added the Barton Farm, containing 441 acres, making a total of 817 acres. Barton Farm, also the property of Lady Isabella Blatchford, has now become the freehold of her Majesty, of which formal possession will be taken on the 1st of May. The whole royal purchase embraces an indented shore of the ea of about a mile and a half, Fish-house Creek being the eastern boundary, and Norris Castle the western limit. It extends inland to the Newport high road. Various reports are current respecting the anticipated alterations at Osborne. One states confidently that her Majesty has determined to use Osborne House as a nursery for the royal children, and that the house at Barton is to be taken down, and a suitable palace erected on its site. Another is to the effect that it is only in contemplation to enlarge and restore Barton House, thereby preserving the fine old ex-ample of the Elizabethan style, of which it is considered to be a very perfect specimen. A pier will be run out from the beach under Osborne House immediately. From this place in the new yacht-tender, Fairy, the royal party will be enabled to land and embark at all times of the tide.

FALL OF A BUILDING.—FIVE LIVES LCST. —On Friday, the 28th ultimo, a most melan-choly accident occurred at Pollokshaws, dis-tant about three miles from Glasgow. Some time ago it was proposed by the Old Trades' Societ of Pollokshaws to ascet a shulding in time ago it was proposed by the Old Fisher Society of Pollokshaws to erect a building in the main street of that town. This building was commenced, and on Thursday, the 27th ultimo, the mason-work of it was finished, and the scaffolding removed the same evening. Close to this building stood a thatched house Close to this building stood a thatched house of one story high, occupied by poor but re-spectable tenants. The occupants of this hum-ble dwelling, seven in number, had consider-able doubts as to the stability of the building erecting adjacent to them, and during the course of the preceding week, remained two nights in a lodging-house, being afraid that the building would fall upon them. On Thurs-day evening while the wind was blowing a day evening while the wind was blowing a burricane, the inmates entered their habita-tion, still under the same fears. They con-gregated themselves around the hearth, and gregated themselves around the hearth, and sat there listening to the storm raging without, until far in the morning. Thinking, then, their fears were groundless, and danger distant, they all retired to rest; but they were not ten minutes stretched upon their beds, than down fell upwards of 20 feet of the gable and chimney-stack, which was very high, of the building, crushing beneath it the humble do-micile of these unfortunate beings. The crash was heard in an adjoining house, the inmates of which instantly rose and procured every asof which instantly rose and procured every assistance in their power to have the sufferers removed from the awful situation in which they were placed. Two of the seven were speedily got out, and found to be little injured. It required upwards of two hours, however, of great exertion, before the remainder of the sufferers could be reached. When discovered they were all found to be lying in their beds with life totally extinct.

POMPEIL.—The latest excavations made at Pompeii, by M. Vilain XIV., the Belgian charge d'affaires, have been exceedingly inter-esting. A house was laid open in the quarter of the people. Twenty workmen were em-ployed at the task, and the entrance-room furnished about twenty-five articles, vases, cups, altars, and bronze paterze. Another room. from which a narrow passage led to the kitchen, contained some large earthen jars. In the kitchen, the tinning of the saucepans was still bright. A large boiler, two jars with handles, light and transparent, objects exceed-ingly graph and there ware also found there ingly rare in collections, were also found there. The next excavations were to be made in the workshops of sculpture of the town.

LEVIATHAN AIR ENGINE .--- We have lately heard of a most stupendous construction of this kind, said to be the invention of Professor Reinagle, who is securing patents in every civilized country for his discovery, and this will obviously account for our not being able to enter into a definite description of its component parts. Report says, that Professor Faraday, having seen the drawing, and heard Faraday, having seen the drawing, and heard the theory and practice of this invention ex-plained, complimented the inventor by declar-ing, that he had discovered perpetual motion of the most terrific description. It is also stated, that other eminent men have recently seen it, amongst them Professor Byrne, Dr. Armstrong, Dr. Carpue, and some distin-guished foreigners, besides very many private friends of the inventor, of great intelligence, who have all expressed their candid opinion of its perfect simplicity, and of its immense power. To enable the public to form some notion of the power obtained, Professor Rein-agle has contrived a table apparatus, anything agie has contrived a table apparatus, anything but air-tight, by which he moves 80 lbs. full 2 feet in three seconds (placed on a four-wheeled car) by his breath alone. Even 100 lbs. can be moved in like manner.

NINEVEH .- " The discoveries in architec ture and statuary made at Nineveh, by M. Botta," says the *Moniteur Parisien*, " must be of considerable value if we are to judge by the specimens which have arrived at P aris. They consist in pieces of architecture, bassi relievi, and statues, in better or worse preser-vation. The inscriptions are perfectly legible, but altogether beyond the art of modern deciphering. The king, after having examined these curiosities with great interest, has de-cided that a vessel belonging to the Governwhole collection to Paris." MONUMENT TO DE. WATTS. - The com-

mittee under whose management this monumittee under whose management this monu-ment is to be erected, have engaged Mr. Baily, the eminent sculptor, to execute it. The monument will consist of a statue of colossal size, and will be placed upon a pedestal in Ahney-park Cemetery, the directors of which have promised to grant a site. No place could be more appropriate, for there, at the residence of Sir Thomas Abney, Dr. Watts spent thirty-six years of his life. There he wrote most of his works, and at a place of workhin near to Abney he frequently preached. Morship near to Abney he frequently preached. Mr. Baily says, in a letter to the Morning Post, "in consideration of the moral and intellectual benefit conferred on the nation at large by his works, I consented to execute the same in Portland stone, for the money which might be raised, and which does not exceed 3001., though my price would have been, under other circumstances, 500 guineas." LORD NOBTHAMPTON'S SOIREE.—The ac-

complished and amiable president of the Royal Society gave his closing conversatione on Saturday last, when a larger number of distinguished men were present, and more interesting matters were exposed in the rooms, than we have ever seen there.

CITY BRICKLAYEB. - An election took place last week for the office of bricklayer to the corporation of the city of London, when, after a poll between the only two candidates, Mr. Boucher was elected by a majority of sixty-five votes over his competitor, Mr. Ward.

FIRES IN LIVERPOOL .- The total value of during the last three years, was, in 1842, 517,927*l*; in 1843, 119,584*l*; in 1844, 24,391.

Mr. Bowes, M.P., 157.; and Mr. Farrer, 27.2s.; towards the erection of a building for the Mechanics' Institution, at Stockton.

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to canit the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our readers however, they are entered in a book, and may be seen on application at the office of "The Builder," S. York-stroet, Covent-garden.]

For the restoration of the Parish Church of Grays Thurrock, Essex. April 12. For the erection of a Church in the parish of St. Thomas, Winchester. April 12. For the supply of 600 Coal Waggons of superior

construction, spring mounted, with mallesble iron wheels, and calculated to carry about six tons of coals each, for the Great North of England Railway.

April 15. For the erection and building of a Farm-house, Barn, Stable, and other offices, at Hepworth, Suffolk. April 16.

For keeping Battle-bridge and Holloway-road

For keeping Battle-bridge and Holloway-road in repair for one or more years. April 17. For making a Brick Barrel Calvert from the Pump in Much Park-street to Jordan Well, Coventry, and for Excavating and Carting away the soil and rubbish. April 17. For submitting a plan of a Tread-wheel, and con-structing the same in the Common Gaol of Great Varmonth, Norfolk. April 24.

Yarmouth, Norfolk. April 24. For all the Works to be done in the creation

and completion of the new cast-iron Bridge over the Haven of Great Yarmouth, including the find-ing of labour, certain materials, &c. April 26. For the construction of the third and fourth

divisions of the Chester and Holyhead Railway.

April 28. For the supply of Materials to the Commis-sioners of the Metropolis Roads. April 30. For performing the several works in building a new Workhouse at Tenterden. May 2.

For the formation and completion of a new For the formation and completion of a new Drain, being about eleven miles long, twenty yards wide, and five yards deep, for the Middle Level Drainage Commissioners. Also for the erection of a Stanach, several Bridges of wood with brick abutments, together with the needsary calverts, and other works. May 8. For the erection of a Baptist Chapel at Holk-stone.

stop

For laying out the Grounds of the Nictoria-park Cometery, and for draining the same, making the roads, paths, and finding all necessary trees, shrubs, materials, &c.

COMPETITIONS.

Plans, sections, and elevations for a Terminus, and other requisite accompanying offices, for the Great Southern and Western Railway, Ireland.

Great Southern and Western Railway, Ireland. Plans for a Church to be erected within the Borough of Kingston-upon-Hull. May 8. Plans, Specifications, and Estimates for the Building and Interior Fittings of a Church, to be erected in Gloucester. To contain 600 adults and 200 school children. The shape of the ground is nearly rectangular, and measures on the east sider 55 feet, on the west 62, on the north 120, and on the south 112.

APPROACHING SALES OF WOOD, &c. BY AUCTION. April 14.—On the Estate of Mr. John Welham,

ar the Mills, Earl Stoneham, Suffolk. Six capital

Timber Ashes, of first-rate quality, measuring from 60 to 30 feet in a tree; also 180 Pollard Elms. April 14.—At Chapple Essex : a large quantity of Ash, Elm, Pollards, and some very good Elm Timber

April 15.—At the Three Ashes, crossing near Witham, Essex : 1185 Oak Trees, now growing in the woods and fields of Lanhams, and Crossing Lodge Farms. Many of the Trees are of large di-

mensions. April 15.—At 23, Fuller-street, Church-street, Bethnal-green: a quantity of Spanish and Honduras Mahogany, several thousand feet of Cherry-tree, Birch and Beech, &c. April 16.—At Camberwell, Surrey: several Elm Trees, large Walnut and Ash Trees, also the Beild-ing Materials of the Grammar School and two large Dwelling-houses.

Dwelling-houses.

Dwelling-houses. April 16.—At the Wiffin Inn, Malpas, Ches-hire: 68 Oak Trees, and 4 Cyphers. April 16.—At the Cups Inn, Colchester: above 100 fine Oak Timber Trees, now standing upon Dove House Farm. The metings average from one load to three loads per stick, and of consider-able length able length.

able length. April 17. — At the Roebuck Inn, Loughton, Essex: 100 Oak Timber Trees, wry old and sound, and the greater portion of large dimensions. April 18. — At the Greyhound, Sandy, Bedford-shire: 950 Larch and Scotch Spires. April 18. — At the George Inn, Froome, Somerset: 310 fine grown Oak Trees now standing on the Orchardleigh Estate. They are of large dimensions, great length, and of very superior ouality. quality.

180

Last week in April.—At the Timber-yard, opposite St. Giles's Church, London: 3,200 Pine Deals, Planks, and Battens, 840 Yellow Deals, 2,480 Sprace Deals and Planks, 120 Yellow and White Battens, 14,000 feet of three-quarter inch and half inch Pine Boards, &c.

and half inch Fine Boards, &c. Some time during the present month.—A large quantity of full-grown Coppice and Hedgerow Timber, now standing at Denby, Derbyshire. End of April or beginning of May.—250,000 Building Bricks, 40,000 Arch ditto, &c.; now at Sherborne Kiln, three miles from London.

BY TENDER

All the implements used in the execution of the works at the Fleetwood pier; they are now on the wharf at Fleetwood, and can be put on the railway-

wagons, or on board ship. April 21.—Above 1,000 Oak Trees, now stand-ing upon Lewisham Lands-wood, near Beckingham,

20 Oak, 1 Elm, 1 Cherry, and 12 Ash Trees; ow standing at Hanmer, near Welchhampton, Cheshire.

MEETINGS OF SCIENTIFIC BODIES

STABLE and LUSH, Clerks.

COURT OF SEWERS FOR WESTMINSTER, AND PART OF MIDDLESEX, No. 1, Greek-street, Sobo-

10 BUILDERS and Others interested in

TO BUILDERS and Others interested in buildings or in ground for building upon, within the district under the jurisdiction of this Court, drained by water-courses falling into the river Thames, between the city of London and the parish of Fulham. The Commissioners hereby give notice, that by an Act of the 47th Geo. III. (chap. 7, local) it is required that, pre-viously to the making of any new sever in any street, lane, or public way, or in any part intended to become a street, lane, or public way, or to carry off or drain off water from any house, building, yard, or ground, into any sever under their management, or within their jurisliction, a notice in writing that such new sever or severs shall be constructed and made in such manner and form as shall be directed by the said Commissioners, and not otherwise. And, in order to pererent the serious evils and incorveni-being excavated at too great a depth, the Commissioners have directed that, upon ary licath roling made at this office previous to the elowest depth at which the same can be drained. And the Commissioners do also give notices that when-

be given as to the lowest depth at which the same can be drained. And the Commissioners do also give notice that, when-ever the lower floors or pawements of buildings shall have been laid so low as not to admit of their being drained with a proper current, they will not allow any sewers, or drains into severs, to be made for the service of such buildings. It is recommended to all persons about to purchase or take houses, or other premises, to ascertain whether such premises have separate and distinct drains into common sewers. All petitions must be delivered at this office at least three elear days before they are presented to the Commissioners; and all such petitions will be called on in the order of their appli-cation, and the name of any party not present when called on to support the application will be struck out, and the pro-ceedings must in consequence be commenced de novo. All communications made with any sewer without leave of the Commissioners, will be cut off, and the parties making the same will subject themselves to a fine. By order of the Court, LEWIS C, HERTSLET, Clerk.

TO BE SOLD or LET, at a Ground-rent, Two or Four detached CARCASES of seven-room COTTAGES, in a wide and principal road at lalington, the severs and roads being complete; ierm 97 years. Apply to Messrs. Overton and Hughes, 23, Old Jewry, City.

TREEHOLD GROUND and partly erected HOUSES TO LET on Building Lesses, with the op-tion of purchasing the Freehold if desirable: situate in Single-street, Mile Erd, rather less than a mile from the City; a famous spot for letting. The houses are fourth-rate, and will be either let as they stand or when tiled in ; mosey will probably be advanced. Apply personally at the offices of Mr. Single, surveyor and auctioneer, 34, Coleman-street, near the Bank of England.

SATURDAY, APRIL 19, 1845.

HE demand for a museum illustrative of our national architecture is becoming louder, and must ultimately be listened to by those who are in authority :—a collec-

tion of casts chronologically arranged, where the student may draw and compare, and so gain in a month a clearer understanding of the peculiarities which distinguish different epochs than he now does in the whole of his clerkship,--- sometimes the whole of his life. Year after year the importance of obtaining such a collection has been arged by different individuals, but has been disregarded, and, in some quarters, laughed at; and, to the disgrace of succeeding governments be it said, no attempt even, has yet been made to form it. Two years ago Mr. E. B. Lamb addressed a very sensible letter on the subject to the trustees of the British Museum, praying them to provide in their new building an extension of accommodation for British antiquities, so that works of British art, from the earliest to the latest periods, might be arranged in the national museum. He pointed out, that specimens judiciously procured from various parts of the country, and arranged in chronological order, would enable the architectural student to gain such a knowledge of the forms of ornaments, mouldings, and sculpture, as could not be obtained from the objects themselves in their original position. The distinctive characteristics of Gothic architecture being divided into numerous classes, and each style imperceptibly growing out of the other, the gradations are so delicate, and the peculiarities so minute, that without a place for the reception of wellselected examples, the student is put to considerable labour and expense before he can acquire any knowledge of that part of the art; and then only by unweared exertions, and the examination of many edifices.

The answer he received was, " The trustees are not prepared to recommend her Majesty's Government to provide in the museum for any general collection of remains of the Gothic architecture of Great Britain," and there the matter stopped. An outbuilding, a mere shed, would have been something, and might at once have been filled with actual relics and casts, at present put away in holes and corners. At the Royal Academy, for example, a considerable number are stowed away in a cellar simply for want of a proper receptacle. But no, the trustees were not prepared to recommend that any attempt should be made to meet the want which was felt, and advance the study of our national architecture.

At the last meeting of the Institute of Architects, a paper on this same subject was read, as will be seen in another part of the present number of our journal, and was warmly responded to. It was then suggested, that the Institute should not simply look on and wish, but should come forward and act; and we sincerely hope that the suggestion will not be disregarded.

Mr. Wyse, we understand, is about to bring the matter before Parliament, and now, therefore, is the time for all who feel how advantageous such a collection would be to petition the legislature, and otherwise assist the endeavour so far as they may be able.

BUILDER.

THE

It is not simply to the professional inquirer that such a museum would have great attractions. Architecture now occupies the attention of a much larger class than it formerly did. Many now say with Chateaubriand,-"it cannot be denied that architecture, considered as an Art, is in its principle eminently religious-it was invented for the worship of the Deity, and those who had a multitude of gods, were led to different kinds of edifices, according to the ideas which they entertained of the different powers of those gods:" and with this feeling have commenced the study of it earnestly. Look also at our carvers, modellers, glass painters, and other decorative artists, now coming into more active existence, to whom such a collection would be of the first importance, and it must be seen that a very large section of the public would hail the establishment of a museum of national architecture as a boon.

For a continuation of the subject, we refer to the following article.

THE PRESERVATION OF NATIONAL ANTIQUITIES.*

"You, too, proceed ! make falling arts your care, Erect new wonders, and the old repair."

UNDER the conviction that specimens of medieval art still remaining in England are more numerous, and of more interesting character, than generally supposed, even by many antiquaries, we have endeavoured to give some notion of the extent to which examination, and the immediate prevent to which examination, and the immediate prevention of further destruc-tion is needed. The necessity for something more than individual exertion is great and pressing, as well to preserve antiquities of national value, as to rescue ourselves from the reproach of being the only one among modern nations, wanting in the proper estimation of records of such interest and importance. Associations for objects of an antiquarian nature have either lost the vigour of their youth, departed greatly from the objects of their foundation, or are consuming valuable time in disputes, ridiculous in their origin, but not on that account the less interminable. The Society of Antiquaries does nothing more than publish transactions, and hold weekly conversazioni, though its long standing, and the great names it boasts, gives it the opportunity of effecting a considerable amount of good. The committee of the Cambridge Camden Society, because not seconded in practices foreign to its ostensible purpose, have threatened to break up the whole body, thus at the same time concluding the only approximation to an effec-tual supervision of medieval remains, that we have experienced. Lastly, the British Archæological Association, from which so much was expected, is likely to end its days in contention on matters having no bearing upon the real objects of the institution. Thus, the fate impending over our cathedrals and churches is as lowering as ever, and the necessity for the immediate attention of the Government at once apparent. It may indeed afford matter for surprise, that while the Governments of foreign states are actively employed in upholding the decaying fabrics, and in furthering the pursuit of art in their respective countries, ours rather holds such matters to be without the sphere of the duties of a minister. But an enlightened administration will surely advance in the path it has already indicated, and willingly hear any practical suggestions for the attainment of an end of such manifest importance.

The systematic examination and description of those treasures of art with which this country is enriched, while adding to the antiquary new objects of interest and investigation, could not but advantageously influence the ornamental and decorative branches of art, and add new data for the elucidation of obscure points in British history. No longer confined to the biography of monarchs, and to the picture of martial strife, history, in the hands of its true illustrators, treats the condition of the

history of a country is the history of the peo-ple who dwelt in it, their manners, civilization, and arts, not of a section of its rulers. The historian, Gibbon, felt the importance of placing Italy, during the evential times of which he wrote. The writer has elsewhere said:— "The architecture of Egypt in its paint-ings and hieroglyphics, in its long and gloomy vistas, and its avenues of sphinxes, is a lasting petrifaction of the manners and customs of the people, and of the domi-nion of that mysterious hierarchy who sat in indement over the dead, and who curbed in judgment over the dead, and who curbed the flights of imagination in architecture and in sculpture by inviolable regulations. The porticos and sculptures of Greece are evidences The of the refinement of a nation, who responded to the works of its artists as to the creations of the dramatist and the reasoning of the phi-losopher; while the sumptuous edifices of the Romans speak of the pomp of imperial sway, and the slavery of subject states. The archi-tecture of every country and of every age is vocal with the inmost workings of its creating mind: and it occupies the place of written history in points, which, though of the highest interest, historians have, for the most part, failed to touch. Every village church is a key to the history of the surrounding district; from its effigies, its sepulchral brasses, and its heraldic enrichments, the topographer and the genealogist may derive important data for the prosecution of researches into the history the prosecution of researches into the history of a county, and of its principal inhabitants. The very age and body of the time are manifest in each feature, and in the minute details are related even the passions and the animosities of the different orders of the priesthood."* The of the different orders of the priesthood."* The writer of British history seldom versed in matters of art, has made little use of the means at his disposal in architecture and antiquity: ignorant of the skill, which the works of medieval artists evince, he has set forth the period anterior to the Reformation as entirely dark and illiterate. But the succeeding his-torian will full cheat of his tack values the in dark and interace. But the succeeding his-torian will fall short of his task unless he in-vestigate the architecture of the country, and the numerous branches of art which that architecture called into play; and the number of those engaged in antiquarian topics is now so great, that the minister who, in emulation of Mons. Guizot, when Minister of Public Instruction in France, should do what he did for the examination and description of the antiquities of the country, could not but deserve well of all promoters of truthful repreinfluence. The "Comité Historique des Arts et Monuments," founded by the French mi-nister, has been for some time in active operation. Under the term "historical monu-ments" mere insulad ments" were included not only literary documents, but monuments of art; and it was proposed to publish, by degrees, a complete an-tiquarian survey of France, with descriptions and delineations of all its monuments. The commission has been divided into two comités -one for historical documents, and the other called the "Comité des Arts et Monuments." The latter has already issued several popular treatises on different branches of archæology, in the form of instructions for its numerous correspondents, as well as more lengthened and learned dissertations. The good thus effected has been great and permanent; it has already led to that active spirit of preservation with which France is actuated, and which the Government does every thing to second; and with the assistance of the "Société Française pour la Conservation des Monuments His-toriques," will shortly remove at least the visible traces of that revolution to which the country owes the destruction of its monuments, as well as the alteration of its political institutions. The "Société Française" was established about nine years ago by that enlightened antiquary M. de Caumont, of Caen, in Normandy; and now, by its repeated

visits to different provinces, is rapidly extending the taste for preservation and research.

The British Association has not yet manifested the vigour of the French society; but, could the contending parties be reconciled, might be of equal service, and might be the means of influencing the Government in the direction pointed out. It can hardly be hoped, that an association of private individuals can ever do more than diffuse the salutary influence of good taste; and any active operations must be the work of a government. But the association might do good service through corresponding members and branch associations, to induce a higher feeling of the value of national antiquities, and often, by its mere representations, might prevent needless alterations. To procure drawings of existing remains, and more especially of such as might be in danger of demolition, should also be one of its main objects. It might also undertake such restorations as were desirable, and did not involve much expense,—as the removal of lath and plaster ceilings, which so often occasion the decay of roof timbers, and the cleaning of churches from whitewash. We would suggest, that in the latter work, the services of the younger members of the profession might be made available for superintendence with considerable advantage. The respect for the forms of Gothic architecture which, we are happy to say, exists amongst the rising generation of architects, would be likely to prevent the destruction of mouldings and ornaments, such as might otherwise occur in the process of cleaning; and the payment of travelling expenses, with the opportunity of gaining much valuable knowledge not to be found in books, would be a sufficient recompense. At the same time, these persons might superintend the taking of casts of ornaments for a muscum of national antiquities, a true British muscum, such as we hope one day to see in England.

It is to be regretted, that no provision has been made in the buildings of the British Museum for a collection of national antiquities. Such a collection would be of higher value, and of far less expense, than the blocks of granite brought from Egypt at so much trouble and cost, which, however singular as curiosities, have no claim upon the delineator of national manners, and are all but valueless to the ar-tist. It is for want of a receptacle for na-tional antiquities, that we find so many pieces of pottery, carvings, and stained glass, in the hands of dealers, or in private collections; and there is no doubt, that if a proper building were set apart. many private collections would were set apart, many private collections would be presented to the public. Such museums exist on the continent, not only in the capitals, but in many provincial towns; and it is to be hoped that the measure now before parliament may end in the immediate establishment of such desirable institutions. We regret that a motion in the common council on the subject of a museum for the city of London did not even come to a discussion. The canopy from the tomb of John of Eltham in the collection a Strawberry-hill, a ceiling from the chamber a Crosby-hall, and considerable portions of St. Katherine's, Tower-hill, in the museum of a celebrated architect; original capitals from Wells Cathedral, in the window of a dealer; frag-ments from the Temple Church sold publicly, at the time of the late restruction to find out of the later the time of the late restoration ; pieces of stained glass, and encaustic tiles innumerable, might have been restored to their proper positions, or have remained available for examination, had the existence of a national commission in the one case, and of a national museum in the other, preserved them from the comparative oblivion in which they now exist, to the serious detriment of the arts and history of the king-dom. As we have said, no restoration, however perfect, can be of the same value as the original fragment, therefore the latter should be preserved, at least, in some other locale.

We cannot too strongly urge the importance of exertions for the preservation of national antiquities of every description, and that those exertions should he immediate and vigorous: let chartered bodies forget their origin in another century, and lead the march of modern improvement, and let antiquaries forget their differences and re-form *oue* association stronger than the last. In the present posture every day lessens the number of antiquarian remains, and implores more loudly for a protecting hand. The proceedings of the Central Committee of the Archæological Association shew, that destruction is still at work to a lamentable extent. Old halls and manorhouses disuppear even more rapidly than ecclesiastical antiquities, and the same hall, which once we could not walk through without learning, at every step, something of the customs of our ancestors, has been despoiled of its old features, or divided into several residences :--

"The court with nettles, moats with cresses stored,

Like some lone chartreux stands the good old hall.

Silence without, and fasts within the wall; No rafter'd roofs with dance and tabor sound, No noontide bell invites the country round : Tenants with sighs the smokeless towers survey, And turn their unwilling steeds another way : Benighted wanderers, the forest o'er,

Curse the saved candle and unopening door; While the gaunt mastiff, growling at the gate, Affrights the beggar whom he longs to eat."

The old halls of England are antiquities most interesting to every one, and expressions of regret at their disappearance are frequent. Can it be necessary that they should, in every case, be sacrificed to modern improvement?^{*}

A national commission for the preservation of antiquities will fall short of its duties unless it secures, consistently with the same preservation, the free admission of the public to every cathedral and museum, which is public property, and endeavours to influence the posseesors of privato collections to throw their galleries open, on proper stipulations. That most interesting edifice, Hattield House, is closed to the public, or was so last year; and many others have the like restrictions. That it is not the love of the British people to destroy works of art has now become as much an axiom as was the reverse, twenty years back; and while the love of education is on the increase, as now, there is no fear for the future. E. H.

BRICKS AND BRICKMAKING. BY JOSEPH LOCKWOOD.

As my former short article on this matter appears to have attracted the attention of some your readers, I feel justified in adding a few more remarks to those already made. I shall be glad if I succeed in having this matter fully discussed in your pages; for it is not a little singular that, in this scribbling age, the subject of brickmaking should have been passed over by most of the scientific writers of the day, or at least if they have not entirely passed it over, they have touched upon it so lightly, that little or no information is to be gathered from what they have written, with respect to the proper proportions of the materials required in brickmaking. There is considerable difficulty in the matter, and I am afraid it is not possible to clear up all the doubts which exist until a regular series of practical experiments has been carefully performed and the results registered. Brickmakers are as much, if indeed not more, divided on the niccties of their craft, than mere theorists themselves, for, as far as my experience goes, I think I may venture to assert that no two brickmakers agree as to the proper or best way of proportioning the different ingredients they use in the manufacture of their bricks.

This subject hitherto has not attracted that attention amongst architecta and engineers that it ought to do; why such should be the case I am at a loss to discover, unless it be that it is thought unworthy of their consideration. I hope, however, the case is different now, and that the working brickmakers themselves will come forward and explain the motives for using their different materials in the way they now do, of course not forgetting in all cases to forward an exact description of the nature and quality of their different earths.

To take up the thread of my former article, I will observe that the quality of a good brick depends principally upon two things—the goodness of the materials, and the way in which they are used. The principal ingredients from which bricks are made are clay, marl, and loam, in all their variety, with the different admixture of breeze, chalk, sand, small coke, &c. The whole of these are reducible into their

• We have hinted, previously, that Gothic buildings are not the only structures requiring the hand of preservation. Many of our most interesting examples of Italian architecture are in as bad a state. constituent elements, and by ascertaining what each of the above articles principally consists of, per sc, we shall most likely be able to get some clue as to what ought to be the different proportion used of either the one or the other.

I cannot here, however, undertake to describe the chemical bases and relations which belong to each of the above articles, as that would make the present article of too great a length. But before any really correct results can be given, or general rules laid down, it will be necessary to examine each ingredient separately, to ascertion its various combinations, and neutralizing properties, when mixed or applied in any way to the other articles with which it has to be incorporated, when used ip brickmaking.

It is impossible to give a general description of what in common language is called "clay," as it comprehends too many substances and qualities, which vary with local circumstances; most clays possess an earthy texture, and yield an argillaceous odour when handled; they differ as much in their plastic qualities as they do in colour. The principal ingredients of clay are silica and alumina, with a small quantity of lime, and occasionally of magnesia and slkali. Sometimes clay is red, yellow, blue, greenish blue, or mottled; it is often light, loose, and sandy, frequently heavy and greesy, and mostly friable when exposed to the action of the atmosphere. It varies in its bed even in the narrow limits of a field, some portion of the same field being much superior to the other, although it does not differ much in colour or appearance, but a practised hand and eye will readily detect the different qualities when examined closely.

mined closely. If a clay contains an over proportion of sand, it will require the assistance of some dry substance to modify the action of the fire in the clamp, as the siliceous particles in the clay will fuse and run when under the action of great heat. In such case, it is plain that an increase in the quantity of chalk will be of great service if properly blended with the clar, because it will take up the fusing silica, and hold it together; a much less quantity of breeze also will be required, for as the materials used readily transmit heat from particle to particle, it will be easier to get them up to any required heat than when the substances do not so readily take the fire.

In round numbers, silica contains about 51 of oxygen in one hundred parts, and of alumina about 47, so that there is a large amount of oxygen combined in the elementary bases of clay, which will convince us of the necessity of not applying too strong a fire in the case where the silica is plentiful, for if we do, the certain result will be, that the bricks will "ran" and be burnt into clinkers; in such case, therefore, my experience leads me to increase the chalk or similar "holding" bodies, and decrease to some extent the quantity of breeze mixed with the clay. The more alumina there is in the clay the better will be the brick if it is properly tempered by the introduction of sand and breeze, the one to burn it, the other to keep it from shrinking too much when under the action of the fire.

The best malm-bricks are made from a light kindly clay, which contains a free proportion of limestone. To get up good coloured, finegrained bricks from this description of earth, it will be advisable to introduce both sand and breeze, the latter in larger proportion perhaps than with commoner clay, because the lime which is incorporated with the clay contains less oxygen in proportion than when the base contains a greater quantity of silica; added to which, the sulphur in the breeze or cinders combines during the process of combustion with the alumina, and brightens the colour by turning the clay more or less white, for it is well known, that when clay contains a large proportion of alumina, it has a tendency to turn white when under the action of fire.

turn white when under the action of fire. From what has just been advanced, it would appear that the quality of the bricks may bet very much varied by increasing or decreasing; any of the different materials used in its manufacture, in some measure, if not principally, in consequence of the chemical property of the clay being materially changed by the addition or subtraction of one or other of them; if we add a larger quantity of breeze, for instance, to a clay overcharged with sand, a necessary consequence will be, that it will have a tendency to run; if, on the other hand, we hold back the breeze when there is but little sand and a large proportion of alumina, the bricks will be brittle and porous for want of a flux to solidify them.

The colour of bricks appears to depend upon the proportion of the different materials mixed with the clay, and the time taken in burning them, as also the degree of heat used in the latter process. Chalk, when properly prepared and introduced into the material from which bricks are to be maile, will have the effect of lightening the colour when burnt. It is very desirable in all cases where chalk is used that it should be washed, to free it from the foreign bodies mixed with it, and get rid of the pebbles, flints, and coarse sand which are intimately connected with it, for they will injure the quality of the brick if not removed. The flint, which is generally abundant in chafk, would do no harm if it was pulverised after being calcined, and then mixed with the clay; it would have the effect not only of whitening the bricks, but also of improving their quality with respect to durability. A superabundance of chalk in clay, tolerably free from siliceons sand, will cause the bricks to be britte and spongy, especially if it is not carefully incorporated with the mass of the clay by erinding or kneading.

1.

e 1

It will be reading. It will be readily gathered from what has been already stated that breeze or ashes constitute a very important element in the manufacture of bricks, for if carefully managed according to the quality of the clay, it may be made to produce very effective results both with reference to colour and quality. The reason why breeze appears to play such a useful part in the process of brickmaking is, I have reason to believe, in consequence of the quantity of subhur which it generates, or gives out, when fixed in the clamp; added to which, it is the principal agent for vitrifying the siliceous particles in the clay, and combining them with the alumina and carbonate of lime, which form the basis of bricks. Most brickmakers prefer breeze or domestic ashes for their work when they can get them; if these are not readily obtained, they have resort to the small broken refuse coke, and sweepings from the gas-houses in the neighbourhood of London, and in rural districts small coal is used in piece of the ashes.

The inferiority of coke ashes, when compared with breeze, appears to arise from the different mode in which these articles are made, the former being reduced from coal to coke in close retorts, free from the action of the external air during the process of combustion, while domestic ashes are produced from coals consumed in the open grate, fully exposed to a free current of air during the whole time of being in the fire; so that in the former case the sulphur, gas, &c., are driven of more perfectly than in the latter case; thus, although coke is more highly carbonized than breeze, it is less useful to the brickmaker than breeze, or domestic ashes.

That the sulphur contained in the ashes plays an important part in colouring bricks may. I think, be easily proved without entering into any thing like chemical detail; for if a brick clamp is carefully examined when opened, the course which the blue lambent fame of the sulphur has taken may be readily traced by the streaks or deposits of sulphury particles which it leaves on the bricks whereever it has played upon them; and further, sho, by the fact that many bricks, though of good colour externally, are often more or less red within. I do not mean to assert that it is the sulphur alone which produces this colour, it is, no doubt, caused by the combination of the sulphur from the ashes with the iron contained in the earths used in the brick, which by the longcontained action of the fire is converted into a peroxide, and this we know gives various colours according to circumstances; it is a question, however, whether the colour would be sogood if the sulphur were less abundant, or the brick subjected to the fire with a greater supply of air. Generally speaking, the bricks placed nearest the outside of a clamp are of different shades of red, which is either a consequence of being imperfectly burned, or else of the too free absorption of air; the former, however, is believed to be the real state of the cuse. The *rationale* of mixing the ashes with the clay is exactly similar to that of mixing the refuse coal from the mines with a large

proportion of clay to make what are called fire-balls, which are much used by poor people in many parts of Wales and in the north of England: it economises fuel, and gives out greater heat than if the small coal were burnt in the open grate, for it evidently first undergoes a process of coking, and then of more perfect combustion; it is during the latter stage that the greatest heat is evolved; hence, therefore, these fire-balls are always put on a fire already well ignited, as they require a considerable degree of heat to set them going. I have often noticed that when these balls are taken from the fire, at their greatest heat just before they break, and allowed to cool gradually, they turn more or less white, which is also a property of all kinds of clay slate, and, as is well known, of pure alumina,—the chief basis of clay itself. Breeze I consider to be much better for the

Breeze I consider to be much better for the purpose of brickmakers than small coal, although the latter in most cases would yield more sulphur than the former, but the effect is neutralized by gas which is evolved during the process of combustion in the clamp: bricks, therefore, made with small coal are not likely to be so good in colour as those made with ashes.

The effect of adding siliceous sand to clay, as has been already observed, is to hold the particles of the clay more strongly together when under the fire, as a natural tendency of pure clay when subject to great heat is to contract, and frequently in cooling to break up into cracks and flaws, which sand prevents, by fusing and combining itself intimately with the particles of the clay, so that on cooling they are prevented from separating by the powerful cohesive powers of the vitrified sand. Extremes, however, must be avoided, for if there should be an excess of sharp, siliceous sand, it will run into a shapeless mass when in a state of vitrifaction: if it should be burned too much in this state, it will form what are called clinkers, which are produced by excess of heat and sand.

From what has been stated, it will be perceived that the quality of the brick produced from any given quality of earth will depend upon the skill of the brickmaker, and the judgment he displays in assigning the proportions of the different ingredients he has to add to the clay; it is therefore impossible that any thing like a general rule can be laid down to govern all cases; it may, however, be observed that when the clay is heavy, the addition of chalk will lighten it: when it contains much sand, chalk will be necessary to take up the sand, and keep it from running; if, on the other hand, the earth should be of a marly nature, a little sand will be of service: with heavy earth a larger proportion of ashes will be required than when the soil is light and friable, as it will be more difficult to burn in the former case than in the latter.

the former case than in the latter. With respect to the proper quantity of the different ingredients to be put into a given amount of clay, it may be again observed, that it will depend entirely upon the nature of the earth to be issed in making the bricks; in the neighbourhood of London, I find most brickmakers use a different proportion, more indeed by chance than reason, some preferring one thing, some another; some use breeze entirely, while others prefer a mixture of breeze and small gas-house coke; some also would use more chalk than others even with the same description of earth. For myself, I think I should venture to point out the following mixtares, having more especial reference to the clay in the immediate neighbourhood of London, with which I am more familiar than any other. With good clay of average quality, being rather heavy than light, say

| 611 ··· 65 ··· | Class CK |
|----------------|-----------|
| Clay65 or | Clay65 |
| Breeze 20 | Breeze 15 |
| Chalk 15 | Chalk 15 |
| | Sand 5 |
| 100 Loads | |
| | 100 Loads |

It will be seen that the quantity of breeze here used is rather less in proportion than most brickmakers generally employ in such case. With clays of a lighter nature, I should use

| With clays of a lighter nut | ture, I should use |
|-----------------------------|--------------------|
| Clay75 or | Clay75 |
| Breeze 15 | Breeze15 |
| Chalk 71 | Chalk 10 |
| Sand 2] | |
| | 100 Loads |
| 100 Load | • |

in all which cases, the average of the breeze is lighter than what brickmakers would use, because they are always anxious to burn their bricks as soon as possible; which, in my opinion, is the cause of an unnecessary amount of waste from clinkers and imperfectly burned bricks.

Here I must again be allowed to press upon all brickmakers the absolute necessity of allowing themselves more time if they really wish to make good durable bricks, for they may rest assured that it is scarcely possible to make them good even with the best materials unless they are properly incorporated by careful labour. It is a common practice in London brickfields for the clay after being dug from its bed, merely to be turned over, then it is covered with a layer of breeze or coke-dust for a few inches, and merely mixed together by passing them through the pug-mill, from whence the clay is carried to the moulder, to go through the remaining operations.

remaining operations. It is, however, generally admitted, that the clay ought to be well worked during the winter season, especially during the variable frosts, which tempers it, and renders it more tough and plastic, and in the end a far better material for the purpose of the builder, as the bricks will be all the stronger for the labour bestowed upon them, hesides being more close and compact in grain. The action of the frost causes the water in the interstices of the humid clay to swell during the process of freezing, so that in the succeeding thaw it becomes friable and loose in texture, and consequently so much the more easy to be worked. I would, in all cases, recommend the clay and chalk to be well washed and cleaned before they are used, as that will improve both the appearance and quality of the brick beyond measure, and turn out articles worth looking at, good in colour, and tough in quality; quite different from the roiten, soft, and porous things now so commonly used, I am sorry to say, in situations where they ought never to be have been permitted.

Time and labour I am fully persuaded is of the very greatest importance in brickmaking, but as these ingredients are expensive, it is not likely that my solitary volce will be able to induce brickmakers to be more liberal in the use of them in the preparation and manufacture of their earths, as well as in the burning of their bricks in the clamps; if such was the case, there would not be such an over-abundance of imperfect bricks as now deluge the market, and damage and deface almost every new building in or near the metropolis. I shall devote what little space now remains

I shall devote what little space now remains to your correspondent, who signs himself "An Early Subscriber," in your last number. Whatever may be the spirit in which his queries are put, I beg to assure him that if any of my opinions and statements are erroneous, I shall be most happy to be corrected, as I at least am anxious to elicit trath, and not to propagate error. If any of your readers should not approve of the opinions I have expressed, I hope they will at once explain their reasons for not doing so, and at the same time convey as much information on the matter as they possibly can, as this subject is one not yet very well developed, and is capable of great extension and improvement.

sion and improvement. With respect to the first question of your correspondent, I can at present only refer him to what I have stated above and in my former letter. With respect to the second, I think he must be a very "young brickmaker" indeed if he cannot tell when his materials are properly mixed. If in taking up a shovelful of the prepared earth he can see streaks or layers of breeze, or sand, and lumps or layers of chalk, he may rest assured that his materials are far from being properly mixed, and ought to be immediately reground. If the earth is well prepared, it will be of a uniform colour throughout, and he will neither be able to detect breeze or chalk in a separate state; to be properly mixed, they must be thoroughly incorporated one with the other.

For want of time, I must pass over the first part of the third question, and say of the remainder that I believe the articles would certainly be better mixed together, and that I have no reason to fear that the burning qualities of the breeze would be damaged by being mixed with the clay for a few of the winter months.

Child's-place, Temple.

ALL SAINTS' DISTRICT CHURCH, STAN-WAY AND LEXDEN, NEAR COLCHESTER.

THIS church, of which an engraving has appeared in THE BUILDER, was consecrated on the 8th instant by the Bishop of London, in the presence of nearly 500 persons, including the Venerable Archdeacon Burney, and about sixty of the clergy, and many influential families in the neighbourhood. At the conclusion of the ceremony, the architect, Mr. George Russell French, was introduced to the bishop, when his lordship was pleased to ex-press to him his unqualified approbation of the sacred building, in which feeling the whole of the clergy present seemed to participate, de-claring that it might be justly looked upon as a model of its kind. The pulpit, which projects from the wall, and which is accessible from the charged and yearty, was especially an object the chancel and vestry, was especially an object of admiration, being of Caen stone, with highly enriched tracery panels, the cornices filled with the ball-flower and the four-leaved flower, and the lower spandrils having palm-branches and crowns carved thereon. The seats of the and crowns carved thereon. The seats of the church are of oak, with low backs, the bench ends in the nave having buttresses, low doors marking the appropriated seats; the ends of the seats in the chancel and of the reading-desk have carved finials. The roofs are open to the ridges, shewing the entire construction of the timbers and boarding, which are stained.

The date of the architecture is that of the middle of the 14th century, when the Deco-rated style is considered to have reached its height of purity; a style, it is believed, as suitable to small country churches as to a vast cathedral, and admitting of great variety of detail: thus, in All Saints' Church there are not less than seven different patterns of windows, and four of gable crosses, yet all agree-ing with each other. In order to make the period chosen appear with the more certainty, portraits (taken from their sculptured effigies) portraits (taken from their sculptured effigies) of Edward III., his queen Philippa, and their son, the Black Prince, are introduced among the heads which support the labels on the north side, as is that of Bishop Wykeham (at the east end), the great architect of the great Edward. The series of heads on the north side is chosen to illustrate that passage in the 148th Psalm, "Kings of the earth and all people, princes and all judges of the earth, young men and maidens, old men and child-ren. praise the name of the Lord." ren, praise the name of the Lord."

ren, praise the name of the Lord." The font, of Caen stone (in which material all the external decorations of the church are executed), has been much admired; it is octa-gon, having on each side of the bowl varied tracery, within which are symbols of the Trinity, or the dove, the cross, or monograms of the Saviour's name; the pedestal is carved in tracery panels, and the ball-flower is intro-duced in the cornice. The font is lined with lead, and has a drain.

It is also raised on a platform of Chamberlain's encaustic tiles, the four Evangelists being at the corners, and the riser is formed of glazed tiles, which bear the text - IN : THE : NAME : OF : THE: FATHER: AND: OF: THE: SON: AND: OF THE: HOLY: GHOST. In a small transept (built for an organ) is a triangular gable-light tilled with stained-glass, the gift of Mrs. John Papillon, and in the chancel is a single-light window presented by the architect herit window, presented by the architect, having a ruby border enriched with the vine-leaf, and the text in old English letters, "Blessed are the poor in spirit, for theirs is the kingdom of heaven :" being the first of the beatitudes occurring in the gospel appointed for All Saints' day. A few points connected with this church have been thus dwelt upon to lead those who are designing ecclesiastical buildings to bestow some study upon their subject in connection with the particular era of architecture chosen for imitation, and thus the antiquary and man of taste will recognize the union of chronology with architecture, and the poorer fre-quenters of the sacred building will be led to take an interest in that church in which they and their children are henceforth to worship, and the contemplation of the sculptured stone and storied glass will raise their thoughts to that "house not made with hands, eternal in the heavens."

RESTORATION. - The beautiful tombs of the Black Prince, and King Henry IV., in Canterbury Cathedral are to be restored at the expense of the Government.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At an ordinary meeting on Monday evening, the 14th instant, Mr. H. E. Kendall in the chair, Mr. H. R. Ricardo was elected an asso-The foreign secretary introduced Herr ciate. Kühnell, architect of Berlin, who has visited England to study our gas establishments, with reference to the general introduction of gas-lights throughout Berlin. Mr. Donaldson took occasion to state to the meeting, that a number of gentlemen who appreciated the services conferred on the profession by Mr. John Britton contemplated presenting to that gentle-man some testimonial of their esteem, and he esteem, and he invited the co-operation of all who thought with them.

Mr. Godwin said, that a preliminary meeting would be called next week; that pro tempore he had been requested to act as hon. secretary in conjunction with Mr. Peter Cunningham, and would gladly receive the names of any gentlemen willing to be on the committee. A letter was read from Mr. Wright, associate, inclosing a copy of an advertisement for plans, pecifications, and estimate for building a specifications, and estimate for building a church in Gloucester; wherein the committee offered no premium, would not bind themselves to adopt the best, and in a correspondence, which was also sent, would not say that if a design were selected, the architect would be employed to carryit out. The meeting seemed unanimously of opinion, that the force of im-undence could no further go. How, which pudence could no further go. How much longer architects will encourage the repetition of such insults remains to be seen.

The hon. secretary then read a paper on the formation of a museum of casts, illustrative of the architecture of antiquity and of the middle ages, by Mr. C. H. Wilson, director of the Government School of Design. The writer considered that the extent of the assistance considered that the extent of the assistance which Government should give to art was an important inquiry. He urged the necessity of having collections of fine models, but cautioned students against a disposition to copy slavishly, now apparent. The Germans, much as had been said of their return to ancient examples, did not imitate so closely as we did; they did not think it necessary, when adopting a particular style, to restrict them-selves to the immature details, should it have them. In this he agreed, and thought that. them. In this he agreed, and thought that, instead of copying dislocated saints, it would be better to introduce correct drawing, and use our improved knowledge. In an architectural museum he should like to see the models take the position in which they properly were; he would have the portico of a building set up full size. He commented on the difficulty of obtaining architectural casts in England, and urged the establishment of a central casting establishment, whence museums and galleries might at once be supplied cheaply. In France this was the case, and the greatest advantages resulted.

After the paper had been read, Mr. Donaldson made some remarks on the points which it had suggested, and especially dwelt on the little interest in such subjects exhibited by English Governments as compared with those of other countries. Amongst other instances, the French had recently sent to Bruges to obtain casts of a very fine chimney-piece, which is in one of the public buildings there. We really did nothing. Look at the ancient monuments in Westminster Abbey, they were rapidly decaying, and even the royal family, who might be supposed to feel especially in terested in them, seemed quite careless about the matter. The importance of models was very great; more might be learnt in a museum in an hour than by reading for a day. The question of cost should not be considered,— the education of a people should not be measured by money.

Relative to casts from Gothic buildings, it was mentioned that a modeller had been recently sent into the country by our Government, with authority to take casts from all public buildings, for assistance in the completion of the Houses of Parliament.

An Anti-inclosure Association is talked of, and would probably be serviceable. Its claims on public attention should, however, be put forward in milder tones than those of the circular issued by Mr. Henry Dowell Griffiths.

FREEMASONS OF THE CHURCH.

-Mr. James Finn, in the chair. APRIL 8th. Mr. W. G. Rogers exhibited a series of ex-quisite carvings in oak, by Grinling Gibbons, consisting of books, flowers, medals, &c., from the pulpit of St. Clements Dane. Also a very early carved boss from Winchester Cathedral, and an Italian bronze of the sixteenth century.

A lecture was then delivered by Mr. William Papineau, on architectural chemistry. After regretting the extraordinary apathy the archi-tectural profession had shewn in the acquirement of the collateral sciences bearing upon architecture, the lecturer proceeded to en-force the great importance of their cultivation to the advancement and exaltation of the profession, adducing as a parallel case, the rise of the medical profession from the debased and empirical age of the barber-surgeons to its present high standing and repute, solely by the appointment of standard qualifications in its members, and the gradual extension and elabo-ration of the circle of knowledge. He dwelt on the close connection of many of these sciences with the theory of architecture, and the important advantages which an intimate knowledge of them must confer on the prac-tical part of the profession.

After strongly urging the importance of the principle laid down and the great good which must eventually accrue to the profession from a more extended and scientific course of study than the ordinary routine through which the majority at present passed, and particularly inmajority at present passed, and particularly in-stancing chemistry as a science at once emi-nently useful to, and greatly if not entirely neglected by the architect, he proceeded to give an introductory view of the properties of matter and laws of combination, at the same time regretting that the short space of two locuments preserving all the month of the same lectures, necessarily allotted to him, would prelectures, necessarily allotted to him, would pre-vent his entering so fully into details as he could desire, which deficiency he trusted to make good by practical papers contributed from time to time, and by the systematic courses which were in preparation.

ARTISTICAL.

IN a letter recently received from Rome, Mr. Gibson, R.A., states that be is now modelling the statue of the Queen, and that it will be two years before it is finished. Our distinguished countryman is also engaged on a repetition of his statue of "The Hunter," for Lord Yarborough.—Thorwaldsen's statue of Byron, which has occupied a cellar in the London Docks for several years past, in consequence of the refusal of the Dean and Chapter of Wastminster to admit it into the Chapter of Westminster to admit it into the Abbey, is destined for the library of Trinity Abbey, is destined for the library of Trinity College, Cambridge.——Mr. Lough's colossal figure of her Majesty, for the Royal Exchange, is completed, and is about to be raised to its place.——The exhibition of the New Society of Painters in Water Colours will be opened to the public on Monday.——M. Alost, sent to this country by the King of the French to obtain the portraits of all the members of the London Corporation who attended his Majesty with the address at Windsor, for the purpose of painting a large picture commemorative of of painting a large picture commemorative of it for Versailles, has completed the sketches. It for Versattles, has completed the backet. The likeness in above thirty of them which we have seen is admirable. A duplicate of the picture will be presented by the king to the city, and be hung in the Guildhall.—The annual meeting of the Art-Union of London will be held on Tuesday next the 22nd in Drarebe held on Tuesday next, the 22nd, in Drarylane Theatre, to receive the committee's report and distribute the amount subscribed for the purchase of works of art. The Duke of Gam-bridge will take the chair at twelve. We shall give a full report of the proceedings in our next number.

ST. PAUL'S CATHEDRAL.-The porticoes of the western entrance of this splendid cathedral are about to undergo a thorough cleansing and scraping, with a view to removing the incrusta-tion that has settled on the stone work, arising from smoke and dirt. On Tuesday week the scaffolding under the lower portico was erected, and the workmen commenced their opera-tions; it has not, however, yet been determined whether the whole of the western front, as also the other outer portions of the building, will be scraped and cleansed, the lower part being tried first by way of experiment.

WORKS IN THE PROVINCES.

On Tuesday, the 1st instant, at noon, the ceremony took place of laying, not the founda-tion, but a main corner-stone of the new church, at South Milford, a township in the parish of Sherburn. The church will be in the earlypointed style of architecture, and consist of nave 52 feet by 271 feet; chancel 281 feet by 18 feet; octagonal vestry on north side of the latter, and porches on the north side and west end of the former; the gable to the west is surmounted by a bell turret, which, the site heing in a central and elevated part, will supply that feature so essential to an English vil-lage. The cost of the fabric will rather ex-ceed 1,400*l*. The accommodation provided will be for 240 adults and 60 children. The architect is Mr. George Fowler Jones, of York. The Rev. Mr. Matthews, the Vicar of Sherburn, who officiated in laying the stone, stated in his address that the patrons of the benefice and others proposed to raise a sufficient sum for the construction of a house for a resident minister, and a school-room for the children. The church will be dedicated to the Virgin Mary.

On Easter Monday, the ceremony of laying the foundation-stone of a new church took place at Woodford, a village pleasantly situated place at Woodford, a village pleasantly situated is the Avon valley, about midway between Salisbury and Amesbury. The ponderous corner stone, forming the south-east angle of the church, was laid with due ceremony by Mrs. Duke, supported by Archdeacon Lear. The tower is the only part left remaining of the old church, the building having become very much out of repair through lapse of time. The new church will have an additional aisle, there being one only on the south side before. there being one only on the south side before.

there being one only on the south side before. Mr. Wyatt is the architect. At Eastover, near Bridgwater, the new church, to be dedicated to St. John, is nearly finished, and will be consecrated in a short time by the Bishop of Salisbury. It is designed in the early English style, and substantially built of stone. The south side of the church has a deeply-recessed and ornamented doorway. The whole of the windows are completed, and consist of richly-stained glass. The roof and seats are of beautiful carved work. This is the only church in the town or neighbourhood where every sitting will be free, there being accommodation for about 500.

The railway works at Ely are proceeding with great rapidity. Near the bridge above one hundred labourers and artisans are actually employed. The station will be situated on the south side of the bridge, and is to be built of wood; but, upon some future occasion, it will be removed for an elegant structure of stone. The report that the company have given the contractors an extra month to finish the line from Brandon to London is untrue. It will be fully completed by July 1st.

At the West-Riding Sessions at Pontefract, held last week, a motion was made by Mr. Hall to authorize the inhabitants of Wetherby to take down the old Court-house, which was now of no use to the Riding. A memorial had been presented last year, which was re-ferred to a committee; and that committee had reported in favour of the request. It eppeared that the inhabitants had raised by subscription 700%. to which a gentleman promised to add another 100/; and the object required was to be allowed to take down the old Court-house, the property of the Riding, throw the site thereof to the Market-place, and to erect some public buildings thereupon. After some discussion by the magistrates, it was sgreed that the prayer of the petitioners be auted, on an arrangement being entered into by the parties for allowing the use of a room over the building for the West-Riding magistrates, as may be satisfactory to the committee already appointed.

The Scott Monument at Edinburgh, having been most satisfactorily completed by Mr. Lind, the builder, a public dinner was last week

Ling, the budger, a public dinner was last week given to that gentleman, Alexander Robertson, Esq., of Eldin, in the chair. At Windsor, St. George's Chapel has just been embellished with two additional stained-glass windows, executed by Mr. Willement. These windows are in the north aisle of the chapel, immediately under the Royal closet, sed facing the heak of the tomb of King and facing the back of the tomb of King Edward the Fourth, and his Queen, Elizabeth Wydville. In the two centre compartments

of one of the windows are full-length figures of Edward and his queen, attired in their robes of state, in devotional attitude, over the sacred volume. The two outer compartments contain the armorial bearings of that monarch, contain the armorial bearings of that monarch, and also of his queen. The other new window adjoining is to be called the "Rutland Window," and contains the arms of Ann, daughter of Richard Duke of York, Thomas Earl of Rutland, Richard Duke of York, Richard Earl of Cambridge, and Ann, daughter of Thomas St. Ledger. Mr. Wille-monthes also filled up the three compartments ment has also filled up the three compartments left in one of the new windows fronting the rets in one or the new windows fronting the royal closet with the arms of the King of the French, the Duke Saxe Coburg and Gotha, and Philip Earl de Grey, the three newly in-stalled knights of the most honourable and stalled knights of the most honourable and noble Order of the Garter. The fountain de-cided upon by the Board of Green Cloth, to be placed in the new Royal gardens at Windsor, is now complete, and was played for the first time on Friday last, before Sir Thomas Marrables, who attended on the part

Thomas Marrables, who attended on the part of the board, and approved of it. The committee for managing the erec-tion of new churches within the borough of Kingston-upon-Hull have made the requisite arrangements for immediately pro-ceeding with the third, in the recently endowed district of St. Paul's. Plans and specifications have been advertised for, and it is confidently anticipated that the additional is confidently anticipated that the additional means required for carrying them into effect will be readily contributed, and insure an early completion of the work. Lord Lyttleton has addressed a circular to

the gentry of the neighbourhood of Stour-bridge, in the name of a committee of gentle-men formed for the purpose of extending hospital accommodation to the district.

The Gloucestershire Chronicle states that his Royal Highness Prince Albert is expected to lay the foundation-stone of the new Agricul-tural College at Cirencester.

At Kirkaldy, in Scotland, a bonded warehouse is now in the course of erection on the ground immediately on the east side of the harbour.

A new church, now fast approaching to completion at Sowton, near Exeter, has been built, at a cost of 3,0004., by the munificence of John Garratt, Esq., of Bishop's-court. Mr. Garratt was one of the Aldermen of London for many years, and highly-respected in the me-tropolis. He accumulated a handsome competropols. The accumulated a handsome compe-tency by activity and integrity in mercantile and commercial pursuits, and retired into Devonshire, where he has made large pur-chases of landed property, and where, as a country gentlemen, he has acquired the general esteem of the nobility, gentry, and all classes. He possesses a large portion of the parish of Sowton

The Hon. H. Herbert, son of the Earl of Carnarvon, is building a new house at Street, in the parish of Blackawton, Devonshire.

THE LONSDALE MEMORIAL. DURABILITY OF MARBLE.

WE stated in our impression of the 8th ult. that a marble statue of the late Earl of Lonsdale was about to be erected in the county of Cumberland. Since then the committee appointed to carry out the design have de-termined to entrust the execution of it to Mr. M. L. Watson, who is, we believe, a native of Cumberland. The following letter from the artist has been addressed to the

treasurer :-" DEAR SIR,-Permit me to submit to you for the consideration of the committee a few remarks respecting the durability of marbles.

The purest marbles are those of Tuscany. They are admirably fitted for works of art, universally adopted in monuments and and statues intended to be placed in the interiors of churches and public institutions. Not one of these will bear exposure to the atmosphere

in our northern climate.) The marble of Sicily is, however, well cal-culated for statues and monuments intended to be erected in the open air. The triumphal arch in St. James's-park, embellished with figures and relievi from designs by Flaxman, and executed by Sir Richard Westmacott, is entirely of Sicilian marble. The colossal statues of our Saviour and the Apostles, by Thorwalsden, erected at Copenhagen, are of the same material; and you may rest assured that the durability of this marble was satisfac-torily ascertained before the sanction of the respective governments could be obtained for the adoption of it.

A colossal statue placed on a truncated co-lumn or lofty pedestal would be imposing, and endure for many centuries. The amount subscribed is nearly sufficient to defray the entire cost. There is not a marble statue in either Cumberland or Westmoreland. I cannot express to you how deeply I shall regret that any thing less important than a colossal statue in marble should be determined on as an appropriate monument to the late Earl of Lonsdale.

The subscribers may desire, however, to erect a work, still more colossal, executed in native stone, which is much less durable than Bicilian marble. Should this be resolved on, the statue 15 feet in height might be completed for the funds you have on hand.

It may be long ere so favourable an opportu-nity will present itself for the encouragement of sculpture in our native county. I cannot for-bear expressing a hope that the arts may not be forgotten by those who have so liberally subscribed towards a memorial intended to record the virtues and eminent services of the lamented Earl of Lonsdale."

THE WATERMEN'S FLOATING PIER AT GREENWICH.

A CAUSE involving the legality of this pier was argued at Kingston on the 31st ultimo, before Lord Chief Justice Denman and a special jury. The plaintiffs were Sir Richard Dobson, the deputy inspector of hospitals, and a gentleman named Sutton; the defendant, Blackmore, was superintendent of the pier in question. From the statement of Mr. Serjeant Channel,

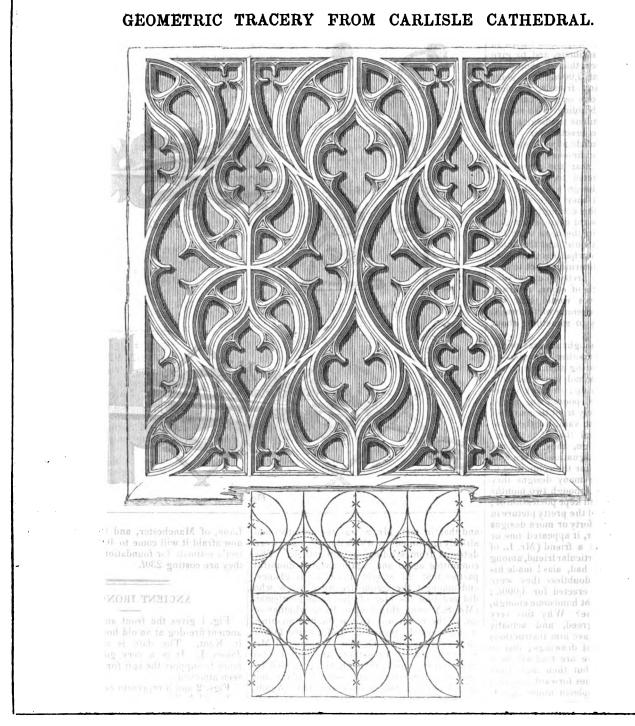

it appeared that the plaintiffs had purchased seven houses, some of which abutted upon the river, and others were close to it, and to the whole of which there had always been free access from the water, until the persons with whom the defendant was connected thought proper to build this pier, the effect of which was to prevent all access, and no boats or barges could get to them. The proceeding upon which the present action was founded took place in 1842, at which period the plaintiffs were desirous of repairing some of the houses which they had just purchased, and two barges containing the necessary materials were sent for that purpose. The watermen, were sent for that purpose. The watermen, however, refused to let them come in, and the result was that one of the barges was swamped and sunk, and the other was compelled to go a considerable distance up the river to unload, thus entailing a good deal of additional expense

in performing the repairs. Mr. Serjeant Shee, in addressing the jury on behalf of the defendant, said that they had to decide a dispute between a stone pier erected by Act of Parliament, and which belonged to the plaintiffs, and a small floating pier, which had been erected by a body of men pier, which had been erected by a body of men who, finding their former means of obtaining a livelihood entirely taken away from them by the use of steam, had been compelled, in their own defence, to have boats of their own, and to erect a pier for the accommodation of the meansain the travelled by them having the passengers who travelled by them, hoping thereby to be enabled to support themselves and families. The object of the plaintiffs, who were the proprietors of a rival pier, was to thwart and oppose them in this attempt by every means in their power. He concluded by contending that no real obstruction had been made out against the pier, and that the defendant was entitled to a verdict. The Lord Chief Justice in summing

The Lord Chief Justice in summing up observed, that it ought not to make any dif-ference to the jury if they should be of opinion that the plaintiffs had purchased the property in question solely with a view to the present proceeding. The only question for them to decide was, whether or not the free course of the water may have been obstructed, and whether the defendant was the party liable for that obstruction. dif-

The jury, after deliberating for a few minutes, returned a verdict for the plaintiffs—damages 1s.

The effect of this verdict, if it is not set aside, will, of course, be to do away with the floating pier altogether.

GEOMETRIC TRACERY FROM CARLISLE CATHEDRAL,

THE accompanying engraving, from a draw-ing by Mr. R. W. Billings, represents one of a series of panels from the wooden screens in Carlisle Cathedral. This particular example forms part of St. Catherine's Chapel, in the south transept, and still remains in the cathedral; but many similar specimens have been removed by barbarous churchwardens, and are to be found scattered about the country. Mr. Bilfound scattered about the country. Mr. Bil-lings published a small volume some time ago illustrative of this paneling, to which we alluded in our notice of the author's work on the tracery of Brancepeth Church, Durham, p. 104, *ante*. Some of the panels which he gave are enshrined at Carlton Hall, near Penrith, and at Featherstone Castle, Northumberland. Apart from their elegance, they are valuable as proving that the Gothic architects designed on system. Although the result is very dif-ferent, it is found that the majority of these panels were formed on the same ground-work, panels were formed on the same ground-work, namely, on the division of a square into four parts each way, or sixteen squares. Upon the lines of these squares, as shewn by the diagram below the example we have given, the centres of all the curves are worked, and upon such a simple calculation of parts as to render their construction perfectly easy. It is singular to observe how great an alteration in the general features is effected by a very slight deviation in the curves the curves.

In the leading curves of these examples, Mr. Billings remarks, nothing can exceed their accuracy of projection; but all the foils con-tained within are worked by hand. They are ascribed to the time of Prior Thomas Gondibour, who presided over the cathedral from 1484 to 1507. His initials were cut in the tracery of a panel in the door to the chapel, but this was unfortunately broken out and carried away a few years ago. The engraving is one-third the real size of

the panel represented.

THE HISTORY OF A COMPETITION.

"If the history of competitions were written, its details would shew an extent of rauchity astounding to archi-tects themselves."--THE BUILDER, p. 52, ante. Sir,---In the Manchestor Guardian and Courier

-Persons desirous of sending in plans and specifications for building the above church are requested to forward the same as soon as possible to Huitson Dearman, Esq., treasurer to the committee, Springfield-lane, Salford. All plans to be in not later than the lst of October." In answer to this, some twenty or thirty architects wrote for particulars, and amongst them was one, who from the answer received, inserted in THE BUILDER of the 5th of October, a paragraph headed "Increase of

honour and profit to Architects;" now though it is evident from future proceeding, and even from the general tenor of the partiand even from the general tenor of the part-culars, that your correspondent had misunder-stood the intent of the committee, yet I can assure him, it is much better for him that he did do so, than if he had entered into competition with others for the building of the aburch at the mite of 5 me cost of the the church at the rate of 5 per cent. on the whole amount; however, to return. The llth of October at length arrived, and with it some fifty or sixty plans from architects in the towns of Manchester, Sheffield, Liverpool, and Lon-don. Now, in the conditions as framed by the committee (who doubtless were all honourable men), was a stipulation to the effect, that the cost was not to exceed the sum of 3,000*L*, and further, that if any design which might be chosen, should exceed that sum, the committee should be at liberty to reject it altogether; this in itself, was perfectly right, but let us see how far this committee acted up to their con-ditions. the church at the rate of 5 per cent. on tbe ditions.

••• •

1 . . 1 сı. i

.

Some of the designs bore names, and some mottoes, about which there was no express stipulation, and amongst the latter was one bearing the signature of "Ignatius." A few days passed on, and it began to be talked of that "Ignatius" would be the successful candidate, but who "Ignatius" was, at present seemed a mystery; however, time, as it mostly does all things, unravelled this, and the design was said to be that of two young architects

(Messrs. B. and P.) of Manhester The compotition now began to wear a settled aspect, and a few of the architects sent for their plans back, but the answer in all cases was that it was not determined. The designers of the plans bearing "Ignatius" were now called in to make an approximate estimate, and to give a guarantee to the effect that it should be completed for the sum of 3,000*l*. The plans too were shewn to many friends, amongst whom happened to be one or two having a practical knowledge of building, who stoutly declared that it was ridiculous to imagine that such a design could be erected for 3,000*l*. Hewever, the architects made an estimate, and shewed that it could be finished for about 3,250*l*., this was pretty near the mark, and certainly not to be objected to. Upon this the, committee sent the design to the London commissioners (to whom they were applying for a grant); when, to the committee's astonishment, in a few days word came down that the walls for the aisles in the nave were but 14 inches thick, or thereabouts, and that those in the clerestory were somewhat less than that; but the committee, still determined not to lose a chance of having the pretty picture converted into a real church of stone, returned word that they themselres would bear the extra expense of the thickening of the walls, thus increasing the outlay to something about 3,500*l*. The committee now thought all was pretty

safe, when down came another objection in the form of a letter, stating that the tower with the supports it then had would actually fall before it was half way up; in short, objection upon objection was poured in, whilst the committee as obstinately tried to get rid of them; but, alas! all was in vain, for the commissioners at last resolved that if the committee attempted the design, they would not aid them. The hopes of "Ignatius" were now at an end, and it was left for the committee to choose another from the many designs they had received, and which (though two months had now elapsed) they still kep possession of; but it seemed they still had the pretty picture in their eye, for none of the forty or more designs would suit them: however, it appeared one or two of the committee had a friend (Mr. L. of Manchester), perhaps a particular friend (Mr. L. of Manchester), perhaps a particular friend, among the competitors, but who had, alas! made his plans too plain, though doubtless they were bonest, for his could be erected for 3,000*l*.; but then the church was not handsome enough, so what was to be done? Why this very honourable committee agreed, and actually sent for this friend, and gave him instructions to draw out a fresh set of drawings; this he did, and produced what we are told will be a very handsome church: but then may it not well be so, when he comes forward and says this design cannot be completed under 3,500*l*. Of course the committee are very sorry for that, but then he is a friend, and, what is more, he has produced a more handsome design than any sent in (because, he had 500% more to work upon), so he must be the architect, and the church must proceed. Now let us take a glance at the private doings of this committee, and see how the competition has been carried on, and then we will leave these honourable men to their fate, and let us hope to public in-

men to their fate, and let us hope to public indignation too. When first the building of this church was in its infancy, which was some two or three months before it was advertised, a certain minister (the Rev. H. Stowell) introduced to the intended minister of the new church, and one of the committee (the Rev. E. Harper), an architect (Mr. Shellard, of King street), one whom no doubt he had every wish to see as the architect for the new building; however, I believe the minister there and then informed him that ultimately it would be a competition; but at the same time said, that if he would send them in a set of plans, the committee would look at them, and no doubt be should have interest enough to serve him. In a short time from that, a set of drawings was duly received, and pretty well looked over, but as the day of competition drew ness, another set was also received from the same person, and took its place among the rest (this set was got up entirely under the immediate superintendence of the minister). Now these proceedings had been whispered abroad, and reports reached the ears of the committee back again, that it was bat a sham competition,

Fig. 2 and that in fact, Mr. S. was the architect and already appointed; by which doings, many were detered from seading in altogether. The committee again and again assured doubtful parties that all should have a fair chance, and amongst the committee were a few who did not like the idea of this same gentleman (Mr. S.) being thrust upon them whether or no, so the result was, that at the first meeting, it was moved, seconded, and carried (three only voting against it), that the plans of Mr. S. be taken away altogether: and thus was his chance lost entirely through being misled by one of themselves, his second plans not even looked at, but at once rejected. Again, in their conditions, all plans were to be in by the 11th of October, yet even for more it than a fortnight after, plans were still being received; and yet further, to the regret of several of the committee, there were no plans in from the office of two architects (Starkey and Cuffley, Cross-street, partners), who had built a very pretty church in the town (they had been deterred by the alarm that it was a false commetitee do even a fortnight or move after the day mentioned in the stipulations, but call at the said office; and solicit a set of drawings; whether, they got them, or not, I am not sure, but I believe they idid. And still_after all not one of the designs sent in has been chosen; the committee have wasted the money of the subscribers too, for they have paid "Ignatius" between 10/, and 20/. for after trouble, and besides this report speeks of a bill of 50/. by way of a charge, which has been presented to them by their first friend, Mr. L. Such is a pure and ungarnished history of

Such is a pure and ungarnished history of the competition of St. Simon's Church, a competition in every way disgraceful to the committee; a committee appointed to inquire into the merits and demerits of some forty designs or more, each of which will have cost to the designers from 201. to 501. each, and lest it may be said that the grapes are sour, I beg to subsoribe myself not an architect, but simply Yours obediently,

A LOOKER ON.

The church is now proceeding under the superintendence of the friend named, Mr.

Lane, of Manchester, and the committee are now afraid it will come to 4000*l*., for the architect's estimate for foundations was 180*l*., and they are costing 230*l*.

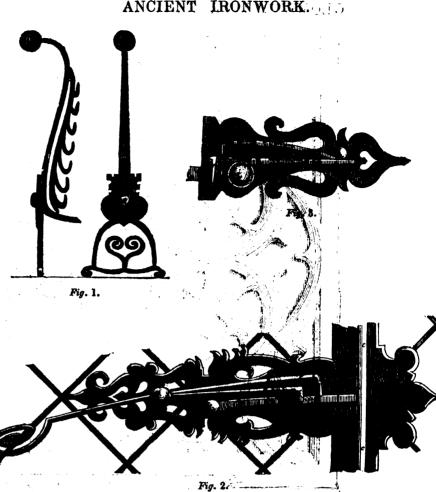

ANCIENT IRONWORK.

Fig. 1 gives the front and side view of an ancient fire-dog at an old hospital at Sandwich, in Kent. The date is about the time of James I. It is a very good example; the hook to support the spit for cooking is seldom seen attached.

Figs. 2 and 3 represent casement-fastenings. In old buildings the iron casement-fastenings were often very much enriched; they were sometimes so large as to reach quite across the frame iself. "The larger of these examples here given is of the latter desoription. The old lead-light casements opening in the centre, were very difficult to close effectually, so as to keep out the wet; that the inconvenience must have been felt as fully in former times as it would be at present, our larger example is proof. It is a very ingenious contrivance for securely closing the two halves of the sash-frame. The rod cc, attached to the end of one-half the frame, and turned by the handle b, has a buckle on the top and bottom, which falls on the other half of the iron frame of the sash. The springlatch, as by a leverage action, elosely presses in the handle b, and keeps the such effectually tight, preventing; any shaking from the wind, &c.

It may be here observed, that the iron sashframes in the state apartments at Holland House, Kensington (a most interesting structure). fastened on the same, principle, are models of what may be done with these very inconvenient parts of old structures.

The two examples given are probably of about the period of, Charles I. Such examples are seldom most with, though in some parts of the country they are numerous; at Saffron Walden; in Essex, for example, nearly every cottage has specimens, as ornamental as our largest examples, but they are merely spring-latches. R.

CAST-IRON PIER AT GRAVESEND.

Ar the Institution of Civil Engineers, on April the 8th, Sir John Rennie, President, in the chair, a paper was read by Mr. J. Baldry Redman, giving a description of the new cast-iron pier at Gravesend, just completed from his designs, and under his superintendence. After an introductory memoir, describing the rapid growth of steam navigation, and consequent increase of the town, and demand for greater consequent accommodation, the paper gave an account of the mode of construction adopted, which was illustrated by drawings, and a model of the work by Mr. Salter. The pier is situated in front of the Terrace-gardens, in a line with Harmer-street. The length is 250 feet, and tarmer-street. The length is 250 feet, and it is supported upon twenty-two Doric columns of cast-iron, 28 feet long, weighing nearly ten tons each. The first tier is situate at high-water mark, and from thence there are three spans, of 50 feet each, to the pier-head, which is 90 feet long by 30 feet wide. Horizontal iron girders support the platform, and the external girders are inclosed by an entablature, which also forms the parapet; at the south end are solid abutments and wing-walls to support the approach, and stone offices with turrets flank the entrance. The first tier of girders is the entrance. The nrst uer or graces is carried over the esplanade in front of the gardens, which is thus continued underneath the pier. The whole area of the platform is covered by a wrought-iron roof, boarded is covered by a wrought-iron roof, boarded and slated, and supported upon coupled iron pilasters, with corrugated iron panels between, and the sides can be inclosed at will by shutters sky-lights are introduced in the roof. The approach from the river is by a double flight of steps with landings to suit all states of the tide. A powerful light is exhibited from a cast-iron lighthouse, surmounting the junction of the roofs at the pier-head, which is sup-meted metry a system of iron truesing 43 feet ported upon a system of iron trussing, 43 feet in span; octagonal copper gas-lamps are sus-pended from the apex of the roof. This structure has been designed to meet the views of the conservators of the river, so as to offer bat little obstruction to the subjection and bat little obstruction to the navigation, and there is a clear headway of 8 feet underneath at high-water spring-tides. The comfort and convenience of passengers by steamers have been also materially consulted. The name described in detail the method

The paper described in detail the method adopted in getting in the foundations which was one of the chief features of the paper, as the method was novel, viz., by sinking castiron cylinders to a depth varying from 9 feet to 14 feet below the level of low-water mark of spring-tides, and keeping their tops always raised above high-water.

The ground was excavated from within them, and they were fitted with solid work to the level of low-water mark, where the columns were bedded on the stone bases; the work occupied two years in its construction, and has been since Easter Monday, open to the public.

A very ingenious machine was exhibited for making with perfect accuracy artificial teeth, gums, and palates: it is the invention of Mr. Tomes, who described its action and demonatrated its capabilities. A plaster of Paris cast of the gums having been obtained, a peculiar moulding composition, softened by heat, is pressed upon the cast and allowed to cool in that situation, it is then removed and reduced to the shape of the intended teeth, and if on trial this composition model is found to fit the mouth accurately, it is placed in the face-plate of the machine, and a perfect copy is obtained by the mechanical action of the revolving cutter or tool. The machine consists of three slides; two are placed vertically and move in two directions horizontally and vertically, but each in the vertical plane. Upon these slides is a plate of iron, to which is fixed the compo-sition model and the substance in which the copy is to be produced; the two, therefore, par-take of equal motion. The third slide is placed horizontally, and admits of horizontal motion only, but at right angles with the motions of the perpendicular slides. Upon this slide a trace with a blunt point is permanently fixed, and parallel with it is a revolving cutting point or drill, by the three sliding motions the tracer is made to pass over the surface to be copied, whilst the drill is con-

its action, copies with accuracy the most minute projections on the cast. In the specimen exhibited the finest filaments were accurately delineated on the ivory carving, and the machine was pronounced to be capable of adaptation to many other purposes beyond dental carving, for which it was designed and for which it has been entirely used by the ingenious inventor.

PROPOSED NEW BRIDGE OVER THE MENAI.

THE great national improvement involved in the establishment of a speedy communication by railway and steam-ships between London and Dublin, viá Holyhead, being now in progress, and, as it is understood, sanctioned by the Government, powers for crossing the Menai by a bridge at the Britannia Rock, one of the wildest and most critical parts of the Swellies, have been introduced into the Chester and Holyhead Railway Bill now pending in Parliament.

The idea is by no means new. It appeare to have first originated about the year 1783; the expressed object being to facilitate the communication with Ireland, and do away with the delay and danger of the ferry called "Bangor Ferry." The inhabitants of Car-narvonshire, more particularly those of the county town (where the principal chiming county town (where the principal shipping interests of the coast were then located, but not as now incorporated by Act of Parliament) took alarm at what they considered a danger-ous obstruction to the navigation of the Straits, and a bill being brought into Parliament for the purpose, it was strenuously opposed in the year 1784-5, and finally defeated in 1786. The question, however, was not set at rest, but still continued to be occasionally agitated, and in 1801 a survey of the Straits was made by the late Mr. Rennie, under the direction of Government, with the object of crossing them by a bridge; he reported in favour of the project and proposed two plans of bridges, both arched and of cast-iron, and supported by pillars of masonry; one of a single arch at the side of the present suspension bridge; the other of three arches at the Swelly, Benlas, and Welltog Rocks ; and these plans being submitted to Mr. Jessop, an engineer of great celebrity, and to Dr. Hutton, the Royal Professor at Woolwich, were approved of by them.

Notwithstanding the reports of the most scientific men of their day, the Government never carried into effect their suggestions of arched bridges on piers of masonry. The Chester and Holyhead Railway company now propose to carry their road over the Straits at the Britannia Rock, a spot never proposed by former engineers, and by a bridge of two castiron arches, supported on piers of masony, founded at low-water mark, of the following dimensions:--

- Span of the arches from pier to pier.... 360 ft. Height of ditto from high-water to the
- the arches

Clear space for headway under the arches 200 In width at a minimum height of 90 feet-

| which at a minimum neight of so rect- | |
|---|-----|
| Width of middle pillar of solid masonry | 130 |
| Height of ditto | 140 |
| Width of side pillars 60 to | 70 |

The Trustees of Carnarvon Harbour, as well as other parties concerned in the coasting trade, regard this proposed bridge as possessing all the defects and dangers of the arched bridges of former times, aggravated by its diminished space from pier to pier, by its increased mass of masonry, by its fixture in a most dangerous locality, and by other circumstances too numerous and particular to detail in this article.

sition model and the substance in which the copy is to be produced; the two, therefore, partake of equal motion. The third slide is placed horizontally, and admits of horizontal motion only, but at right angles with the motions of the perpendicular slides. Upon this slide a trace with a blunt point is permanently fixed, and parallel with it is a revolving cutting point or drill, by the three sliding motions the tracer is made to pass over the surface to be copied, whilst the drill is constrained to describe an exactly similar surface in the substance placed before it, and by the rapidity of its motion joined to the delicecy of

sible information on the mode of navigating vessels there. The Chester and Holyhead Railway Company were represented by Captain Moorsom, R.N., and Mr. Robert Stephenson, the engineer, attended by Mr. Parker (of the firm of Parker, Hayea, Barnwell, and Twisden, of London, solicitors); T. H. Evans, Mayor of Oarnarvon; H. P. Manley, Esq., collector of the Harbour Dues; R. A. Poole, Esq., of the firm of Messrs. Poole and Powell, solicitors of Carnarvon, with Mr. Poole, jun. appeared for the trusteen.

with Mr. Poole, jun. appeared for the trustees. The most particular attention was paid by the scientific gentlemen present to the statements of every person examined, and we believe the contending parties separated with the best feelings, and under the impression that their respective interests had been carefully considered, and would be duly protected.

In the course of the inquiry, Mr. Stephenses stated that he considered it perfectly practicable to construct cast-iron arches which should est be effected by the vibration of a railway. That he was not at present prepared with any plan of a suspension bridge which he considered anobjectionable as applicable to a railway. That the arches of the proposed bridge could be let down from above into their proper places, but that for this purpose the main or middle pillar of masonry must be at least of the height marked, viz. 130 feet, and in all probability more. That it would not be difficult to form it into two pillars by an arched aperture in the middle.

THE BOX TUNNEL.

CONSIDERABLE alarm having been excited by an account in the newspapers, of the fall of a quantity of stone from the top of the Box Tunnel, it seems desirable to give increased publicity to Mr. Brunel's report, as calculated to allay the fears of the public:---

"18, Duke-street, Westminster, April 7.

"Gentlemen,-I beg to lay before you a short statement of the circumstances attending the falling of a stone in the Box Tunnel, on the 24th ult. I should remind you that about 'a quarter' in length of the tannel, near the east end, is cost through the natural rock, and is not lined with masonry. At the eastern extremity, a short distance was arched or lined subsequently to the completion of the tunnel. In the centre of this length of in-clined tunnel is one of the large working shafts. During the winter, and particularly during the thaw after a severe frost, the surface of the rock, and some of the beds particularly, have always suffered in the immediate neigh bourhood of the shaft and formerly also near the east mouth; but since the arch has been turned, for some short distance within the mouth, no further spawling or scaling of the stone takes place there. Down the shaft, hew-ever, the cold air descends, and for 50 or 100 yards on either side of the bottom of the shaft the most intense cold frequently prevails. During the past very severe winter, men have been constantly employed between the trains in breaking the icicles which form in and about the shaft, and knocking down spawls or loosened stones, and the effect of the shaft was found to be so mischievous that it has been determined to close it as soon as the frost would permit of the necessary masoury being built. Between the trains on the day in question a large stone which apparently had been loosened by previous work, fell, not from the roof, but from the side of the tunnel, near the shaft. It fell upon the rails, and the empty assistant engine, although signalled by the men employed at this work, ran upon it and was thrown off. This led to the delay of the succeeding trains. The accident was entirely the result of the severe cold, and owing to the open shaft. The shaft is now being closed. effect has ever been produced upon any other part of the rock than that exposed to the direct action of the frost-formerly, near the mouth, and subsequently near the shaft. Such occurrences are by no means unfrequent consequences of severe frost in open cuttings either of railways, canals, or common roads, and are much more rare in tunnels. In the Box Tunnel the frost only reached, as I have said, a short distance either way from one shaft, and this will now be closed. It is shaft, and this will now be closed. altogether an incorrect statement which has been circulated, that there is any thing peouliar

New Books.

Bloomfield's Poems. Illustrated Edition. Van Voorst. London, 1845.

THE public are indebted to Mr. Van Voorst for beautifully illustrated editions of several of our best authors, amongst which the "Vicar of Wakefield," with Mulready's drawings, stands quite alone. The work now before us contains thirteen illustrations by Sidney Cooper, Thomas Webster, A.R.A., J. Callcott Horsley, and Fred. Tayler, admirably engraved on wood by Thurston Thompson. It cannot fail to be acceptable to the admirers of "The Farmer's Boy," and will make better known writings which are full of right feeling and exquisite sensibility. The drawing at the head of "Richard and Kate," by Webster, is our favourite;" we should advise the artist to make a picture of it.

A Series of Letters on Agricultural Improvement. By J. J. MECHI. Longman, 1845.

ment. By J. J. MECHI. Longman, 1845. THESE letters unfortunately look a little too much like advertisements; but as we concur with the author "in thinking that the United Kingdom should be as a well-cultivated garden — that our national agriculture has not progressed in the same ratio as our other productions — that this non-progression is a serious national evil, and source of weakness — and that it arises from a want of knowledge and inclination rather than from want of means," and, moreover, are of opinion, that the letters contain much which may be studied usefully by all who are engaged in agriculture, we cannot avoid recommending them to the consideration of our readers. Efficient drainage, good farm buildings, and careful preservation of all manure produced on the farm, are amongst the prominent points urged.

Correspondence.

BATHS AND WASH-HOUSES.

Sin,—I beg leave to trouble you with a few remarks concerning the designs for Publie Baths and Wash-houses. I had inspection of the designs at Mr. Rainy's rooms on Tuesday; after spending some time there, I was struck with the idea that the plans generally were upon one principle, and I cannot conceive that any one of those designs was such as should be acted upon; some of them, so far as the drawings and designs for elevations were concerned, certainly deserved credit, but some of the gentlemen strayed away from the voluntary contribution bath and wash-house edifice to that of the private gentleman's country seat.

Now, my idea as to that which is wanting for such a public building and purpose is:---lst. A cold plunging bath for male adults, and another for male youth; another for female adults, and another for girls, all of which should be of good extensive dimensions. This is one most essential requisite for the poor, in proof of which I will refer you to the bathing in the Thames, Lea River, and ponds wherever they can get to swim and wash in; none of these plans possess these plunging baths except two or three of them, and those only on a very small scale.

My second observation will be in regard to the washing department; most of the designs have these offices upon the ground floor plan, which, according to my opinion, is out of all character so far as concerns the principle of steam, because in having the washing rooms on the ground floor, the wash steam will rise, and obtain access to the upper floors.

I consider the plunging, warm, vapour, and shower baths should be on the ground-floor, and the washing rooms on the upper floor, because when the women are in the building, they would have every requisite before them for washing; that the trouble of going up one pair of stairs would not be much to them, but to warm bathers it would be so, as many of them are invalid, and some scarcely able ot crawl—for instance, a poor creature with violent rheumatism.

Waste steam from the washing being carried on up stairs would do no harm; the building might have a ventilated roof for the escape of steam, and thus be kept in a healthy state, at least as far as vapour is concerned. The ironing and drying rooms could be in connection. If these obser-

vations be worthy of your consideration, you are at liberty to use them in may way you please.

you please. Before concluding, I will remark respecting the committee for deciding upon a design for such an important matter; it should consist, I think, of the following, and to be men of experience :--architects, medical men, merchants, tradesmen, and poor mechanics; from such a committee as this a good result might be expected. In the first place, the architects would be enabled to decide upon the mechanical arrangement of the design; the medical men would be enabled to state upon the requisite wants and construction of shower, vapour, and warm baths; the merchants and tradesmen upon the general wants, and the mechanics upon the actual necessities of the poor.--I am, Sir, &c., Hoxton, April 3rd.

ACCIDENT AT OLDHAM .---- IBON GIRDERS.

Sin,—In your journal of the 21st of last December, you announced that the Government had appointed a commission, consisting of Sir Henry De la Beche and Thomas Cubitt, Esq., to inquire into the causes of the falling of the cotton-mill at Oldham, and as to the failure of part of the prison at Northleach; and on the 1st of last February, you stated that certain experiments had been made at Thames Bank on the strength of iron girders, for the express purpose of assisting those gentlemen in their inquiries. These announcements have maturally induced me, and to my knowledge many others, to look almost impatiently for a detailed account of these experiments, as well as for a full statement of the causes which led to the accidents referred to in the commission, I therefore beg to inquire whether a report has yet been made, and if it has, whether you intend to give the substance of it in your valuable journal?—I am, Sir, &c.

SIDEROS.

•• We understand that the commissioners made their report some time ago: we shall not fail to give our readers the substance of it. As to the experiments on cast-iron girders, we were prepared to place the results before the public, but learning afterwards that they were to be made part of the report to her Majesty's Government, considered it expedient to defer doing so until after the report had been considered.—Ep.

THE DISTRICT SURVEYORS.

Site,---With others of the building community, I have anxiously been looking in your useful weekly columns, under the hope of finding, either from yourself or your correspondents, some article tending to relieve the building interest from the despotism desired to be exercised over it by the district suveyors. They make every frivolous circumstance a matter of reference to the official referees to whose dictum we are still exposed, notwithstanding the excellent and unanswerable arguments which have appeared in your columns.

ments which have sppeared in your columns. To myself it would seem that the secret desire of these gentlemen is to perplex all building operations carried on under the guidance of private surveyors, so as to make it compulsory on builders to employ the surveyor of the district in which he is about to build, in order to protect his operations from molestation or hindrance; to resist which dishonourable attempt, it is a matter of surprise that the trade has not united.

trade has not united. Union is strength—every wrong has its remedy, and this would be found a certain one. I am aware some will say this position is improbable, because the Act specifies that if a district surveyor be employed by the builder, he, the district surveyor, shall not be the official surveyor over such building, but this is easily managed in more ways than one; and looking at their procedure, I maintain that their litigious and unnecessary conduct fairly induces this conclusion. But whether right or wrong in this general censure (upon a body who should be far above such measures) it would be desirable, under the circumstances, to call a public meeting of the trade, request yourself, or some other gentleman who has studied the subject, to preside as chairman, and making common cause, select some cases best calculated to elicit a legal and bonest construction of such points as press mose heavily upon the trade by an appeal to the highest authorities.

in the stratification or the character of the beds of oolite at Box that can or does cause any danger; on the contrary, there is a very fine, hard, and sound bed, which has been selected and made to form the roof by working up to it, and from which nothing ever fell, and there are extensive quarries close by exhibiting the durability and soundness of this stone with roofs of much greater extent than in the tunnel. "I. K. BRUNEL."

General Pasley has also reported, and declares that the tunnel is perfectly sound and safe.

COLLEGE OF CHEMISTRY.

As attempt is being made to establish a college of chemistry in the metropolis. It is a national disgrace that we have not had for many years an institution of this kind in active operation, and it is to the want of such a college that we must attribute the little progress which this science has made in this country, when compared with the improvements which have been effected in the various continental states, particularly Germany, where schools of practical chemistry have for a long period been established.

The promoters of this college have four objects in view—vis.: 1st. To establish a laboratory (as designed by Sir H. Davy) for original investigations, and for extending the boundaries of chemical science on the model of the Giessen laboratory. 2nd. To form a "college" for the instruction of students in analysis and scientific research, upon such terms as to encourage young men of talent and scientific taste to apply themselves to chemistry, and for qualifying public lecturers and teachers. 3rd. To form departments for the application of chemistry to agriculture, geology, mineralogy, and metallurgy, by an analysis of soils, rocks, &c.; to medicine, physiology, the arts and maunfactures. 4th. The employment of such means as may appear expedient for eneouraging the pursuit of scientific chemistry throughout the country, and for making it a aranch of general education.

The project is patronised by some of the most eminent public and scientific men of the day, among whom we find (on the council) the names of the Dukes of Wellington and Sutherland, the Marquis of Lansdowne, Earls of Dalhousie and Fitzwilliam, Sir J. Clark, Bart., Dr. Holland, Dr. Gregory, and the Rev. Dr. Buckland.

It is trusted that so noble an undertaking will not be allowed to fall to the ground for want of public patronage.

A case illustrating the importance of a school of practical chemistry, with reference to metallurgy, has been mentioned recently. A student of the Giessen school having visited and inspected the iron-works of Count Salm, in Austria, was enabled to suggest improvements in the processes employed, the cost of which did not exceed 600% sterling. For this, and for superintending the processes, the chemist agreed to receive a third part of the profus accruing. At the end of five years he had realized a fortune of 30,0004.

Seasts EFFECTS.—For the approaching hasaar to be held in Covent Garden Theatre, in aid of the Anti-corn Law Fund. It has been determined by the stroke of Grieve's magic wand, and the aid of the "willing imps" in the service of Mr. Edwards, builder, of Manchester, to transform the whole interior of the theatre, andience part and stage, into a Norman-Gothic hall, which is to have a roof escreepouding in character with the style of the trast of the building; this will be of stained glass, from a design of Mr. Grieve, and brilliantly lighted from above so as to shed a "myrind-coleured lustre" of great brilliancy on the upper part of the large area. The pit will be floored over, so as to make it and the stage one was thall; and there will be a range of Gothic windows of stained glass round the stage part of the hall.

LINCOLN'S-INN NEW SQUARE.—The projected improvements in the new square have been somewhat suddenly suspended by order of the Benchers, in consequence of a protest against them having been numerously sigued by the owners and occupiers of chambers in the square.

I will gladly attend myself, having hoped before this to find such a course suggested by some more weighty individual than, Sir, your obedient servant,

SOBUTATOR.

•.• Our correspondent must not be led by the litigious and unwise proceedings of two or three of the district surveyors to condemn the whole body, which consists, for the most part, of able and right-judging men. We may feel it our duty shortly to animadvert on the conduct of these exceptions more pointedly. As auct of these exceptions more pointedly. As to the proposed public meeting, we received some weeks ago from several of our corre-spondents a similar suggestion, but delayed publishing it on the ground that time would more clearly point out what portions of the Act required alteration.—ED.

ABCHITECTURAL MODELLING.

-I see in your last number a letter on SIB. the subject of architectural decorations, the tenor of which I should like to see carried into tenor of which I should like to see carried into effect. At the same time, as a practical man, I would wish to point out a few of the evils of the present system, which architects might easily alter. In almost all cases the decorative modeller is not employed by the architect, but by the builder, who, having little taste for works of art himself, employs any body he can get to do it cheap, mostly some plasterer, who understands little about modelling, nothing about drawing or style of composition, while the artist of acknowledged talent is entirely deserted by the architect. The drawing marter part, gives a very ambiguous idea of the by the arcuitect, scholm for more than a quarter part, gives a very ambiguous idea of the subject wanting, and in many cuses no drawing at all; the models so made are consigned to the tender mercies of some hod boy to cast, and fixed by others who know as little about it. Were the architects to employ the decorative artist without the interference of the builder, and allow a fair remuneration for his work, he would feel an interest in the finish of the works, and would soon effect great improvement.

I am, Sir, &c., A Decorative Modeller and a Subscribes.

CEMENTS.

SIR,—I think your correspondent, James ulham, in No. 113, would do many of Palham, in No. 113, would do many or your readers who are users of cement a favour if he would explain the difference in the proerties of Maude's Portland cement, Pulham's perties of Maude's Portland cement, Pulham's Portland-stone cement, and Austin's stone-colour cement; the three are described as bearing a close resemblance to Portland stone. esenioiano -I am, Sir, &c., A READER.

Newcastle-on-Tyne.

Miscellanea.

THE PYBAMIDS EOLIPSED .- The National Intelligencer contains a long letter from Mr. Pickett, at Lima, commenting upon discoveries of very extraordinary ruins said to have been of very extraordinary ruins said to have been found by Judge Neito, in the province of Ohaohapovos, while on an exploring expedi-tion. In making a survey of the country he found at Ceulap, a building of most extraor-dinary character, which he describes as a wall of hewn stone 560 feet in width, 3,600 feet in length, and 150 feet high. The edifice being solid in the interior for the whole space con-tained within 5,366,000 feet of circumference, which it has to the beforementioned height of which it has, to the beforementioned height of 150 feet, is solid and levelled, and upon it there is another wall of 300,000 feet in circum-ference in this form, 600 feet in length and 50 in breadth, with the same elevation (150 feet) in the lower wall, and, like it, solid and levelled to the summit. In this elevation, and also that of the lower wall, are a great many habitations or rooms of the same hewn stone, 18 feet long and 15 wide, and in these rooms, as well as between the dividing walls of the great wall, are found neatly constructed ditches, a yard or two-thirds in length, and half a yard broad and deep, in which are found bones of the ancient dead, some naked, and some in cotton shrouds or blankets, of very firm tex-ture, though coarse, and all worked with borders of different colours.

INGENIOUS WORKMANSHIP .--- We have inspected with much gratification a working model of a beam steam-engine, manufactured by Mr. Benjamin Warner, a watch-spring maker, who has already exhibited at the Polytechnic Institution some extraordinary examples of patient ingenuity. It is composed of more than 200 pieces, and has the follow-ing dimensions:—The length of the stand is 34 inches, the length of the beam 24 inches, 34 inches, the length of the beam 24 inches, the height of the supporters of beam 18 in., the diameter of cylinder 8ths of an inch, the length of stroke 8ths. It has governors acting correctly, and fine silk forms the band. The parallel motion has straps and brasses, and is fixed with gibs and keys. Every part of the engine is bolted and screwed together, and finished in the same manner as the inside of a watch. We were sorry to find that the ingrewatch. We were sorry to find that the ingenious mechanist who had constructed this curiosity was about to seek his fortune in America. It is a pity to lose such a workman.

RADIATION OF HEAT .- M. Melloni, of Naples, has just completed some very in-teresting experiments on the radiation of heat. The previous researches of Rumford and Leslie proved that the surfaces of different bodies possess at very different degrees the faculty of giving out, by radiation, the heat of the substances which they envelope; and it has also been satisfactorily established that layers of the same varnish considerably modify the radiating powers of the surfaces over which they are laid; shewing, therefore, that the rays of heat given out by a substance proceed not only from its surface, but the points around it to a certain depth. It, therefore, remained to measure numerically the fore, remained to measure numericany the thickness of the superficial layer which assists the radiation, and to this undertaking M. Melloni applied himself. He covered the faces of Leslie's cube with equal layers of a proper varnish, augmenting successively the number of layers, and measuring each time with his thermometrical spparatus the radiating powers of the surface; he found that the power went on gradually increasing up to the seventeenth layer of varnish, when it became stationary. At this point, the total thickness of the varnish, as ascertained with the greatest possible minuteness, was about the four hundredth part of a millimetre. In comparing this result with that which attended the use of loss found M. Malleri found that the use of leaf-gold, M. Melloni found that a much thinner coating of gold would produce the same amount of radiation; but this difference is not to be imputed to the greater or lesser transparency of the coating, for lampblack, which is very opaque, possesses like varnish the property of giving out heat from the layers on which it is placed.

FATAL ACCIDENT THROUGH THE FALL OF QUANTITY OF IRON RODS .-- On Saturday the sth inst., just at the hour when the men en-gaged in the works of Messrs. Ditchburn and Mare, at Blackwall, were assembled to be paid, a loss of life ensued from the giving way of a stack of iron rods, which had been placed in a slanting direction against a beam, the bottoms of the rods resting upon the ground in the same way as they are placed in other iron yards in London near the Thames. Eight bodies, two lifeless, and six more or less mangled, were found under the ponderous weight, said to be about eleven tons. At the inquest, which was held on the Monday following, the cause of the accident was ex-plained by Mr. Ditchburn's foreman, who stated his belief that the stack was thrown down by the men pressing against it. They were very by the men pressing against it. I hey were very numerous, and were lounging about waiting for their pay. He could not account for it in any other way, because the iron actually fell in the opposite direction to that in which it was placed. They were within an inch and a half of an upright position, and he had him self seen them properly strutted and supported. It would, by pressure, have fallen forwards, but it fell sideways. Mr. Ditchburn stated that the rods were so placed against his orders, and he was unconscious of its position until he heard of the accident, which he could not believe to be true, as he had given express orders that the iron should be moved away from its original position and placed horizon-tally on the ground. He had no doubt that it was thrown down by the pressure of the men against it. A verdict of "accidental death" was instantly returned.

DEMOLITION OF THE FLEET PRISON .- The Corporation of the city of London having Corporation of the city of London naving purchased this property for 25,000% from the Government, are now engaged in disposing of its materials by auction. The first days of its materials by auction. The inst days sale took place, on the premises, last week; the second portion is to be disposed of by the auctioneers, Messrs. Pullen and Son, on the 21st instant, and following day. The carriest mention of the Fleet Prison occurs in the reign of Richard I., but up to the 16th century nothing is known of its history. The prison was burnt by the followers of Wat Tyler, and in the 16th and 17th centuries the records of the Fleet became suddenly filled with matters of the deepest interest in connection with the religious martyrs of the reigns of Elizabeth and Mary, and the political prisoners of the Star Chamber in the reign of Charles I. It appears that the prison was used for the con-finement of debtors from the 13th century, and a petition from a debtor named John Fraunceys, in 1290, is stated in Mr. Knight's "London" still to be preserved. Great atrocities were committed on the inmates, and until the year 1727 little was done in the way of redress. In that year, however, a Parlis-mentary committee brought many things to light, and since then improvements have been effected in the management of prisons. The great Howard and the other "sons of mercy" have not laboured in vain, though they were not permitted to see the fruit of their exertions. The building now standing was erected after the burning of the older one in the Gordon riots of 1780, when the mob was polite enough to send notice to the prisoners of the period of their coming, and on being informed that it would be inconvenient, on account of the lateness of the hour, to postpone their visit to the following day. The former building also dated its erection from the period of a fire, its pre-decessor having been destroyed in the great conflagration of 1666. The entire prison at the present time occupies an acre of groad Nearly 1,000 prisoners, besides the numerous officers of the establishment, have at various premises. The buildings are computed to contain upwards of 3,000,000 of stock bricks, 50 tons of lead in the various forms of gutters, 50 tons of lead in the various forms of gutters, flats, cisterns, and pipes, 200 squares of slated roofs, 40,000 leet of York paving, 250 pair of glazed sashes, an infinity of doors, partitions, and interior fixtures and fittings-up, the pewing of the chapel, strong boarded and timber floors, iron girders, massive iron gates with locks and bolts of singular construction and well-tested excellence. At present it is not decided what improvements will take place on the site-whether a new street will be formed, or accommodation afforded for the administration of public justice.

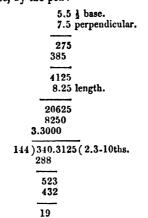

۰£

FURNITURE WOODS.—A few nights since, in the House of Commons, Mr. C. Buller said that Sir Robert Peel had stated that furniture woods would be exempted from duty. He had thought they would have been included in one category; but he found the Government had enumerated the woods they meant to exempt. Now, there were various new kinds of these woods continually coming in from the colonies, with respect to which he wished to know whether, if left unenumerated, they would come in under the general designation? Many such Many such woods, the produce of Ceylon and New Zealand, were not found in the list at all. Mr. Labou-chere said that, consistently with their professed views, the Government ought to encourage the importation of these new furniture woods. There were many species of woods in the colonies which had hitherto been kept out by the duty. They all ought to be admitted on the same terms as mahogany. Sir G. Clerk said that as soon as the names of these new said that as soon as the names of these new furniture woods were known, they might be admitted free of duty. Mr. C. Buller observed that the Government list was an ungracious one. There were a great number of furniture woods from Italy, among others olive wood, fig, and orange wood, which were not in the list. Mr. Mitchell then inquired whether the Government meant to take of the duty of list. Mr. Mitchell then inquired whether the Government meant to take off the duty on wainscot logs; if not, he should submit a pro-position for that purpose. Sir Robert Peel, in answer, said the Government was under the necessity of making some discrimination. If they said that wainscot woods in general were to come in, it would be contended that wainscot logs from the Baltic should come in free of duty.

and Crewe, on the Grand Junction, is one of the extraordinary products of the railway enter-prise of the present day. Until lately Swindon was remarkable for nothing but heath and upland; it is now the nursery of a new com-munity, the seat of well-ordered industry, and a colony of engineers and handicraftsmen. The total sum, expended on the locomotive establishment at Swindon, including engines and car-rieges, is about 550,000%, exclusive of the ex-pense of engine-house, machinery, and tools, amounting to 26,500%. The average halfyearly expenditure in wages to engine-drivers, fremen, guards, servants, porters, clothing, fremen, guards, servants, porters, clothing, fcc., is 140,0007. The company manufacture their own engines at the factory, where clean-ing and every thing connected with construc-tive repair is carried on. The number of nechanics, including engine-drivers, firemen, fitters, coppersmiths, cleaners, and labourers, constantly employed, varies from 300 to 350. Swindon consists of neat brick buildings, and Swindon consists of neat brick buildings, and is so far adjacent to the line as to be seen by the passing trains. The total population is upwards of 800. A library and reading-rooms have already been formed for the use of the inhabitants and servants of the company, together with a Mechanics' Institute. The church, which is being built entirely of stone, under the superintendence of Massre church, which is being built entirely of stone, under the superintendence of Messrs. Scott and Moffatt, is nearly completed. It is in the decorative style of the 14th century, with aisles, elerestory, chancel, tower, and spire. The entire structure is 140 feet high, and will accommodate 800 persons, all the sittings being entirely free. The estimated cost is between 5,000*l*. and 6,000*l*. Its consecration by the Bishop of Gloucester, and Bristol is by the Bishop of Gloucester and Bristol is fixed for Friday, the 25th of April, St. Mark's and for Friday, the 20th of April, St. Mark's day, and it is to be dedicated to this evangelist. Adjoining the church, at the east and west, are the schools and parsonage, built in a style cor-responding with the church, at a cost of 1,700/. On the south of the church a spacious piece of ground has been purchased by the Great Wattern Company and had been built Western Company, and laid out as a park or pleasure-ground for the inhabitants. ph

BARN FLOORS .--- A correspondent of the Mark Lane Express states, that having a very had barn floor, he thought of boarding it, but the expense was an objection, us the boards would require to be very thick; besides, he had observed that a floor of that kind in the eighbourhood had become splintered by the flails, was rotted by the damp, and gnawed by rats. Happening to have a large number of unsaleable pieces of timber, coarse, crooked arms, and knotty ends, that were altogether worthless, even for firewood, for it was im-possible to split them it coarse to have the possible to split them, it occurred to him that they would make an excellent surface for his barn floor. He thus describes the mode he adopted in carrying out this idea and success that attended it. "I had an X cross cutting stool made, on which these logs were placed, and cross cut into blocks of a foot long; the bark and any excrescences having been chopped off by the batchet, the blocks were thus reduced to irregular figures of all shapes, no matter what. The floor having been excavated to the proper depth and levelled, blocks were placed at distances so as to be levelled by a long band level, and the whole surface levelled off from those by a straight edge. The blocks were laid down on their ends, having the cross out surface or end of the grain upwards; the best face of course up, and some attention being paid to their mutual adaptation with regard to fit; but, of course, with such a variety of irregular figures there were numerous cavities between—these were filled as well as might be by smaller blocks, thus occupying the larger spaces. Still lesser pieces were now put into the remaining openings, and dry sand were swept over till the holes were filled up to near the top, and the remaining interstices were filled with wedges, the heads of which were sawed and adzed off: all was rammed down with a common paving hammer. This floor has now been a year in use, and is perfection itself for its purpose. The cost was trifling : two labourers in a fortnight cut most of the blocks ; and the carpenter, with a handy assistant, laid them in a few days. The wedges should not be driven hard, nor until the blocks are well confined, or they will be spread asunder by the wedges."

MEASUREMENT OF WOODEN SLEEPERS FOR RAILWAYS.—The following is a copy of a new rule or method, approved by the commissioners of the customs, for the measurement of wooden sleepers of a triangular form, usually imported for railway purposes, when measured singly :--- "The length to be taken to the quarter of a foot, and the perpendicular height to be taken to the quarter of an inch, adding thereto the height of the defec-tive angle, which together will constitute the entire perpendicular height; one-half of the base to be then taken, and the contents ascer-tained by the inverted side of the sliding rule, as directed in the measurement of unequalsided timber. An example is given of a piece of timber of the description and shape imported in large quantities for the purpose stated, the length being 81 feet; the base or breadth at the end, 11 inches; the perpendi-cular, 64 inches; with 1 inch defective angle: for instance, by the pen:--

Operation by the sliding rule. Set 71 inches, the perpendicular height (the defective angle being added thereto) on the inverted line E to 51 inches-one-half the base on line C; then opposite to 84, the length in feet on the line A will be found 2.3-10ths on the line B, the content in cubic feet for duty." This order has been communicated to revenue officers at this port and at the various outports of the kingdom by directions of the commissioners for their future government. IMPORTANT DISCOVERY.

scientific Α gentleman, residing at Ipswich, Mr. Frederick Ransome, engineer, has lately discovered a method whereby the hardest stone can be brought into a consistence resembling common putty, so that it can be cut and moulded into any shape, for useful and ornamental purposes, without altering its general character and ap-pearance; for it becomes as hard, and in some instances even harder, than when subjected to the process. Another peculiarity of the pro-cess is, that any colour, or variety of colours, can be imparted to its solid substance, so that an endless variety of shades can be produced, and as it is capable of being polished, it ef-fectually resists the action of the weather. It can also be used as a cement, and can be brushed over the surface of wood, so as to

render it fire-proof.—Sheffield Mercury. COPPER.—Returns of the average prices of copper purchased for the use of her Majesty's dock-yards in each year, from 1815 to 1844 inclusive, and of the price of cake copper in London during the same period, have been issued in the shape of a parliamentary paper, obtained on the motion of Sir C. Lemon, one of the representatives of the mining districts. ot the representatives of the mining districts. From 1815 to 1832 the return is *nil*; in the year 1832, the average price of the copper in question was 82. per ton; in 1833, 87. 14s. 6d. per ton; in 1836, 1117. 7s. 1d. per ton; in 1839, 97% 10s. per ton; in 1840, 1027 2s. 6d. per ton; in 1841, 102% 8s. 10d. per ton; in 1842, 93% 10s. per ton; in 1843, 82% 10s. 9d. per ton; and in 1844, 83% 7s. per ton. The Admi-ralty department possesses. it appears. no ralty department possesses, it appears, no official means of furnishing the price of cake copper in London during the period stated.

STATUE TO GEORGE STEPHENSON, ESQ. It is said to be in contemplation to adorn the splendid high level bridge across the Tyne, about to be constructed under the auspices of Mr. Hudson, with a noble statue in honour of George Stephenson, Esq., the eminent civil engineer, a native of Newcastle-upon-Tyne, and beyond all doubt one of the greatest men of the day.

NEW STOCK-EXCHANGE AT BRISTOL. At Bristol, a large and influential meeting was held on Monday, the 31st ultimo, at the offices of Messrs. Bradley, Barnard, and Co., Albion chambers, at which resolutions for forming a Stock Exchange were cordially and unanimously passed. John Kerles Haberfield, Esq., has consented to accept the office of president.

MUSEUM OF ARTS BILL.—The Museum of Arts Bill was opposed by Mr. Buck, who moved that it should be committed that day six months. Sir J. Graham hoped that Mr. Buck would not persevere in his motion. The government were prepared to support the principle of the bill, although its provisions went rather beyond the understanding which had been come to. He would recommend the postponement of the committee for a week, He would recommend the and in the interim he would devote attention to the subject, and take an opportunity of pri-vately explaining to the hon. member the objections entertained to the bill in its present shape. This proposition was assented to, and the committee was accordingly postponed as suggested.

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom teaders, &c., are to be addressed. For the convenience of our readers however, they are eatered in a book, and may be seen on application at the office of "The Builder," 2, York-street, Covent-garden.]

For the supply of from 2,000 to 3,000 feet of new 21 York Paving to the Commissioners for paving the Skinners' Estate, St. Pancras. For the execution of certain Works required to

be done in Hestings-street and Clarement-place, for the Commissioners of the Skinners' Betate, St. Pancras. 11

For the building of a new Bridge on the Brithen-ham and Pleasley Turnpike Road st. Guilthwaite Common, near Rotherham, Yorkshire, Store the erection of Stone Arches and other works

For the swostle and Carliale Railway Company. For the supply of Paving Granite, fint, Keatiah Rag, and Gravel, to repair the highways of Saint Mary, Newington, from 23rd April, 1845, to Easter Tuesday, 1846. For such Masons', Paviors', and Plasterers' Works as may be required at Hull for the Board of

Ordnance.

For furnishing and fixing in the town of South-ampton 205 Gas-lights, to consist of 81 Columns, and 124 Scroll Brackets, with the necessary Lamps,

and 124 Scroll Brackets, with the necessary Lamps, Pipes, Fittings, &c. For taking down a tenement in Bishop-street, Coventry, and erecting two Messuages on the site and ground adjoining. For submitting a plan of a Tread-wheel, and con-structing the same in the Common Gaol of Great

Yarmouth, Norfolk.

For the restoration of the Parish Church of Grays Thurrock, Essex. For all the Works to be done in the erection

and completion of the new cast-iron Bridge over the Haven of Great Yarmouth, including the find-ing of labour, certain materials, &c.

For the construction of the third and fourth divisions of the Chester and Holyhead Railway. For the supply of Materials to the Commis-sioners of the Metropolis Roads.

sioners of the Metropolis Roads. For providing, squaring, and laying new York Paving and Granite Curb, &c., for the Commis-sioners under the Bedford Paving Act, St. Panoras. For various Engineers' and Joiners' Works required to be done at the new Workhouse, Birch-field-wood, Saubridge, Kent. For the Masonry Work of several Viaducts and Bridges.

Bridges.

For performing the several works in building a new Workhouse at Tenterden.

For the formation and completion of a new Drain, being about eleven miles long, twenty yards wide, and five yards deep, for the Middle Level Drainage Commissioners. Also for the erection of a Staunch, several Bridges of wood with brick abutments, together with the necessary culverts, and other more and other works.

COMPETITIONS.

For the erection of a Baptist Chapel at Folkstone.

For laying out the Grounds of the Victoria-park Cemetery, and for draining the same, making the roads, paths, and finding all necessary trees, shrubs,

materials, &c. Plans for a Church to be erected within the Borough of Kingston-upon-Hull.

Plans, sections, and elevations for a Terminus, and other requisite accompanying offices, for the Great Southern and Western Railway, Ireland.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

192

At the Union Inn, Denby, Derbyshire : a large quantity of full-grown Coppice and Hedgerow Timber.

At Shortgrove-park, Newport, Essex: 150 Timber Trees, consisting of Beech, Ash, Sycamore, Alder, Elm, &c.; 230 very fine large Firs, &c.; many of the Beech and Ash Trees are of large

dimensions and good quality. At Waresley, Huntingdonshire : upwards of 200 very choice Oak Trees of large dimensions and fine quality. Also several lots of Ash and Elm Timber Trees, and Larch and other Spires.

At Framsden, near Debenham: a quantity of Ash and Elm Pollards; Ash, Ekn, and Sallow Timbers, &c.

At the Swan Inn, Rickmansworth, Herts: the growing Oak Timber on Linster's Farm, and on Sayor Farm consisting of the state of the state

Savoy Farm, consisting of about 255 Trees. At Seagry Wood, near Chippenham, Wiltshire : from 1200 to 1400 Ash Poles of large dimensions;

rrom 1200 to 1400 Ash Poles of large dimensions; prime Elm, Ash, Beech, and Chesnut Timber, &c. At the Timber-yard, opposite St. Giles's Church, London: 3,200 Pine Deals, Planks, and Battens, 840 Yellow Deals, 2,480 Spruce Deals and Planks, 120 Yellow and White Battens, 14,000 feet of three-quarter inch and half inch Pine Reserts Ac

Pine Boards, &c. 250,000 Building Bricks, 40,000 Arch ditto, &c.; now at Sherborne Kiln, three miles from London

At Patcham, near Brighton : a large quantity of Railway Materials ; the whole of the Iron is of Staffordshire manufacture.

BY TENDER.

All the implements used in the execution of the works at the Fleetwood-pier; they are now on the wharf at Fleetwood, and can be put on the railwaywaggons, or on board ship.

Above 1,000 Oak Trees, now standing upon Lewisham Lands-wood, near Beckingham, Kent. 20 Oak, 1 Elm, 1 Cherry, and 12 Ash Trees; now standing at Haamer, near Welchhampton, Cheshire.

MEETINGS OF SCIENTIFIC BODIES During the ensuing week.

MONDAY, April 21. — Statisfical, 11, Regent-street, 8 P.M.; Chemical (Society of Arts), Adelphi, 8 P.M.; Medical, Bolt-court, Fleet-street, street, 8 p.m.

TUBSDAY, 22:--Medical and Chirurgical, 53, Berners-street, 81 P.M.; Civil Engineers, 25, Great George-street, 8 P.M.; Zoological, Hanover-square, 84 P.M. ;

WEDNESDAY, 23 .- Society of Arts, Adelphi, 8 P.M. (antiversary); Microscopical, 21, Regent-street, 8 P.M.; Pharmaceutical, 17, Bloomsbury-square, 9 P.M.; Ethnological, 27 A, Sackvillestreet, 8 P.M.; Antiquaries, Somerset-house, 2 P.M. (anniversary).

THURSDAY, 24. - London Institution, Finsbury-circus, 12 P.M. (anniversary); Royal Society of Literature, 4, St. Martin's-place, 3 r.M. (anni-versary); Medico-Botanical, 32, Sackville-street, 8 P.M.; Numismatic, Somerset-house, 7 P.M.

FRIDAY, 25. — Royal Institution, Albemarle-street, 84 P.M.; Philological, 49, Pall Mall, 8 P.M.

SATURDAY, 26. — Royal Botanic, Regent's-park, 4 P.M.; Westminster Medical, 32, Sackville-street, 8 P.M.; Institute of the Fine Arts (Society of Arts), Adelphi, 8 P.M.

TO CORRESPONDENTS.

"County Lunatic Asylum."-Several corr spondents are anxious to learn the decision in this competition.

"A Subscriber" (Camberwell), and "T. A., next week.

"P. D." (Lambeth). — An inch superficial (4 by 3 for example) is the 12th part of a foot superficial, but a square inch (1 by 1) is the 144th part.

"A Subscriber," who asks relative to the Bellhanging at the new Houses of Parliament, should inquire of the Clerk of the Works.

"William Sugden."-We are not disposed to pursue the subject further.

"A Surveyor."-We do not see any reason why the chimney in the fourth story should not be built over the breast below.

"T. G. S." asks whether the district surveyor roof 20 feel from the house. If the roof of any building (unless insulated) be "stripped, ripped, or uncovered," Schedule G. provides that it "must be covered with slates, tiles, metal, glass, artificial

or cement," and as the district surveyor is stone, or cement," and as the district surveyor is bound to see the Act carried out, he might claim a fee even for a privy. If it be claimed, we shall be glad if "T. G. S." will let us know the sum asked,

glad if "T. G. S." will let us know the sum asked, and in which district it occurs. "Repeal of the Window-tax."—We will attend to the report of the delegates. Received.—"A Manual of Gothic Mouldings," by F. A. Paley, M.A. Van Voorst, London, 1845. A valuable little volume, to which we shall direct from medean' attention showith — A Subscriber from our readers' attention shortly.—A Subscriber from No. 1.

This beautiful and unequalled article is allowed to be the cheapest and most useful Paper hitherto introduced to the public, as will be best proved by a trial.

PAINTING BRUSHES OF SUPERIOR QUALITY. TO PAINTERS, BUILDERS, &c. J. J. KENT AND CO.,

ability to apparent cheapness. 000000.--7 in. Dusters. 000000.--7 in. ditto, extra. 00000.--Ground Brushes.

0000.-Ground Brushes. Plasterers' Brushes. Distemper ditto. Ground and Unground. Sash Tools, and Common Tools. Tar Brushes and Masons' Brushes, and all other Brushes used by Painters and Artists. Lists of Prices of Painting Brushes, and of all other kinds of Brushes, forwarded on application. Established 1777.

TKINSONS CEMENT .- The public is A TRINSONS CEMENT.— Ine public is respectfully informed, that the price of this very ex-cellent Cement, which has now been in use for Architecture and Engineering works upwards of thirty years, is reduced to 2s. 3d. per bushel, and may be had in any quantity at Wyatt, Parker, and Co.'s Wharf, Holland-street, Surrey side of Blackfriars-bridge. N.B.—This Cement being of a light colour, requires no arti-ficial colouring or painting, and may be used for stucco with three parts its own quantity of sand.

three parts its own quantity of sand. **KEENE'S PATENT MARBLE** CEMENT.-The Patentees of this composition beg to refer to the British Museum, the Royal Exchange, the new works at Bethlem Hospital, Greenwich Hospital, and the Co-liseum in the Regent's-park, as buildings finished or in pro-gress, in which Kerne's Cement has been used as an internal stucco. Its superiority to common plastering consists in its extreme hardness, and the rapidity with which it dries, which them other water Cement. When employed for skirtings, architrave, and other mouldings, in place of wood, it checks dry-rot, is impervious to vermine, prevents the spread of fire, and is more eco-nomical in its application than the material for which it thus becomes the substitute. Confirmation of these statements is to be found in the all flooring in the new houses on the Hyde Park Estate, where its application is to be seen to the fullest advan-tage. In Livernool and Manchester, Kenne's Cement her in

where its application is to be seen to the third have a tage. In Liverpool and Manchester, Keene's Cement has in several cases been used for the covering of the fire-proof warehouse floors, where its lightness and hardness give it the preference over tiles and flagging, which are much heavier, and necessarily leave the floor intersected with numerous joints, whilst Keene's Cement is laid down in one unbroken surface.

Joints, while accure a communication of the source of the

Cement. Depôt in Liverpool, 36, Seel-street, James Woods, Agent.

MARTIN'S PATENT CEMENT. TO ARCHITECTS, BUILDERS, AND PAINTERS IN FRESCO. STEVENS and SON, PATENTEES and Source that this beautiful cement has now arrived anounce that this beautiful cement has now arrived as degree of excellence far surpassing their most sanguing superiority over every article hitherto in use; it is now being used extensively by Government in the British Museum and other public buildings. IT DOES NOT THROW OUT ANY SALT, but presents a beautifully pain and perfect surface, which may be painted upon dry work within four and the beautifully applicable for walls even substitute to form the best ground for freeco painting, having been used for many of the prise freecos lately exhibiting in Westminater Hall. It will bear an intense heat withous the eventset. B, DRURY-LANE, LONDON.

be equalled. 186, DRURY-LANE, LONDON. Agent for Liverpool and Manchester, Mr. R Part, 11. Atherton's-buildings, Dale-street, Liverpool.

STOCKTON LIAS CEMENT.

STOCKTON LIAS CEMENT, MANUFACTURED upon principles laid down in Major General Pasley's Essay on Limes and Cementa.—It is of a beautiful Stone Colour, and of ac-knowledged superior quality, free from vegetation, does not erack, and is well adapted for every description of modelling and casting. It has been extensively used at the Earl of Macclesfield's, Ensham-hall, by C. Barry, Esq., at Sir F. Shuckburgh's, Shuckburgh-hall, by H. E. Kendall, Esq. i for Works now in progress at Marbury-hall, Cheshire ; and for many of the Mansions erected during last Summer in the vicinity of London. WILMCOTE LIAS CEMENT, Is of inferior colour to the above, from containing oxide of iron, but of very Superior Quality for Tunnels, Sewers, and Hydraulic Purposes, its use is stipulated for by Mr. John Roe, Engineer of Sewers, London. OROUND LIAS LIME,

Roe, Engineer of Sewers, London. GROUND LIAS LIME, For Concrete, and every description of Hydraulie Work, for which purposes it has been used at Woolwich and Chatham Dock Yards, the London Docks, New Exchange, Hunger-ford Suspension Bridge, Westminster Bridge, Grand Junc-tion Water Works, Holborn Sewers, Regent and Grand Junction Canals, Wood Paving Companies, London and Bir-mingham Railway Company, for Works in the Alster at Hamburgh, the Kiel and Altona Railway, and various Sea Walls, &c. At R. Greaves's Works, Stockton, near Southam, War-wickshire, and at No. 2, South Wharf, Paddington, Lon-don.

don.

O ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MER-CHANTS, SHIPPERS, AND THE PUBLIC IS GENERAL. то

CHANTS, SHAPPERS, AND THE PUBLIC IS GENERAL. JOHNS and CO.'S PATENT STUCCO CEMENT.-The following are the positive advantages possessed by this Invention over every Cement hitherto in-troduced:-It will effectually resist Damp. It will mever regetate nor turn green, nor otherwise discolour. It will never crack, blister, nor peel off. It will form a complete Stone casing to any Building covered with it. It as closely resembles Stone that it is impossible to detect it. It is and good in the cask in any Climate for any number of years. It is the only Cement that can be depended upon for export. It is the only Cement that can be used with confidence by the Sca-side. It may be used in the hottest or coldest Climates at any season. It will adhere to any substance, even to Wood, Iron, or Glass. It will carry a larger Proportion of Smad than any other Cement. It matures by ace, and be-comes perfect when other Cements begin to periah. It may be worked through the Winter, as froat has no effect upon it. It may be used on the Inner Walls of new Houses, which may be papered over or painted directly. Roofs laid or pointed with this Germant will remain undamaged by the severest Storms. Any Plasterer may apply it, the Instru-tions for use being very clear and distinct. The first cost of this material does not exceed that of the cheapest Cement on use, but with all the above-named extraordinary and valuable advantages, nothing can approach it in point of exonomy. Architects and Builders who have used this Cement have

now in use; but with all the above-named ettraordinary and valuable advantages, nothing can approach it in point of economy. Architects and Builders who have used this Cement have declared that it requires only to be known, to be universally preferred. Specimens may be seen, and a Prospectus fully describing the Cement and its mode of application, together with a volume of Testimonials from zery part of the Kingdom, may be obtained on application to MANN and CO., SOLK AGENT'S for the Patentees, 8, Maiden-lane, Queen-street, Cheapside, London: of whom also may be had, JOHN'S and CO.'S PATENT STONE-COLOUR STUCCO PAINT, expressly intended for Painting over ex-terior Walls of Houses that have beene dirty and disco-loured. It is in every way better suited for this purpose tham White Lead Paint, which will frequently come of in **Gakes**, being in direct chemical opposition with Oement; whereas MESSRS. JOHN'S and CO.'S PATENT PAINT having an affinity for Stucco, binds itself with it, stopping the suction, thereby rendering the wall proof against weather, and in the finish producing a pure stone-like effect, produceable by no other Paint whatever. It is cheap in its application, —and may be used by any Painter, in any climate, even in the most exposed Marine situations.

LIFE ASSURANCE.

THE BRITISH MUTUAL LIFE AS-SURANCE SOCIETY entertains proposals of any escription from 202. upwards, involving the contingency of uman life, and offers the following advantages to its mean-

BONUS ANNUALLY (in shape of low Promiums), al to those of other offices, granted every three, five, or preserved.

THE PROSPECT OF A LARGER BONUS than can

CHARLES JAMES THICKE, Resident Secretary. 17, New Bridge-street, Blackfrians.

SATURDAY, APRIL 26, 1845.

ANT of attention to what may be termed minor matters in the erection of dwelling-houses, sometimes leads to serious inconveni-

ence and expense. We were called in not long ago to explain how it happened, that when there was a fire in the dining-room, smoke invariably came through the joints of the floor above and from under the skirting, and rendered the spartment almost useless. Worse still, there were other rooms in the house similarly affected by other fires. On examination, the cause was obvious: the brickwork was badly done, the flues were not properly pargeted, and the smoke consequently found its way through the joints of the brickwork between the ceiling and the floor, where the walls were not plastered. This very serious defect is by no means unusual. Operatives, speaking generally, have ceased to feel interested in the production of good work ; all that they desire is to get over the ground, and very often this is the case with their masters too. The house will be sold, they hope, as soon as it is finished, and they leave the purchaser to discover the defects, and remedy them if he can.

Sometimes, the particular evil of which we are speaking is caused by the carpenters in fixing the skirting grounds; a header is driven in and a crevice formed, through which the smoke escapes. Very often, the source of the evil is discovered with difficulty, for the smoke, being confined between the ceiling and the floor, may travel to some distance, and make its appearance in an opposite direction; even when discovered, it cannot be remedied without considerable inconvenience and expense.

Considerable injury is caused to many fabrics by the want of a little care when fixing the window-cills. The atone cill is not properly weathered, and does not extend sufficiently under the wood cill of the frame, so that if the latter shrink, or the brickwork settle ever so slightly, the rain-water constantly finds its way between the two, and does serious mischief. A small fillet of mastic at the junction of the wood and stone may be applied remedially, but ought not to be needed.

To the badness of the brickwork executed at this time in the neighbourhood of the metropolis, we have alluded in our pages more than once. Hasty, bad work, induced by competition and the operation of speculative builders, has become so much the habit of our bricklayers, that it is difficult to find men capable of producing superior work, or, at all events, it is difficult to induce them to abandon their hasty, careless, mode of proceeding, and exercise the skill they possess.

The way in which the walls of the majority of houses are "blown up" now-a-days, must be distressing to those who desire to see our operatives advance in knowledge, and the arts of construction improved: half-hollow, improperly bonded, and out of perpendicular, they seem prepared expressly for premature decay and ruin. In Manchester and some other places brickwork is still practised as an art. We are not, however, now dealing with the general question of construction; our object was simply to allude to two or three minor defects in ordinary modern houses, the result merely of thoughtlessness and the want of care.

Shaking floors, which produce a running obligato accompaniment to every movement upon them, might be avoided in many cases if the strutting were properly, instead of improperly, executed. Two nails in each strut, instead of one, and the exercise of some little thought, so as to be able to wedge up the whole soundly, would often prevent a nuisance without any extra cost worth consideration, the removal of which, if incurred, might entail an outlay of many pounds.

THE ART-UNION OF LONDON.

On Tuesday last, the Theatre Royal Drurylane was filled to the ceiling by the members of this important association, to receive the report of the committee, and distribute the amount subscribed for the purchase of works of art. The house presented a most animated and elegant appearance; stage, stalls, pit, boxes, and gallery, were alike crowded with well-dressed persons; and when his Royal Highness, the Duke of Cambridge, accompanied by the Duke of Mecklenburgh Strelitz, appeared on the stage, to take the chair, precisely at twelve o'clock, his Royal Highness was received with loud and continued cheering. On taking the chair, the president briefly congratulated the subscribers on the prosperity of the association. "Last year," said his Royal Highness. "the subscription was

On taking the chair, the president briefly congratulated the subscribers on the prosperity of the association. "Last year," said his Royal Highness, "the subscription was 14,800.", this year it amounts to 15,440. Now when we consider that in the year 1837, when we began, we only collected 490. I think there is every reason for saying that we are thriving; and I most sincerely hope that we shall continue so. After saying these few words, which I trust will be satisfactory to you, I will call on the honorary secretary to read the report."

The Hon. Sec., Mr. George Godwin, F.R.S., then read the following

REPORT.

For the ninth time the committee have the great satisfaction of announcing the continued and increasing prosperity of the Art. Union of London, a more extended and better appreciation of its great objects, and clearer evidence of the goodness of its plan and working.

The subscription for the present year amounts to the sum of 15,440%. 5s., and would have been larger, but for the misapprehension that Lord Monteagle's Act (under which the present distribution is made) applied simply to the past year, and that as no fresh Act on the subject had been passed, we were not recognized by the legislature. In reality, however, the Act in question remains in force until the 31st of July next, before which time, as there is every reason to believe, the association will be placed on a firm and permanent basis by an Act of Parliament, to be brought in by the Right Hon. Thomas Wyse, as chairman of a committee of the House of Commons appointed in June last to consider the objects and results of Art-Unions, and the most expedient and practicable means of rendering them most subservient to the improvement and diffusion of art through the different classes of the community. The minutes of evidence and the report of the Parliamentary Committee have been printed, and, when made public, will doubtless afford many valuable suggestions for the future conduct of this association.

It is gratifying to find that the late agitation of the subject and this inquiry have not had the effect of changing the opinion of any early friend to the Art-Union of London, so far as is known; while it has even already induced many, who entertained doubts on the matter, to give it the advantage of their countenance. And here they cannot omit offering publicly respectful thanks to his Royal Highness the Duke of Cambridge, President, for the interest H. R. H. manifested in the successful issue of the late proceedings, and his personal endeavours on several occasions to obtain it. His Royal Highness has himself brought the subscriptions of various members of the Royal Family, and has been graciously pleased at all times to give assistance to the committee.

The list of provincial and foreign secretaries has been increased considerably, and now numbers 338. In addition to New York, Mexico, Novia Scotia, Hobart Town, Ceylon, Bombay, and Singapore, mentioned in the last report, the society has now active correspondents at Coblentz, Wiesbaden, Aix-la-Chapelle, New Brunswick, Dominica, Monte Video, La Guayra, Toronto, in Montreal, and last, but certainly not the least in importance, at Canton, in the Celestial Empire !

Canon, in the Gelestial Empire: The prizeholders of last year purchased 253 works of art, including two pieces of sculpture. These were exhibited for the usual time, at first to the subscribers and their friends, and afterwards gratuitously to the public, and were visited by 250,000 persons without the occurrence of any accident.

without the occurrence of any accident. Relative to the selection of the works of art on that occasion, it is the painful duty of the committee to reprobate in the strongest terms the conduct of one of the prizeholders, who sought unworthily to divert the funds of the association from their proper course for his own pecuniary advantage. The artists to whom he applied proved themselves men of honour and integrity, and his scheme failed. The committee minutely investigated the occurrence, and received the fullest proof that the selection ultimately made was a *bond fide* transaction, or they would assuredly have declared the prize forfeited, and allowed the subscriber to seek what remedy he might. They deemed it right, however, with a view to the attainment of the objects of the association and the protection of artists, to make the "Regulations as to selection" more stringent than they were before, and have accordingly provided that no arrangement whatever shall be made, or attempted to be made, between a prizeholder and an artist, or by any parties on their behalf, in the selection of a work of art by which a prizeholder may obtain, or attempt to obtain, the return of a portion of the amount of a prize, or other valuable consideration; that no prizeholder shall sell, or attempt to sell, the right of selection; and that should any attempt to evade the published regulations be discovered, the amount of the prize shall be forfeited and merge in the funds of the society. In this determination they are quite satisfied they will receive the support of all who appreciate rightly the real objects of the association, and they would state emphatically, it is only these they desire to find in the list of subscribers. The engraving due to the subscribers of last year, "The Castle of Ischia," will be delivered, in pursuance of the notice already sent to every subscriber, on and after the 7th of May next. "The Convalescent from Waterloo," engraved by Mr. G. T. Doo, after Mr. Mulready, R.A., due to the subsc

"The Convalescent from Waterloo," engraved by Mr. G. T. Doo, after Mr. Mulready, R.A., due to the subscribers of the present year, is approaching completion. In addition to this print the subscribers will receive for each guinea paid, a series of designs in outline illustrative of Thomson's "Castle of Indolence," made by Mr. William Rimer. The drawings have been placed in the hands of Messrs. Webb, Whitfield, H. W. Collard, and Joubert, and the engravings from them will be distributed as soon as they are completed. Every subscriber for 1846 will receive an

Every subscriber for 1846 will receive an impression of a line engraving, "Jephtha's Daughter," after Mr. O'Neil, by Mr. Peter Lightfoot, which is already far advanced, with such other advantages as the committee may be able to afford. For the subscribers of some future year the

For the subscribers of some future year the committee have been enabled, by the kind permission of the artist and of the proprietor, Mr. Willes, of Goodrest, Berkshire, to place in the hands of Mr. C. Rolls and Mr. Frederick Heath, two pictures by Mr. Uwins, R.A., "The Last Embrace," and "The Neapolitan Marriage," to be engraved by them for the society and distributed as a pair.

The committee look anxiously to the result of the offered premium of 5002. for the best original picture illustrative of English history. The cartoons are to be received in competition on the 1st of next January, and the committee venture to repeat to the artists of the United Kingdom their earnest hope, that a work will be obtained for engraving creditable to them and to the country.

to them and to the country. A statement of the engraving account, still open, will be published with this report.

In reply to the offered premium of 60% for the best consecutive series of not less than ten designs in outline, illustrative of some epoch in Biblical or British History, or of the work of a British author, nineteen sets were received, from which the committee selected a series from the "Bevelations of St. John," afterwards found to be by Mr. George Elgar Hicks, of Lymington, Hampshire, as entitled to the reward. Considering that much talent was displayed by some of the competitors, and anxious to stimulate young artists to exertion, they further awarded honorary premiums of 20% each to Mr. G. E. Sintzenick, Mr. W. Cave Thomas, and Mr. G. Scharf, jun.

With the view of inducing the production of finer and more elaborate works in lithography than are now general in this country, the committee some time ago placed in the hands of Mr. Templeton, Mr. E. M. Ward's excellent picture, "La Fleur's Departure" (selected by a prizeholder in the last distribution), to be executed on stone of a large size. As this is not yet finished, it will be made to form part of next year's arrangements.

In continuation of the society's endeavours to encourage the production of bronzes, Mr. John Bell's statue of the "Eagle Slayer," exhibited in Westminster Hall last year, has been reduced by Mr. Edward Wyon, and of this twenty copies in bronze will be distributed to-day. The thanks of the society are due to Mr. Bell for the liberal manner in which he placed this figure at the disposal of the committee. For the ensuing year Mr. Foley's statue, "The Boy at the Stream," has been reduced by Mr. Cleverton's machinery, and will be produced in bronze by Mr. Foley himself.

be produced in bronze by Mr. Foley himself. Your committee have long borne in view the connection between manufactures and art, and have felt the importance of leading one to the aid of the other. Considering the porcelain manufacture to be of considerable consequence, and greatly dependent on art, they propose to reduce a statue to a convenient size, and to issue a certain number of copies in that material. Mr. Gibson, R.A., when in England kindly offered the use of any of his works for this purpose, and the committee have determined on adopting "The Narcissus" for the first experiment, his diploma piece at the Royal Academy. Some difficulties which arose at the Academy have delayed the completion of the intention, but these are now removed, and the work will be proceeded with immediately by Messrs. Copeland and Garrett. Mr. A. J. Stothard has completed the medal commemorative of Sir Joshua Reynolds; the committee propose distributing to-day to thirty subscribers the right to receive an impression of it in silver. Any subscriber who may desire to have a copy of the medal in bronze, in lieu of the engraving for the present year, will become entitled to do so by forwarding to the office a note to that effect.

the office a note to that effect. The want of encouragement in the art of gem engraving, at present serionsly felt, has been urged upon them in several quarters. It has been shewn that we have no artists in this department capable of engraving a figure equal to those which were produced in England only a few years ago, and that there is not sufficient inducement to lead engravers to pursue such a course of study as would enable them to execute works of first-rate excellence; the committee take this opportunity to draw public attention to the fact.

Since the last meeting Thomas Griffith, Esq., M.A.; George John Morant, Esq.; W. J. Smith, Esq., F.S.A.; Henry G. Atkinson, Esq., F.G.S.; and Arthur Tooke, Esq., M.A.; have retired from the committee : and the Right Hon. the Earl of Arundel and Surrey; the Rev. Edward Coleridge, of Eton; T. C. Harrison, Esq., F.L.S.; and Mr. Serjeant Thompson; have been elected to fill the vacancies thus created.

The account of receipts and disbursements is as follows :---

| | £15,440 | 5 | 0 |
|--|---------------|----------|----|
| engraving of the year | 2,383 | 14 | 2 |
| and Printing Outlines Balance reserved for the line | 960 | 0 | 0 |

| Ditto for Bronzes | 450 | - | |
| Pictures, &c | 9,650 | 0 | 0 |
| Sum allotted for the purchase o | f | 10 | 10 |
| Expenses :Clerks, Printing Advertising, Postage, &c | , £. 1,796 | 8. 10 | |
| is as follows : | | | |

The amount set apart, according to the foregoing statement, for the purchase of works of art, viz., 9650%, will be thus allotted :---

40 Works of Art of the value of 10?. each. 55 Works of Art of the value of 15?. each. 39 Works of Art of the value of 20?. each. 37 Works of Art of the value of 25?. each. 25 Works of Art of the value of 30?. each. 25 Works of Art of the value of 30?. each. 14 Works of Art of the value of 50?. each. 12 Works of Art of the value of 70?. each. 10 Works of Art of the value of 70?. each. 10 Works of Art of the value of 80?. each. 6 Works of Art of the value of 100?. each. 3 Works of Art of the value of 100?. each. 20 Works of Art of the value of 100?. each. 20 Works of Art of the value of 200?. each. 20 Works of Art of the value of 300?. each.

To these are to be added twenty bronzes of "the Eagle Slayer," and thirty medals of Reynolds. To save the time of the meeting, the medals will be allotted to the first thirty names drawn consecutively at the close of the general distribution.

The reserved fund now amounts to 1,524.2s., consisting simply of the interest on subscriptions received, the sums unexpended by prizeholders, and the profit on the sale of catalogues at the exhibition. In order to enlarge it, the committee renew their exhortations for the payment of subscriptions early in the year.

The committee are anxious to increase to the utmost the efficiency of the association.

The various new modes of multiplying works of art, the announcement of which has recently startled the public, will not be disregarded by them, so far as they may be likely to assist in spreading abroad universally works of fine art. The steam-press has made good literature cheap, and the increased demand consequent has made it cheaper still, without weakening in any degree its worth and power. The delight and instruction it gives are extended to all and lessened to none. So it should be, and will be, with art. It is recorded of Apelles that he could not enduro that a picture should have but one master; he thought that the works of great artists should be carried from one country to another, because painting "was a common good to all the world." We are told too, there was a period when such works were looked upon in Greece as public treasures, whereof the enjoyment was due to all.

In modern times the *engraver* has extended the delight afforded by the contemplation of works of art to a wide circle, and the processes now in progress of development may enable him to fulfil literally Apelles' wish, and make a fine picture a common good to all the world. If we look back hardly a century, and note the state of the arts in England at that time, the utter disregard of them which was shewn, and the prevailing opinion that Englishmen had not the qualifications necessary for the successful practice of them, and remembering what has been done since, observe the important movements now making in favour of the fine arts, we shall find reason to be hopeful. Amongst the most recent efforts in this behalf is the bill now before the Legislature to enable town councils to establish muscums of art, for the henefit of the public,—to provide galleries for the reception of

" ------ Gems of art

And genius, ravish'd from the grasp of Time." and to adopt the most efficient means of rendering them educationally useful.

Emanating as this bill does from a member of their body, Mr. Ewart, to whom, in conjunction with others, the public are greatly indebted for the establishment of schools of design, and believing that if carried out efficiently by the local authorities, public taste will thereby gradually be improved, and that much good will result, the committee feel entitled to allude to it in terms of sincere commendation. The connection between manufactures and arts is generally admitted, and has been always urged in the reports of your committee; it is assorted, that we cannot compete with foreign manufacturers in some branches of trade because of the want of knowledge of the arts of design on the part of the operatives. By providing collections in each town, of the finest casts of the ancients,—forms of perfect beauty; giving general access to them, and making drawing a part of ordinary education, we might speedily overcome this reproach, and become independent of foreign aid. The increased facilities of access to national and private collections, now enjoyed by the public, was threatened by the recent demolition of an ancient relic. The law being found defective, a proof amongst others of the indifference towards the fine arts which has been entertained by our legislature, a bill for the protection of works of art has been brought into the House of Commons, and will specify be made law; and it is to be hoped, that should any evil-disposed person commit a similar outrage, he will be punished with rigour; all have an interest in maintaining the security of works of art publicly exposed, and thereby preventing the renewal of an unjust stigma now nearly removed.

The remission of the duty on glass will be advantageous to painters in water-colours, and lead many to adorn their houses with prints, who otherwise would not have done so. The increased attention paid to the fine arts

The increased attention paid to the fine arts at our universities, the important proceedings of the Royal Commission for their encouragement, the rapid spread of a desire for artistical decorations in our buildings, and other evidence, that the love of art is penetrating the mind of the country, would afford important matter for congratulation and comment.

It is not too much to assert, that the proceedings of the Art-Union of London have greatly assisted in producing the movement now apparent, by leading multitudes to talk and think of art who otherwise had disregarded it, and obtaining a more extended consideration of its value and uses. It will be the duty of the committee, as it is their pleasure, to aid in giving this movement a right direction, and they call upon the subscribers, and they call upon artists, as they have before done, zealously to assist them in the endcavour.

upon artists, as they have before done, zealously to assist them in the endeavour. "The great end of art," says a philosophical writer of the last century, " thas been so little considered, that many are accustomed to look on pictures as they would on rich hangings. It is true, that some kinds of pictures, like some kinds of books, can do no more than please. But the first object of high art is no more to be ornamental than the first object of an author is to decorate a library. Like poets, historians, and philosophers, painters have the power of instructing whilst entertaining the mind." To painters we say, exercise this power, produce works to teach as well as please, and rouse art to her proper station amongst us; and to the public we say, purchase these works when produced and so lead others to follow the right path,—to advance the character and increase the enjoyments of their countrymen. Seek excellence in every department, from the lowest to the highest, and remember, that by rewarding mediocrity to the exclusion of genius which may await your assistance, you depress talent and commit injustice.

Let us all bear in mind, that the great olject of our association, is to elevate and diffuse art.

GEORGE GODWIN LEWIS POCOCK. Hon. Secs.

The cheering which followed the report having subsided, the Duke of Mecklenburgh Strelitz, moved that the report be received, and Sir C. Hopkinson seconded it. The motion being carried by acclamation, Mr. Uwins, in a very eloquent speech, moved a vote of thanks to the committee and officers; as an artist, he said, he was proud to stand forward to give expression to the gratitude that was felt by the whole body. Mr. Cooper, R.A., seconded the motion, and it was carried by acclamation.

Mr. W. H. Rosser, F.S.A., and Mr. Fred. Haggard, having consented to act as scrutineers, and Miss Royds and Miss White, to draw the prizes, the distribution commenced, and his Royal Highness then vacated the chair in favour of Mr. B. Bond Cabbell, F.R.S., and retired amidst loud plaudits.

The following is a list of the principal prizeholders :---

Lord F. Beauclerk, 68, Grosvenor-street; Sir F. Berry, Bombay - each 300/

E. Perry, Bombay, —each 3007. Rev. A. R. Lloyd, Whittington, Owestry: Mrs. A. Packe, Caythorpe rectory, Grantham, each 2007.

J. Jarman, Half-moon-street, Bishopgate; G. Twiss, Cambridge; W. F. Watson, Chelsea.

each 150/. C. Claydon, Cambridge; W. Gow, Hungerford

* Richardson's "Art of Criticism."

Wharf; W. M'Donald, Queen-street, Glasgow; H. S. J. Medley, Farringdon; Lady A. Paget, 1, Old Burlington-street; E. Shepheard, Coventry, ---each 100/.

--each 100?. F. Allen, Pershore ; B. Brown, George-yard, Lombard-street ; Henry Brown, Boughton, Chester ; H. W. Dobell, Sussex-square, Kensington ; A. G. Fraser, Halifar, Nova Scotia ; P. H. Green, Manchester ; W. Keary, Stoke-on-Trent ; J. Wayer, Astley-crescent ; E. Westall, Croydon ; B. Williams, Waterloo-place,--each 80?.

liams, Waterloo-place,—each SU.

England; Mrs. Veal, Barnstaple; Lady Whichcote, Buckingham—each 501. D. W. Alexander, Halifax; Miss Armstrong, Stafford; A. Attwood, Gracechurch-street; W. Beckwith, Isle of Man; Mary A. Clarke, Durhamstreet, Strand; A. Dawson, Old Broad-street; T. Furguson, Mill-wall, Poplar; T. M. Gresham, Dublin; E. Griffith, Newton; E. Hunt, Southampton; Dr. Jones, Chester; T. Leftwich, Cumberland market; W. F. Moore, Isle of Man; J. Patten, Paddington; F. R. Perkins, Chipstead-place, Sevenoaks; G. Phillip, Liverpool; R. R., Dunchurch; A. Rowbotham, Market-place, Sheffield; Sir M. A. Shee, P.R.A., Cavendish-square; J. Simpson, 43, Newington-place, Kennington; J. Smith, 49, Long Acre; W. Stone, Darwin-street; J. Symonds, Warrington; Mrs. S. Wade, St. Albans; J. Watt, Wych-street,—each 400.

Thanks to the young ladies who assisted in the distribution, moved by Dr. Dickson and seconded by Mr. Wyndham, and to Mr. Bunn, for the liberality with which he had placed the theatre at the disposal of the society, moved by Mr. Noble and seconded by Mr. J. S. Gaskoin, were carried unanimously.

Alderman Wilson proposed a vote of thanks to the honorary secretaries for their exertions in promoting the interests of the Institution, which was seconded by Mr. Cabbell (the chairman), and passed unanimously.

SUSPENSION BRIDGES.

SUSPENSION bridges appear to be of very ancient origin; travellers have discovered them in South America, in China, in Thibet, and in the Indian Peninsula. They are mostly met with in mountainous regions, and being suspended across a deep ravine, or an impetuous torrent, permit the passage of the traveller when the construction of any other kind of bridge would be impracticable. It is not, therefore, from the celebrated nations of antiquity that the engineer has derived his first hints for the construction of suspension bridges, as neither Greece, Rome, nor Egypt is ever known to have had one, but from rude and unpolished people, the results of whose ingenuity we proceed to describe.

In South America there are numerous rope suspension bridges formed of the fibrous roots of the great American aloe (Agave Americana). The roadway is formed by covering the ropes transversely with small cylindrical pieces of bamboo. The bridge of Penipi, erected over the river Chambo, is 120 feet long and 8 feet broad; but there are others of much larger dimensions.

The utility of these bridges in mountainous countries is immense. Humboldt mentions that a permanent communication has been established between Quito and Lima by means of a rope bridge of extraordinary length, after 40,000*l*, had been expended in a fruitless attempt to build a stone bridge over a torrent, which rushes from the Cordilleras of the Andes. This is erected near Santa, and travellers with loaded mules pass over it in

safety. A rope bridge will generally remain in good condition twenty or twenty-five years, though some of the ropes require renewing every eight or ten years. But composed of stronge and more durable materials than the twisted fibres and tendrils of plants, suspension bridges are found to exist in remote and semi-barbarous regions. In Thibet many iron suspension bridges have been discovered, and it is not improbable that in countries as little known and isited by Europeans, others may exist of which Turner, we have as yet received no accounts. in his "Embassy to the Court of Thibet, mentions a most remarkable bridge of this description, stretched over the Tehintchien, situate about eighteen miles from Murichom. "Only one horse is admitted to go over it at a time; it swings as you tread upon it, re-acting at the same time with a force that impels you every step you take to quicken your pace. It is constructed of five chains, which support the is constructed of new chains, which support the platform, and on which chains are placed several layers of strong, coarse mats of bamboo, loosely laid down, so as to play with the swing of the bridge; a fence on each side further secures the passenger." The date of the erection of this bridge is unknown to the inhabitants of the country, and they even ascribe to it a fabulous origin: its length is about 150 feet. In Kircher's "China Illusabout 150 feet. In Kircuer's County Inte-trated," there is a very clear description of a Chinese iron-chain-bridge. "In the province of Junnan," says he "over a valley of great of Junnan," says he "over a valley of great depth and through which a torrent of water runs with great force and rapidity; a bridge is said to have been built by the Emperor Mingus, of the family of Hama, in the year of Christ 65, not constructed of brickwork or of blocks of stone cemented together, but of chains of beaten iron and hooks, so secured to rings from both sides of the chasm, that it forms a bridge by planks placed under them. There are twenty chains, each of which is 20 perches, or 300 palms in length. When many persons pass over together, the bridge vibrates to and fro. It is impossible to admire sufficiently the dexterity of the architect Sinensius, who had the hardihood to attempt a work so arduous and so conducive to the convenience of travelling."

Another suspension bridge in China is described in the sixth volume of the "Histoire general des Voyages." The following is a condensed translation :---"The famous iron bridge (such is the name given to it) at Quay-Chen, on the road to Yun-Nan (Junnan?), is the work of an ancient Chinese general. On the banks of, and stretching over the Pan-ho, a torrent of inconsiderable breadth but of great depth, a large gateway has been formed between two massive pillars 6 or 7 feet broad, and from 17 to 18 feet high. From the pillars at each end four iron chains extend, on this bridge of chains thick planks laid across formed a platform. The whole is covered by a roof which rests its ends on the pillars at each side of the bank."

Scamozzi speaks of suspension bridges existing in Europe in the beginning of the 17th century, but it is very questionable if the term he employs designates the same structure as that to which it is now applied. On the Continent no suspension bridges seem to have been erected save those of recent date, and in England the oldest bridge of the kind is believed to be the Winch Chain Bridge suspended over the Tees, and forming a communication between the counties of Durham and of York. Mr. Ste-phenson (Edinburgh Philosophical Journal for October, 1821) conjectures that the date of its erection was about 1741. It is or was (for we do not know whether it is still in existence) about 70 feet long, and rather more than 2 feet wide. The roadway was supported immedi-ately by the chains which were stretched into a nearly straight line, and were steadied by in-clined ties from the banks below. A hand-rail was added on one side only for the protection of the passengers whose footing Was far from steady. But few suspension bridges and those of minor importance were erected in Great Britain before the construction of the celebrated Menai Bridge. Drewry ("Memoir on Suspension Bridges," 1832) mentions one across GalaWater, which was made of thin wires, at a cost of only about 40%, although its span was 111 feet. It was erected in 1816 by a manufacturer named Lees of Galashiels. Another wire bridge, of about the same length, was built in 1817, across the Tweedat Kings Meadows, at

* See Navair. " Memoire sur les Ponts Suspendus."

an expense of 160*l*. The platform was 4 feet wide, and was sustained by wires radiating from the tops of two cast-iron columns at each end of the bridge. The columns were cast hollow, and within each of them was placed a verticle bar of wrought-iron 2½ inches square, to which the wires were immediately attached. Other bridges were built upon this principle, which, according to Navier, was suggested many years before by a Frenchman of the name of Poyet.

which, according to Navier, was suggested many years before by a Frenchman of the name of Poyet. In 1817, Captain (now Sir Samuel) Brown, obtained a patent for an improved method of constructing chains for suspending the roadway, and three years afterwards, had an opportunity of testing its merits in the erection of the Union-bridge across the Tweed, near Berwick, which was opened for use in July, 1820. The length of the chord-line between the points of suspension on the tops of the towers, is 449 feet, and the deflection is about 30 feet. On the 10th of August, 1820, the first stone was laid of the Menai Bridge, a noble monument of the scientific skill of the late Thomas Telford. In January, 1826, preparations were made for opening the bridge, and on Monday, the 30th, the mails drove over it for the first time. Shortly after, however (February 6th), a tremendous gale did considerable damage to the iron-work, and repeated gales during the spring, tended greatly to retard the necessary operations in repairs. But no inconvenience has since been felt, and there is reason to believe, that with ordinary care and attention this noble structure will last for ages.

In 1821, Captain Brown commenced the Trinity Suspension Pier at Newhaven, near Edinburgh, which consists of three spans of 209 feet each, with 14 feet deflection. He also constructed the Suspension Pier at Brighton, which consists of four openings of 255 feet each with a deflection of 18 feet.

In 1824, Mr. W. Tierney Clark commenced the Hammersmith Suspension Bridge, the first erected in the vicinity of London. The central opening has a chord-line of 422 feet, with a deflection of 29 feet 6 inches. This bridge was opened for use in 1827.

Was opened for use in 1027. In 1828, Captain Brown commenced a large suspension bridge over the South Esk, at Montrose, the chord-line of which is 432 feet, and each chain extends 115 feet from the centre of the tower to the farthest end of the chamber of masonry, in which its end is secured.

After the completion of the Menai Bridge, others on the suspension principle began to be universally adopted throughout Europe, but it was not till iron-wires had been proved to be more firm than bars of a greater thickness, that these bridges received their most extensive apnlications.

plications. Since 1821, Messrs. Sequin have constructed more than fifty wire-bridges in France with great success.

In a recent number of the *Pittsburgh Chronicle*, is the following account of a suspension wire bridge, now being constructed over the Alleghany :---

The suspension ropes, which extend from pier to pier in the form of an inverted arch, are to consist of seven strands of wire, each strand being about 3 inches in diameter. The ropes will then be wrapped in annealed wire (No 14) which will render it one solid mass, and as each individual wire is varnished before it is put across, and as the whole will be painted when finished and wrapped, it will be impervious to water, and consequently not liable to be weakened or impaired by the weather. On these two immense wire ropes the structure is to be suspended. But this is not the only reliance for strength. The trunk is to be constructed from pier to pier—the sides being of solid lattice-work — that is, strong beams placed in this form—XXX. The beams are to be placed contiguous to each other for greater strength, so that when finished the trunk alone, without the wireropes, will be a firm and strong structure, capable not only of sustaining its own weight, but also of bearing up as much additional work as a lattice-work bridge without arches. The ropes being suspended across strong stone towers placed upon the piers, are in fact, inverted arches, capable of sustaining more than double the additional weight which the letting in of the water would place upon the trunk; the trunk itself is an independent, strong, and immovable structure, so that when

THE BUILDER.

finished the aqueduct will not be liable to be moved either from the swell of water or the effect of storms. The wires are carried across effect of storms. The wires are carried across the river, from one pier to another, by a wheel which traverses the whole distance upon ropes, unbinding the wire from the reels as it goes. The ropes are moved by horse-power. The splices of the wire are made by placing the two ends together and winding them with fine annealed wire, and it is done so strongly, that sufficient force will break the wire, but will not affect the splice. affect the splice.

THE BRITISH ARCHÆOLOGICAL ASSOCIATION.

MATTERS at present remain in statu quo, but we understand efforts are about being made to effect a junction of the two parties; we heartily wish success to the endeavour.

Relative to the account we gave of the un-fortunate dissensions in the committee (p. 170

been the first to have objected to it, that in justice to myself, your words 'trumpery, wind-bag, and sputter,' are very incorrect represen-tations of my purity of motive and mildness of manner towards Mr. Wright, when, on De-cember 11th I 'suggested that the detailed account of the proceedings of the association at Contachury, beaut to be given in the Arahm at Canterbury about to be given in the Archæ-ological Album (a new periodical to be edited by Mr. Wright) should be prefaced by a statement that such account is unauthorized by this committee,' and I beg to inform you, Sir, that to prove that there was no 'trumpery' (tromperie — deceit) on my part in so doing, I had previously told Mr. Wright by letter, that I 'considered it (' the Album') a kind of poaching on the manor of the committee, and should call their attention to it;' and, moreover, that the president on that day publicly and in a letter soon afterwards sent from his lordship to me privately, said, 'I cannot but consider that your conduct is invariably based upon a conviction that the principles upon which you

Allow me now to say a few words on your observations. The 'great faults' were our not having any laws to guide us but those of honour.

If on the minority's side are the two first founders of the association, the two next founders, myself and Mr. Way—who is certainly the most influential founder in every respect, and also one of the honorary secretarieson the majority's side.

I fear, however, that from the rash and illegal proceedings of Mr. Pettigrew's meeting in Leicester-square, that his minority branch can never be rejoined to the majority of the comité. But neither, therefore, are its objects 'wrecked' nor have 'some of the authorities at Winchester' refused their assistance at the conwinchester' refused their assistance at the con-templated meeting there in September, of the majority's party, for on the contrary, from the town clerk to the dean, every gentleman connected with that city and its cathedral has subscribed his money and hearty interest towards the said meeting. And though some members of the sub-

And though some members of the association may now be perplexed, and imprecase 'a plague on both our houses,' and others have been seduced by the activity and cleverness of the minority to go astray, very many are re-turning to their old fold, so that I have no doubt that your 'tangled web' will soon be un-ravelled, and that even in your estimation will raveiled, and that even in your estimation with again shine forth as untarnished as ever (and I hope surmounted with the union flag), your so called 'trumpery Peg.' Yours, dear Mr. Editor, most truly, W. BROMET, M.D.'

Our good friend, the writer of the above letter, will see, on reconsideration of the article in question, that the terms to which he objects do not apply to himself or any other indi-vidual, but to the proceedings generally which caused the quarrel, and that we see no reason for designating them by any more dignified words than those we have used. Our statement, however, is before the public, and they can judge for themselves : its correctness has been admitted by partisans on both sides, and

the Doctor himself does not offer the slightest contradiction to it, excepting as to our asser-tion that some of the authorities at Win-chester have refused their assistance at the contemplated meeting there, and this, we fear, will be found quite true notwithstanding the denial. It is stated by persons in whom we have perfect confidence, that the other party have actually received pressing invitations to meet at Winchester; and we mention it simply as shewing how likely it is that the interests of the association will suffer if a coalition be not effected before the proposed meeting is held.

NEW SOCIETY OF PAINTERS IN WATER COLOURS.

On Saturday last, we attended the private view of the eleventh exhibition of this society, view of the eleventh exhibition of this society, previous to its being thrown open to the public, and perceived with gratification that it had not degenerated from its usual ex-cellence. There are not so many large pictures, which is accounted for by the small degree of patronage bestowed on this branch of art. There is great improvement in the choice of subjects (half the battle by-the-by), and four milk maids and fewer milk-maids, plough-boys, and the

like, than are sometimes seen. Our attention was at once attracted by the Our attention was at once attracted by the gorgeous colouring of No. 81, by L. Haghe, "Ferdinand visiting Rubens at Antwerp," which is almost equal to that great colourist himself. The drapery of Ferdinand, yellow and crimson, contrasted by the light blue scarf, tells most forcibly by the side of the soberly-clad Rubens. This drawing is on the whole a triumph, and merits the greatest compliment we can pay to Mr. Haghe. Mr. Warren's nicture "The Crusader's

Mr. Warren's picture, "The Crusader's first sight of Jerusalem," is of the highest class, and full of beauties, but wants in parts this artist's usual depth. A certain filmsy transparency about some of the figures may be considered questionable.

be considered questionable. A palpable instance of improvement is No. 61, "The Prisoner of Gisors," by E. H. Wehnert; the conception of which is re-markably fine. There is a solemnity of tone about it suitable to the story, which is un-exceptionably treated, and the work altogether is worthy of the subject. It is one of the cleverest pictures in the gallery. "Bianca and Lucentio," by the same artist, is originally treated, but will not sustain a comparison with the former. No. 244, from "Le Juif Errant," is by E. Corbould. The horse is well drawn and coloured, more particularly the head, also the veteran soldier; but we cannot say the same of the young ladies.

the young ladies. Mr. Absolon's "Judgment of Midas" is Mr. Absolon's "Judgment of Midas" is a careful drawing, beautifully finished. The two girls on the left-hand side are truly ex-quisite, and will enhance the artist's reputation. Mr. Kearney's picture of "John Knox and Mary Queen of Scotts," is weak and insipid. Mr. Duncan has produced a gem in his (No. 194) "Shrimpers." The effect of the sun is managed most marvellously. "Sheep-washing" (212), is another beau-tiful specimen.

tiful specimen. 266. "The Ascension," by Mr. Corbould, is

266. "The Ascension," by Mr. Corbould, is a very clever little drawing, well composed. The group of cherubim that encircle the Messiah is very beautiful, and contrasts well with the depth of the apostles' draperies. "Returning from Market," and "The Gleaner," have both great merit as to drawing and colour, but are depreciated by effeminacy and wfictation of treatment

and affectation of treatment.

Absolon's pictures, (227) "From Izaak Walton," "Spring" (16), "Summer" (274), and "From the Fair Maid of Perth," need no other eulogy than that they are quite worthy

other eulogy than that they are quite worthy of the artist. "A Street in Fougéres, Brittany" (9), "Doorway, Rouen" (197), "Tower of Rouen Cathedral" (151), and "Dinant on the Meuse," are by R. K. Penson. This artist excels par-ticularly in architectural drawings, which he gcts up with boldness and skill, without the angular and crude appearance predominating in ordinary pictures of this class. 181. "The Old Gate House, Rotterdam," by G. Howse, is another excellent architectural drawing in a very different style, the whole picture made out with that remarkable clear-ness peculiarly the artist's own. The colour-

ing is warm and effective, a rich brown predo-min ating. There are many other smaller productions of this clever painter, interiors and architectural bits, the majority of which

and arc excellent. Two pictures by H. Weigall, from Bloom-field's "Abner and the Widow," are well worthy of attention for truth and domesticity. "The Age of the Horse" (in 133) is carrectly portrayed

portrayed. "The Ring," by A. H. Taylor, is a pretty picture, but we should advise him to avoid such works as "Playmates" (125). Mr. Jenkins has considerably distinguished himself. "The Vaunt," "Light from Burns," "Jeunes Filles," "Jouant aux Gazelle," "A Sunny Moment," "La Fille de Fermier," and "Jealousy," are highly characteristic of this artist's style—original, yet somewhat affected. Among the landscapes of H. Jutsum are some lovely bits, remarkable for the coolness of shadow

lovely bits, remarkable for the coolness of shadow and decision, yet here and there overdone.

Topham has this year made rapid strides wards excellence. His style is very slight, Topham has this year made rapid struces towards excellence. His style is very slight, and the effect produced by mere washing is next to miraculous. The picture of "Pilgrims to the Holy Well," is full of truth and feeling, the posé of the girl in the immediate fore-ground easy and graceful, and the effect of the whole broad clear, and harmonious.

ground easy and graceful, and the effect of the whole broad, clear, and harmonious. No. 112, from English History, by H. P. Riviere. A work of promise. The subject, "Gregory and the Saxon Slaves." If more attention had been paid to the hands and feet, and perhaps the drawing in general, the picture would be entitled to great praise. Mr. Campion's "Waterloo" is an elabo-rate work: the distance well managed, but the action of the picture is rather monotonous. "Christians," by Aaron Pealey. A pisture of deep sentiment and impressive argument. The bead of the female is most carefully stippled up.

stippled up.

The bead of the genale is most carefully stippled up. Amongst the landscapes, we particularly noticed No. 276, by J. M. Youngman, "Dis-tant View of Malvern Hills, Departing Day," by Aaron Pealey; "A Wild pass in the vicinity of Harlech," by Thomas Lind-say; "Mayence," by J. Fahey, "The Curfew tolls the knell of parting day," by H. Ma-plestone; "Cottage near Bettws y Coed, North Wales," by David Cox, jun.; "Rising Moon from Greenwich Park," Thomas Lind-say; two of "Kenilworth Castle," by H. Warren; "Maude Castle, Aberdeenshire, sunset," by Aaron Penley; "Water Mill near Streatly," H. Maplestone; "On the River Llugwy, North Wales," David Cox, jun.; "Lochen-y-gair, Aberdeenshire," Aaron Pen-ley; and several "Garden Scenes," by G. Dodgson. The "Marine Pieces," chiefly by Robins and Callow, have great excellence.

INSTITUTION OF CIVIL ENGINEERS.

ATMOSPHERIC RAILWAYS APRIL 15th .- Sir John Rennie, President, in the chair.

The paper read was by Mr. Berkley, Associate. It consisted rather of a series of questions on the "peculiar features of the at-mospheric system," than an expression of any mospheric system," that as expression of any peculiar views on the subject; and had for its object to elicit clearer and more positive opinions of the leading members of the pro-fession upon the comparative practical advan-tages and disadvantages of the atmospheric red locamenting enters

tages and disadvantages of the atmosphere and locomotive systems. The chief points which were raised con-sisted of the mechanical difficulties in the ap-plication of the atmospheric system to level crossings and sidings, and the performing the work at the stations, &c., which, in spite of the ingenious device of the talented engineers who had adopted the system, appeared to entail considerable cost and complexity. entail considerable cost and complexity.

The advantages and economy of frequent trains on short lines were admitted, but it was stated that the same plan could be effectually practised with locomotive engines without any disadvantage or risk. For a long time the necessity and benefit of the plan was questioned.

It was shewn that greater safety did not exist even on single lines when the circum-stances were equal, and if the electric tele-graph was applied to each; in fact, that when the whole position was considered, the balance of advantage of probable freedom from ac-cident would appear to be somewhat in favour of the locomotive system.

That greater speed also had not been usually attained; or that, if attained at all, it must involve "inordinate cost."

The facility for surmounting steeper gradients was questioned, and the inference drawn, that the enormous first cost would confine the application of the atmospheric system to the same narrow limits as were occupied by other stationary systems of traction: and that it must be classed with them only as a means of overcoming lengths of such bad gradients as did not come within the limits of locomotive power, or where the lines were short, and the traffic was great, terminal, and simple.

In adverting to the cost of maintenance of the line, the comparative advantages of the two systems were examined, and it was argued that it was fallacious to compare the expense of keeping up the Dalkey line, which was excavated in rock, and resembled an "un-covered stone drain," with that of maintaining the Dablin and Kingstown Railway, which was a sea-embankment stretching across a part of the bay, and on which the passage of the trains was not unfrequently stopped by the inroad of the waves.

A careful examination was entered into of the difficulty of removing the earth from slips, or doing any of the usual quantity of contractors' work on the line without having recourse to locomotive power; on this point the observation of Monsieur Legrand, the French Minister of Public Works, might be quoted. On his return from inspecting the Dalkey Railway, he said that there could not be any doubts of the applicability of the atmospheric system to some positions, and probably with advantage; "mais après tout il fallait avouer ce n'etait pas un cheval à la main, comme la machine locomotive."

Numerous other points were strongly in-sisted upon: Mr. Robert Stephenson's report was frequently referred to and quoted, and the most eminent engineers were called upon, whether they had adopted or rejected the system, to give the facts and arguments by which their decision had been influenced.

In the discussion which ensued, the theory propounded by Dr. Robinson in his recent exa mination before the Parliamentary Atmospheric mination before the Parliamentury Atmospheric Railway Committee, that "a steady uniform height of barometer had nothing to say to the velocity," or did not indicate, as Mr. Stephen-son had stated in his report, "a maximum eniform velocity," was examined, and it was generally admitted that the case which he proposed, in illustration of his theory, was prac-tically impossible, and was entirely irrelevant to the subject. The supposition of the exto the subject. The supposition of the ex-istence of a perfect vaccuum in front of the piston would entirely throw aside the question of the uniform action of the machinery, with an accelerating motion of the train, which, it was shewn, must produce an unsteady height of the barometer, the condition of a steady height could not exist unless both the power of the resistances due to the velocity were either equally irregular as regular; in either case an exact balance being maintained.

In Mr. Stephenson's experiments at the Dalkey Railway, the circumstances of regular power and steady height of the barometer were shewn to exist simultaneously, and the inevitable inference was that a regular uniform maximum velocity was attained. Dr. Robinson's case was allowed to have been stated only for the sake of argument before the com-mittee, but a practical inconsistency in Mr. Stephenson's experiments of a steady height of barometer with a slight accelerating velocity, was put forward as condemnatory of his report, on the supposition that it was more practicable to note correctly the velocity of the train than to observe the indication of the barometer, and that the true reason for this slight acceleration was the shortness of the Dalkey line, and that hence no accurate result could be arrived at.

The question of the loss arising from the evolution of caloric in the air-pump due to the condensation of the air, from its rarified condition in the tube to the density of the atmosphere was considered, and was generally admitted to be at least as great as had been stated by Mr. Bergin in the discussion of the subject during the last session.

The further discussion of the question was adjourned until Tuesday evening, the 22nd iest.

THE EVILS OF INTERMENT IN TOWNS.

WE mentioned in page 173 that the House of Commons had come to the resolution that the practice of interment in large cities is injurious to the health of the population, and demands the attention of Parliament. The following is a summary of the discussion which preceded it

Mr. Mackinnon stated that three years ago, when he first brought forward this subject in Parliament, he had been met with jeers and laughter, and a statement that his notions were quite absurd. There had been a great change of opinion since that time; and a strong feeling now pervaded the country that there was a paramount necessity for making some alteration in our laws with respect to interment. He then referred to the fact that three commissions had been appointed by the Go-vernment, and that one committee had been appointed by the House of Commons, to inquire into this subject, and read extracts from the different reports which they had presented, for the purpose of shewing that they had all been of opinion that the practice of interment within the walls of large towns was most injurious to the health of the public. He read a letter which he had received from Mr. Brace, of Surrey-street, Strand, containing some startling particulars as to the abominations of Enon Chapel, and told the House, that if it were of opinion that such a plague spot should continue in the centre of the metropolis, it would be difficult for it to justify its conduct. There was no other civilized nation in the world in which this practice of interment within the precincts of large towns continued to exist; and he thought it a most disgraceful circumstance that we should persist in a practice so abhorrent to human nature as to bury the dead in the midst of the living.

Sir James Graham said he was aware how closely the subject was connected with the feelings of the humblest classes of the communetwide the number classes of the commu-nity, and therefore it was that he paused before he legislated on it. The example of foreign countries on this point was inapplicable to our own; for there various artificial means to facilitate the decomposition of dead bodies were employed, which would not be permitted It was a difficult thing to say that a here. man should not be buried where his relations were buried before him; and any legislative measure which should be founded on such an interdict would interfere with warm feelings which ought not to be hastily violated. He looked upon it as a gross exaggeration to say that our practice of interment in our large towns was abhorrent to human nature and made foreigners view us as savages and barbarians. He knew that the practice was said to be incompatible with the public health; but he could scarcely believe the assertion to be well founded, when he reflected that there was no other metropolis in the world in which the state of the public health was so satisfactory as it was in London. He demurred to the assertion that health was endangered by residence near a churchyard, and told the house that the Bishop of London had resided for some years in Bishopsgate-churchyard, and had informed him that he and his large family had never enjoyed better health than they did during their residence in that spot. Mr. Mackinnon had complained of the inde-cent proceedings in Spatields. He had ordered a proceedings in the commenced sprains the a prosecution to be commenced against the parties concerned in them; and if the facts were proved, he had no doubt that the law would be able to grapple both with the offence and with the offenders. So, too, in the case of Enon Chapel, which appeared a very fit case for further inquiry. He was afraid that if the House proceeded to put a stop to these proceedings, and also to the practice of intermural interment by any very stringent enactment, public feeling would be strongly excited against it. He did not assert that this subject might not hereafter come under the purview of the Council of Health; but he had carefully abstained from placing it under their jurisdic tion in the first instance, lest prejudice should be created against the council by its having such a duty assigned to it. He spoke in terms of warm approbation of Mr. Chadwick's re-port; but the proposition of that gentleman had convinced him more than any thing else of had convinced him more than any thing else of the difficulty of legislating ou this matter. He believed that the adoption of the measures re-vol. ii. p. 175.

would be generally repudiated by the country. He denied that the church was opposed to any alteration in the mode of our interments, and stated that the Bishop of London had turned his attention to the subject and intended, he believed, to introduce a measure upon it. But caution must be observed in adopting it. If he had matured a measure on the subject, he would have introduced it to Parliament; but he had not, and until he had done so, it was his duty to attend to the measures introduced by others.

Mr. Bernal thought that the Government would not be justified in postponing for more than another session a measure for curing some of the evils of the present system. He recommended Sir James Graham to close the cemeteries of the parishes of St. Clement and of St. Anne, and of some other populous parishes in the metropolis, as such a measure would be productive of the greatest benefit to the working classes.

Dr. Bowring said that Spain, Germany, France, and all the countries of the east, had removed their places of interment to a distance from their large towns, and recommended the house to follow their example. He thought that the objection to such a course rested on the fees which the clergy would lose if such a proposition were adopted, and advised the house to buy off their opposition by granting them an adequate compensation.

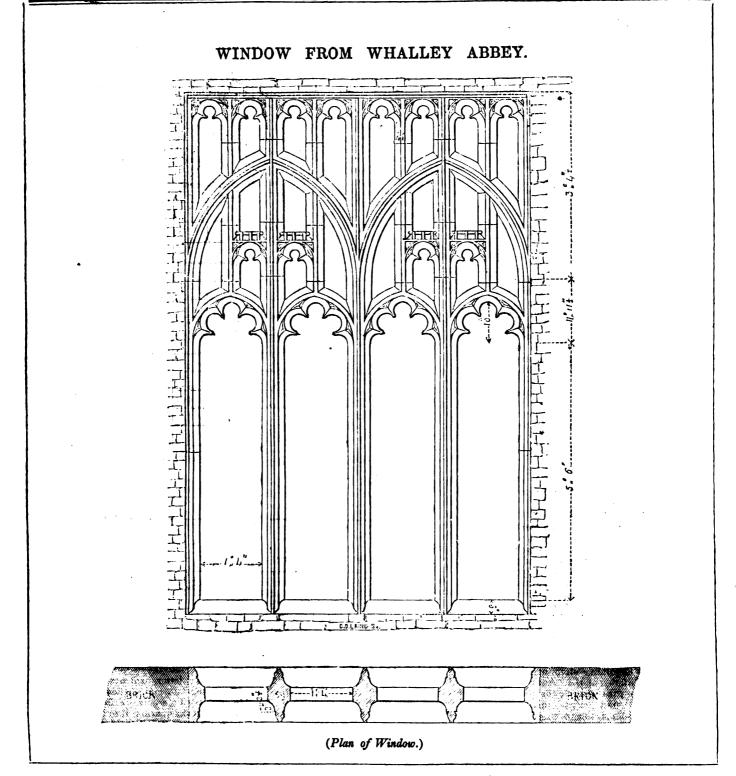

Lord Mahon, after making reference to his having been a member of the committee appointed to examine into this subject, said that it appeared to him that Sir James Graham had not exaggerated the difficulty of this subject, but that he had greatly underrated its importance. No question was more es-sential to the health of large towns than that which Mr. Mackinnon had that evening laid before the house. The Government was pre-paring measures for the better ventilation and draining of large towns; but those measures were but trifles in comparison with that referred to by Mr. Mackinnon. Of what avail would any measures for the better ven-tilation of a large town be if the air passed through the miasma of crowded churchyards? And of what avail would any measure for its better drainage be, if the water which flowed through the streets were tainted with the drippings and distillations from buried corpses l

The Earl of Lincoln pressed upon the attention of the House the necessity of considering all the difficulties which attended legislation upon this subject. He believed that the feelings of the poor would be found opposed to any plan for removing the place of burial to any distance from their towns and villages.

Sir R. Inglis said that the difficulties with which they were met in attempting to legislate upon this subject arose from the neglect with which the religious polity of England had been treated by every Government for the last century. The remedy was to be found in the extension of the parochial system for the living, and also in its extension for the dead. He thought that parishes ought to be empowered to join and purchase burial-grounds for the poor.

Sir James Graham in addressing the House a second time attempted to shew that the remedies which had been proposed for the pre-sent system, and which were founded on the practice of foreign countries, were most of them inapplicable to the present state of society in this country. He thought that it would not be impossible to get over the difficuliies of the clergy on this subject; but it, perhaps, would not be so easy to overcome the objections of the Dissenting clergymen, who had burialgrounds attached to their chapels, and who derived from them a benefit which they shared in common with the rest of their congregation. He would gladly aid any member who would bring forward a bill upon this subject; but he had stated to the House the difficulties which environed any legislation upon it, and he confessed that he did not know how to remove them.

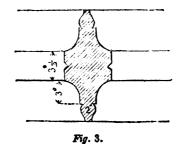

BUILDER. THE

WINDOW FROM WHALLEY ABBEY.

S1R,—As there have been through the medium of your highly-valuable journal many delineations of beautiful and interesting remedium of your highly-valuable journal many delineations of beautiful and interesting re-mains of ancient architecture of this country, I as one, who feel interested in the study of such, have ventured to send the enclosed sketch from Higher Hall, Samlesbury, which is about five miles east-north-east from Preston, and is the property of F. R. Gall Braddyll, Esq., of Cowishead Priory, near Ulverston. This hall formerly belonged to the South-worths' family, and was erected between the years 1532 and 1545, by Sir Thomas. The chapel, or south end, possesses a window, brought from Whalley Abbey, of which the above sketch is a representation. The inside of the hall contains richly-moulded beams and rafters of oak; the joists lie parallel to the beams, as if disdaining their support. There is a very good chinney-piece in the kitchen, bearing the date of 1545, with escutcheons and foliated work. The brick-work is one of the earliest specimens in the whole manor of Samlesbury. Several heads in panels did occur, but many of them have been carried off piecemeal. The principal part of this hall consists of framed timber-work, of which there are many specimens in this country. vork, of which there are many specimens in this country.

Figures 1 and 2, shewing the elevation of the window and plan, are drawn on a scale of

half an inch to a foot. And figure 3, shewing the mullion at large, is on a scale of one inch G. P. to a foot. Preston.

STIR IN THE SOCIETY OF ANTIQUARIES.

A FBELING of dissatisfaction with the mode

members, and the result will be, unless they become wise in time, a sweeping and whole-sale reform from without, which might have been altogether avoided by timely concession and a little judicious alteration.

At the anaiversary meeting, held on Wed-nesday last, it was manifest that the great majority of the members entertained but one opinion : every Fellow who spoke said the same thing, and if those who guide the helm shut their eves wilfully to the state of things, they must be presented for the concentrations. they must be prepared for the consequences. Dr. Henderson asserted from his own expe-

rience that the recommendation of members ruled by some invisible power beyond the council. That the object was, to elect as many inactive members as possible, and that if a member shewed any desire to move in the efficiency of the society was affairs of the society, he was cashiered at the end of the year, and never elected again. Mr. Wansey alluded to the growth of other so-cieties in consequence of the inactivity of the Society of Antiquaries. The conduct of the president was commented on, and it was shewn A FRELING of dissatisfaction with the mode in which the business of the Society of Anti-quaries is carried on, has been long growing up, and has now reached such a point, that it exhibits itself on every occasion which offers. By some strange fatality, observable in mightier governments, the ruling powers shew no disposition to meet the wishes of the president was commented on, and it was shewn entered the rooms. The Bev. Joseph Hunter said, the present meeting afforded proof of the want of proper officers, for there was neither president nor a vice-president to take the chair. Dr. Lee even went so far as to move a

Chair. Dr. Lee even went so nar as to move a vote of censure, but this was not seconded. At the dinner afterwards, the intensest dull-ness reigned,—there seemed to be a wet blanket over all, and men who are often eloquent, simply stammered out a few common-places. With a sincere desire to see the Society of Antiquaries renew its youth, and the greatest respect for those connected with its manage-ment, we earnestly invite the new council to apply themselves vigorously to the task of improvement.

WINDOW FROM ASH CHURCH, IN KENT.

THE parish church of Ash is situated on the main road from Canterbury to Sandwich, and is dedicated to St. Nicholas. It contains several ancient and interesting monuments of good design and workmanship, and some brasses.

Drasses. The window represented by our engraving is at the east end of the north aisle of the church. It is 15 feet 6 inches high, and 10 feet 5 inches wide, and consists of four lights, each

5 inches wide, and consists of four lights, each 2 feet 2 inches wide. Fig. B is the plan of the window, and fig. A gives the section of the rereal, and label or hood-moulding, at large. The window has at first sight a perpen-dicular character, but an examination shews that it is a good though singular specimen of decorated work, and belongs to the 14th cen-tury.

tury. The roll-moulding forming the label is almost peculiar to the decorative style. Mr. Caveler, by whom the window was

measured and drawn, remarks that it is now in a very ruinous condition, and that much injury has been done elsewhere in the church by injudicious repairers.

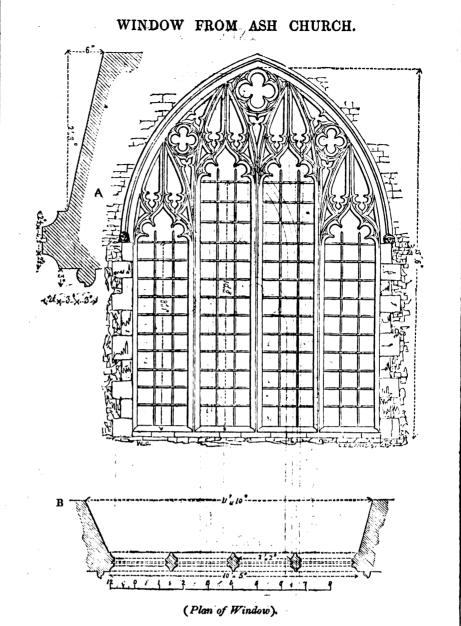

NOTES ON COMPETITIONS.

CLIFTON UNION WORKHOUSE.

CLIPTON UNION WORKHOUSE. SIR,—The letter from your correspondent, "A Guardian," respecting the affair in which he took part, whereby at least 1,000*l*. have been dishonestly extracted from the pockets of those who can ill afford to lose it, necessarily calls for some remarks, and although he may be personally a most estimable man in his voca-tion as a malter, I submit that the board must be sadly in want of "A Guardian," to leave its defence in such hands. In the first place, it is desirable to state that the union in place, it is desirable to state that the union in question, although named after a rich parish, includes within its bounds many of the out-parishes of the adjoining city, which are inhabited by multitudes of the lowest orders, pitmen, colliers, &c., the board is consequently composed of a heterogeneous mixture of gentlemen who seldom attend because they are outroted, and a phalanx of men, a grade above their constituents in education, who old motto of "union is strength." The board consists of forty-eight guardians; bat for the purpose of the sham competition, a committee, a select serves, were appointed, three or four of whom, from their station in life, were, as Mr. Allom says, above the sus-picion of doing any thing; but there were also amongst them three friends of the stronger place, it is desirable to state that the union in

cessful competitor, to when the stronger remark of Mr. Allom will apply, of dropping in the mixture one or two shrewd, clever, but not over-scrupulous follows," &c. &c.

As to the successful design, it was well known in the neighbourhood that it had been concocting, making, and remaking, in the office of the owner, for very many months, during which time it was being constantly seen by individual members of the board, by whose advice and at whose suggestions innumerable alterations were made in it (my informant told me he was present when three of them were there was present when three of them were there giving advice); and indeed to such a gross extent was this partiality for their bantling carried, that it was taken to a board-meeting, and an attempt was made to get it chosen by the guardians *a few* days only before the advertisement appeared in the newspaper for designs; this trick was for the time prevented by the clause in the Poor Law Act which by the clause in the Poor Law Act, which requires all things to be publicly advertised for. So much for the probability of a fair election. No pretension is made as to forming a opinion on the cost or merits of the success-

ful design; but a professional man who has seen it has stated that it could not be built for less than 30 per cent. above the estimated cost; and as to its merits, the building, if not a disgrace, will not be a credit to the guardians.

dians. Having occupied so much of your valuable space, I will briefly allude to the sarcasms of Mr. Allom on the local architects, by agreeing with a "Guardian," that he, at all events, ought to be thankful, as the second premium was awarded to him by the three or four gen-tlemen above suspicion, on account of the artistical and picturesque effect given to his ele-vation (a talent for doing which is peculiar to architectural draughtsmen), and not for any merit in his plans, as a "Guardian" says they were reported to be deficient in the three great requisites of "space, classification, and inspecwere reported to be deficient in the three great requisites of "space, classification, and inspec-tion." If this is a fact, premium the second was unfairly given, and the architect who assisted in the selection must have toadied his betters, instead of expressing an opinion contrary to his personal interests.

contrary to his personal interests. With respect to the owner of the successful design, I will simply say that he lived, until within the last year, in the midst of the guardians, inhabiting the out parishes above alluded to, and with whom he was connected, encouraged, or employed, and that he is not an architect by education or by professional mention practice.

After entering so fully into the facts of this gross, but well-bolstered up job, I beg to add that if any man should again spend his money in seeking for public employment in public competition, he will deserve the unjust treatment which he is sure to get.

I am, Sir, &c.,

A SUBSCRIBER FROM NO. I. April 16, 1845.

CLIFTON UNION.

SIR,-My letter, which you published respecting the late competition for the Clifton Union, has, I perceive, called forth a reply from one of the guardians, in which the writer admits the report of the architect consulted to be most favourable to my plan, but states that I had omitted to name two important features expressed in the opinion (viz.), a deficiency of space, at a greater cost than that of the resi-dent and successful competitor.

dent and successful competitor. These are, indeed, most important fea-tures, and, if founded in fact, quite sufficient to justify these worthy gentlemen in congratu-lating themselves on the actual possession of an architect capable of astonishing us poor Londoners; he might have added, that I was in attendance to prove the correctness of my estimate had a hint been thrown out that it was eloubted and L did prove in the presence of doubted; and I did prove, in the presence of the board, that in the dormitories alone no less the board, that in the dormitories alone ho less a space than 6,250 square feet was omitted in their calculations; shewing, beyond dispute, that every class had, according to their own data, the space required. But it is not to speak of myself, or of my doep held scheme for signing the square the

deep-laid schemes for giving the paupers the best possible ventilation at the least possible cost, that I now trouble you with this communication; it is for the purpose of making the numerous competitors conscious of the measure of justice they have had from this tribunal,— the high consideration in which they have been held as scientific men pursuing and practising the most useful and noble of the arts,--the the most useful and noble of the arts,—the courtesy which has been extended to them as gentlemen confiding in the honour of those into whose hands they intrusted their pro-perty,—the thanks voted (and publicly adver-tized) to those professional gentlemen who have thus nobly spent their thousand pounds in the

Digitized by Google

199

endeavour to help the union out of its difficulties; true it is, their difficulties appear to have been of a somewhat imaginary character, considering they were already in possession of the required assistance; but having thus called forth the energies of the profession, the board has determined to do the thing handsomely, and, if they cannot return them their money, will give them their thanks.

It is observed by this guardian of their honour, as well as of their poor, "that of all the architects who sent in plans, Mr. Allom has the least cause to complain." How distressing to witness the ingratitude of mankind ! After selecting me as the object of their muni-After selecting me as the object of their mani-ficient gratuity of twenty-five guineas, leaving the other luckless twenty-nine with nothing but their thanks, to think that the individual whom they have thus honoured should persist in believing this money well spent in prying into their proceedings; every one will allow, that to stand up and be popped at with one's own powder cannot be a pleasant thing. I reall blush when I reflect on my conduct.

" But,' cries one of the luckless twentynine, "if their choice has fallen on this acme of perfection in the shape of classification, in-spection, and space, why don't they shew it? Why is the light of their architect thus hidden from us; is he about to patent the invention and afraid that his ideas should be stolen." Oh no, my dear sir; listen to the long and the short of it.

I made a pilgrimage to that classic spot called Clifton Workbrouse, Pennywell Road, Bristol,—you all know the address, and it will no doubt dwell in your memories. I went for the sole purpose of being enlightened on this very point; but here let me whisper that you have not been dealing with grocers and cheese-mongers, whom by courtesy you call gentle-men when in office, but whom you never expect to act as such either in or out of it. No, no. I was told that these were the real and genuine sort : men who had been to school, and been taught manners; and some there were among them rejoicing in the proud title of patrons of the fine arts. Then was I glad; for I thought that no foul thing dare shew itself among such men; and with that I presented my petition.

Now, to those who are of a philosophic turn of mind, it will probably appear an easy task to explain the cause of the following effect.

Oliver Twist asking for more, never raised such a storm of virtuous indignation among the authorities of his workhouse, as burst forth from certain members of the board at the Clifton union when the simple request to see the successful design was made known to them; it is scarcely necessary to add that, astonished and confounded, scarcely knowing if a certain projecture of my own face was not lost in the harpness of the contact, I returned with knowledge just as extensive regarding the object of my visit as at the outset of my journey, and having subsequently forwarded a letter, in which it was suggested that you might possibly consider yourselves entitled to a greater amount of good manners than was commonly conceded to paupers, an advertisement did appear a few days back in the *Times* newspaper, stating that a Bristol architect had carried off the palm, and that you might send for your THINGS; but, as a warning to all rebellious competitors for the future, it was agreed not to name the indi-vidual who carried off the premium.

I trust, therefore, that my professional breth-ren will no longer knock their heads together under the idea that their brains have been sucked by these worthies, but rather ascribe the above phenomenon to the air of the place in which they were congregated; and I ear-nestly wish them the enjoyment of a climate so congenial to their tastes, and a habitation so fitted for their deserts. Apologising to you, Mr. Editor, for taking up so much of your space,-1 am, Sir, &c.,

THOMAS ALLON.

14, Hart-street, Bloomsbury-square, April 16th.

*** Another correspondent on this matter, wishes to know why the twenty-nine compe titors have not had their designs returned, nor any official announcement of the decision, although several weeks have elapsed since Mr. Allom's first letter appeared. The same writer thinks the letter of "A Guardian" was intended to shew that Mr. Allom was also a favoured competitor, but he does not establish his position.

COUNTY LUNATIC ASYLUM FOR SOMERSET.

SIR,-I venture again to address you on the subject of the County Lunatic Asylum for Somerset. I have waited patiently in hopes that some of your numerous readers might have obtained information respecting the decision of the visiting magistrates, and have done me, and the rest of the competitors, the favour to communicate the same through the medium of your journal; but from their silence, I must presume that all is still in darkness.

I have had some thought of waiting on the county members to solicit the required infor-mation, and should have done so long ago, could I have obtained the sentiments or names of any of the disappointed competitors; but perhaps there are none but myself that have been weak enough to believe in the honour and integrity of county magistrates, so I will con-clude with—Oh! you blessed ministers above, keep me in patience, and, with ripened time, unfold the evil which is here wrapped up in countenance.

Though an humble individual, I am ready to unite in the adoption of any plan that may be suggested likely to effect a better state of competition, and would devote may time and best energies in the cause.

I again call on the profession to act with vigour, and not to waste their time in writing their own particular cases, which apply only to things gone by, and inform and enlighten all those who may require the future aid of architects how to obtain it without a fee. I am of opinion that all the exposure and satire that can be brought to bear on committees who act with want of judgment or partiality will never effect the reform required. A combina-tion with architects is what is required! is there no person in the profession with public spirit enough to offer the gratuitous use of his chambers for a meeting to discuss the subject? I am, Sir, &c.,

A SUBSCRIBER TO YOUR WORK.

COMPETITIONS GENERALLY.

SIR,--Much has been written and appeared in the pages of your journal upon the subject of architectural competition, and many sug-gestions have been made with the view of correcting the evil universally acknowledged to exist, but not any appear to me worthy of adoption. In my opinion, the fault rests en-tirely with architects themselves, for as long as persons in the profession are found weak and foolish enough to enter into competitions as at present conducted, and waste their time and money in such fruitless enterprises, they richly merit the treatment they frequently experience. In those cases that have been brought before the public, through the laud-able instrumentality of your journal, it has generally appeared that some favoured one has been deputed to carry out the work after inspecting and studying the designs, &c., so kindly and gratuitously forwarded by his more intelligent and enlightened brethren, during his pleasure, or until he has acquired sufficient information to be enabled to perfect and mature his own plan. The plan adopted at the Reading competition seems to me to be open to objections, or rather adds to the evil than otherwise, even if every competitor would attend, for I imagine few would feel disposed to travel far at a further expenditure of time and money, merely for the purpose of selecting the best design; nor do I think the competitors themselves are the most competent parties to do so, as they would enter upon the matter with peculiar crude notions of their own, imbibed during the execution of their designs. The present system of competition is conducted upon very ridiculous and erroneous principles, for the board, or committee of management, that have to select the best and most suitable design are generally composed of very heterogeneous materials, country gentlemen, merchants, tradesmen, &c., who, as a matter of course, have little or no knowledge of practical architecture, and are therefore totally incompetent to enter into the various merits of the designs submitted to them, and so decide impartially, as it often happens, if no favourite is in the way,-that look more at the pictorial effect of the they drawings, then their real and sterling archi-chitectural merits. It may be urged by those favourable to the present system, that it is the means of drawing out latent talent, but, on the other hand, I beg to observe

that it also brings into the same arena incompetent pretenders, as alluded to by "A Looker-On" in your last number, and this at once accounts for the frequent failures and accidents we repeatedly hear of in the construction of buildings, both public and private, in this country. If this system of competition continues, I would suggest the If this system of propriety of the designs being submitted for the decision of the Royal Institute of British Architects, or a committee composed of that honourable body, as the most competent tri-bunal, and their decision should not be gratuitous, but upon payment of certain fees; this would insure the selection of the best design; and, as it would be tempered with justice and impartiality, our most able and talented men would think it worth their while to compete. In the same way, engineering works might be submitted for the decision of the Institute of Civil Engineers, and no architect or engineer ought, in justice to himself or the profession, to compete unless the promoters of the scheme would consent to such an arrangement. This would also be the means of still further extending the usefulness of these institutions.

Building competitions are also very erro-neously and unfairly conducted. I think the system adopted by the Board of Ordnance appears to be founded on the principles of justice and equity; if work is to be well and properly executed, it is evident we ought to pay an adequate price for it, so that builders may be fairly remunerated for their labour; I therefore think all building work should be contracted for at an equitable schedule of prices, subject to the fluctuations of the market prices, subject to the fluctuations of the market prices, subject to the fluctuations of the market measured and paid for accordingly; this would check the spirit of reckless competition now too prevalent, every party would receive the full value for his labours, and work would be efficiently and substantially constructed, which is not the case at present.

B. BAYLIS.

ł

WORKS IN THE PROVINCES.

Brecon.

At the Bedfordsbire Quarter Sessions, which commenced on Thursday week, on the motion of Lord St. John, it was determined to postpone for one year the proposed alterations in the county prisons, the estimated expense of which amounts to 20,0004

The committee for the foundation of new parks in Manchester have purchased Lark-hill near Pendleton, the late residence of W. Garnext, Esq. The purchase includes an area of seven acres, and the price asked by Mr. Gar-nett was 5,000*l*, but he ultimately accepted 4,500*l*, desiring the committee to consider the difference of 500*l*. as his contribution to the public parks. Lark-hill was erected at a cost public parks. Lark-hill was erected at a cost of 10,000*l*. The subscription in Manchester for public walks, parks, and wash-houses, had last Saturday reached the sum of 30,3207.19s. 11d.

The contemplated improvements of the River Dun Companyare said to be proceeding very satisfactorily. About seventy workmen are engaged in raising the embankment six feet higher than at present on each side of the canal from Stainforth. The quick wood fence further back, so as to allow of the present path being added to the canal. A considerable length of the embankment is already completed. The swing bridges, giving an open and uninterrupted communication to the sea, are nearly finished, and vessels with fixed masts can now come up to Doncaster without the least interruption

In Wales, several new blast furnaces are being erected, and others are in contemplation. Sir John Guest is erecting one at Dowlais, and the Neath Abbey Iron Company have com-menced building two at Cwn Neath. The spirited proprietors of the Porthcawl iron and coal works Massre Mallins and Rawlingons coal works, Messrs. Mallins and Rawlinsons, are crecting another furnace at Cofn Cwsg, together with twelve coke ovens, and a large number of workmen's cottages. At Coed-y Garth and Llwydarth, three new furnaces, coke ovens, blast engine, workmen's cottages, &c., are in the course of crection.

At Porthcawl, near Swansea, the Llynvi Iron Company have commenced building a new furnace, forge, and revolving mills at their works.

A marble mural tablet has been recently placed in Hanley Castle Church, near Uptonupon-Severn, to the memory of the Rev. George Turbeville, upwards of fifty years vicar and resident of that parish. This tribute of respect has been erected at the expense of the Hon. Gen. H. B. Lygon, M.P.

The foundation-stone of the intended church in the new district of St. John, in the parish of Wednesbury, was laid by Lady Emily Foley, on Thursday week. The site of this intended church was given, together with a donation of 510*l*., by Samuel Addison, Esq. The edifice will contain one thousand sittings, one-half of which will be free. It will be in the early English style of architecture, having a capacious and lofty nave, with ornamental timbered roof.

bered roof. The contractors of the Lancaster and Carlisle Railway, Messrs. Stephenson and Co., have undertaken the execution of the Caledonian line, as well as the Kendal and Windermere Railway. These gentlemen have on hand railway work nearly 350 miles in extent.

The Earl of Falmouth has contributed 504, and Lady Bassett a donation of 1004, to the local fund for the extension and improvement of the Penryn Docks and Falmouth Herbour

of the Penryn Docks and Falmouth Harbour. Earl Talbot, the Hon. R. Curzon, and Sir George Chetwynd, Bart., have contributed liberal donations towards the rebuilding of the ancient parish church of Armytage, Staffordshire, which has become much dilapidated by the course of time. At the Essex Quarter Sessions, held last

At the Essex Quarter Sessions, held last week, it was determined that the proposed extensive alteration of Springfield Gaol should be carried into effect; that the buildings be executed by contract; and that the money required for the purpose be raised on security of the county rates, to be repaid in thirty years, and borrowed in separate sums, as the committee may recommend. The estimates amounted altogether to 32,5844.

At Sudbury, the sutherities, with the view of improving the town by their removal, have lately purchased two heuses, for which the sum of 2,5801. was paid. It is now some years since the commissioners under the former Act made the first purchase, amounting to 3001, with the faint hope that ultimately the whole of the houses, ten in number, then surrounding the church of St. Peter, might be purchased, and taken down. This desirable object, as far as relates to the purchase, is now completed. The contemplated improvements, if carried out, will prove highly ornamental to the place. At the Warwickshire Easter Sessions, held last week, a report from the committee on county prisons was presented. It appears that having examined and considered the five several plans for altering and improving the county prisons suggested to the Court at the last sessions, they came to a unanimous opinion in favour of adoping the one submitted by Major Jebb, for an entirely new gaol for the whole county, to be erected outside of the town of Warwick, but as near thereto as a convenient site may be found. On the motion of Lord Brooke, it was resolved to take the subject into further consideration at the next sessions.

At Weston-super-Mare a new pier is about to be erected after the design of Mr. Horwood, of Bristol. It is proposed to carry the pier out with solid masonry a distance of 396 feet; the roadway or surface being 17 feet wide, and at the end to extend it on either side, so as to form a promenade of 100 feet in length, and affording at its back a shelter to vessels in all weathers. At the end of 396 feet from the main land the pier will terminate, but a slip will be continued, extending in the same direction to several feet below dead low-water mark, and on which a landing can be effected at any time. Towards the carrying the design into execution John Hugh Smyth Pigott, Esq., the lord of the manor, makes a noble gift of whatever land may be wanting for the object, an unbounded supply of stone, such timber as the hill will afford, and will take shares in the undertaking to the amount of 1,000*l*.; Mr. Synge, Mr. Pavies, Mr. Chalmers, Mr. Edgar, Mr. W. Cox, Mr. R. Parsley, and other gentlemen of the committee, will also take shares to the amount of 2,000*l*. more.

At Eastover, near Bridgwater, the new church of St. John the Baptist was opened hast Wednesday week by licence from the

bishop, the Ecclesiastical Commissioners being unable to make an immediate grant towards the endowment. Drawings of this church (which was designed and executed by Mr. Brown, of Norwich) have been selected for publication by the Church Building Society. as a favourable example of modern church architecture.

At Lynn, the foundations of a new church having been completed, the ceremony of laying the first stone was to have taken place yesterday, the Bishop of the Diocese officiating.

The Learnington Courier states that there is every probability of a Tennis Court being soon erected in that town. The cost of erection is estimated at 1,600*l*, and the number of shares already taken amount to 1,300*l*, the subscribers including Lord Leigh, Lord Brooke, Lord Howth, Lord Guernsey, Lord Lewisham, Sir C. Douglas, M.P., Dr. Jephson, and many other visitors and residents of distinction.

At Southend, the pier is fast approaching completion, it will be ready for opening by the middle of July. The old light-house has been swept away, not by the tide but by the hand of the improver, and the piles are all driven and the lower platform prepared for a convenient pier head.

The column about to be erected in Holkham Park, to the memory of the Right Hon. Thomas William Coke, Earl of Leicester, consists of a fluted shaft, whose base stands on a pedestal of four sides. The capital of the pillar, which is Composite, has at each angle the head and neck of a horned ox. A circular turret, supported by scroll buttresses, perforated with oval apertures, and embattled ornamentally, surmounts the abacus, or crowning of the capital; out of which rises a dome-like termination, with the figure of a wheat-sheaf on the top. The four sides of the pedestal are occupied with sculptured designs in bas-relief, allusive to the celebrated sheep-shearing and farming festivals held, during so many years, under the presiding auspices of that great patron of agricultural improvements. A donation of 2,0004, has been contributed

A donation of 2,0004 has been contributed by a wealthy individual in the neighbourhood of Liverpool towards the erection of a new church in Toxteth Park, coupled with the condition that the Rev. H. M'Neile should be one of the trustees.

The parish church at Bawdeswell, Norfolk, having been rebuilt, was consecrated last Tuesday week by the Bishop of Norwich. The church, erected in the pointed style on a cruciform plan, with a south porch and bellcote at the east gable, has sittings for 317 persons, of which 277 are free. The cost of the building was 1,400!. At Manchester a new chamber of commerce is being formed. On Monday last a meeting was held at the Albion Hotel, when a committee of sixteen gentlemen was appointed for

At Manchester a new chamber of commerce is being formed. On Monday last a meeting was held at the Albion Hotel, when a committee of sixteen gentlemen was appointed for the purpose of framing the laws and regulations of the institution, to report to a future meeting, when directors are to be appointed, and the necessary arrangements made for commencing the proceedings of the association. About 150 individuals and firms, of all shades of opinion in politics, and inoluding a large proportion of the leading merchants and manufacturers of the town, have already given their names as members of the new chamber. Such is the present activity in the building of houses, warehouses, railway extensions, &c., in Manchester and its vicinity, that so early in the season as the present, bricks have advanced, as compared with their value this time last year, more than 75 per cent. At a meeting, held last week, of the authorities in Hull as report from the sumer or

At a meeting, held last week, of the authorities in Hull, a report from the surveyor containing various recommendations for draining the town was read, and will, without doubt, be carried into effect. The surveyor (Mr. H. Newton) concludes his report by saving that, " with these improvements you will be prepared to send a stream of water through every street in Hull, as often as the tides will allow; and, when completed, the town of Hull will not be surpassed in drainage by any town in the kingdom." The whole of the improvements suggested were estimated at 3,000*l*., as several large drains would have to be made.

Ments adgressive would have to be made. Messrs. Leaby, the engineers of the Cork and Bandon Railway, propose erecting a viaduct on a novel construction for the intended crossing over the mail-coach road and valley at Chetwynd, pear Cork. The extreme height of the viaduct is 82 feet over the valley,

which is passed by three equal spans, each 240 feet; the centre and the two abutment piers are of stone, in the Doric style, The construction is very simple and novel; the greater number of its parts are of uniform size and shape, and there is neither a mortice and tenon joint, or a spike or nail, in the entire structure, nor will there be any necessity of centering for its erection. All these peculiar features of the design will reduce the expense of its construction far below the usual cost of such works. There is no viaduct in Europe constructed on this principle, and if successful it will enable companies to construct railways in localities where otherwise they could not be attempted, and for this reason it promises to be of national advantage.

The work of improvement is steadily progressing at Yarmouth, and building and railroad schemes promise not only to be beneficial to the inhabitants, but profitable to those who are so ready to embark in these undertakings. Houses are gradually covering the building sites laid out.

THE IRON TRADE.

.....

THE usual quarterly meetings of the ironmasters at Walsall, Wolverhampton, Birmingham, Stourbridge, and Dudley, were held the week before last. The prices agreed upon may be quoted as follows :--

| | Æ | 8. | d. | |
|----------------------|----|----|------------|--|
| Bars | 12 | 0 | Ó | |
| Common nail rods | 12 | 0 | 0 | |
| Rails | 14 | 0 | 0 | |
| Ноорв | 13 | 0 | 0 | |
| | 14 | 0 | 0 | |
| Sheeta | 14 | 0 | 0 | |
| Pigs (Shropshire) | 6. | 10 | 0 · | |
| Pigs (Staffordshire) | 6. | 10 | ٠ | |
| • • | - | | | |

There was a prevalent opinion that the last advance of 2*l*. was uncalled for, injudicious, and likely to prove injurious both to masters and men. This extraordinary price is, however, justified upon several grounds. The great advance which has taken place in the price of coal and limestone, combined with at least 25 per cent. increase in the wages of the miners, has unquestionably compelled the ironmasters to put a high figure upon their make. Coal at the present moment, owing to the prevalence of local strikes in certain districts, is extremely scarce, and in many other parts, where the men are apparently satisfied with the wages given, the miners do not work more than four days a week. The advance in the price of coal in consequence of the flourishing state of the iron manufacture and the demand of the colliers has not been less than 3s. per ton. Still, it is thought, that even the increased demand, great as it was, and the high price of materials, did not justify the advance in bars at one sudden step from 10*l*. to 12*l*. One singular reason, however, in addition to the more plausible ones already urged, has been given for this advance. It is stated, that it was suggested by some of the great firms with a view to stop further orders. This may appear somewhat absurd, but if good authority is to be relied upon, it is nevertheless true.

Several of the most extensive and influential iron-masters stated that "there was no intention to attempt a further advance—they were perfectly content with the present prices if they could be maintained." It cannot, however, be doubted, from the general complexion of the various meetings, that some misgivings as to the long continuance of the present prices have come over the minds of some of the great masters. The defeat or abandonment of many of the projected lines of railway—foreign competition, already sensibly felt in the market—and the great injury which the high price of iron has already inflicted upon the hardware trade, it is thought of necessity will cause a reduction. Another more powerful reason may be given for the probability of this result. The large speculators in iron—men who, for the last, four or six months, have been hoarding up stocks with a view to a high price—seem to imagine that it has reached the market. With respect to Staffordshire pig iron, the

With respect to Staffordshire pig iron, the opinion is it will fall. It will be observed that in the list given above, the prices of Staffordshire and Shropshire pigs are given as the same. So they were quoted in Birmingham

on Thursday. It was indeed stated that Staffordshire had been sold at 7*l*.; but the purchaser could not be ascertained. Now, the ground upon which a reduction in the Staffordshire is expected is the known supe-riority of the Shropshire pigs, till lately selling at 6*l*. 5*s*., and now at 6*l*. 10*s*. It is thought that the Staffordshire makers cannot maintain an equality of price with their Salopian neighbours. on Thursday. It was indeed stated that

an equality of price with their Salopian neighbours. At the monthly meeting of the Glasgow iron-masters, held the 16th inst., the price of pig iron was unanimously fixed at 6l. per ton, being 10s. advance on the price declared at the last monthly meeting. The term of credit was reduced from six to four months. A few parcels were sold for immediate cash at 95s. to 97s. 6d.

LORD PALMERSTON ON SHIP-BUILDING.

In a recent speech on the navy estimates, Lord Palmerston introduced the following remarks:—" The first thing to be looked to with regard to the navy was the possession of a number of efficient ships—efficient, not only in number but in cupling the thought in number, but in quality. He thought the discussion of thisevening had shewn, if any doubt existed before, the necessity the discussion of this evening had shewn, if any doubt existed before, the necessity and expediency of calling in the aid of science with regard to the construction of ships. It was very well for the gallant admiral opposite (Sir George Cockburn) to say that during the last war, although our ships were considered clumsy, and of an un-scientific construction, yet that with those very ships our sailors overtook the enemy and defeated superior force. This, however, did defeated superior force. This, however, did not prove the ships to be good; it only proved that our sailors were so expert, enterprising, and skilful, that with inferior ships they could outsail superior ships, whose crews were less skilful, and that our seamen triumphed over the difficulties to which they were exposed. The French vessels that were taken were universally admitted to be far superior to the ships by which they had been overtaken and captured. Although that might be a fair reminiscence of former glories, it shewed rather the superiority of our sailors than the good qualities of the ships of that day. It was known to all who had turned their minds to the subject, that there was no problem in science or in mathematics more difficult to solve than what is the best construction of a ship destined for the purposes of war. First of all, it was not easy for the most skilful mathematician to tell the form of a solid body which was best calculated to go rapidly through a fluid I to sen tan easy matter to say what a fluid. It was not an easy matter to say what would be the floating-line of a ship. It was not easy to tell beforehand the construction not easy to tell beforehand the construction which would give the greatest steadiness to a ship; nor was it easy to say where would be the centre of gravity, or where would be the centre of impulse in the rigging, the ascer-tainment of which was as necessary for the purposes of the ship as the adaptation of the hull to make its progress through the water. A practical man could not do this, for he could not tell on what prin-ciples of construction these qualities depended. ciples of construction these qualities depended. The scientific man could tell beforehand what, upon scientific principles, would produce the desired qualities : but if not assisted by an able practical man, conversant with stowage, arrangement, and trim, the scientific man alone would not be able to give such information as would afford a good ground for building. Then it was said the Admiralty were making experiments; that they had employed one man to build two vessels, and another to build three or four; and that they were ready to attend to every suggestion which might be made. That, certainly, was very praiseworthy, and, as far as it went, it shewed a desire to improve the construction of ships of war; but, with all deference to the Admiralty, he did not think they were possessed of that scientific know-ledge which was the only element on which ledge which was the only element on which the results ought to depend; and instead of being content with the costly experiment of building large ships by persons who were only scietific to a certain degree, and who did not possess the whole of that knowledge which was essential to the subject, it would be much better to procure the assistance of the most better to procure the assistance of the most

be made in building ships, which would then be so constructed as to be likely to answer the purpose for which they were intended. The class of steam-vessels required the particular attention of the Government, and, he believed, that a great improvement would take place in their construction. The right hon. baronet said that in this respect our naval force was at least upon a satisfactory footing, and that our horse-power, compared with that of our nearest neighbour, was in the ratio of three to two. He (Viscount Palmerston) did not consider that to be altogether a satisfactory statement, because a comparison of the horse-power did not apply to the question, for if two parties had an unequal number of vessels for the purpose of warfare in a narrow sea, the superiority of horse-power might not counterbalance that inequality of numbers.

Correspondence.

THE FIRE AT YORK MINSTER, &c.

S1R,-Ilaving read with much pleasure the interesting article of Mr. James Wylson on the late fires at York Cathedral, in which he has introduced a brief account of the incendiary Jonathan Martin, I feel induced to trouble you with this letter, as I knew Martin very well, as almost every boy in York did. In the year 1829, just about the time of the first fire, I was boy at school at York, and frequently a little saw Martin, who was in the habit of hanging about the different schools and public places, to about the different schools and public places, to pick up what he could, either by selling the printed accounts of his dreams, or by ballads, threads, tapes, knives, combs, and other nic-nacks of similar value. In my estimation, he was quite as much "a rogue as a fool," for be knew pretty well how to drive a bargain favourable to himself; he used often to pay the school a visit and as he was good naravourable to himself; he used often to pay the school a visit, and as he was good na-tured, and did not mind being pulled] about by the hove, he was no unuclean by the boys, he was no unwelcome guest, es-pecially if he had any little novely in his basket to tickle their fancy with, although it might perchance tempt them to spend more of the "needful" than they otherwise would have done.

His usual dress was that of a poor mechanic, over which he wore a clumsy, thick, felty-looking great coat, with a large cape and turnlooking great coat, with a large cape and turn-up collar, reaching almost up to his eyes; he generally had a grizzly beard of a day or two's growth, which, combined with his old slouching hat and rolling walk, gave him altogether a very eccentric appearance. He used to be a fre-quent attendant at the Minster, where I have often seen him stalking about, during the en-viable half-holidays, when I used to go there, more perhaps to listen to the music than for any other purpose.

any other purpose. I have seen him in all parts of York, and under all circumstances, both sober and under the influence of Sir John Barleycorn, to whose exhilarating friendship he had no particular objection.

I saw the fire, and never shall I forget it, as it was one of inconceivable grandcur, not so much from the vast quantity of flame it produced, as from the variety of complexions it assumed during its progress; it was re-markable for the volumes of thick, white, steamy smoke that it emitted, in consequence of the large amount of water thrown into it acting on the partially consumed stone, which seemed to steam up like unslacked lime.

The Minster yard was deep in water, and the effect of the number of men ranged in rows, handing buckets of water from one to the other, to supply the engines in the interior of the building, was strikingly grand, at least so it appeared to my boyish imagination; and as most of the engines had to pass through the water to get to the building, the picturesque effect was increased by the firemen standing or their engines as they would through it in effect was increased by the firemen standing on their engines as they rushed through it in their rapid course, one in particular, which arrived late (I believe from Lecds), being drawn by four white horses. The engine from the Cavalry Barracks, just outside the city, was one of the earliest that came up, it passed are on my road there in Conce stread ever me on my road there, in Coney-street, sur-rounded by the soldiers running full speed with it.

I saw Martin once or twice after his capture eminent scientific men in the country. By combining their knowledge with the experience of practical men an important progress would that a few days before the fire, he was heard take the chair at 12 o'clock precisely.

to state that there would soon be a great fire in York, but as pothing was suspected, of course no further notice was taken of what he said, as he was a chattering gossiping fellow, par-ticularly if he could get a patient listener to er to swallow all he had to say about his dreams and visions and religious creeds. /

4

I left York a very few weeks after the fire, and have never since had the pleasure to look upon the restored glory of my native city; since then the busy hand of improvement has been earnestly at work, and swept away many of the old land-marks of antiquity, which as a genuine son of the *Eboracenti*, I feel disposed to regret, notwithstanding all the advantages the improvements may introduce within the ancient walls of time-honoured York. J.T.

TERRA COTTA.

SIB,-Can you tell me were terra-cotta is to be obtained? I think a church has lately been crected at Bolton-le-Moors, Lancashire, entirely with that material. If you, or any of your correspondents can inform me if such be the case, and if so who manufactured the terracotta, you will greatly oblige Yours obediently,

A CONSTANT SUBSCRIBER.

• The new church at Lever Bridge, near Bolton-le-Moors, an elaborate structure in the Decorated style, with a spire of open tracery, is executed entirely of terra-cotta. Mr. E. Sharp, of Lancaster, the architect of the church, under whose superintendence the moulds were made, would probably give any information that might be required. Mr. Fletcher, of Vale-Bank, near the church, superintended the pre-paration of the clay and other processes for the terra-cotta, and has since established works, we believe, for the manufacture of it at Ladyshore, near Manchester. A correspondent in-forms us that parties are about to commence the manufacture of this material near London. -ED.

INTERCOLUMNIATION.

SIR,-I have lately observed the term intercolumn, and intercolumns, frequently made use of instead of intercolumniation, and intercolumniations. Which is the more correct mode of expression? neither Hosking nor Gwilt gives the term intercolumn at all in his glossary; and yet in speaking numerically of the spaces between columns, it seems to me more ac-cordant with the analogy of language to describe them as so many intercolumns; inter-columniation having a more general and colcoumination having a more general and col-lective meaning, implying rather the mode of spacing the columns than the actual spaces themselves. I have not the means of referring to Britton's "Dictionary of Architecture;" but if I mistake not, he points out the distinc-tion to be observed between intercolumniation and intercolumn, and the authority of so care-

ful a writer ought to be decisive. This may seem a very tritling matter, yet it would be as well to have it settled either one way or the other, if only for the sake of uni-I am, Sir, &c. formity.

INQUIRER.

1

*** Gwilt, Hosking, Britton, and the "Ox-ford Glossary," call the clear space between two columns an intercolumniation, and do not give the word intercolumn. The propriety of using the latter term was urged, if we remember correctly, by an able writer in the "Civil En-gineer's Journal;" at this moment, however, we cannot bit upon the passage.—ED.

PRWS.—At a meeting held last week at Ips-wich, to consider and decide upon the best decide upon the best means to be adopted for affording additional accommodation in the church, the following resolution was carried with only three dis-sentients :-- "That it is the opinion of this meeting that the pews in the church should be taken down, and open seats, all similar in plan and general outline to the one exhibited to this meeting, be placed in their stead." Mr. Fon-nereau, the gentleman who proposed the above, offered a donation of 2001, towards the contemplated alterations.

LONDON MECHANICS' INSTITUTION.—A meeting will be held in the Lecture Theatre of this Institution, on Wednesday next, for the purpose of promoting the erection of a new reading.room, &c. The Earl of Radnor will

Miscellanea.

CLOSE BED-ROOMS .--- Long experience has convinced me that nothing could be more con-ducive to public health, than the ventilation of our bed-rooms; multitudes of people never one single day, for years, rise refreshed in the morning, but always feel weary, oppressed, and unwilling to rise on awakening, though feeling lively, well, and unfatigued in the evening. The commonest of all the causes of this oppression and laziness, is the non-venti-lation of our bed-rooms. I believe that this simple plan would entirely cure many apparently perennial chronic discomforts, make thousands rise early and refreshed, who now rise, or lie in bed, stupid, unrefreshed, and heavy; prevent innumerable head-aches and foul tongues; dissipate the gloomy thoughts and despondency with which so many rise to their daily tasks of body or mind; and cause many to start up active and alive, who never now feel refreshed, and who have, in fact, so in fact, so many attractions of cohesion of comfort between themselves, their beds, and bed-clothes, that themserves, their beus, and beu-clothes, that their unrevived spirits, from a want of pure air during the night, and their habitual irreso-lution, produced by a nameless ailment, of which they do not know the real cause, prevent their ever being able to practise a habit of early rising, as it requires too great a daily struggle, for which a want of feeling of in-ternal habit, disqualifies them. In this way, the purity of the air of our bed-rooms would be as great at least, and probably much greater, than that of our sitting-rooms, which are pretty well ventilated by the constant opening of their doors, and the draughts of their fires;

bat even in these, the unaughts of their mes, are very imperfectly changed.—Medical Times. CHOICE OF SITE FOR TOWNS.—The news-papers state that the small town of Graus, in Arragon, is threatened with annihilation. portion of the conical rock at the foot of which it is seated has, from the effects of the thaw after the long-continued frost, begun to separate to the extent of 15,500 cubic metres, or 20,000 cubic yards. The whole of the inhabitants, seeing the impending danger, have left their houses, many of them with so much precipitation, that they have not stayed to take their furniture with them. An engineer, employed by the municipality, has surveyed the mountain, and reported that there are no means of preventing the fall.

FATAL ACCIDENT AT DEBBY .--Last week a portion of the arch just erected over the Mill Fleam, in the Morledge, gave way, and buried four persons amongst the ruins, two of whom were found, after the lapse of an hour, dreadfully mutilated and quite dead. The other two succeeded in extricating themselves without much injury. This is the second fatal accident that has occurred in the erection of this arch: the first was about six months since, and caused the death of six persons.

PARKS AT MANCHESTER.—A deputation, appointed by the local committee connected with these improvements, had an interview with Sir Robert Peel last week for the purpose of ascertaining to what lengths Government is disposed to go in assisting to carry out the object. The Premier said that be could not at present ask Parliament for a larger grant than 3,000*l*., and that, on condition that a Government surveyor be sent down. to inspect its disposal, and that 30,000%. of the local subscription be actually paid up.

NEW EPISCOPAL CHURCH IN CONNECTION WITH THE SAILOBS' HOME.—A public meet-ing will be held on Wednesday next at Crosby Hall, Bishopsgate street, for the purpose of taking measures to provide funds for this building, and endowing an Episcopal church for the use of seamen of the Port of London. The Earl of Haddington, first Lord of the Admiralty, will preside.

STONE ALTAR AND CREDENCE TABLE. Both of these innovations have been removed from the Round Church at Cambridge, by the churchwardens, who received a monition to that effect from the Archdeacon at Ely. The church will, therefore, very shortly be reopened for divine service.

WESTMINSTER BRIDGE. — Reports are in roulation to the effect that Westminster circulation to the effect that Bridge is in a very insecure condition, and that Mr. Barry will, after all, see it replaced by a structure more in accordance with the new senate house.

GLASS .- Mr. Ord, M.P., has obtained, by order of the House of Cammons, returns of the amount of duties charged, and drawbacks paid, on glass, and of the quantities imported and exported, retained for home consumption, and remaining in bond, for the year ending the 5th of January, 1845 (in continuation of the ses-sional paper No. 200 of the year 1844). It appears from this paper that the following were the quantities of glass charged and the amount of duty respectively imposed on the amount of duty respectively imposed on the different descriptions of glass in England during the year 1844-45, viz.: —Flint glass, 9,529,2941b., and 55,271*l.*; plate glass, 29,765 cwt., and 93,759*l.*; crown glass, 99,180 cwt., and 382,710*l.*; German sheet glass, 31,560 cwt., and 121,782*l.*; common bottle glass, 345,810 cwt., and 127,084*l.* The quan-tities exponented upon which deswhad was tities exported upon which drawback was allowed were of flint glass, 11,277 cwt.; of plate glass, 116,955 feet; of crown glass in tables, 1,527 cwt.; of crown glass in panes, 6 661 cmm a floot of a 6,661 cwt.; of German sheet glass, 7,656 cwt.; and of common bottle glass, 213,056 cwt. It further appears, that the quantities of glass further appears, that the quantities of glass retained for home consumption in the United Kingdom for the year 1844.45 were, of flint glass, 83,712 cwt.; of plate glass, 24,405 cwt.; of crown glass, 93,347 cwt.; of German sheet glass, 23,175 cwt.; and of common bottle glass, 193,108 cwt. The net amount of duty received thereon amounted to the sum of 645,7157. The amount of drawback or allowance on glass for the use of churches during the year 1844-45 was 1,3431. The quantities imported into the United Kingdom during the same period, from various countries of Europe, &c., were,—of crown or any window glass not exceeding one-ninth of an inch in thickness, 6,680 cwt.; of German sheet glass, white or coloured, 1,280 cwt.; of all glass one-ninth of an inch in thickness—all silvered or polished glass, of whatever thickness-and plate glass, glass, of whatever thickness—and plate glass, however small each pane, plate, or sheet, 18,915 square feet (superficial measure); and of flint and cut glass, 2,883 cwt. The quan-tities exported from the United Kingdom of the same description of glass as those which we have already enumerated above were rewe have already enumerated above were re-spectively, 6,241 cwt.; 906 cwt.; 16,971 square feet; and 1,448 cwt. The quantities of British glass exported from England in 1844-45 were,—of flint, 11,277 cwt.; of plate, 116,955 feet; of crown, in tables, 1,526 cwt.; of crown, in panes, 6,661 cwt.; of German sheet glass, 17,695 cwt.; and of common bottle glass, 213,056 cwt.

TRANSIT THROUGH EGYPT.-Mr. Galloway, of London, has made his report on the pro-posed Suez Railway. It is understood that that he has offered to guarantee the completion of the work within eighteen months, and that the cost, including all, shall not exceed 350,000/. His report speaks favourably of the facilities which exist for the easy formation of a railway and for obtaining necessary materials along the line. It does not apprehend any serious inconvenience from the presence of drift-sand. It states the levels to be so moderate and gradual, that in only two portions of the entire line will embankments and cuttings of any serious extent be rendered necessary. It contemplates having the terminus from the river, at Boulac, and the other to terminate in a jetty, a little to the westward of Suez, and about a mile distant from the ships' anchorage; thus saving four miles in the communication between the roadstead and the shore as at present. The line as surveyed will be 88 miles.

Acoustics.-The temporary Law Courts with which Palace-yard and Westminster Hall are disfigured, and will be, it is supposed, for several years to come, are complained of on account of the difficulty with which sound is transmitted. An investigation into the cause of this might be advantageous.

WOOD-CARVING .- Mr. Jordan, late keeper of the mining records in the Museum of Economic Geology, has invented a new method of carving in wood by means of machinery, and has obtained a patent for it.

THE BRITISH ASSOCIATION.- A public meeting was held last Tuesday at the Town THE BRITISH ASSOCIATION .-Hall, Cambridge, for the purpose of appointing a committee to make preparations for the reception of the British Association in June.

HUNGERFORD SUSPENSION BRIDGE.—The opening of this bridge has been deferred till Thursday next, the 1st of May.

TESTIMONIAL TO MR. BRITTON, F.S.A. -A preliminary meeting to appoint a com-mittee to carry out the proposed testimonial to Mr. Britton was held on Thursday last, too late in the day for us to report the proceedings in our present number. We shall allude to it next week, and in the meantime invite our

readers to co-operate with the committee. MANCHESTER SCHOOL OF DESIGN.—The Council have just announced their intention to hold during the vacation in August next, an exhibition of specimens of manufacture and industrial art, in connection with the drawings to be produced by the students in competition for the prizes.

New APPOINTMENT.—The Queen has been pleased to appoint John C. Millward, Esq., to be Assistant Civil Architect for the island of Mauritius.

Town-HALL, COLCHESTER.-The new hall is to be opened on the 1st of May.

Tenders.

TENDERS for church to be called the All-Saint's Church, St. John's Wood,—under the direction of Thomas Little, Esq., architect,—for the body of the church only.

Separate amounts of the two lowest, shew the cost if executed in Kentish Rag-facing.

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our readers however, they are entered in a book, and may be seen on application at the office of "The Builder," 2, York-street, Covent-garden.]

For the supply of Materials to the Commis-sioners of the Metropolis Roads.

For providing, squaring, and laying new York Paving and Granite Curb, &c., for the Commis-sioners under the Bedford Paving Act, St. Pancras. For various Engineers' and Joiners' Works required to be done at the new Workhouse, Birchfield-wood, Saubridge, Kent. For the Masonry Work of several Viaducts and

Bridges.

For performing the several works in building a new Workhouse at Tenterden.

For supplying her Majesty's Dock-yards with soft melting pig-iron. For the supply and delivery in Bristol of about 300 tons of cast-iron Water-pipes, of various dimensions, from 7 inches downwards, with certain elbows, nozzles, &c.

For the formation and completion of a new Drain, being about eleven miles long, twenty yards wide. and five yards deep, for the Middle Level wide, and five yards deep, for the Middle Level Drainage Commissioners. Also for the erection of a Staunch, several Bridges of wood with brick abutments, together with the necessary culverts, and other works.

For the performance of the Works connected with the erecting of the new Pier at Penzance. For the erection of the Borough Gaol, Bir-

mingham. For the supply of 1,200 lineal yards of 11-16ths

best attested, close, short-linked Chain. For the erection of a Building in London for a highly-patronized purpose, at the estimated cost of about 30,000%.

COMPETITIONS.

Plans for a Church to be erected within the Borough of Kingston-upon-Hull.

Plans, sections, and elevations for a Terminus, and other requisite accompanying offices, for the Great Southern and Western Railway, Ireland.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

At Ipswich: 15 Logs of Spanish, Cuba, and Honduras Mahogany, of superior quality and large dimensions; 4 pieces of Rosewood, 10 pieces of Cedar, and a few lots of Maple and Rosewood Veneers.

At the Timber-yard, opposite St. Giles's Church, London: 3,200 Pine Deals, Planks, and Battens, 840 Yellow Deals, 2,480 Spruce Deals and Planks, 120 Yellow and White Battens, 14,000 feet of three-quarter inch and half inch

Pine Boards, &c. 250,000 Building Bricks, 40,000 Arch ditto, &c. ; now at Sherborne Kiln, three miles from London.

At Patcham, near Brighton : a large quantity of Railway Materials; the whole of the Iron is of Staffordshire manufacture.

BY TENDER.

A Virgin Forest of Valuable Timber in Wala-chia. The principal part of the Trees is Oak. The said Forest may produce about 500,000 cubic feet of Timber

MEETINGS OF SCIENTIFIC BODIES During the ensuing week.

MONDAY, April 28.—Geographical, 3, Water-loo-place, 81 P.M.; Brilish Architects, 16, Grosvenor-street, 8 P.M.; Medical, Bolt-court, Fleetstreet, 8 P.M.

TUBBDAY, 29.—Civil Engineers, 25, Great George-street, 8 P.M.; Zoological, Hanover-square (anniversary), 1 P.M.

WEDNESDAY, 30.—Society of Arts, Adelphi, 8 P.M.; Geological, Somerset-house, 81 P.M.

THURSDAY, May 1.—Horticultural, 21, Regent-street (anniversary), 1 P.M.; Zoological, Hano-ver-square, 3 P.M.; Antiquaries, Somerset-house, 8 р.м.

FRIDAY, 2. - Royal Institution, Albemarle-street, 81 P.M.; Botanical, 20, Bedford-street, Covent-garden, 8 P.M.

TO CORRESPONDENTS.

" Lavinia."-We feel greatly indebted for our correspondent's attention, and regret much that the drawings are not sufficiently precise for publicatimm. They will, however, be useful to us in another way.

"Patent Hand-rails." — J. Melville, of 64, John-street, Filzroy-square, will give information

on the subject. "J. M."—It is unnecessary for us to call, as we know your work, allhough we had forgotten the name

"W.J.S."—We shall be glad to hear more of the proposed manufactory. We can hardly afford time to visit it until it is in operation.

time to visit it units is in operation. "B. B.'s "suggestions shall not be lost sight of. "C. T.," Norwich.—Next week. We shall be happy to hear from him, although we cannot promise space every week, and will gladly send him copies without charge. "Description of Windester" Sourced each

"New Church at Winchester."-Several archi tects wish to know how many tenders were received, and what was the amount of the lowest.

"A Builder."-If you give the district surveyor notice of your intention to do certain works he will inform you if there is any objection to them. He is certainly not bound to give you information if the work is merely problematical. "J. Dale."—Pulsam's manufactory is at Hod-

desdon.

"E. M., a bricklayer," is thanked for his in-

formation. "N. C."-We fully agree with our correspon dent, that "there are few practical subjects of greater importance than the construction of chimwith reference to the causes and remedy for nevs.' their smoking, and that it is very imperfectly understood. His suggestion shall be considered. We shall be glad to receive remarks relative to it, also the names of any works upon the subject. "A Subscriber from the First," next week.

ADVERTISEMENTS.

SPACIOUS BUILDING GROUND in the heart of the City TO BE LET on a Building Lease. The site comprises Founders' Hall, Lothbury (ex-tending from East to West 70 feet, and from North to South 50 feet), and a further space in connection with it, suitable for purposes of an additional entrance to the premises. Par-ticulars may be obtained by applying at the Founders' Com-pany's offices, or to J. B. Gardiner, Esq., architect, 4, Bank Chambers, Lothbury, where a plan of the premises may be seen.

NOTICE. -- INVENTORS desirous of NOTICE. — INVENTORS desirous of obtaining LOANS ON or of SELLING their IN-VENTIONS, or Patents, should apply to Mr. M. JOSCELIN COOKE, at the OFFICE for PATENTS, 20, Half Moon-street, London, where English and Poreign Patents are ob-tained, and Designs registered. An INDEX is kept for inspection of all Patents granted for the last century; also copies of every Patent of importance. Instructions to Inventors and a list of charges gratis on application.

Inventors and a list of charges gratis on application. OFFICE FOR PATENTS REMOVED FROM No. 16 TO 117 CHANCERY-LANE. PRACTICAL ASSISTANCE GIVEN to partics taking Letters Patent, by Mr. J. WILSON, Engineer and Patent Agent. Every description of business relating to or connected with Patents, Registration of De-signs, Patent Agency, &c., conducted at his offices, 117, CHANCERY-LANE, opposite Carey-street. Negotiations entered into with parties wishing to dispose of or purchas: patented or registered inventions. Every necessary infor-mation may be obtained at the offices as above, where also may be had printed instructions (gratis), to which Mr. W. begs particularly to draw the attention of parties about to take out patents Mechanical drawings of every description, original designs for machinery, models, &c., executed with dispatch and economy.

THE **BUILDER.**

MARTIN'S PATENT CEMENT. TO ARCHITECTS, BUILDERS, AND PAINTERS IN FRESCO.

STEVENS and SON, PATENTEES and SOLE MANUFACTURED STEVENS and SON, PATENTEES and SOLE MANUFACTURERS, beg respectfully to announce that this beautiful cement has now arrived at a degree of excellence far surpassing their most sanguine expectations. For all internal work it possesses a great superiority over every article hitherto in use; it is now being used extensively by Government in the British Museum and other public buildings. IT DOES NOT THROW OUT ANY SALT, but presents a beautifully plain and perfect surface, which may be painted upon dry work within four days without peeling. It is equally applicable for walls or lath, for mouldings, architraves, skirting, or flooring; and is admitted to form the best ground for freeco painting, having been used for many of the prize freecos lately exhibiting in Westminster Hall. It will bear an intense heat without cracking, and for hardness, durability, and economy, cannot be equalid. 186, DRURY-LANE, LONDON.

186, DRURY-LANE, LONDON.

Agent for Liverpool and Manchester, Mr. R Part, 11, Atherton's-buildings, Dale-street, Liverpool.

STOCKTON LIAS CEMENT.

STOCKTON LIAS CEMENT, MANUFACTURED upon principles laid down in Major General Pasley's Essay on Limes and Cements.-It is of a heautiful Stone Colour, and of ac-knowledged superior quality, free from vegetation, does not erack, and is well adapted for every description of modelling and casting. It has been extensively used at the Earl of Macclesfield's, Ensham-hall, by C. Barry, Esq.; at Sir F. Shuckburgh's, Shuckburgh-hall, by H. E. Kendall, Esq.; for Works now in progress at Marbury-hall, Cheshire; and for many of the Mansions erected during last Summer in the vicinity of London. for many of the Ma vicinity of London.

WILMCOTE LIAS CEMENT,
 WILMCOTE LIAS CEMENT,
 Is of inferior colour to the above, from containing oxide of iron, but of very Superior Quality for Tunnels, Sewers, and Hydraulic Purposea; its use is stipulated for by Mr. John Roe, Engineer of Sewers, London.
 GROUND LIAS LIME,
 For Concrete, and every description of Hydraulic Work, for which purposes it has been used at Woolwich and Chatham Dock Yards, the London Docks, New Exchange, Hunger-ford Suspension Bridge, Westminster Bridge, Grand Junction Canals, Wood Paving Companies, London and Birmingham Railway Company, for Works in the Alster at Hamburgh, the Kiel and Altona Railway, and various Sea Walls, &c.
 At R. Greaves's Works, Stockton, near Southam, Warwickshire, and at No. 2, South Wharf, Paddington, London.

O ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MER-CHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL. то

JOHNS and CO.'S PATENT STUCCO **GENERAL**. **J**OHNS and CO.'S PATENT STUCCO CEMENT.—The following are the positive advantages possessed by this Invention over every Cement hitherto in-troduced:—It will effectually resist Damp. It will never vegetate nor turn green, nor otherwise discolour. It will never crack, blister, nor peel off. It will form a complete Stone casing to any Building covered with it. It so closely resembles Stone that it is impossible to detect it. It never requires either to be painted or coloured. It will keep fresh and good in the cask in any Climate for any number of years. It is the only Cement that can be depended upon for export. It is the only Cement that can be used with confidence by the Seaside. It may be used in the hottest or coldest Climates at any beason. It will adhere to any subtainee, even to Wood, Iron, or Glass. It will carry a larger Proportion of Sand than any other Cements begin to perish. It may be worked through the Winter, as frost has no effect upon it. It may be used on the Inner Walls of new Houses, which may be papered over or painted directly. Roofs laid or pointed with this Cement will remain undamaged by the servers Storms. Any Plasterer may apply it, the Instru-tions for use being very clear and distinct. The first cost of this material does not exceed that of the cheapest Cement now in use; but with all the above-named extraordinary and valuable advantages, nothing can approach it in point of enormy. Architects and Builders who have used this Cement have

now in use; but with all the above-named extraordinary and valuable advantages, nothing can approach it in point of economy. Architects and Builders who have used this Cement have declared that it requires only to be known, to be universally preferred. Specimens may be seen, and a Prospectus fully describing the Cement and its mode of application, together with a volume of Testimonials from zvery part of the Kingdom, may be obtained on application to MANN and CO., SOLE AGENTS for the Patentees, 5, Maiden-Iane, Queen-street, Cheapside, London: of whom also may be had, JOHNS and CO.'S PATENT STONE-COLOUR STUCCO PAINT, expressly intended for Painting over ex-terior Walls of Houses that have been covered with Homan or other Cements, and which have become dirty and disco-loured. It is in every way better suited for this purpose than White Lead Paint, which will frequently come of in flakes, being in direct chemical opposition with Cement; whereas MESSRS, JOHNS and CO.'S PATENT PAINT having an affinity for Stucco, binds itself with it, stopping the suction, threeby rendering the wall proof against weather, and in the finish producing a pure stone-like effect, producerable by no other Paint whatever. It is cheap in its application,—and may be used by any Painter, in any climate, even in the most exposed Marine situations.

TKINSONS CEMENT .- The public is A A respectfully informed, that the price of this very ex-cellent Cement, which has now been in use for Architecture and Engineering works upwards of thirty years, is reduced to 28. 3d, per bushel, and may be had in any quantity at Wyatt, Parker, and Co.'s Wharf, Holland-street, Surrey side of Blackfriars-bridge.

N.B..-This Cement being of a light colour, requires no arti-ficial colouring or painting, and may be used for stucco with three parts its own quantity of sand.

KEENE'S PATENT MARBLE CEMENT.-The Patentees of this composition beg to refer to the British Muscum, the Royal Exchange, the new works at Bethlem Hospital, Greenwich Hospital, and the Co-liseum in the Regent's-park, as buildings finished or in pro-gress, in which Keene's Cement has been used as an internal stucco. Its superiority to common plastering consists in its extreme hardness, and the rapidity with which it dries, which qualities fit it to receive paint or other finishing sooner than other water Cement. When employed for skirtings, architrave, and other mouldings, in place of wood, it checks dry-rot, is impervious to vermine, prevents the spread of fire, and is more eco-nomical in its application than the material for which it thus becomes the substitute. Confirmation of these statements is to be found in the almost universal adoption of Keene's Cement for Skirting and Hall flooring in the new houses on the Hyde Park Fastate, where its application is to be seen to the fullest advan-tage. In Liverpool and Manchester Keene's Context her in

surface. The high polish and marble-like hardness of which this Cement is susceptible render it the most suitable material for the manufacture of Scagliola. Patentees, J. B. WHITE & SONS, Millbank-street, Westminster, Manufacturers of Roman and Portland

Depôt in Liverpool, 36. Seel-street, James Woods, Agent.

M OON'S IMPROVED CHIMNEYS. M CON'S IMPROVED CHIMNEYS.— Samples of the Bricks to form the Circular Flue, now coming into general use, also those invented by Clark and Reed for a similar purpose, may be seen at the Patentee's Western Depôt, New-road, near Tottenham-court-road, where may be procured the Metal Bars and Throats, also the much-approved Caps for the prevention of Smoky Chim-neys, without causing adjoining flues to smoke, or producing the noise so generally complained of, arising from a large surface of metal being exposed to the action of the wind. Licences are granted to Brick and Tile Makers for manne

Licences are granted to Brick and Tile Makers for manu-facturing the Bricks and Tiles, throughout the United King-dom, by application as above, or to Mr. ELIAS DORNING, 37, Cross-street, Manchester.

PAINTING BRUSHES OF SUPERIOR QUALITY. TO PAINTERS, BUILDERS, &c.

J. J. KENT AND CO., MANUFACTURERS,

11. GREAT MARLBOROUGH-STREET, LONDON, Offer to Paintern, Builders, Rc., Painting Brushes of a quality far superior to those generally offered for sale, to which they beg to call the attention of all who prefer quality and durability to apparent cheapness.

- abuity to apparent chequees. 000000.--7 in. Dusters. 000000.--7 in. ditto, extra. 00000.--Ground Brushes. Plasterers' Brushes. Distemper ditto. Ground and Unground. Sash Tools, and Common Tools. Tar Brushes and Masons' Brushes, and all other Brushes used by Baitors and Atistr.
- Brushes used by Painters and Artists.

Lists of Prices of Painting Brushes, and of all other kinds of Brushes, forwarded on application. Established 1777.

THE PATENT ASPHALTED FELT, FOR ROOFING

THE PATENT ASPHALTED PELT, FOR ROOFING HOUSES, VERANDAHS, SHEDS, &c. Beg to call the attention of the Trade to their ROOFING FELT, which has been exhibited at the great Agricultural Shows of England, Scotland, and Ireland, and orst NRD THE FAIZE, for being the beat and cheapest article for Roofing. Its advantages are lightness, warmth, durability, and economy. It is impervious to rain, snow, and frost, and a non-conductor of heat and sound. The Felt can be cut to any length, by 22 inches wide. The price is only One Penny per Square Foct. Samples, with full directions as to its uses and the manner of applying it, with TESTIMONIALS, some of them of seven years' experience, from Architects, Builders, Noblemen, and Gentlemen, who have extensively used it, sent free to any part of the town or country. A Dyr-hair Felt, for covering Boilers, &c., is also manufactured, by which a saving of about 25 per cent. in fuel is effected. The TRADE are respectfully enjoined to send their orders DIRECT to the FACTORY, as the surest means of being supplied with the genuine article, and in lengths best suited to their roofs. They are likewise CAUTIONED AGAINST MISREPRESENTATION. THE ONLY WORKS in Great Britain where the above roofing is made are F. McNEILL and Co.'s Manufactories, IAMB'S-BUILDINGS, BUNHILL-ROW, LONDON. A Specimen Roof to be send the Factory. A liberal Discount allowed to the Trade.

SATURDAY, MAY 3, 1845.

SOME difference of opinion has existed relative to a requirement of the Metropolitan Buildings Act with regard to the construction of chimneys. Schedule F

provides, that every chimney and chimneystack, except. angle chimneys, "must be built from the foundation to the top thereof, without any corbelling over, whereby any upper part of the brickwork of such chimney or chimneystack shall overhang any lower part of the brickwork on the front thereof."

Many of the district surveyors considered that this interdicted all corbelling whatsoever in chimney-stacks, and that a chimney-breast in an upper room could not be made wider than the breast below, any more than it could be made to project further from the face of the wall.

The referees have now made an award which settles the question. A joint requisition was sent by the owner and the district surveyor with regard to a third-rate dwelling-house now building in Regent's-park-terrace. It stated, "That doubts exist as to the propriety of allowing jaumbs and flues to project from party-walls upon strong stone or iron corbels bearing partly upon the jaumbs and chimneybreast underneath, in order that the chimneys of the third stories (the one-pair floor) may be placed in the centre of the rooms, there being a difference in the depth of such rooms and the rooms of the story below," According to a plan and elevation of the chimneybreasts which accompanied the requisition, one of the breasts was required to extend in width twelve or fourteen inches beyond the breast below it. The referees determined that the chimneys in the third and fourth stories (one-pair and two-pair floors), and in the front room of the fifth story, as shewn in the elevation, might either "be gathered over in the brickwork, or be set over upon sufficient iron or stone bearers in the direction of the length of the wall to which the breast is attached."

We apprehend, although not needed in the particular case laid before the referees, that the breast in the second story of a building (ground-floor) may be gathered or set over in like manner in the direction of the length of the wall, as the clause in Schedule F, already quoted, simply interdicts corbelling, " whereby any upper part of the brickwork of such chimney or chimney-stack shall overhang any lower part of the brickwork on the front thereof."

The same Schedule, in continuation, moreover, provides for corbelling over not more than nine inches from the front of the wall or stack to which the chimney shall adjoin, in certain situations : that is to say, above the ceiling of the third story (the one-pair floor, ordinarily), in buildings of the first-rate and extra first-rate; and above the ceiling of the second story (the ground-floor), in buildings of the second and third rates.

The question, What constitutes the bond fide commencement of a building ? still occupies, occasionally, the attention of the referees. The following are the heads of two awards on the subject recently made :--

THE BUILDER.

Norland-road, Hammersmith, The district surveyor stopped the works, on the ground that the walls were insufficient in thickness, and the footings insufficient in height. The owner contended that the surveyor had nothing to do with them, as they were commenced before the 1st of January last, and called upon the referees to direct the surveyor to withdraw his notice. The surveyor stated that the houses were commenced hastily, during the latter part of December last, and were carried up four feet in height in an unworkmanlike manner, and were left exposed to the weather without any drain, so that the work had become quite ruinous; that portions had fallen, and great part of the remainder had been pulled down. He said it was not a bond fide commencement because the buildings appeared to be essentially different from those first projected, of better character, and were constructed in part of another material: further, that if the referees should consider it a bond fide commencement,-the nature of the works now in progress, comprising "the rebuilding, enlarging, and altering the same," brought them under the control of the Act. The works referred to he described as, "Generally rebuilding the external walls from the footings and facing same in part with stone ashlaring: setting back the front wall to the centre house 4 inches, and laying new footing to part: increasing all the party-walls and their footings one-fourth in thickness: removing the additional buildings (which had been raised same height as the rest) in the rear of the two end houses : taking away the chimney-stacks and their footings from the external walls of the two end houses, and building two new chimneys with the party walls of the same: the two end houses are also to have an additional story, and the walls to be carried up doubtless, of an increased thickness."

The owner admitted that a considerable portion of the work, being injured by the weather, had been taken down.

The referees decided, that as the houses were duly commenced before the 1st of January, "and are now being carried on mainly in accordance with the same commencement, so as to evidence that the same was a bond fide commencement, the alterations stated are not such as to bring the said houses within the operation of the provisions of the said Act so far as relates to the original building of the said houses."

As it was a case of "reasonable doubt," they awarded that the expenses (34.9s.2d.) should be paid by the parties in equal moieties.

The other case was in the Paddington district. The owner gave notice to the surveyor, November 27, 1844, of his intention to erect two second-rate dwelling-houses. Ho had previously prepared a concrete foundation, and ultimately completed the footings before the 1st of January last. The surveyor taking a particular view of a letter sent by the referees to Mr. Allen, of Rotherhithe, in January (see BUILDER, p. 37, ante), concluded that footings only did, not constitute commencement, and called on the owner to give a fresh notice. The owner, it should be said, had contracted with a bricklayer for the erection of the houses before he gave the first notice: and the surveyor did not doubt his ' good faith."

The referees decided that as the footings "were completely formed and executed in a regular and workman like manner, such buildings must be deemed to have been com-The first relates to six third-rate houses now menced before the 1st day of January, 1845,

building for Mr. Stewart on the west side of | and to be 'already built' buildings within the meaning of the said Act, and not within the operation of the provisions thereof, so far as they relate to the original building of such buildings."

It was awarded that the expenses (31.2s. 4d.) should be paid by the parties in equal mojeties.

In reply to the inquiry of some corresspondents, whether or not projections from external walls formed of timber and covered externally with incombustible materials would. be conformable to the Act, we can mention that the referees have decided in the negative. in the case of a water-closet projecting from the back wall of a house in Dover-street, Piccadilly. The materials proposed to be used and declared inefficient,-were, timber framing and a covering of galvanized iron.

INSTITUTE OF BRITISH ARCHITECTS.

On Monday, the 28th ult., a meeting of the Institute was held at their rooms in Grosvenorstreet, Mr. H. E. Kendall in the chair.

Amongst the donations announced, were designs for churches and parsonage houses, published by the Prussian government, a work on the Greek Theatre, by Herr Strack, and ten guineas from Mr. Donaldson towards the library fund.

Mr. Fowler, who was the bearer of the German works, made some remarks on the buildings in progress in Berlin. Amongst the most important was an addition to the National Museum, whereof the construction was peculiar, The building is fire-proof, and displays a union of great lightness and great strength. In digging for the foundation they reached a stratum of infusorial earth, and this was made into cones and pots, with which to form the ceilings. The modern Gothic at Berlin he considered bad; in all other styles the buildings there were very satisfactory. The munificence of the government contrasted strongly with the parsimony exhibited in England.

Mr. James Thompson read a paper on the hagioscope and other parts of the chancel of Alderton Church, ten or twelve miles from Malmsbury, Wilts; but as we shall probably print the paper entire, we refrain from any notice of it here. A conversation on the uses of hagioscopes, or squints, took place, wherein Messrs. Scoles, Richardson, Godwin, and others ioined.

Mr. F. J. Francis then laid before the meeting some remarks on encaustic tiles; and, after tracing the history of their manufacture in the East, Greece, Italy, and our own country, commented on symbolism, and found fault very properly with some of the absurdities in Durandus.

Earl de Grey, the president, has invited the members to a conversazione on Friday, the 9th inst. The council will have the honour of dining with his lordship previously.

CAMBRIDGE CAMDEN SOCIETY .- Sir William Follett and Professor Starkie have given an opinion in reply to a case submitted to them, that the dissolution of the Society cannot be effected except by the unanimous and expressed assent of all the members ! As this is not likely to be obtained, the committee will be prepared to submit resolutions at the anniversary meeting on the 8th inst., to enable the society "to continue to subsist in the spirit of its original constitution, and consistently with duty, usefulness, and honour." Blank forms have been sent to all the members in order to obtain their opinion, but it seems quite ertain that dissolution will not take place.

ECCLESIASTICAL ARCHITECTURE.

THE that action of periodical reviews is at this thick very different from what it was orl-ginally, when they did simply what they pro-feesed to the, namely, gave you a notion of the ressed to the, namely, gave you a notion of the books randed at the head of the article, and their own opinion thereon. You now find, in addition sometimes to this, and sometimes indeed altogether without it, the reviewer's own views on the subject of the works named, so that they present, in fact, a series of estays on the various topics successively brought before the public by writers. Thus in the present number of *The Quarterly*, "Vacher's Parliamentary Pocket-book" introduces a paper on Whig Tactica; "The Crescent and the Cross" a disquisition on the results of French ambition in the Levant; and the beau-tiful works of Mr. Gally Knight and the Chevalier Bunsen, a valuable and interesting essay, seventy pages long, on ecclesiastical ar chiteoture, more especially as regards plan.

Such of var readers as may not be able to be the Review in question will be glad to find a portion of this latter article in our pages; to those who may be able, it will serve as an inducement to obtain the whole.

The writer thus introduces his subject :

"Your Jonathan Oldback, your staunch antiquary of the genuine plodding Gough and Stukeley school, who values architecture historically, and merely historically, escapes in-numerable distresses by which Sir Visto would torically be crazed. He considers every ancient building as an ancient chronicle: Ordericus Vitalis in 'Cash stone,' Gervasius Dorobernensis in Purbeck marble.' He reads his tome for the distraction thereby imparted; he delights in it will "The inelegance of the composition offende him not, neither does he despise the radeness or coarseness of the illuminations. Continued by successive annalists, he is un-would be the ant of uniformity in style. Wach wave of the wart of uniformity in style. "Back wave of the wart of uniformity in style. "Back wave of the soul of those whose bodies are silent in the grave. Though the handwriting may change, and the shape of the letters vary, and the method of narration alter, still your chronicle, like the community to which it belonged, forms one continuous whole. You, if you imbibe Oldbuck's spirit, read it on from year to year, from reign to reign, from century to century, through Anglo-Saxon and cloister-Latin, and cloister-Latin and Norman-French, and Norman-French and Chaucerian-Esglish, as one authentic volume. You cannot bear that the smallest portion should be expunged, even for the purpose of being supplied by the most clever conjectural emendation. Still less would you wish that some ingenious popular literateur, acting abbot or prior, were to suppress the original, and recompose the in affected archaisms, so as to make the whole story look as he fancies it might have done, if compiled in the twelfth century. 'L'abito non fa il monaco;' he will not gain Anselm's 'sanotity by arraying himself in Anselm's and).

" 'Is it not a great blemish, Mr. Oldbuck,' says Sir Visto, 'that the front of our noble Minster should exhibit the deformity of un-Anison owners; the northern, rude, clumsy Norman, whose stumpy bulk contrasts so dis-sgreesably with the delicate proportions of its southern companion ?'

* By no means, Sir Visto; the rude, clumsy, northern tower is a certificated work of the times of the Conquest. It is coeval with Archbishop Lanfranc. The tower constitutes tectural history; if you tear the page out, the facts it tells you are lost.'

Surely that perpendicular tracery, blocking up the circular arches of the solemn transept windows, should be removed, and the composition restored to its primitive simplicity?

You are quite mistaken. In its primitive state the transent was not simple : every capital and moulding being rich in gold and colour. By letting in more light, the blanched walls would only look more cold and crude, and at the same time you deprive the building of the instructive lessons this portion imparts; for I, Sir Visto, always view the material church as an emblem of the spiritual church, and the perpendicular tracery is to my mind a memo-ried of the era of Chicheley and Stafford, and Gerson and the Council of Constance, when

.....

so many changes were fermenting in Christen-dom. Were I reading to the collegers here, I should make them attend to such architectural features, as a branch of technical memory

"Well, Monkbarns, but what should be done with that diminutive gable; the debased Gothic of the Elizabethan era? Would you not restore the cathedral to its former lofty proportions ?'

'By no means, Sir Visto; don't meddle: the walls have been so weakened by the demolition of the refectory and cloister which once adjoined them, that they could not bear their pristine altitude. You would ruin the buildng by such injudicious and cruel kindness. The whole pitch of the roof has been lowered to suit our modern mode of carpentry, and the choir could not now carry the beams according to their ancient elevation. The king-post and the queen-post, so essential to all such high trussing, have been very materially shortened by the alterations begun in the time of William and Mary. If you attempted to raise the cross-crowned pinnacle to the standard of William of Wykeham, it would tumble down.

Well, but Mr. Oldbuck, surely you will not plead for those misshapen porches and door-ways, with heavy arches and contorted pillars, Laud?'

Uncouth as they may be, they decided ecclesiastical character: · I do. possess a decided ecclesiastical they are in keeping with the cathedral chaunt, They are more than mere ornaments; although both you and the utilitarian would strangely coalesce-so constantly do extremes meet casting them off. Our poor dear old church has been so hacked about, that Laud's additions have become incorporated in the original work. Cut them away, you will topple the whole edifice upon your head.'

Thus are the feelings of our antiquary dis played. There is no one vestige or memorial of past times, which he does not consider as of past times, which he does not consider as appealing to the heart. The rays which, dimly discerned in the dark niche, beneath the battered canopy, surrounded the head of St. Erasmus' demolished statue, remind him of the error of the worship, but also of the inde-cent new corributions with with it. cent, nay sacrilegious violence with which it cent, hay sacrilegious violence with which it was removed. Refusing to replace the statue, he will not efface the traces of its existence. He seeks not to blot out the St. Christopher peering through the whitewash, the token of the simple faith of past ages, yet he abstains from restoring a portraiture which would be a

mockery in our own. The lead-work in the windows, describing the void outline of the figure which has been dashed out by the despoiler; the head in blank, and the hands in blank, and the long robe in blank, and the feet in blank, at the bottom of the blank by which that long robe is indicated, the ideal, as it were, of form, reproduce in his mind a far more true conception of the build-ing in its glory, because they tell of the cala-mities it has sustained, than as if the absent stained glass had been replaced bv the most glowing vitrifications of Willement or Wailes.

The sepulchral recess is closed by the elaborate trellise, quaintly knotted and contorted, rusty and broken, half hiding the tomb behind. Rusty and broken as the iron may be, Oldbuck advises that it should be let alone; he will not have the enclosure repaired, for with hot mending and marring are synonymous terms, nor will he clear it away for the purpose of giving a better view of the monument: he values the effect of mystery; and though he would not brighten up the curious workmanship of the old craftsmen of St. Eloi, he knows that if it were removed it would be sold in 'naval-store' shop for two-pence the

specimen remaining of that species of art will be irrecoverably lost.'

The heavy memorial of the age of our first Stuart, the knight in his stiff armour, the lady in her stiffer roff and fardingale, block up a Sedilia; but the knight was a benefactor to the poor: he founded the decayed hospital: perhaps the sight of his effigy may yet do some good, as a reproach to his posterity; if you demolish the incumbrance, as you call it, your Sedilia will still continue as unfilled as Banquo's chair.

Our antiquary will not relay the footworn pavements, where the sunken flag-stones mark the once frequent resort of the pilgrims along the aisle, nor, for the sake of trim neatness, mend and replace the altar-steps hollowed by the knees of the worshippers now gathered to their rest. 'Nay,' says Oldbuck, 'I reverence their rest. 'Nay,' says Oldbuck, 'I reverence even the ponderous, robust, ample brown woodwork of the choir, with the hurlybarly festoons, coveys of merry plump cherabs, mitres which would give a headache to a wig block, croziers fit to fell a bull, and full-bottomed Corinthian capitals; for they do so put me in mind of the days of good Queen Anne, "Convocation," High Church and Dr. Sacheverell.' So Jonathan Oldbuck ponders and reasons, finding sermons in every stone, and deriving pleasure and therefore profit. and deriving pleasure, and therefore profit, from every token of the successive generations who have worshipped within the consecrated walls.

Ill-judged was the allegory which placed the statues of painting, sculpture, and architecture as the mourners round the tomb of Michael Angelo. We do not pay due honour to Archi-tecture if we consider her as the sister, and therefore the equal, of the mere imitative arts: she is their queen. We want a term to desig-nate the intellectual rank of architecture, so closely connected with the imagination that we can scarcely term it a science, so entirely practical and subservient to our needs, that we can scarcely reckon it as one of the sesthetic arts. And yet the arts must all be coerced into the architect's service. Architecture, as a branch of human wisdom, constitutes a genus of its own. Sculpture and painting are entirely founded upon the imitation of nature, whereas the basis of architecture is utility-utility in every sense, from the lowest to the highest, whilst it is wholly conventional in outward arrangements and forms. Architecture may borrow many a principle from nature; but she consults nature for *lessons*, and not for *models*; and let us here hearken to our friend Mr. Cockerell, and listen to his exposition of this principle, in a passage as remarkable for its acuteness as its truth. 'Sir C. Wren reflected that the hollow spire

which he had seen or built in so many varieties was, after all, but an infirm structure; and he sought that model which should enable him to impart to it the utmost solidity and duration. Simple was the original from which he adopted his idea. He found that the delicate shell called turretella, though extremely long, and liable to fracture from its base to its apex, by the action of the water amidst the rocks, was rendered impregnable by the central column, or newel, round which the spiral turned. Therefore, in his spire of St. Bride's he establishes the columella in the centre, round which he forms a spiral staircase to the top, issuing on stages of arched apertures; thus giving us (if not the most beautiful) certainly the most remarkable and enduring spire hitherto erected.

When Brunelleschi was charged with the erection of the dome of Sta. Maria, at Flo-rence, of nearly equal diameter with that of the

ship of the old craftsmen of St. Eloi, he knows that if it were removed it would be sold in 'naval-store' shop for two-pence the pound. That reredoss, erected during the short reign of Mary, may be inelegant, and incon-sistent with the decorated tracery and the graceful foliage of the battered screen; but, executed in graffito, the drawing and hatching produced by scratching off the upper coat, so as to shew the black ground below, it is a valuable memorial of the short sunshine which gleamed upon 'the ancient worship,' as well as evidencing the spreading influence of ultra-montane taste. 'And if the reredoss be taken down,' says Oldbuck, 'I know that to the brokers it will wend its way, and our only

Pantheon, but at more than twice its height from the pavement, upon a base raised on piers, and by no means of the strength and cohesion of the original model, the Pantheon, it was apparent that in giving it the same solidity, the weight would be insupportable on such a foundation. How was this object to be accomplished? Brunelleschi reflected that the bones of animals, especially of birds, possessed solidity, without weight, by the double crust and hollow within. But above all, he remarked that the dome which completes the architecture of the human form divine was constructed with a double plate, connected by the light and fibrous but firm walls of the hollow cancelli, so that strength and lightness were combined in the utmost degree. Brunelleschi followed this model in his dome of Sta. Maria; and the traveller now ascends to the lantern, between the two crusts or plates forming the inner and the outer Domes.

'Michael Angelo adopted this contrivance in the dome of St. Peter's; and almost all the subsequent domes are upon the same idea.' •

In ornament, architecture must equally appeal to nature, to the graceful leaf, the binding tendril, the spreading herb and flowret bright; but the architect employs them all as elements and in combination. Even as the living body assimilates to itself the food which gives it growth, and the air imparting health and vigour, and above all bears in its countenauce the expression of the vivifying mind, so does architecture render all the material objects of which the building is composed, and all the knowledge requisite for their combination, and all their elegance and symmetry, subservient to her own dominion and empire. Hence the magnificent conception of Vitruvius—every branch of human knowledge is needed to constitute the perfect architect : literature, design, geometry, optics, arithmetic, history, philosophy, music, medicine, jurisprudence, astronomy. There may be somewhat of Platonic mysticism in these Vitruvian opinions. Still we always find them cleaving more or less to the great masters of the art. They are founded upon immutable truths. Every structure becomes the living evidence of the knowledge, the manners, the opinions, and the feelings of mankind."

After examining Mr. Gally Knight's works, especially "The Ecclesiastical Architecture of of Italy, from the time of Constantine to the 15th Century," the reviewer pays well-deserved tribute to the industry, ability, and munificence of the author. Mr. Knight's name is inseparably connected with the history of pointed architecture, to the illustration of which his labours have chiefly tended. In his first work "An Architectural Tour in Normandy," he completely controverted the statements of the Norman antiquaries to the effect that pointed architecture was fully developed there in the 11th century.

lith century. In the "Architectural Tonr in Sicily," his main object was, further to investigate the origin of the pointed style, "From the facts which he collected, he ascertains that as soon as the Normans achieved their conquest, they employed, as Mr. Knight calls upon us to observe, a style hitherto wholly unknown in Europe. The conquest of Sicily was effected six years after the conquest of England—San Giovanni dei Leprosi was built in 1101, by Count Roger, in the time of Rufus. The other examples of the pointed style in Sicily, built by Count Roger's son, the first Norman king, were begun whilst Henry I. was still sitting on the throne of England. All these are in the pointed style of architecture, which gradually prevailed in all the sacred, civil, and domestic architecture of Sicily.

'The buildings, therefore, still existing in Sicily, prove first, that the Normans in Sicily employed the pointed style; secondly, that it was used in that island before it was used on the continent of Europe; and thirdly, that it was borrowed from the Saracens. But the Norman Sicilian style was not Saracenic alone. Saracenic in its arches, it was Roman in its pillars and capitals, Byzantine in its cupolas and mosaics, Norman and Greek in its enrichments—a combination only to be found in Sicily, and natural there, from the mixture of the different nations.'

The fact, that the Sicilian Normans em-

• We quote from the report in the Athenseum. Why does not Mr. Cockerell give us an authentic edition of his lectures ?

ployed the pointed style at a very early period, and the presumption that such style was borrowed by them from the Saracens, being established, the question then is raised as to its mode of transmission, and Mr. Knight concludes by adopting the opinion so often advocated, that the pointed arch, borrowed from Asia by the Crusaders, was by them generally introduced into Europe."

THE BUILDER.

- -

causes destined to produce that alteration in the human intellect, of which the outward token was exhibited in the so-called decline of the fine arts. Symptoms of this altered course of thought were evident before the promulga-tion of Christianity, and proceeded with in-creasing rapidity as the new faith became triumphant. The problem of the great change which thus came upon the human mind is very intricate. Art may have lost its ancient ele gance, but this mutation was nevertheless the necessary means for the wonderful develop-ment afterwards assumed by architecture, in producing a style, which, though not rendering others unchristian, was certainly more than all others congenial to Christian faith. One element, however, cannot escape notice. The antipathy borne by the early Christians to the fine arts, debased by the pollutions of heathen idolatry, can neither be denied nor concealed; and the same causes which prevented the cultivation of the arts ensured the degradation and subversion of their proudest and most splendid monuments. Excluding for the present the consideration of other agencies, the first paragraph in the rise of Christian architecture must narrate the fall of the structures devoted to the superstition, which it was the end of the Gospel to obliterate and

It was the end of the Gospei to obliterate and destroy. The beathen temples were doomed to inevitable ruin. Laws had been promulgated by Theodosius for their preservation; conducive to the decoration of the city, they might be perhaps rendered useful for the purposes of civil society. Some may have been thus respited, though not rescued, until the decayed remains crumbled to the ground; they were never respected or honoured by public opinion, and could rarely be adapted to the objects pointed out by the imperial law, without such alterations, as, in most cases, amounted to destruction. Others were accidentally preserved in desolate or secluded situations, in the forest or the marsh, or the mountain-glen, or on the shore, whence the inhabitants have been extirpated or chased away. Such are the columns of Pæstum; the heavens are yet as bright as when the garlands hung down from the ruined architrave; the sea as azure as when the waves were ploughed by the painted prows; the crushed herbs beneath your feet still send up their rich perfume. To the senses the works of art are still as noble, the works of nature as sweet and gay; but the whole scone mourns under the curse inflicted upon scoffing, lascivious, corrupted Hellas. Language, people, race—their very name has disappeared. The wasting pestilence still hovers, and will ever hover, marking the vengeance which has fallen on the deserted shore.

Few temples were ever adapted for the purposes of Christian worship: fewest of all in the capital of the Christian world. 'Of the Christian hierarchy,' says Gibbon, 'the bishops of Rome were commonly the most prudent and the least fanatic; nor can any positive charge be opposed to the meritorious act of saving and converting the majestic structure of the Pantheon.' In casting the account of the merits and demerits of the Christian hierarchy, such a pontiff as Gregory the Great would have been ill inclined to accept the encomium. In the gergo of Gibbon, 'fanaticism' is piety, and 'prudence' unbelief. The 'meritorious act,' thankful as we may be for the result, was a single item, by no means influencing the general balance of praise or dispraise; it was the solitary performance of Boniface IV.;

it was an act from which na consequences resulted. With the exception of the Raathean, we fail to detect any real example in Rome, of a temple which can be said to owe its preservetion, in the proper sense of the terms, to the Christian clergy. They had then no thought of the kind—they took no pleasure in such antiquities. They sought no credit for such care. Antiquaries, with eager zeal, have collected about ten examples, in which this preservation is asserted. Even in the cases which are least dubioue, no further merit can be claimed for the hierarchy than the accidental preservation of a portico, a cella, or a wall, an encumbrance which it was troublesome to remove-ra fragment which saved some expense, built up, concealed, marred, or deformed by the new erection to which it was unwillingly conjoined.

---207

It could not be otherwise. In the early Christians, any participation in our modern worship of heathen art, would have been false and unnatural. All the opinions, all the habits, all the feelings, all the conscience of the early Christians strove against the preservation of the memorials of heathenism. Neither beauty nor convenience, if they had possessed the latter requisite, would, save in some few special cases, like that of the Pantheon, plead for the preservation of the relics of classical antiquity They considered the idols as scoursed. No object which had in anywise been connected with the worship of idols, or could be supposed to have been employed in their service, was to be used without exorcism. Thus, in the ritual of the church of Durham, there is a form of by the charter of Durhand, there is the form of prayer for hallowing, the vase found in the Roman encampment, which could not he em-ployed for any Christian use until adjected to such purification. Nor, was this belief con-fined to the rude Northumbrian persent, or to be between any Let a barbarous age. Let us place eurselves be-fore the portal of St. Peter's, fresh from the workmen's hands. Four months have been employed in removing the huge obelisk of Sesostris from the ruins, of Nero's Circus to the front of the Great Basilica. Eight hundred workmen, toiling at creaking winch and groaning capstan, heave up the mass; whilst the breathless crowd watch the slow rising of the gigantic besm. It stops; when the one cry-'aqua elle funi,' which subjects the in-dividual who suggests the bappy expedient to the pain of death, enables the maestro to complete his task ; amidst the thunder of the can-But is the work completed i No: the trophy of the victory of Christianity over heathenism cannot yet be received as such, until all connection with its former slavery to the fiend has been destroyed. In solemn procession, the supreme postiff exorcises the magnificent work, so long dedicated to the foul superstition of Misraim, and devotes it to the honour of the cross, performing the rites which were deemed to expel the spirit. Those who may not share in the belief which dictated these ceremonies, must, nevertheless, respect the sentiments contained in the simple majestic language, commemorating the consecration of the spoils of heathenism to the service of the cross—'Eace Crux Domini —Christus vincit—Christus regnat—Christus imperat—Christus ab omni malo plebem suam defendat—Vicit Leo de tribu Juda.'

Thus did Pope Sixtus record his triumph. Yet there was a greater triumph felt by the zeal which taught the early Christians to glory in casting down the altars and the high places devoted to sin-deeming-we will not presume to judge whether rightly or wrongly---that such a testimony to the truth was imperstively enjoined upon them. By their deeds they-contemned the temporizing policy of the emperors. They sought the actual and visible victory of literally erecting the temple of the Lord upon the ruins of the habitation of the demon. The statues were broken, to be buried in the foundations: hence few sculptures have ever been found at Rome which did not, like the Venus of the Medici, show, by their defacement and fractures, the aversion of which they had been the objects. Amongst the great congregation of the faithful, the distaste, the horrors excited by paganism--its structures, monuments, glories, charms--were unconquerable and paramount. Idols might have been rites, which, according to the primitive belief, would drive away the demon--yet no lustration

could entirely heal the leprosy of the walls. The language of the Virgin Martyr was schood in every heart—

Your gods, your temples, brothel-houses rather; Or wicked actions of the worst of men, Pursued and practised. Your religious rites 1call them rather juggling mysteries,

The haits and nets of hell.

Your Venus whom you worship was a harlot. Flora, the foundress of the public stews,

And has for that her sacrifice.

Your Jupiter, a loose adulterer, Incestnous with his sister. Read but those That have canonized them. You will find them WORK

Than in chaste language I can speak them to you.' Whatever had been touched by paganism, seemed-and can we say unjustly?---to be reeking with impurity.

Whilst conscientious feelings thus deterred and repelled the early Christians from adopting the heathen temples for the purposes of Christian worship, the same feelings attracted them to holy ground. We shall see hereafter why the temples were wholly unfitted by their mere plans and arrangements for the celebra-tion of the Christian ritual. But, above all, they were destitute of the associations by which devotion was nourished, and faith enhanced. Jove'stemplecrowned the Capitol: the structures devoted to the false gods shone above the palaces of imperial Rome: but the victories of faith had been won by pain, anguish, suffering, death: the altar was not to be raised amidst the haunts of men; the communion of saints was sought amongst the lone memorials of the departed."

FREEMASONS OF THE CHURCH.

APBIL 29th .--- Mr. George Perry, architect, APBL 29th.....Mr. George Perry, architect, in the chair. The following new members were electedMr. Thomas Longman, Mr. John Brown, Mr. John Harvies, Mr. George Field, and Mr. John Wilks. The meeting came to a resolution that a petition should be presented by the vice-presidents to the two Houses of Parliament in favour of Mr. Ewart's bill for forming museums in large towns, and another in favour of forming a gallery for the preservation of British antiquities.

Mr. G. Aitchison, jun., exhibited a rubbing from a brass of John Knapp, formerly portman or mayor of Ipswich, and others from St. Mary, in the Tower, and St. Clement's. Also a drawing of a font in Waley Church, Essex, a small village church, some few miles from Walton on the Naze. Mr. Backhorne exhibited an ancient vessel discovered adjoining Old London Wall, at the back of Ludgate-hill on digging for the foundations of some buildings lately erected there.

Mr. William Papineau delivered a second lecture on architectural chemistry. After reeapitulating the substance of the former lecture, and dwelling shortly on the principles and laws of chemical attraction and affinity, he proceeded to the enumeration and classification of the elementary bodies, detailing the properties of each and their action and reaction upon each other, and the general laws by which they are divided into classes; and dwelling particularly on those of common occurrence and more nearly connected with the science of architecture.

He regretted that want of time allowed him only to give a cursory view of principles which he feared proved somewhat dry and formal to his hearers, but reminded them of the im-portance of a knowledge of theory to successful practice, comparing it to the foundation of a building, which, hidden and forgotten by the multitude, was nevertheless of vital importance to the spongity of the supermutation the to the security of the superstructure; the defective construction of the one producing flaws and settlements in the building, the neglect or imperfect acquaintance of the other producing doubt, indecision, and error in practice.

A NEW SYSTEM OF ARCHITECTURE. Some time ago Mr. W. V. Pickett offered to impart to the Royal Academy his plan for a new system of architecture, provided they would pay him a certain large sum of money for the secret. The Academy refused the offered confidence, and the secret was tendered on much easier terms to the Institute of Architects. Being declined there also, the author first published an account of it in a book, and then, on the 23rd ultimo, brought his system before the Society of Arts. Not being in a position to give an opinion upon it, we content ourselves, for the present, with laying the author's own views before our readers, in nearly his own words :---

The leading principles upon which this system of architecture is founded, are, the adaptation of the law which governs natural forms, and the development of the peculiar properties of metallic bodies.

he highest order of beauty, united with the largest amount of utility, is universally allowed to be exhibited in the works of nature, espe-cially in organic nature and in human form, head the attainment of the highest order of beauty, in conjunction with the most compre-hensive amount of *utility*, is the true end and purpose of art in architecture.

The great peculiarity in natural organic form is, that its outlines are invariably deter-mined by combinations and modifications of curved lines; and in the adaptation of this law, in the formation of the primary masses, compart-ments, and apertures of architecture, a higher order of beauty may unquestionably be attained than is possible to result from combinations of straight lines; and while the important purposes of shelter, comfort, and safety, are equally well attained, the additional utility and convenience of infinitely greater *cleanliness* is effectually secured, because the occurrence and junction of right angles, consequent upon all combination of straight lines, invariably occasions the harbour of dirt and insects, which are, with much trouble and difficulty, if, indeed, they ever can be, thoroughly eradicated. Utility unquestionably demands the partial occurrence of straight lines in building, and such are found conducive alike to beauty and utility in the organic constructions of nature. But nature does not inflict upon her creatures the trouble and inconvenience of direct and acute angles; and art, the highest art, in following, as it ever must, her footsteps, would also abstain from the introduction of the inconveniences and inferior beauty resulting from square forms and right angles in the pri-mary arrangements of architecture.

Now, for the embodiment of forms deter-mined by curved lines, and for general appli-cability to the purposes of architecture, metals are the most efficient and durable in substance, affording indeed greater facility for the pro-duction of forms of this description than any wherein the straight line prevails, in conse-quence of the liability of the latter to warp during the process of cooling, while their extraordinary strength and tenacity gives most ample occasion for the introduction of the whole range of botanical forms in the decorative arrangements of building.

In the architecture in question, the development of the properties of these bodies is proposed to be effected by the introduction of hollow walls or other primal masses, composed of scantling or tie-bars covered on either side with cast-iron plates, attached together by pins or rivets passing through each, and secured on the inner side by a nut or screw; while for all decorative features the imitation of the basso-relievo style of execution is abandoned as fitted only to masonry, and that which is transparent and primarily isolated is which is transparent and primarily isolated is adopted. Such features are affixed to the walls by means of the necessary instruments for holding the parts together, viz. pins or rivets, --not closely affixed, because many dis-advantages in respect to beauty and utility would result from such arrangement, but by a simple extension of the pin held a short distance in advance, whereby the beauty and cleanliness of the structure is most effectually secured; and by the introduction of suitable colour, combined with the natural agency of light, the shadows of these features become projected on to the primal masses, thereby creating an additional and interesting variety in effect altogether impossible of accomplishment in any other architecture.

Again, in obedience to that unerring maxim in architecture, "that real and apparent constructions should assimilate, the development of metallic properties will demand the general disuse of columnar support; because metals possess a power of suspension and capabilities of sustaining from within the walls of edifices, the weight of all such projective fea-tures as are required for the utilities of porticos or similar constructions in aid of general effect, without the intervention of any incumbent support of similar description to the column in masonry; and as the general character of the decorative features should be conformable to the nature of the primary constructions, the substitution of suspended features of pendentive character will form another marked distinction of this architecture. The author considers that, by his system, we may attain a higher order of beauty and a combination of effects different from those of any other architecture. We may have structures of greater cleanliness, whether on account of the non-absorbent properties of the material, the nature of the decorative constructions, and the peculiarities in primal form. We may have buildings perfectly fire-proof, and, from the circumstance of a stratum of air passing between the plates of the walls, cooler in summer, and warmer in winter, than any others. We may have them durable to the greatest extent; present-ing the utmost facility in erection, and capable of being removed at trifling cost, and without the injury or destruction of their respective parts. We may have an architecture not necessarily demanding the application of metal in its primal parts, but equally with masonic art, employing brick, cement, and other factitious substances in place of its legitimate material,-an architecture adapted to the various requirements of domestic life and of modern society, at once perfectly practicable, and on many occasions more economical than any other; and above all, he contends, we may have that which the world has never yet had, a commercial architecture, opening new and untrodden fields for enterprise of almost every description, and enabling this country to become the great emporium of art throughout the world, by supplying the various nations of it with the productions of architecture.

We reserve to ourselves the right of expressing our own opinion upon this hercafter, should it seem desirable to do so.

NORFOLK CHURCHES.* FOULSHAM.

WE were gratified to notice that those con-nected with this spacious and handsome edifice have acted as conscious (which too many are not) that "all the comeliness we can give to God's house is necessary, if we would have his blessing." It was reduced to a ruinous shell blessing." It was reduced to a ruinous shell by the calamitous fire which occurred here in 1770: but the devastation has been in degree repaired; we say in degree, because there are yet strong objections to the taste in which this has been effected. How truly has it been ob-served that "until within a very recent period, purity of design and character in our ecclesiastical buildings seems to have been well night banished from the land."

This church is dedicated to the Holy Innocents, and consists of a chancel, a nave flanked by two aisles, a south porch, and a fine perpendicular tower situate at the west end of nave; it contains only two bells.

The east window-we begin our survey the chancel-comprises five lights, the mullions, which throughout the entire range are beaded, simply crossing on the head. The arch, which has labels both within and without, springs internally from jamb-shafts, two on each side, separated by a cavetto moulding, and having the capitals enriched with foliage. On either side appears a trefoiled niche under a decorated ogee canopy, adorned with crockets and a finial; but these are partially blocked by a vulgar painted dossel in the heavy style of the Stuart period. A large double piscina is found under foliated ogee arches, having the space between pierced by a quartrefoil; the orifices have disappeared. The sedilia are very fine; two clustered piers have their bowl-shaped capitals enriched with folisge; from these and their "responds" spring three cinquefoiled

* Sec Vol. II. p. 629. † Markland's "Remarks," &c. Digitized by 8

EPISCOPAL RESIDENCES .- It appears from a Parliamentary paper delivered this session, that Episcopal residences have been provided in the dioceses of Gloucester and Bristol, Lincoln, and Ripon; in that of Lincoln at a cost of 14,788.; and in that of Ripon at a cost of 14,611. The cost of the Episcopal residence for the Ripher Control of the Second Presidence for the Bishop of Gloucester and Bristol cannot be stated, the building not being yet comod.

drop-arches, canopied by a like number of richly crocketted ogee labels with finials; the whole, inclusive of the piscina, being inserted within a square compartment, having its hollow moulding relieved with roses, and the spandrels carved in decorated tracery. The corbels under the labels exhibit male and female heads in the costume of the sixteenth century. The benches of the sedilia are lost, but a chair, with arabesque carving upon it, stands on the north side of the table—by the -by the way a nowise eligible position; the altar rails are heavy and unsightly, the table a good plain oak one.

Oak one. Over the sedilia occurs a beautiful pointed window of three lights, with fine geometrical tracery in the head, and supplied with label and jamb-shafts, like that over the altar. The chancel has a clerestory tier of windows, four on each side; they are of two foliated ogee headed lights "supermullioned" under de-pressed Tudor arches; we regret to add that the heads of these, as also of a three-lighted range in the clerestory of the nave are without range in the clerestory of the nave, are without one redseming exception blocked. The pointed chancel arch, which is recessed, cham-fered, and beaded, springs from large half-round piers, each flanked by two smaller ones, with a broad cavetto between. The corbels of the original wall-pieces are carved with Lombardicks, having coronets over them. The meagre open roof, of low pitch with tie-beams, &c., was placed there towards the close of the last century.

A chancel seat, we hardly know how cor-rect the designation, an open sitting, has lately been placed longitudinally against the south wall. With examples in two churches, each within an hour's ride, of what such seats ought to be, one is at a loss to account for the utter want of taste so prominently shewn here, for good material (oak) being so wretchedly perverted.

vertee. The rood-screen has wholly disappeared, unless indeed a quantity of voluted panelling, yet remaining in the vestry and elsewhere, formed portions of it; though on this we are by no means confident. The nave exhibits on each side four plain circular piers with bell-shaped capitals supporting equilateral double-faced pointed arches with chamfered soffits. The bases partake of Norman character, into a form a bee-hive flattened at the sides into a form a bee hive flattened at the sides into a square. The belfry-arch rises from large and small half-round piers; the architrave is comsmall half-round piers; the architrave is com-posed of two sets of mouldings, the one con-tinuous with the cavettos on the jambs, the other (quarter-round and filletted) springing from the encased shafts with plain moulded capitals. The timbers of the roof here are hidden his a courd calling partially relieved at capitals. The timbers of the roof here are hidden by a coved ceiling, partially relieved at the extremities by scholls, and at the spring of the arch by a large but inelegant cornics.

The polygonal pulpit, set on a mass of brickwork penelled in cement, with early-English arches, is reached through a portion of the ancient wood staircase. It stands on the ancient wood staircase. It stands on the south side of the nave, and has a pendant in the reading desk opposite. There is little to commend in the style of either, the perked up desk being only in too close keeping with the bad taste of square and high pews, some of them lined and carpetted, which occupy the aisles. The nave is without a ceptral avenue. being crossed by a range of hollow-backed -the cheerless portion of such as bear seate

" The trace of the sad trinity Of want, and pain, and sin."

The pavement is of stone throughout. The windows in the aisles, each of three trefoiled ogee lights, with vertical tracery inserted under a depressed Tudor arch, have the central divisions supplied with transoms inter-secting the head which reaches a higher elevation than the rest. The aisles have modern sloped, or lean to roofs, ceiled between the timbers. The font, situate at the west end of the nave, somewhat in advance of the belfryarch, is raised on two low steps forming a spacious octagonal platform. It consists of a circular marble basin placed on a modern stone pedestal, the latter spirally filletted, the other with lonic flatings under a horizontal dancette band. The rim of the basin, which has not the convenience of a drain, is "returned" with an inverted edge. In Parkin's time there was "a neat font of stone with a modern cover, which opens below, and thereon are the

four Evangelists painted." It is impossible to congratulate on the exchange.

The square tower, its outline varied by "franch" or diagonal buttresses at the west end, is divided into four stages by string end, is divided into four stages by string courses, those under the parapet having grotesque gurgoyles in the centre: it has pin-nacles at the angles, crocketted and panelled, with ogee arches. The embrasures of the parapet are in two stages, and are richly carved with quatrefoils, shields, and panels. The belfry windows, of three foliated lights under a pointed arch are supermullioned; and under a pointed arch, are supermullioned; and square-beaded windows in the third stage exhibit stone lattice-work of the same character. The west window, of four trefoiled lights, is inserted beneath an equilateral arch with the dripstone returned horizontallygeneral feature here. The tracery, with ex-ception of the head being pierced with a quatrefoil, and that the mullions cross each general feature here. other, runs in vertical lines. The steeple has a newel staircase threading a semi-hexagonal

a newel staircase threading a semi-nexagonal projection at its north-east angle. The south porch has been converted, by blocking the open archway, into a vestry, lighted by a single ogee-headed window on the western side. The south, or, as by this perversion, vestry door, has its jambs and the ar-chitrave above recessed and chamfered with continuous mouldings, the whole being set under a double-headed label rising from corbels, one of them a head in mascled armour. A triangular or gable-headed buttress, on the south side of the chancel, offers the first feature of the kind occurring in our survey.

"In the churchyard is an altar-tomb of stone, about six feet long and three high, and round this an inscription, which, for the anti-quity of the letters, order, and disposition of them, has been engraved by the Society of Antiquaries, and is Rob. art. COL. LES. UEC. I. LY. HIS. VIF. Each letter has a coronet over it " a monitorian liter has a coronet over a peculiarity already noticed in our remarks on the chancel. С. Т.

HUNGERFORD SUSPENSION BRIDGE.

In addition to the account of this work already given (p. 169 ante), we append the following valuable particulars taken from a paper on the subject read by Mr. Cowper on the 18th ult., at the Royal Institution. This bridge consists

This bridge consists of four broad chains, viz. two chains, one above the other, on each side of the platform; each chain consists of ten and eleven links alternately, and, near the piers of eleven and twelve. This increased strength is to meet the increased strain which takes is to meet the increased strain which takes place near the piers. The chain of the Menai Bridge is only five links wide, and the chain of the Hammersmith only six links wide; but the great breadth of the Hungerford chain (viz. eleven links, or about two feet), gives them great power to resist the effects of the wind, and thus to prevent vibration.

The two piers are in height..... The central span between the piers (being 110 feet wider than the Menai 80 feet.

676] ,, Deflection of the chain Length of each link (7 in. wide, 1 in. 50 ,, 24 ,, 54 cwt. 715 tons. Their weight Width of the platform Height above high water at the centre 352 14 feet 321 ,, 281 ,, for the river traffic, and produces a graceful curve, and prevents any ap-

pearance of swagging.) The section of the chains at the centre of centre span is.....

296 sq. in. 312 ,, - near the piers..... A square inch of iron breaks with 27 or 29 tons, but 171 tons is taken as the impairing weight, i. e. the weight at which it begins to

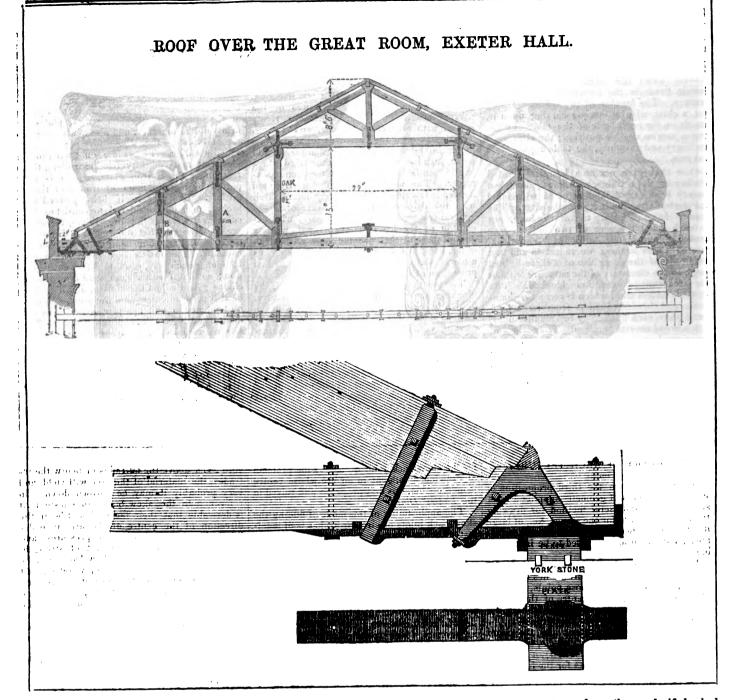

stretch; we have, therefore, for the weight the bridge will actually bear,- $296 \times 17\frac{1}{2}$ tons = 5180 tons. while 296 × 5 tons = 1480 tons.

is the greatest load that can be put upon it. This is taking a crowd standing close together to be 100 lb. per square foot. The entire weight of the chain, the platform, and a full load upon it, would make a load of about 1,000 tons on each pier, being about 8½ tons on each square foot of brick-work, or not quite 14 cwt. on each square inch. The chains are attached to large wrought-iron vertical plates at the summits of the piers: these plates are firmly bolted together, and also to a strong herizontal plate,—the whole forming what is called a saddle. The saddle is not fixed to the pier, but rests on fifty friction rollers, these rest on a thick iron plate, which is sup-ported by a solid mass of iron and timber girders. The pier itself, being pierced with arches, may be considered to consist of four columns of brickwork; the girders, therefore, are so arranged that no weight is therefore, are so arranged, that no weight is thrown on the arches, the whole weight resting on the columns. The saddle is capable of moving 18 inches each way, equal to 3 feet entire mo-tion; so that if either span were crowded the chains would adjust themselves, and the strain be still perpendicular upon the piers, and have no tendency to pull the pier over. The me-thod of putting up the chains was thus :- Two sets of wire ropes, each consisting of three ropes, were hung from abutment to abutment over the piers, in the exact situation the chains over the piers, in the exact situation the chains were to occupy,—these scaffold ropes, as they may be called, being distant from each other equal to the length of the connecting pin. A few feet above the scaffold ropes, two other ropes were hung in like manner; on these tra-versed two light boxes, very much resembling a carpenter's bench turned topsy-turyy. These erradies as thoy are called wors convected to cradles as they are called, were connected together, and contained two windlasses, like those over a common well; these cradles held the workmen. A barge containing the tinks was moored under the cradles; four men in the cradles hauled up a link; and when they had raised it above the scaffold ropes, the connecting pin was put through, and the pin being allowed to rest on the scaffold ropes, of course supported the link. The cradles were then moved forward, and two links joined to the single link, then one joined to the two; the chain consisting, thus, in the first instance, of alternately two and one links. When this twoand-one-link chain was completed, the scaffold ropes were not required, the two-and-one-link chain forming, as it were, a scaffold for the rest of the links; and thus was this bridge erected without any scaffolding but these few ropes, and without the slightest impediment to the navigation, or a single accident. The bridge was opened to the public on Thursday, the lst instant.

FALL OF A VIADUCT AT ASHTON. - One of the most distressing and extensively fatal accidents occurred last Saturday week et Ash-ton-under-line. The Ashton branch railway, ton-under-line. The Asnton oranen ranway, now in progress of formation, and nearly com-pleted, is carried over the river Tame, between Dukinfield and Ashton, by a viaduct of nine arches, and it was this entire viaduct that fell, arch after arch, like a row of nine-pins; precipitating, with the viaduct, between 20 and 30 workmen, who were upon it, chiefly ex-cavators, engaged in filling up the spandrils of the arches with soil and gravel, for the permanent way. As to the cause of the catastrophe, those who are best acquainted with the works, say the arches were very substantial and well-constructed. It is stated that close to the arch which first gave way there is an "eye" of an old coal mine, which has long since been abandoned by the miners, and that some time ago the earth near this "coal-pit eye" was seen to sink, and that it was then stated that the foundations of the arches were unsound. An inquest is now sitting on the bodies of eleven persons who were killed; and it is feared that four more will be added to the number before its conclusion, that number being still missing, and supposed to be under the ruins.

and supposed to be under the ruins. FALL OF AN ANCIENT CHURGH.—On the 14th ultimo, the eastern wall of St. Julian's Church, situate in King-street, Norwich, fell, burying the communion table and one or two pews contiguous thereto. For-tunately no one was personally injured. This sacred edifice, one of the most ancient in the city, consists of a nave and chancel with a round towar. tower.

THE BUILDER.

THE ROOF OVER THE GREAT ROOM AT EXETER HALL.

DUBING the last three months, we have received from several correspondents a request to be furnished with the particulars of the roof which covers the large room at Exeter Hall.

which covers the large room at Exeter Hall. In the annexed engraving Fig. 1 represents one of the trusses on a scale of 12 feet to an inch, and gives the plan of the underside of the tie-beam, shewing the scarf. The width between the plates is 75 feet 10 inches; the width be-tween the walls 76 feet. The height of the roof from the underside of the tie-beam is 21 feat 6 inches. feet 6 inches. The trusses are placed at alter-nate intervals of 2 feet 6 inches and 9 feet. The following are the scantlings of the timbers used :---timbers used :-

mainder, tinted darker, is of cast-iron. We are indebted to Mr. Laurie, clerk of the works at Pentonville Prison, for the drawing from which our engravings were made.

We found no disposition at Exeter Hall to afford the slightest information, and owe no thanks to the officials.

FATAL ACCIDENT AT DERBY.

WE mentioned in our last impression that WE mentioned in our last impression that a portion of the arch just erected over the Mill Fleam, in the Morledge, had given way, and caused the death of two persons, and that this was the second fatal accident that had occurred in the erection of the same arch, the first causing the death of six persons. At the inquest, held last week, on the bodies of Mr. James Sims, the builder, and Edward Harlow, his apprentice, it appeared from the evidence of Mr. Harpur, the archi-tect and auryevor to the corporation of Derby.

tect and surveyor to the corporation of Derby, that the centres of the arch had been impro-perly removed, and that he had cautioned the deceased Sims, the contractor, not to remove them in the manner he had done. He did not, however, interfere with Sims, as he con-sidered that he had more practical informa-tion than himself, and he had a better opinion of his knowledge of building than he had of his own his own

Mr. J. H. Stevens, of Derby, architect, was of opinion that the accident might arise from Ditto B..... 10 ...42 Figure 2 represents the foot of the truss with the iron-work at large. The strap and abutment piece are of wrought-iron, the re-sure. He believed Sims to have been perfectly bit opinion that the accident inight allow hold in the side, are introduced so two causes—the extreme weight upon the two causes—the extreme weight upon the two causes—the superincumbent pres-sure. He believed Sims to have been perfectly Balley, a teket is forwarded.

competent to perform the work if he had proper instructions." The jury returned the following verdict: "Accidental death; but the the jury cannot separate without expressing their strong con-viction that had the joint committee of the corporation and the commissioners appointed a competent and efficient engineer to superintend over Mr. Sims during the progress and in the execution of the works, and which, they think, after the warning the first accident had conveyed, they should have done, the accident which has since occurred would not have happened."

ANCIENT CAPITALS FROM THE SOANE MUSUEM.

THE extraordinary collection of works of art left by the late Sir John Soane is now open to the public, and will remain so during May and June. A delightfol and in-structive morning may be spent there, and we may perhaps before long offer to our readers the notes of a stroll through it, as an induce-ment to them to examine it for themselves.

The engravings on the opposite page, from sketches by Mr. Richardson, represent some ex-amples from this collection, of a class of antique caps not generally well known. Fig. 1 is from a cast brought from Rome by Mr. Lee, and purchased at his sale by Sir John Soane. The original of figure 2 is not so perfect in *front* as it is shewn by the engraving. The lower leaves, copied from the side, are introduced so

ANCIENT CAPITALS FROM THE SOANE MUSEUM.

GEOMETRY OF ARCHITECTURE.

As inference from the third proposition of Bucild's elements of geometry supplies a most simple, ready, and useful method for drawing the radiating joints for the stones, &c., of large flat circular arches whose centres are inconvenient, and which are supposed to be inaccessible.

From points on the circumference of a ciralar arc, it is required to draw lines that shall be perpendicular to it at those points, and that shall pass through the centre of the circle; without reference to the centre, or making use

and a_i or a_i of see Euclid 8 of the angle a_i i of see Euclid 8 of the interpret the chord of an interpret is bisected by a perpen-result to and pase through the interpret a_i is bisected by a perpen-result to any be drawn by the graph points as before. This problem of drawing a tangent to an arc whose centre is inaccessible, was first proposed and solved in

of drawing a tangent to an arc whose centre is inaccessible, was first proposed and solved in the Ladies' Diary. The applicability of this mode of finding the skew-back joints of circular arches is of mani-fest utility to plasterers and bricklayers, but more particularly to the latter, when forming the skew-backs of discharging and counter arches (i. e. arches over lintels, &c.); and were this method adopted and practised, it would prevent unsightly and weak arches from being formed, which too often is the case from a want of understanding the nature of their thrusts and pressures; for the joints of all arches should be perpendicular to the curve of the neutral axis which passes somewhere within the substance of the arch; but if the forces acting against the arch be very great, and the equilibrated curve corresponding to the pres-

sure runs above the extrados or below the in-trados, the material of the arch will yield, and very probably it may be thrown down. In reference to the skew-backs in question, it is desirable that their faces should be in the direction of the centre of the arc, in order to distribute and equalize the pressures, and to distribute and equalize the pressures, and to produce the greatest amount of strength. The true radiation of the skew-back may be obtained mechanically by simply setting off from the point a, on the core or centre, any two equal distances $a a_1, a_1, a_2$; apply a line or plumb-rule from a to a_2 , measure the distance under a_1 to the line, and set that distance above a_1 to e_i then apply the line from a to e_i and cut the skew-back a b square from this line.

But the method of drawing the joints for the stonework of large flat circular arches for bridges, &c.,—and indeed its application in

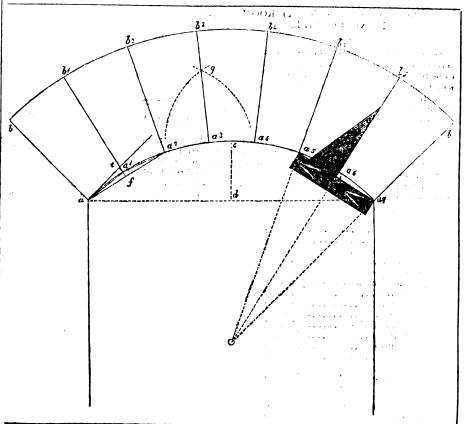

Fig. 2.

212

very many cases may arise in practice,—will also be of much service to architectural and mechanical draughtsmen, as it will tend very materially not only to abridge their time; but will save a vast deal of unnecessary trouble, and obviate the necessity of drawing the joints from the centre of the circle; or, by taking a_a as centres, and with a radius greater than half a_a , describing arcs intersecting in g, and then drawing the joint from a_a through g, and so on.

JOHN PHILLIPS.

INSTITUTION OF CIVIL ENGINEERS.

APRIL 22nd .- Sir John Rennie, President, in the chair.

The discussion upon the atmospheric railway system was renewed, and continued throughout the evening to the exclusion of every other subject. The principle of the basis of Mr. Stephen-

son's calculations, that the maximum uniform or mean velocity was attained, appeared to be conceded; but a question had been raised upon what was termed an inconsistency in the periments, which was the attainment of a steady height of barometer with an accelerating velocity. In order to subtantiate the view, that a maximum velocity had never been attained, the steady height of the barometer, and the principle therein involved, was dis-puted, while an acceleration, made up by grouping a number of the velocities registered in the tables, was advanced as an incon-sistency, amounting to a proof that the height of the barometer could not have been steady. The fallacy resulting from any arbitrary group-ing of these registered velocities, in any of which on error of eight miles per hour might exist, was shewn by a comparative analysis of the grouping. If column No. 4, in the tabulated experiments; was grouped into divisions of five observations in each; an acceleration of 1.60 would be shewn; but if the division be made into groups of four observations in each, a *retardation* of 8 would result. This clearly shewed that either an acceleration or a retardation might be established from the same figures, depending upon the method of grouping them, which was entirely arbitrary. test, therefore, of the amount of acceleration was considered nugatory. On the other hand, it was proved from the experiments of Mr. Stephenson and his assistants, corroborated by those of Mr. Bidder, that a perfectly steady height of barometer was maintained, and could be observed with the greatest accuracy, when there was nearly a balance between the power and the resistance, and therefore no forces were in operation to cause an undulation of the mercury.

As to the comparison between starting with a low amount of vacuum, and the getting up the steam under a locomotive, and then starting as soon as the steam would move the piston, it was contended that the raising the steam of the fixed engine ought equally to be taken as an element of the comparison if any deduction was drawn from it. In a similar comparison of the time required to attain a maximum speed by locomotives, on ordinary railways, it was shewn that it was rather a chemical than a mechanical question, depending upon the intensity of combustion in the fire-box, which would be at a minimum when the engine was stationary, and that it required a certain time to produce a sufficient amount of combustion to attain velocity; therefore the comparison was inadmissible A balance, by comparison was inadmissible. A balance, by figures, was established by Mr. Bidder, of the power given out and that observed by each of the resistances: from which balance that amount due to acceleration was ascertained, and it was shewn that this amount could only cause a certain amount of acceleration, which was all given out before the end of the experiments at Dalkey; and while the barometer was nearly uniform the acceleration was little more than was due to the progressive diminution of leakage.

THE DIFFICULTIES AND OBSCURITIES OF THE METROPOLITAN BUILDINGS ACT.

Sin,—Having by your courtesy been permitted recently to occupy so large a space in your columns, I had hoped that the remarks hazarded, principally upon points I conceived to be without the operation of the Act, would not have induced remark or comment on the future operation thereof. But feeling two points of difficulty to press very inconveniently as to the course to be adopted in practice, viz., the lack of declaration as to the reading put upon certain clauses by the official referees, and the obscurity of other clauses, where it would be unreasonable to expect either them or the district surveyor to give an intelligible reading thereof, I would suggest what appears a reasonable course to adopt in aid of the steps apparently intended to be taken by the note to your correspondent "Scrutator," in your journal of the 19th instant.

The Act is a public one, and I contend any party has perfect right to read for himself, and so read with a desire to conform to its enactments: I do not believe he would find let or hindrance from any constituted authority. That some men in new districts have offensively, in "litigious and unwise proceedings," exercised their "little brief authority " is quite true. Let them be met with firmness and fair argument; this evil will soon cure itself; and I quite believe that both referees and "the able and right-judging men," of whom you speak as district surveyors, will be very glad to come to a fair and intelligible understanding with their professional brethren, and those interested in the operation of the Act. The course I therefore would suggest is, at a timely moment, let a meeting be called, through the medium of an advertisement in your columns, perhaps aided by a leading article. At such meeting appoint a special committee to receive for a given period all communications: such committee, from the mass of evidence they will receive from parties who conceive themselves aggrieved, and taking up other points of apparent difficulty, viewing the whole with unbiassed minds, would be prepared to request a meeting with the official referees (which I feel satisfied would be accorded), and upon a fair and impartial statement, request them to issue a circular to the district surveyors as to their equitable decision or opinion upon the several points submitted to them seriatim. Having already assumed this authority in respect of matters in operation before the 1st of January, for all matters subsequently (being distinctly clothed with large equitable powers, and being the appellant court in case of difference), it would appear not to be probable that any district surveyor would venture to oppose his opinion to such a dictum, and the public would be too thankful to have such an authority as their sheet anchor.

In such a discussion I am fain to think, all parties would gladly avail themselves of the opportunity of drawing the attention of the legislature to the repeal or considerable alteration of many clauses. The referees and district surveyors can have no object in being at issue with their neighbours, and much good may be done by courteous communication. As a key to the kind of information that would be useful to such a proposed committee, I will give the evidence I have upon a few out of the number of difficulties that appear to present themselves.

From the part I have taken in the subject some professional men have asked my opinion upon the construction of schedule D. part 2, as to laying bond timber into walls, their doubt being strengthened by the district surveyor declining to give an opinion, which I think he was quite justified in doing. The paragraph alluded to states, "and every plate, lintel, bond, corbel, being of wood, and every wood-brick laid into any external wall, and all ends of joists, of girders, and of the heads and sills of partitions running into any external wall, must be fixed at a distance from the external face of the wall of four inches at the least." This would appear to be clear and intelligible : the point of difficulty is raised by the concluding paragraph: "But no timber must be laid into any external wall in such manner or of such length as to render the part dependent upon the wood for support, or so that any such wood might not be withdrawn without endangering the safety of the super-

incumbent structure, except in the case of brestsummers." I am surprised that any doubt should have arisen on this point, but it is a matter better set at rest as proposed. My reading would be, the first enactment is clear and positive—adopt it. Will any district surveyor be bold enough to demur to it? the onus probandi of danger would be with him, as contemplating the very unusual course of withdrawing bond-plates or joists. The Act permits the erection of nine-inch walls, and has suggested no new mode of construction to render unnecessary the laying ends of joists into such walls: the exception in favour of brestsummers would appear singular, as they generally have a considerable superincumbent weight. Let a district surveyor object in any case to so laying timber in a nine-inch wall ex uno disce onnes—no timber can be laid in such a wall, which would be an absurdity.

A difficulty has arisen in the minds of several professional men having works in operation under written contract, in consequence of section 9 declaring that, "the difference of the costs and expenses of the works when performed according to the provisions of this Act, and the works as stipulated for in such contract." are subject matter of reference. I consider this one of the most equitable clauses in the Act, viewing it as I do. It can have no relation to any written contract in respect of the completion of works commenced before the 1st January, and thus taken altogether out of the operation of the Act; but I can imagine not an extreme hypothetical case, where its operation would be essentially equitable. A party has entered into a written contract to build six houses of similar character and cost; three were so far progressed before the 1st of January as to be irrespective of the Act: the other three, not commenced, would come within its operation, and for want of conformity would be induced a larger outlay. The difference in such a case to be assessed by the district surveyor, or if disputed, by the referees. Here would appear a broad principle of justice: the contract who probably had taken the contract with prospect of small gain, ought not to be the sufferer by a change in the law of the land he could not contemplate.

I regret not being able to accord the same merit to sec. 10, relating to the modification of building leases, which I fear will lead to serious mischief and litigation; but being a question rather for those learned in the law, I will not attempt to discuss it, nor at present refer to other similar points of difficulty, but urge each party to make out his own catalogue of complaints as the first step to inquiry.

I would close these remarks by drawing attention to what would appear a serious difficulty in carrying out the intended operations of the Act as to schedule H. relating to " drains into sewers." This section is very imperative, but owing to the reservation of powers by sec. 51 to commissioners of sewers, will, I fear, in large districts be found perfectly inoperative. The question of sewage in densely-populated districts is now a subject of public interest, hitherto not sufficiently understood; it appears to be a matter more peculiarly addressed to our attention as in connection with house drainage, and it is with deep regret I feel myself bound to declare, that enormous sums in large districts have been so unscientifically expended, as to prevent the possibility of the sewers being rendered available for house drainage; thus throwing an insurmountable difficulty in the way of carrying a portion of the Act into effect, which contemplated the health and comfort of a neighbourhood. It is a subject at a future period I propose to intrude on your columns.

GREENWAY ROBINS.

NASMYTH'S PILE-DRIVER.—The first experimental trial of this invention was made at Manchester on the 19th ultimo. From want of space a 14-inch pile of 16 feet in length was employed; this the machine drove 15 feet into hard ground with twenty blows, at the rate of 65 blows per minute. Two of these machines will very shortly be in full action at the great steam dock about to be constructed by the Admiralty at Devonport.

CHARITY IN MARYLEBONE.—No less a sum than 1,500% has been distributed among the poor during the past twelvemonth by the district societies of this parish.

NEW INVENTIONS.—A meeting will be held at the Islington Literary Institution on Thursday, the 8th of May, at 8 o'clock, for the exhibition and explanation of new inventions. The secretary will be happy to receive models &c. for that purpose if sent free of carriage **prior to the 7th May.**

THE OLD SOCIETY OF PAINTERS IN WATER COLOURS.

THIS collection, consisting chiefly of land-scapes, is, on the whole, most unexceptionable. The artists in general have evidently struggled hard to surpass their competitors of "The New Society

The lion is certainly Cattermole's "Benve-nuto Cellini defending the Castle of St. Angelo," (300). For breadth, animation, and effect, this picture has hardly been surpassed in water-colour drawing. The figure of Benvenuti is extremely fine, well drawn, and magnificently coloured in the miniature style of scene painting, belonging only to this artist. Some plate on the left is very effectively painted. "The Visit to the Monastery" (330) by the same, is an exterior vying in beauty and

excellence with No. 300. "Instruction" (142), by J. W. Wright. A fine subject well treated. The two children are very beautiful, and the drapery broad and well cast, but the distance does not sufficiently retreat.

The next picture to it, by Copley Fielding, "View of Lancaster from the Coast," is a lovely drawing, remarkably sunny and rich in colour. " Danseneu on the Lahn, Morning" (75), by T. M. Richardson, jun., is a most beautiful picture, equal to Fielding. Other landscapes by this artist are remarkably fine

and well studied. "The Holy Well" (40), by Alfred Fripp; a clever and bold attempt, with much of the character and treatment of the same sub-ject by Topham. The head of the girl to the left, and indeed the whole figure, is very nice, but the other girl with upraised face, very nice, but the other girl with upraised face, although full of expression, strikes us as being deficient in drawing. His "Irish Mendi-cants" (152), displays mind and considerable feeling, more particularly in the old man, the hands of which are well drawn; the children are not so good. This artist's colour is pre-judicial to his pictures by the strong predomi-nation of cold, slaty greys. "Rowich Davotion" (10) by W. Hust is ition of cold, slaty greys. "Romish Devotion" (10), by W. Hunt, is

a most beautiful work; expressive pathos and unaffected simplicity are the leading excel-lencies of this perfect production; it is certainly Mr. Hunt's chef d'œuvre.

26. "Berne, Switzerland, Morning as it sometimes awakes among the Alps," by J. D. Harding. A fine landscape, broad and effective;

the sky somewhat exaggerated. "Café de la Place, Rouen" (30), by S. Prout. An elaborate and well-arranged draw-

ing. "A Cloudy Day" (112), by D. Cox, is a bold, fine sketch. Total disregard for any thing like prettyness and adherence to truth and natare are the strong characteristics of this artist. The same may be said of the "Corn Field" of Paul De Wint (221). Frederick Taylor's "Counting the Game

Bag," is a beautiful sketch, the effect of which, produced by a few vigorous touches, is won-derful. "The "Interior of a Cow-house" derful. "The "Interior of a Com-nouse (18), "Ploughboy and Cart-horses" (23), and the "Gipsy Girl" (268), are three other ex-cellent specimens of his happy and bold style. 57. "The Coast of Antrim," H. Gastineau. A bold attempt full of beauty, but wants depth and decision in parts

and decision in parts. "Scene in the South Downs" (92), by

Copley Fielding, affords an excellent example of the clever management of mist rolling between the distant mountains.

Harding's "Beilstein on the Moselle" is a beautifully subdued bit of warm colour. 13. "Eagle's Nest, Glengariff." A clever landscape, the mountains in the distance well

managed. "View from Bolton Abbey" (188), by George Fripp, a masterly piece of colour and effect, but the golden warmth of the sun is deteriorated by the excessive coldness of the greens.

eens. 51. "A Cast-away," by Oakley, is clever, the formed and theatrical. 139. "A

61. "A Cast-away," by Oakley, is clever, but rather forced and theatrical. 139. "A Gleaner," by the same, is much better, and is doubtless his best picture. 47. "Oratory, Naworth," by S. Rayner, is an exceedingly hold and elever drawing, very much in the style of Cattermole, shewing great power of execution. 91. "Lanercost Priory" is rather heavy, but very powerful.

C. Bentley has distinguished himself in (95) "An Indiaman lying-to," "Wreck on the Rocks of Elizabeth Castle, Jersey" (46),

"Ballyshannon, Donegal" (117), and many other capital landscapes and marine pieces. 85. "House of the Francs Bateliers, and

Church of St. Nicholas on the Canal of Ghent, W. Callow, is a capital picture, the best of this artist's many good works. 108. "Sunset, an effect from Nature," by

108. "Sunset, an effect from Nature," by F. O. Finch, is a very clever work in his style. 119. "Sir Roger de Coverley with the Gipsies," by George Harrison. A fine, rich landscape, the avenue of trees most effectively painted. 129. "Deserted," by the same, a read idea well treated

good idea well treated. 178. "The Weary Travellers," by J. M. Wright. Clever, but monotonous and flat in colour.

206. By J. Stephanoff, is "an amalgama-tion of Museum Studies," and a most elabo-rate piece of work it is. Nos. 202 and 204,

rate piece of work it is. Nos. 202 and 207, by the same, are very indifferent pictures. 210. "Hollyhocks," by V. Bartholomew. Nature itself, or rather a reflection in the look-ing-glass. 222. "Fruit," by the same, is perfect. 217. "Second Cabinet of Isabella d'Este,"

Lake Price. A most elaborate and beautiful

drawing. Another fine architectural drawing is (232) "Dumbarton Castle, on the Clyde," by S. Prout. 252. "Room in Gate-house, Kenilworth," by Joseph Nash, is one of his best.

The fruit pieces and flowers by Hunt are delicious; and two little pictures, 234, "Writing," and 266, "A Paper Lantern," are full of his usual natural truth, humour,

and originality. 293. "Ill Omens," by Wright, is an exqui-site morsel, though the flesh is rather too pink. "Love and Hope" is another beaupink. "Love and hope a Love a

Palmer, Morison, and Glennie have some excellent productions.

There are a few pictures that deserve censure, but we do not desire to find fault: we leave off while we can without offending.

MUSEUM OF ARCHITECTURE AND THE DECORATIVE ARTS.

Sin,-I am very glud to see that you have urged the importance of a Museum of Archi-The want of such an institution is tecture. tecture. The want or such an institution is much more felt by the artisan than by the architect's clerk; the latter has generally the opportunity of referring to his principal's library and collection of casts, whilst the former has seldom any thing else to refer to then the small collection of engravings &c. than the small collection of engravings, &c., which his slender means may enable him to gather together; and even these he is seldom able to classify, and is left entirely to his own judgment to select the good from the bad. The museum spoken of in your journal would be exceedingly useful and a very great boon, as far as it goes, to all engaged in architecture and decorative art, but would be still more so if it comprised specimens (either originals or casts) of the different styles of ornaments used for decorative furniture-such as the different periods of the French, the Italian, Renaissance, &c., and classified as proposed for the archi-tectural antiquities. Such a collection and classification would be of immense service to the decorative workman; he would then have an opportunity of correcting his taste and judgment, and of executing his work in perfect keeping with the style required. I speak feel-ingly upon this subject, as I have long felt the want of such a collection; for although from practice I may have a tolerable idea of the different styles, still, from the want of correct data, one cannot always be certain of the detail. A knowledge of the varieties cannot be correctly obtained from books; indeed there is but one that I am aware of, that makes any attempt to define the styles (Page's "Acanthus,") some of the examples in which are rather wide of the mark.

I trust you will not allow the subject to drop, and that through your influence a petition to Parliament for the promotion of this object may be drawn up. --I am, Sir, &c. April 23rd, 1845. J. B.

ROYAL COMMISSION OF FINE ARTS.—A notice has been issued by command of the commissioners to the effect, that works of art intended for exhibition are to be sent to Westminster Hall on or before Saturday the 7th of June.

LIST OF NEW PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &c., GRANTED FOR ENGLAND.

213

Furnished by Mr. A. Prince, of the Office for Patents of Inventions, Lincoln's-Inn Fields. [SIX MONTHS FOR ENROLMENTA]

William Henry Fox Talbot, Laycock Abbey; William Henry Fox I aloot, Inycous Hooty, Wills, for improvements in obtaining motive power, and in the application of motive power to railways. March 3. Alexander Gordon, Westminster, for an im-

provement or improvements in producing motive power, by the action or agency of heat, and in the application of that power to pur-poses of locomotion or navigation. March 3. Robert Frederick Browne, Knightsbridge, for certain improvements in the construction of obside and outputs.

for certain improvements in the construction of chairs and couches. March 8. George Selby, Birmingham, for certain im-provements in the manufacture of pipes or tubes of that class or kind which are formed by welding skelps of wrought iron. March 8. John Blyth and Alfred Blyth, of Saint Ann's, Middlesex, engineers and copartners, and George Parker Hubbuck, of Ponder's-end, Middlesex, engineer, for certain improvements Middlesex, engineer, for certain improvements in steam-engines, steam-boilers, and machinery for propelling vessels, which improvements in steam-engines and steam-boilers are for the most part applicable to the purposes of steam navigation, but are also applicable to other purposes for which steam engines or steam-boilers are or may be used. March 13.

Thomas Dunn, of Manchester, engineer, for certain improvements in, or applicable to, turn tables, to be used on or in connection with railways. March 13. John Ainslie, Redheugh, near Dalkeith,

North Britain, farmer, for a certain improve-ment or certain improvements in the apparatus and arrangements for the manufacture of tiles and similar articles from clay, or other plastic

matter. March 13. Pryce Buckley Williames, of Llegodig, North Wales, gentleman, for certain improve-ments in the manufacture of artificial stone. March 17.

John Cleaveland Palmer, of East Hadham, Middlesex, U.S., gentleman, for certain ma-chinery to be used in manufacturing certain kinds of tools for horing wood or various other

substances. March 17. Augustus Coffyn, of Paris, gentleman, for improvements in pumps. March 17. Henry Samuel Rayner, of Alfreton, Derby-shire, gentleman, for certain improved means of preventing anoidants to certaing on of preventing accidents to carriages on railways and common roads. March 18. Richard Weller, of Capel, near Dorking,

brick and tile manufacturer, for improvement in the manufacture of drain and other tiles and pipes. March 27. Joseph Courad Marie Baron de Liebhaber,

of Paris, in the kingdom of France, for im-provements in blasting rocks, and other mineral substances for mining and other purposes, and in apparatus to be used in such works. March 27.

BATHS AND WASHHOUSES FOR THE POOR. -The committee have nearly concluded the purchase of a site for the first model establish-ment on the north side of Whitechapel, be-tween the new street and Aldgate church. A working model of the selected design has been prepared and will be shortly submitted to the subscribers. It is said, that arrangements will be made to enable the very poor who cannot afford any payment to wash gratuitously during the summer. We learn from the newspapers, that an experiment has been made at the Eastern Asylum for the Houseless Poor which has satisfactorily proved that the very lowest of the poor will gladly avail themselves of facilities for will gladly avail themselves of facilities for personal cleanliness. On the evening of March 29, the apparatus, consisting of a boiler and tanks, with two hot baths (convertible into va-pour baths), six wash tubs, and a drying closet, through which a draught of hot air is driven with great velocity, was first used. At first there was some reluctance on the part of the inmattee to use the baths, but as even as they inmates to use the baths; but as soon as they had felt the refreshment of the warm water nad reit the refreshment of the warm water and clean clothes, they eagerly availed them-selves of it. During the first five days eighty-six persons bathed and washed; during the last five (the apparatus having been used nineteen days altogether) the number was 391 —the total being 987.

Carresvondence.

214

DISTRICT SURVEYORS.

-I fully agree with your correspondent SIB "Serutator" as to the despotism desired to be exercised over builders by the district sur-veyors, or at least by those in the new districts. I have myself experienced great inconvenience from the menner in which the clerk to one of the new surveyors (who acts by deputy) per-forms his duties. If he sees a barrow of bricks or mortar in front of any house in his district, he makes it his particular business to district, he makes it his particular business to catechise the labourers as to what they are doing. On one occasion he was told that they were cleaning and repairing some drains, and was not persuaded that such was really the case until he had leave to go in and see for himself. On another, he walked into a house where a bricklayer was engaged taking out a range, and seeing that the man was remaining range, and seeing that the man was repairing part of the chimney jaumb, which was found to be defective, he expressed much displeasure that no notice had been given to him before the work was commenced. The man replied that his master was not aware that it was necessary to give notice of such work; but the clerk said, his master had no right to think, that was his (the clerk's) place, and he wished to have notice in every case of works to be begun.

This gentleman also requests that a drawing may be submitted to him of any works pro-posed to be done in his district, which would certainly in some cases be desirable as well to the builder as to the surveyor, if the latter would say before the works were begun or estimates given, what part of the proposed works he perceived were contrary to the Act, and which he could not, therefore, allow to be executed; but all practical men will see the inconvenience and trouble occasioned by it in inconvenience and trouble occasioned by it in many cases where the job to be done is but trifling. For instance, I received an order to put up an outside spring-blind to a shop-front in the same surveyor's district, and, in course of conversation, asked him whether there was any objection to it? He said he could not allow it to be fixed at more than ten inches distance from the front wall of the house, I afterwards saw that he had allowed one to I atterwards saw that he has allowed one to to be fixed on the cornice of another shop which projected some two or three feet, and on representing it to him, he replied: "That shews you the folly of my answering questions abstractedly, you must send me a notice and a drawing of what you propose to execute, and I will survey the place;" which, I suppose, I will survey the place;" which, I suppose, also means that he will demand a fee for the same, and thus add considerably to the ex-

pense of a very trifling work. Now, if all the district surveyors were to perform their duties in the same vexations manner, the Act would become the oppression of all persons concerned in building operations; and I think that no time ought to be lost in calling a public meeting of the trade to means of defending themselves consider the from such arbitrary proceedings. I would wish, however, to bear testimony to the fair conduct of all the old district surveyors with I would whom I have come in contact since the com-mencement of the new Act, as they have all appeared willing to assist and advise the builder rather than to oppress him, and to endeavour to increase their fees at his ex-I am, Sir, &c., pense.

A SUBSCRIBER FROM THE FIRST.

POSITION OF ENCLOSURE WALLS IN KENT. SIR,-Will you have the courtesy to answer the following question, and by so doing clear up what I conceive to be an erroneous view of the law of freehold property, and settle a most

important object to all engaged in building? I hold certain land in this county, and am about to build a boundary wall in place of a hedge and dike which at present divide my land from the adjoining (which is arable). Of course I wish to take in all the freehold, and to build to the extent of my bounds; but I am told that "dike room" must be left for the purpose of ploughing the adjoining land, so that three feet in width along the extent of the boundary of the freehold must be left unoccupied for the convenience of the ploughmen of the adjoining occupier, in order that he may plough the land to the extreme boundary. I wish, Sir, to be informed whe-ther the common law maxim, "a solo usque

ad cœlum,' is, or can be, contravened by what I think may be termed "ploughman's law." By giving your opinion on the above, you will not only render an essential benefit to builders and building proprietors, but confer a favour on one who is at present Kent, April 24, 1845. A NONSORIBER.

•. • We know nothing that would lead us to suppose our correspondent can be prevented from enclosing the whole of the land which belongs to him : we should not hesitate about doing so.-ED.

ST. THOMAS'S CHURCH, WINCHESTER.

SIR,—In reply to the inquiry which ap-peared in your last, I beg to say the lowest tender delivered for St. Thomas's Church, Winchester, was, as I have just heard, between 6,000% and 7,000% exclusive of the materials of the old church.

The advertisement for designs stated, that a church was required to cost 4,000/. If the amount I have named is correct, great in-justice must have been done to the other competitors, as I cannot imagine that any but a very young and very green architect would, without additional means being placed at his disposal by the committee, have prepared a de-sign which has so far exceeded the stipulated amount. I am, Sir, &c.,

AN ADHERER TO STIPULATIONS.

P. S.—Can you tell me why Mr. Elmslie's design was sent in, in the name of his clerk, Webbe?

TERRA COTTA.

SIR,-Having seen the letter on the subject of terra cotta in THE BUILDER of the 26th instant, I beg to state, that as Mr. Sharpe has no connection with my works, it is scarcely fair that he should be troubled with questions which the manufacturer (and he alone in many instances) can best answer. I shall therefore be glad to reply to any communication on the be glad to reply to any communication on the subject, addressed to me, Ladyshore, Bolton-le-Moor, where I established extensive works in order to manufacture the terra cotta for Leverbridge Church, and where I am now engaged, along with various other works, in preparing material for another church now building at Rusholme, near Manchester, also designed by Mr. Sharpe. I take this opportunity of correcting an erroneous impression, which appears to be con-veyed by the amounts published in the "Com-panion to the British Almanac" and the "Illus-trated London News," by stating, that no

trated London News," by stating, that no "immediate superintendence" by the architect of any branch of the manufacture is now, nor has ever been, necessary to secure the correct execution of any work in terra cotta from plans drawn in the ordinary manner. I am, Sir, &c., John Fletcher.

Ladyshore, Bolton, April 29, 1845.

. We have received intimation that G. and C. Bishop, of 3, Benet's-hill, Doctors' Com-mons, have specimens of the Ladyshore terra cotta, and will give any information that may be required.—ED.

TESTIMONIAL TO MB. JOHN BRITTON, F.S.A.—At the preliminary meeting of the friends of Mr. Baitton, held on Thursday, the 24th ult., to consider the best means of testifying their appreciation of his valuable labours, committee of fifty gentlemen was formed, with power to add to their numbers; and it was power to add to their numbers; and it was resolved to adjourn till the 10th inst., and to invite the co-operation of all persons who are friendly to the object. The committee com-prise Messrs. W. J. Booth, E. W. Brayley, F.S.A., H. Broadley, M.P., F.R.S., W.Brock-edon, F.R.S., A. Burgess, F.S.A., W. H. Ludlow Bruges, M.P., L. Cubitt, W. Cubitt, T. Cubitt, J. G. Children, F.R.S., G. Corner, F.S.A., Peter Cunningham, T. L. Donaldson, C. Fowler, W. J. Donthorne, T. Grissell, G. Godwin, F.R.S., Nathaniel Gould, John S. Gaskoin, J. E. Gray, F.R.S., J. D. Harding, W. Hosking, F.S.A., W. Herbert, Dr. Ingram, Dr. Knapp, T. Longman, The Rev. J. Mit-ford, J. B. Nichols, F.S.A., H. W. Pick-ersgill, R.A., L. Pocock, F.S.A. Dr. Rees, F.S.A., Lieut. Stratford, F.A.S., The Rev. S. Turnbull, M.A., W. Wansey, F.S.A., T. Unwins, R.A., W. Tite, F.R.S., The Right Hon. Thomas Wyse, M.P., &c. resolved to adjourn till the 10th inst., and to

Aliscellanea.

METROPOLIS IMPROVEMENTS.-The Com-missioners of her Majesty's Woods and Forests have, during the last few days, issued their plans for the erection of the houses in -The Com-Endell-street, between Broad-street, St. Giler, Engen-street, between broad-street, St. they, and Long-acre, the gas and water-pipes having been laid down and the sewers constructed. The fronts of the several houses are to be "architectural elevations" of a uniform ap-pearance, and "no objection will be made to huildings of the style known as Elizabethan" buildings of the style known as Elizabethan." The ground excavated, if required by the commissioners, is to be deposited to fill up the low ground around the Millbank Prison. All the pieces of ground to be let on lease, for a term of eighty years from Midsummer day 1845, at a rent of one peppercorn for the first year, and at such rent or rents for the remainder of the term as shall be agreed upon; and the lessee is to forfeit all right to the lesse unless the carcass of each house be completed by or before Christmas-day, and the houses and all other buildings be rendered fit for habitation by or before Midsummer-day, 1846. The lessee is to reimburse the commissioners for the expenses incurred on account of buildfor the expenses incurred on account of build-ing the values and sewers, and for paving the street, at the ratio of 700% for a frontage of 114 feet 6 inches, or in lieu thereof 35% reat per annum. The width of the street is to be between 50 and 60 feet.—*Times*. Cost of GAS.—From various experiments recently made by Mr. Lumsden, of Monk-

recently made by Mr. Lumsden, of Monk-wearmouth, he found that one ton of cosl, which cost 16s. produces thirty bushels of coke, twenty gallons of tar, and 9,000 cubic feet of gas. If this is correct, and if we apply the result of these experiments, it will be found that the quality of onke and tar produced from that the quality of coke and tar produced from a ton of coal amounts exactly in value to the price of the coal used, and that the 9,000 cubic feet of gas, sold to consumera at its present price, yields to its. fortunate makers, the gas companies, a profit of not less than 31. 7s. 6d. GLASS PIPES. -- Mr. James Hartley, of Bishopwearmouth Glass Works, has, after ex-

tensive experiments, succeeded in establishing the practicability of making glass pipes, suitable for the conveyance of gas or water, and has it is also said, proved that pipes, stronger than the ordinary metal ones, and much chesper, may be made of glass.—Mining Journal. THE CITY MUSEUM.—At a recent meeting of the Common Council, Mr. Ashurst brought

up the report of the City Lands Committee, to whom had been referred the subject of the to whom had been referred the subject of the appropriation of part of the crypt at Guildhall for a museum. The report, which was ordered to be printed, stated that the clerk of the city works had certified that an outlay of 2,000/. would be necessary to effect the purpose contemplated.

SITE FOR BATHS.—At the same meeting Mr. Alderman Johnson presented a petition from the Committee for Establishing Baths and Wash-houses for the Labouring Classes, praying for a lease of part of Farringdon Market, next Shoe-lane, for the term of sixty years, at the yearly rent of 100%, at 2,500% premium. On the motion that the petition be referred to the Market Committee, a lengthy conversation arose, in which the majority of the speakers, though friendly to the establishment of baths, and to the general objects of the petitioners, were opposed to the appropriation of the site solicited for the establishment, on the ground that it would interfere with the improvements in the locality, with a view to improve the traffic in Ludgate-SITE FOR BATHS .- At the same meeting with a view to improve the traffic in Ludgate-hill and on Holborn-bill. The motion was in

the end negatived by a large majority. ARTIFICIAL STORE.—Mr. Frederic Ran-some, of Ipswich, has obtained a patent for the formation of artificial stone. This desiderature is accomplished by chemical process, of a novel description. The materials used are flint, or granite, or marble; and these when pulverized and worked up, form a thick silicious paste. This paste so produced, is placed in moulds of I his paste so produced, is placed in moulds of any given design, and upon being subjected to the action of an oven, the contents of the moulds become vitrified; thus the most com-pact and beautiful designs in slate, or granite, or marble, are produced, applicable alike for or-nament as for more substantial purposes; the material is said to be fully capable of with-standing all atmospheric changes, and is durable as fint

New Gavaones.-At the monthly meeting of the society for promoting the enlargement, building and repairing of churches and building and repairing of churches and chapels, held last week, grants were voted for the erection of new churches in the districts of Rainow, in the parish of Prestbury; Homer-ton, in the parish of Prestbury; Homer-ton, in the parish of Hackney; Ramsbottom, in the parish of Bury; Chapeltown, near Sheffield; Melplaish, near Bridport; Bishop's Sutton, near Bristol; and Bensham, in the parish of Gateshead. Towards rebuilding the parish churches of Wolsingham, near Dur-ham; Woolsthorpe, near Grantham; Fair-light, near Hastings; Great Musgrave, near Brough; and Kingsweare, near Dartmouth. Also towards increasing the accommodation by various means in the churches at Broughtoo, near Manchester; Gorlestone, near Yar-mouth; Naishead, near Bristol; Brompton Rolp, near Wiveliscomb; and East Knoyle, neur Hindon.

BRITISH ARCHEOLOGICAL ASSOCIATION. -The rival bodies are coming into closer col-lision. In consequence, as we learn, of the pressing invitations received from Winchester by the committee appointed at the general meeting held in London, they have determined to adhere to the original plan and hold their congress there in August. Lord Albert Co-nyngham has consented to preside. The meeting advertised by the other party is proposed to take place in September. Now is the time for all those who desire that the society should not be wrecked, and are not mere partisans, to come forward and declare they will not attend either meeting, unless a ccalition be brought about. A statement to that effect, signed by a hundred members of the association would surely induce both committees to pause before they risked failure. ST. MATTHEW'S CHURCH, GOSPORT.---

. -The foundation-stone of this church was laid in Foundation-stone of this church was faid in the presence of a large assemblage of persons of all ranks, by the venerable Archdeacon Wilberforce, assisted by the neighbouring elergy, on Thursday, the Poth dit. The site was presented by her Majesty's Honourable Board of Ordnance, together with land for ex-tensive national schools. The style of archi-tecture is the early English; Mr. Benjamin Ferrey is the architect, and Mr. D. Nicholson of Wandaworth the builder of Wandsworth, the builder.

RESTORATION OF STEPNEY CHURCH. An effort is now making to restore and enlarge the old parish church of St. Dunstan, Stepney, which has long been suffered to lie in a state of neglect and dilapidation. To carry out the proposed objects as they ought to be, the sum of 4,000% will be required, and as it is not possible to raise the whole amount among the inhabitants, the public at large have been appealed to for assistance.

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our readers however, they are entered in a book, and may be seen on application at the office of "The Builder," 3, York-street, Covent-garden.]

For the works required in the extensive enlarge-ment of the Liverpool Workhouse for the several ranches as follows :- Excavating and Brickwork. Masonry, including flagging, Joiners and Carpenters, work, including Ironmongery, Plumbing and Glaz-ing, Smith's Work, Slating and Plastering, and ing, Smit Painting.

For taking down part of the present County Gaol of Lincoln, and erecting a New Building on the site thereof, with airing yards and other requisites.

For building Sewers in Helmet-court, Wormwood-street; Sweet Apple-court, Bishopsgate-street; Fire Bell Court, Houndsditch; and Garden-court, Petticont-lane ; for the Commissioners of Sewers of the City of London.

For the reparation of ten houses in Houndsditch. The whole to be finished by the end of August.

For the maintenance of the Birmingham railway

between the Easton and Rugby stations. For the erection of an office for the Manchester and Leeds Railway Company. For building a school-room in London near the

bridges.

For the supplying of such quantities of Broken Guernsey Granite as may be required by the Poard for Repairing the Highways in the parish of Clerkenwell.

For the supply and delivery in Bristol of about 300 tons of cast-iron Water-pipes, of various di-mensions, from 7 inches downwards, with certain elbows, nozzles, &c.

For the Masonry Work of several Viaduois and Bridges.

For the formation and completion of a ne Drain, being about eleven miles long, twenty yards wide, and five yards deep, for the Middle Level Drainage Commissioners. Also for the erection of a Staunch, several Bridges of wood with brick abutments, together with the necessary culverts, and other marks and other works.

For the performance of the Works connected with the erecting of the new Pier at Penzance. For the erection of the Borough Gaol, Bir-

mingham.

For the supply of 1,200 lineal yards of 11-16ths est attested, close, short-linked Chain.

For the erection of a Building in London for a highly-patronized purpose, at the estimated cost of about 30,000*l*.

COMPETITIONS.

Plans for a Church to be erected within the Borough of Kingston-upon-Hull.

Plans, sections, and elevations for a Terminus, and other requisite accompanying offices, for the Great Southern and Western Railway, Ireland.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

The timber and other trees now standing upon the estate at Woodseaves, Salop. By order of the Lord Chancellor made in the cause "Dickin v. Barker."

At Mitchell's Farm, near Saffron Walden, A fall of 68 famous Oak, and six Ash timber trees with

the top wood. 250,000 Building Bricks, 40,000 Arch ditto, &c.; now at Sherborne Kiln, three miles from London.

At Patcham, near Brighton: a large quantity of Railway Materials; the whole of the Iron is of Staffordshire manufacture.

BY TENDER.

A Virgin Forest of Valuable Timber in Wala-ia. The principal part of the Trees is Oak. The chia. The principal part of the Trees is Can. and said Forest may produce about 500,000 cubic feet

BASTENNE ASPHALTE and BITU-MEN COMPANY, Offices, 31, Poultry. The Directors of this Company beg leave to call the atten-tion of ARCHITECTS, BUILDERS, and others, to the very beneficial results attendant on the use of BITU-MEN in the erection of buildings, &c. Its application as a FLOORING will be found eminently useful. It is also valuable for numerous other purposes, more par-ticularly where the object sought for is the EXCLUSION OF DAMP AND VERMIN. The Directors beg to refer to the works in Trafalgar-square, which have given general satisfaction. Scale of prices per foot square: -- inch thick, scd. 2 finch thick, 7.1, 5 inch thick, fdl. Works not mea-suring 400 feet, 1d. per foot extra. Moofing executed at 6d. and 7d. per foot square. Concrete is charged in addition according to the thickness when required. Carriage and men's time are charged extra when works are asccuted beyond three miles from the General Post-office. Bitumen atto per ton, without grit. Bitumen 25 per ton, with grit. CHARLES F. TILSTONE, Sec.

TO ARCHITECTS.

N consequence of many complaints having been made to the Company, by Architects, of a spurious material having been used in the execution of Works where the SEYSELASTEAD the had been specified for, the Directors, with a view to ensure the fallfuncat of any such specification, have suthorised CERTIFICATES to be granted to Builders where the

SEYSSEL ASPHALTE

SEVABLE ASTRACIE bas been used. For the purpose of securing the use of the Genuine Article, Architects and others are recommended to insert in their specifications the "Seyssel Alphalte, Cla-ridge's Patent," and not merely "Asphalte," or "Bitu-men," as in many cases where these terms have been used, gas-tar and other worthless and offensive compositions have been introduced. I. FARELL, Secretary, Stangate, near Westminster Bridge, Jan., 1845. Hock of Lastmeticane for Use may be had at the Office of

Books of Instructions for Use may be had at the Office of "The Builder," and of all Booksellers in Town and Country, price 15.

price 1s. *.* In proof of the necessity of the above advertisement, it may be mentioned, that it has come to the knowledge of the Directurs, that in certain works which have been executed by Messrs. Cartis, builders, of Stratford, a spurious material has been used by them, contrary to the specifications, which expressly mentioned, that " Claridge's Asphalte" was to be used.

TKINSONS CEMENT .- The public is A RELEVOING CEMENT.—The public is respectfully informed, that the price of this very ex-cellent Cement, which has now been in use for Architecture and Engineering works upwards of thirty years, is reduced to 2a. 3d, per bushel, and may be had in any quantity at Wyatt, Parker, and Co.'s Wharf, Holland-street, Surrey side of Blackfriars-bridge. A

N.B.-This Cement being of a light colour, requires no arti-ficial colouring or painting, and may be used for stucco with three parts its own quantity of sand.

MARTIN'S PATENT CEMENT. TO ARCHITECTS, BUILDERS, AND PAINTERS IN FRESCO.

FRESCO. STEVENS and SON, PATENTEES and SOLE MANUFACTURERS, beg respectfully to announce that this beautiful cement has now arrived at a degree of excellence far surpassing their most sanguine expectations. For all internal work it possesses a great superiority over every article hitherto in use; it is now being used extensively by Government in the British Museum and other public buildings. IT DOES NOT THROW OUT ANY SALT, but presents a beautifully plain and perfect surface, which may be painted upon dry work within four days without peeting. It is equally applicable for walls or task for mouldings, architraves, skirting, or flooring; and is admitted to form the best ground for fresco painting, having been used for many of the prize frescos lately exhibiting in Westminster Hall. It will bear an intense heat without cracking, and for hardness, durability, and economy, cannot be equaled. 18(5) DRURY-LANE, LONDON.

186, DRURY-LANE, LONDON.

Agent for Liverpool and Manchester, Mr. R Part, 11, Atherton's-buildings, Dale-street, Liverpool.

STOCKTON LIAS CEMENT,

STOCKTON LIAS CEMENT, MANUFACTURED upon principles laid down in Major General Pasley's Essay on Lines and Cements.—It is of a beautiful Stone Colour, and of ac-knowledged superior quality, free from vegetation, does not crack, and is well adapted for every description of modelling and costing. It has been extensively used at the Farl of Macclesfield's, Ensham-hall, by C. Barry, Esq.; at Sir F. Shuckburgh's, Shuckburgh-hall, by H. E. Kendall, Esq.; for Works now in progress at Marbury-hall, Cheshire; and for many of the Mansions crected during last Summer in the vicinity of London. for many of the Man vicinity of London.

WILMCOTE LIAS CEMENT,

Is of inferior colour to the above, from containing oxide of iron, but of very Superior Quality for Tunnels, Sewers, and Hydraulic Purposes; its use is stipulated for by Mr. John Roe, Engineer of Sewers, London.

GROUND LLAS LIME,

GROUND LLAS LIME, For Concrete, and every description of Hydraulic Work, for which purposes it has been used at Woolwich and Chatham Dock Yards, the London Docks, New Exchange, Hunger-ford Suspension Bridge, Westminster Bridge, Grand Junc-tion Water Works, Holborn Sewers, Regent and Grand Junction Canals, Wood Paving Companies, London and Bir-mingham Railway Company, for Works in the Alster at Hamburgh, the Kiel and Altona Railway, and various Sea Walls, &c. At R. Greaves's Works, Stockton, near Southam, War-wickshire, and at No. 2, South Wharf, Paddington, Lon-don.

KEENE'S PATENT MARBLE K EENE'S PATENT MARBLE CEMENT.—The Patentees of this composition beg to refer to the British Museum, the Royal Exchange, the new works at Bethlem Hospital, Greenwich Hospital, and the Co-liseum ia the Regent's-park, as buildings finished or in pro-gress, in which Keene's Cement has been used as an internal stucco. Its superiority to common plastering consists in its extreme hardness, and the rapidity with which it dries, which qualities fit it to receive paint or other finishing sooner than other water Cement.

When employed for skirtings, architrave, and other mouldings, in place of wood, it checks dry-rot, is impervious to vermine, prevents the spread of fire, and is more eco-nomical in its application than the material for which it thus becomes the substitute.

Confirmation of these statements is to be found in the almost universal adoption of Keene's Cement for Skirting and Hall fooring in the new houses on the Hyde Park Estate, where its application is to be seen to the fullest advantage.

In Liverpool and Manchester, Keene's Cement has in several cases been used for the covering of the fire-proof warchouse floors, where its lightness and hardness give it the preference over tiles and flagging, which are much heavier, and necessarily leave the floor intersected with numerous joints, whilst Keene's Cement is laid down in one unbroken surface.

The high polish and marble-like bardness of which this Cement is susceptible render it the most suitable material for the manufacture of Scagliola.

Patentees, J. B. WHITE & SONS, Millbank-street, Westminster, Manufacturers of Roman and Portland

Depót in Liverpool, 36, Seel-street, James Woods, Agent.

O ARCHITECTS, ENGINEERS, CONTRACTORS, Builders, Masons, and Plasterers, Mer-Chants, Shippers, and the public in General.

JOHNS and CO.'S PATENT STUCCO

JOHNS and CO.'S PATENT STUCCO CEMENT.-The following are the positive advantages possessed by this lavention over every Cement hitherto in-troduced:-It will defectually resist Damp. It will never vegetate nor turn green, nor otherwise discolour. It will never crack, bliater, nor peel off. It will form a complete Stone casing to any Building covered with it. It so closely resembles Stone that it is impossible to detect it. It never requires either to be painted or coloured. It will keep fresh and good in the cask in any Climate for any number of years. It is the only Cement that can be depended upon for export. It is the only Cement that can be depended upon for export. It is the only Cement that can be used with confidence by the Sea-side. It may be used in the bottest or coldest Climates at any season. It will adhere to any substance, even to Wood, iron, or Glass. It will carry a larger Proportion of Sand than any other Cement. It matures by age, and be-comes perfect when other Cements begin to perish. It may be worked through the Winter, as frost has no eiffect upon it. It may be used on the Inner Walls of new Housea, which may be aperfed over or painted directly. Roofs laid or pointed with this Cement will remain undamaged by the severest Storms. Any Plasterer may apply it, the Instruc-tions for use being very clear and distinct. The first cost of this material does not exceed that of the cheapest Cement valuable advantages, nothing can approach it in point of economy. Architects and Builders who have used this Cement have

conomy. Architects and Builders who have used this Cement have celared that it requires only to be known, to be universally

declared that it requires only to be known, to be universally preferred. Becimens may be seen, and a Prospectus fully describing the Cement and its mode of application, together with a volume of Testimonials from every part of the Kingdom, may be obtained on application to MANN and CO., SOLE AGENTS for the Patentees, 5, Maiden-lane, Queen-street, Cheapside, London: of whom also may be had, JOHNS and CO.'S PATENT STONE-COLOUR STUCCO PAINT, expressly intended for Painting over ex-terior Walls of Houses that have been covered with Homan or other Cements, and which have been covered with Homan or other Cements, and which have been over event white Lead Paint, which will frequently come off in flakes, being in direct chemical opposition with Cement; whereas MESSIRS. JOHNS and CO.'S PATENT FAINT having an affinity for Stucco, binds itself with it, stopping the suction, in the set of the suction of the suction in the MESSES. JOHNS and CO.'S FATENT FAINT having an affinity for Stucco, binds itself with it, stopping the suction, thereby rendering the wall proof against weather, and in the finish producing a pure stone-like effect, produceable by no other Paint whatever. It is cheap in its application,—and may be used by any Painter, in any climate, even in the most exposed Marine situations.

CAEN STONE

LUARD and BEEDHAM have a quantity of the above stone, of the best quality, direct from their Quarries at Allemange, which may be inspected at the Norway Sufferance Wharf, Greenwich.—Further particu-lars at M.E. G. GATES', 18, SOUTHWARK-SQUARE, SOUTHWARK.

BEST FARLEIGH DOWN FREE-STONE, CHEAPER THAN EVER, at the Wharfs of Mr. Hanson, Kensington; Messra. Druce, Chelsea; Mr. Rogerson, Pinilico; Mr. Poot, Westminstor; Messra. Brown and Russy, Bank-side; and Mr. Searle, Wapping. General Agent, T. E. Weller, Steel-yard Wharf (late Drewe's), Thames-street.

CUNDY'S MARBLE AND STONE WORKS, PIMLICO.

CUNDY'S MARBLE AND STONE WORKS, PIMLICO. THE BEST AND MOST DURABLE ROOFING.

By Per Majoriy's Patent.

THE PATENT ASPHALTE FELT FOR ROOFING, as improved by the Original Inventor and Patentee, can be had only by applying to THOMAS JOHN CROGGON, 2, INGRAM COURT, FENCHURCH STREET, LONDON. This Felt has been extensively Patronised by Members of the Royal Agricultural Societies of England, Scotland, and Ireland, and used in the Royal Agricultural Society's Gardens at Chiswick, and is the only Felt in which Asphalte is used without any mixture of Pitch, Tar, or Rosin, and in which Hair (the most durable article) is used, and is consequently the best non-conductor and the most durable. The advantages of this Felt are Light-ness, Warmth, Cheapness, and Durability, and the pric. is only 1d, per square foot, or 1s. 6d, the yard run, by 32 inches wide, being much less than half the price of States, Tiles, &c. There is also a Great Saving in the Tinaber, Carriage, and the Expense of Putting On. Samples, with Directions for Laying On, and Testimonials, sent Free to any part of the Town or Country. The Felt can be had of any required lengths, by 32 inches wide. T. J. Croggon respectively used by the most Eminent Architects. The New Committee Rooms of the House of Commons are entirely covered with it. There is no other "Patent Asphalte Fert Manufactory" in the United Kinedom than that which has been extensively used by the most Eminent Applate generally are therefore particularly requested to send their orders to

THOMAS JOHN CROGGON, 2, Ingram-court, Fenchurch-street.

As the only guarantee of having the GENUINE PATENT ASPHALTE FELT.

SATURDAY, MAY 10, 1845.

COHE first Monday in May is waited for with eagerness and anxiety by a large number of persons. That section of the public who regard

with interest the progress of art in this country look to the opening of the Royal Academy for an assurance that our painters, sculptors, and architects, are advancing, and pass up the staircase full of curiosity, and impatient to see what has been done. Many amongst them, by the operations of the Art-Union, have acquired the right of purchasing a picture, and, excited by a desire to have an early choice, and obtain what may really be a prize, enter with greater anxiety and stronger feelings of interest. But the class to whom this Monday is of the greatest moment is, of course, the artists themselves; the 800 producers, in the present instance, of the 1470 works exhibited ; to say nothing of a large body of persons who, having had their own productions refused, pay their shilling and enter depressed, to discover, if it may be, in what they are inferior to their more fortunato contemporaries.

Amongst the authors of the accepted work, the rising, the risen, - enter many beating hearts on that Monday, when they are to learn whether the result of the chief part of the past year's labour has been appreciated, and is likely to produce a return, or that his time has been thrown away. The failure of an artist at the public exhibition, let it be remembered, is, in nine cases out of ten, a failure for a year ; and, according to the position of his picture or his statue, is his chance of success. Many a pang have fine spirits suffered, hardly recovered from in some cases, on that first day: such pangs as those who are not in the same position are quite unable to conceive of. We remember the case of a young artist last year, which shews the effect of disappointment and wounded self-love on some minds. He had produced an admirable work ; it was the labour of the year, and went to the extent of his power. By accident rather than design, it was condemned to the "octagon room,"-the black-hole, as it is expressively called, and was as much put out of public view as if it had remained in the artist's study. So affected was the painter by the entire destruction of his expectations thus produced, that he immediately sold all that he had and left the country. We are free to admit, that we have no great faith in genius which is depressed by the first difficulties that occur, but there are few minds that can withstand repeated mortifications and disappointment, and the object of our remarks is to aid in awakening those on whom the onerous duty devolves of hanging the pictures at the Royal Academy, to the great responsibility attached to the office, and to induce greater and graver consideration to it than is sometimes given.

We would at the same time bid those who consider the treatment they receive not equal to their merits, persevere in their endeavours, and shew their real power by overcoming difficulties. An estimable member of the Royal Academy writing recently to one who had been to Rome, became national, and the only

BUILDER. THE

rejected by that body as a student, urged truly, that it would be much better in the end than if he had been admitted on the first trial; and cited various mortifications he had himself experienced, and the advantages which had resulted. At the conclusion of his letter, he says,--" There is a little song on this subject, the burden of which is 'try, try, try, again.' The wisdom of this ditty so struck my mind when I first heard it, that even to this moment whenever I am thwarted in a good object I sing 'try, try, try, again; ' and this we earnestly recommend to all our young readers.

The present exhibition at the Royal Academy, although wanting in the works of some of our best artists, and abounding in portraits, especially in the principal room, to an extent greater than usual, must be regarded as very satisfactory. Of first-rate works, pictures of high class, there are few, perhaps we ought strictly to say none; but in the next grade there are many of great excellence, to which we shall hereafter point attention.

The architectural room contains 138 drawings belonging to that subject, mixed up as usual with heterogeneous oil-paintings,-shipping, burlesque portraits, the Queen opening Parliament, and Austrian pilgrims. Few of the elder members of the profession are exhibitors on the present occasion. Messrs. H. E. Kendall, jun., Railton, Thomas Little, Gwilt, Wyatt and Brandon, Wigg and Pownall, Cottingham, Mocatta, E. B. Lamb, Owen Jones, Beasley, Douthorne, Derrick, &c., have drawings, but, as a whole, the collection offers no great claim for attention. We shall speak of it more at length next week.

For the illustration of our present number, we have engraved, from a drawing made for us by Mr. Richardson, No. 1,222, the Interior of a new portrait gallery now being erected at Drayton Manor, the seat of Sir Robert Peel, Bart., by Mr. Sydney Smirke, which is especially interesting, as being intended to receive representations of the most eminent men of the day. The length of it is 90 feet; the walls are to be covered with green silk of a diaper pattern, and the ceiling grained oak and touched with gold. The floor will have an inlaid Elizabethan border composed of various woods.

ANCIENT MODELS.

"You, then, whose judgment the right course would steer, Know well each ancient's proper character."

OF all the difficult inquiries which have so long delayed the elucidation of the principles of design, no one question in the wide field of esthetics has presented obstacles so insur-mountable as the correct definition of imitation, and the exact analysis of the extent to which it is valuable in architecture. The injury, which the art sustains during the present hiatus in its progress, is not lessened by any general attempt to unravel its fundamental principles; to balance and estimate the exact and relative importance of the antiquarian, the creative, and the purely matter of fact, and to bring about a state, in which the imitation of ancient models shall be an aid to art, rather than its object. It may well be said, that in all the freaks of fancy which have prevailed under the name of taste, the world has never beheld a state so singular and unsatisfactory that at present existing. The whole of Europe seems bent on producing structures, which may cheat the observer into the belief, that he has before him the works of another century, and there is no style at this day which we can call our own. It is not only that we shew an entire lack of invention, but we are not consistent even in imitation. From Grecian to Italian, Italian to Gothic, with short reigns of Louis Quatorzine and Cinque-cento, we change our fashions as often

style for imitation among a people comparatively deficient in inventive genius. Not long confined to the reproduction of Grecian temples, and the adaptation of columns plundered from their original sites, it became essentially different in treatment and in character, and now remains the most complete exponent of the characteristics of the people. So, had we any system, even in imita-tion; had we no more than one or two styles, and were not led away by every new fancy however opposed to the end in view, we might hope to find accurate imitation the forerunne of a style characteristic of the nation and the Exact imitation, even of objects the age. most beautiful, is not the highest quality in art, but it is the first and firmest stepping-stone to excellence. That imitation should be the first aim of the artist, we have the opinion of Sir Joshua Reynolds, who said that "by imitation only, variety and even originality of invention is produced." The choice of style is now regulated by no principle whatever; the same description of edifice may one day rise in the Italian as to-morrow in the Elizabethan, and often under the hand of one archi-tect. We are but students and experimenters, but have not the convictions to which experiment should lead.

We assume that the architect will well consider the purpose and object of his design, for unless these be his main endeavour, it cannot be doubted that the result of his efforts in the art will be incomplete and unsatisfactory. The practice of architecture has palpable and paramount objects; these must be arrived at ere the art of architecture is called into being, or Βy this itself will be defective and spiritless. many it has been argued, and with some shew of reason, that the origin of all beauty is in utility, but in architecture, which has other objects besides the gratification of the eye or even of the understanding, it must especially be allowed that art holds the second place, though it thus acquires a peculiar grace, which it would not have possessed in another mode of treatment.

" Still follow sense, of every art the soul, Parts answering parts shall slide into a whole, Spontaneous beauties all around advance, Start e'en from difficulty, strike from chance; Nature shall join you; time shall make it grow A work to wonder at."-----

But, while we assume that the purpose of the edifice is the first matter for the architect's notice, it unfortunately does not follow, that all are agreed as to the objects in view. The various influences, under which the Church of England at present exists, render it necessary for the architect of every work to choose one of two courses, and with the certain prospect, that in purusing one he will meet with all the enmity of the advocates of the other. There-fore, till the views of all as to the mode of celebrating religious worship are identical, it will continue to be the greatest injustice to con-demn an architect for exact imitation of a particular style, when such imitation is often best fitted to meet the ends proposed by his employers. It is true that the reproduction of Gothic churches has sometimes rendered it difficult to distinguish the architecture of the nineteenth from that of the thirteenth century, but let the requirements in a place of worship be once determined, and another century may commence in the progress of ecclesiastical architecture.

The objects and destination of the edifice being provided for, one of two causes might tend to a characteristic style; one-the com-plete oblivion of every thing we now possess, and a recurrence to the actual wants of manis manifestly beyond our influence; but a complete investigation of every style of archi-tecture, and the adaptation of all beautiful features, which do not militate with each other and with the actual requirements of the building, should lead to originality, and to the highest efforts of genius, unless analogous principles, evolved by the most able investigators in all the paths of art and science, are erroneous and devoid of foundation. It was an unalterable truth long before the time of Reynolds, that "by being conversant with the inventions of others, we learn to invent, as by reading the thoughts of others we learn to think." "There can be no doubt but that he who has the most materials has the greatest means of invention; and if he has not the power of using them, it must proceed from a

feebleness of intellect, or from the confused manner in which those collections have been laid up in his mind." Therefore to the architectural student, who is confused with the number of varying subjects open to his in-vestigation, we would say:--let no style be deemed valueless, but choose that; one as your chief model, which is best adapted to the requirements in view, and bears the character which you would wish to impress upon your works; discover the rules of art by careful examination and comparison of original examination and comparison of existing examples, always observing the pre-cise intention of each. A theory which would banish precepts and data from our notice, with a view to originality, is inconsistent with all investigation, and would name education itself a thing valueless and banaful. The present imitation of Gothic architecture is at least better than the state of that style a few years back, when not only were the principles of pointed architecture, but the universal principles of art, caricatured and destroyed. Our present knowledge is meagre compared with what it may become when the immense number of churches in England have been examined and classified ; our defective knowledge is the cause of the mere reproduction of old churches; but the day is at hand when originality will be as much the characteristic of modern Gothic architecture as of that of the middle ages. Therefore examine, study, and compare the Gothic churches of England; you will discover "more things than are dreamt of in some men's phiand matter which lies not in books losophy," and matter which lies not in books and portfolios. Gothic architecture is not to be acquired entirely at the office or the museum, but in the open air, and under the aspect of Nature, the creator and inseparable companion of the art. Е. Н. **** 1.

ON THE ART OF CONSTRUCTION IN BRICKWORK.

No branch of the constructive arts is of greater megnitude and importance than that of bricklaying. Yet we are assured, and can testify from experience, that no trade stands more in need of improvement than this does. Persons of known ability from their habits and experience, have written upon and improved almost all other branches of the building art, and the constructive art of brickwork has been but very little noticed. The poverty of bricklayers' knowledge is a proverb, and is a disgrace to them. Bricklayers and brickwork bave always of late years been conbrickwork have always of late years been con-sidered of minor or secondary importance, and this is not to be wondered at. They scarcely have any knowledge whatever of the general arts of construction; beyond the mere routine of the scaffold, and packing and piling bricks upon each other, they very rarely attempt to soar. The public-house is their in-fected haunt. There they spend a great portion of their time and more of their money, revelling in drink, which impairs their facul-ties, and keeps themselves and their facul-lies always in beggary. We believe that if a series of cheap publications were thrown in their way, treating upon practical and the most necessary and striking problems of theo-retical geometry, and the most approved methods of geometrical construction, is also an abridged treatise of practical mechanics, made plain, and divested of all technical phrases, but more especially a well-written, well-digested treatise upon brickwork, they would be induced to purchase them, and would become interested in their contents. This would lead to habits of study, which beget inquiry; and from thus understanding how interwoven are all the arts of construction, how dependent one thing is upon another, they would strive to improve themselves, and to execute work soundly and properly. The desire of the writer is to give, if pos-

The desire of the writer is to give, if possible, an impetus to the introduction of a better system of executing brickwork, and to create among all parties, but bricklayers more particularly, an inquiring spirit for the attainment of so needful a purpose. Disposition in this, as in other matters, is every thing; where a person is not disposed to do any thing it is not all the advising or telling in the world will induce him to do it; but create the disposition, and the object is better than three parts attained. If we can induce a disposition in bricklayers to execute work soundly and properly, that is all that need be done; the thing

will then work its own cure. It is impossible that some of the present ill-constructed dwellings can last many years ; they will ever be in want of constant and extensive repairs, and, in consequence, the parties into whose hands they may fall, will be disposed to encourage better work, and that of a more durable description. Let every bricklayer who has the welfare of his trade at heart strenuously apply himself to its improvement; study the excellent and approved specimens and methods of his art which lie scattered around him, and endeavour to raise it to what it was in former times, namely, an art. We feel assured that there are at the present time throughout England, many bricklayers who are eminently qualified to impart this knowledge; and if any one thinks he has more knowledge on this subject than the generality of his fellow workmen, let him apply himself to the laudable task of freely communicating it. No matter how trifling the item of information may be, the aggregate, when collected and properly edited, will be of value, not only to the bricklayer, but to the whole building profession. It is well known, and the history of past

nations and people confirms the fact, that a general taste for the arts and sciences has a considerable tendency towards civilizing and elevating the moral character of the popula-tion. Whatever subject a man may be employed upon, if there be any thing in it which requires more than mere ordinary skill and contemplation, he immediately, when encouraged, seizes the opportunity, and throws his whole energy and spirit into it, becomes in-creasingly interested in its perfection, and endeavours to produce a work that shall rival all former productions. In olden times, when architectural adornment was sought for in the art of brickwork, extreme pains were evinced on the part of workmen not only to give the exterior work a clean, neat, and close appearance, but at the same time the arrange-ment of the bond of the interior of the walls, so as to produce the utmost strength and security, was strictly attended to, as is evi-denced on observing the disposition and arrangement of the bricks in old walls. And in those times the art of brickwork was considered of primary importance, and its details and neatness of execution were to the archi-tect as well as to the workman, a peculiar source of study and gratification.

Bricks when properly made, well-burnt and sound, and when properly laid, are equally as good, strong, and durable for walls as stone. In all alluvial countries where clay is abundant, and where stone is scarce and not easily to be obtained, good, sound, and ornamental brickwork sppcars to be indigenous and general. Very many and important buildings throughout the continent, but more especially those in Italy and the south of France have their various moulded forms and rich details of columns, pilasters, capitals, architraves, friezes, and cornices executed in brick. Many parts of the finest compositions of the old Italian and French architects are executed in the same material : it is wreathed into forms so elaborate and the workmanship is so clean, neat, and regular, as not to require the assistance of any excrescences of plastering to work it up, or to improve its sppcarance. And without going further than our own country, specimens of beautifully executed brickwork may be seen in various parts where the soil has afforded the proper material for the manufacture of bricks.

Many parts of the ornamental details of the works of Wren, Inigo Jones, Vanburgh, Chambers, and indeed of many other architects since them, have been executed in brickwork, without the least dependance upon base, villainous cement-veneer. Beautiful specimens of excellently-executed ornamental brickwork may be observed in and about the metropolis. The back courts of Greenwich Hospital—the works of Jones and Wren—present most eminent examples of arched work; as also Chelsea Hospital, another work of Wren's. Although now in a dilapidated condition, Old Chelsea Church had originally considerable pretensions as an excellent piece of brickwork; indeed the whole neighbourhood of Chelsea affords very many well-executed examples, and more especially along Cheynewalk, fronting the Thames.

attained. If we can induce a disposition in bricklayers to execute work soundly and propoly, that is all that need be done; the thing

Kensington-palace, and the conservatory in the gardens contiguous. This latter may be the gardens contiguous. This latter may approached and closely examined; and sgain, and again, its beautiful well-performed work cannot fail to strike one with astenishment when compared with the villainous, falsely-called brickwork executing at the present time about the metropolis. The only fault to be observed in this beautiful piece of brick work is in the key courses of the niche heads at the north-west angle of the building; and this must have arisen from a default in the templet mould used in forming the other courses. But more respecting this division of the art of bricklaying hereafter. Other ex-amples of good old brickwork may be observed at Marlborough-house, the screen in front of Burlington-house, Piccadilly, Spring-gardens, St. Martin's-lane, and at the back of the Admi-ralty, all in the neighbourhood of St. James'sand the several streets in the immediate park neighbourhood of Covent-garden, exhibit fair examples of this kind of work. Good speciexamples of this kind of work. Good speci-mens may also be seen scattered about in and around the City, and to the eastward of Lon-don. The fronts of several houses in Lincoln's-Inn-fields, and some piers there, present some very excellently executed work.

But no where in and about London, is there any thing in this department of the building art that can vie, or excel the beautiful specimens of well-executed ornamental brickwork that are to be found in and around the Temple-gardens, between Fleet-street and the Thames. A few hours spent here in contemplating these examples cannot be otherwise than both grati-fying and instructive, and would teach bricklayers, if architects would give them the opportanities, to imitate the work. But it may be said that such work requires much time in its execution, and costs a great deal of money. Granted; but no work to be properly done can be performed without them. And, not better argument can be brought forward in its favour, and as to its ultimate cheapness, than favour, and as to its ultimate cheapness, than (withough the present specimens may be worn with age, and what is not?) that they are nearly, if not quite, as firm, sound, and perfect as when they first passed out of the hands of the bricklayers; while the plastering or veneering on walls requires an incessant expenditure of money to keep it decent and in repair. How often do we see beautiful moulded and neat brick fronts of old houses in the me-tropolis being covered with a coarse veneer of wretched cement no better than mud. tinselled and tickled up to please the fancy and taste of the present time; thus blotting out the abihand handiwork of our forefathers, which tics ought rather to be allowed to remain, or restored as it was executed, for workmen to contemplate and imitate, and improve upon it if they can.

In order that brickwork may be executed in a properly bonded, neat, and superior manner, is necessary that much time and labour should be spent in its performance; but ac-cording to the present system of execution, by competition and on speculation, he who can execute the greatest quantity of work, without any attention or reference whatever to its character for quality and stability, in the less time, is considered the best and most useful workman. At the present time, the custom among bricklayers is, that he who will offer to execute work at the lowest possible prices is sure to be encouraged by employers, and thus obtains the work; and in consequence of this debasing practice, each and every one who is striving to obtain employment is lowering the prices of work, and cutting his fellow tradesman down. The general result of this mode of proceeding is, that after commencing a building, the bricklayer finds he cannot perform the work soundly and properly for the prices, and in order to make it pay him, is induced, at all hazards, to execute the work improperly from a desire to get as much money as possible. This, then, being the case, as well as to make the workmen earn their wages, they are forced to execute work in a hasty, careless, rotten, and insecure manner. This method of pro-ceeding begets a recklessness in the general execution, and, in consequence, good work properly bonded is seldom, or never execute JOHN PHILLIPS. ř executed.

•.* We shall be glad to receive remarks and information on this subject from practical men, details of fire-work, &c.-ED.

BCCLESIASTICAL ARCHITECTURE.*

We continue our notice of the valuable article on this subject in the current number of the Quarterly. "It has been doubted whether we possess

"It has been doubted whether we possess any Christian edifice at Rome belonging to the age of Constantine. The late Mr. Hope places the earliest in the reign of Theodosius. This is a misconception, in consequence either of his supposing that the sacred structures of the Constantinian era which still exist were henthen temples, or of his forgetting that a baptistery was essentially a church, though not commonly called by that name. In Italy, every baptistery and every chapter-house has its alter; we believe, that, with respect to the latter buildings, such was equally the case in England. We are, however, very deficient in informa-

We are, however, very deficient in information as to the architecture of the Greek and Oriental charches. This deficiency, we trust, will be supplied by the increasing energy of our travellers. Asia minor might, without doubt, supply far more facts than have hitherto been obtained. Ecclesiastical archæology ought to be investigated with the same cheerful diligence which Mr. Fellowes has exhibited with respect to Hellenic and Lycian antiquity. One very remarkable specimen we possess in our own dominions. It is the portal of the church at Corfu, erected by Jovinian, A.D. 364, known only by means of an imperfect drawing given by Dr. Walsh.

Reverting, however, to the influence of hallowed locality, the first and earliest Christian churches of which we can form any clear idea, either from actual plans or existing remains, are the sepulchral churches of the Constantine sige; we commence our series by the most remarkable monument of the Christian world. In the florid description of Eusebius, we find an elaborate yet confused notice of the sacred buildings raised by Constantine at Jerusalem. The panegyrist exalts our notions of the munificence of the founder and the splendour of the structures: yet amidst his rhetorical phrases, we obtain only a vague conception of their ichnography. The Chevalier Bunsen has bestowed an ample commentary upon the difficult text, whose words, as we have observed, convey but an indefinite conception of the architectural arrangements. This information must be sought elsewhere, and we possess it. But it is not through the medium of the writers of Rome or Byzantium that we have heave heave heave heave

sented with the ground plot, which, however rude, removes all uncertainty as to the type presented by the Church of the Holy Sepulchre, or the plan according to which it was formed. Whence do we obtain this knowledge? Would it be guessed that we derive it from regions covered by almost impenetrable obscurity? Are we to seek our records of the monument raised by Constantine, amidst that opprobrium of our historical research, the Pictish race, or to obtain the solution of our doubts from the enigmatical Pictish realm? Amoagst the shadows of past times, are there any more visionary and unsubstantial than Taran MacEntifidic and Brudei MacDeirly, who flit before as like beings of another world? Yet it is in the remotest, the most secluded of the Western Isles, amongst the Pictish race, and from the Pictish wilds, that the knowledge, denied elsewhere, is obtained. Iona shines in the midst of Cimmerian darkness. Here flourished Abbot Adamnan, so distinguished by his participation in the great Paschal controversy, A.D. 705; and he supplies the architectural antiquary with the knowledge so much desired. We ouve the information to a singular contingency. After a long pilgrimage and continued residence in the Holy Land, a Gaulish bishop named Arculphus, driven to the Hebrides, became the guest of the Culdee monastery. Here he related his perils, describing the holy places he had visited; and the 'Licellus de loce's sanctis' contains his narrative. Rarely has any work been transmitted with

Rarely has a ny work been transmitted with more peculiarity and authenticity. Adamnan wrote upon his tablets from the actual dictation of the stranger; the notes so taken became the book we now possess. The Holy Sepulchre, as might be anticipated, was the main object of Adamnan's curiosity; and, in addition to the verbal description, Arculphus drew a plan of the buildings upon the tablets with his own hand."

* See p. 206, ante.

A copy of this plan is given, and affords some curious information :---

"From its sanctity and celebrity, the holy sepulchre became the primitive type of all the other churches of a circular form. It has been considered by most antiquaries, that the circular temples of ancient Rome, such as that of Vesta and the somewhat hypothetical Minerva Medica, constitute the models for the circular church; but this supposition, though plausible, is quite untenable. The oatline proves nothing. The circular shape would naturally suggest itself for buildings in which a sepulchre was to be the chief object; and there is a most essential difference in the type of the circular temple and the circular church, demonstrating that the latter cannot have been copied from the former. The temple has its detached columns on the exterior, supporting an entablature; the church has its detached columns arranged in concentric circles within, connected by arches springing from the capitals, forming one or more aisle or aisles.

Such was the church which Constantine raised over the tomb of his mother Helen, now called the Torre Pignaterra; but the ruin now exhibits nothing but rude brick walls, and we gain no knowledge beyond the fact of the adaptation of the form.

More perfect is the church of Sta Costanza, the burial-place of Constantia, daughter of Constantine, of which Mr. Knight has given an excellent engraving, plate iii. Some have supposed it to be an ancient Temple of Bacchus.

⁴ This opinion is principally founded on the mosaics with which the ceiling of the aisles is adorned, and which represent vine-leaves and grapes. But the vine is a Christian emblem, and is so frequently introduced in the decoration of Christian places of worship, that little weight can be attached to this circumstance. The architecture of this building is in conformity with the style of the time of Constantine, and not in conformity with that of a much earlier date.³.

The plan bears as much resemblance to that of the Holy Sepulchre as could be needed or expected in an edifice of contracted dimensions. But it shews how that edifice had become a type; and, except in the duplication of the pillars, it approaches closely to what we must suppose the Round Church of Cambridge to have been, before the erection of the modern chancel. San' Stefano rolondo is the largest of the

San' Stefano rotondo is the largest of the ancient round churches now existing, and the most perfect example of structures erected according to this type. The plan shews how very closely the model of the Holy Sepulchre was followed. It has been supposed that portions were added by Pope Nicholas V.; but from the comparison with Adamnan's plan, we cannot doubt that he merely repaired what had stood before. The earnest zeal exhibited by antiquaries to rescue any work of architecture from the reproach of Christianity, has induced them to contest for this church the honour, also claimed for Santa Constanza, of having been a heathen temple. Few indeed, especially of the Italiane, are disposed to abandon its primitive dedication to Faunus, instead of the protomartyr. In this oipnion they persist, though every part and feature of the structure—the difference of size in the columns, the coarse workmanship, the ill-fitted capitals and deficient bases, and above all, its total dissimilarity to any classical building all its characteristics fully prove its original destination. The period of its dedication (467—483), by Simplicius, is well attested. Still it remains a question whether he did more than reconstruct, or perhaps enlarge, an edifice previously existing on the same site.

We cannot pursue the history of round churches, est, ially as connected with the Knights Templars, from whom it is impossible to disjoin them. We can only remark here, that the Templars affected the round or octagon form in Italy just as in England, as is evidenced by the church of the Santo Sepolcro at Pisa, anciently belonging to the order.

Round churches seem, from the scanty remains and still more scanty descriptions, to have been common in Scandinavia. An obvious conjecture would be, that the type was borrowed from Byzantium, through the medium of Russia; but from the only example of which we possess a delineation, namely, the round

church at Soroe; we are certain that they are exactly in the Romanseque style of Western Europe. Soroe is a circular building, with a chancel; the arches which connect the columns are of the usual semicircular form. There is a similar church at Thorsager (the Field of Thor) in Jutland, and four in Bornholm. Greenland displays the foundations of similar round structures, erected by the extinct Scandinavian colony. A very remarkable building at Newport, in Rhode Island, is now supposed to be the remains of a church erected by the Scandinavian discoverers of Vinland, whose further progress in the new continent was so mysteriously withheld. The structure, as it now stands, consists of a circular colonnade; the pillars being connected with circular arches. Without entering into discussion, which could not be estisfactory unless accompanied by accurate drawings, as well as a survey panied by accurate drawings, as well as a survey of the style of masony, which alone could decide the question, it appears to us, on the face of the engravings published by the Co-penhagen Antiquarian Society ('Mémoires de la Société Royale des Antiquaires du Nord,' 1840. 1843) to be ontiguaires invite a cou 1840-1843), to be entirely dissimilar to any structure which we can imagine to have been raised by the pilgrim fathers of New England.

Whatever exaggerated extension may have been given to the principle of symbolism, it is nevertheless quite clear that this species of allegory, suggested by Scripture, did prevail in the primitive Christian structures. Thus we have seen that the Church of the Holy Sepulchre was supported by twelve pillars and lighted by twelve lamps. There were also twelve pillars in the adjoining Church of the Resurrection, upon which twelve lamps were placed, or suspended, in honour of the twelve apostles. From some analogy, not so easily perceptible, the octagon form was conconsidered as peculiarly applicable to the baptistery :---

 Octochorum sanctos templum surrexit in usus : Octogonus fons est munere dignus eo.
 Hoc numero decuit sacra Baptismatis aulam Surgere, quo populis vera salus rediit.'

And the octagon—the outer walls being often converted into a circle—constitutes the germ of those buildings so characteristic of the ecclesiastical architecture of Italy—we mean the detached baptisteries."

After describing the baptistery of San Giovanni Laterano, the writer continues :--"We now approach the Gothic age. In

"We now approach the Gothic age. In Italy, the custom of considering the cathedral, for many purposes, as the sole parish-church, continued unaltered; and with the one parish, the one baptistery. Whilst, therefore, the main type of the baptistery was retained with religious fidelity; still the accident of locality, or the influence of individual genius, or caprice, occasioned several marked varieties. Parma thus possesses a splendid baptistery of a very singular character. Mr. Knight's engraving (vol. ii.; plate xxiii.) gives an accurate representation of the exterior of this edifice; the interior, from its peculiar complexity, as well as from the height and proportions of the building, would almost defy the artist's skill. It was completed, except as to the vaulting, between 1196 and 1216, from the designs of Antelmi. The exterior is an octagon, but within it offers sixteen sides, formed by working in the thickness of the wall. The details of the architecture are very remarkable: for whilst the general forms are Romanesque, you observe, as it were, a species of inroad of Gothic taste, which preponderates in the upper tier of arches by which the exterior is surrounded. The portals below are Romanesque, of a fine character; whilst in the intermediate stories there are Gothic pillars, connected by architravee, upon what may be called the classical principle, though wholly without the classical form.

The detached baptistery continued peculiar to Italy, and perhaps hardly any example can be found beyond the Alps, except in our own island. Elgin furnishes the solitary instance where the octagon baptistery, in the most graceful Gothic style, groups with the cathedral, whose deformed and neglected ruins relate the calamities which the church of Scotland has sustained.

Whatever beauty the circular form may possess, it is, taken singly and simply, most unfit for the Christian liturgy: and whatever interpolations are made, detract from the simplicity

and unity from whence its charm arises, without rendering it appropriate for the service of the altar. Hence it never became a favourite in the west. Though the circular is unsuited in itself for a Christian church, yet if employed Though the circular is unsuited as a part of the plan, and connected with other members, it is susceptible of the highest excellence. Great difficulties, however, attend its application : the Byzantine architects may claim the merit of first attempting to work the problem, never entirely solved until Wren's transcendant talent raised our metropolitan cathedral :---

'An entirely new form for churches was, at an early period, introduced at Constantinople. The oblong was shortened into a square, with a view to the noble addition of the dome, which the Byzantine architects had now learnt how to support. This plan, especially after the creation of St. Sophia, became a favourite in the east, and was adhered to, in those parts, with the greater tenacity, in consequence of the schism which subsequently took place between the Pope of Rome and the Patriarch of Constantinople. There was to be a difference in every thing. The Greeks insisted upon the square form of their own inventions, whilst all the nations who continued to acknowledge the supremacy of the pope continued to employ the long form, which was persevered in at Rome.

'The Greek plan was, in course of time, in-troduced into Italy by the Greeks themselves, in such parts of that country as remained in the hands of the Greek Emperor, and in the north by the Venetians. — Intr., p. iii. Mr. Knight's observations with regard to

the antagonism of the eastern and the western churches, are entirely correct. Except when favoured by peculiar political relations, it is remarkable how little influence was exerted in Italy by Byzantine art. Ravenna and Venice are almost the only localities where we may trace any decided imitation of the type of Constantinople. Indeed, there was little to be gained. Deduct mere barbaric splendour — barbaric, perhaps, in the truest meaning of the word and there is a spirit, genius, energy, in the rudest churches of Latin Christendom, wanting in the most sumptuous edifices of the Greeks. The very buildings reflect the characters of their respective communities. Nor is it less important to remark, how entirely uninfluential are the noblest works of art in eliciting a corresponding talent amongst those who are accustomed to behold them. To judge of the accusioned to renoid them. To judge of the lessons which the productions of Phidias and Praxiteles imparted to the Byzantine artists, look at the 'tre ladri,' the group inserted in the angle of the church of St. Mark! Had it not been for later interpolations, San' Vitale, at Barenna (nlate in) would have been the at Ravenna (plate ix.), would have been the most perfect Italian specimen of the Byzantine

type. • This church was erected in 547, by Julianus, with the the treasurer, at the command and with the assistance of the Emperor Justinian.

The plan at once reveals its Eastern ori-gen, and its affinity to that of St. Sophia, which had been erected at Constantinople a few years before. Instead of a Latin basilica, it is an octagon supporting a dome; not, however, unprovided with the addition of the indispensable absis. This plan must have come direct from Byzantium, and was the first appearance of the Byzantine style in Italy. The chief architectural novelty and leading

feature in this building is the dome. No vaulting of any kind had ever been hitherto employed in the roofs of churches, much less that most skilful and admired of all vaulting, the cupola, samulation and authors of all valiting, the cupola, or dome; a mode of covering buildings per-fectly well understood by the Romans, but dis-continued as art declined, and, for the first time, reproduced by the Greek architects of Constantinople, in the instance of St. Sophia. If it is difficult to support the downwerd area If it is difficult to support the downward pressure and outward thrust of ordinary vaulting, how much more is required when the pressure has to be resisted at every point, and the circle above has, as is frequently the case, to be connected with the square below! This was accomplished, in the construction of St. Sophia. by means of what are technically called pendentives; brackets, on a large scale, projecting from the walls at the angles, and carried up to the base of the dome. At San Vitale, which is not a square, but an octagon, a series of small arches is employed, instead of pendentives, but setting upon the same principle. By this expe-

dient the dome is united to the body of the dient the dome is united to the body of the edifice. The thrust has then to be resisted by the thickness of the walls; and the downward pressure to be supported by arches and piers. In most cases the pendentives are exposed to view; but at San Vitale the mechanical contrivances are concealed by a ceiling. It was always an object to diminish the weight of the dome; and, with this view, materials of the lightest kind were employed in its construction. Sometimes a sort of pumice-stone was used. At San Vitale the dome is composed of a spiral line of earthen vessels, inserted into each other; and where the lateral thrust ceases, and the vertical pressure begins, larger jars are introduced in an upright position.' A long interval elapses before Byzantine

architecture reappears in Italy; for once only,

Sophia is a Greek cross, with the addition of spacious porticos. The centre of the building is covered with a dome, and over the centre of each of the arms of the cross, rises a smaller cupola. All the remaining parts of the building are covered with vaults, in constructing which the Greeks had become expert, and which are much to be preferred to the wooden roofs of the old basilicas.

Colonnades and round arches separate the nave from the aisles in each of the four compartments, and support galleries above. The capitals of the pillars imitate the Corinthian, and are free from the imagery which at that time abounded in other churches of Italy. is computed that in the decoration of this building, without and within, above 500 pillars are employed. The pillars are all of marble, and were chiefly brought from Greece and other parts of the Levant. Whilst St. Mark's was building, every vessel that cleared out of Venice for the east was obliged to bring back pillars and marbles, for the work in which the republic

took so general an interest. The defect of the interior of St. Mark's is, that it is not sufficiently light. The windows are few in proportion to the size of the building. Rich, therefore, as the interior is, it is gloomy to a fault, in spite of the brilliant rays of a southern sun."

The reviewer then proceeds to investigate more closely the causes which rendered the plans of the heathen temple, and the sepulchral church, inconvenient or inappropriate for the general purposes of liturgical worship, and lead to the adoption of another type, more adapted to the Roman ritual.

FALL OF YARMOUTH SUSPENSION BRIDGE.

It is our painful duty this week to record It is our painful duty this week to record the distruction of the suspension bridge at Yarmouth, accompanied by a scene of hor-ror which baffles all description. This dis-tressing and almost unprecendented calamity, involving the death of upwards of 100 per-sons, took place on Friday afternoon, the 2nd inst., and was occasioned by the breaking of the principal chains of the bridge one of the principal chains of the bridge, caused by the weight of an extraordinary number of persons being thrown on one side of the structure for the purpose of witnessing the absurd exhibition of a theatrical clown

drawn by four geese in a washing-tub. An inquest is now sitting on the bodies of the unfortunate sufferers, and doubtless competent persons will be examined touching the quality of the material of which the bridge quality of the material of which the bruge was formed, as well as the mode adopted in its construction. The bridge was erected by the late Mr. Robert Cory in lieu of the ancient ferry across the Bure, of which he was possessed, and was opened on the 23rd of April, 1829. The chain or either side is attached to four pedestals of piers, also of iron, and fastened to abutment stones.

In April, 1844, in contemplation of in-creased traffic to the railway, in order to afford sufficient width for carriages to pass, a platform for foot passengers was erected outside the bars on either side, it being the intention of the proprietors, on completing an arrangement with the railway company, and obtaining an Act of Parliament, which has been applied for this session, to erect a new arched stone bridge. It is to be hoped that Government will fol-

dents at Oldham and Northleach, and issue a commission of scientific and practical men, to investigate the character of the construc-tion in all its bearings; and it is matter for consideration whether they should not forth-with appoint a permanent board of competent persons to inspect all such and similar constructions before they are opened to the public.

It is due to the architect under whose direction the bridge was originally erected to mention, that he was in no way connected with the recent enlargement. In a letter from that gentleman which we have seen, and (although not intended for publication), ven-ture to quote, he says, "I have minutely ex-amined the bridge and the broken frag-ments, and I find that the main chain broke near the pier, from a flaw in the interior of the bar of which it is composed, which no human eye could see or any foresight could enable any one to discover. The fracture did not occur at the parts where the greatest weight was, nor was the weight equal to what the bridge had often sustained.

e all know that the axle of a railway carriage has given way from a similar cause after having stood all tests that human ingenuity could apply, as likewise chain cables break from similar defects in the annealing or moulding of the iron."

HOUSES FOR THE LABOURING CLASSES.

THE best means of improving the dwellings of the poorer classes of the population occupies at this time the attention of many. The effect of the residence on the habits, and of the habits on the morals, is beginning to be understood, and there is a very general desire abroad, in the words of the Duke of Norfolk, "to put the poor man's house in order." At Birkenhead, opposite Liverpool, where a town with docks, sewers, public grounds, and other far-sighted arrangements, is rising with sin-gular rapidity, an experiment is being made which merits attention. By the operations going on, great numbers of workmen have been brought to the place who require dwell-ings. The Birkenhead Dock Company have viewed the matter broadly: they have takon into consideration not merely profit and loss, but the comfort of the inmates and the welfare of their neighbours, and the course they have adopted, as we learn from our contemporary, the Spectator, is as follows :-- " They have They have found it a better economy to build large houses rather than cottages; they have adopted a plan prepared by Mr. Charles Evans Lang, of London; and the buildings are now in progress. The ground which they are to occupy lies between two of eight streets that meet in a circus, and may be described as a triangle; across which, from street to street, houses are erected in rows, with alleys between; there is a school-house at the apex of the triangle, and in the centre of the circus a handsome church. Each row resembles what in Scotland is called a 'land,'-a pile four stories high, comprising several distinct houses, each house having a public staircase communicating with the several 'flats' or stories; each flat divided into two separate dwelling-places. Each dwelling contains a 'living-room,' two bed-rooms, and a 'yard.' The living-room is capacious, and well-arranged for ventilation and comfort : on one side are the entrance-door and the door into the yard; on the next side, near to the entrance are the doors into the two bed-rooms: on the third side, opposite to the bed-room doors, is the window; and on the fourth side is the fire-place : nearly the half of the room, towards this fourth side, is left without any door or other opening, so that the hearth is removed from direct draughts. In this room there is a gas-pipe, for light. The 'yard' is a sort of gas-pipe, for light. gas-pipe, for light. The 'yard is a sort of scullery, but comprising the sink, coal-hole, dust-hole, &c.; in short, all the 'domestic offices,' packed into a very close space, but fitted with conveniences not always found even in the houses of the middle-classes. Up the whole height of the building is a shaft, with which pipes from each yard communicate: at the top is a cistern with a preparation for keeping it full, to the extent of 1,000 gallons of water; from which, independently of individual use, a stream can be at pleasure made to rush down the shaft, low out the course they wisely adopted a carrying away the ejicienda into the sewer, few months since with respect to the acci-

scale, for an Eye Infirmary in St. Mary-street;

that respect the most complete means for securing tidiness, decency, and health. The independent run of water will be a guard against many of the evils even of individual negligence; but it is inconceivable that with such conveniences the humble tenants should not acquire the better habits that await on opportunity. At the top of the building is an 'airing flat,' in which all the families whose dwellings open into the common staircase will have the right to dry their clothes. There is, we believe, some means of regulating the tem-perature of the whole pile of buildings: at all events there are appliances to secure thorough ventilation; and the whole structure is fireproof. The external aspect of these dwellings for the poor is handsome, and even imposing ; in a style so ornate, as quite to relieve them from the aspect of alms-houses; to which, indeed, they bear no sort of resemblance. Now it is calculated that this kind of house-property will 'pay,' even as a commercial speculation: with all this convenience, salubrity, and comfort for the tenant, and let to him at the rent which he usually pays,—the landlord, too, settling all rates and other charges, so that the tenant will pay for the whole house, its gaslight, water, taxes, rates, and all, one fixed weekly charge,-with all these unwonted comforts and facilities, the tenant paying no more rent than he is used to pay for bad lodging elsewhere, the landlord will yet reap a profit of 8 or 10 per cent. on the capital invested. In the present instance, that is not the whole ad-vantage derived by the landlords, the company; for they will find great immediate convenience in the concentration of their workpeople, and great henefit may be expected by all who have a stake in the town from the improved salubrity and the high character which these farseeing plans must secure for it. The experiment may prove to the speculative builder, that he could provide for the humbler classes a very superior kind of accommodation at a profit to himself; it may teach those classes what they should obtain for their money."

At Liverpool, we observed a short time since a file of houses for the poor, several stories in beight, called Kent-terrace, of which the upper stories were approached by means of a general balcony around the outside of each floor, with steps from the road at the two ends of the pile of buildings.

ARCHITECTURAL MEMS. FROM THE COUNTRY.

THE first stone of the new church at Lynn was laid by the Bishop of Norwich last Saturday week. The design is by Mr. Salvin; the contractors are Messrs, Bennett and Son.-Windsor Castle for several days past, between 30 and 40 carvers and gilders have been engaged in embellishing several of the private apartments occupied by her Majesty and Prince Albert when the court is residing there. Very extensive excavations have just been made on that portion of the north-terrace which is nearl opposite the George the Fourth Tower, for the purpose of forming large coal vaults, to communicate with the interior of the castle, so as to enable the coals to be delivered without, as at present, the waggons being driven across the quadrangle. After penetrating to the depth of between 20 and 30 feet, an immense passage, through which a portion of the drainage was conveyed from the castle, was discovered, leading, as it is supposed, to the river. In order to form a communication between the intended new coal vaults and the castle, it would be necessary to cut an operation which, it is supposed, if carried into effect, might not be unattended with some danger; consequently, a morning or two since, just after the labourers had arrived, an order suddenly reached them to discontinue the works for the present, and they have not been resumed.—At a special meeting of the committee of council of the Queen's Hospital, Birmingham, held a fortnight ago, it was resolved to erect additional buildings in connection with the hospital. A subscrip-tion was then entered into, the Reverend Dr. Warneford heading it by a donation of 500l. The intended new buildings will contain eight wards for the accomodation of 50 patients.-At Weymouth, a spot of ground has been selected, and a subscription opened, for erecting a building on an enlarged and improved

very liberal donations have already been made among which that of a lady, distinguished for her philanthropy, stands prominent, being for no less a sum than 400?.—Very extensive -Very extensive no less a sum than 400. Very extensive measures are being adopted by the inhabitants of Liverpool, towards improving the sanitary condition of their town. It has long been a disgrace to the corporation, that while expend-ing thousands upon the decoration of publio buildings, they neglected those true and vital interests which do not meet the eve. Several new church schools are about to be immediately commenced in the eastern dis-tricts of Leeds. Mr. Sugden, of Pontefractlane, has given the site for one in the York-road, and Mr. Rhodes, of Farnley Hall, has given a donation of 200% towards erecting a school in the Leylands. — Yesterday week, the Bishop of Ripon laid the first stone of a new church and schools, for the newly formed district of St. Andrew, East Moor, Wakefield. The government has purchased the lands of Broombill, near Glasgow, for the erection of cavalry and infantry barracks. The price paid for the property is said to amount to nearly30,0007.-----A pedestal 14 feet in height, surmounted by a bust of Sir Walter Scott, has recently been erected at Perth. ----has recently been erected at Perth. _____ James Foster, Esq., has signified his intention of giving the sum of 500/. towards the erection of an hospital in the neighbourhood of Stourbridge, and an annual subscription of 50%. There are about forty new cemeteries projected at present in Scotland. The committee appointed for the purpose of raising funds for the establishment of public walks and baths in Leeds, have determined upon holding during the present month & public exhibition of works of art, models of machinery, speci-mens of natural history, &c., and with this view they have issued a circular calling upon those who are friendly to the undertaking and capable of assisting, to lend them, for a period not exceeding three months, articles suited for such an exhibition.— Yesterday fortnight, St. such an exhibition.----Yesterday fortnight, St. Mark's Church, at Swindon, was consecrated by the Bishop of Gloucester, who took occa-sion to say that he had entered upon the ceremony with heartfelt gratification, from the peculiarly singular and novel direumstance connected with it, that this was the first church which was purely of railway origin.—At a recent meeting of the Ripon Diocesan Board of Education, an inspection took place of the plans, specifications, and estimates of the pro-posed new Training Schools, which had been prepared by Mr. Andrews, of York, and sub-sequently submitted to and approved of by Mr. Railton, of London. The committee having carefully considered the same, determined upon appointing an efficient clerk of the works to superintend their erection, and, with a view to invite public competition, to advertise as pub-licly as possible for tenders. The cost of the licly as possible for tenders. The cost of the erection was estimated at 8,000%, exclusive of 1,250/. for the site.—At a meeting of the Ipswich corporation, held last week, Mr. J. L. Clark, architect, proposed to fit up an apartment as a commercial news-room, for the reception of publications and for the transacting of business connected with the port, entirely at his own expense. The Mayor said this was a very spirited offer on the part of Mr. Clark, and he was deserving of the encouragement of the council, and of the patronage of the public. He hoped the council would permit Mr. Clark to have the apartment he required, for a year, at a pepper-corn rent.——The Sheffield and Manchester Railway is fast approaching completion. From the last report it appears that it will be opened during the approaching July. In the engineering depart-ment, conducted by Mr. A. S. Jee, under the consulting superintendence of Mr. Locke, there are features of considerable boldness. The viaduct over the vale of the Etheron is of three arches, of 150 and 130 feet span, supported by stone piers, built on rock, and 130 feet in height. The next work of magni-tude is the viaduct across Dinting Vale, near Glossop, of five arches, each 125 feet span, and length 500 yards. It crosses the vale at and length 500 yards. It crosses the vale at a height of 125 feet. The greatest work on the line is the tunnel at Woodhead, running through three miles of mountainous country, at a depth of 600 feet. The great difficulties encountered in its construction have tended to retard its completion ; more than four-fifths of the whole is now arched, and the remainder

has a drifting through it .--The Educational Board, in connection with the Diocese Ely, held a meeting last week, at which it was announced that the new schools at St. Ives, towards the erection of which the committee had granted 100*l*., were nearly com-pleted, and would be soon opened. The school at Stilton, which has been delayed for some months, in consequence of a difficulty respecting the site, was reported to be in course of erection. Applications were made by the Rev. Yates Fosbrooke for a grant towards the erection of a scholmistress's dwelling-house at Hurst, to meet a liberal donation on the part of the Lord of the Manor; and by the Rev. H. Randolph for an additional grant for Abbotaley schools.

PROCEEDINGS AT ST. PAUL'S CATHEDRAL,

Sin,-It was with feelings of deep regret I perceived that the stone-work under the western portico of St. Paul's Cathedral was being besmeared with paint, and I hope, by making it generally known through your widely-circulated journal, to cause some person in authority to remonstrate with the dean and chapter, or to bring it under the notice of their architect, Mr. Cockerell, so that we may not have its ornaments filled up with putty, nor its stonework reduced to one monotonous tint of rusty yellow.

It is painful on entering this cathedral to have those feelings aroused which it was founded to repress; but its dusty monuments, its whited walls, the insolence of its vergers, and the careless way in which the service is performed, make us look to the dean and chapter, whom we find, instead of emulating the deeds of their ancestors, resolutely op-posing every effort, however noble or disin-terested, which has been made to embellish or beautify this sacred structure, whilst they have concurred with every measure to spoil or desecrate it; and there is not a single instance of any attempt on their part to carry out the intentions of its illustrious architect, nor even to uphold it in its pristine integrity. The op-portunity of adorning it with paintings was lost when it was nobly and patriotically offered, and at a time when it might have been executed with the greatest ability, its stone-work, so beautiful and so free from stain, was covered with whitewash, and is now hideously blackened and disfigured. And had not the public outery caused those Brobdignagian braziers to be removed whose pipes de-formed its windows, another coat of whitewash would have been applied, so that while they are redeeming ornaments with penknives by inches, they are covering up cunning work, infinitely more beautiful, by acres. Though the bequests of Sir C. Wren, and

Though the bequests of Sir C. Wren, and other pious persons, have never been applied to enriching the dome with mosaic, filling the windows with stained-glass, nor to finish the altar with marble, with brass, and with gold, let them not mar the beauty of its exterior with paint, nor spoil the delicate beauty of those ornaments which the tooth of time has commit impressed. Let them not and avour to scarcely impressed; let them not endeavour to bonour their sovereign by dishonouring the temple of their God: let them make some little effort to prevent the desecration or decay of that structure which was built for the promulgation of the truths of His religion. One of the first bishops spent his whole fortune in erecting the former edifice. His successors enjoy the lands and the revenues, but enjoy the lands and the revenues, our leave the sacred edifice to the tender mercies of the painter, the whitewasher, and the putty-man. And I would appeal to the public also and ask who has a heart so void of feeling, or who has an eye so dull, as not to have been struck with its sublimity? or on passing its sacred threshold, whose soul has not been elevated to the praise of that Deity whose mercy, like the glow of the sun-beam, is re-vealed by the smiling face of Nature, whose power is charactered in flame by the lightning, and thundered by the billows of the deep. Let him, then, strive to save from defilement this glorious achievement of art-this crown of our city—this monument of the wisdom of our countryman, bestowed on him by God for our countryman, his own praise ! I am, Sir, your obedient Servant, G. A. J.

Trinity-square, 5th May, 1845. Digitized by Google

ON THE HAGIOSCOPE AND OTHER PARTS OF ALDERTON CHURCH, WILTS. BY JAMES THOMSON, M.R.I.A.

remarkable that there should exist no early historical record of Alderton Church, With a there are strong indications that it must have been one of the most ancient ecclesiastical structures to be met with in an English village.

I say village because I would not venture to extend my observation beyond that limit. I use it in contradistinction to those which exist in towns and cities, where it frequently happens that erections are made of a more massive and enduring character than are to be found in

villages. With respect to the village in which it is the words of our justly situate, I beg to quote the words of our justly celebrated antiquary, John Britton, who in his

* See p. 217, in present No.

"Beauties of England and Wales," published A.D. 1814, thus refers to it:" "Alderton, or Aldrington, is a village and parish situated to the westward of the Fosse-way,† on the confines of this county with (loucestership) Gloucestershire.

According to the Parliament returns of 1811, the parish contained twenty-nine houses and 153 inhabitants. This manor belonged for upwards of three hundred years to the family of the Gorcs, several of whom were knights or persons of distinction. The old manor house, which is still standing, is situated to the north of the village church, and is now the property

of a family named Hedges. Thomas Gore, an antiquary, and a political

Vol. xv., p. 2.
 † This Fosse-way is one of the Roman roads which pass through Wiltshire, being a branch of the Julia Strata, ex-tending from Beckford, is continued through Bannerdown, Easton Grey, across the turppike-road between Tetbury and Malmabury to Circuester.
 ‡ That was in 1814; it is now entirely gene.

writer of considerable note in the seventeenth century, was born at the manor-house of this village, in the year 1631, and received the early village, in the year 1631, and received the early part of his education at Tetbury, in Gloncester-shire. In 1647 he removed to Margiaken this lege, Oxford, and afterwards went to London, and entered himself a member of the society of Lincoln's Inn. He soon, however, quitted the metropolis, and retired to his patrimonial estate at Alderton, where he followed the beat of his inclination by devoting his attention to the study of antiquities and heraddry. In the lutter branch of knowledge, indeed, he become one of the greatest proficients of his age, and published several works on the subject written one of the greatest proficients of his age, and published several works on the subject written in Latin. Among these was 'A Catalogue of the Writers on Heraldry, with a Prefatory Discourse of Arms and Armoury,' which was first published in London in 1668, and again at Oxford in 1674. Mr. Gore, being considered a man of talent, influence, and property, was nominated high sheriff of his native county for

England there had been frequent intercourse from even a much earlier period than 1 have mentioned. It is therefore another work, also edited by Mr. Friend, that so early as A.D. 314, at the state of Arles, three British bishops attended of Arles, three British bishops of London, and Adelphius, or Courtee, and at a later period, but still earlier than the date 1 have referred to, viz., in the 7th century, it appears that the monsateries, both of Malmsbury and Gioucester, t existed. It is therefore not too much to imagine, from It is therefore not too much to imagine, from its local position being not more than 10 or 12 miles from Malmsbury, and the existence of its Norman porch, that this was an early outpost of those Christian missionaries.§

The porch consists of two slender columns, I he porch consists of two siender columns, nearly but not quite disengaged from the jambs of the door; they have capitals formed as in imitation of the stems of trees, just at the point where the limbs branch off, terminating in a square and filleted abacus. These columns support a semi-circular arch having very beau-tiful moulded chevron or zig-zag ornaments interwoven at right angles with each other. This brings me to explain the general features and condition of the church as it appeared in the spring of 1843, and is shewn by the an-nexed plan. It then consisted of a nave, about 40 feet by 17 feet internally, aisle about

EXTERIOR VIEW OF THE HAGIOSCOPE.

PLAN OF ALDERTON CHURCH, WILTS.

40 feet by 14 feet, a chancel about 22 feet by 13 feet, a square tower and a north and south porch.

The nave and aisle were, and still remain, divided by three early pointed arches rest-ing on Saxon (or I should rather consider them Romanesque) pillars, having moulded caps and bases, but without carving, and the whole supporting a roof of solid oak, which also is still preserved. There were also windows down to the latest perpendicular. The Chancel, to which I have more parti-

cularly devoted attention, was, I think, singu-lar in some points, and curious in all. I thad such a mixture of dilapidated dignity in its old features, and clumsy introduction of new ones, as to make one wish either that there were no such officials as churchwardens at all, or that they should be men of better minds.

The oak screen was not less remarkable for the strength and construction of its frame-work, than for the lightness and beauty of its carving. The massiveness of the former carving. The massiveness of the former enabled it to withstand the effect of time or the rude hand of man; but of the finer parts only enough remained to indicate what it must have been, and enable the artist to develope nave been, and enable the artist to develope them anew; some of these were found "used up" in other parts of the church "to patch a wall t'expel the winter's flaw." It con-sisted of three principal divisions, the two sides being divided into five compartments, each with moulded mullions, the lower ones inclosed with pannels, and the upper ones open and terminating in very beautiful tracery. The middlo compartment had an old ledged door, borrowed apparently from some outhouse in the neighbourhood, for it did not even fit the place. It was fastened by a padlock, and served to secure the miserable appendages of the church. These compartments were sur-mounted by a very bold cornice, in the hol-low of which a rich vine-leaf ornament, strung as it were together by a twining rope or cord, was introduced. The top was quite bare, but had a groove, and by chance I met with two or three pointed finials, the *tenoned* end of which upon trial was found to correspond with it.

I must not omit to mention a mistake into which I was likely to have been led by the ledged door just alluded to. It seemed very natural that a screen with a doorway should have a door, and I had proposed one to be made of corresponding character with the rest of the screen, and thought it worked out ex-ceedingly fortunate, as it would just admit of three similar compartments: when I came, however, to examine how a door had been originally applied, I found not only that there had been no door, but that it had not been designed to have one, and that two grooves existed in the side posts, shewing that the head of this opening had also been finished by tracery, to which I subsequently found a sufficient clue. These grooves did not come down more than about 12 or 14 inches from the top,

and there abruptly stopped. I come, therefore, to the conclusion that this aperture, if it had any inclosure at all, had some kind of curtain. The chancel also contained some very interesting monuments of the Gore family, before mentioned, who once possessed the manor of Alderton. One of these deserves particular notice, and an *alter tomb* of mess deserves cient date. This latter (probably of the 15th or 16th century) consists of a massive top having a moulded edge and supported by stone panels, divided into ficture in a support of the store of the store of the store of the support of the store of th divided into Gothic compartments, three of which have shields of an ancient character, attributed (from the hollow scoop on one side) to the time of the Crusades and Tournaments; and the only heraldic device being the chevron, traced in red colour across each shield each shield.

The former monument has a sort of Elizabethan framework ornamented with angels' heads and other devices. Within this was an arched niche deeply recessed in the wall, and containing in alto-relief a figure in an atti-tude of carnest prayer before a table or altar supporting a book; but the figure was at the sume time so gorgeously and quaintly dressed,

"With nip, and snip, and cut, and slish, and slash, Like to a censer in a barber's shop,'

that one was at first inclined to smile at its inconsistency, especially as it was emblazoned in the colours of the rainbow.

I am, however, induced to believe that even this attempt of the sculptor, whoever he night be, reached what in our monu-mental works of this day is not always attained, viz. the comprehension of those to whom it was addressed.

It shewed first that the person referred to was one of rank aad condition, and that his condi-tion did not render him unmindful of his duty to his God! Some indeed might contend that this figure was not designed to represent the deceased person at all, but that of his sur-viving relative who was occupied in saying masses for the soul of the departed. I do not, however, think that was the case, and whether so or not it does not alter the general inference that the parties were not less digni-fied than devout.

But although the church retained these good memorials of bygone days, it was fright-fully mutilated and distigured by the miscalled fully mutilated and disfigured by the miscalled improvements of later times. Thus, the chancel roof, which had been of fine old oak, with collar beams or arched ribs greatly de-cayed by neglect of the tiling, had for its sub-stitute a lath and plaster ceiling flat over the whole. It was deemed of little consequence that the head of the case mindew weeden whole. It was deemed of ittle consequence that the head of the east window was clean cut off, nor that a bulk head filled up the great chancel arch. For all this mischief the *amende* was held to be some new square deal tablets with "Batty-Langly" mouldings, and

Surmounted by a solid heart all on fire! There is something lamentably deserving of notice in this, viz. that the very iconoclastic spirit which led to the mutilation and defacing and destruction, as idolatrous, of what was at least refined in its character and imagery, had run into the grosser error of symbolizing the flame of divine love by so coarse and clumsy a device as this *

The mixed abuse and neglect of the chancel had naturally led to an equal malformation of the church: here and there would peep out a fine piece of old carved-work of various dates to the most decorated English, but these for the most decorated English, but these for the most part were hacked and cut to pieces; while to the solid oak carved ends of the seats were hung dwarf ledged doors, exactly like these of the size structure the seller.

those of the pig-styes in the village. The south aisle was in a worse condition with respect to dilapidations; by the decay of the collar-beams, the roof had so bulged the walls by its lateral pressure, that but for the porch, which acted as a buttress, it would have long been a promiscuous heap.

In the nave was another indication of change-ful times. The font had evidently stood at one time on the north side of the west pillar, thus presenting itself towards the chief door of entrance. This might be gleaned from the existence of a wrought-iron bracket, which had no doubt once suspended an ancient cover. The cover, however, at the time I speak of, was exactly like a copper lid, and the bracket was used to carry a common glazed street lamp to "light up" the church.

The feature of most "pomp and circum-stance" was a large square family new T stance " was a large square family pew, I believe the churchwarden's: it was raised on a platform, with sides so lofty, that no one entering the church could know if any persons were there (even though it might be full), except at those parts of the service where all the people stand.

It may be here proper to remark, that after scraping off the many coated whitewash, there was an appearance of coloured bordering round the arches (not fresco), but a sort of Roman ochre, exhibiting that scroll, the origin of which has been said to designate the waters, from its resemblance to the motion of waves.

And here, with respect to symbols, and ornament, and devices ;-surely the suitable adorn-ings of the church are not less incumbent on us than the bare erection of the walls. So long as we do not rest in them as objects of any vital and saving importance, they may be sim-ply an outward act of the inward grace which prompts the building of a temple to religion. We all know the rebuke which King David received for presuming to erect a temple at all; but nevertheless we learn that his son, Solo-mon, was permitted to build a "house that was magnificent;" and that the temple where

* As this is not the place for expressing theological opinions, I would simply remark what I have somewhere read, "that be the shade of Christian faith what it may, it rarely happens that the religion is in fault, but the errors which the minds of men engraft upon it,"

あるところで

the apostles Peter and Paul deigned to enter and preach had its "beautiful gate." But, not to multiply instances, which, in-deed, would be endless, to shew how proper it is that a church should be suitably adorned. I would quote an expression of one of our English poets, who says,-

"How lost to piety and virtue they,

Who with superfluous pageantry and pomp, Adorn their mansions and Neglect their God's !"

The most important marks of the antiquity of this church have yet to be noticed, viz., the formation of a hagioscope,* of which it may not be superfluous (as it is comparatively a new, or revived term in ecclesiology), to offer some

or revived term in ecclesiology), to offer some prefatory remarks. In one of the works published by the Cambridge Camden Society, and which has had very general circulation, the word is thus explained: —"By this term is meant those singular and not uncommon apertures which were made through the different parts of the interior walls of a church, generally on one or both sides of the chancel arch, as at S. Sepul-chre's, in order that the worshippers in the aisles might be able to see 'the elevation of the host. host.

The term in general use is "squint;" that used by some ecclesiologists "loricula;" the former is every way objectionable, and the latter unmeaning; and also elevation aperture was sometimes substituted.

was sometimes substituted. These apertures were usually oblong slits in the chancel wall, opening obliquely into an aisle or chantry; at Tillbrook, Beds, is an example of a chantry piscina, serving also for a hagioscope, as there likewise is at Castle Rising, in Norfolk, and at St. Mary's, Guild-ford, a benatura was thus used. Standground, in Huwingdowing of the set between one Huntingdonshire, has a hagioscope 00 both sides of the chancel.

In early Norman churches, their place is sometimes supplied by a small one on each side of the chancel sisle, &c." I think it is due to the rival societies of Ox-

ford and Cambridge, whether they continue to ford and Campridge, whether they continue to be, or cease to be, to admit that they have *done much* good, in their generation, and that to their efforts may be greatly attributed the revival of our ecclesiastical architecture. They have brought to light much valuable material, and possibly having done so (seeing that would not be in their province, nor, I may add, legiti-mately in their power to adopt them), they may be content with the good they have achieved, and rely upon the just appreciation of their labours both by the profession and by the country country.

To return to the subject of the apertures in question, which are marked on the plan, I would observe that they corre-spond as to their situation and direction with the examples alluded to by the Camden Society, viz., that they were squints in each side of the chancel arch, cut in an angular direction towards the high altar; but as it appears (to towards the high altar; but as it appears (to me) rather formed for hearing than sceing; as although their exterior was bulky, as you will perceive by the annexed engraving of the interior, at the time I speak of, was not more than 12 or 14 inches square. It is true they might have been filled up, and indeed one of them was filled up entirely. They also differ from any example I have yet heard of, in this, that they are cut so entirely through the walls of the chancel, that it became necessary to corthe chancel, that it became necessary to cor-bel out for them, and cover them over with a tiled roof. Moreover, they intersected the splayed jamb of the lancet window on one side, and on the other obliged it to be walled up. Indeed, much of these were not known to many to have existed, owing to the general decay of the church, and that it was thickly covered with ivy in many of these parts. The best in-terpretation that I have been able to come at is one for which I am indebted to a passing remark the other day of Mr. Scoles, and which has reminded me of other facts that serve to corroborate his opinion. serve to corroborate his opinion. He said, with reference to these sportures,

that there might have been side altars at the end of the aisle or aisles (and I believe it is in this day not uncommon in Catholic churches in one of his works, published 1843, ex-hibits such a one at St. Giles's, Cheadle).

* Hagioscope, from the Greek Angios, holy, acoptas, to

This suggestion brought to my recollection that the stone floor of the church at that end was considerably elevated, I should say more than a foot above the common level of the church," and indeed which ever way you passed round the end of the south aisle, you had to step up or step down at opposite ends. To return to the north side, as the tower of

the church is of much later date, it is more than probable that either a north aisle or transept and side chapel may have also existed transept and side chapel may have also existed there, and thus we get a probable solution of the whole matter. It may be also mentioned, as identifying the object of the aperture, that in one of them was found (and I happened to be present at the time) the clapper of a little bell, most probably the sancte bell, which is rung on elevating the host, and that no more should be found than the clapper may be accounted for by the probability that the bell itself was a silver one.

Now several curious inferences may be drawn from these facts; first, that the introduction of these apertures must have been at a very early date, and secondly, that the walls of the chancel must have been of one still more For if it had been considered that such apertares were necessary at the time of its original erection, they would have been better provided for, and the lancet windows would not have been placed in such a situation.

On the whole, I come therefore to the con-clusion (as I ventured to say in the commencement of this paper) that taking into considera ment of this paper) that taking into considera-tion the many features it contained, and some of which are still preserved, especially its Saxon pillars and its Norman doorway; its fine massive oak roof, and the existence of these curious apertures; its approximation to the old Roman road, and its relations to the abbeys of Malmsburyand Gloucester, it must have been one of the meet appear at structures to be met one of the most ancient structures to be met with in a retired rural district.

A few words are due, by way of explanation, for the parts of this church which have been necessarily removed in the recent repairs, as well as those which are preserved. Of the former, especially the hagioscope,

on one side a new chantry has been thrown out for the better accommodation of parish-ioners, and on the other a small turret leading to the before said, most of the ancient features. Of these apertures has been preserved, and, as I have before said, most of the ancient features. Of those which have been renewed I may also add, that they have been done in the most durable and substantial manner at the sole cost of a gentleman whom we have the honour to number amongst the members of the Insti-tute, I mean Mr. Neeld, M.P.: indeed, I think it is due to him to say, that in the restoration of this church, he has spared no expense to render it complete as an example of its kind; and that whatever faults it may have, they neither arise from any arbitrary rule in the proprietor, nor restricted means: the only condition he imposed was, that it was not to be forgotten that it was a village church.

Even the parts which were too dilapidated to be repaired, but to which their time-worn features gave value, he allowed to be preserved by the erection of a *rustic school-house*, in which they would be introduced; so that even for years to come they may (within a few yards of their former destination) be identified as the olden features of the village church.

NEW EPISCOPAL CHURCH IN CONNECTION wirst ris Sallos's Home. — At a public meeting held at Crosby-hall on the 30th ult., the Earl of Haddington in the chair, it was resolved that a subscription be entered into for the purpose of erecting and endowing, under trust, a church with free sittings for seamen frequenting the port of London. Captain Sir Edward Parry, R.N., expressed a hope that the example which they were about to set would have the effect of inducing other churches to be built in every port throughout this great maritime country. Before the meeting separated subscriptions were announced amounting to nearly 1,700%. Measures have already been taken for securing a site for the proposed church in the new street now forming in the vicinity of the London and St. Katharine's Docks.

Bo little care had been taken about the level when it was pplied to a different purpose, vis., burial vaults, that when became necessary to have an even floor, throughout the hunds, we had some difficulty to clear the crown arch of the sale.

THE DISTRICT SURVEYORS.

SIR,—I think your correspondent who signs himself "A Subscriber from the First" is rather too severe upon the new district surrather too severe upon the new district sur-veyors. I am living in one of the new Ken-sington districts, in a row of houses built about fifty years since, and which have the party-walls certainly not more than nine inches thick, if so much. My next door neighbour, an old lady, who has nothing on earth to do, has been amusing herself lately by having the interior of her house very extensively altered ; the staircase has been removed, and turned, I believe, in another direction. Now, Mr. Editor, for several days (within the last fortnight) her workmen were knocking at or into the party-wall between us: through which besides the annoyance that resulted from the noise commencing early in the morning, my furniture had to be removed, and I was in momentary expectation of some of the wall tumbling in. Now, was the new district surveyor informed by the builder of these operations? Oh no, nor was there any thing in the vulgar form of a "barrow of bricks or mortar" placed outside the house, to inform any one of what was going on within. All the brick rub-bish removed was carefully buried in the back garden, and the job was kept snug and comfortable. Before, therefore, a public meeting of the builders is called to consider the means of defending themselves from the arbitrary proceedings of the new district surveyors, I should recommend them to look at home, and to endeavour honestly and in a straightforward way to obey the new Act. I am, Sir, &c.,

May 3rd.

 \odot

SIR,-Having been employed to fix some zinc fannels upon the tops of chimneys above four feet high, I have complied with the Act in building two feet of brickwork round the same, but the district surveyors in two of the new districts, viz. Lewisham and Camden Town, are not satisfied unless they finger their fees; whereas none of the old surveyors have taken any notice of them.

The Act, I am sure was not made for the purpose of simply putting fees into the pockets of those gentlemen, but for the better protection of the public. I should feel obliged by your information as to how I am to act in the matter. I am, Sir, &c., Josh. Bird.

Seymour-place, May 5th, 1845.

. The district surveyors can claim a fee if they attend to see the chimney-pot fixed in accordance with the Act. The amount of the fee must be settled by the referees with the consent of the Commissioners of Works and Buildings.

We have received intimation that the next we have received intimation that the bext meeting of the master carpenters will be held at the Freemasons' Tavern on Wednesday, the 21st, instead of the 28th, when the working of the New Buildings Act will be considered by the board, "especially the alteration of the Act by the mercers in the neuroscience of the Act by the referees in the permission to over sail in extending the width of chimney-breasts, and in the fees to the district surveyors as to smoke-pipes and chimney-tubes; also as to the operation of the New Act in the price for party and party fence-walls if built 'previous to the present Act coming into operation."

We suspect the board are wrong in considering that the referees have made any alteration in the Act as to over-sailing to increase the width of chimney-breasts. See our last number, p. 205.

PROJECTIONS FROM BUILDINGS COM-MENCED BEFORE JANUARY LAST.-We have the particulars before us of proceedings relative to a bow from a house built before the 1st of January, which the district surveyor for Lewisham, in the face of common sense and the published award of the official referees in precisely similar cases, has thought proper to take. The matter has been heard by the referees, but as they have not yet made an award, we withhold comment for the present.

HUNGERFORD BRIDGE .--- It is stated that 20,000 persons paid toll between the hours of 12 and 1 on the day the bridge was opened. The directors and others dined together in the evening.

REASONS FOR THE REPEAL OF THE WINDOW TAX.

THE committee deputed by the metropolitan parishes to collect information on the subject of this obnoxious, injurious, and unjust tax, with a view to its repeal, have published a very able report. After commenting on the tone of the late debate on the subject in the House of Commons, the total absence of any attempt at argument in favour of the tax, the unanswer-

direct attention to the innumerable evils affecting the moral and physical condition of society, which originate in the imposition of this cruel tax. A tax on the light of heaven, and on the air we breathe, denounces itself in terms too strong for aggravation, too precise to admit of dispute. But if any confirmation of the ap-palling mass of human misery which it involves were needed, it is to be found, repeated again and again, in its minutest details, in the reports of sanatory commissions, and in the evidence of statistical inquirers, medical practitioners, and ministers of the Gospel; all bearing concurrent testimony against this crying iniquity. Disease, pestilence, and un-timely death; moral contamination, and a consequent large amount of crime, are among the results directly traced by these incontrovertible witnesses from the penalties unwisely imposed by the Legislature on the free enjoyment of light and air.

To what motive then are we to attribute the continuance of a tax so incontestibly noxious in its effects? Grieved, indeed, should we be, to be compelled to believe that it is maintained for no other reason than this--tha**t** while it presses on the poor mechanic and the humble tradesman, with a crushing prepon-derance, the scale under which it is collected is so arranged as to fall lightly on the rich, and scarcely to be felt by the opulent classes of society. Yet, if the tax be continued after of society. Yet, if the tax be continued after the late debate, in which these facts were proved beyond all possibility of doubt or denial, to what other conclusion can we come than that all its monstrous evils are inflicted for the very sake of this unequal pressure on the lower and middle classes, while the upper are purposely relieved by it from bearing their just share of the obnoxious burthen ?

From the data afforded by the Government Tables it will be seen that while houses having 20 windows are charged at the rate of 6s. 21d., and houses having 39 at the rate of 7s. 8d., houses having 180 are charged only at the rate 500 at the rate of only 2s. 7d. per window. But this is taking a very superficial view of the subject, a deeper investigation of which lays bare so enormous a disproportion as would scarcely be credited, if we were not prepared with undisputed and indisputable proofs of its reality. Unless it be the express object of the tax to exclude from our dwellings as far as possible the blessings of light and air, the only assignable purpose of taxing windows according to the above scale, is to be found in the assumption, that the value of houses increases in the proportion, and only in the proportion, of the scale up to thirty-nine windows, and in a much smaller proportion beyond that number. But so far is this from being the fact, that a very little investigation suffices to prove that the number of windows affords nothing like a definite criterion of the value of a house, either above or below the number of thirty-nine; but that so far as it can be applied, it is in houses containing a greater number of windows than that which is taken as the pivot of the scale, that the most rapid advance takes place in value in proportion to the additional number of windows they contain.

For the purpose of illustrating the gross, the almost inconceivable, inequality of the tax, we present the following table (drawn up from official sources), and confidently submit the justice and policy of the continuance of such a monstrous impost to the judgment of honest and reflecting men.

In this table, the *first column* shews the number of windows; the second, the moneyrate at which they are assessed to the windowtax; the third, the annual value at which the several houses are assessed to the property-tax; and the *fourth*, the per centage on their value, as assessed to the property-tax, borne

by the amount, which they pay to the window-

No middleity leak justiff, no sephistry can pulliate, injustice 'so glaring,' addr an anequivoes ascriftee of the proter to'the wealther classes,' as are exhibited in this plain table of official facts..' To add to 'its' injugity' would seem impossible; but 'We are much mistaken if the following 'table, illustrative' of 'the comparative amount of relief obtained by the rich and the poor accupions of houses from the repeal of the house tax, in preference to the window duties (which took place in 1834), do not excite equally strong feelings of indignation in the minds of these who reflect by what class it is that taxes are imposed and rejected. If that class has any regard for commun whice; any desire to remove the almost universal inpression that it legislates solely for 'its' own advantage, and without regard for 'the interests of the community at large, it will take the earliest opportunity of effacing from the statute book such a daming record as is here presented of the justice of the charge. Up to this time we may believe that they have legislated in ignorance; but the facts are now laid bare, the plea of ignorance will no longer avail, and the regeal of the window-tax is a debt which they owe to their own characters, if they wish to continue to be regarded and respected as men of honour and as men of principle."

THE BUILDER.

INSTITUTION OF CIVIL ENGINEERS.

APRIL 29th .- The discussion on the atmospheric system of railways, which had occupied the attention of the Institution for the two previous evenings, was renewed by Mr. Bidder presenting a statement in a tabular form, from which he clearly deduced the tractive force which the atmospheric system was capable of exerting over a pipe of a mile in length, and by taking from this the losses consequent on the friction and gravity of the train, shewed that which was due to the resistance of the atmosphere, &c. His statements were proved by reference to the avowed experiments of Mr. Samuda. His investigations also enabled him to render conspicuous the loss arising from the friction of the air within the tube, which accounted satisfactorily for some apparent discrepancies in the acceleration of velocity of different trains over the mile at the end of the tube. His views on this point were confirmed by the experiments of Mr. C. H. Gregory, and those published in the report of M. Mallet. The discussion of the basis of the deductions, reported by Mr. Stephenson, was then dis-posed of with the decided and generally prevailing admission of its truth.

The commercial part of the question was then entered upon, and the case of the Norwich and Yarmouth Railway was quoted as one of the most simple character, and one which would be of frequent occurrence. It was shewn by facts and authenticated statements of first cost and expense of working, that if Mr. Samuda's estimate for the apparatus, as applied to the projected Croydon line, was diminished by half, or from 6,000% to 3,000% per mile, the mere interest of the outlay at 5 per cent. would amount to 104, per mile per annum more than the present cost of locomo-tive power on the Norwich and Yarmouth line. It had been stated before the atmospheric committee of the House of Commons, that a much smaller apparatus could be constructed to do the work of this line. The fallacy of this assumption and the calculations were analysed and clearly exposed, inasinuch as it was shewn to be mechanically impossible for the contrivance to perform the amount of work for which it was designed, and that that work was not analogous to that which was required by the traffic of the Norwich and Yarmouth Railway, inasmuch as the bulk of the traffic was, of necessity, by particular trains, which rendered their weight about four times greater than had been estimated for.

The case of the necessity of a swing bridge of 100 feet opening for the passage of vessels, as at Yarmouth, was suggested as a mechanical problem upon which the adherents of the atmospheric system might be advantageously exercised.

On reverting to the loss arising from the friction of the air in the pipes, two of the principal mining engineers of England characterized it, from their experience in the ventilution of mines, as being of vital importance to the atmospheric system.

to the atmospheric system. The speeds attained on the South Shields and the Newcastle and Carlisle Railways, with the usual number of stoppages, were given, and the deduction substantiated that a velocity of upwards of thirty miles per hour was attained within, a distance of three-quarters of a mile from the starting point. Experiments were also quoted, shewing, 1st. That a locomotive train could be stopped in a shorter distance than the train on the atmospherie railway, the nett weight, speed, and number of brakesmen being identical; and, 2nd. That the engine and tender alone were stopped in one-fourth of the distance that the train alone was stopped. The main conveniences of the atmospheric system were incidentally alluded to, but were admitted not to be of great importance.

LIGHT FOR ALL NATIONS. -- Mr. William Bush has addressed a letter to the authorities at Lloyd's, in which he states that he has recommenced his arduous undertaking, by boring to accertain the substrate of the Godwin Sands; and, at 50 feet beneath the platform, finds nothing' but hard sand, hearly as solid as the rock itself. He appears confident of success.

Lew Books.

A Monual of Gothic Mouldings. By F. A. Paley, M.A., Hon. Sec. to the Cambridge Camden Society. London: Van Voorst. 1845.

This volume treats of the formation of mouldings, their gradual development, combinations and varieties, with directions for copying them. It is illustrated by nearly 500 examples, and will enable all who study it carefully to determine the dates of buildings with greater accuracy than by any other means. The subject is one of great interest, and, up to this time, only slightly investigated. As the author remarks in the introductory section :-"No person can have devoted much time

and pains to the investigation of Christian architecture, as it was practised in this country during the Middle Ages, without feeling the importance, and at the same time the difficulty, of acquiring an accurate knowledge of MOULD-INGS. That certain conventional forms or de-tails were in use at certain periods, and were uniformly adopted in the constructive decoration of all edifices, ecclesiastical and secular, throughout the length and breadth of the land, with varieties rather of combination or disposition, than of the component members, is an undoubted fact, well known to and admitted by all who have paid any attention to and admitted by all who have paid any attention to the subject. But whence these forms arose, whether from a natural process of gradual development, or from some esoteric principle of symbolical de-sign; whether they originated in some real or pretended secret of freemasorry, or, lastly, in mere secident or convice use curious queetions mere accident or caprice, are curious questions, which, so far as the author is aware, have never yet been made the subjects of much investigation. Again, how far the same forms were arbitrary or obligatory in ancient freemasonwork, how far they emanated from some par-ticular source, and were dispensed by authority through the country, or were assumed by some tacit agreement on the part of the masons themselves, are equally interesting speculations, though, perhaps, equally difficult to determine. However this may have been, it is quite cer-tain that a strict intercourse must have been kept up between the members of this body of artisans, or almost every ancient church would exhibit new and strange varieties in the details of its mouldings. When we consider the difficulty which then existed of constant and speedy communication between distant parts of the country, this general resemblance and uniformity, not only indeed in mouldings, but in all the parts and features of Church architecture, must appear still more surprising. There is in all these enough of licence and variety to make the knowledge of them a comprehen-sive and difficult study to us, and yet such evident resemblance and decided adherence to rule, as to convince us that some system must baye been observed both in designing and executing them."

From the apparent extent of the inquiry, the want of a reduction to leading principles, it has been shirked by modern architects, and many works consequently exhibit in the mouldings most striking, anachronisms and confusion of styles. We are disposed to think the book now before us will do much towards inducing, a more careful investigation of the subject, and we recommend our readers not merely to buy it, but to study it carefully.

The necessity of *copying* mouldings in order to understand them is very properly urged, and the precautions to be observed in using the *lead tape* for that purpose, are pointed out. The practice of copying mouldings by the eye alone is of great importance; by practice the eye becomes familiar with the varicties, and in a very short time, a power of delineating with accuracy may be attained, which renders the student independent of mechanical aids, and enables him to proceed more rapidly than by any other means. The planes in which the mouldings lie, and the relative proportion of the parts are chief points to be observed.

the parts are chief points to be observed. "In considering any series of mouldings previously to copying them, the first point is to lay down on paper the various planes, that is, to ascertain the plan of the arch, or other feature, before the mouldings were cut. When this is done by accurate measurement, the rest of the process becomes comparatively casy, and the most complex and extensive combination, which it appears at first sight impossible to copy with any thing like accuracy, may be res-

Digitized by GOOGLE

dily disentangled, analysed, and sketched with precision. Without attending to these facts, all attempts to do so will be futile.

It may be alleged as a general rule, that Early English mouldings lie on the planes rectangular; that Decorated, according to their kind, fall either on these, or on the chamferplane atone; and that Perpendicular mouldings almost always lie on the last. If some mem-bers seem to fall short of one plane, they will generally be found referable to some other; if they fall on the segment of a circle, which is much more rarely the case, the in-climation must be determined by bending a ruler of piece of lead across them.

A writer in the English Review for Decem-ber, 1844, has the following remarks on the And thus in general we measure, or, if the expression may be used, we read and peruse a Grecian mounding by its lights, and the Gothie by its shadows." Again: "Of the differences between the two classes of moulding, some may be detected by a superficial view. For instance, the Grecian delights in convex lines, the Gothic in concave; the Gre-cian in broad lights, the Gothic in narrow. The Grecian throws out projections to catch the eye; the Gothic endeavours to bury it in deep recesses. The Grecian leads it gently along in sweeping, unbroken undulations; the Gothic fractures its lines, and combines them in angles and curves. The lights and shadows of the Grecian melt and side insensibly into each other; those of the Gothic are planted each other; mose of any count are plant together in strong and hold contrast. . . . In the purest Grecian buildings, vertical mouldings are rare. Horizontal mouldings in the purest Greetan ballings, vertical mouldings are rare. Horizontal mouldings form the leading lines; and it is by these, even in later and degenerated specimens, that the vertical mouldings are regulated. In the Götthic, vertical mouldings are most frequent; and they overrule and determine those which and they overfule and determine those which are horizontal. And Grecian mouldings are simple and easily divisible into parts; Gothic are entangled in labyrinths, and perplexed with innumerable intricacies."

To the subject of Gothic mouldings, their developement and varieties, we shall shortly recur. - . -

Correspondence.

DIFFBRENCES IN BUILDERS' BOTIMATE. Syn,-I take the liberty of forwarding to you the amounts of the tenders for a large hotel at Whitehaven, Cumberland, for the Barl of Lonsdale. The difference between the highest and lowest is most extraordinary. Mr. Nelson, one of the parties, is an architect and builder at Carlisle, and a person well acquainted with the place and prices, having built several large edifices in the town. I went down and made strict investigation as to every item, I had to price out, and assure you that I went very closely into the estimates for Messis. Burton: How can you account for the difference, when all parties were furnished with the quantities by the architect, Mr. Carpenter?

BRITISH ARCHÆOLOGICAL ASSOCIATION.

SIR,-The very liberal and impartial view you have taken of the dissensions which have unfortunately arisen in the Archæological Association, induces a belief that your columns are open to advocate an adjustment of their differences, which, it should be remembered, by the committee on both sides, have involved the whole body of members in their quarrel. There are few lovers of the history of their own country who did not gladly hail the attempt to form a society having for its objects

the promises their first prospectus held out, and a proportionate degree of disappointment, within a few months, to see the association threatened with dissolution. Not from want of objects for investigation, or money, or talent, but a mere difference of opinion amongst the members of the committee on a truly slight ground, the subject of which, as well as the consequences, are too well known to require repetition. The position of both sides is ab-solutely absurd, if not melancholy, when it is considered the bitter feeling that this really trifling cause has engendered in the lists, in-cluding some of the first spirits of the day, as well as reverend divines.

I would beg to suggest, to the latter more especially, the propriety, not to say duty, of offering their services in a spirit of conciliation to bring about a proper understanding, and I venture to predict, their endeavours towards an adjustment of their differences would be attended with good results. I am, Sir, &c. P. A. X.

INTERCOLUMN AND INTERCOLUMNIATION. SIR, -- According to Nicholson, both the above terms convey a definite meaning. In-tercolumn (from the Latin inter, between, and columna, a column) signifies the open sroe between two columns. Intercolumnistion, the distance between columns, measured by their lower diameter.-I am, Sir, &c. N.

Miscellanea.

FALL OF A VIADUCT AT ASHTON. -- We stated in our last impression, that an inquest was then sitting on the bodies of the unfortunate persons who were killed by the falling of and persons who were killed by the laming of nine arches in the Ashton branch Railway. At the request of the coroner, Mr. Samuel Holme, engineer and builder of Liverpool, in conjunction with Mr. Bellhouse, and Mr. Lee â Manchester, made an examination of the ground and works where the accident occurred, with the view of finding out the cause. In their report they state that on examining the plan they found the interior filled up with rubble stone mixed with scablings and brickbats negligently thrown in, without being regularly bedded, with mortar of a very inferior quality, all of which bore evidence of the slovenly execution of the works. The report. which was lengthy, concluded with the following declaration : - "We cannot close this painful examination without expressing our opinion that great blame has been incurred, and that this accident has taken place through the inferiority both of the material and the workmanship. We refer particularly to the construction of the piers. These were totally insufficient for sustaining the weight which had been placed vertically upon them. The The pressure could only act on the exterior casing, for the interior did not in the slightest degree contribute to their strength, and would not have borne their own weight if the exterior casing had been removed from them. The want of binders also, to connect the two sides of the piers together, has been a most fatal error, and painful as it is to us, we are com-pelled to state that in our opinion, this accident would not have occurred had the works been executed in a proper manner.¹⁰ ,⁴¹he jury returned a verdict of Accidental Death, accompanied by the unanimous expression of their opinion, that they considered the sole cause of the accident to arise from the insufficiency of the works and the inferiority of the material used, together with negligence of the men and the contractors, also that of the company's servants, and a request that the coroners would forward the evidence taken before them to the Lords of the Privy Council or the Board of Trade, with the view to the Government sending down some competent engineer to inspect the whole of the works prior to the line being opened to the public.

NAMES OF STREETS .--- Monmouth-street, named after the unfortunate son of Charles the Second, so well known from its being the residence of the purveyors of second-hand habiliments, has had its name changed to Dudley-street. Petticoat-lane, at the East-end, has in a similar way been transferred to the more euphonious sound of Middlesex-street.

ATMOSPHERIC RAILWAYS .--- The committee of the House of Commons appointed to inquire into the merits of the atmospheric system have reported fayourably of it.

Window-cills. MARTIN'S PATENT CEMENT. TO ARCHITEOTS, BUILDEBS, AND PAINTERS IN PRESCO. SOLE MANUPACTURERS, beg respectfully to announce that this beautiful cement has now arrived at a degree of excellence far surpassing their most sanguine expectations. For all internal work it possenses a great superisetity ower every article hitherto in use; it is now being used extensively by Government in the British Museum and other public buildings. IT DOES NOT THROW OUT ANY SALT, but presents a beautifully plain and perfect auface, which may be painted upon dry work within four days without peeling. It is equally applicable for walls or lath, for mouldings, architrave, skirting, or flooring; and is admitted to form the best ground for freece painting, having been used for many of the prise fraces lately exhibiting in Westminster Hall. It will bear an intense heat without cracking, and for hardness, durability, and sedeomy, cannot be oulded. 160, DRURY-LANE, LONDON.

TO ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MER-CHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL

BUILDERS, MASONS, AND PLASTERERS, MER-CHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL¹⁰ JOHNS and CO.'S PATENT STUCCO CEMENT.—The following are the positive advantages possessed by this Invention over every Cement hitherto in-iroduced.—It will defectually resist Danmy. It will never vegetate nor turn green, nor otherwise discolour. It will never erack, blister, nor peel off. It will form a complete Stone casing to any Building covered with it. It so closely resumbles Stone that it is impossible to detect it. It never requires either to be painted or coloured. It will kope fresh and good in the cask in any Climate for any sumber of years. It is the only Cement that can be depended upon for export. It is the only Cement that can be used with confidence by the Senside. It may be used in the hottest or coldest Climates at any season. It will adhers to any substance, even to Wood, Iron, or Glass. It will carry a larger Proportion of Sand than any other Cements begin to periah. It may be worked through the Winter, as frost has no effect upon it. It may be used on the Inner Walls of new Houses, which may be papered over or painted directly. Hosts laid or pointed with this Cement will remain undamaged by the serverst Storms. Any Plasterer may apply it, the Instru-tions for use being very clear and distinct. The first cost of this material does not exceed that of the chespert Cement now in use; but with all the above-named extraordinary and valuable advantages, nothing can approach it in point of cornory. Architects and Builders who have used this Cement have

economy. Architects and Builders who have used this Coment have declared that it requires only to be known, to be universally

Architects and Builders was have used this Cement nave declared that it requires only to be known, to be universally preferred. Specimens may be seen, and a Prospectus fully describing the Cement and its mode of application, together with a volume of Testimonials from every part of the Kingdom, may be obtained on application to MANN and CO., SoLE AGENTS for the Patentees, 5, Maiden-lane, Queen-street, Cheapside, London: of whom also may be had, JOHNS and CO.'S PATENT STONE-COLOUR STUCCO PAINT, supressly intended for Painting over ex-terior Walls of Houses that have been covered with Roman or other Cements, and which have become dirty and disco-loured. It is in every swy better suited for this purpose than White Lead Paint, which will frequently come off in flakes, MESSRS. JOHNS and CO.'S PATENT PAINT having an affinity for Stucco, binds itself with it, stopping the suction, thereby rendering the wall proof against weather, and in the finish producing a pure ston-like effect, produccable by no other Paint whatever. It is cheap in its application,—and may be used by any Painter, in any climate, even in the **most exposed Marine situations**.

TKINSONS CEMENT .--- The public is A respectfully informed, that the price of this very ex-cellent Cement, which has now been in use for Architecture and Engineering works upwards of thirty years, is reduced to 28. 3d. per bushel, and may be had in any quantity at Wyatt, Parker, and Oo.'s Wharf, Holland-street, Surray side of Blackfriars-bridge.

N.B.-This Cement being of a light colour, requires no arti-ficial colouring or painting, and may be used for stucco with three parts its own quantity of sand.

three parts its own quantity of sand. **K** E E N E'S PATENT MARBLE CEMENT.—The Patentees of this composition beg to refer to the British Museum, the Royal Exchange, the new works at Bethlem Hospital, Groenwich Hospital, and the Co-liseum in the Regent's-park, as buildings finished or in pro-gress, in which Keene's Cement has been used as an internal stucco. Its superiority to common plastering consists in its extreme hardness, and the rapidity with which it dries, which qualities fit it to receive paint or other finishing sooner than other water Cement. When employed for skirtings, architrave, and other mouldings, in place of wood, it enceks dry-rot, is impervious to vermine, prevents the spread of fire, and is more eco-nomical in its application than the material for which it thus becomes the substituts. Confirmation of these statements is to be found in the almost universal adoption of Keene's Cement for Skirting and Hall flooring in the new houses on the Hyde Park Extate, where its application is to be seen to the fullest stran-tage.

where its application is to be seen to the inner and tage. In Liverpool and Manchester, Keene's Cement has in several cases been used for the covering of the fire-proof warchouse floors, where its lightness and hardness give it the preference over tiles and flagging, which are much heavier, and noceasenily leave the floor intersected with numerous joints, whilst Keene's Cement is laid down in one unbroken surface. The high polish and marble-like hardness of which this Gement is susceptible render it the most suitable material for the manufacture of Scagliola. Patentees, J. B. WHITE & SONS, Millbank-street, Westminster, Manufacturers of Roman and Portland Cement.

Depót in Liverpool, 36, Seel-street, James Woods, Agent.

TO ENGINEERS, ARCHITECTS, AND BUILDERS. PATENT METALLIC SAND CEMENT. -The Metallic Sand, from its chemical onalities.

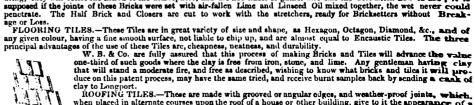

TO ENGINEERS, ARCHITECTS, AND BUILDERS, DATENT METALLIC SAND CEMENT. --The Metallic Sand, from its chemical qualities, forms, when mixed with blue lias lime, a metallic cement of great strength and density, the iron, which is one of its principal constituents, combining with the bed in which it is deposited, and communicating to it a greater degree of hardness than can be obtained by admixture with any other known material. Concrete and mortar in which the metallic sand has been used are more durable than any other, continuing to indust with lime, and not being affected by damp, otherwise than by increasing in hard-ness from the oxydation which is thereby occasined. Employed as a cement to turn water from brickwork in tun-nels, sewers, and other underground works, the Metallic Sand is found chesper, and from its eminent adhesive qualities to form a more solid and hydraulic body, in com-bination with the brickwork, than any other ement at present known 1 and in all cases the Metallic Sand is found the best substitute for possolano that has ever been presented to the public. As an external stucco, the Metallic Coment assumes a rich stone-colour without the aid of paint or thot of any blisters, and continues to improve both in appearance and durability by exposure to the weather. The Proprietors refer-with confidence to works in which the Metallic Sand has been extensively employed as concrets and mortar, specified in the prospectus, where also will be found refe-rences to very extensive crections which hare been stuccoed with the Metallic Cement. Further information will be given, and specimens shewn, on application to Mr. C. K. Dyer, 4, New Broad-street; and at the Metallic Cement.

BRITANNIA IRON AND LINC WORKS, 174, HIGH HOLBORN, STOVE GRATE, KITCHEN RANGE, STEAM-COOKING APPARATUS, AND BATH MANUFACTORY. R. K. BUTLER

R. K. B U T L E R INFORMS ARCHITECTS, BUILDERS, THE TRADE, AND ALL FARTILE DESIROUS OF ECONOMICAL OUTLAY IN GENERAL AND FURNISHING IRONMONGERY. That he has completed very extensive alterations at his Establishment, and invites an inspection of his Show Rootne and Warchouses, which will be found replete with every novelty of USEFUL and ORNAMENTAL MANUFACTURE for GENERAL, HOUSEHOLD), and DOMESTIC USE. Strong, Self-acting Kitchen Ranges, with back Boiler, Oven, and Wrought Bars :-Sft. 3 ft. 3 ft. 3 Sft. 3 ft. 6 ft. 9 Sft. 3 ft. 6 ft. 9 Ditto Ditto as above, with R. K. B's. Improved Wrought Iron Oven, &c., from 30s. each extra. Bright Register Stoves from 41. each to 36 guines. Best Black Metal do., 7d. 8d. 9d. 10d. 1s. per inch. Ditto Ditto Elliptic Do. 3dd. 4d. per inch. Estimates given for every description of Iron Work, Iron Senkes, Bakonics, Staircase Bailing and Palinedes made from Original Designs. Ventilating, Warming by Hot Water, Steam, &c. Experienced and steady Workman zent to all parts of the hinguidors.

By Der Majesty's Royal Letters Batent.

BASFORD & CO., Patentees of the improved mode of Manufacturing Bricks, Tiles and Quaries, &c., respectfully solicit the attention of Architeets, Builders, Brick and Tile Manufacturers, and the Public generally, to their improved Front or Face Bricks for first-rate houses and other buildings. These Bricks are manufactured by a peculiar method; the mould is so constructed as to make that side and end upwards to the plain of the mould that forms the out-face in any building, and not on their flat bods as in the ordinary way of Brickmashing. Thus a smoothness and pollah is given to them, either with or without a costing of fine prepared clay, which it is impos-sible to give to Bricks made with their flat beds uppermost. Thus any colour can be worked on the surface of Bricks made in this way, seen the most expensive, without the body of the article being an expensive material. This process is adapted to making camber and other arches, cornicing, spouting, &c., and owing to the great heat in which they are subject in fring, they will resist the action of the atmosphere, and are not liable to gather dirt like the best Bricks now in mee; it is supposed if the joints of these Bricks were set with air-fallen Lime and Linseed Oil mixed together, the wet never could penctrate. The Half Brick and Closers are cut to work with the stretchers, ready for Bricksetters without Break-sign of Leas.

duce on this patent process, may have the same tried, and receive burnt samples back by sending a crack of lay to Longport. ROOFING TILES.—These are made with grooved or angular edges, and weather-proof joints, which, when placed in alternate courses upon the roof of a house or other building, give to it the appearance of a pannelled surface, as indicated in the plate at the side, showing a section of a roof. These Tiles are of two kinds, the one having a broader, and the other a narrower width. The broader once may be made of any size practicable. They are so constructed as to make a firm and elegant roof, resembling the Stiles and Panels of a Wainscot. HIP, GUTTER, and other Tiles, equally improved and elegant. These articles are manufactured by the aid of a Machine, which is exceedingly simple in its construction, and uniform in its operations. The Patentees will be able to give sufficient information as to their improved mode of firing. Letters of Liecence. together with Terms and Prices, may be had on application to the LONGPORT BRICK & TILE W ORKS, Staffordshire Potteries.

33 HIP TILES. Digitized by Google

HIP TILES to suit slate roofs in colour; Bidgers, with plain or whethed ising will there are HIP TILES to suit elate roofs in colour; Ridges, with plain or rebased joints, roll tops, and vertical ornaments; drains, many sizes, with plain or socket joints; paving in squares, heragons, octagons, &c., dif-ferent colours; roofing, in Grecian or Italian styles, ether devices also, or plain; conduits, which do mot injure pure water; fire-bricks and tiles; clinkers, and out-door paving; sundry wall-coping, garden-borders, chinney-tops; also tubular and other fives of poculiar masterial. No agent, but a depôt at WHITEFRIARS, and 32, WATER-LANE, FLEET-STREET, LONDON, under Mr. PEAKE'S per-sonal care, to supply genuine TEBRO-METALLIO goods at fair prices as per quality. The TILERIES, TUNSTALL, STAFFORDSHIRE, are near the centre of England, whence boats are sent direct to any inland place; or to the Mersey for the coasts, the colo-nies and cloewhere.

MOON'S IMPROVED CHIMNEYS. MOON'S IMPROVED CHIMNEYS, Samples of the Bricks to form the Circular Flue, now coming into general use, also those fiveneted by Ciark and Reed for a similar purpose, may be seen at the Fatenstee's Western Depót, New-road, near Tottenham-court-road, where may be procured the Metal Bars and Throats, also the much-approved Caps for the prevention of Smoky Chim-neys, without causing adjoining flues to smoke, or producing the noise so generally complained of, arising from a large surface of metal being exposed to the action of the wind. Licences are granted to Brick and Tiles Makers for manu-facturing the Bricks and Tiles, throughout the United King-dom, by application as abore, or to Mr. ELIAS DORNING, 27, Gross-street, Manchester.

SATURDAY, MAY 17, 1845.

Conservative Club which Conservative Club, which have been under the hands of Mr. Sang and his assistants for some time past, are now nearly completed,

and will enable the public to judge conclusively of the merits of the painter. We are not of those who would join an outcry against the employment of an artist simply because he is a foreigner, or willingly shut our eyes to any superiority he might exhibit: we know too well the advantage which has resulted both to manufactures and art in England from the contrary course. But it does seem to us, that unless there be a decided superiority on the part of the stranger, unless it be seen positively that we could not obtain so good a result by employing native artists, our own countrymen should be first considered.

Mr. Sang has shewn considerable ability in the decoration of the building in question : the upper part of the hall has a very harmonious and admirable effect; but few will pretend to say that an English artist could not be found who would have executed the commission as well, if not better, for the same amount of money ; 1,500L, we believe, were paid for the hall and staircases alone ; the cost of the drawing-rooms we have not heard.

Mr. Sang has a good eye for colour, and while, by the variety and brilliancy of the tints employed, and the novelty of that style of decoration in England, the spectator is amused and surprised, he produces a whole which is harmonious and pleasing. But examine the design in detail; it is found to consist of the most common and hackneyed forms ; and when you are close to the work you see that the execution of it would disgrace a tea-garden. It is, in fact, scene-painting; and there are several men engaged in our theatres at this time who would do it better.

Nevertheless, the effect of the hall at the Conservative Club is glittering and magnificent; the motive of our remarks is, to contradict the impression that English artists are not competent to execute the coloured decorations of important buildings, and to urge on those who have the direction of them that, as opportunities of this kind are rare, their countrymen should in all cases receive consideration. That the impression should exist is not surprising when we remember that in the only two buildings of any consequence in the metropolis where colour has been resorted to, the German artiste were called in."

certial, and hints that we have suffered in England from not pursing the same plan. On a vertice of the method of instruction in Lyons (says the official report, page 31), as far as it is connected with faradiature, it appears to me to exhibit the true principle on which a school of design ought to be constituted. * * * it's papil intends to become a designer and fabricator of rmall brenze work, pendules, ite., or a curver in wood, or a liver chaser, or a house decorator, unless the human figures

In several respects the Conservative Club may be expected to exercise considerable influence over internal fittings and decorations. The tessellated, or mosaic pavement of the hall and vestibule above, executed by Mr. Blashfield, is an admirable example of that description of flooring. It consists of cubes

of different sizes, varying from the eighth of an inch to an inch and a half, placed so as to form certain patterns, and uniting so as to produce one harmonious whole. The effect is exceedingly good.

The extensive use of real woods for the doors and other parts of the structure,--sycamore, bird's-eye maple, &c.; the introduction of electrotype adornments, and the pains taken to obtain furniture in accordance with the building, by the employment of a professed designer, are all worthy of remark and commendation.

In the general arrangement of the structure, the architects, Mr. G. Basevi (the architect of the Fitzwilliam Museum, at Cambridge), and Mr. Sydney Smirke, have displayed great skill and ability; convenience, fitness, and beauty have all been studied, and no young architect can walk through it without gaining much useful information. The vestibule, or inner hall, which is the most peculiar feature of the interior, is full of striking effects and beauties, perhaps more so than any other with which we are acquainted in the metropolis. The size is 35 feet square, and the height 60 feet, and it communicates with the staircase (which is also 35 feet square), and has a circular gallery about midway, giving access to the principal rooms on the first floor. Each side of the hall is divided into three arched compartments, and the whole is lighted by a glazed dome 20 feet in diameter. The centre arch on the west side on the ground floor opens to the first flight of the principal stairs, which is 12 feet broad, whilst all the three arches on the gallery floor are open to the staircase; the return flights of the staircase, each 91 feet broad, entering the gallery at the two side arches.

In addition to the brilliant colourings with which we have said the hall and staircase are adorned, scagliola is profusely applied, and the perspective effects produced by the plan are multiplied by several mirrors.

The dimensions of the morning-room are 92 feet long by 261 feet wide in one part and 344 feet in another; those of the coffee-room are 80 feet by 28} feet; those of the house diningroom 36 feet by 23 feet, and all the rooms are 20 feet high. The morning-room is divided in its length into two comparements, and enriched with fourteen Sienna marble scagliola columns and pilasters of the Italian Ionic character. The coffee-room is divided in its length into three compartments by twenty Devonshire marble scagliola columns and pilasters of the Italian Doric order, with gilt capitals. The walls of both rooms are panelled, and the cornices and ceilings enriched. The drawingroom is 92 feet long by 261 feet wide, and 25 feet high, and is enriched with scagliola

columns and pilasters of the Corinthian order. Above the entablature, in the frieze of which are ornaments composed of the rose, thistle, and shamrock, alternately, springs a cove terminating with a broad band of fruit and flowers. The card-room is 40 feet by 19 feet, and 25 feet high, subdivided by Corinthian columns. From the card-room is entered the library, which is 80 feet by 22 feet high. This is divided into three compartments by square panelled scagliola pillars and pilasters of various green and gray marbles. The ceiling is divided into square panels, with enriched mouldings and frets, and the whole is painted oak and gilt. Polished oak bookcases line all the walls up to the height of 13 feet. The appearance of the library is peculiarly good.

The exterior of the building is rich and stately, displays much originality as well as careful study, and is admirably executed. In the whole it may be said, that the Conservative Club House is one of the most successful achievements of modern skill, and entitles its architects to take a very eminent place in their profession.

THE ARCHITECTURAL ROOM AT THE ROYAL ACADEMY.

WE mentioned last week that few of the elder members of the profession were among the exhibitors, and we might have added, not one of those who are members of the Academy. On first looking round the room, the impression is far from satisfactory; churches, and Eliza-bethan maneions very much like other churches and Elizabethan mansions; a few Tudorhouses, and some village schools : there is nothing which at once arrests the eye and bespeaks which at once arress the eye and despeaks attention. On looking further, however, its character improves, and it is seen, although there are no particularly important or striking designs, that there are many other compositions displaying much good taste and proper feeling, exceedingly well drawn. Without awarding this praise to all we may

mention, we will pass round the room and mention a few of the more prominent exhibitors

G. H. WATHEN has a design for a lighthouse and telegraph tower for the new Birken-head Docks, near Liverpool (1100), which has much originality : it exhibits evidences of its author's recent travels in Egypt.

J. THOMSON, whose paper on Alderton Church as it formerly was, we printed last week, exhibits a view of that structure as rebuilt by

him. WYATT and BRANDON have only one drawing (1104), a perspective view of the north entrance to Kensington Palace Gardens, --the new road now in the course of formation from Kensington High-street to the Bayswater Road. This locality affords two other drawings (1150), the Garden Front of the Mansion now erecting there for J. M. Blash-field, Esq., by J. FINDEN and J. H. LEWIS, and (1235) the Garden Front of Villa, No. 3, by OWEN JONES. The former is after an Italian Palazzo, with an arcade in front of both the two Palazzo, with an arcade in front of both the two principal floors, and although somewhat heavy in appearance on paper, has a certain air of grandeur. Mr. Owen Jones's design looks better in execution than in the drawing. No. 1273, by the same, an Ornamental Cottage and Deirw is more ancessful and merita and Dairy, is more successful and merits commendation.

S. S. TEULON in 1126, St. Mary's Lodge,

Hastings, displays much taste. H. E. KENDALL, jun., exhibits a Mansion in Progressnear Chalford, Bucks (1127), which would seem to be of more than ordinary importance, and is treated with his accustomed ability. It is a Tudor structure castellated, with a tower over the principal entrance.

THOMAS LITTLE has several drawings, all THOMAS LITTLE has several drawings, all displaying a cultivated taste. 1134 is a view of Fairlight Church, near Hastings (of which some notice will be found in another part of our present number), not All Saints' Church, St. John's Wood Road, as it appears in the catalogue; 1286 represents the latter, about to be built under Mr. Little's direction, although this is termed in the catalogue "a Church. E. Thompson." These are not the only mistakes

BUILDER. THE

⁶ That there is a lack of decorstive artists in England we do not protein d to deny; and if so encouragement be offered to those who do practise this branch it will be long before there are more. On the subject of decorative art a letter upreared in The These two sets to or three days ago, inquiring what our school of design for nine years; it has cost the cost for econtry parties will be wanted for the House of Lords, are there now poils adquate, or do any give promise of being so? or will the writese to an the result? When decoraters will be wanted for the House of Lords, are there now popula dequate, or do any give promise of being so? or will the writese to a obliged (as was done not two years since in scotter place) to send to Manich for half-adven?"
The writese quotes a report on the schools of design abroad, in 1440, shewing that fine art was there made the basis of accorative art, and that the system had been eminently succerval, and hints that we have suffered in England from not parsuing the same plan.

there where NEW CHURCHES AND THE OFFICIAL Lines REFERBES

SIR.--I beg to call destation of the Sin, -1' beg to call other attention of the architectural profession, through the medium of your valuable journal; to the working of the new Metropolitan Buildings Aut as regards the creation of buildings of the third, or public building class, sepecially churches. A market By clause 6, these buildings arb placed ander the apartal supervision of the efficial referees and the supervision of the efficial referees

the (sparsel supervision of the efficial referees as, well and the district surveyor, and the alaute 15; the official weignees are required, on noise; to make a survey of the buildings when the darease is erceted; and then to order any works which they may does requisite to add security to the stillion.

By classe 16, it is required that plans, any classe 16, it is required that plans, abrations, &c., of all isuidings comprised in schedule B: (which uses not include: churches) should be anoministed to the referets previous to the commengement info the works; and as this course is not prescribed for buildings generally of the third class, it might be presumed, that in this littler case; the ket does not make it im-perative moto do. Front scome inication, however, which it has the collect from the registrar, it appears that the collect referees apprehend, in the clause in schedule O, part 5, placing fra the walks and other construction of buildings of this class under their special approval, it oothes "practically necessary ", to submit the designs to them in the first instance.

an an in tar in s giù la bistigna i dan B

I am certainly inclined to take this view myself of the operation of the Act, and how-ever irksome it may be to architects to submit ever inksome it may be to architers to submit their drawings to other gentlemen, whose experience and practice may not perhaps be superior to their own, yet as the legislature has thought proper to give them the power to pre-vent a building being used, it would be hazardous to erect a structure without ascer-Saining their opinions previously. But the point which I wish to discuss is the manuer in which this controlling power is worked out, and the effect which it will produce. The system at present adopted by the referees is this: the architect sends them his design, the referees require alterations or not as they deem proper, they then take copies and lithograph them, issue these lithographic copies to the architect and district surveyor with their seal affixed, and in an instance, which has occurred to myself, refuse to deliver up the original drawinge. A charge is also made to the party for taking these copies, as also for the correspondence.

It will immediately occur to all professional the with minimulatory occur to all processional gentlemen that there is much which is highly objectionable in these proceedings. To say nothing on the minor points of charge, &c., can it be possible that the enactments of the Act make it legal for the referees to print and making the designs of as architect whereas which blish the designs of an architect, whereby his copyright is infringed ? or what clause autho-rises them to take copies of drawings, and

charge for so doing ? The Act is sufficiently stringent to cause much tunoyance to practitioners, and it behoves the profession to guard against its provisions being stretched one inch beyond their bounds. The course, I apprehend, which the fair constrac-tion of the Act requires, and the least objec-tionable one to the profession, would be to mabuit the designs, and receive them back again with such remarks and referred them back again with such remarks as the referres might think proper; they would still have the oppor-tunity of seeing, during the progress of the building, of their remarks had been attended to, midd full power of conforming them afterwards. This appears to have been the intention of the legislature, but by the present system, it seems to be the object to prevent the architect exerobing any judginess doring the progress of the works, while an inquisitorial power is obtained over the works and designs of the profession.

This also suggests another point connected with the subject. Do the official referees, by with the subject. Do the official referees, by their sanction and required alterations, take the responsibility of the building upon them-selves, and is the architect relieved thereby? In an instance which occurred under the Commissioners for Building New Churches, who had sanctioned and scaled the design, this was held, I am informed, to be the case; and on the failure of the roof at the Lower Norwood Church, the expense of reinstatement was defrayed by them. Is it not evident that the fear of this respon

eikility, with persons who have nothing to gain in reputation by bold and skilful construction, will induce a humdrum tame style of execution in our public works? they will naturally be inclined to reject the untried and novel, and to pest satisfied with the old and earsly com-may be shown by the architectaral canons at me time imped by the Commissioners for Building, New Churches, one of which enforced that no node would be allowed to be executed without /a, wie being 1 -- thout many Gothic problet /a. the behavior and book many a Goldic, aborches/warn disfigured before they despect that it stars about thus to fissif constructive pricess before a new surgers ad and wather proceedings above surgers a would find the proceedings above surgers and the proceeding and the proceedings above surgers and the surgers are surgers and the surgers and the surgers are surgers

official referees would obtain sufficient previous control to prevent any improperly con-structed building being attempted without obstructing the architect in the free exercise of his science and knowledge; the responsibility of the construction would remain with him, and not with the referees, while the security of the public would be guaranteed by the survey of the referees on completion of the carcass, when any new mode of construction could be fairly tested by them, and they themselves be relieved from the liability of sanctioning or rejecting an architect's design. I believe this will be found to be in the spirit of the Act, and indeed its letter.

I hope it is needless for me to disclaim all imputation upon the abilities of the present Na to transitional data

referees, their characters stand too high to be affected either by my praise or consure. My objection is against the system, and not the individuals; this is a fair subject of discussion, and you must yourself, Mr. Editor, be aware that there is a strong under-current of disatisfaction among the profession on many other points, which alone would render it soviesble to avoid hurting the feelings of experience

As this is an important public subject, 4

THOMAS DOPPENSIO 36. Northumberland-street, New-road, A Er ach

REVIVAL OF THE CAMBRIDGE CAMDEN SOCLETY OF AT TEST .

THE sixth annual meeting of the Caulotter Camden Society, shout which so mach that been said in consequence of the proposit of the committee to dissolve the secoristion, was held on the 8th inst. The main business of the evening was to ascertain the general scattments of the members as to the proposed dissolution or one manufers us to the proposed dissolution, as shown by the voting papers which had been transmitted to every member who could be reached by post, with a request that they might be returned by the 6th of May. I A impe-number of the papers were reteried, but the president announced that if any gentieness present had not sent in their votes and desired to do so, the committee would receive them now. A considerable number of voting papers were consequently inid apon the table. The president then senounced that the numbers

livered this, exempg mingo was a ranged bestim Assents of a total of a construction of the first of the first of the total of total And a set Mijort, Contract Server and the structure of the server of the

From the Spancial, statements it appeared that the society had a balance of about 600%, in hand. The report contained intimation, amongst other matters, that "a member of the society, who has departed this life since the last anniversary, bequeathed the sum of 6,000, to be expended by the society in the building and restoration of churches. The employment of this legacy according to the wishes of the testator will form a subject of great importance to the new committee:" and it concluded thus:

thus:--"The committee have already given full notice, by addressing a circular to every member, of the circumstances which coupelled them to withdraw their proposed recommen-dation of the dissolution of the society. They also issued at the same time voting papers in order to ascartain the general sense of the members with respect to the expediency of attempting to accomplish a dissolution in the way indicated by the pouncil. In answer, they have received the written votes of about half the members of the society, which give the proportion of above two to one against the proposition; while a very large number of the proportion of above two to one against the proposition; while a very large number of the minority accompanied their votes with the in-timation that they assented to the proposition, against their own wishes, merely in order to support what they supposed to be the wish of the committee. the committee.

"This result has shewn satisfactorily to the committee, that the great majority of the members are averse to the stopping at this time of the society's labours. Very many also have expressed in their correspondence, an earnest wish that the affairs of the society may be conducted on the same principles as have been hitherto maintained.

"These considerations have induced the committee to believe that it is their duty as the present executive of the society, to offer to the meeting this evening a scheme by which, in

"After the reading of the present report the

"After the reading of the present report the sommittee will have given up their office. The president will then submit a resolution which shall embody the obunge in the society's rules performended by the committee. ""The committee in conclusion will merely refer to the nature of the changes proposed. [They will be such as shall retain those parts of the society's operations which are confess-elly beneficial, discarding, so far as this society is concurred, everything which hings it into is concerned, everything which brings it into contact with this university."

A code of " have as proposed to be revised," was then distributed for the information of the members, and the following resolution pro-

"That the committee to be elected this utile he instructed to revise the laws on the sistefn the scheme: now submitted to the

deligent to sentene of new substitute to the statistical and the periodi of mestings were to be disentioned on The President, Archdencon Thory, shid, in the course of a long address, "this portion of the sociaty's functions the tee thought scarcely compatible with aisdamic duty, and they were therefore an-willing to be connected with it any more. They did not think is right to undertake the self of mosting where they should bell together, particularly in this place where they were themselves under discipline and autority, a great many persons who hight be supposed to form a sort of imperium in impurio, and whose meeting tegether had given office to those whose commons hught to be respected. That circumstance, which was inmeetings, came to be very different when it included unneggivits members persons com-mitted to particular opinions, and had accurate, if it, were not presumptuous to say so, some-what of a mational instead of a local character. what of a national instead of a local character. They wished the society to continue as it was —its framework, prive pites, and operations the same, all the same exception, and weident members into so prominent a position in the eyes of the priversity. It was possible they might have the committee just the same as before if so, if the Cambridge Camber Society bias to go on the tworld meintain the neuroinles the other in the value in the control of the society is to go on, it would maintain the principles identified with its name. It might be a good thing to give up the society; but if that could nut be done, do not let it subsist on any other principle. He should deprecate the existence had be done, do not let it subsist on any other principle. He should deprecate the existence of a society under that name which did not adhere to its principle. He was far from defending all that the society had done, and all that its members had published, but he did not come before that meeting to accuse people who had done injudicious acis—he told them them-selves. The society, however, had adopted vertain principles, and not without effect; something had come of it let not those principles be changed." In conclusion, the president threw out a suggestion for the for-mation of mather society by those who could not conscientiously go on with the Camden. Professor Lee was disposed to support a society having almply the study of church architecture in view. To the study of archi-tector he should be the last to object; but here other principles were propagated under the cloak of sirchitecture. The public were alarmed aboat this society, and many members had withdrawn in consequence of such alarm.

had withdrawn in consequence of such alarm. The Church had enemies enough already, what The Church had entemies enough already, what with Romanism with out, and something very like Romanism within, to say nothing of Dissent. He thought the society should be dissolved forthwith, and constructed de novo, and he moved to that effect, the funds to be handed over to the Church Bailding Society. Mr. Scott rose to order, and said the pre-sident had had an opinion that the society could not be dissolved, and therefore he submitted that the amendment could not be

The President asked if it were competent for The President asked if it were competent for him to put a motion for the dissolution, after the feeling shewn by the voting papers, in the namer directed by a legal opinion?-(" No, ".") If they wished it ever so much the society could not be dissolved: the question "", what were they to do? But to save time,

he would take the sense of the meeting as to

THE BUILDER

his power to put the amendment. The meeting decided, by a very large majority, that the amendment could not be put. Professor Sedgwick said, "He was an old member of the society, and had stuck to it through good report and evil report: he hoped at one time that certain appearances which had manifested themselves on the face of it were, like pustulary eruptions, of a temporary character, but was sorry to say that those eruptions had now assumed the form of a virulent sourvy, damaging the whole constitution, and requiring a strong and active remedy. Professor Lee's prescription was an entire extinction: amputa-tion or depletion might be useful, but it was not necessary to smother the society like a mad dog. Everybody knew that men con-nected with the society had sent forth books the language and principles of which no con-sistent member of the Church of England could possibly approve of. The society had made itself responsible to a greater or less degree for publications that were a disgrace to the academic body. He had attended one meeting of the society in which the subject of Ecule-stastical Architecture was properly discussed, but afterwards there was property discussed, course of which it was broadly stated that Granmer, Latimer, and Ridley, had suffered death or martyrdom, he knew not which, as a judgment for having consented to the confiseasion of momentic property. This was per-mitted to go on, and the man who uttered such a detestable insult to the Church of England proceeded without being called to order by the chair."

The President asserted that the paper in

question had been stopped. Professor Sedgwick next alluded to the Ecclesisetical Calendar published last year, and setting forth in large type, that it was by a member of the Camden Society. As a mem-ber of the church he americal, as strongly as he could, that that production was an insult to the Church and University. He did contand that if the Society were to be carried on, he who could violate, the destrines of the Church as they were violated in that Calendar was not fit to be entrusted with its administration. The Society required a deeper purgetion than a mere change of its rules. Afterwards, when the author of this work was named to serve in the committee, the professor denounced him as unfit to be a member of the society at all.

Various amendments were proposed and lost and ultimately the original motion was carried. A committee of eix, including the author of the work referred to, and the chief of those who have heretofore conducted the society who have heretofore conducted the society is to be looked for in the proceedings of the Society. It is not to be called an academic hold mean and the holding of unstimute it to body new, and the holding of meetings is to be discontinued for the present, but in all other respects the Society remains' precisely what it 1. 1.1

the ancient palace was consecrated for religious purposes, whilst the basilica was severed from its ancient associations, and erected on those sites where the jurisdiction of the popular tribunals could best be exercised.

Greatly modified by the Romans—whatever the Romans borrowed they borrowed as conquerors—the basilica appeared, at an early period of the Republic in the Forum. The form of the building was an oblong, terminated by the tribunal. In the midst of the semicircular apsis arose an elevated platform, upon which the seat of the prestor was placed. This is the portion to which in Scripture (St. John, xix. 13) the name of Gabbaths, or Lithostroton (pavement), was assigned. On either eide, but lower down, were the seats of the centumviri, the officers, the scribes, and all others who participated in the honours of the tribunal or the duties of judgment; guarded from the intrusion of the infariar orders by the *cancelli*, or grated inclosures. Still lower down was the portion allotted to the notarise and advocates. Three-fourths of the oblong composed a vast hall, whilst a transverse aiele, or transept, if we may so call it, separated this hall from the apsis—the posuliar region of dignity and awe. In all the basilicas, the great hall was divided by columns into a portion similar to the centre aiele of a church, flanked by side aisles; and these columns usually supported a gallery above. The central nave generally received light from windows in the upper wall. Sometimes the whole building was covered by a roof, sometimes and portions. This seems to have been the case particularly in those basilicas in which a section of the nave, being left open te ahe sky, constituted an atrium within the aiales.

Such was the general type; but without any material departure from the normal form, there was, nevertheless, a considerable degree of variety in the arrangements, resulting from the greater or lesser convenience of site, or magnificence of building. With respect to the particular evidence, it has been collected by M. Bunsen, with singular labour as well as acuteness, not only in the works which we have already noticed, but also in his Esseys, inserted in the Transactions of the Roman Archeeological Society; and we shall now present our readers with some scanty gleanings from his ample harvest.

Bunsen assumes that the basilicas of the Campanian cities form, as it were, a connecting link between the Hellenic and the Roman plans. They want the semi-circular apse, found in all the Roman examples; but its place is supplied by some equivalent. The first and simpler is found at *Pompevi*; a rectangular building, the columns supporting the side aisles. At the extremity is the tribunal, raised about seven feet above the ground, beneath which are cells or prisons corresponding exactly in position with the crypts at the altar end of our ancient esthedrals. A porch forms the entrance from the Forum.

forms the entrance from the Forum. The remains of the Basilios Ulpia, A.U.O. 865, 866, remained, until recently, covered by the soil at the base of the Trajan column. These relics of the most magnificent of the structures which decorated the Forum of Trajan, have been partially brought to light by excavations: its elevation is preserved upoh medals, which afford some notion of the external form. The plan differs very materially from all those which we have hitherto described. At each termination was seen a magnificent apse, and before each apse was a corresponding transept, with three ranges of columns, forming double cross-aisles. Two rows of columns in the main body of the building formed the nave and side aisles, the nave rising about thirty (Roman) feet above the other portions of the edifice. Within, this central nave exhibited two, if not three tiers of orders, the uppermost being composed of Caryatides sustaining the rich roof, crossed by beams of gilded bronze, which crowned the edifice. It was this building which, above all others, excited the admiration of Constantine. And although the ancient capital was now mourning in widowhood before the presence of the Emperor, who had transferred her dignity to a younger rival, yet Constantine enjoyed one of the three aspirations of Saint Augustine—Cicero pleading—Paul preaching Rome in her glory.

Had the basilics, such as we have described

it, been planned for the express reception of a Christian congregation, it scarcely could have received a more convenient or appropriate form constitutions, was to be an oblong, like thick a ship, that is, to the vessel of the ark. Look at the preceding plans: does not the outline of the ground plot of the basilica entirely meet the suggestion? and the terms nave, nef, or vais-seas, applied to the main portion of the edifice shew how enduringly the idea prevailed in subsequent ages. The elevated apse, in which the prætor administered justice, surrounded by the centumviri and other judges, offered a dignified tribunal for the bishop and his clergy, the dark chambers below suggested the subterraneous chapel, in which might be deposited the re-mains of saint or martyr. The inclosures, the cancelli for the notaries and advocates, might, receive the singers of the choir. The length-ened sisles would furnish space for the congregation of the faithful, the galleries seclude the women and the porch, fronting some of the basilicas, or the uncovered portion, which, if separated from the rest by a wall, would constitute a court, was prepared for those who had been separated from the rest of the congregation by their sins, or were not yet allowed to participate in the sacraments. Hence we find, from one of those incidental notices which often are more instructive than the set narrative of history, that the Basilices had been given up, bodily, for the purpose of Christian worship. A post, but also a ractor, addressing an emperor, tells him that these structures, heretofore wont to be filled with men of business, were now thronged with votaries praying for his safety: ' Basilica olim negatifs pleno, nuno vatis pro tua selute susceptis. This occupation of the Roman basilice was, never occupation of the Roman basilice was, hever, theless, only transitory. They did not be-come the abiding-places of faith. Why was this privilage denied them ? In situation they were most convenient, placed in the centre of business and population. Their plan and form so convenient as to invite the purposes of wor-ship. Unpolluted by the idol or sacrifice, they were free from the recollections renderthey were free from the recollections render ing Heathen temple odious. With the smallest proportionate expense or labour, the basilism of the forum might have been rendered the most stately and dignified of sanctuaries. Yet they fell ! Only one example can be found of a secular basilica actually converted into a Christian church—and that example, memorable as it is, does not exist in Rome. As II for the purpose of constantly demonstrating to mankind the visible triumph of the spiritual kingdom, every stage in the early develop-ment of the empire of Christianity seemed destined to efface the honours of heathen sovereignty. The Christian basilica, though entirely modelled upon the heathen basilica, able as it is, does not exist in Rome. As if entirely modelled upon the heathen basilica, and constructed with the spoils of the basilica, was therefore fated to be its ruin and destruction.

A single cause suffices—a cause of which we new can searcely appreciate the potency. Veneration for the graves of the martyrs, as an almost irresistible motive, attracted the Christian basilica away equally from the preciset of the secular basilica, as from the site of the heathen temple. By determining the locality assigned to the Christian edifice, this fueling necessarily determined the neglect, ruin, and destruction of the proud monaments of senators and Casars. The demolition of carlier structures, for the purpose of farnishing materials, had already been long practised. Thus the interior of the coliseum displays the friesce and fragments, mixed up in confusion, amidst the masonry of the beautiful yet appalling circuit of its walls. These, perhaps, may have resulted from the removal of other buildings previously existing on the site; but under Constantine similar demolitions proceeded, as it should seem, equally from the desire of sparing expense, and the increasing inability to execute works of art. The spiendid Forum of Trajan, which had excited Constantine's admiration, fell at his command, and furnished by its spoils the decorations of the arch of the first Christian emperor. Abandoned for more hallowed ground, the civil basilicas were destroyed, and the columns which supported them transported to the new sites, where they arose in lengthened

perspective and barbaric splendour. By their very aspect, such of the Christian churches as retain their original features, show the haste and unskilfulness with which they were reared: one capital cut through and deprived of the lower range of the acanthus, to fit it into the required space; another projecting over the shaft; a third shrinking within; a fourth, the leaves blocked, and prepared for the touch never to be given—of the chisel that was to have imparted Corinthian elegance; — the columns themselves of unequal circumference or unequal height, deprived of their due proportions, or rudely stilted to attain the necessory elevation. The richest materials are mixed with others of inferior quality; pavonaszo and verd antique, the products of the quarries of Syene or of Paros, and the homely travertine, are intermingled without choice or discrimination.

The pillars, or 'bearing shafts, 'ware often connected, according to the classical system, by the architrave ; but the plan of employing the arch for this purpose had already been suggested, and, on the whole, became more prevalent. Upon these were raised the lafty walls constituting the superstructure of the building. But the columns in the Roman Christian Basilics were never connected into piers ; they were only bearing-shafts; the thin brick-walls, the only weight the columns were able to support, never being of sufficient solidity to reaist the pressure and transverse thrust of a vault. Let this characteristic be carefully marked. It therefore became impossible to give, as in the Tentonic Romanesque of Germany, or the Gothic, its derivative, the addition of a vauk of brick or stone; and thus the adoption of the ancient fragments for the columns determined the material of the roof. Recourse was also had to timber. So much for the main construction of the building. The minutar development of the parts resulted from their adaptation te the purposes for which the building was raised.

from their adaptation to the purposes for which the building was raised. The reminiscences of Hierosolyma, as well as the discipline of the church, suggested the addition, in front of the Basilica, of a cloistered area, a Court of the Gentiles, the *Atrisum*, where those who were excluded from the full participation in the ordinances of the church, might yet in some degree share in its misistrations. This atrium was also used as a cemetery, yet only for persons distinguished by rank or holiness. In the centre was a fountain, or '*Canthorue*.' Following the ancient traditions of Jerusalem, it was enjoined that, as a symbol of inward purity, the worshipper was to wash his hands previously to entering the sanctuary.

Plain almost to rudeness — a low and unpretending portico constituted the chief, or rather only adorement bestowed upon the front of the Basilies. Above this portico were usually three long, round-headed, undivided windows, symmetrically arranged, and these surmounted by a round window in the pediment. A few sculptured decorations might grace the portal, but they rarely extended beyond the symbolical lions who guarded it on either side. Beyond this, and within the walls of the structure, the Narthew, or Pronzes, furnished further means of separation, and yet of union, between the catechamen and the penitent. The derivation of the term narther is uncertain; perhaps it was more permanently adopted in the Greek Church than in the west. But the same purpose was answered by the porch, or portico.

Towards the upper end of the nave was placed the choir, surrounded by its Cancelli, or enclosures. In the early Oriental churches, these cancelli may have been of wood; in the West, all the examples and fragments which remain are of richly worked marble, very generally adorned with the species of mosaic, partly of glass and partly of precious marbles, known by the term of 'opus Alexandrinum.' On either side of the choir arose the Ambones, the pulpits from whence sub-deacon and deacon respectively read Epistle and Gospel. From the Gospel pulpit, the loftier and more richly adorned, were promulgated the Episcopal injunctions and censures. From this pulpit siso the 'bidding-prayers' were read, and the sermons preached by priests or deacons; but the bishop preached sitting in his faldistorium before the altar. A small pillar before the Gospel pulpit supported the paschal taper. Within the cancelli of the choir were stautoned the singers, by whom the savise was chaunted,

who, in the earlier ages of the church, were all clergy having minor orders; priests or deacons did not perform this portion of the divine service, for to them were the higher mysteries reserved. We apply the term chancel to the portion of the church enclosed by the cancell. The Germans give the name of Kanzell to the pulpit standing on the cancelli, and all the languages of Europe the title of Chancellor, or Cancellarius, to the successor of the officer who stood within the cancelli. In this example we are able to trace each derivation to its source, the channels are yet visible through which the ideas have flowed. But how useless must be our conjectures when the channels are filled up! Hence the imperfection of all histories of language.

The high altar, the only Communion Table —for the primitive Church was a stranger to the multiplicity of the modern Romish ritual —stood within the santuary, more or less advanced towards the choir. Causes which it is not necessary here to enumerate, might occasion some slight changes in its position, but it was always free and isolated, surmoanted by its tabernacle, or baldachino, and detached from the wall.

Lastly, the Sanctusry was terminated by the Apsis, sometimes called the Exedra or Bema. Here sat the archbishop or bishop—his chair, or throne, in the centre—the seats of his suffragans and presbyters around. This division of the building was considered, so to speak, as its crown. Protected, like the choir, by cancelli, no layman could enter its precinets ; rich curtains shrouded its recesses from the sight of the congregation, until the completion of the Eucharistic consecration.*

Whilst the exterior of the Basilica was naked and simple, almost to poverty, the interior exhibited the utmost splendour which could then be effected by all the resources of art. The roof was invariably composed of wood. In the churches built by Constantine, and some other of the earlier churches, it is said that the beams and rafters were concealed here a flat ceiling of gilt panels. We doubt by a flat ceiling of gilt panels. We doubt much, however, whether this assertion, grounded upon the very obscare text of Eusebius, be correct. We should rather suppose that the enapplied to the beams themselves, as is the case at San' Miniato, one of the most curious and interesting objects which Firenze la bella affords'. At all events, there is no one early, or even mediæval, specimen of a flat ceiling at Rome; the panelings all having been added at comparatively modern periods. On the whole, the concealment of the beams has not been an improvement. Those who recollect the north transept of Winchester Cathedral before the masquerading and destruction effected by the "refined taste" of poor Dr. Nott, will agree with us in deeply lamenting the loss of the tranquil and stern simplicity of the ancient open roof-the durk beams, solid in their strength, and the spex of the concave losing itself in darkness."

After some remarks on mosaics; the most characteristic decoration of the basilica, and on the absence of sculpture in the structures of the ancient Estholic church, some of the principal basilice of Rome are described and illustrated by plans and sections, including old St. Peter's, the memory of which is almost effaced by the modern marvel.

GOVERNMENT PROPOSAL TO ERECT THREE New COLLEGES IN IRELAND. — Sir James Graham during the past week, in explaining the views of Government with respect to academical education in Ireland, recommended the establishment of three colleges for the cultivation of literature and arts; one in the north, another in the west, and the third in the south. The building of each college he estimated at 30,000*l*., or in round numbers 100,000*l*. for the three. He further recommended, as localities for the proposed crections, 1, Derry or Belfast; 2, Galway or Limerick; 3, Cork.

* For details let the reader consult Bingham. Many years ago (vol. xxvii., p. 320), we pointed out the utility of the old-fashioned parson of Havant, as a guide to Christian archæology. No book, either here or abroad, has yet appeared, which can supersede his *Origines*, which should be found in every clergyman's library. The general form of the Basilica has been adopted with great skill in the building of Hungerford Market. The shops, which have recently been built up in it, now unluckily spoil the perspective, comfort having been preferred to picturesque beauty. But the whole is strikingly *Roman*, and will afford useful hints **19 the exclasionized architect**.

FALSE HERALDRY ON THE NEW HOUSES OF PARLIAMENT.

A WRITER in the Art-Union of the present month, has drawn attention to a number of asserted heraldic blunders which appear on the exterior of the new Houses of Parliament. He states that many of the shields are charged with devices copied from coins of various sovereigns which were never intended to represent arms, and that it would be as reasonable to take St. George and the Dragon for the arms of George IV., as to adopt those devices for the arms of the monarch on whose coinage they appear. He points out too, amongst other objections, that supporters have been assigned to every sovereign, beginning with the Conqueror, though it is known that supporters were not used by the kings of England till the reign of Richard II., three hundred years after the Conquest.

We have so much confidence in the ability and caution of Mr. Barry, that we feel little doubt he will be able to explain away the apparent mistakes; if, however, by oversight the heraldic adornments have been left to those who were not competent to the task, and errors have been committed, they should be immediately corrected to the utmost possible extent. Heraldry is very closely connected with architecture, and we hold that, when employed, the most scrupulous accuracy should be observed.

A morning paper estimates that the Houses of Parliament will be at least twenty years more in hand; and adds that such an opinion is strengthened by the arguments of Mr. Barry binself, who, in justifying the small progress at present made when the peers complained of his delay, said, "The time it will take to complete even the architectural portion commot be exactly specified." In looking at the time that the erection of other edifices of extraordinary magnitude and splendour occupied, it will be found that it was sometimes the work of centwices. St. Peter's, at Rome, took a century and a helf to complete; Milan cathedral twice as long. The most persiment comparison is St. Pau's, because it is both nearer to our own day, and was the work of one architect throughout; there was no material interruption to its progress, yet it took thirty-five years to complete (1675-1710); and whereas its cubic contents are 11,000,000 of fect, those of the palace of Westminster are estimated at 16,000,000 of cubic feet---half as much again.

SOCIETY FOR THE PRESERVATION AND DESCRIPTION OF FRENCH HIS-TORICAL MONUMENTS.

THE congress of the Society for the preservation and description of French Historical Monuments is fixed to take place at Lille, on the 3rd of June, and the seven or eight succeeding days. Dr. Bromet has obligingly forwarded to us a list of the questions immediately relating to architectural antiquities to be discussed at the meeting, to which we gladly give circulation. We hope that some of our readers may be induced to attend. Part of the time will be spent at Tournay, one of the meat interesting towas in Belgium, and very close to Lille.

1. With respect to monuments of the middle ages, is there any remarkable difference between the architecture of the north of France and that of the south of Belgium, or of the seventeen Belgic provinces; and have the architectonic types of East and West Flanders, Hainault, the Cambresis, and Artois, been borrowed from France, or from the great monuments of the most northern of these provinces, or from Germany? And what are the differences and the analogies of other contemporary works of art in those countries?

2. As it does not appear that either in French Flanders, or French Hainault, or the Cambresis were ever any such vast basilical churches with statuary fronts as still exist in the countries adjacent to them, it is desirable to seek the cause of this almost total absence of statuary decoration, which renders the study of Iconography in the provinces abovenamed so difficult.

3. It being generally thought that the new styles of Gothic architecture were but slowly adopted in French Flanders,—can this opinion be supported by any monuments of well

attested date, which were constructed according to the styles of periods which preceded their erection?

4. As several religious edifices without any thing remarkable in their architecture, contain very interesting pulpits, stalls, confessionals, reliquaries, tabernacles, shrines, fonts, processional crosses, and bas-reliefs, &c., a description of such objects may enable the congress to ascertain the state of the fine arts in those provinces now under consideration, during the middle ages.

5. Does it appear that Spanish manners exerolsed any influence on the architecture of Flanders and Artois? Were all the buildings attributed to the Spaniards, such as belfries and town-halls, &c. really constructed by them, and what are the peculiarities of that architecture of which the towns of Lille and Arras afford so many examples.

60 many examples. 6. Can it be proved that any Romanesque churches with large courts before them ever existed in the northern provinces of ancient Gaul?

7. Are there in other parts of ancient Gaul any churches of Romanesque architecture, which have never had any other than flat ceilings of wood?

8. Are there any existing apsidal ends or sther parts of Romanesque churches of octagonal form ?

9. Are there any specimens of pointed vaulting put up after the completion of edifices of pure Romanesque style?

10. What churches are there of a transitional epoch from the semi-circular to the pointed styles, which are exteriorly Romansique, and interiorly pointed? and, where such exist, has not the interior been added when a vaulted ceiling may have been put up? 11. How, in the morth of Brance, during the above named epoch, are the two architectural styles generally combined?

12. Did the serveral (people of Germanie origin similarly adopt the different changes in architectural style ?

13. Are these any crypts under the churches of Belgium and the aorthem provinces of France in these styles prevalent from the eleventh to the sixteenth conturies.

14. What was the ancient destination of crypts, or subterranesa churches, and what peculiar ceremonies were therein celebrated?

15. To what epoch may we refer the introduction of zodiacal signs in monuments consecrated to Christian worship, and are they frequently employed on their walls or pavements in the north?

16. Are there any church pavements formed of stones sculptured in low relief, having in their cavities a coloured cement?

17. Are there any mosaic pavements in churches of the pointed style?

18. What examples are there of that peculiar kind of pavement called labyrinths, or roads to Jerusalers, sometimes seen in the pavements of middle-age buildings? and to what epoch may we refer their introduction? 19. How happens it that there are so many

19. How happens it that there are so many large religious edifices of the first and second styles of pointed architecture still existing in these provinces on this side of the river Loire, formerly called the county of the Langue d'oil, compared to the small number of religious edifices of the same epochs in the provinces south of the Loire, and which is called the country of the Langue d'oc?

20. Do Belgium and the northern provinces of France afford any examples of Romanesque churches paved with glass?

Gentlemen proposing to attend the discussion of the above-stated questions are cordially invited by the authorities of Lille to its grand "Fêtes Patronales," which will take place on the first, second, and third days of June, and during which there will be several opportunities of observing the ancient memory and usages of Flanders, as exhibited at its. "Kermesses" and other assemblies. The admission card to the Congress, which costs but ten francs, including the privilege of partaking of a banquet to be given by the city of Tournay, may be prosured on arrival at Lille from Mons. de Contencin, to whom, or to M. de Caumont, the director of the society, Dr. Bromet, will be happy to make known any person who may be desirous of joining him at Lille, and which by steam to Ostend, and thence by railroad, may be reached from London in sixteen or eighteen hours.

ANCIENT CAPITALS FROM THE SOANE MUSEUM.

THE accompanying engravings represent other ancient marble capitals in the Soane Museum,^{*} and form a class almost anknown

The used in," and form a class almost anknown to the public. They were mostly brought from Italy by C. H. Tatham. Figure 4 consists of two separate marble fragments. The diameter being nearly the same in each, Sir John placed one on the top of the other of the other. Figure 6 represents the side of a marble

Capital of an engaged column brought from Pompeii and now in the museum at Naples; this was copied from Mr. Hakewill's sketch book.

NORFOLK CHURCHES,†

THEMELTHORPE. " Churchwork is slow."

THIS little edifice, dedicated in honour of THIS little edifice, dedicated in honour of St. Andrew, comprises a chancel, a nave, and a square tower at the west end: the bearing by compass is 12° south of east. Our first visit found the general condition one so re-pugnant to a wholesome feeling of what became the God's tabernacle, that we have shoice repeated it, to find at length some par-tial improvement, a few things meanly, though tial improvement, a few things meanly, though

not altogether injudiciously, repaired A niche for the venatura occurs on the right within the outer doorway of the porch, which has for its sill an ancient coped tomb without cross. The dilapidated voussoirs of the arch have been replaced by a framework of wood, now fast verging on a similar state : the windows are perpendicular, of two lights.

Between the doors of the nave, that on the north side having a large hole in it, stands the font, a massive octagon, its rim much broken in wrenching out the staples of the cover. The sides, now plain, appear to have been charged with coloured scrolls, of which one the letters I H S, the monogram of the name of Jesus-may perhaps be deciphered : the bowl is lined with lead and has a drain. On raising the top, we found in it a coil of rope, the sexton's grave-tackle, the only present use, as our informant very innocently informed use, as our informant very infocently informed us, to which the orifice is now applicable. And yet, in the orders and directions given by Bishop Wren, A.D. 1636, to be observed in his diocese of Norwich, it is enjoined, "that the font at baptism be filled with clear water, and that no dishes, pails, or basins be used in it, or instead of it." At the period of our last visit the ropes had yielded place to a linen blouse. louse.

The rood-screen yet survives, although in a putilated state, the "beautiful gates" having fong since disappeared. Portions of elegant tracery remain on the panels of the lower section, and several piers or buttresses, section, and several piers or buttresses, having the fronts terminated by small attached half-round shafts with caatellated capitals, present models of no ordinary attraction. Would that we might speak in praise of some recent attempts at restoration here, but such work is far above the skill of a common artisan. The sedilia are graduated in three separate seats, a form by no means usual in this deanery; a square perforation next the upper one communicates with the trefoiled fenestella adjoining. A shelf forcuts here, supposed by some to have been a recentated for the holy oil cruets, and beneath we faid the sual water drain. esual water drain.

" It is always desirable that there should be narrow entrance at the side of the chancel a narrow entrance at the side of the chancel, sppropriated to the use of the clergyman ? and this convenience has been carefully pro-vided by the original builders. A crop of dandelions, *leontodon taraxacum*, rooted in the crevices of its broken sill, indicates, however, that to use it is a thing out of mind here. An early English triplet occurs over the ammuearly English triplet occurs over the commupion-table, that and the altar-rails forming no exception to the general decay. The deca-logue, flanked on the gospel side by the royal arms, appears on the rood-screen. The lateral windows of the chancel, two of them lychno-scopic and the languiger complete of the para scopic, and the lanciform couplets of the nave, have all been blocked with fint to above the centre of elevation.

We have spoken of a partial repair; it con-

* See p. 211 ante. † See page 209, ante.

sists mainly in a remodelling of the pulpit and reading-pew, situate southward without the reading pew, situate southward without the rood-screen. We were pleased to find the offensive backing upon the altar no longer dis-gracing them; but when will all confess, and act on their convictions, that the place of prayer is in the chancel! An effigies in brass occurs in the central avenue near the font: it is well worthy of inspection.

The weather moulding of the ancient roof, seen on the western façade of the tower, indi-cates the extent to which the present meagre affair has been dropped. Would that it offered the only instance of spoliation ! but how gross in many ways the disregard of this place where the only instance of spoliation ! but how gross in many ways the disregard of this place where His honour dwelleth; how niggard the supply that has been extended to its necessities; how secular the tastes and dispositions by which that supply has been directed. The sleek steed in the rich man's stall, the costly furniture of his dwelling, have left an obolus only for the sanctuary, and even that hus been ill-expended. But "is it a time to dwell in ceiled houses, and the Lord's house not regarded?" С. Т.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At the annual general meeting, held on the 5th of May, Earl de Grey, President, in the chair; the report of the council on the affairs and finances of the institute was read, and the following office bearers for the ensuing year were elected :-

President .- Earl de Grey.

President.—Earl de Grey.
Vice-Presidents. — Messrs. H. E. Kendall,
J. B. Papworth, W. Tite.
Ordinary Members of Council. — Messrs.
Thomas Bellamy, W. Burn, E. M. Foxball,
George Godwin, James Noble, Charles Parker,
W. F. Pocock, John Shaw, Sydney Smirke, James Thomson.

Hon, Secretaries-Messrs. Ambrose Poynter.

and George Bailey. Hon. Secretary for Foreign Correspondence. -Mr. T. L. Donaldson.

Dar. T. L. Donaldeon. On Monday, the 12th inst., Mr. Kendall in the chair, the Rey. Richard Burgess, B.D., read a paper "On the Walls of Ancient and Modern Rome." In opening the subject the rev. gentleman sketched the history of walling, and laid down as a haw that no walls could be properly termed Cyclopean where any of the sten beyond Cyclopean. He traced the gradual step beyond Cyclopean. He traced the gradual progress of Roma from the time of Romalus, and, taking his hearers round the enlarged city, and, taking his hearers round the energed city, explained the various gates and walls in the circuit. The whole circumference was thir-teen miles, and he had estimated that they population had never been more than 160,000. Custom battered down walls and prejudices, and even the great wall of China was likely and even the great wall of China was likely soon to fall.

EARL DE GREY'S CONVERSAZIONE.

EABL DE GREV, as President of the Insti tute of Architects, entertained the members of that body at his relidence in St. James'sthat body at his relaidence in St. James's-square, on Friday, the 9th instant, and invited a large number of the nobility, and men distinguished in likenture, selence and art, to meet them. By ten o'clock his lordship's saperb suite of rooms were thranged, and pre-rented a find appropriate. The presence of many of the handsomest women of whom the English Court can boast, added meturially to the obsern of the even int, and served to render English Court can boast, added maturally to the charm of the evening, and served to render this unquestionably the most brilliant conver-sezions of the season. His Royal Highness Prince Albert was expected, but was unfortu-nately prevented from attending. The tables were filled with choice portfolios, and works of art. The council of the institute, compris-ing Mr. Papworth, Mr. Kendall, Mr. Noble, Mr. Roberts, Mr. Pocock, Mr. Godwin, Mr. W. Donaldson, Mr. Booth, Mr. Poynter, Mr. Bailey, Mr. Foxhall, Mr. Thomson, Mr. Grellier, and Professor Donaldson, dimed with Earl de Grey previonsly. In reply to an acknowledgment, on the part of the souncil, of the services rendered by the noble host to the Institute, very admirably tendered by Mr. Institute, very admirably tendered by Mr. Paparorth, his Lordship expressed himself as ever most anxious for the prosperity of the association, and willing at all times to exert himself in its favour.

ARCHITECTURAL MEMS. FROM THE COUNTRY.

THE talked of appeal to the House of Lords has been entirely abandoned in the matter of the Stone Altar at the Round Church, Cambridge, and the costs have been paid by the church-warden's proctor. A table of oak elaborately carved, is nearly ready to take the place of the stone altar which, as we have already stated, has been removed, and com-munion rails are prepared. The church will be re-opened in a few Sundays for divine service. At Cambridge, that venerable structure Jeaus Callege Chapel is now in course of being rescued from the melancholy state in which it has been left for many years. From a legacy, benfactions and other sources, the master and ballows are enabled, and have de-termined to spend about 1,000% on its restoration; the works were commenced in the Easter maction, and are to be continued in the long vacation, the ceilings are to be removed long vacalies the cellings are to be removed and the streades set free, and the whole to be brought more nearly to its ancient cha-racter.....At a meeting, held recently, of the Ripon Diocesan Charch Building Society, the following: grants were made in sid of the erection of new churches, viz.: 400% to Mid-dleton, in the parish of Rothwell, to contain 509 siting estimated ceat 2.290% - 300% to 502 sittings, estimated cost 2,290/.; 3004, to St. Mary's, Sowerby, in the parish of Hali-fax, having accommodation for 404 adults and 150 scholars, estimated cost 1,635.; 5004. to St. Andrew's, Wakefield, having accommoda-tion for 700 persons, estimated cost 2,880. — The works on the Blackburn and Preston Railway are proceeding rapidly. Upwards of 100,000 cubic yards of earth have been re-moved, and in several places active preparations are being made for laying down portions of the permanent way. The piers of the via-duct over the river Darwen, at Hogbton, which have formed one of the most difficult portions of the undertaking, are now up to she level of the water, and several of the bridges on the Hoghton contract are com-menced. The works at the Blackburn end, menced. The works at the Blackburn end, which have only lately been commenced, are now urged forward with increased energy. ——At Scarborcugh, the improvements at the opening of St. Nicholas's-street are rapidly progressing. The excavations for the founda-tions of the new houses are completed, and not many weeks will elapse before the new frontage is reared, and the row of commodious shore prepared for the coming season. — The shops prepared for the coming season. —The Lords of the Admiralty have appointed James Walker, Esq., C.E., and Captain Vidal, R.N., to inquire into the plans of the South Wales Railway Bridge over the Severn, at the Hock Crib, the proposed cut or canal from that spot to Framilode, and the other works connected therewith, with the view of ascertaining the probable effects of the same upon the navigaprobable effects of the same upon the naviga-tion of the river. — It is expected, that during the summer, the Grand Junction Railway Company will build more cottages at their "new town" of Crewe, the number of cot-tages at present being inadequate for their nu-mercus workpeople. Every house is now oc-cupied, and several of them by more than one family. The Chester Courant in mentioning the fact monends the following remerk: the fact sppends the following remark :----"Among the many speculations of the day, it is a matter of surprise to us that no company has, yet been formed to build towns conpany has yet been formed to build towns con-tiguous to the principal stations. No doubt, if building societies were organised for this purpown a good per centage would be obtained for money." — The Earl of Derby has contracted for the erection of a stuppedous conservatory and aviary of a great height, and mostly glass on all sides, in Lancashire. — At a meeting of the Huntifder Commissioner of Paysment on Huntingdon Commissioners of Pavement, on Wednesday week, the subject was renewed of introducing a new system of road making lately solopted at Burton-upon-Trent, and found to answer there exceedingly well. It consists of an under stratum of angular broken stones, then a layer of smaller stones and gravel, and the upper coat of gravel mixed with gasand the upper coat of gravel mixed with gas-tar, the whole being about six inches in depth. It resists the wet, is perfectly free from dust, and unattended by any of the inconveniences of the wood-pavement; whilst the cost would be less than the present system of using cobbles. After much discussion, it was re-solved to try the experiment on about 150 yards in the High-street, and should it be

found to answer, it is not improbable the whole town will ultimately be paved with it. A gigantic wooden-bridge has just been erected over the river Lowther, between Clifton and Brougham-hall, and close to the stone visduct over the same river new in the course of erection for the Lancaster and Carlisle Railway. It is 530 feet in length, 18 feet in width, and 110 feet in height; and there have been used in its construction upwards of 26,000 cubic feet of timber, and thirty tons of iron. Some very extensive alterations are in progress at Ely Cathedral. An arcade of fifteen or sixteen arches, from a design by Professor Willis, of Cambridge, is about to be introduced at the communion-table; and the four windows under the lantern are to be filled with paintedglass, executed by Wales; one of them at the cost of Mr. Edward Sparke, son of Bishop Sparke, and the other three at that of the dean and chapter.-----The foundation-stone of the Royal British Orphan Asylum was laid at Devenport, on Wednesday, the 30th ult. Earl Fortescue, as Provincial Grand Master, came purposely from Ireland to attend the coro-time since.—Mr. Laycock, of Liverpool, after having built an iron palace for an African king, and a residence of the same material for a. West Indian family, has just finished an iron house for a family in Nove Scotia. During the past week two new churches, both of them exected after the designs of Mr. Benjamin Ferrey, have been consecrated, vir., All Saints, Dorchester, and Christ Church, St. Giles's, London, notices of which will be found at pp. 104 and 114, ante. In addition to our former remarks respecting the Dorohester structure, we may state that the design of the principal doorway Westminstern Abbey ; and that the roof is of open .woedwork (i the principals are curved, and meat upon projecting bemmar-beams, which continue through the walls into the side sisles, and there form the tie-heams. | These hammer-beams are again supported by bracketformed trusses, which rest on stone-moulded corbels inserted over the piers of the arcade. The timbers of the nave and chancel roof are also connected by curved braces.-----At a very respectable and influential meeting, held a few days since at Bristol, it was resolved, that for the maintenance and advancement of the trade of that city it was essential that a floating pier at Portbury, as designed by Mr. Branel, be constructed. A provisional committee was appointed for the purpose of taking the requi-site measures for the formation of a company to carry the undertaking into effect.-----The new church at Greenstead-green, Halstead, is rapidly approaching completion, and is expected to be consecrated in July next. A parsonage house is also in the course of erection on the same plot of ground, at the sole cost of affered to complete the Clifton Suspension-bridge on condition of receiving the tolls, but that it will be carried into effect without his individual assistance, ------ It seems probable that the building of the churches at Morton and Stockwith, in the parish of Gainsbro', which has been in abeyance, will be com-menced forthwith. It is said that the follow-ing parties are the contractor wir Mr. Behart ing parties are the contractors, viz. Mr. Robert Wood, of Doncaster, builder; Messra. Oates and Newton, plumbers, Gainsbro'; and Mr. springing from low piers of plain mouldings. The chancel has two hooded windows of two lights, and a priest's door. The windows of the aisles are square-headed, the side walls shire, is just completed by Messrs. Binks. A new font has also been erected. The whole has been executed at the expense of the Rev. Chas. Constable, of Wassand .-----The foundation stone of a national school, at Whitby, Yorkshire, was laid on Monday, the 5th instant, by H. Welder, Esq. The site

 $r \sim$

236

THE BUILDER.

selected is close to the entrance of the tunnel on the Whitby and Pickering Railway.——A company is being formed to establish waterworks on an extensive scale in Bristol. The proposed capital is 200,000%. Many of the leading merchants in that city have consented to be placed on the provisional committee. The present supply is obtained from public or private wells at a cost averaging 30s. per annum for a family. The committee propose to afford an increased and permanent supply at a much less cost, besides improving the health of the city by a constant cleansing of the sewers as well as the streets by means of water jets.

FREEMASONS OF THE CHURCH.

May 13th.; the Rev. G. Powell, L.L.B., in the chair. Mr. J. Sedgwick and Mr. William Papineau were elected members. Mr. Rogers exhibited an ancient and rare specimen of Italian ware by Lucca del la Robbia, the property of Mr. C. B. Wall, V.P., M.P.; also a curious specimen of the work of Bernard Palissy, representing fish, herbage, and pebbles, at the bottom of a circular dish, by permission of the Right Hon. the Earl Cadogan, V.P., &c.; also a specimen of early Italian carving in walnut tree representing the death of the Virgin Mary, which was preserved by Mr. W. Gill, M.P., from the now destroyed convent of Annecy, in Savoy, and a carved wood trophy for his Majesty the King of the French.

Wood trophy for the angle of the second former of t

Mr. W. H. Rogers exhibited several sketches and models of ecclesiastical architecture from Alderton Church, Wilts. The subjects exhibited were—part of a boldly carved cornice of rope and vine leaf in the oak screen of the church, stone corbels, embellished with the emblem of the boar and vine, the pelican in her piety, monster representing an evil spirit, an angel in adoration, serpent with the forbidden fruit, St. Michael, the tree of life, the crown of life, swallow building her nest, shield of St. George, the phœnix of resurrection, the Good Shepherd, the Rose of Sharon, hart and waterbrook, six angels bearing the Passion of Our Lord, viz., a cross calvary—heart and nails scourges—spear and sponge—crown of thorns and pillar of flagellation, &c.

Mr. Thomas Leeson presented a mould and a cast of a bronze, representing Richard I. in armour, on horseback, as a Crusader; above the king's head is a trefoil, in the centre foil is a lion's head, and in the remaining two, helmets, swords, and other implements of war, suspended by a chain from the lion's mouth; beneath the feet of the horse are two Saracens, slain.

Mr. C. H. Smith then delivered a very interesting lecture on building stones, treating both of their composition and decay.

FAIRLIGHT CHURCH, NEAR HASTINGS.

THE necessary arrangements are completed for rebuilding this church. The old church, consisting of a nave 30 feet by 20 feet, a chancel 20 feet by 15 feet, and the remains of a western tower, is said to have presented no vestige of architectural interest, and was in a most dilapidated state. The principal proprietors of the parish having resolved to rebuild a structure suitable to the increased population of the village, and worthy of the purpose to which it is dedicated, raised subscriptions sufficient to defray the expense without a parochial rate. Mrs. Milward, of Hastings, whose activity in forwarding all good works is well known, contributed 1,000*l*.: Mr. Lucas Shadwell, bestowed 500*l*., and granted the free use of his stone quarry. By the exertions of the Rev. Mr. Pearse the subscriptions amount to 2,500*l*. The new church, designed by Mr. Thomas Little, is a single aisle church, and consists of a nave 62 feet by 24 feet, chancel 20 feet by 17 feet, north aisle, and a massive western tower, 80 feet high, at the end of the aisle. The nave and aisle are separated by three archee springing from octagon piers. The style is early English, with am equilateral open-framed roof. The building throughout is of stone.

HISTORY OF A COMPETITION. st. simon's chubch.

Sin,—A history of this competition, which has now been before the public some weeks, has just come under my observation in the monthly part of "The BEILDER." This history is signed a "Looker On;" but I would suggest to that individual, that be ought to have well *looked* into the details of this affair, and ascertained the trath of his information, before bringing himself and his history so unceremoniously before the public. As the author of the design "Ignatius," I feel myself called upon to correct a "Looker

As the author of the design "Ignatius," I feel myself called upon to correct a "Looker On" in one or two particulars, which might otherwise be injurious to my reputation; and, in doing so, I shall state nothing which I cannot clearly prove, and which is not quite requisite in shielding myself from unnecessary blame.

Any one reading the account alluded to, would infer, that the committee had chosen a design, which might be a "pretty picture," but which, in reality, was worthless, and soon found to be good for nothing. The architest also, a reader would conclude to be of the same character, and ignorant of his profession. Proofs are brought forward sufficiently pointed to warrant such a conclusion; to which I must oppose the following facts. When first this design was sent in to the

When first this design was sent in to the committee, it was distinctly stated in the description, that the cost would exceed the sum named in the instructions. Of course they were perfectly at liberty to reject it if they thought proper; however, it was retained, even after the general estimate was found above the 3,000*l*, whereupon the working drawings were at once proceeded with.

Here, I think, was no "ridiculous" professions on the part of the architect, or any attempt to deceive a committee endeavouring to perform an onerous duty. "The walls for the aisles in the nave, and clereatory were not to be 14 inches thick, or thereabouts;" but drawn to scale, and figured two feet. The difference between 14 and 24 inches in too great for me to suppose such a mis-statement should have arisen accidently. I therefore conclude this falsehood was created wilfully, and probably from malicious or interested motives.

Our well-informed historian says, the committee agreed themselves to bear the expense of thickening the walls, which, he states, would be about 250*l*. How far does he imagine that sum would go in such an operation? Two feet may not be too much, but he would be content with 18 inches.

With respect to the rejection by the "Incorporate Society," I must make the following statements. It was necessary to obtain pecuniary assistance, for which purpose the drawings were forwarded to the society for inspection, aid being only given in building churches of approved accommodation; that is, a certain number of free seats for the money. The "objections" which I received from the society's secretary were the following r manely, 61b. instead of 81b. lead was specified for the gutters. The specification had not provided for the excape of the water condensed on the windows. The "beard" found fault with the arrangement of the free seats (not mear smough the minister), and the children's seats. Also that the font was not in the right place; and

that the walls appeared too thin. The objections which "poured in," to the committee, and which I heard of, were these. The tower was more intended for display than utility (not uncommon this,) and it was suggested that one of the vestries might be dispensed with.

Now, it will be seen, these objections are not of very great moment, and the committee can hardly be blamed, though they did "obstinately" try to "get rid of them."

At length the society, perhaps annoyed at the obstinacy of the committee, and their dulness in not taking the hint, and dismissing their architect with his plans, sent down the final decision of the "board;" which was, "that this design is fundamentally erroneous. arising from the disproportion between the side and centre aisles." (The centre aisle is more commonly by architects termed the nave.) Of course after this the committee found themselves under the necessity of adopting a fresh design, or building without the society's grant; and as the lesser evil, the

Digitized by GOOGLE

chosen design was abandoned, and another sought for. The reason advanced for procuring the assistance of another architect was, that they had already lost much time, and Mr. L. had a set of plans ready prepared, which might at once go up to the society. It only remains for me to make a few re-

marks on this evidence, and first I would ask: had the society sufficient grounds for causing the rejection of an already adopted design, and the dismissal of an architect already gaged? Some of the objections are too trifling to be worthy of notice; only observing, that it is by no means unusual for an architect to make alterations from his original design, even during the progress of the building : and this is often called an oversight in construction.

The charge of disproportion between the nave and sisles may seem very formidable to those ho de not exactly know what it means, and the committee were no doubt surprised to find the design they thought the best, which pleased them the most, was just a jumble of error and disproperties. Now, there are churches built t aisles, and some with them; and there are various proportions between the mave and sinks. I thought I saw some advantage in my proportion, and so it appears thought the comproportion, a mittee. If, however, a certain proportion was at all requisite, why was it not mentioned at first. If the error was so very glaring, why was it not sooner discovered ?

Bupposing the saciety justified in rejecting the design, then I ask of any competitor, or any one connected with this competition, was it of the "Incorporate Society," and guaranteed to pass the examination of the "board?" There are many churches half where the

regulations are not complied with, and which would not be canationed by the society. Ac-cordingly, I did not consider myself bound to comply with the regulations of any society, except society in general, and I was a good deal snrprised to find that any one had the power to take a building out of my hands which I had fairly won in competition, and which was mine by right of conquest. I am, Sir, Sre., R. H. BENTHAM.

T think it is not unreasonable to ask "A Looker-On" for his authority for some of his statements relating to my design, and I may also observe, that he himself has the "advan-tage" in being merely "A Looker-On."

THE IRON TRADE.

THE extravagant height to which the price of iron had reached has been followed by a reduction equally sudden, although by many persons confidently expected. According to the best anthorities the reduction may be taken at 20s. Pigs were stated at the last quarterly meeting to be 64. 10s., they are now to be bought at 54. 10s. In merchant-iron there is a reduction of 22, per ton. It appears to be the prevailing opinion that the late extraor-dinary advance of 24 within three months was artificial, uncalled for, and highly isjudicio it proved very injuries to the iron manufac-turers of Staffordshire and Shropshire, un-settled the business of the Birmingham factors, and was the cause of orders to a considerable amount being sent to Germany

When we reflect that pig-iron was selling in the Clyde at 35s. per ton, and has been lately quoted at 51, 10s. to 61., and that bars were selling at 47.5s., and have recently realized 10%, and even 11%, it may very well be imagined that the iron-masters must have been doing a good trade.

THE SMOKE NUISANCE .- We are told that an economical plan of consuming the smoke made in furnaces is being generally adopted by manufacturers whose premises are situated in crowded localities. The principle is exceed-ingly simple, consisting merely of a course of brickwork at the back part of the furnace. The space under the boiler is closely built up with the excention of with brick and mortar, with the exception of two holes left at the bottom, through which the flame is directed; this being quite filled by the fame, the smoke which occupies the other space is intercepted by the brick-work, and brought back upon the fire, where it is consumed, and a small quantity of white vapour only escapes into the atmosphere.

THE ELIZABETHAN PERIOD.*

HADDON HALL, like many other magnificent abodes, appears, on close examination, evi-dently built when comfort was not a peculiarity of art in household construction. The doors are very rudely contrived, except when pic-turesque effect is the object; few fit at all close, and their fastenings are nothing better than wooden bolts, clumsy bars, or iron hasps. To conceal these defects, and exclude draughts of air, tapestry was put up, which had to be lifted in order to pass in or out; and when it was necessary to hold back these hangings, there were great iron hooks fixed for the purpose. All the principal rooms, except the gallery, were hung with loose arras, and their door were concealed behind.

The universal rage for building in the sixteenth century (felt by no one more than Henry VIII, who built, improved, or com-pleted no less than ten palaces), caused a rapid development of the new style then in process of formation—the Tudor Gothic. This style was in effect the latest form of the eccle-sisstical Gothic, but modified by the necessities and proprieties of a domestic residence. Thus, more light was required for a room than for the interior of a chapel or a church; so the fronta of houses became one vast expanse of glass. "You shall have sometimes fair houses so full of glass, that one cannot tell where to come to be out of the sun or cold" (Bacon). Chimneys of all shapes and sizes, and some of them exceedingly ornamental, sprung up. But in Elizabeth's time a new element came into operation. Italian art was introduced. Henry VIII., in a spirit of rivalry with Francis of VIII., in a spirit of rivalry with Francis of France, had sought to bring foreign artists to England; and though Raffaelle and Titian declined the invitation, other eminent men from different parts did come; among them Holbein, the universal artist. Many of the chief buildings erected after the middle of the chief buildings erected after the middle of the sixteenth century shew the influence of the Italian architects. Somerset House was built by John of Padua, and became, as the first Italian edifice erected in England, an example Italian editice erected in England, an example for others to follow. But the English archi-tects did not servilely copy them or any other works. They preserved some of their own Tudor-Gothic tastes; they admired, and there-fore added something from the Italian; they also admired, and therefore also borrowed from Holbein and the German and Flemish schools, and they arout was unsuestionably. schools, and the result was, unquestionably, magnificence.

As presenting generally a notion of the plan of Elizabethan mansions of the first rank, Buckhurst House, Sussex, may be usefully studied. This was built about 1560 by the author of the glorious poetical Induction to the Mirror for Magistrates, Lord Buckhurst, afterwards lord treasurer and Earl of Dorset. We regret to say, not only for the sake of the building, but for the associations connected with its author, that Buckhurat has long since disappeared. But magnificent as were these great massions in their size, arrangement, and general aspect, there was little even in them that would harmonize with our notions of what the interiors should be to correspond with such exteriors.

Walpole justly observes, with regard to the manaions of the sixteenth century, "Space and vastness seem to have made their whole and vasciless seem to have made their whole ideas of grandeur; the palaces of the memo-rable Countees of Shrewsbury are exactly in this style. The apartments are lofty and enormous, and they knew not how to furnish them. Pictures, had they had good ones, would have hear has in chambers of each would have been lost in chambers of such height: tapestry, their chief moveable, was not commonly perfect enough to be real magnot commonly perfect chough to be real mag-nificence. Fretted ceilings, graceful mould-ings of windows, and painted glass, the orna-ments of the preceding age, were fallen into disuse. Immense lights, composed of bad glass, in diamond panes, cast an air of poverty over their most costly apartments.'

Hardwick, in Derbyshire, between Chester-field and Mansfield, the property of the Duke of Devonshire, is one of the "palaces of the memorable Countess of Shrewsbury," here re-ferred to. A strange story is told in explanation of this lady's building propensities. A tradition, recorded by Walpole, says, the countess was told by a fortune-teller that she

* "Old England, a Pictorial Museum of Antiquities." C. Knight, London,

should not die whilst she continued building ; so she went on, crecting mansion after mansio until her proceedings were arrested one winter by a bard frost, which rendered the workmen unable to continue their labours, and then she died. Two or three portraits of the countess, or as she is more popularly called, Bess of Hardwick, are to be found here. The gallery is of the amazing extent of 195 feet, and con-tains some interesting pictures; among them one of Mary Queen of Scots, whose residence as a prisoner in the mansion has given to it a still higher interest than is attached to the wellknown countess its founder. Mary spent a considerable portion of her long nineteen years of imprisonment at Hardwick, during which time she occupied some of her dreary hours by embroidering the black velvet chaircovers that are still preserved in the mansion. Indeed, one of the most delightful features of the place is its perfectly Elizabethan character. Every thing remains unaltered from the days of

the two queens-the oppressor and the oppressed. Of old castles, as well as old churches, we take our leave in the present period. Their uses had passed away. Many of these built in imitation, to a certain extent, of the ancient castellated style, were but superficial imitations, calculated to please the still lingering military tastes of the owners, but utterly unsuited for the real wear and tear of military defence. Indeed, Elizabeth, as well as her father, would no doubt like to have seen the man who were have ventured to have spected a real strongno doubt like to have seen the man who would hold in her time. Power enough was reserve for the aristocracy, but it was to be hence-forth the power of station and wealth only, whether exercised in public or in private life. So, although castles were erected, and strong and strong ones too, no subjects were the builders. There were to be defences provided, not to facilitate internal warfare, but as a protection from foreign aggression. Henry VIII, caused a chain of fortresses to be raised for the protecchain of fortresses to be raised for the protec-tion of the northern and environ coasts as Sandown; and otherns. The Elizabeth we owe the commencement of the coasts named after herself at Jersey, to which Clarendon resided for two years, and wrote a large pertion of his "History of the Rebellion." Mount Orguell, also in Jersey, commandingly situated on a rocky headland that projects forward into the sea, is famous as the prison of Prynne, and the residence of Charles II. during a part of his exile. Upnor Castle, on the Medway, a little below Chatham—now completely in ruine...is distinguished as being one of the last, if not the very last, of those places of last, if not the very last, of those places of defence that were built on the old principles of fortification.

We cannot better take leave of the general subject of castles, than with a few words upon a fortress that formed a most perfect example of the class in all its genuine strength, and sternness; and inconvenience for residence, and which, to the regret of those who like to have something better than mere descriptions of antiquity to rely upon, has been recently much damaged by fire. Naworth stood on the edge of a ravine, had walls of enormous thickness, and was altogether in the style of a eastle of the fourteenth century; when all such works were built with the expectation that occasions might arise to test their strength, and with more than expectation— the certainty—where castles like Naworth were concerned. To the strength of wall, and narrowness of window that marked the exterior of such places, must be added, in order to combine their chief characteristics, the dun-geons within for prisoners, and the fire-places of the hall, which were really of almost incredible dimensions. That of Naworth was seventeen feet broad.

PROPOSED AERIAL TUNNEL OVER THE MENAL.—Mr. Randall proposed last week, be-fore a committee of the House of Commons, to carry the Chester and Holyhead Railway across the Menai Straits, by means of a huge tube composed of sheet iron, and to support the same midway on the Britannia Rock, thus forming a kind of aerial tunnel, consisting of two spans, each being about 450 feet in length. General Pasley on being questioned as to the merits of the proposition said, that he con-sidered it sound in principle as well as safe in practice. He also was of opinion, that two small tubes, one for each rail, would be pre-ferable to a single large one.

LIST OF NEW PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &c., GRANTED FOR ENGLAND.

Furnished by Mr. A. Prince, of the Office fur Petents of Inventions, Lincola's-Inst Fields. ħ

[SIX MONTHS FOR ENROLMENT.]

298

William Robinson Mulley, and George Mason, jun., of Ipswich, contractors, for improvements in collecting and raising stone or sub-stances from below water. April 2.

Otis Tufts, of Boston, in the state of Massachussetts, America, engineer, for a certain new and useful mode of building or constructing either the hulle or decks, or both, as the case may require, of ships, beat, and various other miling or fosting vasels made of iron, or other witable metal or metably. April 2.

John Dewrance, of Liverpook, angineer, for certain improvements in steam beilers, and in the construction, composition; and manefactore of bearings, steps, and other rabbing surfaces of steam rugines and other (a scholery, and also for a method of lubricating the same. April 7.

Thomas Metcalfe, of Elizabeth-street, Eaton-

Thomas Metalfe, of Elizabeth-street, Eaton-nutro, dirach-maker, for certain improvements in propelling curriages, which improvements are also applicable to driving certain ma-ohinery. April 7. James Lamb Hancock, Frederick Augustus Lamb Hancotk, and William Lamb Hancock, of Guidefield, Montgomery, for an improved retary steam ongine. April 7. Edward Bary, of Hanalopa, Buckingham-shire; civil angineer, for certain improvements in lobomative engines, cerriages, or wagons zonning upod sailways or seminon roads, for the prevention of accidents. April 7.

provements in water-closes. April 9. John Coope Haddan, of Liverpool street, King's-cross, Middleser, engineer, for im-provements in praparing sleepers, chairs, and spikes, and constructing wheels for railways. April 14. Frederick Rosenborg, of Kingston-npon-Hull, gentleman, for, certain improvements in machinery for cutting and shaping wood and other materials into various forms or figures, and also for cleaning and smoothing the

and also for cleaning and smoothing the surfaces of the same forms or figures. April 15.

George Carter, of Willenhall, Stafford, job-bing emith, for certain improvements in locks and latches. April 15. John Lord, of Friday-bridge, Birmingham,

merchant, for improvements in supplying steam-boilers with water. April 15. George Boyle, of Church bill, Wednesbury, Stafford, whitesmith, for improvements in loco-

mative, marine, stean, gas, and other tubes. April 17.

William Mackie, of Baggot-street, Dublin, builder, fon improvements in window-sashes. and shutters. April 22.

Freeman Roe, of the Strand, engineer, for improvements in the manufacture of pipes for onveying water and other fluids. April 22.

Joseph Maudsley, and Joshua Field, of Lam-beth, angineers, for certain improvements in propelling, and, propelling, machinery. April 24.

Robert Beart, of Godmanchester, gentleman, for improvements in the manufacture of bricks and tiles. April 24. Samuel Wilkes, of Wolverhampton, iron-

founder, for improvements in the manufacture of binges. April 26. John Sylvester, of Great Russell-street,

Bloomshury, civil engineer, for improvements in stoves and firs-places, A pril 29. Glimoer, Wilson, of Earl street, London,

engineer, for improvements in the construction of wheels for carriages. April 29, Fraderic, Lannard, of Kepple, street, engi-

neer, for improvements in generating steam and evaporating liquids. April 29. James Nassyth, of Arandel-street, gentle-

man, for certain improvments in engines or machines for obtaining and applying motive power. April 29.

Correspondence.

THE BUILDER.

ARCHITECTURAL MODELLEBS. Sig.—Your correspondent who writes an architectural modelling at page 190 of your excellent periodical seems to entertain a mis-taken and somewhat prejudiced feeling towards architects, builders, and plasterers, which I shall endeavour to correct.

Your subscriber states: "In almost all cases the modeller is not employed by the ar chitect, but by the builder, who, having little taste for works of art himself, employs any body he can get to do it cheap, mostly some plasterer, who understands little about modelling, nothing about drawing or style of composition, the artist of acknowledged talent is enwhile tirely deserted by the architect.

In reference to the above remarks, I shall admit that the decorative modeller is seldom directly employed by the architect; but instead of being employed by the builder, it much more frequently occurs that he is engaged by the plasterer, as was the case at Buckingham Palace, Windsor Castle, York House, &c., where architectural modeling was carried out to an extent of beauty and magnificence, if not to an extent or beauty and magnificence, if not unequalled, at least unsurpassed, and that too, under the immediate guidance of a *plasterer*, whose name will go down to posterity as the greatest man in the line ever produced in England.

Your correspondent also (with all due deference to his talents) evidently writes on a subject he does not quite understand when he states, that "the drawing made by the architect seldom for more than a quarter part, gives a very ambiguous idea of the subject wanting, and in many cases no drawing at all; the models so made are consigned to the tender mercies of some hod boy to cast, and to fix by others who know as little about it."

others who know as little about it." Surely, Mr. Editor, your *decorative modeller* is sadly out of his latitude in the above asser-tion. Firstly, are we to understand him that in some cases the architect makes no drawing at all ? if so, pray what is the architect's office? Secondly, there is not such a class of individuals in London, or elsewhere as "hod boys. ere is not such a class of indivi-I presume your correspondent or your printer's devil has made a mistake, for this should have been "odd boys;" and certainly odd lads they are some of them, and clever fellows too; really boys of intrinsic value, some of them really boys of intrinsic value, some of them bright young geniuses of the very first magni-tude. I have had many of these same lads to cast my enrichments, and when properly trained, they do it in the most expert manner; their proper cognomen is "hawk boys." Thirdly, the decorations after being modelled and cast are in all good establishments fixed by expert plasterers, picked men, masters in their particular branch; and, lastly, to wind up this statement, and to shew that your subscriber is labouring under a delusion, I have to add that the very best architectural modeller, as regards minuteness of detail, &c., served his time to be "a plasterer" with the late Mr. Geo. Robson of Durham, never had an hour's instruction in drawing, and has immortalized his name in the annals of modelling by his copies of various sizes from the remains of the Temple of Jupiter Stator, &c. Need I name the justly celebrated." Tom Gillespie." Further, the concurrence, a om Gillespie." Further, the very best general modeller and designer ever known in London was originally a "hawk boy;" and again, the best men in the line practicing at the present day, have more or less originated from the plasterer and, the hawk how. If I have hear concurrent hawk boy. If I have been somewhat ungentle in my remarks, and indulged in a touch of pleasantry in this matter, I trust your correspondent will forgive me, my observations being well meant, and originating in the wish to set both him and the public right, for I merely lifted the pen to correct his erroneous con-clusions, and to defend the architects, builders, and plasterers, from imputations they do not deserve; the former of whom, instead of deserting talents and genius when they see them eveloped, invariably encourage them to the fullest extent. The fault does not rest with the architect, as your writer supposes, but in ninety-nine cases out of a bundred, with the modellers themselves, some of whom possessing talents of the very first order, are unbappily too much given to gaiety and midnight carousals, in-stead of attending to the instructions of their patrons the architects. Others, again, do not pos-sess those peculiar abilities requisite to carry out

the ideas of the architect, and consequently are rejected. So ends my present theme, and if he and the public will not assent to its truth, why verily they are dissenters worse than pagans, as Fraser or some of his writers would have said, and consequently not entitled to con-sideration.—I am, Sir, &c., FBANK TYREELL.

Newcastle-upon-Tyne.

SKETCHING INTERDICTED IN CATHEDRALS. SIR,-Pray enter a protest in your influ-ential journal against the exclusive system of preventing architects and others sketching in cathedrals, churches, &c., To-day, seeing some excellent bosses in the Lady Chapel at St. Saviour's, and being of course anxious to sketch, I was told, as usual, "No sketching is allowed, Sir, without a permission from the warden," which, having only an hour or so to spare, was not to be obtained. It is the case all over this construct. all over this country-at Canterbury, Here-ford, Westminster Abbey, and wherever I have been,-Durham is the only honourable exception, and I do not think that the cathe-drai has suffered for this unusual liberality. In France, I have skotched, measured, and In remove, 1 have succeed, measured, and studied in the eathedrahs without any hinder-ance whatever, and I think that you will agree with me, that it ought to be the case here. If you will make this a subject of consideration, and notice it in your paper, you will much oblige, Sir,

Your obedient servant, A SUBSCRIBER,

*** We fully agree with our correspondent, that such prohibition, where it exists, is unwise and veratious, and will gladly lend our assistance to induce the discontinuance of it.- Ep.

COVERING FOR ROOFS.

Sin,-I shall be glad if some one of your correspondents will give me some inform respecting a really good and light material for rooting, in a chimate such as that of America. Zinc I am fearful of, as the heat of the suc Zine I am fearful of, as the heat of the sum draws it out of shape, and wherever there is much condensed anoke or toot settling upon it, it corrodes most provakingly. The build-ings I wish to roof are in one story; they are built of wood, and the roofs are wasted a good apan, say 50 feet. I have heard of galvani and iron, but wish to hear how those who have tried it find it to answer, and the expense per square foot. Any of your correspondents able square foot. Any of your correspondents able to furnish me with this information will confer to furnish me water and so. a great favour by doing so. I am, Sir, &c.,

A SUBSCRIBHR.

ESTIMATES FOR HOTEL AT WHITEHAVEN.

Sik,-My attention having been drawn to a letter in THE BUILDER of last week, professing to give information respecting the tenders for the proposed hotel at Whitehaven, I have to observe that it is not my practice to a supply quantities on any occasion, and with reference to the business in question, that the quantities were abstracted by Mr. John Blyth on my behalf, as architect, and by Mr. Eppy on the part of the builders.

I shall be obliged by the insertion of this letter, and remain, Sir, your obedient servant, R. C. CARPENTER.

Guildford-street, Russell-square,

May 12th, 1845. . .

HAGIOSCOPE IN BARLY CHURCHES.

SIR,-In "THE BUILDER" of the 10th inst. I find inserted a very interesting account, historical and architectural, of Alderton historical and architectural, of Alderton Church, Wilta. The writer refers, at some length, to a very curious "hagioscope" in the said church, and inclines to the opinion, which he quotes from the Cambridge Camden Society, that such openings were found in early Norman churches.

In a late charge of the Venerable Arch-deacon Shirley, I find the early origin of these architectural features of a church questioned. Would you, or any of your readers, have the goodness to mention any instances of "hagio-scopes" of undoubted early character. I much scopes" of undoubted early character. question if there were any in Norman times. I am, Sir, &c., J. F.

STRENGTH OF TIMBER BEAMS.

SIR, - I have made a model of a truss beam to a 1-inch scale, its bearing is 25 inches, the flitches are 27 inches long, and 11 by 78, the fitches are 21 inches long, and 12 by Ta, its contents are about 24 parts, it carries a weight of 168lbs, with very little flexibility. Now, I should be glad to know (and by what rule) how much a beam of 25 feet bearing will carry whose fitches are 15 inches by 64, which is none the size of first model according which is near the size of my model according to scale. If any of your talented readers will solve this question, it will oblige, yours respectfully,

À CONSTANT SUBSCBIBER.

. Maiscellanea.

PROPERTY-TAX AND WINDOWS. -- Lord Dancan, the member for the city of Bath, has procured, by order of the House of Commons, a return shewing the total number of house assessed to the property tax in the year 1844, in respect of certain streets, squares, and courts, in Westminster and Marylebone; also a similar retarn of the amount of window duty paid by the several bouses assessed in each, of the above classes, distinguishing the amount paid for each class, &c. It is hence accertained that the total number of houses assessed in 1844 amounted in Regent-street to 302-of which 21 were under 150%, 65 under 200%, 115 under 250%, 49 under 300%, 26 under 400%, 8 under 500%, 5 under 1,000%, and 3 under 2,000%; in St. James's-square, 28—of which 4 were under 150%, 1 under 200%, 3 under 750% 12 under 1000% and 8 under 200%. 4 were under 1502., 1 under 2002., 3 under 7502., 12 under 1502., and 8 under 2,0002.; in Berkeley square, 45—of which 1 was under 1002., 3 under 1502., 3 under 2002., 7 under 2502., 6 under 3002., 5 under 4002., 7 under 5002., 11 under 7502., 1 under 1,0022., and 1 6 dubier 2,000% and 35 above 2,000/; hr Peter-street, Westminister, to 89; in Berwick-street, Sohoy to 88; in Chapel-street, Westminster, to 15; in Little Sunbope-street, to 18; in Dui face's-place, St. James's, to 10; it Cross-street, St. James's, to 14; in Broad-street to 49; in Poland-street to 63; and in Lancashire-court, Westminster, to 14; all the houses in in conversion with the attern. The smooth in comparison with the others. The amount of window duty paid by the several houses was in Regent street; 2,060/.; in St. James'ssquare, 6694; in Berkeley-square, 7124; in Ox-ford-street, 2,3104.; in Grosvenor-square, 9834; in Piccadilly, 1,7914; in Peter-street, 1144.;

in Piccadilly, 1,7914; in Peter-street, 1144; in Berwick-street, Soho, 4834; in Chapel court, Westminster, 3s. 6d.; in Little Stan-hope-street, St. George's, 624. 13s.; in Du-four's-place, 784. 7s. 6d; in Cross-street, 774. 13s. 6d.; in Broad-street, 3324; in Po-land-street, 4154.; and in Lancashire-court, 224. SOCIETY OF ARTS.-May 7th, Mr. G. Moore, V.P., in the chair. Mr. J. Scott Russell described an opright drill, the invention of Mr. J. McDowall; the novelty and advantage of which consisted in the application of the power employed being in the direction of the axis of the drill, instead of at right angles, as in the ordinary drill. Mr. Boulter described his im-proved compensation pendulum spring, where proved compensation pendulam spring, where-by he is enabled to regulate the pendulum without altering the adjustment, and vice versd. The pendulum is attached to a rod (of white deal) by means of a pivot passing through two small steel plates let into the rod. The secretary read a paper by Mr. Dicksee on the manu-facture of his pressed glass mosaics, applicable alike for pavements, mural decorations, and furniture, several specimens of which were laid on the table. The mosaics may be produced of any colour. They may also be modelled into any required shape, while the glass is in a fused state, by means of a double-action screw press. In order to prevent the surface of the mosaics being bloated and uneven, it is necesmosaics being bloated and uneven, it is neces-sary that the pressure should be continued on a sufficient time so that the glass may harden before being removed from the mould. Dr. Jarvis, of Connecticut, U.S., explained to the meeting his "Surgical Adjuster," the objects of which are to reduce dislocations, to adjust all fractures, and preserve the fractured ex-tremitics in apposition during the process of confidential, Lettern pre-part. reunion.

WESTMINSTER IMPROVEMENTS.—A public meeting of the inhabitants of Westminster was held last Saturday, at the Mechanics' Institution, Great Smith-street, for the purpose of having submitted to them the report of the committee appointed on the 7th of February, to consider the best means of carrying out the projected improvements in that district. The Hon. Captain Rous, M.P. presided. It ap-peared that the committee had had an interview with Sir Robert Peel, who approved of their proceedings, and recommended them to communicate with the Commissioners of Woods and Forests, which they accordingly did. The Earl of Lincoln informed the com mittee that he was so pledged to Mr. Rigby Wason's line and plan of improvement, that he could not even examine other plans shewn,

much less entertain them. We gave a short time since (see page 147, ante), the names of those gentlemen who had sent in plans. It was stated at the meeting, by one of the committee, that on the question being put to each of those gentlemen, as to his being prepared with suffi-cient means to carry out his design, if approved of, not one of them could answer in the affirmative, with the exception of Mr. Abraham, whose plan is the one adopted by Mr. Wason. We are indebted to the excellent secretary to the Westminster Improvement Committee (Mr. W. H. J. Traice), for a copy of the report laid before the meeting, and shall refer to it next week.

depressed state, chiefly arising from the use of machine-made nails, and also from a spirit of competition among the employers. The average earnings of the nail-makers in this quarter; for some years past, have not exceeded 7s. a week; for though in some few instances 8s., 10s., or even 12s., have been realised, yet these 10s., or even 12s., have been realised, yet these sums were only got by extra labour, or perhaps a better paid kind of work. About six months ago the workmen obtained a penny additional for making 1000 nails; and after some agita-tion on the part of the workmen, several of the employers have this week advanced another 3d. on the same quantity. This will have the effect of raising the nail-maker's weekly earn-ings to about 8s. 6d. or 9s., or from 20 to 30 ings to about 8s. 6d. or 9s., or from 20 to 30 per cent. on their wages, which, though still a small pittance, must be productive of a little more comfort to this long-depressed body of men .- Scotch Paper.

THE KING'S ROAD, READING .- Relative to the late competition at Reading, 'we are informed that, after thoroughly considering the whole of the designs submitted to the adjudicators, the proprietor has decided to adopt one of the designs which received a premium both from the suitability of the design to the situation and aspect of the land, and the wants of the town of Reading. The land on the north side of the King's-road is intended to be laid out in one square of ample dimensions, in the area of which an ornaother arrangements with respect to walks and borders similar to Hyde Park-gardens, London. That on the south side will also form a terrace, with a diversified shrubbery in front. The style is to be restricted to the Italian, and care taken to preserve the character of the whole design. Our readers will find in our adverdesign. tising columns a notice of the land as now offered to the public.

SMORE NUISANCE.-It appears by the re-ports made from Woolwich and Portsmouth dockyards, that after a lengthened trial of nearly two years, it has been determined to adopt Godson's patent smoke-consuming upparatus in the Government yards, in consequence of its satisfactory performance. This invention combines the two principles of coking the coal and introducing heated air into the farmace, by either of which methods, scientific men are agreed that a very large proportion of the smoke of furnaces may be consumed; and by the joint operation of the two, it is to be expected that the most perfect combustion of the smoke will be obtained .-- Morning Paper.

THE SCHOOLMASTER ABROAD .- The Archdeacon of Middlesex at a recent visitation stated, that the National Society had raised above 197,000% between the 5th of July, 1843, and Christmas last, a period of only sixteen months. That no less than 845 schools had been built or enlarged, and accommodation provided for 108,937 acholars. A statistic the and statistic for 108,937 acholars.

HOT-AIR PIPES USED AV. THE BOMANS. It is stated, in a letter from Treves, that a curious and interesting, discovery has been made, in the course of the excivations among made, in the course of the excevations among the foundations of the uncient Round builties of that place-shoat to be restored, in its primitive form, as a Lutheran Church. Be-neath the mosaic pavement of its principal ball, which rests on brick buttresses, has been found a complete system of metal pipes, of a large calibre, which have obviously, it is said! been used for warming that apartment by means of steam or beated air+thus proving that a method of heating believed to have been of recent invention was known and practised in the days of the Romans.---Not far from the Webersbach gate of the same city, and about. four feet basesta, the surface of the soil, has been likewisa dissovered an extensive end been likewipa discovered an extensive and magnificent payament in mossio, also resting on brick pillers and which appears to have belonged to some shately edifice. It is divided into large compartments of which, eleven are uninjured, and represent mythological subjects, one as combase of gladiators, and military, and havehand tenhing. and bacchanal trophies.-Athenœum.

BASAAR IN COVENT-GAEDEN TREASAR' An extraordinary effect has been produced in Covent Garden Theatre by the specie-geinter and the expression money is a shiking. The whole house, including the stage, to ithe back while house, including the stage, to ithe back wall, is formed into a vist hally with open timber such; chestered cobusts, and pointed arches, elaborately adpried with paneling and colours. Soch from the upper bixes, which form the exploratory galling, the effect of the lengthened peroperties is very striking and the lengthened peroperties is persurbing and the lengthened peroperties is departed for the set of a strike to the the the bing of the set of the lengthened peroperties is the bing of the set of the for whose purposes the binary is opened; who BASAAR IN COVENT-CARDEN TREATER out: seference to the the the total new the set in the set is the set of the

public and a manual promised service and a service and a service and the service and the service and s most of the meteorological changes, may be greatly altered by having from conductors tra-versing the country in all directions. Thus, iron transmits electricity easily from due end of the country to mother; but not being in-sulated, it only opens a communication of, easier transmission in all the directions of the iron rails. It has been said that not more than half the quantity of rain has fallen during the past year. The electricity of the clouds would be puzzled were the surface of the earth covered with a non electric, as glass; and why should not a complete conduction in certain lines give passage to much electricity, which in the ordinary character of the usual surface of the ground would be more naturally and more beneficially distributed?

oenencially distributed? DESTRUCTION OF PIPE's ELM.—The cele-brated Piff's Elm, near the parish of Ucking-ton, was some time since sold by auction by order of the Dean and Chapter of Westminster. It was hought by Mr. Crook, of Hasfield, hear the Haw-bridge, for the sum of 124. About a fortnight ago, the work of demolition com-menced, and was commisted at 20 million comand was nine days - six in stocking h, erecting the scaffolding round it, and hopping off the limbs, and three in felling the trunk, which was about eight or nine feet in diameter. Nine was about eight or time teet in manneter. It no sawyers' were employed in catting the training through the centre, and afterwards in sawing it across at the root. A great many bets were made by gentlemen as to the soundness of the tree; the timber was found to be perfect.... Chellenham Free Press. 4. 11

ELECTION OF A SUNVEYOR FOR THE PARISH OF ST. JAMES'S. A hotics has been PARISM OF ST. JAMES'S. A DOILOG has been issued by the Middlesex 'magistrates, signed "Heaton'Ellis, 'clerk of the peace," to the effect that the court will proceed on Thursday; the 29th instant, to the election of a surveyor for the parish of St. James's; in the liberty of Westmann to the more at James's in the liberty of Westminster, in the room of Mri Jumes Gray

have some notes in type relative to the recent failure of this construction. So many con-failure of this construction. So many con-dictory opinions, however, are before the public, and so little information that is satis-factory, that we defer publishing themain and an longed blocking of a specia with an element.

NEW REVOLVING RULE FOR MEASURING NEW REVOLVING RULE FOR MEASURING LUMBER, &c.—A patent has recently been granted in America for the above purpose. The invention consists in a wheel of one foot in circumference, so arranged in a case as to have a portion of its periphery project beyond the case, and a portion of its face visible through a hole, the edge of which is graduated in the manner of the common lumber via through a hole, the edge of which is graduated in the manner of the common lumber rule. The shaft of this wheel is geared with the shaft of a cylinder, so that the latter will make one revolution to thirty-six of the former, there being thirty-six divisions to indicate the number of revolutions made by the wheel; and the shaft of this cylinder is geared with another cylinder which makes twelve revolutions to one, to mark the number of revolutions made by the first cylinder. The scales on the wheel and cylinders are so arranged, as to give the superficial as well as the running measure. The name of the inventor is Charles Ross.

ROYAL BOTANIC SOCIETY, RECENT'S-PARK.—At a recent meeting of the society an announcement was made by the secretary, that the council had at length succeeded in completing the necessary arrangements for the immediate commencement of the conservatory, Immediate commencement of the conservatory, or winter garden, and had with this view entered into a contract with Mr. Turner, of Dublin, already known by similar works in progress, or executed by him for the Boyal Gardens at Kew, the Earls of Derby, Aber-deen, &c. The building, the framework of which is rupon the suggestion of Mr. Deciwhich is upon the suggestion of Mr. Deci-mus Barton, under whose superintendence works are conducted, to be constructed the wholly of iron, was to be made available for the purposes of the society within the ensuing half-year.

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omis the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our readers however; they are entered in a book, and may be seen on application at the office of "The Builder," S. York-street, Covent-garden,] Covent-g

For taking down part of the present County Gaol of Lincoln, and erecting a New Building on the site thereof, with airing yards and other requisites.

For building a school-room in London near the hridges.

For the erection of the Borough Gaol, Birmingham.

For the erection of a Building in London for a highly-patronized purpose, at the estimated cost of about 30,000%.

For the supply of 20,000 slow-grown Larch Sleepers, wanted by the Manchester and Birming-

ham Railway. For the Alteration and Enlargement of the Union Workhouse at Whittlesey, in the neighbour-

hood of Huntingdon. For the Erection of a Workhouse between Swin-

don and Highworth, Wiltshire. For the performance of the necessary works in the construction of a New Dock in the Borough of Kingston-upon-Hull.

For repairing and keeping in repair for three years, from Midsummet-day next; the Cannon-street Road, Middlesex.

For Erecting a Market-house at Malmesbury,

Wiltshire. For a quantity of proof chain 2}, 11, 1, 1, and inch, wanted by the Universal Salvage Com-

pany. For the reparation of Ten houses in Hounsditch.

The whole to be finished by the end of August. For Lighting the Public Lamps within the City of London with gas, for the term of one year, from

Midsummer-day next. For Building Sewers in the eastjend of Tower-

street, Herplane, and St. Mary Hill, and other places adjacent thereto, within the City of London. For Building the Carcasses of certain first-rate Houses, with Shop Fronts, in the new line of

Oxford-street, leading into Holborn. For laying the Carriage-way of part of the Parishes of St. Giles-in-the-Fields and St. George,

Biomsbury, with Wood; also for supplying the same parishes with the best new squared Aberdeen, Mount Sorrell, and other Granite, and the best Eland Edge, Yorkshire, and other Foot Paving.

COMPETITIONS.

Plans, sections, and elevations for a Terminus. and other requisite accompanying offices, for the Great Southern and Western Railway, Ireland.

A premium of 30 guineas will be presented to the party offering the best plan of Docks, capable of admitting ships of 1,000 tons burden, to be erected at Burnham, in the Bristol Channel.

Designs for houses to be crected at Dover. The ground is nearly seven acres in extent, and lies on a gentle slope between the south-west boundary of gentic slope between the south-west boundary of Dover Castle and the town. A premium of fifty guineas is offered for the set that may be most approved of.

APPROACHING SALES OF WOOD. &c. BY AUCTION.

The timber and other trees now standing upon the estate at Woodseaves, Salop. By order of the Lord Chancellor made in the cause "Dickin v. Barker."

At Mitchell's Farm, near Saffron Walden. A fall of 68 famous Oak, and six Ash timber trees with the top wood. At Wiston Woods, near Nayland, Essex: all

the Timber, Timber-like Trees and Saplings (con-sisting of Oak, Ash, Elm, Asp, Birch, and Cherry) arising from the Wood of 13 Acres called "Hfils."

Artsing from the wood of 13 Acres called "Hifs." At Kensey, near Hadleigh, Essex: 130 Capital Oak Timber Trees, 70 Oak Standels, and about 30 Pollards, lying on "The lvy-tree Farm." At Earlsham, a quantity of oak, ash, elm, and poplar timbers. Oak, ash, elm, and other pollards, tea

Co. On the premises, West Harding-street, East Harding-street, Middle New-street, and Great New-street, Fetter-lane, the building materials of six houses, by order of the Goldsmithe' Company.

BY TENDER.

A Virgin Forest of Valuable Timber in Wala-chia. The principal part of the Trees is Oak. The said Forest may produce about 500,000 cubic feet of Timber.

MEETINGS OF SCIENTIFIC BODIES During the ensuing week.

MONDAY, May 19. — Statistical, 11, Regent-street, 8 P.M.; United Service Institution, White-hall Yard, 9 P.M.; Chemical (Society of Arts), Adelphi, 8 P.M.; Medical, Bolt-court, Floot-street, 8 р.м.

HATCHER'S BENNENDEN TILE-MACHINE, Manufactured and Sold only by COT-TAM and HALLEN, Engineers, Agricultural Implement Makers, &c., 3, Winsley-street, Oxford-street, London.

This is the most efficient Machine that has been invested for the purpose of making Drain Tiles. Any shaped This can be made by merely changing the die, which can be done in a few minutes. It requires but few hands, vin., one man and three boys. With this amount of labour, the pre-duct of a day of 10 hours is as follows, viz :---

Tile, 5,896 ,, 3,200

See Letter of Thomas Law Hodges, Esq., in the "Transac-tions of the Royal Agricultural Society of England," page 551, part 3nd, vol. v. The Machine is moveable down the drying-abeds, so that it requires no extra boys to carry the Tiles, nor we subtree required in drying. It has been in full operations for upwards of four months at Hempstead Park, near Cran-brook, Kent. No charge made for Patch dues or licence. The parchase of the machine includes free use of it.

TOTICE. - INVENTORS desirous of NOTICE. — INVENTORS desirous of obtaining LOANS ON or of SELLING their IN-VENTIONS, or Patenta, should apply to Mr. M. JOSCELIN COOKE, at the OFFICE for PATENTS, 20, Half Moon-street, London, where English and Foreign Patenta are ob-tained, and Designs registered. An INDEX is kept for inspection of all Patents granted for the last cultury; also copies of every Patent of importance. Instructions te Inventors and a list of charges gratis on application.

OFFICE FOR PATENTS REMOVED FROM No. 16 TO 117, CHANCERY-LANE.

PRACTICAL ASSISTANCE GIVEN to A parties taking Letters Patent, by Mr. J. Wildson, Regioner and Patent Agent. Rever description of business relating to or connected with Patents, Registration of Deregimor and Patent Agent. Every description of busisters relating to or consected with Patents, Registration of De-signs, Patent Agency, &c., conducted at his offices, 127, CHANCERY-LANE, opposite Carey-street. Negotimitiens entered into with parties withing to dispose of or purchase patented se registered inventions. Every necessary infor-mation may be obtained at the offices as above, where also may be had printed instructions (gratin), to which Mr. W. begs particularly to draw the attontion of parties about to take out patents Mechanical drawings of every description, original designs for machinery, models, &c., excuted with dispatch and ceonomy.

r machi conomy.

MORTGAGE and ANNUITY OFFICE, No. 123, Chancery-lane.-Persons requiring LOANS by way of MORTGAGE, or otherwise, upon any available security, may at all times procure an advance to the extent of from 1001. to 200,0001., or so much as the property will bear, by applying to Mr. BRAY, Surveyor, Land and Estate Agent, at the offices as above, where a Registry for the sale of Estates, Houses, Land, Life Interests, and Reversiona, is kept for inspection. N.B.-To expedite the procuration, personal application at the office would in all cases be better, the party bringing with them the abstract of tile, planes, &c.

All communications for Money are considered strictly confidential. Letters pre-paid.

"George's Pier Head, Liverpool,"--Two corres

SATURDAY, MAY 24, 1845.

N our journal of the 12th ult. (p. 169, *ents*) we communicated two awards by the official referees, as to bows and projections to houses commenced before

last January, establishing conclusively what we had before urged, that projections which were part of the original design, although not yet formed, were "already built" in the eyes of the law, and did not fall within the provisions of the Buildings Act,—always provided that the same should be finished and the houses rendered fit for use before January, 1846.

At the close of the article we remarked, "we need say no more on this subject." The law seemed so clear to common sense, and the referees had so strongly enforced it by these awards, that we thought it was not likely that the question would be again raised. We were, however, wrong in that belief, and are induced to state the particulars of one other case in point, with the referees' decision, as a warning to the obstinate and litigious.

In the autumn of last year, Mr. Harvey, a builder, erected a detached house on Lord Dartmouth's land in the Lewisham-road, with a porch in front and bow window at back. The carcass was covered in, and the basement story of both porch and bow erected by December. The upper part of the bow was to be formed in timber (so shewn on the plans originally made); and when the builder last month completed it, as always intended, Mr. Badger, the district surveyor, gave him notice of irregularity, and ultimately he was summoned to appear before the referees at the "Lion and Lamb," Lewisham, — not an inapposite conjunction.

The facts above stated were proved and admitted: and it was shown at the hearing that the registrar, on receipt of the district surveyor's information against the builder in question, had actually directed his attention to the awards we have alluded to, so that he was unable to plead ignorance in excuse. Lord Dartmouth's surveyor, Mr. Godwin, who attended for the builder, called on the referees (in the full assurance that they could do no other than award against the interference of the district surveyor) to provide for the payment of his client's personal costs, urging justly, that when the builder is wrong they force him to pay an extra fee to the district surveyor for his attendance, and therefore when he is right they ought not to allow the expense of professional assistance to fall on him.

The award of the referees, which has just been taken up, does not go quite so far as this, but determines that the bow does not fall within the provisions of the said Act, and that all the costs and expenses, so far as relate to the Office of Metropolitan Buildings, are to be paid by Mr. Badger.

We may hope that this award will have a salutary effect; it will be aided by a second, made by the referees, on a case heard at Lewisham on the same day as the preceding. This relates to repairing the chimney shafts of some houses at Hither Green. The owner had requested a builder to stop a leakage in

THE BUILDER.

one of the roofs, and make good the pointing. Upon examination, it was thought necessary to point the chimney shafts; and, according to the builder's statement, about a dozen bricks were replaced by new. The whole repair did not amount to 3*L*. The district surveyor seeing what had been done, remonstrated with the builder for not giving him notice, and, as a correspondent informs us, declared he would, in consequence, compel him to raise the chimney shafts, as they were not of the height required by schedule F; that is, not less than three feet above the highest part of the roof, flat, or gutter adjoining thereto.

The award of the referees, and it is one of considerable importance, is as follows :--

"That inasmuch as the repair in question was not a repair involving a structural alteration, the same was not liable to be raised to the height of three feet, according to the rule in schedule F of the said Act;

"And with regard to the costs and expenses attending this proceeding, they do further award that the same be *paid by the said Charles Robert Badger*; that is to say, as to the fees and expenses of the Office of Metropolitan Buildings, that on or before the 17th of May, inst., the sum of 2l. 6s. be paid to the Registrar of Metropolitan Buildings, at the said office, at No. 3, Trafalgar Square, London."

One word to the district surveyor on whom these expenses have fallen, and we say it from a sense of duty, prompted by no less than five statements now before us, and without any illnature, or desire to annoy. He is placed in his office to see an Act of Parliament carried out for the protection of the public, not to bring that Act into disesteem, and to induce evasion of it by uncalled for interference, or even by stringently enforcing the letter, rather than attending to its spirit; and we sincerely hope that he will take a fresh view of his position, and do nothing needlessly to render the office of district surveyor unpopular.

OUTSIDE WINDOW BLINDS .- Some of the district surveyors having considered that outside window blinds must be regarded as projections from face walls within the meaning of the Buildings Act, summoned the makers to remove their work. A meeting of muster window-blind makers was in consequence held, and they, finding great want of information as to whether they could proceed in finishing the various orders they had received, addressed a requisition to the referees setting forth this fact, and asking an award or certificate to enable them to follow their business without interruption or delay. They forwarded diagrams of the ordinary window blinds (known as Oriental, Florentine, Spanish, Hood-blind, Venetian-shade, and Shutter-blind), and the referees have certified that such window blinds "are not projections from face walls within the meaning of the Metropolitan Buildings Act, and do not come within the operation of the said Act."

PORTLAND TOWN CHUROH.—It has been proposed to erect a church to contain 1000 sittings in Portland Town, a district of the metropolis containing a population of at least 5,000, of whom the greater part are very poor. The cost of the site will be 1,700*L*, and the building is estimated at 6,500*L*, making a total of 8,200*L*. Towards defraying this amount Her Majesty's Commissioners have granted 500*L*, the Metropolis Churches Fund 1,500*L*, and subscriptions have been promised amounting to 2,440*L*, making up altogether the sum of 4,440*L*. For supplying the deficiency of 3,760*L* an appeal to the public has been made, and a subscription opened.

ON THE WALLS OF ANCIENT AND MODERN ROME.

241

BY THE REV. RICHARD BURGESS, B.D.*

WHEN I had the honour of attempting to describe and illustrate the aqueducts of ancient Rome, I remarked that there was some asso-ciation between those great works and the walls of the city. The first period of the ruin walls of the city. The first period of the ruin of Rome was marked by the partial destruction of the walls and aqueducts; the materials of the one served for constructing a fortress, while the other were falling before the de-structive engines of the Goths; and the breaches were subsequently repaired under the cars of Belisarius with the large peperine blocks of the Claudian arches. nounced my intention of making the walls a separate subject, beginning with those of Romulus and Remus, which perhaps never ex-isted, and ending with the Aurelian circuit, which existed too much for the theory of antiquaries. I thought it a desirable subject to learn how walls were made when arrows were instruments of war, without meaning, however, to illustrate that point by shooting with a long bow. I shall confine myself as nearly as possible within the limits of historical truth, and I hope I shall not violate too much your rules of architectural proportion.

Although walled or fenced cities reaching up to heaven are now of little use in modern tactics, they were of great importance in the time of ancient warfare. The huge masses of stone piled one upon another were a sufficient defence against the rude engines of attack, when brute force without skill aimed its blow upon the immoveable barrier. In very remote times, carrying us back to the days of Homer, at carrying us back to the unys of riomer, at least, walls of cities were reared of huge poly-hedric stones, uncut and unshapen, with the interstices filled up with small stones or broken pieces of flint, and this has received the name of Cyclopean. It is not properly Cyclopean construction, if there be any attempt at cutting or squaring the blocks. I have observed a specimen of this construction in the island of Cephalonia, where, in the walls of Cranii, I measured an irregular block of stone to be 13 feet 10 inches in length, and 6 feet 10 in depth. Another specimen is to be seen in the walls of Tyrins, at the extremity of the plain of Argos, where the huge stones are laid one Argos, where the huge shows are that one upon another without any attempt at cutting out the angles. The walls of Mycense, although containing similar specimens, are upon the whole an improvement: the interstices are sometimes removed by a slight linear adjustment of the blocks, and such a step in masonry destroys in part the character Cyclopean. The next step was angularity, and then came the construction which is properly speaking Hellenie, and this had prevailed in Etruria long before Romulus began to enclose the Palatine Hill at Rome. I cannot enter into a disquisition on the walls of antiquity generally, but if any of you are curious upon this subject you will do well to consult the atlas which belongs to Micali's work, entitled "L'Italia avanti il dominio dei Romani," published at Florence in 1821. Sir William Gell has also illustrated this subject with his usual accuracy and skill.

The most ancient buildings of Rome of which vestiges now remain, were of stone brought from Alba, commonly called peperine. This was used under the kings, as we see in the Cloace Maxima, and in the Mamertine prison built by Ancus Martius. It was of the same material that Servius Tullius built his walls, and Tarquin fortified his agger. We find it in the tomb of the Scipio, in the Temple of Piety, in the substructions of the Capitol, and in the aqueduets of the republic. But as this stone was not accessible to the Romans before the conquest of Alba under Tullius Hostilius, we cannot admit Romulus into the primitive society of free masons. If we may still adhere to the old story of that hero having surrounded the Palatine Hill with a wall, and made three gates to his new city, we can afford him very little material better than baked mud and pumice stone; and the innocent freak of poor Remus leaping over his brother's fortifications has thrown immortal contempt upon the walls of the founder of Rome. This may be altogether a subject too remote and too insignificant to claim your attention, but the descrip-

• The substance of this paper was read at the Institute of British Architects on the 19th inst.

tion of the walls of Roundos: and the position of his gates have employed the pens of learned antiquaries, and it has always been considered a cusus belli to decide whether Romulus made three gates or four.

To settle this difficult point Varro and Festus have left on record no less than eight names of gates, the very enumeration of which would cause serious alarm to this meeting, lest I should enter upon the etymology of them all, I shall, however, content myself with referring you to a plan of the eity of Rome as it was left by Romulus, that is to say, when to the Palatine the Capitoline Hill (taken from Tatius) was added, the space (afterwards the Roman Forum) being included within the walls. I need hardly add that of those walls wais. I need hardly add that di those wais every vestige had disappeared before we come to any authentic records of the city; and it is only for the sake of beginning and following out the successive enlargements of Rome that I have mentioned either Romulus or his forti-fications. The other hills of Rome are said to have here odded hy the encourted there to have been added by the successive kings, and when they had got to the number of seven they were surrounded by a continuous wall. The eastern side of the city being exposed to the Sabine territory, without the advantageous defence of a hill, was fortified by a high mound strengthened by etrong walls; and thus was the circuit, begun by Servius Tullius and ended by his successor, complete. This was Rome in her fullest extent during all the ages of the Republic; and although Pliny informs us that the suburbs of Rome extended for many miles in every direction, as so many additional towns, 'yet the city properly so called maintained its contracted circuit until the walls of Aprelian in the third century re-vealed the fatal secret that the mistress of nations required a defence of bricks and cement.

Of the old walls of Servius Tullius some vestiges are traced in the vineyard be-neath the Villa Barberini; they exhibit a regular good specimen of the Etruscan stone wall, regular square or oblong blocks of peperine, resembling much in gonstruction, though not in material, the walls of a neighbouring Etruscan city, which I consider one of the most interesting monuments of antiquity; I allude to the ancient Falerii, not far from Civita Castellana. A rough plan of the circuit of those walls almost intact. I have circuit of those walls almost intact, i nave found among my fugitive pieces. It is pos-sible that some remains of walls upon the Capitoline Hill may also be as ancient as the kings of Rome. Upon a part of the Tarpeian Rock we yet see a mass of wall standing, built of the same materials and masanry as those of the same materials and masonry as those vestiges of the walls of Servius Tullius to which I have alluded; but, as these might be construed into treasonable words if any learned Roman antiquary were to hear them, I will hasten to quit that peperine subject and bring you, through eight centuries, to plain bricks and cement.

In the time of Vespasian and Titus, Pliny measured the circuit of the old walls, which in many places were so blended with the build-ings of the city as to render it difficult to trace them. If Pliny's text has come down to us unscathed, he found the measurement to be about thirteen miles, and we hear no more of the walls of Rome until the time of the Emperor Aurelian. Before he began his expedition against the Queen of Palmyra, in the year 271, he thought it advisable to consult the senate, and take measures for preventing a repetition of the insults which the Goths, under the effeminate Gallienus, had offered to the majesty of Rome. Several authors of that time have dropped a few words respecting the new forti fications, but none, except Vopiscus, have told us to what extent the work was carried; and he has given us a measurement so incredible

that all critics have given it up in despair. The circuit of Aurelian's walla, says that respectable writer, was nearly fifty miles. No traces of a wall, corresponding to such a cir-cumference, have ever been found; and, if we must believe the text of Vopiscus, there is no way of explaining it but by measuring from Castra or Septio to another, which were one built, or planned to be built, at different points about the city. We leave, therefore, Aurelian, and his fifty miles of walls, to rival the new fortifications of our Gallican neighbours, which are probably destined to puzzle posterity as much as those of Aurelian now puzzle us.

Down to the reign of Arcadius and Honoriusthere is not another word to be found which relates to the walls of the city. The only historian of that period is the poet Claudian, who was born to chaunt the praises of Stilicho, and awake the muse once more ere Rome became a desert. Claudian tells us, in wellmeasured hexameter verse, that the new walls of Honorius gave a handsome face (pulchrum vultum) to the city; that more hills were added to the famous seven, and that flanking towers and lofty walls were got up with wonderful rapidity, in consequence of a threatened irrup-tion of the Getæ, a people from the north. Three inscriptions, of which two still exist and are legible, are a key to the poetry: they tell us, that at the suggestion of Stillecho, the great captain of the are the prefect of the great captain of the age, the prefect of the city, Longinianus, took upon him the care of rebuilding the walls, gates, and towers; and as this Longinianus held office in the sixth consulate of the Emperor Honorius, we get at the date of the present circuit of the walls of Rome on this side the Tiber, viz., about the year 403. The whole was got up in haste, and this may account for our finding, in the line of the walls, various edifices which appa-rently stood in the way, but which, to save time and materials, it was very convenient to enlist in the service. The present walls and gates, therefore, must be considered as pre-serving the limits drawn under the Emperors Arcadius and Honorius, subject, of course, to the repairs and alterations made by Belisarius and the Goths, and variegated, through at least ten centuries, with the patchwork of belligerent popes and engineering cardinals. But before I proceed to point out some specimens of construction varying in antiquity from the Augustan to the present age, let me finish my historical sketch of the circuit of Rome.

The dilapidations caused by the Goths and Vandals during the fifth century were made up by Theodoric in the year 500, and in 535 Beli-sarius entered Rome by the Porta Asinaria, while the Goths fled by the Porta Flaminia; at that time the gates were fourteen in num ber, and all made to open as portcullises. The general of Justinian fixed his head quarters on the Monte Pincio, to be near that side of the city which was the least defended. The ravages of Totila were more considerable, and when Belisarius returned a second time to rescue Rome from the hands of the barbarians, it cost him twenty-five days to fill up the breaches in the walls, and his handy-work still remains to be seen near the Lateran Church. The reign of the Lombards in Italy, from 566 to 774, placed the municipal arrangements of the city in the hands of the bishops. Sisinnius was the first of them who attempted to repair Sisinnius the walls; but little was done until towards the close of the eighth century. It was when the circuit of Rome was in this state (that is, in the first half of the ninth century), that a curious description of the walls was made by a swiss or German pilgrim, who appears to have been (for his day) a diligent observer and excellent scribe. He counted all the turres, propugnacula, posternæ, and neces-sariæ in the whole circuit of the walls as they then stord, the target man 222 the held. then stood: the towers were 383, the battle ments 7,020, the posterns 6, and the temples of Venus Cloacina 106. Butthis mediaval writer (generally known under the title of the anonymous of the ninth century) gives no de-scription of either form or materials : we are therefore left to find our way through near three centuries before we alight upon another date wherein to fix a specimen : an inscription of 1157, contemporary with Frederic Barbarossa, directs us to a now walled-up gate be-neath the Cælian Hill. But the thorough re-paration of the whole circuit, exclusive of the Vatican, was reserved for Pope Nicolas V.; and it is one of those historical coincidences which sometimes strike us in the vicissitudes of empire, that while the Turks were taking Constantinople and putting an end to the name and power of Imperial Rome, Nicolas V. was restoring the walls of the ancient mistress of the world, now transformed into a Papal city. The works of the popes who succeeded Nicolas V. were mainly on the Vatican side, and these I shall point out when we pass the Tiber. The works on the Monte Pincio, begun by Leo XII., are the most important of modern improvements connected with the walls of Rome.

through which those walls have passed; T propose to offer some description. It will not be easy to captivate either the eye or ear by a e description of bricks and mortar ; and me in order to have rendered the subject at all in-teresting, I ought to have pressed into the service of this conversazione as many pencils as there are towers enumerated by the anony-mous of the ninth century. The interest of thesubject for this institute, at least, lies chiefly in exhibiting brick and stone work of every age, from Servius Tullius the king, to Gre-gory the pope. I must content myself with offering you but a few specimens, as they occur in the circuit which we will now make to-gether, beginning at the Porta del Popola. By this arrangement we shall gain in coavenience what we lose in chronological order: by taking the specimens as they come in the circuit we shall have to pass from popes to emperors and back again without breathing, but it will be easy when we have made our round to adjust the whole in the order, of time.

Between the Tiber and the Porta del Popolo occurs the first specimen of the work of Nicolas V., made in the year 1452: the construction is of thin bricks, mixed with irregular pieces of tufo; and this is all the description I intend to offer of the reparations made by that pontiff, which chiefly exist on the north east side of the city : the Porta del Popolo and itself, substituted to the ancient Flaminia, exhibits in its external elevation the genius of the celebrated Vignola in 1561; but the two square towers which flank the entrance were erected nearly 100 years earlier: the ancient gate stood in the time of Justinian further up the declivity of the Pincian Hill; and the Flaminian Way, by which Rome was approached from the north, passed more immediately under the broken rock on which now the Villa the broken rock on which now the Villa Poniatowska stands; but, leaving the gate by which our modern pilgrims now enter Rome, now defended by the Dogana Pontificia, we come upon a piece of wall built of small blocks of red tufo, probably the work of Ladislaus, king of Naples, in 1408. I mention it, because it is a peculiar style of con-struction called the "Saracenic:" it is so called from the circumstance of its being first adepted at the period when the Saracens pol-luted the Lavinian shores, and turned the basilica of St. Peter into a stable, in the early part of the ninth century. Why the builders of walls should have adopted blocks of red tufo on such an occasion, we cannot tell, unless that was the only method they could devise of representing a Saracen's head; in [which case the surpassing device of London city is manifest in that splendid portrait, which will be familiar to all who are yet reduced to travel by stage-coaches; but the "opus Saracenicum" holds a conspicuous place in the walls of the Papal city, and in the vocabulary of Roman antiquaries.

The next object which occurs in our circuit The next object which occurs in our circuit forms a peculiar feature in the walls. The north angle of the Monte Pincio is built up by a mass of "opus reticulatum," which needs no description, because of its well-known con-struction. Procopius describes this portion of the walls of Rome just as it is at this day, and no one doubts that it was originally built for the purpose of sustaining the Collis Hortorum where the gardens of the Domitian family were, and in which Nero was buried. Belisa-ius observing the same aleft and inclination rius observing the same cleft and inclination which is now to be seen in this immense mass of tufo work, and which gives it the name of Muro Torto, was afraid it would be insufficient to sustain the assaults of the besiegers, and he proposed to pull it down, and rebuild that por-tion of the walls; but the Romans assured him that St. Peter had promised them to take that quarter under his special charge; and the opinion was worth several hundred men to the Roman general; for, during the whole siege, the Goths, even in their nightly attempts to scale the walls, never came near the Muro Torto. We must assign a date as early as the 1 orto. We must assign a date as early as the year 40 A.D. to those vast substructions of the Domitian gardens. The general features of the Roman walls are a plain curtain of brick, with square towers of like materials, projecting from the line at intervals of 100 feet; some of the towers, however, are round. We do not get the original work of Honorius alls of Rome. After this brief account of the changes garden of the Villa Medici. ... One tower rising

from a foundation of tufo, ends in a summerhonse; another finishes in an artist's studio; a third is made of basalt-lava work of the a third is made of basalt-lava work of the twelfth century; but when we get to the fifteenth tower, reckoning from the Muro Torto, we see the greater regularity of the brick-work belonging to the decline of the empire of the west. The only difference in the works of Belisarius is, that there is greater thickness of cement. This appears to be the distinguishing feature in the ancient laterities works of the Romans. In the best age, viz., that of Nero, as may be seen in the arches of his aqueduct, the cement is so thin as only to be discernible like a pencil line drawn between the bricks; but as we advance drawn between the bricks ; but as we advance it becomes more visible between the courses, antil, at last, we get it nearly of the same thickness as the bricks themselves. This might, I think, be accounted for by an analysis of the cement at different periods, where the defects of the sand, whether fluviatic or marine, were more difficult to correct; but this would be a digression from our immediate subject, and I shall not think it necessary to recur to it. The works of Belisarius may be recur to it. The works of Belisarius may be considered as the most genuine, in the neigh-bourhood of the gate which led to his own residence on the Monte Pincio, but which is now closed. A profound silence reigns under the "lofty walls of Rome" here, and the melan-choly interest which tradition has thrown around this gate (still remaining with its portcullis and its Greek cross in a discus upon the key-stone of the arch) makes one linger in the solitude. It was here where the veteran warrior, fallen from the height of his glory and the imperial favour, sat and held out his hand to the passengers, as they entered the scene of his former splendour, and accompanied the humiliating act with " Date obolum Belisario." may be a fiction, but the spirit of it has atory foundation in some truth; for the hero who twice recovered Rome and Africa from the Goths and Vandals died neglected in a land of exile, and two places on the Bosphorus and Chalcedonia shores respectively contend for the glory and the shame of his last sojourning. If is in this way that much abstract truth is embodied in fiction, not only in poetry and romance, but in art and in architecture; and it only becomes hurtful when thus conveyed in religious worship. It was an ingenious device of the two Spartan architects who erected the magnificent Portico of Octavia at Rome, and only asked as a reward that they might have their names inserted in the inscription,—an honour which was refused;—I mean the inserting in the columns the ornaments of lizards and frogs, which carried down to posterity the fame of Saurus and Batrachus as effectually as if the historians had recorded their names. The sculpture which fills the tympanum of our Royal Exchange, though fiction, might convey the truth to other generations in the absence of historical records, that the commerce of Great Britain was then opened with China and ex-tended to every part of the world. It may be worth a thought, Gentlemen, among you who are engaged in immortalizing the age in which you live, to see how you can convey to posterity, by means of art, the characteristics of a period of our history more brilliant than ever existed

"when Rome was free." But I am forgetting my walle, or rather running my head against one of my own erecting. The Pretorian Camp, which was not dismantled until the age of Constantine, stood conveniently for the purposes of Stillcho stood convenently for the purposes of Stilicho and the Prefect Longinianus, and it was there-fore adopted as a defence for that portion of the east side of Rome. It was originally built by Tiberius, and therefore presents us with a specimen of brickwork of eighteen centuries standing. The circuit of it as now forming the walls measures 5,400 feet; in several places the original work has been patched up with farge stones, not improbably by Belisarius, or Narses the eunuch. Several popes have mingled their contributions, and thus made an heterogeneous mass: but amidst it all the practised eye easily discerns the clussical age of Augustus and the Cæsars. To mark the varied constructions and repairs of different ages, as they occur in the curtains and towers, would only be a wearisome repetition of bricks, selce, lava, tufo, and blocks of stone and marble, stolen, as occasion required, from the meighbouring tombs. I shall, therefore, pass on to the Porta San Lorenzo, where the inTHE BUILDER.

scription of Honorius is to be still read, and which, therefore, fixes the certainty of the period when those walls were made. I shall go on to the Porta Maggiore, which has already been described by me when I treated of the aqueducts, and, leaving that gate to continue our circuit, we find another curious ex-pedient for inclosing the city. The arches of the Claudian aqueduct are closed up, and adopted as the wall for a length of 1,200 feet, and then, quitting the direction, we begin again with the general aspect of Honorius' walls. The many breaches which in successive ages have been repaired between the squeduct and Santa Croce, perhaps shew where the King of Naples in 1408 made his impressions upon Rome and the cardinals; but the next object we get into our circuit is the outer wall of half an amphitheatre. Its elevation consits of arches supported by half-columns of the Corinthian order surmounted by a second row of pilasters, all of brick; and the walling up of the arches is easily distinguished from the original work. The period of the building may be dated as far back as 211 A.D., and the great object for which this amphitheatre was built accords with the policy of Caracalla: it was to afford the favourite recreations of the Romans to the Dentering quark with the degree of Prætorian guards, without the dangerous ex-periment of their mingling with the people; and it was therefore called the Amphitheatrum Cartrense. In passing from this to the Lateran Gate, we descend gently past the walled-up Porta Asinaria, which figured so conspicuously in the conflicts of Belisarius with Vetiges and In the condicts of Belisarius with Vetiges and Totila: many a struggle was here sustained by the besieged when the Roman general repulsed the foe and appeared to his soldiers to be every where present at the same time. The walls still tell the history of those battles: a large piece is built up of peperine stones, and upon comparing them we find they have been taken from the neighbouring acceduct and taken from the neighbouring squeduct; and here we have unquestionably a specimen of the repairs of Belisarius, that is to say, the irregular-built wall, as we now see it, here stood for thirteen centurics. I have mentioned the Porta Metionis, which is now no longer used, because we have an undoubted specimen of work in the middle of the twelfth century: the inscription upon it bears date 1157.

The Porta Latina, now closed, and the Porta San Sebastiano, leading on the Via Porta San Sebastiano, leading on the Via Appis, would tempt me to detain you with some observations; but I have not forgotten my pledge, that this paper should be of ordi-nary length. I shall therefore make a sweep-ing curve, and a sweeping assertion at the same time, that there is nothing remarkable in the walls from the Porta Metionis until we come to the Bastion di San Gallo. This is the carliest specimen of modern fortification where we see the upright plain wall, with the spertures for missiles, giving place to the pro-jecting masses, to resist the thunder bolts of war; and the apertures made to receive those more convenient implements called cannons. war; more convenient implements called cannons. Pope Paul III. employed the celebrated San Gallo to erect this bastion. It is an object of great curiosity to engineers, on account of its being the earliest example of fortifications suited for a modern siege; it is now, however, fast falling into decay, and the resources of the papal states, in the present financial emergency, are not adequate to prevent its final ruin. It stands in the old line of walls, like a polished officer in a row of old-fashioned dowagers, where the one uses powder and shot, and the other arrows without points; it is a curious contrast, and takes us at once from the war-fare of the sixth, to the tactics of the nineteenth century. The rest of the walls, to the Porta century. The rest of the walls, to the Porta Ostiensis, is composed of towers and curtains, the patchwork of all ages. And here, again, Ladislaus must be blamed for the irregulari-ties: he, like Totila, entored Rome by the Porta Ostiensis, and there was little to choose between the two visits of the Vandal and the between the two visits of the Vandal and the Christian. "Besieging Rome by land and by water," says Gibbon, "he thrice entered the gates as a barbarian conqueror; profaned the altars, violated the virgins, pillaged the mer-chants, performed his devotions at St. Peter's, and left a gurrison in the castle of St. Angelo." We now include in the walls, the pyramid of Caius Certios, at the foot of which, within, are the graves of our countrument and we are the graves of our countrymen; and we reach the Tiber, after having made a circuit of eight English miles. The Transtyberian region now only remains for our consideration;

but, as imperial Rome had but little to do beyond the Tiber, the whole being comprised in one of its fourteen wards, we must consider the circuit we have made as comprising the magnitude of ancient Rome. From documents of the fourth century we learn that in all the wards or districts there were 46,000 of those places called Insulæ, which meanta large building isolated from others, and inhabited by the common people. There were also 1800 and upwards of Domus, or houses of the rich; and upwards of Domus, or nouses of the rich; and making every allowance for the population, the barracks or stationes, I cannot make out that ancient Rome could possibly contain more than 1,104,000 souls. That is to say, the population of ancient Rome never reached that of our own mattenatis that of our own metropolis.

The walls of Honorius were carried beyond The walls of Honorius were carried beyond the Tiber, so as to include that part of the Janiculum called Mons Aureus, or Montorio; and they still exist, though no longer serving the purpose for which they were originally made. The rest of the walls which are to occupy our attention are Papal, and possess a greater historical interest than the more a greater historical internation and by the loss of Pope Sergius, and by the pro-fanation and plunder of St. Peter's by the Saracens, that [Leo IV. was elected by the nefarious Saracens (says a writer of that day) in returning to Africa laden with their sacrilegious spoils, were averwhelmed in the sca by the intervention of St. Peter and Benedict; but this circumstance did not prevent the new pontiff from taking earthly precautions against a return of those fierce invaders. He set about repairing the walls of Honorius in one direction: but his main object was to secure the Shrine of St. Peter from the profane hands of those enemies; he therefore fortified that part of the Vatican Mount which rises that part of the Yalican Mount which rises behind the Basilica, and his walls and towers still remain, though now enclosed within the more ample circuit of Pius IV. The activity of Leo IV is the admiration of his bio-grapher. The pontifion horseback, and some-times on foot, went round the walls to encourage and promote the works; be found fifteen towers in the circuit entirely destroyed, which he renewed; two of them were near the river, and which were so arranged with a chain drawn and which we so arranged with a chain that with a cross that no vessel could pass, and it was done, says the admiring biographer, "cum magna supientia et subtili prudentia." He began the walls round the Basilica in the began the walls round the Basilica in the second, and finished them in the sixth year of his pontificate. The Emperor Lothaire sent a large som of money; the monasteries, cities, and municipalities within the pontifical do-minion each gave a subscription to build the walls; and, when they were finished, the space enclosed was called the Leonine City. The consecution was done with great power and at enclosed was called the Leonine City. The consecration was done with great pomp, and at each of the three gates the procession stopped until holy water was sprinkled, and each put under the protection of a saint. The walls were built of tufo, of which I have a spe-cimen; and the tower called the Torre dei Venti, rising above the heights of the Papal gardens, is still one of the most picturesque objects of modern Rome. The space enclosed by the Leonine walls is in shape quadritangal, and in circuit about two miles; they under-went repairs in 1370 and 1452, but they were rendered useless as walls by Pius IV., who made a large addition to the Papal city in 1560. Beginning at the Fort St. Angelo, he erected all those fortifications which now ex-tend to Porta San Spirito. The line of his walls tend to Porta San Spirito. The line of his walls in one part nearly coincide with the Leonine, and in two places they come in contact. The next addition was made by Barberini Pope Urban VIII., now two centuries ago. The Urban walls enclose all the rest of the ancient Janiculum, but they afford but little matter for description.

We have then three distinct cities of the pope's besides the diffinal space enclosed by the Emperor Honorins, and if we now adjust our works in some chromological order, we shall have a long range of about 24 centuries

- shall have a long range of about 24 centur for our practice: The Mamartine prison A.c. 630 The remains of the walls of Ser-vius Tullius, as observed in the Villa Barbarine A.c. 520 The Tabularium..... A.c. 26 Prætorian camp..... A.D. 30 Claudian aqueduct..... A.D. 44

If to the eight miles of circuit already given for the walls on the left bank of the Tiber, we add five for those beyond, it will make the whole circumference of Rome as it now is about thirteen Roman miles. The space enclosed has not above one-third of it populated; so that this ample city, capable of holding a million, remains for the convenience of about 160,000 souls : the walls are now of the same use as our coast guard, -- viz. to prevent the con-traband commerce of free-traders. In many places, however, they present a picturesque effect, and they are of use in rendering Rome an object of interest to the historian and the artist. There is yet room for an illustration of the Roman walls as they now exist, by shewing in chronological order the work of different ages; and with but few exceptions, we might find a specimen for each century. But such illustration requires the pencil rather than the pen, which would only be required to put the date beneath each drawing, and perhaps add a page of text for the sake of Belisarius. I know of no other use to which we can now put the walls which have cost emperors so much anxiety, and popes such a store of prudence. The city is not well off whi ch must needs be defended by walls and fortifications. Schrapnel and Congreve would have astonished Stilicho and the prefect Longinianus; and perhaps some "long range" has yet to be invented which will bring to the ground the firmest fortress. The walls of a city are now best built of good laws, and na-tional freedom, cemented with good will towards foreign or hostile nations; but if any others are wanting, we may be content with those old wooden ones which have served the purpose since the days of Queen Elizabeth. Commerce is the mighty engine which batters down walls; whether reared in the shape of national prejudice, or custom-house regulations : even the great wall of China promises to give way under the silent action of this civil battery. But Rome must be an exception to all such ruinous speculations: let her remain, I pray you, ye free-traders, as an old picture hung upon a wall, which, if you attempt to remove, will bring a cloud of ancient dust into your eyes, and antiquaries will haunt your slumbers. I know that opinions vary upon your eyes, I know that opinions vary upon slumbers. I know that opinions vary upon the mode of defending a city, or preserv-ing an empire; and Gregory XVI. has just refused his consent to a railway run through the woods of Laurentum, by Appil Forum, and the Three Taverns. That is his mode of and the Three Taverns. That is his mode of keeping out those Gothic invasions, which cost Belisarius so many stones out of the Claudian aqueduct. Our martial neighbours, not averse to frequency of intercourse, still are of opinion that brick walls are needed to defend their great metropolis, and the lines are now being drawn at an expense of countless millions. Mr. Polk thinks there is magic in the boundary of the Oregon territory to be a defence for the United States; the honest Swiss confides in walls reared by nature herself, and, safe behind their mighty barriers, claims his right to quarrel with their limits. But we are beginning to think that the sole defence of a kingdom is a tariff without duties, and the wall of defence a tax upon income that is of gold and silver. Perhaps I, and a few others, may think that there is nothing for national defence like the walls of our Zion, and the towers thereof; the circumvallation of our Christianity, and the defence of our national church !

ON THE ART OF CONSTRUCTION IN BRICKWORK.

It must be manifest to those persons who have made the constructive arts their study and profession, and therefore are conversant with the art of bricklaying, how greatly its quality has deteriorated within their me-mory. The style and character of brickwork executed now-a-days, compared with that executed formerly, are totally diffe-rent. Very few modern structures, executed in brick, can compete with the neat and sound workmanship of buildings erected some hundred or two hundred years since; and it would appear that the debasement of the art of bricklaying has taken place simultaneously with the introduction of Roman cement, and the taste or necessity of architects and builders in applying it to the covering of walls. Among very many modern architects and builders rough and uneven brick work is regarded only as the most fitting and efficient groundwork for architectural embellishments; and the coarser it be executed the better, as then there is no necessity for backing and chipping the surfaces of walls in order to obtain a key for the adhesion of the *stuff*. The almost general practice of covering the exteriors of new walls with cement, so as to give them the appearance of stonework, has had a considerable tendency towards depreciating the general excellence of brickwork, as it has led to the execution of hurried, coarse, and unsound work. The cross-joints are commonly struck up for scarcely more than an inch back from the faces of the walls, and, in consequence, the interstices between the bricks of each course are usually left unfilled with mortar. The walls, therefore, are raised half-hollow and honey-combed; thus presenting an interesting but bewildering labyrinth for the passage of mice from the extremity of one wall to that of another.

The majority of the buildings which are now being erected, are built on speculation and competition; and, in order to obtain a great return for the outlay of their capital, it is the interest as well as the invariable practice of speculators to get them run up cheaply, and completed as quickly as possible, for the purpose of letting them, or getting them into the market, and so off their hands. Much of the bad qualities and unsoundness of brickwork, and the carelessness of workmen, is to be attributed to this system. The workmen, from knowing that their work is to be hidden with cement, take little or no pains in its execution; and, from being scarcely ever employed on any other kind of work, it leads them to habitual carelessness in the disposition of the bond; and they also become inat-tentive to the performance of their general work. Indeed, how is it possible, after this manner, that bricklayers, and young ones more particularly, can ever become accomplished workmen, seeing that during the last halfcentury, and more especially during the last ten years, they have not been exercised in close, and proper ornamental work, but neat have been called upon to execute scarcely any thing else than that of the meanest and coarsest description? Care and attention are seldom paid to the general quality of brickwork, and the strength and durability of structures are hardly considered. The whole of the atten-tion that is evinced appears to be directed towards the production of architectural show and effect on the exterior surfaces, and ornaments and small cornices are very often stuck upon a cradling of nails, which are driven into the walls with twine woven between them.

The fashion of late years of dressing up the doorways, windows, cornices, &c. of buildings with cement, and leaving the plain brick surfaces exposed, has also led to a prevalent system of carrying up those surfaces in a rough and uneven manner, for the purpose of being tuck-pointed afterwards. In the execution of all rough brickwork workmen do not evince that pains which they would do, provided it were required to be performed in a neat, clean, and regular manner; and thus, what would appear to be gained in present effect is sacrificed in quality and durability. These surfaces, therefore, should always be finished as the work proceeds, and afterwards protected from the cement dirt. The bricks at those parts should be laid evenly and uniformly, and

* Sec p. 218 ante,

with fine, neat, and parallel joints, of regular thicknesses, struck straight and flush with the surfaces of the walls; and the *perpends*, or alternate cross-joints, should be regulated vertically over one another throughout the whole height. The practice of carrying up the brickwork roughly, for the purpose of being tuck-pointed afterwards, is very often of more advantage to the bricklayer, when he has con-tracted for its execution, than if the joints were neatly struck and the work finished as it proceeds; for, whether the joints of the brickwork are to be left rough, or struck, it is very seldom any distinction is made in the labour prices of either. Tuck-pointing of new work is only an inducement for the bricklayer to perform rough and unsound brickwork. Any irregularities in the vertical direction of the cross-Any joints can be stopped, and false ones made on the bricks in order to correspond with those above or below them; in fact, all the visible faults and multitude of sins in its execution can be smothered, hidden, and dandied up by pointing. An extra price at per foot superficial ia allowed (besides the price of the brickwork) for the pointing ; whereas if this extra price were given for laying the bricks on the out-sides in a proper and even manner, the per-pends strictly kept, and the joints made fine and neat, struck clean, and their ragged edges cut off and picked out, much superior and effective work, and of far greater strength and durability, would be the result. By this method the work would not only look much better, but would retain its character for a considerable number of years afterwards. A beautiful old specimen of the kind of work the author means, may be seen in the Temple, facing the gardens.

It is perfectly notorious that the approved methods of execution which constitute ex-cellence in the workmanship, both of the outer appearance of brickwork, and in the proper disposition and arrangement of the component materials of walls, are scarcely to be obtained without much watching and scrutiny, as well as by a great deal of trouble and anxiety. It would appear, therefore, from the influence of many concurrent debasing causes, that the age of executing close, clean, neat, and good sound brickwork has passed away, its decline being considerably as-sisted by the recent, as well as the continued speculative building mania; and even under the fostering care of the new Building Act, what is termed good and durable brickwork is a mere subterfuge and a farce. The violent haste with which buildings have recently been and are now being run up, and the slovenly and scandalous manner in which brickwork has been, and is still being performed, are causes which not only tend to depreciate still more, if possible, the excellence of workmanship, but at the same time tend to create on the part of workmen a disposition to carelessness in the general routine of execution ; and also reduce their moral character ; as from these habits they are continually on the alert, when not properly looked after and watched, to heap up improperly bonded and irregular masses of deception, and, in consequence, no dependence can be placed in them or their performances; works, therefore, are sometimes brought to premature decay and ruin, and the character of respectable persons is liable to be in-jured by such lamentable and disgraceful practices. The materials of a vast majo-rity of buildings already reared, and even many of those now under execution, are jumbled together; and the arrangements of the pressures formed contrary to all static principles. The medley is in such a disordered state, that attention to the proper disposition of bond, and the necessary rules and guidance in carrying up the work, would appear not to have been considered, and, in consequence, uniform gravitation, and equal solidity of the walls, are thrown entirely out of the question ; and thus many portions of them, especially the parts over apertures, are split, rent, and cracked in all possible directions. The bind-ing and adhesive properties of the mortar and the solidity and compactness of the walls are, from the numerous fractures, altogether destroyed, and are thus rendered tottering and insecure.

Instead of a whole or united support being obtained, by a proper arrangement and combination of the materials, scarcely a wall is built now, in which great numbers of bats are not seen huddled together, and here and there,

TERRA COTTA.- A statue of Sir John Crosby, executed by Mr. Nixon in this mateabout to be placed in front of Croshyrial, is Hall Literary Institution, Bishopsgate-street. We understand the artist has taken for his model the figure from the altar tomb of Croeby, in St. Helen's church, hard by.

throughout the base arrangements, two, four, six, and even more upright joints are seen, directly over one another, and the walls built up in an indirect and out-of-perpendicular direction, as may be observed in many modern streets by scanning the faces of the walls. And not only is very little attention paid to the arrangement of bricks in walls, but they are sometimes laid in a composition of mud, or vegetable mould, mixed with a small quantity of lime, and drowned with water; and the bricks are laid in this conglomeration, with great, staring, irregular joints, sometimes half an inch, inch, and more in thickness. It is impossible that the outer walls of buildings, carried up with this stuff, can ever become perfectly dry, or remain so but for a very short time, as the action of the atmosphere will be continually includes the joints away; and it also readily imbibes and retains moisture from rain, &c., as such a mixture is always of a soft and spongy character. With reference to the bond of brickwork,

most bricklayers feel unconcerned, and scarcely evince any interest or take any pains about it; indeed, at the present time, such is the spathy of bricklayers that a vast majority of them are totally unacquainted with its properties—of the manner in which bricks should be disposed and arranged so as to obtain the greatest amount of strength, and that the walls may thus afford the atmost resistance both to transverse and longitudinal pressures. And this is very re-markable, when it is considered that bricklayers markable, when it is considered that bricklayers are constantly laying of bricks, and are thus con-tinually observing their arrangements. But it is well known that invariably they evince the utmost degree of carelessness in this all-im-portant particular. Experience has very often proved to us these facts that while your model proved to us these facts, that whilst young workmen have been kept constantly upon the performance of the coarsest and meanest of work. they never evinced the slightest disposition to improve themselves in the execution of their work, which was slways inferior and badly done; and no advice to act otherwise would induce them to alter their proceedings. But immediately that they were placed upon superior descriptions of work, and some little pains were taken to instruct them in it, it was remarkable to observe with what avidity it was received, and how very soon they improved in their manner of execution, and afterwards performed their general work better and neater. All who have had experience in building, know full well the trouble and anxiety that are usually caused in the selection of good, wellusually caused in the selection of good, well-informed, and qualified workmen, fit for the execution of particular kinds of work in the art of bricklaying; in whom trust and confi-dence can be placed to execute work neatly, soundly, and regularly. The workmen's want of attention, and just appreciation of the paramount importance of the quality and mondpass of their work are well known: and soundness of their work, are well known; and the responsibility which they not only subject themselves to, but their employers as well, ought to deter them from attempting hasty, bad, and improper work of any kind for any neglect or false arrangement is almost sure, sooner or later, to be found out, and the consequences of such neglect may be attended with serious disasters and expense. Failures are of common occurrence, and many of these cannot be attributed otherwise than to slovenly, improper, and inefficient execution, and to the ignorance of superintendents of workmen. Sometimes the carelessness and habitual inattention of workmen, both to the orders given to them and the general manner of executing their work, are the cause of failures. This their work, are the cause of failures. state of things is to be deplored, and it behoves all who have any influence over the execution of works to aid and assist in having it per-formed at all times in a neat and sound manner; no matter where or in what position it may be situated. Works that are placed underground require more attention to these particulars than those which are placed on the surface, in order Works, to ensure their stability and success. therefore, of any magnitude, or where responsibility is involved, require in all cases to be strictly attended to and watched; and the performances of workmen should be placed under constant supervision as they proceed. Good, sound, and regular bond, and neat,

close, and clean workmanship, are the leading points to be observed by workmen in raising brick walls. The nature and properties of the materials used in the manufacture of bricks

and in the composition of mortar are of that resisting or silicious quality-when the bricks are properly made and burned, and the ingredients of the mortar are proportionably and properly mixed together—that time and atmospheric influences will but very slightly affect or impair them; indeed, Pliny says, if he be considered as an oracle in the matter, that bricks which well burned, nard, and of good quality, are will last for ever. Then, as good materials can be procured, bad work should not stand in the way of so desirable an acquisition,—of handing our works down to posterity; and all parties, but more particularly workmen, ought to keep this always in view, namely, that good, sound, well-bonded work and sound inate-rials will last for ages. The practical operations of executing brickwork are usually left to the supervision of a foreman of bricklayers, who ought to be a well-informed and an accomplished workman; and he should understand the nature and properties of the ma-terials he is using—of brick-bond—of the general arts of construction, and of the principles of statics. During the supervision of his men he should endeavour to make them perform their work, at all times and in all cases, in a neat and sound manner; for then, not only will he bring credit to his employers, but to himself likewise; and he will stand a chance of being encouraged, and of rising in the world.

It is highly essential to the exterior appearance, s well as to the soundness, good workmanship, and durability of all vertical and direct walls, that every brick should be laid horizontally, perpendicularly, and straight with the outer face. In the cases of curved walls and arches, pains should be taken to lay the bricks tangentially to the curves, that is, the middles of the faces of each course of bricks next the faces of the walls, or next the centres, should be laid per-pendicularly to the extremities of the radii of all those points; and in battering walls, the bricks should be laid with their beds at right-angles to the faces of the batterings. In all cases it is extremely desirable that the outer faces of all kinds of walls and the soffits (undersides) of arches should be made as even, smooth, and uniform, as possible; which are the principal points to be attended to for the purpose of warding off and preventing the penetration and action of the weather upon the purp them.

The production of beauty in the plain surfaces of walls is mainly dependent upon the symmetry of their parts; and a more pleasing effect may be produced by neat, well-executed brickwork, than with irregular-sized stones. Succession and uniformity in the disposition of bricks arrest the attention, and impress the imagination; for, when the eye wanders over and traces the successive pyramidal and vertical directions of the perpends without any interruption, the whole uniformity creates an excitement and produces a pleasing and lasting effect; but when the succession is in-terrupted, or any irregularities are observable, the sense of beauty and effect is directly marred and checked. Perpendicularity, and marred and checked. Perpendicularity, and absolute uniformity of disposition, then, should be the constant aim of the workmen in the arrangement and execution of brickwork. It is, therefore, of the utmost importance in the production of neatness, uniformity, and excel-lence in brickwork, that in the building of all kinds of brick-walls and arches the vertical joints or perpends should be preserved and scrupulously attended to, or, in other words, that the crossjoints of the alternate recurring courses of bricks should be kept straight, so as to corre-spond, and fall perpendicularly over those eneath. This important process in the art of beneath. This important process in the art of bricklaying is, we are sorry to say, very seldom considered by workmen; hence the almost universal waving, and dissimilar direction of the cross-joints: and here we cannot too deeply impress upon the oricklayer, that, not only is a beautiful effect produced by paying particular attention to this important particu-ar during the actual expectation but transverse lar during the actual execution, but transverse and longitudinal ties, which produce strength and durability to walls, are also dependent upon its observance. The proper arrangements and disposition of bond are nearly destroyed when the perpends are neglected ; and we are perfectly aware that irregularities, both in the widths and lengths of most common bricks, render attention to this truly irksome, or, indeed, scarcely possible; but still, when work-

men take pains in the execution of their work, these little minor difficulties can be easily overcome, and are made to vanish by proper regulations in the thickness of the cross-joints, and during execution by selecting bricks of approximating widths and lengths. JOHN PHILLIPS.

OBJECTORS TO THE CAMDEN SOCIETY.

THE determination of the general meeting reported in our last number has proved unsatisfactory to a large number of the members. A document containing the following passages has received the signature of a large number of influential persons, and is now in circulation among the resident graduates of the uni-

no alteration in the laws to which we think it necessary now to advert, except that the law requiring periodical meetings at Cambridge , should be abrogated. But whilst this change would not meet the objections which the committee had themselves avowed to exist against the society, it would throw the whole management of the society's affairs more exclusively than before into the hands of the committee. Added to this, the committee, with the majority of the society present, evinced their determination to continue to act upon the same principles, and to pursue the same course of operations which had deprived the society of its ecclesiastical and academic patrons: and, as an earnest of the spirit in which that majority are prepared to act, all suggestions for any material change in the executive of the society were rejected.

Thus the executive of the society remain-ing virtually unchanged, and being supported by a majority in the determination to maintain a position which we consider still to be pregnant with evil, and alike disrespectful to the authorities of the church and university, we deem our longer connection with the society inconsistent with the respect which we owe to both these bodies. At the same time we disap-prove of the spirit which has of late guided the society's proceedings, and which will avowedly influence them in future, as slien from the objects for which the society was originally founded. We have, therefore, determined to withdraw from the society." We have received several very strong

very strong letters on the subject, urging that the Protes tant members of the society should at once form another society for the study and improve-ment of church architecture alone. An influential resident member writes us, what must be evident to all, that under the present executive the Cambridge Camden will continue to be a polemical association.

THE BRITISH ARCH & OLOGICAL ASSOCIATION.

THE committee appointed at a special general meeting, held on Wednesday, March 5th, have published the first number of their Journal, consisting of eighty-six pages of letterpress and forty-four illustrations.* It is prefaced by a very temperate and ingenuous statement of the events which led to the recent and greatlyto-be-regretted disagreements, and contains much interesting antiquarian information. On this statement we do not intend to enter; our readers are already acquainted with all the facts of the matter, and our own general opinion. We cannot, however, avoid saying, that the case of the appealing party—the party whose journal is now before us—has been greatly advanced in the minds of many who have not yet interfered, by the gradual explosion of certain *charges*, prejudicial to the reputation of individuals, which have been industriously circuculated by unwise opponents. The high character of Mr. Corner, and the other members of the committee, is beyond questioning, and affords of itself sufficient answer to some recent assertions.

The principal papers in the Journal are by, Mr. C. Roach Smith ("On Roman potters' kilns and pottery, discovered in Northamptonshire"), Mr. Daniel H. Haigh ("On Deerhurst Church, Gloucestershire"), Mr. Thomas Wright ("On Medleyal Architecture," illustrated from illuminated MSS.), Mr. F. C. Lukis ("Cromlech du Tus, Guernsey"), the Rev. Stephen Isaacson ("On Roman remains and other antiquities, at Dymchurch, Kent"), and Mir. J. R. Planché ("Remarks on an enamelled Tablet, preserved in the Museum at Mans, and supposed to represent the Effigy of Geoffrey Plantagenet"), whose valuable paper is entitled to the attention of all heralds. Mr. Wright's paper we are enabled, by the kindness of the committee and the author, to print entire.

MEDIEVAL ARCHITECTURE ILLUSTRATED FROM ILLUMINATED MANUSCRIPTS.

BY THOMAS WRIGHT, M.A., F.S.A.

BUILDERS AT WORK. In the volume of the "Archeological Journal" published under the direction of the central committee of the Association during the first year of its existence, several instances have been given of the valuable assistance which may be derived from the illuminated manuscripts of different periods, in illustrating architectural antiquities. The details of these old pictures are not in general drawn with sufficient minuteness to enable us to derive much benefit from a comparison with existing monuments; but we learn in them the disposition and arrangements of buildings of different classes, of which there are now no perfect examples left. It has been already shewn that, with regard to Anglo-Saxon architecture, the drawings in manuscripts of a date anterior to the Norman conquest furnish us with data of great importance in identifying the few existing remains, which without them are extremely doubtful. The Anglo-Saxon drawings present sufficient characteristics for our purpose. But after the conquest, when existing monuments, the dates of which are known, become more numerous, the drawings in the manuscripts have fess value in this respect, and in many instances the architectural characteristics are so badly designed as to be altogether useless. But, as a compensation for this default, the manuscripts represent to us interiors and exteriors of castles and monasteries, palaces, manor houses, cottages, with street views, and the various buildings peculiar to town and country, as they stood in different ages and under different circumstances; and these are in general further explained by the descriptions in the corresponding text. The earlier illuminated manuscripts are

The earlier illuminated manuscripts are chiefly copies of the Scriptures, or books of a religious character, and the buildings represented in these are mostly ecclesiastical. We find little to illustrate the domestic and military architecture of the Anglo-Saxons. The same remark applies in some degree to the Anglo-Norman period; and it is not till the illuminated romances became common, in the thir-

*." The Journal of the British Archaeological Association, established 1843, for the Encouragement and Prosecution of Researches into the Arts and Monuments of the Early and Middle Ages. No. I. H. G. Bohn, York-street, Covent-garden."

teenth century, that we find many drawings of houses and castles. But there is one part of the subject which is illustrated by these illuminations at all periods when they are found, and one which cannot fail to have an interest for all our readers - the occupations and the tools of the builder and mason. It would be no difficult thing to give a very numerous and perfect series of drawings of builders occupied with their labours, at every period from at least the tenth century down to the sixteenth ; but I will be satisfied in the present instance with giving a few examples, in regular suc-cession of date, although belonging to periods separated by somewhat long intervals.

My first cut is taken from the same manuscript of the translation of part of the Scriptures by Alfric, which has already furnished our illustrations of Anglo-Saxon architecture (MS. Cotton. Claudius, B. iv. fol. 19), and which was executed at the close of the tenth or in the earlier years of the eleventh century. It represents the building of Babel, and is here considerably diminished from the original. The

drawing is somewhat rudely executed, though not without spirit; and the workmen shew as much contempt for the laws of gravitation as the artist has exhibited ignorance of perspective. On the right, a workman is carrying the squared stones for the wall one by one up a ladder. On the left, two men are employed in raising either a large squared stone or a beam of timber to a rather singularly formed scaffold, on which another labourer is lifting a hod of mortar to the workman above. At the top a man is working on a dome with a hammer and chisel, while below him another is similarly employed on a sloping roof. Two others are working with tools of the same description at the door. The next example is taken from the painted

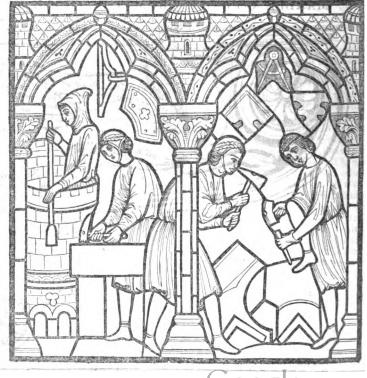

The next example is taken from the painted glass of a window in the cathedral of Chartres in France, executed in the thirteenth century. Our cut is reduced from a larger plate given in the interesting "Annales Archéologiques," by the distinguished French archæologist M. Didron. In the right-hand compartment two masons are at work on the stones which are apparently intended to form parts of mouldings; at their feet are their squares and their compasses, and the models of the mouldings are suspended above. In the other compartment a mason is employed in equalizing the surface of a stone,

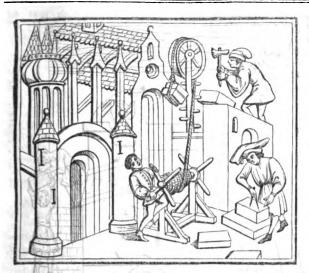

with a tool which appears to have a serrated edge; and the architect is applying a plummet to ascertain if the work be accurately vertical. Above are sus-pended another instrument, apparently a saw, and a board on which is traced the plan of a building with four corner co-lumns and a large clustered pier in the centre. Two of the masons have small caps tied by a band which goes under the chin; and it is singular that both these and the third mason have crowns, ap-parently of laurel. Didron remarks that gloves, to be presented to masons and stonecutters, are often

mentioned in old documents. In a subsequent number of his valuable "Annales," he gives the following examples. In 1381, the Châtelan of Villaines en Duemois bought a considerable quantity of gloves to give to the workmen, in order "to shield their hands from the stone and lime," In October 1383, as we learn from a document of the period, three dozen of gloves were bought and distributed to the masons when they began the buildings at the Chartreuse of Dijon. At Amiens, in 1486 or 1487, twenty-two pairs of gloves were given to the masons and stone-cutters.

Our third woodcut is taken from a manuscript of the earlier part of the fifteenth century (MS. Harl, No. 4431, fol. 111), containing the poems of Christine de Pisan. The stones are here no longer carried up by the hands of the labourers, as in the Anglo-Saxon manuscript, but they are raised by a wheel and axle—a rather rude attempt at a crane. The mason at work on the wall is squaring his stone with a serrated tool, like that which is in the hand of one of the workmen in the foregoing scene. The other is measuring the stone with a compass. One part of the building on which they are employed is a church, with flying buttresses. All the dresses of the men employed here differ from cach other, and perhaps dis-

tinguish the different classes of the workmen. The last example is taken from a beautifully T

The last example is taken from a beautifully 7 illuminated manuscript of the latter part of s the fifteenth century (MS. Harl. No. 4376), t containing an ancient history of the world t

in French. Each book is headed by a large miniature, several of them representing the building of towns and cities. Our cut gives only a portion of one of these miniatures, and is reduced from the original. The buildings of the town, seen in the distance, are neatly executed, and the ornamental conduit, behind the tower on which the workmen are employed, is extremely beautiful. The whole forms a very interesting picture. The crane employed here is a much more perfect machine than that exhibited in the preceding cut. The tools used by the workmen in front differ little from those seen in the two preceding groups. The architect, with his staff in his right hand, is represented in the act

of receiving his orders from the prince or duke, under whose auspices the city has been founded. The smaller cut, taken from the same manuscript, represents a group of builders, with a trowel and hod of mortar, at work upon a tower,—not upon a chimney, as the artist's proportions would have led us to suppose.

In reviewing and comparing these various representations of the same process at so widely distant periods, we are struck much less with their diversity than with the close resemblance between both workmen and tools which continues amid the rapid and continual changes in the condition and manners of so-ciety. Whether this be in any measure to be attributed to the circumstance of the masons forming a permanent society among themselves, which transmitted its doctrines and fashions unchanged from father to son, it is not very easy to de-termine. But it is certainly remarkable, that at the period when architecture flourished most, the date of some of the richest portions of the cathedral of Chartres, the masons should be represented with crowns of laurel on their heads.

ses of the men employed a other, and perhaps dis

MARBLE CONSOLE FROM THE SOANE MUSEUM.

The engraving below represents a marble console from the collection in Lincoln's-Inn Fields, similar in character to the ornamental capitals which have appeared in former numbers.

THE BRITTON TESTIMONIAL.

SINCE our last notice of the proposed testimonial to Mr. Britton, the Earl de Grey, Mr. Decimus Burton, Mr. Edward Willson, of Lincoln, Mr. G. Baker, of Northampton, Mr. Moran, the Dean of Hereford, Mr. Joseph Hume, M.P., and many other eminent men have joined the committee. At a meeting held last Saturday it was decided, as Mr. Britton had disinterestedly declined receiving any personal offering, that a premium of 100 guineas should be offered for the best "Bibliographical Review of Illustrated Literature devoted to the Architectural Antiquities of Great Britain," to be inscribed to Mr. Britton, and published by the committee. Of this essay every subscriber of one guinea, will receive a copy, and it is further proposed, if the sum subscribed should prove sufficient, either to have a portrait of the worthy veteran painted and engraved for distribution, or a good medal struck. At the same meeting it was resolved that Mr. Britton should be invited to a public dinner at Richmond on the 7th of July, his 74th birthday, to meet his friends and the lovers of architectural antiquities; and a sub-committee was appointed to make the necessary arrangements.

quities; and a sub-committee was appointed to make the necessary arrangements. Few men have laboured so long, steadily, and successfully as Mr. Britton. No one can examine his beautiful work on the Cathedral Antiquities, and then look at the works illustrative of our architecture which had appeared before his time, without seeing what a step in advance was then made; and we must remember that he could not then find artists to draw and engrave with facility and precision, as it is easy to do now, but was compelled to lead them up to it, and may be said to have produced a school. We sincerely hope, and have no reason to doubt, that the subscription will be very large, and the result a erowning gratification to Mr. Britton. We will gladly transmit to the committee any subscriptions which may be forwarded to our office.

MOVEMENT IN SOCIETY OF ANTIQUARIES.

OUR readers will remember that a series of suggestions were referred by the members in March last to the council for their consideration, with a request that they should report on them at the anniversary. (See p. 139 *ante*). The arniversary passed by, and no reference was made by the council to the matters submitted to them; much discontent was exhibited, and many of the members have been led to fear that the governing body would draw upon themselves some sweeping interference from without, which might have been altogether avoided by a timely concurrence with the generally expressed opinions of the members.

bers. We are glad to be the first to announce that the council have begun to act on the suggestions then made. The payment of 2s, 6d, to the librarian by each member on receipt of his half-yearly " part" of the transactions is abolished: the price of former publications of the society is reduced to members very considerably; and other alterations are contemplated, and it is to be hoped will be made, so that confidence may be restored and dissension avoided. A young and zealous man should be appointed to assist Mr. Carlisle in his duties as secretary; the council should meet a little oftener; and no gentleman should be elected president or vice-president who is not sufficiently interested, and sufficiently at liberty, to enter into the affairs of the society. To the council we say, seriously, continue to show a desire to meet the wishes of the members, and on all accounts preserve peace.

on all accounts preserve peace. It is singular, as well as unfortunate, that dissensions should exist at the same moment in three important societies. At the Antiquaries it will be entirely the fault of the council if unanimity is not restored forthwith.

TERRA COTTA.

SIB, As my name has been mentioned in connection with Terra Cotta in your numbers of the 26th April and 5th May, and as state-ments were on both occasions made in reference to me without my knowledge or authority, you will, perhaps, admit a few words from me in explanation.

Your first correspondent inquires where Terra Cotta is to be obtained, and whether a church has not been built of that material near Bolton-le-moors. A note from yourself, at the foot, explains that the church at Lever Bridge was constructed from this material, and that the moulds were made under my superintend-ence. You also explained that the material was prepared by Mr. Fletcher of Vale Bank, who had established works at Ladyshore for the manufacture of the material, and that Mr. Sharps would probably afford any further information that might be required. In all these statements you were quite correct, and I did not therefore, think it necessary to answer your correspondent.

Fletcher interposes, however, in your Mr number of the 5th May, to save me all further trouble in this respect, and gives what may be looked upon as sufficiently good reasons; namely,-first, that I have no connection with bis works; and secondly, that he can best answer such questions.

Now, in stating that I have no present connection with his works, Mr. Fletcher ought, in justice, to have added, that they owe their existence to me; that the application of fireclay to architectural purposes, on a large scale, and in a, highly ornamental form is, as I believe it to be, and certainly so far as he is concerned, due to me.

The church at Lever Bridge is, so far as I

know, the first building constructed entirely within and without of Terra Cotta, in the rich style of the fourteenth century, in this country. The experiments which determined the committee to adopt this material were made under my superintendence, and by one of my work-men. And the design of the construction, so essentially different from that of an ordinary stone or brick building, as well as of all the ornamental details, was made by me.

And now, baving claimed this much on my own account, I must at once explain, that in regard to the preparation of the material-the mixing, grinding, tempering, squeezing, dry-ing, and burning of the clay, in fact, the whole of the potters' work-I desire to take no credit. Whatever merit the works at Ladyshore possees on account of the quality, colour, hardness, and durability of the material, belongs to Mr. Fletcher. Neither, on the other hand, do I desire to assume the responsibility which attaches to the proper execution of this department of the works in order to secure these essentials. I have satisfied myself of the excellence and darability of the material if pro-perly treated: it rests with the manufacturer to maintain its character in these respects.

that I cannot subscribe to Mr. Fletcher's assertion, that works in Terra Cotta can be constructed from " Plans prepared in the ordinary manner," if by that he means it to be inferred, that a design for a stone or brick building is equally applicable to fire-clay.

It is clear, that a knowledge of the power of resistance, tenacity, porosity, and specific gravity of the material is as essential to the safe construction of buildings erected from it as a knowledge of the limits, in regard to size and form, which admit of the material being thoroughly and completely burned. It is upon these points, therefore, in designing the con-struction of such a building, that the skill and care of the architect, as distinguished from that of the manufacturer, has to be exercised, and upon which the safety and integrity of any such structure will depend.

I am, Sir, &c., EDMUND SHARPE. Lancaster, May 14.

HACKNEY NEW CHURCH. - The founda-

tion-stone of a new church for the extensive district of South Hackney was laid last week,

in the presence of a numerous assembly of the

residents of the district. The church is to be built by voluntary contributions, at a cost of upwards of 10,0001.

Having made this explanation, I will not trespass on your space further than to state,

" Dressing the Bride" (127), by T. Clater. A very nice work, painted with truth; the still life is exceedingly well put in. Immediately under this is "The Favour," by J. W. Wright, under this is "The Favour," by J. W. High, another very pretty little picture, somewhat marred by the ill drawing of the arm. 144. "A Sketch," by W. Mulready, R.A. A wonderful hit of finish and colour. There

A wonderful bit of finish and colour. is a lovely little sketch in chalk by this artist in the miniature room. 149. "Scene from Moliére," by C. R. Leslie, R.A. This work has a peculiar ap-

THE BUILDER.

THE ROYAL ACADEMY EXHIBITION.

as very satifactory, though deficient in works of the first class. It is satisfactory, as exhibit-

ing considerable progress on the part of the

younger artists. Much has been said against the number of portraits it contains, but it

should be remembered that, amongst the finest

and most beautiful productions bequeathed us, the portraits of Vandyck, Holbein, Kneller, Sir Joshua, and others, hold a high station in the estimation of those who are able to appre-

Gordon, Herbert, and Grant have forcibly proved, in the present collection, the excel-lence of this branch of art. Maclise and other

artists, whose works are missed in the present exhibition, are probably at work for the ensu-

ing Government competition. "Aurora and Zephyr" (12), W. Etty, R.A. A copy of Titian's Venus in the front figure is

A copy of Attan's venus in the front figure is very palpable; the picture itself is wonderfully brilliant in colour. His picture of "Cupid interceding with Venus for Psyche" is even more excellent. No. 185, "A Flower Girl;" 186, "A Votive Offering;" and No. 259, are all beautiful speciment

More excentent. No. 103, "A Flower Only, 186, "A Votive Offering;" and No. 259, are all beautiful specimens.
No. 13, "Amoret, Æmylia, and Prince Arthur in the Cottage of Sclaunder," from the "Facrie Queene," by F. R. Pickersgill; a good picture, broad and well drawn; but "The Four Annu" (260) her the serve suit is better

Ages" (362), by the same artist, is better. Of Mr. Roberts's pictures "Jerusalem" is preferable: they are both in his best style. "The Mole, at Ancona," with "Trajan's Arch," by Stanfield, is a very beautiful compo-ition two in colour and natural in effort

sition, true in colour, and natural in effect.

There is a certain lucidity in all this artist's

Uwin excels in portraying Italian life. Mr. E. Landscer's picture (141), without a name, is a beautiful work. The painting of

the sheep's wool is miraculous; it seems distur-

bable by a breath. A solemnity, truly asto-

nishing, pervades the picture; the very animals

pictures peculiarly refreshing.

are engaged in prayer.

The general exhibition of works of fine art has been already characterized in THEBUILDER

Leslie, R.A. This work has a peculiar ap-pearance of blotchiness, but is of good conception and clever composition. A very beautiful landscape is that by W. D. Kennedy (148), nicely toned and composed.

Turner, R.A., though extravagant and ob-scure, stands alone in his power, and is above either praise or censure. 200. "Fetching the Doctor." W. Collins,

R.A. A humourous production; the pony is

capital, the light well managed. A nice piece of colour is No. 203, by Muller, entitled "Head of a Cingari, Xanthus."

"Dutch Boats running into Suardam, Am-sterdam in the distance," by C. Stanfield, R.A. The water of this is a perfect master-piece, transparent, clear, and effective; this picture must be welcome to all who have any idea of the heartiful the beautiful.

222. From "Milton's Comus." by C. L. Eastlake, R.A. A very fine production in the highest walk of art. It is to be regretted that one head has been made to serve for the whole of the Cherubim."

The landscapes of F. R. Lee, R.A., are of great beauty. Among the best are "The Water Cart" (233), "The Market Cart" (24), and No. 43, "The Mill Ford, Devonshire."

Creswick's "Spot to be Remembered" is a

perfect triumph. Others of his are very beautiful, such as "Rain on the Hills." "The White Cockade" (244), by Farmer, is a nice picture, with his usual little fat redcheeked boy. 258. "Miranda," by R. Redgrave.

A clever picture, the head remarkably beautiful : still we cannot imagine this the artless creature depicted by Shakespeare, but rather an actress playing the part.

A most beautiful landscape is that of Danby (272), unequalled for its intensity of warm light and shade : the effect of the rising

sun behind the trees is perfectly marvellous. The third picture from this is C. Land-seer's "Eve of the Battle of Edgehill." An

seers "Eve or the battle of Edgenit." An improvement on last year; but a monotony pervades the picture which is disagreeable. E. M. Ward's (292) "Scene in Lord Ches-terfield's Ante-room." This work, evidently of much research, full of Hogarthian feeling and human is an excellent picture description of much research, full of flogarithm scing and humour, is an excellent picture, deserving high commendation. The heads, well studied, high commendation. The heads, well studied, are characteristic of their several professions; and the whole is carried out with care and skill. We understand Mr. Vernon has bought

this picture. "Ariel," by J. Townsend. A fanciful ides, Unpression in the state of too much of the manner of Maclise.

. Frost has a fine composition, illustrative of "Sabrina borne by Water Nymphs to aged Nereus' Hall," from Comus.

327. " Burial Ground, Smyrna." W. Muller. This seems an excellent picture, but is placed so high as to defy examination, even at the risk of a broken neck.

A very good specimen of Herbert's peculiar style is "8t. Gregory" (338). The monka' heads are very clever, as are some of the boys'.

Mr. Kennedy's picture of "The Two Nymphs" (347), for colour, style, and per-

fect keeping, cannot be too highly praised. "Repose" (357), by A. D. Cooper, is a beautiful bit of colour, but is too close an imitation of Sir Joshua.

Mr. Webster's "Dame's School" (360), and Goodall's "Le Bon Curé" (361), are face specimens of finish and refinement.

Mr. Marshall Claxton's picture, "Jews la-menting over Jerusalem," can boast of much that is clever, but has a chaotic effect.

Mr. Haydon has produced a fine study of a head in 394.

"Gregory passing through the farket," by J. Sant, is clever, but weak. Slama Market," by J. Sant, is clever, out w can-459. "The Baudit Mether," by W. D.

Kennedy, a good picture in an excellent style.

A miracle in point of finish and study is No. 471, by Mr. Lance, though the general

effect is not pleasing. Robinson Crusoe has made his re-appear-ance in a picture of Mr. Fraser, whereof the tone is excellent.

Mr. Middleton's "Jeanie Deans" appears deserving of better treatment than it has received.

Mr. Müller's beautiful painting, immediately under this, is remarkable for depth and solemnity of tone. We prefer it to those by the same artist already mentioned.

"The Young Squire's Wedding," by T. F. Marshall. A very nice picture, full of truth, and displaying a visible improvement on the

part of this artist. Frith's "Village Pastor" (498) is a perfect piece of truth, genuine feeling, and good draw-ing; it awakens sympathy and touches the heart.

A picture near it, by A. Solomon (502), has much that is good in it, but the faces are

decidedly too long. Mr. M'Jane' (514) is an interesting picture. "Going to Pasture," by J. S. Cooper, can boast of its nicely painted cattle, but wants his accustomed warmth.

Mr. Johnson's fine work (546) will be appreciated by all; the style is broad, clean, and effective. The head of Lady Russell is not sufficiently characteristic t still this picture is one of the best in the collection. "Connamara Girls bathing their Feet," by

F. Goodal, is nicely coloured, but in parts has the fault of being horny. Mr. Bell has succeeded in his water nymphs

(552), but the figure of Hylas is awkwardly placed. "Autolycus," from the "Winter's placed. "Autolycus," from the "Winters Tale," by Egg, is exquisitely painted and

drawn, tells its own tale, but is rather hard. The hackneyed subject of "Boaz and Ruth" is again presented to us by Mr. Le Jeune, who makes a pretty picture of it in spite of its want of originality.

A fine picture of Mr. Eddis, under the title of "Jochebed," hold a prominent situation in the exhibition.

"The origin of the Guelph and Ghibeline Quarrel," by A. Elmore, is an ambitious and clever picture, with much in it to be admired and praised, though not without faults.

" Uriel and Satan" displays Mr. Haydon's

knowledge and his love of grandeur. Mr. Harding, the water-colour artist, has contributed the "Mountain Pass," deserving of the highest praise,

Among the pictures in the black hole (octa-Among the pictures in the black hole (octa-gron room) are some good works; the best, by Mr. Philip, "An Illicit Still," is rather too melo-dramatic; the rolling of the wo-man's eyes, as if to court the plaudits of an audience, might be dispensed with; but the light in this painting is skilfully managed. Among the miniature painters, Thorburn, Ross, Carrick, Newton, and Cruikshank dis-play the finest works. Some by Thorburn are pictures.

pictures.

A ministure, by Hiedmanns (761), is well worthy of notice for its beautiful finish.

There are some good specimens of sculpture, by Bell, Marshall, Weekes, and others. No-thing can be more beautiful or simple than Mr. Marshall's "First Whisper of Love," or Mr. I. Bell's "Child's Attitude." J. A. S.

PROVINCIAL WATER WORKS.

THE health of towns so much depends upon a plentiful and cheap supply of pure water, and the public at large are now so thoroughly convinced of its importance, that a company has been formed for the purpose of affording to provincial cities and towns this necessary of life. In almost all localities there exist ample sources, which require only skill and capital to make them alike valuable to the inhabitants, and profitable to those who shall render them available. In our last number we stated that a private company was being formed to esta-blish water-works on an extensive scale at Bristol. Since then a meeting of the towncouncil has been held, and the propriety of the

council has been held, and the propriety of the city being supplied by the corporation, instead of by a private body, was discussed. Mr. Thomas impressed upon the council the importance of taking the subject in hand before it was too late. The docks had failen into private hands, and now the step was lamented; they ought certainly to be the pro-perty of the city. At Manchestar the people were supplied with gas by the authorities, and from the profits made by it great improve-ments had been effected and were still going on in the town. He contended that Bristol might be not only well supplied with water by the council, but that a profit would accrue, which could be expended in improvements. Dr. Green thought there could be hardly a doubt that a measure would be introduced into Parliament empowering or compelling local

Parliament empowering or compelling local bodies to form water works. He trusted that the council would take the subject in hand, for there was no doubt that such a work would not there was no doubt that such a work would not only be remunerative for the outlay of capital, but also that a large sum would be derived from it, to be expended in public improve-ments. A supply of water ought to be secured, not only for private purposes, but for the esta-blishment of public baths, and a ready supply to be used for the extinguishing of fires. Had the gas-works been in the hands of the council a large profit would have been secured.

a large profit would have been secured. The Edinburgh Water Company, which is, we believe, a private body, charge only four, and, in some instances, only three shillings per annum for water supplied to cottages let for less than 54 per annum.

MRTROPOLITAN RAILWAYS .-- The project of a metropolitan railway tunnel is said to be of a metropolitan railway tunnel is said to be seriously entertained, and a prospectus has been issued, pointing out its practicability. It is proposed that this subterranean railway should commence at Hyde-Park corner, and have intermediate stations at each chief thoroughfare with a street frontage. A prospectus has been issued for the forma-tion of a London Central Railway Terminus in the vicinity of Charing Cross and the tion of a London Central Railway Terminus in the vicinity of Charing Cross, and the connection of various lines, by means of a double line of rails, adjoining the Hungerford Suspension Bridge. A South-London Sub-urban Railway, on the atmospheric principle, is also proposed, for the accommodation of Kennington, Stockwell, Clapham, Balham Ilill, Tulse Hill, Brixton, and other rural retreats. The rage for speculating in shares retreats. The rage for speculating in shares is now so great, that if a railway from Hyle-Park corner to the middle of August were advertised, all the shares would be subscribed for in twenty-four hours.

THE IMPROVEMENT OF WESTMINSTER.

As some of our readers have expressed a desire to know exactly what the committee appointed February 7th stated to the public meeting on the 10th inst., alluded to in our last number, we are induced to print their report

"The committee were appointed to con-sider the various lines of improvement proposed to be made by new or enlarged streets in the vicinity of the Houses of Parliament, and to report to a future general meeting, and were directed by the meeting to impress on the government and the legislature the propriety of withholding their sanction from any plan for improvement which may not be spproved of by the inhabitants.

The committee having by public advertise-ment invited communications relative to the best measures for carrying out the improvement of the neighbourhood, received several plans to promote this object. Mr. Wason attended the committee and stated, that he would not take any step in par-

llament for one month. In consequence of further advertisements by the committee for further advertisements by the committee for plans accompanied by written statements, shewing their practicability, they were favoured with several plans, accompanied by explana-tions and estimates, relative to proposed lines of improvement.

The committee having solicited an inter-view with Sir Robert Peel upon the subject, explained to him the objects for which they were appointed, and his attention was drawn to the several plans which had been sub-mitted, and which the committee were as-sured were practicable. Sir Robert stated that he would speak to Lord Lincoln upon the subject, and recommended the committee to subject, and recommended the committee to put themselves in communication with his lordship. In conformity with this recommen-dation, the committee addressed a letter to Lord Lincoln, and the following correspondence ensued :

iterary and Scientific Institution, Great Smith-street, Westminster, 18th March, 1845.

My Lord,-The Committee for the Westminster Improvements having been honoured with an interview with the Right Hon. Sir Robert Peel, and authorized to enter into com-munication with Her Majesty's Office of Woods and Forests on the subject of the pro-posed improvements request to be promitted posed improvements, request to be permitted (before they solicit an interview with your lordship) to submit the various plans and calculations on which they have been induced to conclude, that no plan should be finally adopted without full consideration of all the peculiar circumstances of the improvement, and the various suggestions made by ex-perienced architects and surveyors. —I have the honour to be, My Lord, your lordship's the honour to be, and most obedient servant, W. H. J. TRAIOB,

Secretary to the Westminster Improve-ments Committee.

To the Right Hon. the Earl of Lincoln.

Office of Woods, &c., 19th March, 1845.

SIR,--I have to acknowledge the receipt of your letter of yesterday's date, and beg that you will inform the Committee for the West-minster Improvements that I shall be happy to receive the plans and calculations, and will not fail to give my best attention to their details whenever the committee may favour me by sending them for my inspection.

I remain, Sir, your obedient servant, LINCOLN.

W. H. J. Traice, Esq., Secretary, &c. March 22, 1845.

My Lord,-The Committee for the Westminster Improvements desire me to convey their sincere thanks for your lordship's early reply to their communication requesting permission to submit certain plans and state-ments, furnished to the committee for your lordship's examination.

In conformity to your lordship's kind assent to the committee's request, I am, therefore, directed to forward several plans and state-ments of the estimates on which such plans have been prepared, of the following archi-tects, viz., Mr. Sidney Smirke, Messrs. Scott and Moffatt, Mr. Bardwell, Mr. Tarring, Mr. Lenidre and Mr. Dorthern Lapidge, and Mr. Donthorn. The committee also beg to solicit the honor

after your lordship's examination of the plans and estimates as may be convenient to your lordship.

I have the honour to be, &c., W. H. J. TRAICE.

Whitehall-place, 29th March, 1845.

SIR,-I have looked over the various plane for the improvement of Westminster which for the improvement of Westminster which you have been good enough to send me, and with one at least of which I have been much pleased. The Commission for Metropolis Improvements meets on Wednesday, the 9th of April, and it will then be my duty to report to the commissioners the communications which I have meaningd from your and the fact of I have received from you, and the fact of

I have received from you, and the fact of several new plans having been proposed since the report in favour of Mr. Wason's line was agreed to. It may possibly be the wish of the commis-sioners to see the gentlemen composing the Committee for Westminster Improvements, and I would therefore prefer postponing my, further communication upon the subject until after the meeting on the 9th of A pril, which I hope will not occasion any inconvenience, to the Committee. I am, Sir, &c.

LINGOLN.

To this the secretary replied, that in the event of an interview being desired a deputa-tion would be prepared to attend the commissioners; and represented that the committee assumed that the bill before parliament would not be allowed to pass to a second reading till the further decision of the commissioners should be made.

The concluding letter was as follows

10th April, 1845.

Sir, - The Commissioners of Metropolis Sir, — The Commissioners of Metropolis Improvements met yesterday, and agreed to Athe report to her Majesty in favour of the new aline of street through Westminater proposed by Mr. Rigby Wason, the substance of that t report having been decided upon at the last previous meeting. I had before the commissioners your letter, if I had before the commissioners your letter, if

and informed them that you had sent me seve-ral plans, as substitutes for that which they had sanctioned.

The commissioners felt that they were committed to Mr. Wason's plan, and could not in fairness adopt any course which should preju-dice the bill now before parliament. They therefore concluded the report with the follow

however, by the fact of such engagement, they, do not feel themselves at liberty to call for with a view to their investigation."

Under these eiroumstances, I shall be glad. to learn from you whether it is the desire of ... the "Committee for Westminster Improveor that I should retain them for the present, in, the event of the Commissioners being willing in to examine them at some future time when , Parliament shall have decided upon the , bill, now before it. I am, Sir, Sec., Lincoln.

The committee have since had several communications with the promoters of Mr. Rigby Wason's plan, who express a disposition to extend their lines of improvement as much as possible upon certain conditions; but they have not been attended with any definite result. (Signed) W. FREEMAN, Chairman.

(Signed) W. FREEMAN, Chairman. 10th May, 1845. With the proceedings of the Metropofis Improvement Commission, in this matter, we are far from satisfied, but, for want of space, must defer comment.

IMPROVEMENTS IN THE TOWER OF LON-DON. - Upwards of 100 of the military are daily employed, in addition to the ordinary labourers, in proceeding with the works of this ancient fortress. The site of the old armoury has been nearly excavated, and concrete laid for the foundations of the new barracks. The The. earth taken out of the latter has been thrown. over the Tower into the most to fill it up, and , it is not now intended to make it into a planta-... tion, but into an exercise ground for the mili-The committee also beg to solicit the honour of an interview with your lordship as early the fortress. 911 19 HAND BOOK FOR LONDON. dedicat into Z od.

AME MURBAY's hand books for travellers are iknowniover Earope. W berever you meet English tourists mnd where on you go without meeting them ?- you may be certain of see-ing the sed-covered guide book. Uniform with these he has just amounced a hand-book for London, past and present, wherein it is proposed among much new matter; to give the origin of the names of places, and to distin-guish, as far as possible, the residences of re-markable men. The author of the book is Mr. Péter Cunhingham, and we anticipate, from his zeal and ability, a peculiarly interesting volume. It a morning's walk we pass miny houses without emotion which; if we but knew the names of former occupants, would ford) matter for much pleasant thought.

nhigham's prospectus azad yatedora off Rarticular residences of remarkabiermes, or streets connected with their hames : Chaucontand his account of what he observed in Friday-street; the house in Aldersgate-street in which the first Lord Shaftesbury lived, in the time of Charles II.; Milton's house in Petty Brance, Westminsters Andrew Mar-vell's reione: in: Maiden-lane, Covent-garden; and Vokalre's London ledging at the Blue Periory, in the same lane; Dryden's house in Gerard-street; Southerne's house in Tothillstreet; Sir Isaab Newton's house and Observatory in St. Martia's street; Hogarth's house on the ent side, and Sir Joshua' Reynolds' house on the west side of Leicester-square; Dr. Johnson's west and of Actoester-square; Dr. Johnson's west and Cough-square; atte of his house in Boit-court, Flett-street; Lord Byron's residence of Johnson wrote his defence of his folkeling and Fall; the house in which Baural the bit graph of Johnson diad the Baswall, the biographer of Johnson died ; the house an shield Horace Walpole died ; the house in which Thomas Gainsborongh lived; the house in which Wilkie painted his 'Blind Fiddler ; the studios of Flazman and Chantrey, and the residence of Sir Thomas Lawrence.

Vie Marchins WIRE ROPES.

MR. CARPHAEL read & paper at the Royal MR. CARPSAR, read & paper at the Royal Institution on the 9th inst., on the mand-facture of wire-ropes. He stated, that the process had grown up within the last four or five years. Till the year 1839-40 there were no real wire-ropes in this country, *i.e.* no manipulation of wire, first producing straads, and then combining these strands into a single rope

893

He briefly noticed the improvements which had been made in the manufacture of hempen oordage during the last fifty years, and laid great atress on Captain thuddatt's contrivative for varying the length of the yarns, according to their distance from the control of the rope, so that each, throughout its course, being kept at the same distance from the central strand, was subjected more nearly to the same amount of tension. The characteristic difference between the mechanical principles of the manufacture of the hempen and the wire-rops was then inculcated. Twisting is essential rope was then inculcated. Twisting is essential to the structure of the former, but would be des-tructive of the latter fabric. This principle, long, everleaked, was discovered by Mr. Ne-well, the patentee of the improved wire-rope, and the object of his machinery is to carry, that principle into effect. The wire-rope con-sists of a hempen, core, the horizontal section of which orbitic machinery could be conof which exhibits seven equal circles,-six round a central one; these, according to a Rnown geometrical law, touch the central circle, and also sach other. Round this central core are six strands, formed exactly in the same way, except that while the central core is of hemp (as is the core of the rope), it is sur-rounded by six wires, the diameters of these wires being equal to those of the yarns of the core; so that a section of the rope exhibits forty-nine equal circles (thirty-six wire and thirteen hemp), arranged in a sort of hexagonal form, the lines joining the gentres of the hempen cores of each strand producing a regular hexagon. Having exhibited the ma-chines by which Mr. Newall lays the wires in the strands exciding call track the wires in the strands, avoiding all twist, Mr. Carpmael stated some of the purposes to which this massificature had been applied. He premised, that the greatest strength is obtained when

wire made of hard iron is used. Ropes thus manufactured arestronger, lighter, and cheaper than hempen cordage bearing equal weights; consequently, when materials are raised from a depth in mines, a heavier load may be lifted with equal power whenever the wire-rope is used. For the same reason, this fabric is preferable in the fixed rigging of ships; and its value for railway purposes has been proved by decisive tests. As long as hempen ropes were used on the Blackwall Railway, there were often two or three breakages a-day. Since these have been superseded by the iron-wire, there have not occurred more than twelve fractures in twelve months, and during six thousand journeys.

Correspondence.

CHURCHES AND CHURCHYARDS. SIR,-In your account of Norfolk churches

no minute is given of -1, Length; 2, Breadth; 3, Height to roof-ridge; 4, Ditto of tower; 5, Materials with which fabric is built;

6, Churchyard, as to size, trees, keeping. In foreign churches we often find the height from the floor to the roof-ridge 60 feet to 100 feet,-in England seldom or never so much. them " Our modern churches are most of playthings" in comparison with those of our forefathers.

As to materials, we should find, I think, that they were chiefly taken, very wisely, from such matter as was found in the locality.

As to churchyards, a report would shew, I fear, that our English cemeteries are a dis-grace to us. Horses, sheep, geese, footpaths, weeds, and filth are the usual features of an English churchyard.

Our clergy would readily, as a body, resign the right of making a churchyard a piece of grazing ground, wherein the kicks and knocks of animals deface or break to pieces tomb-stones, and others violate the sod of the poor man's last tenement.

man's last tenement. Whilst trees add much to the beauty of a churchyard, an avenue of limes, kept clear of boughs inside, forms a fine arcade to the west door of a religious building. Besides, if a parish was once invited by its pastor to make the graveyard an object of attention, there is no doubt but a wilderness would soon be sepulture symmetrically, the spot would become an ornament, instead of eyesore, to every an ornament, instan village in the kingdom. I am, Sir, &c., W. MASON.

Swaffham, Norfolk, May, 1845.

MODERN BRICKLAYING.

S18.--As you invite remarks on the subject of bricklaying, I consider it my duty, being a journeyman bricklayer, and having the welfare of my trade at heart, to accept the offer. I wish to remind you that the generality of our modern builders know nothing of bricklaying, and care less; and I wish to call your attention to the total disregard many surveyors pay to the art of brickwork, who consider that to make a drawing that looks pretty to the eye and can be worked out in cement no better than mad (as "J. Phillips" justly observes) is all that is required of them. The common system of builders is to let these have the work whe undertake to do it for the lowest price, without any regard to quality; and I have worked on jobs of this kind where the bricks have been thrown in the wall quite dry without any mortur. If you wish it I can give you the have been declining since we have had so many Builders: men who care nothing and know nothing about trade, and whose only object is to realize all the profits they can; for I think we had better work done when we had masterbricklayers and master-carpenters, and each man kept to his own trade; I do not con-sider there is one builder who knows the right bond of brickwork, if I except Mr. ----, and it was in his employ that I saw so much bad Was in his employ that I saw so much bau work done. I wish to point out to you the manner in which some surveyors appoint their clerk of the works. They mostly seek for some carpenter to superintend a building,—a man that don't know Flemish bond from old English, and who never thinks of gauging work to see what it rises; so, instead of having four courses to 111 inches, he mostly gets three courses and a half to the foot; and here is the evil, for instead of having so much brick you have the quantity in mortar; and that not of the hest wirt. 1.12

It is a great pity that surveyors do not ap nint a man that is competent to see to the brickwork, and have it properly bonded to-gether and executed according to the specifications, and not allow so much bad work to be done; I can mention a firm in London, who made an excavator foreman of their bricklayers, because he was a bully to the men, and hurried them on. In the same firm that I am now speaking of, I have seen (and I have done it myself) two 4-inches carried up for an 18-inch wall, and the inside S-inches filled in with the clearing of the brick-field, and a course of headers run on the top : then it has had grout covered over it, and ran down the sides of the wall. Yes, Mr. Editor, there is a firm in London, I can mention, who employ the greatest bully they could find as their foreman of bricklayers; a fellow who could not obtain his living as a journeyman, and who takes the brickwork piece work. O Saturday night he is allowed to pay the men, andwhat is the consequence? Why he employs one or two good tradesmen, and the remainder consists of any thing he can pick up that is cheap, he charging his employer 5s. per day for all his men, and paying the majority of them 3s. or 4s. per day, while he pockets the remainder. By this system of *building* a re-spectable workman has but a bare chance of getting employment, much less of having the opportunity of exerting his skill.

I am, Sir, &c., HENRY JOHNSTONE.

BBROBS IN CATALOGUE OF EXHIBITION AT THE ACADRMY.

Mr. Leeds presents his compliments to the Editor of/" THE BUILDER, and begs to say, that among the strange mistakes in the cata-logue of the exhibition, No. 1205 has a wrong title effixed to it. Instead of being called "Street Architecture ; study for the face ule of a small palazzo,"-as which it must seem little less than absurdity,-itshould have been, "Caprice of Architectural Innovation;" it being like No. 1204, not a design for any thing in particular, but merely intended to shew some novel ideas, fanciful or fantastical-cortainly by no means orthodox ones,---and hints for composition and detail.

•.• Our correspondent is not the only exhibitor who has reason to complain of the carelessness shewn in the catalogue.

' ' BUILDERS' ESTIMATES.

SIR,-The following are the prices given in for a new parsonage and out offices to be erected at Brocklesby, in the county of Lin-

coln. Bricks, time, and sand found by the pro-prietor; architect, Mr. S. S. Tealon, of Lon-

"" We occasionally receive letters objecting to the publication of builders' tenders i, and indeed are not quite certain ourselves, that any advantage results from the indiscriminate insertion of such. In a case like the above, however, where the difference is so frightful as to shew conclusively that something must be wrong, we consider it our duty to publish it to draw attention to the system, and induce greater care on the part of builders when estimating.

DECORATION OF HOUSES OF PARLIAMENT. -Mr. Pugin, the architect, has had several artists employed in Lynn, making casts of dif-ferent parts of the architecture of St. Mar-garet's church, and St. Nicholas's chapel, as examples for the decorative parts of the New Houses of Parliament, the arrangement of which, it seems, has been intrusted to him.

-, ANGIENT MONUMENTS. - The Morning Chronicle, in a notice of the British Archmo logical Association, says " From ancient monuments we derive more vivid impressions of past ages than we can in almost any other way. They are themselves portions of the reality of those ages, and they give a wonderful stimulus to our power of canceiving the life and manners with which they were origi-bally associated. On this account the minutest fragments of antiquity are worth preserving. Every ancient building, however much decayed - every half-effaced inscription every braken weapon or industrial tool, aids us in recreating the megnificent picture of a by-gone age. The minute and painful diliby gone age. The minute and painful dili-gence of the antiquary, therefore, which so often provokes a smile, is as truly scientific, and ultimately as productive of important results, as the close observations of the naturalist. Sir, Walter Scott, perhaps, is entitled to the merit of making it widely felt, that the mis-cellaneous collections of the antiquary may suggest more valuable knowledge than the orate and classical narratives in which such things are neglected as unworthy of the dignity of history.' We shall not know how rich we are in the memorials of the past in England until an interest in the subject has been created in every part of the country, and this interest we trust will be excited by the proceedings and publications of the Archæo-logical Association. Wherever an ancient monument of any kind exists-whether church, or castle, or tombstone, or even the earthworks of an ancient encampment-the people of the neighbourhood ought to be inspired with a pride in it which would lead them to with a pride in it which would lead them to guard it from further injury. In many cases this feeling exists, and produces a disposition to restore ancient buildings as nearly as pos-sible to their original state. Whatever tends to strengthen this feeling contributes not a little to the education of the people. If there were no other reason than this, the Archaelo gical Association is well deserving of public support." - C1 21

STRAM BOAT PARES ON THE RIVER Some time since, in consequence of an alteged right on the part of the authorities of the city of London to the soil and bank of the river and under such right of way and soil to erect piers and other buildings thereon, some communications took place between the Lords Commissioners of the Woods and Forests, who claimed the right of way and soil of the river on behalf of the crown, and denied that any right to the bed and bank of the niver existed in the Lord Mayor and Commonalty of the city of London. The authorities of the of the city of London. The authorities of the city, however, asserted their right, and an information is now pending at the instance of the Woods and Forests, on behalf of the Crown, to test that right, and which is expected to come on for argument during the ensuing term before the Lord Chancellor. Notwithstanding these proceedings, the city authorities thought proper to commence the erection of a steam-bost pier at Blackfriars'-bridge, and a number of piles were driven into the bed of the river, Representations of these facts were made known to the Commissioners of Woods and Forests, by whom a communication was forwarded to the Lord Mayor, requesting that all further progress in the erection of the pier should be suspended until the question of right, which has been at issue between the Crown and the city, and which of necessity involved the same question, should be disposed of. Since the receipt of this communication, the Navigation Committee have not met, and the works are suffered to proceed, notwithstanding the re-monstrance of the Woods and Forests on the part of the Crown.

URIVERSITY COLLEGE HOSPITAL. - A public dinner in aid of the funds of this liospital will take place at the London Tavern on the 3rd proximo, Viscount Morpeth in the chair. The committee bave issued an appeal to the public for funds to complete the build-ing. The site of the north wing is now unoccupied: such a wing, if completed, would allow of an increase of fifty in patients, and would confer facilities much desired for the better classification of cases of disease, and for other improvements in the administration of relief, by affording accommodation for a larger number of resident officers.

THE BUILDER.

BOOISTY OF ARTS. --At a meeting held May 14, the secretary read a paper by Mr. Napier on separating metals from their orea by means of electricity. After giving an account of the progress made in the application of electricity for the purpose of manufac, turing metals from their ores since the year 1839, the paper described the author's method of operating, for which purpose he uses a black lead crucible, lined inside, within an inch or two of the bottom, with a coating of fire clay, which is allowed to dry, and a second and third coat superadded. The ore to be operated on (which if a sulphate should be previously roasted) is put into the crucible together with little lime or other fur for the crucible a little lime or other flux for the purpose of giving it fluidity. The crucible with its contents is then placed in a common crucible furnace; a battery of zinc and copper is prepared with five pairs of plates excited by very dilute sulphuric acid. To the zinc of this battery is attached an iron rod, the end of is inserted in the furnace, and caused to which touch the outside of the crucible. Another rod. either of iron or copper, is used, having at one extremity a disc of iron, or coke, which is made to rest on the surface of the fused mass in the crucible; thus the electricity passes down through the whole fluid mass in the crucible, and in the course of an hour the metal is separated from the ore, and deposited at the bottom of the crucible. The society's repository was lighted with two gas lights on Mr. D. Grant's ventilating principle, the chief novelty of which consists in substituting earthen or glass ventilating tubes for those of metal, whereby less heat is given out and the unpleasant odour arising from heated brass or iron entirely obviated.

PROPOSED NEW DOCK IN JERSEY. Committee of Harbours met on the 11th inst., and had a lengthened conference with Mr. Walker respecting the proposed new outer dock. Mr. Walker read the draft of a report dock. embodying his views on the subject, and sub-mitted also to the committee four designs, He also gave an approximate estimate of cost of each plan, as follows:-No. 1, 200,000/.; No. 2, 210,000/.; No. 3, 240,000/.; No. 4, 280,000/. In these sums are included 10,000/. for unavoidable expenses required for the improvement of the inner harbour in the event of its being left a dry barbour; and also 10,000%. for the filling up of sites for stores on each side of the dock. The cost of the inner dock had been estimated at 130,000%. Mr. Walker's plan for certain improvements at Rozel Harbour, estimated at 2,000%, was approved of; and he was instructed to prepare a plan for Bouley Harbour. Mr. Nixon, Mr. Walker's assistant, remains on the island to complete the plans and estimates.

SUBSTANTIAL NEW WAREHOUSES Hull.—The contracts for the Hull Dock Company's new warebouse, at the south end of the Junction Dock, have been let during the past few days. The warebouse will be entirely fire-proof. The length will be 217 feet, the breadth 60; and the height five or six stories; the cellurs will be vaulted, the pillars and groining of the floors cast iron, and the floors themselves of brick, in arches; the thickness of the walls above the ground 3 feet thickness of the walls above the ground 3 feet 2 inches, tapering to 18 inches at the roof, which will be of iron. The warehouse will stand 40 feet from the edge of the dock, and equi-distant from the lock-pit... The com-pany are erecting another strong warehouse on the Old Dook-side, near Lowgute, for a depôt, the walls of which, are to be three feet thick.

LANCASTER AND CARLISLE RAILWAY A few days since the foundation stone of the last under-bridge on the line in the neighbourhood of Penrith, situate at a place called Thucka Beck, in Messrs. Harper and Booth's contract, was laid, with the usual ceremonies, by Mr. Virtue, Mr. Stephenson's managing engineer. Under the south wall were deposited a number of rare and curious coins, namely-from George I. to Queen Victoria; a bronze coin of the reign of Augustus Dominitian, and several Roman, English, French, and Spanish coins; they were forty in number. One of the coins deposited was 1,600 years old, which when re-discovered, if ever it may be, will no doubt give rise to much speculation to the antiquarian and the wise in centuries yet to come, and prove a rare and valuable relic of antiquity.

required during one year; from Midsummer mert, by the trastees of the parish of St. Lake, Middlesson 3,000.12 4413 36.13

THE BUILDER.

A SA COMPETITIONS.

Plans, sections, and elevations for a Terminus, and other requisite accompanying offices, for the Great Southern and Western Railway, Ireland.

A premium of 30 guineas will be presented to the party offering the best plan of Docks, capable of admitting ships of 1,000 tons burden, to be erected at Burnham, in the Bristol Chanael.

Designs for houses to be erected at Dover. Lesigns for houses to be crected at Dover. The ground is nearly seven acres in extent, and lies on a gentle slope between the south-west boundary of Dover Castle and the town. A premium of fifty guineas is offered for the set that may be most approved of.

AFPROACHING SALES OF WOOD, &c.

The timber and other trees new standing upon the estate at Woodscaves, Salop. By order of the Lord Chancellor made in the cause "Dickin v. Barker

Barker." At Wiston Woods, near Nayland, Esser: all the Timber, Timber-like Trees and Saplings (con-sisting of Oak, Ash, Elm, Asp, Birch, and Cherry) arising from the Wood of 13 Acres called "Hills." At Kersey, near Hadleigh, Esser: 130 Capital Oak Timber Trees, 70 Oak Standels, and about 30 Pollards, lying on "The Ivy-tree Farm." At the Three Sarah Inn. Hungerford 400

At the Three Swans Inn, Hungerford : 400 valuable Oak Trees of first-rate quality, felled on

the Chilton Lodge Estate. The Foarth Portion of the Materials of the Fleet Prison, comprising the entire South Wing of the Principal Building, and the Infirmary. At West Wickham: 31 Oak, Ash, and Elm

Trees of good quality, and 60 sound Pollards. At Eversdea Wood, Cambridge : 80 Oak Timber Trees, clean, sound, and of useful dimensions.

At Bourn, Cambridge : a capital Fall of prime Oak Timbar, comprising about 100 Trees of good usions

At Monk Sherborne Brick Kiln, Basingstoke, Hants : upwards of 200,000 new Building Bricks, 40,000 Arch ditto; 25,000 Thes, &c.

At Little Bentley Hall, Essex: soveral Acres of Plantations, consisting of superior Firs, Larch, Sprice, &c., to be taken down by the Purchaser.

At Brandon, near Coventry: several Thousand prime Oak Trees, and a quantity of Planks and Quarterings.

BY TENDER.

A Virgin Forest of Valuable Timber in Wala-chia. The principal part of the Trees is Oak. The said Forest may produce about 500,000 cubic feet of Timber.

HOLBORN AND FINSBURY SEWERS, MIDDLESEX. THE COMMISSIONERS of SEWERS for the LIMITS give NOTICE, that their Office, Hatton Garden, is open daily between the hours of Ten and Four, where information can be obtained (gratia) by persons about to Purchase or Rent Houses or Property, or take Land of Building purposes, of the situation and level of the public Sewers, capable of affording sufficient Dwinage, and which they recommend all such Persons to apply for at the above Office. By the Court, STABLE and LUSH, Clerks.

COURT OF SEWERS FOR WESTMINSTER, AND PART OF MIDDLESEX, No. 1, Greek-street, Sobo-

O BUILDERS and Others interested in

TO BUILDERS and Others interested in buildings or in ground for building upon, within the district under the jurisdiction of this Court, drained by water-courses falling into the river Thames, between the city of London and the parish of Fulham. The Commissioners hereby give notice, that by an Act of the 47th Geo. 111. (chap. 7, local) it is required that, pre-viously to the making of any new sever in any street, lane, or public way, or it any part intended to become a street, lane, or public way, or to carry off or drain off water from any house, building, yard, or ground, into any sever under their management, or within their jurisdiction, a notice in writing shall be given to them, or to their clerk at their office, and into any new sever shall be constructed and made in such manner and form as shall be directed by the said Commissioners, and not otherwise. And, in order to prevent the serious evils and inconveni-ences that must arise from ground proposed to be built upon being exevated at too great a depth, the Commissioners have directed that, upon ary lication being being information shall be given as to the clowest depth at which the same can be drained. And the Commissioners do also give notice that, when-

be given as to the lowest depth at which the same can be drained. And the Commissioners do also give notice that, when-ever the lower floors or pavements of buildings shall have been laid so low as not to admit of their being drained with a proper current, they will not allow any sewers, or drains into severs, to be made for the service of such buildings. It is recommended to all persons about to purchase or take houses, or other premises, to ascertain whether such premises have separate and distinct drains into common sewers. All petitions must be delivered at this office at least three clear days before they are presented to the Commissioners; and all such petitions will be called on in the order of their appli-cation, and the name of any party not present when called on to support the application will be struck out, and the pro-ceedings must in consequence be commenced de novo. All communicationers will be cut off, and the parties making the same will subject themselves to a fine. By order of the Court, LEW 18 C. HERTSLET, Clerk.

WESTERN LIFE ASSURANCE VV SOCIETY, OFFICE, 49, PARLIAMENTSTREET, WESTMINSTER,

Physician. William Richard Basham, M.D.

William Richard Basham, M.D. Surgeons. Alfred Leggati, Esq.; George D. Pollock, Esq. Bankers. Messrs. Cocks, Biddulph, and Co. Solicitors. Messrs. J. L. Bicknell and J. C. Lethbridge.

Measures. J. L. Bicknell and J. C. Lethbridge. The attention of the unassured portion of the community cannot be too pointedly drawn to the unusual advantages offered to the Public by this Society over those of many others, as it enables all classes to effect life assurances in the manner most convenient to themselves, and amongst other of its popular features that of allowing the Assured (by Table 2) to leave HALP THE ANNUAL PERMIUNS unpaid for seven years, will not be found undeserving public attention. Immediate and deferred ANNUTINS, and every description of Life ASSurance business, undertaken by this Society. Prospectuses and all other requisite information will be furnished on application to the Secretary, or the Country Agents of the Society. EDWARD T. BICHARDSON, Secretary.

NOTICE TO INVENTORS. OFFICE FOR PATENTS OF INVEN-TIONS and REGISTRATIONS of DESIGN&, 14, Lincoln's-imn-fields.-The printed INSTRUCTIONS grain, and every information upon the subject of PROTECTION for INVENTIONS, either by Letters Patent or the Design Acts, may be had by applying personally, or by letter, pre-paid, to Mr. Alexander Frince, at the office, 14, Lincoln's-inn-fields.

A TKINSON'S CEMENT.—The public is respectfully informed, that the price of this very ex-cellent Cement, which has now been in use for Architecture, and Engineering works upwards of thirty years, is reduced to 28. 3d. per bushel, and may be had in any quantity at Wyatt, Parker, and Co.'s Wharf, Holland-strest, Surrey dee of Blackfriars-bridge.

N.B.-This Cement being of a light colour, requires no arti-ficial colouring or painting, and may be used for stucco with three parts its own quantity of sand.

MARTIN'S PATENT CEMENT. TO ABCHITECTS, BUILDERS, AND PAINTERS IN FRESCO.

STEVENS and SON, PATENTEES and SOLE MANUFACTURERS, beg respectfully to announce that this beautiful ement has now arrived at a degree of excellence far surpassing their most sanguine supectations. For all internal work it possesses a great used extensively by Government in the British Museum and other public buildings. IT DOES NOT THROW OUT ANY SALT, but presents a beautifully plain and perfect surface, which may be painted upon dry work within four days without peeing. It is equally applicable for walls or submitted to form the best ground for freeco painting, having been used for many of the prise freecos lately exhibiting it westminter Hall. It will been an intense heat without or equilibrium. It will been an intense heat without any for hardness, durability, and economy, cannot be equilibrium.

be equalled. 186, DRURY-LANE, LONDON. Agent for Liverpool and Manchester, Mr. B. Part, 11, Atherton's-buildings, Dale-street, Liverpool.

Atherton's-buildings, Dale-street, Liverpool. **TKEENE'S PATENT MARBLE** CEMENT.—The Patentees of this composition beg to refer to the British Museum, the Royal Exchange, the new works at Bethlem Hoopital, Greenwich Hoopital, and the Co-lieum in the Regent's-park, as buildings finished or in pro-gress, in which Keene's Coment has been used as an internal stucco. Its superiority to common plastering consists in its extreme hardness, and the rapidity with which it dries, which qualities fit it to receive paint or other finishing sooner than other water Cemengs. When employed for skirtings, architrave, and other mouldings, in place of wood, it checks dry-rot, is impervious to vermin, pawents the spread of fire, and is more eco-nomical in its application than the material for which it thus becomes the substitute. Confirmation of these statements is to be found in the and Hall flooring in the new houses on the Hyde Park Estate, where its application is to be seen to the fullest advan-tage. In Liverpool and Manchester Kenne's Comments in the statements of the statements in the substitute.

where its application is to be seen to the fullest advan-tage. In Liverpool and Manchester, Koene's Cement has in several cases been used for the covering of the fire-proof warchouse floors, where its lightness and hardness give it the preference over tiles and flagging, which are much heavier, and necessarily leave the floor intersected with numerous joints, whilst Keene's Cement is laid down in one unbroken surface.

surface. The high polish and marble-like hardness of which this Cement is susceptible render it the most suitable material for the manufacture of Scagliola. Patentees, J. B. WHITE & SONS, Millbank-street, Westminster, Manufacturers of Roman and Portland

ement. Depôt in Liverpool, 36, Seel-street ; James Woods, Agent.

O ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MER-CHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL. то

JOHNS and CO.'S PATENT STUCCO JOHNS and CO.'S PATENT STUCCO' CEMENT.-The following are the positive advantages possessed by this Invention over every Cement hitherto in-troduced -It will effectually resist Damp. It will never vegetate nor turn green, nor otherwise discolour. It will never crack, bliater, nor peel off. It will form a complete Stone casing to any Building covered with it. It so closely resembles Stone that it is impossible to detect it. It never requires either to be painted or coloured. It will keep freah and good in the cask in any Climate for any number of years. It is the only Cement that can be depended upon for export. It is the only Cement that can be depended upon for export. It is the only Cement that can be used with confidence by the Sea-side. It may be used in the hottest or coldest Climates at any acason. It will adhere to any substance, even to Wood, iron, or Glass. It will carry a larger Proportion of Send than any other Cement. Yit matures by age, and be-comes perfect when other Cements begin to periah. It may be worked through the Winter, as frost has no effect upon it. It may be used on the Inner Walls of new Houses, which may be papered over or painted directly. Roofs laid or pointed with this Cement will remain usdamaged by the severest Storms. Any Plasterer may apply it, the Instru-tions for use being very clear and distinct. The first cost ef-this material does not exceed that of the cheapest Cameat now in use; but with all the above-named extraordinary and valuable advantages, nothing can approach it in pount of conory. Architects and Builders who have used this Cement have

Architects and Builders who have used this Cement have declared that it requires only to be known, to be universally

declared that it requires only to be known, to be universally preferred. By commas may be seen, and a Prospectus fully describing the Cament and its mode of application, together with a volume of Testimonials from erery part of the Kingdom, may be obtained on application to MANN and CO., SOLK ACENTS for the Patenters, 5, Maiden-lane, Queen-street, Cheapside, London : of whom also may be had. JHNS and CO.'S PATENT STONE-COLOUR STUCCOPAINT, expressly intended for Painting over ex-terior Walls of Houses that have been covered with Roman or other Cementa, and which have become dirty stud disco-loured. It is in every way better suited for this purpose than of other Cementa, and which have become dirty stud disco-being in direct chemical opposition with Cement; whereas affinity for Slucco, binds itself with it, stopping the-auction, thereby rendering the wall proof against weather, and in the other Paint whatever. It is cheep in its application, — and when be used by any Painter, in any climate, even in the most exposed Marine site.

SATURDAY, MAY 31, 1845.

THE late dreadful accident at Yarmouth has led various correspondents to address us; some on the safety in general of bridges erected on the suspension principle,

some on the cause of this particular accident. and one on the apparent lightness and instability of the new Hungerford Bridge. We have before us various statements, too, for and against Dredge's principle, and a notice of Andrew Smith's suspension and parabolic tension bridge, which does not require piers.

"A fatality seems to attend chain bridges," says one writer, "even when the most eminent engineers erect them. At Paris, two attempts failed a few years since, through, I fear (good mathematicians as our neighbours are), some omissions in the formula. The Montrose suspension bridge partially gave way at the opening some years ago ; and at the time, I was told, several individuals were impaled on the ironwork for hours, before tackle could be brought to bear to relieve them. Since that, both it and the Menai have been injured by storms; and I must say, from what little consideration I have been able to give to the subject, as a mechanic of the humbler class, I do not think suspension bridges are built strong enough or sufficiently braced."

The Broughton suspension bridge at Manchester broke under a body of only sixty soldiers passing over in marching order, - the simultaneous tread of the feet having the effect of a series of heavy blows.

One of Mr. Dredge's bridges in the Regent's Park is understood to have fallen with only a dozen boys on it; and others are said now to be in a state of dilapidation, if not danger. We have no wish, however, to be alarmists, and to raise fears which may not be so easily quieted. Still, feeling that calculations are not to be entirely relied on in these cases; that much depends on the goodness of workmanship which has not been tested; and that the mere fact that a suspension bridge has carried heavy loads nineteen times is no reason why it should not break down the twentieth,-we are impelled to urge the necessity of constant examinations by efficient persons. "From the rapid advances which have, of late years, been made in the sciences," says a writer in the Mining Journal, "and their application to the arts, we have discovered that iron undergoes most important changes under various circumstances - such as continual percussion, electricity, galvanic action, &c. - and I think it becomes a subject of deep interest, and one which ought to be most searchingly investigated, whether these agents, or any of them, have contributed to produce the effects in question; and the public must be informed whether any, and what, examination of the chains, suspension rods, &c., takes place in these erections, and how often; for, be it remembered that, while a stone structure gives token of decay, and openly exhibits to the eye any danger or necessity of repairs, one corroded bolt in a suspension bridge-one portion of iron, which, though having stood the proof before being used, may, from some of the abovenamed causes, have become chemically altered-

THE **BUILDER.**

may at once, unnoticed, and without the slightest warning, be the cause of irreparable mischief." The jury who investigated the late melancholy catastrophe at Yarmouth are much to be commended for the determination they evinced to have the cause of the accident examined into by a scientific engineer. When the towncouncil refused to furnish them with such assistance they addressed a memorial to the Secretary of State, setting forth : " That in consequence of the excitement which exists in the town and neighbourhood, and of numerous reports in circulation as to the state of the bridge, your memorialists considered it absolutely necessary that they should have the evidence of some scientific practical engineer, in order to enable them to arrive at a just and proper conclusion; but the coroner having no power to pay the expenses which would be incurred by the employment of such engineer. your memorialists addressed a representation of the circumstances to the town-council of the said borough, requesting that body to authorize the employment of an engineer for the purpose before mentioned. That your memorialists have received a formal communication from the town-clerk of the said borough, stating that the town-council, at a meeting held on the 8th inst., had declined to comply with your memorialists' request, feeling that it was not in their province to do so. That your memorialists are still of opinion that the evidence of an engineer in their investigation is imperatively called for; because they not only know that it would be satisfactory to themselves and to the public, but they also believe that the publicity which would be given to his evidence might be the means of preventing the recurrence of so frightful a catastrophe :"-and praying that he would direct some civil engineer to attend

Mr. Walker was accordingly sent down, and there can be no doubt that much good will result from the clear and able statement which he made after his survey. This statement involves several questions of great importance, and we deem it desirable to transfer it to our pages nearly entire; the more so, too, as it gives a history of the bridge, and the addition that was made to it.

on the spot.

"The bridge belonged," said Mr. Walker, "to the late Mr. Cory, father of the present owners, and was constructed from a design of Mr. Scoles, an architect in London. At first it was only a substitute for a ferry over the river Bure to the marshes, and to certain pleasure grounds called Vauxhall-gardens, belonging to Mr. Cory. Mr. Scoles, who has attended from London on this occasion, and who has assisted me very liberally with his drawings and calculations, states, that he made designs for a bridge of sufficient width for a carriage and two footways. The design was made from memory of the particulars given to him by Mr. Cory, but I understand that he never was at Yarmouth until the day before the bridge was opened; that these drawings were given to Mr. Green, a surveyor at Yarmouth, who was at that time employed here, and who was well known in this district. Mr. Scoles thinks Mr. Cory had at that time in view the making of a turnpike-road from Yarmouth to Aclewhich-road, which was to pass over the bridge, although Mr. Cory at that time did not so inform him. It appears that the work was offered for competition, and that Mr. Goddard was the contractor (who is since dead) for the bridge work, according to specifications pre-pared by Mr. Green, the surveyor I before re-ferred to. These specifications were embodied in the contract, which contract I have seen, but which does not give the size of the principal parts, although it refers to drawings which it states are attached to the contract, but which are not, nor have I been able to see them. It appears that they are either mislaid or lost. The specifications describe that the iron shall be of the best quality. The specifi-

cation describes it as the best charcoal iron. Now, this is a description of which very little is made in this country; the meaning of the term is, that it was to be British iron of the very best quality. The specifications make no mention as to the quality of the iron being tested, as far as I have observed. From a drawing which is now in Mr. Scoles's posses-sion there appears no reason to doubt that the main or suspending chains and other parts of the bridge are of the size which was intended. The drawing which I have in my hand is executed in a very excellent and workmanner manner. There are altogether four suspending bars, two on each side, to form a chain. The bars are connected together by bolts passing through openings or eyes at each end of them. These bars are 21 inches wide by seven-eighths thick; from them rods of 1 inch square were suspended to carry the roadway, which was 14 feet 9 inches in width, and divided by an iron kerb or carriage-way from a footpath on each side 4 feet in width. The length between the centre of the towers is 92 feet; the deflection of the chains is 7 feet 4 inches. An Act of Parliament, constituting the bridge a turnpike-road, was passed in May, 1830, and the road was opened in 1832; in 1842 the Yarmouth and Norwich Railway Act was passed, which contains a clause, obtained. understand, after much litigation and opas I position, by which this bridge was constituted the only communication between the railagreeing to receive the tolls, stipulating to widen it and afterwards to suspend It appears that on this occasion Mr. Scoles it. again consulted respecting the widening of the carriage-way to a width sufficient for of the carriage-way to a much density of the footway two carriages to pass abreast—the footway being formed on each side by planks separated by iron straps attached to the framing of the bridge. This footway was therefore outside the suspending chains. That was in 1844. Mr. Cory says, that after the above alterations were made, he consulted an eminent engineer as to the sufficiency of the bridge, who said that it was fit for any traffic. I cannot help observing on this, that any opinion taken from an engineer, however eminent, in an off-hand manner, is what the engineer would not con-sider himself bound by, and which I should think it very unfair to implicate him in; because sometimes a gentleman is asked a question in an off-hand manner, and either from a feeling of politeness, or a desire to get rid of it altogether, he answers in a favourable man-ner; much more so than he would if he had an opportunity of examining it. The foundaan opportunity of examining it. The founda-tions appear to have been piled well, and to have stood well. Mr. Scoles shewed me a drawing of the piling, and, if the work were executed according to that, I have very little doubt of the soundness of the foundation. You are probably aware that I am very well acquainted with the foundations of this part of the country, having been consulting engineer to the Haven and Pier Commissioners for many years. I have also made drawings for a fixed bridge over the Yare, and I erected the temporary bridge which is now there. It is stated that the crowd collected on the 2nd of May was confined to the south side; that the crowd was composed chiefly of children in the front rank, with adults behind, to see some exhibition which was then to be seen on th water. They were supposed to be four or five deep, and it appears that they had collected on the bridge to the number of from 300 to 500. The coroner has stated to me that he has seen double the number on the bridge (or even more than that), but that on those occasions they were spread over on both sides of the bridge, so that all four bars or two chains were equally loaded. It has been stated, I believe, by one of the witnesses who has been examined before, that some sort of cracking noise was heard, which induced him to look up, when he saw that one of the bars or rods of the suspending-chain was broken-that two points where the fracture had taken place were entirely separated, and that in about five minutes afterwards came the fatal catastrophe. This cracking was no doubt occasioned by the snapping in pieces of the bar which first way. There was now only one bar left to support the whole weight, and this bar consequently gave way in five minutes after the one on the opposite side; the platform, being then entirely unsupported, fell in the river. I

have seen and particularly examined the two bars which gave way - they form the link next but one to the saddle or top of the chain on the east or Yarmouth side of the bridge. The fracture in the bar which first gave w is about eight inches from the other end, and there is the same distance from the lower end of the bar. It appears that in forming these bars the two circular ends and about six inches of the straight bar were first made. Between these a straight bar of the proper length was afterwards introduced, each of the pieces having been what is termed scarfed—that is, terminating disgonally, and not in a straight line across. These three pieces being heated and welded together made one bar or link. Then each bar had in it two joints, six inches from one and six inches from the other. In work of this kind there is great difficulty in getting iron so constructed as to make a perfect getting if on so constructed as to make a perfect union or junction with the two ends. It was at these points that both bars in the pre-sent case broke. On minutely examining the fracture of the bar, it is evident that for some length of time, or from perhaps its original manufacture, the "weld" was imperfect—not more than one-third of the melting surface being united, and the other two-thirds pre-sented a rusty surface. This would have been doubtless seen, as it is evident on a very slight inspection. The joint or weld of the other link is good—the corresponding one forming the bar. But I find that this bar (the second one) is one inch longer than the one which broke first; in the bar which broke second, putting the bolts through the eye at the lower end, I find that it does not fit, but passes obliquely, and is one inch longer than the other. This extension or difference of length is caused without doubt by the stretching of the unsupported rod before it broke, during the five minutes that it had the whole weight to carry. I have no doubt but that this caused it to stretch quite an inch in length. Having had the quality of the iron tested in a variety of tways, by a very intelligent blacksmith (Mr. Gooda), I find the straight pieces, or middle of the bar, to be much better than the other end; the straight piece is better than the end pieces, which contain the eyes, which are very coarse and inferior in quality. This (holding a bar up to the jury) is one of the middle pieces; not the one which broke, but one taken indiscriminately. I desired Mr. Gooda to lengthen it, and to apply a power to twist it. As far as I can judge this iron is good. I also desired a screw to be formed in another bar, and I am of opinion that that bar is also good. There is another straight piece between the two ends. I think generally that the quality of the ends is not according to the specifications, nor are they in my opinion proper for the purpose. Had any sufficient means been used to prove and test them, the inferiority of this iron must have been at once discovered. This is a piece of one of the ends, which is a very open, coarse-grained, and inferior piece of iron, and which broke when the blacksmith referred to was applying a hammer to the middle of the Was applying a name to the induct of the bar; the part which he did not strike broke like a piece of cast-iron. The blow was applied, remember, at some distance from where it broke. If care had been taken to test this iron properly, it is impossible but what this defect must have been discovered. No one could have expected that it was going to break, but it did. Another bar was taken by my di-rection for the purpose of testing it as to fibre, and it broke in pieces just in the way a carrot would do, and did not bend like a piece of stout fir timber, which it would have done had it been sound. I shall now make a few remarks upon the strength of the bridge, as com-pared with the load. Taking the load at the time to be all on the south chain, I find by calculation that the two rods of $2\frac{1}{4}$ inches by $\frac{7}{4}$ are capable of supporting a temporary load of 56 tons without injury. Of course, I am as-suming in that, that the bridge should be properly constructed. I need not say, that in order to arrive at any thing like accuracy, a great deal of calculation is required, because the deflection of the iron and the span of the bridge ought to be taken into account. I find that the strain, taking 400 individuals at an average of seven stones each, and allowing for the weight of the bridge, was, at the time of the accident, about 44 tons. Therefore, but for the defect in the quality of the iron and in the workmanship, the strength of the bridge ex-

Mr. Walker said-I saw in the original speciceeded the load upon it; but even then the excess was not sufficient where the effects of failure are so important. I say so because experiments are generally made with good iron, and at all times large allowances ought to be made for imperfections. If we suppose any of the pieces to be bad, as was the case here, then we have the strength less than the strain. The bridge appears to me to have been by no means too strong as originally formed, and the additions made to its width have been in the present case exceedingly injurious by the weight being placed outside the suspending chain. The weight had therefore to be carried en-The weight had therefore to be carried en-tirely by that chain in place of being equally borne by all, which is the case when the weight is within the chain. In reference to the sufficiency of the bridge to carry the greatest load which could be placed upon it, I find that its strength is somewhere a little above the weight which it would carry, but so small as not to be practically sufficient, even without any allowance for imperfections. It without any allowance for imperfections. It without any andwance for imperfections. It is proper, however, to say, that the question is not, how many people can be packed *en masse* upon the bridge, although even that contin-gency ought to be provided for. After the bridge was widened the strength exceeded the strain, of course, less than it did before; but, even before, it does not appear to me to have been sufficiently strong to ensure perfect security, supposing a mass of people to have been packed upon it in the way in which I described. It appears that on other have occasions a very great number of persons had been upon the bridge, and that it had borne them without falling; the coroner has in-formed me that he has known twice or thrice the number upon it that was collected on the occasion alluded to, and therefore we have it evident that for the load at that time the strength of the bridge was adequate. It is also evident that when a bridge has been frequently loaded to the utmost which it will bear, it becomes weaker and weaker each time, and the bridge may ultimately give way, although at first it was sufficiently strong to resist the weight put upon it. I have now only a few remarks to add in the shape of general conclusions from what I have stated, and they are these :-

1. I consider the immediate cause of the accident to have been a defect in the joining or welding of the bar which first gave way

2. That the quality of the iron and the workmanship, as far as I have been able to examine them, are defective; and I believe that the accident would not have happened had the work been properly examined at the time of construction.

3. That the widening appears to have been made without sufficient reference to the original strength of the bridge, and the weight which it had to support, and therefore that it acted as an aggravation of the evil.

4. That in the original construction of the bridge, the casualty of a great load, all on one side, does not appear to have been contem-plated; if it had been, I think that the links on that side would have consisted of more than the two bars, any one of which was unequal to the load which the bridge was likely to carry.

I am bound to add, that in this investigation I have received every possible assistance from Mr. Cory with reference to all documents which were in his possession; this has enabled me to come to the conclusions I have done in less time, and I hope with a greater approximation to accuracy, than otherwise I could have done. I believe I have said all I have to say, as far as the case has gone. I can only add, that under the direction of Sir James Graham any ques-tion which any gentleman might put to me I shall be very glad to answer. Perhaps I may also add, that the whole weight of the bridge has been taken with great accuracy by Mr. Scoles, and that the addition to the width, as far as its own weight goes, is comparatively unimportant. The weight of the bridge, including the suspending chains, before the additional width was added, was 17 tons, 14 cwt. 3 qrs. 25 lb.; with the additional width, cwt. 3 qrs. 23 10.; with the auditional width, and the railing added, its weight was 20 tons, 8 cwt. 9 lb., making an addition of 2 tons, 13 cwt. The evil of it is, the footway being outside the chains, and therefore throwing the whole load upon the two suspending chains, without any part being thrown upon the chain on the north side.

In answer to questions put by Mr. Evans,

fications that all the wrought iron should be proved by heating it red-hot; and, if this had been adopted, we should not have had the weldings which we have seen to-day. I observe, in the specifications, that all the mate-rials to be used in the before-mentioned works should be of the best quality, and that it should be in the power of Mr. Cory, or his surveyor, to reject any materials which he or they might deem insufficient for the works. It was most undoubtedly the duty of the person undertaking to be the surveyor of these works to have as-certained by some such means as I have described the quality of the iron, and the manner in which it had been welded. If the surveyor, who is since dead, and whose duty it was to watch and see the contract carried out according to the specifications, had done so, this accident would not have happened, in all proba-bility;—I mean that the defect must of neces-sity have been discovered. If a person had watched, as he should have done, the welding of every link, this defect would not have arisen : the defect in the quality of the iron must have been very apparent to any one at all acquainted with the subject. I have made my calculations as to the weight of the people upon the bridge upon six to the square yard. should think that, practically, such crowding seldom, if ever, occurs. It is with reference to such packing that I have spoken, and I think the bridge would hardly have borne it. I think even if, as I believe to have been the case, the crowd consisted chiefly of women and children under fourteen, that seven stones is about a fair average weight. It is too much of course for children, but not enough for a good fat woman. It is perhaps rather a large average. I took it partly because it has been frequently adopted before. Looking at the contract generally, I do not think the gende-men who built the bridge originally had taken the necessary precautions to have the work properly done, more particularly as regards the mode of doing it. I think the contractor should have given the engineer or inspector of the work the power of having it tested in such a way as he should think fit. I do not find that in the contract. The clause which empowers the engineer to reject any materials which he might deem unfit gave this power indirectly, and in a manner; but I think the surveyor ought to have the power to do so without such a clause as that.

۱

By the Jury.—In my opinion, and speaking from the general result of experience in these matters, the defective iron bars were probably made in the country; they were sent here, and the good iron (the middle pieces) was sup-plied at Yarmouth and used here. The weldplied at Yarmouth and used here. The weld-ing, or joining, was most likely done here. The difference between good and bad iron was shewn mainly by the breaking; good iron broke like a piece of good fir timber; bad, as I have before said, like a carrot—it snaps in two the before said the number or the two. He had estimated the number on the bridge at 400, because the statements he had heard were 300 and 500. If 300 were the proper number, you have only to deduct one-fourth from the estimated weight on the bridge.

GOVERNMENT GRANTS. — In the Parlia-mentary estimates, under the head of "Public Works and Buildings," we find the sum of 112,217*l*. appropriated to public buildings and royal palaces, 6,500*l*. to the palm house at Kew, 8,395*l*. to the temporary houses of Par-liament, 85,000*l*. to the new houses of Parlia-ment 3,236*l* to Labrack backwar and roads ment, 3,8361. to Holyhead harbour and roads, 50,000% to the Caledonian Canal, and 24,6614 to public buildings in Ireland. Under the head of "Education, Science, and Art," we find a sum of 75,000%, applied to public educa-tion in Great Britain, 75,000% to public edu-cation in Ireland, 4,911% to schools of design, 2,0061. to professors at Oxford and Cambridge, 4,540% to the University of London, 7,380% to universities in Scotland, 5,910% to the Royal Dublin Society, 2,100% to the Belfast Acade-mical Institution, 52,040% to the British Dublin Society, 2,100% to the Benast Acade-mical Institution, 52,040% to the British Museum, 52,020% to the British Museum buildings, 6,217% to British Museum pur-chases, 1,500% to the National Gallery, 8,850% to the Museum of Economic Geology, 5,920% to calculate and experiments 5,8391. to scientific works and experiments, 1,5001. for the monuments of Sir S. Smith, Lord Exmouth, and Lord De Saumarez.

WESTMINSTER IMPROVEMENTS AND THE WESTMINSTER REVIEW.

In our leading article of March 15th (p. 121 ants), we drew attention to the lethargy of the Metropolitan Improvement Commission, and certain defects in the plan sanctioned by them for the improvement of Westminster; and we described some plans emanating from the Metropolitan Improvement Society, wherein by a slight deviation from the intended line and the sacrifice of an old workhouse, the abbey was brought into view; the roadway was continued round the south side of the abbey, leaving the Cloisters untouched, and terminating with the Victoria Tower of the new Houses of Parliament.

Houses of Parliament. These latter were afterwards submitted to the commissioners; but they declined to reopen the question, considering themselves pledged to the plan now before the House; and unless some effort be made, the new road will be formed so as to shut out the abbey and render its isolation unlikely for many years to come. The same society proposed a road from Buckingham-palace to the new Houses of Parliament, which would dovetail admirably with their proposed Westminster line, and is imperatively required, and by which the Victoria Tower would be visible at the palace gates. If the Westminster plan now adopted be carried out, this important improvement will be entirely prevented.

In a very interesting article on Old and and New London, that appears in the present number of the *Westminster Review* (for June), and to which we may have occasion to refer again on other ground, there are some remarks on the subjects that may be usefully circulated, and we accordingly transfer them to our columns. "The site of Westminster Abbey was, in

"The site of Westminster Abbey was, in the Roman time, an island formed by a branch of the Thames, and a stream from the uplands, called the Ty-bourne. It was a wild place, overrun with thorns, and was hence called Thorney Island; the name it still retains in old writings."

The ground, in the course of centuries, has been considerably raised, but a large portion of the district, where the old streams flowed, is still below the level of high-water. The first church, or *Minster*, erected here, was called the *West Minster*, from its being situated to the west of London.

Nothing is known with certainty of the history of any buildings in Thorney Island at the period alluded to by the old monk, when he said: 'the suburbs of Thorney offer incense to Apollo.' A church or an abbey was undoubtedly built about the seventh century, and according to Flete, by Sebert, King of the East Saxons, and nephew of Ethelbert; instigated to the work by Mellitus, Bishop of London. The account of its dedication is fabulous, but not more so than that of a thousand other churches; and is curious as characteristic of the times.

'It was to be dedicated to St. Peter, and the preparations were already made for that august ceremony, when, according to the relation of several writers whose fidelity we leave our readers to judge of, the apostle himself appeared on the opposite bank of the Thames, and requested a fisherman to take him over. There he was desired to wait while St. Peter, accompanied with an innumerable host from heaven singing choral hymns, performed the ceremony of dedication to himself; the church, meanwhile, being lighted up by a supernatural radiance. On the return of St. Peter to the astonished fisherman, he quieted the latter's alarm, and announced himself in his proper ebaracter, hidding him at the same time go to Mellitus at day-break, to inform him of what had passed, and to state that, in corroboration of his story, the bishop would find marks of the consecration on the walls of the edifice. To satisfy the fisherman, he ordered him to cast his nets into the river, and present one of the fish he should take to Mellitus; he also told him that neither he nor his brethren

• The whole of the abbey and palace precinct, south of Pall Mall, was called by the Normans, "Thorney Island and tout le champ." From the latter phrase Mr. Bardwell derives the word Tot-hill. As there is no hill near the Abbey Tot-Aill Street would be a misnomer, but it is certainly not at all improbable that the French phrase of foul te champ was first clipped into tout le and then corrupted into toutite and Tot-Aill. In like manner the favourite Norman sign of Bealogue Mouth became the Bull and Mouth; L'aiguille et fils was corrupted into the Eagle and Child; and the more classical sign of the Satyr and Bacchanals was ultimately changed into the Deril and Bag of Nalls.

should want fish so long as they presented a tenth to the church just dedicated, and then suddenly disappeared. The fisherman threw his nets, and, as might have been expected, found a miraculous draught consisting of the finest salmon. When Mellitus, in pursuance of the apostle's mandate, went to examine the church, he found marks of the extinguished tapers, and of the chrism. Mellitus, in consequence, contented himself with the celebration of mass. We may smile now at such a story, but there is no doubt whatever that for ages it obtained general credence. Six centuries after, a dispute took place between the convent and the parson of Rotherhithe, the former claiming a tenth of all the salmon caught in the latter's parish, on the express ground that St. Peter had given it to them; eventually a compromise was agreed to for a twentieth. Still later, or towards the close of the fourteenth century, it appears fishermen were accustomed to bring salmon to be offered on the high altar; the donor on such occasions having the privilege of sitting at the convent table to dinner, and demanding ale and bread from the cellarer.'

The abbey was rebuilt by Edward the Confessor in the eleventh century, a short time prior to the foundation of old St. Paul's. A portion of the Confessor's building still remains in the Pix-office,^{*} and adjoining parts against the east cloister and south transept; but the greater part of the existing abbey was erected by Henry III., about the year 1250. Henry the Seventh's Chapel was commenced

Henry the Seventh's Chapel was commenced January 1503; but was still unfinished when Henry died in 1509. In his will, in which provision was made for the completion of the chapel, he names the Prior of St. Bartholomew, Smithfield, as 'the master of the works.' Henry the Seventh's Chapel is the chef-

Henry the Seventh's Chapel is the chefd'œuvre of decorative architecture. In its construction, to use the words of Washington Irving, 'stone seems by the cunning labours of the chisel to have been robbed of its weight and density, suspended aloft, as if by magic, and the fretted roof achieved with the wonderful minuteness and airy security of a cobweb.' But we need not comment upon a work of which the exquisite beauty is acknowledged; we seek only to interest the reader in its preservation, and to shew its connection, at the present moment, with the measures now in progress, professedly for the improvement of the metropolis.

The fire of London, which laid eighty-nine churches in ruins,—the fire of Hamburg, which lately destroyed the Church of St. Nicholas, an extensive edifice, nearly as large and as lofty as St. Paul's,—the fire which consumed the two Houses of Parliament, in which Westminster Hall escaped by miracle,—shew the importance of effecting a complete isolation of Westminster Abbey, by detaching it from the old and decayed buildings by which it is in part surrounded; while public convenicnce, and the architectural embellishment of our streets—both of which require a worthy approach to the tomb of kings, warriors, poets, and statesmen, and the seat of British legislature—point equally to the same object. What stands in the way? The apathy (ap-

What stands in the way? The apathy (apparent at least) of a Committee of Taste sitting as a Metropolitan Improvement Commission; the natural obstructiveness of a chancellor of the exchequer upon all questions of ways and means not belonging to routine, and the cost of purchasing a mass of inferior third-rate houses and miserable tenements.

The houses in Snow-rents stand in the direct course of a straight line drawn between Buckingham Palace and the Victoria Tower of the new Houses of Parliament; a line which, if adopted for a new street, would isolate the abbey by bringing a roadway on the south side.

A plan for such an improvement was submitted to the commissioners a twelvemonth back, and is given in plan 3 of their third report, just published.⁺ It is dismissed with the following brief

It is dismissed with the following brief remarks :---

remarks:----'The Society for Metropolitan Improvements submitted a plan, of which copy is appended, involving a total re-arrangement of the district. Her Majesty's commissioners have declined, therefore, to include the plan of the society in their inquiries.'

* The pix was the box for the consecrated host. † Hansard, price 5s. The reason assigned appears singularly inconclusive, for 'the total re-arrangement of such a district as lower Westminster' was almost, in the very terms of the commission, one of the objects for which it was appointed. The line proposed would have been a short one, entering the park near the Broadway, and thence proceeding to the palace through an avenue* of trees. From the palace gates the Victoria Tower, 300 feet high, would have been visible as the termination of a grand vista, corresponding with that of the Champs Elysées and the Triumphal Arch of Napoleon, but superior in effect; and the cost of a line, thus forming a fitting connecting link between the residence of the monarch and the seat of popular representation, would not have been attended with a very serious expense. The cost, we believe, would have been less than that occasioned to the French by the removal of the column of Luxor, now standing in the Place de la Concorde ; which was 100,0004.

Another line was at the same time proposed with the same eastern terminus, consisting of a modification of Mr. Wason's new street leading to Belgrave and Eaton squares; and the commissioners took a right view of the subject when they decided, that a thoroughfare in that direction was of more immediate importance to the public than an improvement upon the communication with Buckingham Palace already existing by way of Great Georgestreet. They would have been fally justified in deferring the latter project: they were wrong in abandoning it; and they have put themselves still more in the wrong by adopting such a deviation from the plan as, if carried into effect, will render the complete isolation of Westminster Abbey for ever impracticable.

Mr. Wason's line is the proposed street to which we have before alluded; sanctioned by a committee of the House of Commons in 1832. As modified, it will be a street 80 feet wide, with a natural and excellent terminus at the upper end of the Vauxhall Bridge-road, leading to the new and fashionable suburbs of the south-west. So far all is well; but at the other end of the line, approaching Westminster Abbey, what have the commissioners done? To avoid the additional outlay required to purchase an old and dilspidated workhouse, held upon a lease which has but sixteen years to run, the commissioners have made the line crooked at its eastern extremity, cutting off the direct approach to the new Houses of Parliament, and building out of sight, to all persons passing down the line, both the Victoria Tower and Westminster Abbey.

Let us hear no more of taste in England. Love of art, reverence for its noblest monuments, respect for the dead, pride in the past, progress in the present, are sacrificed to a pseudo-utilitarianism; not that which Bentham loved, but scorned;—a rotten workhouse is weighed in the scale against the most sacred objects of British nationality, and the latter, in the estimation of a Metropolitan Improvement Commission, kick the beam !

When the intentions of the board became known the commissioners were urged by the Metropolitan Improvement Society to reconsider the plan in reference to the eastern terminus, with a view that nothing might be done to impede further and greater improvements in the vicinity of the abbey; however long they might be delayed. The application was unsuccessful. The society then forwarded to the commissioners a new plan, accompanied with a sketch shewing the abbey as it would appear on the south side, with the cloisters, chapter-house, and other parts of the old cathedral restored, if the abbey were isolated as proposed, by a roadway carried entirely round the edifice; but the commissioners again declined to re-open the question, on the ground that a definite engagement had been entered into with the promoters of the bill now before the house, which could not be honourably brokeu. The society might have replied, that the practical part of this question is not one of keeping or breaking engagement, but simply of money. We will answer for Mr. Wason and his friends that they, at least, will be willing to re-open the question, if the Government will re-open is exchequer. The abbey is now chiefly seen from the north; a view of the southern elevation would

* This is not properly shewn by the plan published in the report, which, as coloured, makes the road appear as an encroachment upon the park.

be a novelty to the oldest inhabitant of the metropolis.

A copy of the drawing referred to is given in the review, and the following extract from the explanatory statement by which it was accompanied.

'3. The society, therefore, propose that the line should be so far modified, that its present eastern terminus should be in front of the western towers, and that thence the line should be prolonged on the south side of the abbey, through great and little Dean's-yard, leading directly to the new Houses of Parlia-

4. While suggesting this line of roadway, the society desire that it should interfere in the smallest possible degree with the legitimate smallest possible degree with the regulation of the college, connection between the abbey, the college, and the ecclesiastical buildings and residences attached. With this view they propose to accommodate as great a number of residents in immediate connection with the abbey as practicable, and to construct connecting archways across the roadway, forming covered communications between the abbey, the college, and the residences. At the same time, the extension and restoration of the cloisters by for the convenience of the residences, the most beautiful perspectives and effects of light and shade would be opened to the roadway. A picturesque foreground is obtained to the general elevation, as seen from the south; and it is from the south that all buildings should be viewed, from the superior effects produced by the direct rays of the sun.

6. The magnificent architectural combination of the cathedral buildings with the Victoria Tower of the new Houses of Parliament, which might thus be realized, would cost a very inconsiderable sum, as the buildings required to be removed are of very inconsiderable value, exclusive of that part of Abingdon-street which, it is understood, the Government have already determined to pull down without any reference to the present plan. The im-proved value of the ground available for building, should the plan be adopted, would, it is thought, be nearly equivalent for the purchase-money required in the first outlay. 7. The property belongs chiefly to the dean

and chapter, and the proposed plan would allow of far more eligible sites than at present for the buildings required, either as connected with the abbey or the school.

The society, taking into consideration that we owe to the church the noblest architectural monuments in the world, cannot doubt the cooperation of the dean and chapter, and of the highest ecclesiastical authorities, if the object be favourably recommended to their attention by her Majesty's commissioners.'

It is certainly within the bounds of possibility that another prior of St. Bartholomew may arise in Dean's-yard; but at present, the dean and chapter of Westminster have the reputation of being hostile to all improvement connected with the abbey, or the district in which they reside. We believe this supposed hostility is merely indifference. The wretched state of their property arises from the system of fortyyears' leases, which is about to be changed. They have submitted no plans of improvement leases, which is about to be changed. to the commission, and contemplate none, only, as they say, because they are not projectors of schemes they could not carry into effect, Sleeping men carry nothing into effect; and it is natural to deans and prebendaries to think more anxiously of preserving a secluded corner for quiet dreams that of Henry the Seventh or dward the Confessor. But what have we of] to do with a dean and chapter ! They are but the trustees, not the owners, of Westminster Abbey; it is not for them to decide for the public what approaches shall or shall not be made either to the abbey or the imperial senate house. Let the nation look to its own. An act of Vandalism is about to be perpe-trated. It may yet be stopped. Without in-terforing with the provess of the private Bill

terfering with the progress of the private Bill Mr. Wason and his friends have introduced, powers may be taken by the Crown to reserve the question of the eastern terminus of the proposed street, or to repurchase, before new ouses are built, the ground required to isolate the abbey, and complete in a satisfactory manner the approaches to the new Houses of Parliament.

We appeal to the Metropolitan Improvement Commissioners to revise their judgment, although at the eleventh hour. Among them |

are men for whom we entertain the highest personal respect, but we would not see them shut their eyes (nor should the best friend they have) to the true nature of their position. They have undertaken the discharge of a great public duty; and they owe it to themselves they owe it to their countrymen-they owe it to posterity, which, if we mistake not, will criticize their proceedings with more severity than the present age,—that the mischief now in progress should be remedied, ere it be too late.

THE DISTRICT SURVEYORS.

SIR,-In the Times of May 22nd, there are the following remarks :-

"The best friend to the lawyers is a crotchety law reformer, who is permitted by the courtesy of Parliament to turn his conceits into statutes; but such a legislator is any thing but a blessing to his country. If, in addition to an irresistible inclination to alter, be happens to try his hand on subjects with which he is but imperfectly acquainted, the risk that the country, minus the lawyers, will run of regarding him with any thing but gratitude will be so much the greater."

Are not these observations, Mr. Editor, very applicable to the new Building Act? Again in the *Times* of May 24th :--"The Hong Kong papers have been re-ceived, but they contain little more than a

number of ordinances exhibiting extreme fertility of invention in the art of raising taxes ' (alias fees). "Such legislation, as was to be expected, had produced considerable discon-tent, especially as it was feared, if commerce were shackled with so many burdensome regulations as were either in actual operation or proposed, merchants would resort to some port with a less active legislation."

Would not a less active legislation in building affairs be equally desirable?

The case of arbitrary and dictatorial supervision under which the profession model. -, the working of the Metropolitan Buildings Act vision under which the profession labours (as set forth by your correspondent "Mr. Thomas Little," in your paper of the 17th May) must come home to every professional man

However, by the report in your paper of last week, 24th instant, of the decision of the official referees in the Lewisham case, there is a gleam of hope that the building world will not be so much annoved and badgered as the inclination of some officials would cause them to be.

It is to be hoped that the frequent complaints of the system will have the effect of causing amendment, as dripping water ope-rates, "non vi, sed sæpe cadendo." sed sape can I am, Sir, &c., Philoclarus.

-Some observations having been made SIR,through your journal against the new Buildings Act and the surveyors appointed to carry it into effect, allow me to state that, in my humble opinion (if honestly carried out), it is a great improvement on the old, and you will find the majority of the surveyors appointed under it are men of sound judgment; and I do hope before the public condemn the whole, they will observe in the several districts how their surveyors act, and report accordingly to magistrates in the respective the several ties, in order that efficient men may fill such offices : for it is a more serious matter than has been heretofore considered for the general good of the working class and the public.

I can assure you, with truth, that many buildings have been abandoned in the parish of Bermondsey, owing to the surveyor having been very litigious; and (if I am informed correctly), in six cases out of ten which have been forwarded to the registrar, he has failed. Now, if this be a fact, it is quite time one of our members for this county should move in the House of Commons for a return of the number of cases sent before the registrars under the new Metropolitan Buildings Act, and their results.

I think that would in a great measure make known who are the inefficient persons, and who are competent to fill the office of district surveyor.

Allow me to trespass further on your time, in giving you a statement of facts as to a cir-

these last few weeks. My child having received a present last summer of a pair of pigeons, I had a house, or cage, made for them at the back of my dwelling, but finding I had not made it sufficiently high for the child to view the birds from the window of the sittingroom, I had it raised four feet higher, merely room, 1 had it raised four reet ngner, merely elevating the same covering and enclosing it with lattice-work. This was done either the last of December or beginning of January; be that as it may, I have received notice after notice from the district surveyor to pullit down; and at last a meeting of the referees, who, after some conversation on the subject, viewed; but I have not yet heard the result: when I do, I shall feel great pleasure in forwarding the same to your journal for the benefit of the public. I send you a copy of the several notices received, as also the questions to the referees.

Can you inform me if or not I can proceed for the expenses I have been put to in opinions on the Act, caused to be taken through the re-ceipt of the several notices,—not wishing to act on my own opinion, which is, that the district surveyor has no jurisdiction over it, and which I find to be the opinion of most surveyors? Lean... please of these, I am, Sir, &c., W. S. HOLLANDS. 24th. Leaving you to make what use you

• • As this matter is now before the referees it would be unwise to discuss it. When the award is taken up we will give attention to it.

The new number of the Westminster Review (for June), has the following note :-

"An occupier of premises in the city wished to introduce in his house some of the zinc ventilators recommended by Dr. Arnott (price 2s.), but was informed that before any cutting in an external or party wall (without which they could not be inserted), notice must be given to the district surveyor, pursuant to section 13; and a fee paid. On consulting the list of fees in schedule L, it appeared that the fee would be 14. 15s. the house being a firstrate, and possibly 3/. 3s. if the cutting were made in a chimney breast. The official referees had, however, the power to reduce the fee if they thought proper, and an applica-tion to them would only cost a guinea for The ventilators are, of course, the hearing. deferred for the present; and as the act makes no mention of any apertures for ventilation beyond a window and a chimney, it is to be hoped the official referees will publish some instructions on the subject, without waiting till an object of such importance is brought before them on appeal. All decisions, how-ever, of the official referees should be advertised and sold, with the act, or they will be useless to the public, as district surveyors do not hold themselves bound to supply informstion gratis. The act does not enjoin them to give any assistance to a builder in the form of explanation or advice, but, on the contrary, it places them in the position of public informers, profiting by every error committed; one fee being chargeable if the act be doly **observed**, treble fees in every case of neglect."

We may again mention that all awards made by the referees are open to the public on payment of 6d. for each class of awards consulted. We have taken some pains to communicate to the public all the most important decisions pronounced by the official referees, and shall continue to do so, with even greater minuteness, as we are satisfied we may thus prevent much litigation and ill-feeling.

The district surveyors meet periodically, for the discussion of the various questions which arise from the act: if they would enable us to place the result of their deliberations before the public also, difficulties would sooner cease, and much advantage be gained.

REDUCTION IN THE PRICE OF GAS.-Mr. Hedley stated a few days since before the committee of the House of Commons on the Caledonian Railway, that in consequence of im-provements effected by him in the manufacture of gas, so great a saving in price to the consumer had been effected, that in Liverpool alone it amounted per annum to 20,000%. He further stated, that all over Scotland the gas was better in quality than in England, owing to cumstance which has occurred to me within the superiority of gas-coal in the north.

0

ATTACHED OFFICES TO BUILDINGS COM-MENCED BEFORE LAST JANUARY.

ONE of the latest awards made by the official referees is still further confirmatory of the view we have taken of attached offices and projections, not yet formed, to buildings commenced before January last. After what has appeared in our pages, it ought not to be necessary to publish this award, but as it affects a large number of persons, and some of the surveyors are not convinced without difficulty, it may mot be useless to insert it.

Mr. James Bonnin had commenced, and in some instances covered, in before January last, a number of houses in Thurloe-square, in the district of South Kensington. He was in course of completing them by the construction of certain offices attached, and party fence walls, when the district surveyor claimed the superintendence of these offices and walls, on the ground that the footings had been laid since the 1st of January, that they were outside the houses, formed a distinct addition, and were therefore subject to the regulations of the Act.

The builder appealed to the official referees and urged that the offices and walls were a component part of the houses as commenced, and had been delayed merely for the convenience of scaffolding for the higher parts.

The referees awarded (May 24th), that inssmuch as the buildings in question formed, together with the main buildings to which they are or are to be attached, one general design, as shewn by the plan, and that such main buildings were commenced before the 1st day of January, 1845, the said buildings in question, that is to say the aforesaid attached offices and party fence walls to the three unfinished houses in Thurloe-square, are not subject to the operation of the said Act, as to the original building thereof.

And with regard to the costs, they further awarded, that, "inasmuch as the case was one of reasonable doubt," the same (41. 2s. 6d.) abould be paid by the builder and surveyor jointly.

ENGLISH ARCHITECTS AT HAMBURG.

THE committee for rebuilding the church of St. Nicholas at Hamburg (destroyed by the great fire) having some months back offered premiums for the best designs for that building, which they wish to make one of the finest modern churches in Europe, have lately, out of forty-four designs submitted to their consideration, selected that of Mr. George Gilbert Scott and William Bonython Moffatt, of London, as deserving of the first, and those of Professor Strack, of Berlin, and Mr. Ludwig Lange, of Munich, as those meriting the second and third premiums. In coming to this decision, they were aided by the advice of Mr. Boisserte, of Munich, and of Mr. Zwirna, the architect to Cologne Cathedral. A design by Mr. Atkinson, late of Manchester, is said to have been much liked. The selected design is in the style of the

The selected design is in the style of the fourteenth century (the decorated); and may be regarded as one of the most successful efforts of modern architects. The tower is in the centre of the west end, and is surmounted by a lantern and lofty spire of open-work paneling, the whole very elaborately adorned. A peculiar effect is given to the upper part of the tower by a parapet around the base of the spire which projects considerably before the face of the building. The aisles outside present a series of gables, with buttresses and crocketed pinnacles at the points of junction. The commencement of the chancel is shewn by a stone lantern, rising from the ridge of the roof, and a small turret with pinnacle against the clerestory wall on each side. We hope the architects may see their very beautiful design satisfactorily carried out.

INSTITUTION OF CIVIL ENGINEERS.

At a meeting held on the 20th inst., the president in the chair, Mr. P. Barlow presented, as an appendix to his paper on the atmospheric system, the result of a series of experiments upon the force employed in drawing carriages up an incline plane of 1 in 43, by a stationary engine and rope traction, upon the Canterbury and Whitstable Railway. From these experiments it appeared, that the stationary engine of 25-horse power, with a rope, would produce a useful mechanical effect equal to the engine of 100-horse power on the Dalkey Atmospheric Railway; thus proving, by direct facts, the deduction of Mr. Stephenson as to the amount of lost power by the latter system. These statements were ordered to be printed with Mr. Barlow's paper.

to be printed with Mr. Barlow's paper. A paper by Mr. Thorold, M. Inst. C. E., gave an account of the late failure of the Suspension Bridge at Yarmouth. After giv-ing the dimensions of the structure, which appear to have been altered from the original design without the consent or superintendence of the architect, the immediate cause of the failure of the bridge was attributed to the fracture of one of the main links near the point of attachment to the pyramid: on examination it appeared that the iron was originally of indifferent quality, and that the weld had been made so imperfectly that only one-twentieth part of the sectional area of the bar had been welded: it was therefore evident that these links could never have been properly tested. An interesting discussion ensued, in which the principles of the construction of suspension bridges were laid down; and it was insisted upon, from the experience of the Menai, and Montrose, and other large bridges, that the platform of such bridges should be rendered perfectly rigid, so as to prevent any undula-tion, and that the chains should be merely used to support the actual weight of the platform and the road. The novel and ingenious plan for the bridge over the Menai straits, proposed by Mr. Stephenson, (?) to be constructed of a large wrought-iron tube, supported by chains, was also mentioned, and the principle appeared to be considered sound.

The next paper was by Mr. Grantham: it gave an interesting account of the wreck of the "Vanguard," iron steam vessel, which went on shore on a ledge of rocks, at the entrance of the Cove of Cork, and after remaining there until the rocks were cut away at low water, so that a high-water tide carried her off, was found to be so little injured that a few days sufficed to repair all damages. The engines were scarcely strained, and nothing was broken. This led to mention of some very remarkable instances of the power of resistance of iron vessels, and to the experiments now in progress of trial at Woolwich, on the powers of iron vessels to resist shot. It appeared that with a light charge of powder a hole was merely punched through the plate by the ball, but that with a heavy charge the ball striking the plate with great velocity rendered it brittle, and the fragments fled about in an extraordinary manner.

extraordinary manner. On the 27th instant, the paper read was by the president, giving "An account of the ancient Harbour of Ostia." From the concurrent testimonies of the classical writers. Ostia was originally founded anno 634 B.c. by Ancus Martius: it was situated at the mouth of the Tiber, about fourteen miles below Rome, and as the supplies for the capital arrived by the river, it was of importance to improve the navigation, and, at the same time, to provide for the shelter of the fleet which usually lay in the roadstead. Accordingly the Emperor Claudius determined to construct a new harbour entirely indepen-dent of the river, but at the same time having a connection with it. The general plan of this work, as described by Suetonius, and as given in Cannia's great work on the architecture of the ancients, is shewn to have consisted of extensive outer harbour, formed by two arti-ficial moles, each projecting about 1,900 feet into the sea, enclosing a space of about 130 acres. Between the extremities of the 130 acres. moles was situated another detached mole. which formed a breakwater, supported a lighthouse, and gave two entrances to the harbour, across which chains could be drawn, to form a closed port in time of war. A small inner har-bour was also constructed, in which vessels

could always remain afloat. This covered about 7 acres, and communicated with the Tiber by means of two parallel canals, furnished with stop gates, in order that the water of the river might be turned through the harbour, for scouring away the mud, or for other pur-poses. There is no evidence to shew that the pound lock was known or used. The walls of the moles were constructed upon arches, so as to give free access to the current, but at the same time they were sufficiently solid to break the sea, and to produce tranquillity within. This was very necessary, for, from the geological condition and the geographical position of Ostia, the coast was subject to constant advance from the alluvial deposit brought down by the Tiber : by this means a delta has constantly been in progress of for-mation, and in the course of 2,480 years the line of shore has advanced about 3 miles 600 yards. All the attempts to improve the entrance of the Tiber were, by this deposit, rendered completely abortive, as the project-ing walls only increased the deposit. Eventually the ports of Claudius and of Trajan suffered the same fate, and although the works at Ostia were considered by the Romans as their greatest labour, they were of necessity abandoned, and the harbour of Centum Cellæ, or Civita Vecchia, was constructed as a substitute.

In the work of Ostia there was visibly much novelty and ingenuity in design and in construction; indeed, it must be observed, that almost every principle adopted by the improved skill and science of modern times, appears to have been there carried into effect pears to have been there carried into effect with singular perseverance and ability. By a careful study of the original plans of these ancient works and the results, engineers might read very useful lessons for the treat-ment of many of the harbours of England, perticularly the south courts of the south particularly those on the south-eastern coast, where, as at Dover, great difficulties are to be contended with from the motion of shingle and silt. The position of English harbours differs in some degree from that of Ostia, on account of the former being subject to the action of a great rise of tide and strong littoral currents; while the latter was situated in the Mediterranean, where there is scarcely any tide, and of which the shore currents are sluggish. The deposits of silt would be in the latter case very rapid, as the water of the Tiber entering nearly at right angles with the shore, would arrest the current, and the whole speedily would become comparatively stagnant.

In the discussion which ensued upon this paper, the cases of Dover, Rye, Ramsgate, and many other harbours were explained, and the probable result of the present works commented upon.

INSUFFICIENT SCAFFOLDING.

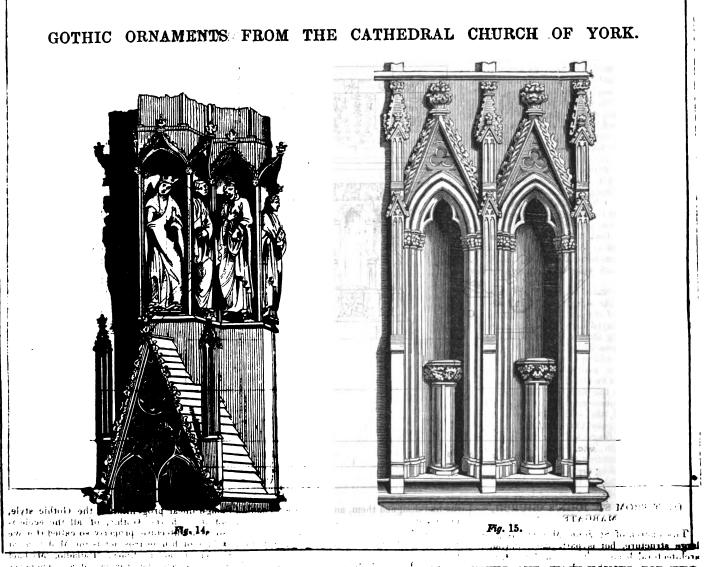

THE daily papers speak of a fearful accident which happened last week at a house opposite Bow Church, where five men were employed upon a scaffold in front of the building. Whilst thus engaged, one of the putlogs, intended to sustain the planks upon which the workmen stood, gave way from the wall, and the cross pieces, being thus left unsupported, broke down, and precipitated all five men, four of whom fell with great violence to the ground, while one clung to a scaffold pole. One of the poor fellows had his leg dreadfully smashed, so that it is feared amputation will be necessary. The other workmen, happily, have not sustained any very serious injury.

any very serious injury. Hardly a week passes without the occurrence of an accident through want of care in the preparation of scaffolding, or the use of improper materials: it is really incumbent on masters to see that their workmen are provided with sound and proper boards and poles for the purpose, and are enjoined to avoid unnecessary danger. All who are in the habit of ascending many scaffolds must occasionally shudder at the imminent peril to which workmen are sometimes exposed in this respect.

IMPROVEMENTS AT GAINSBRO'.—It is proposed to benefit the town of Gainsbro' by converting certain premises situate in the market-place, and recently in the occupation of Mr. F. Otter, into public rooms, corn market, covered butter market, &c., for which they are said to be in every respect peculiarly eligible.

ABSUBDITY. — A country correspondent tells us that a gentleman in the neighbourhood of Dudley has recently offered to give the sum of 5,000%. for the purpose of erecting a new church, provided that penny postage stamps to the amount of 2,000%, which have been obliterated by passing through the post-office, are sent to him within a limited period. We said "how great!" on commencing the paragraph, but ended it with "how small!"

THE BUILDER.

GOTHIC OBNAMENTS, PROM. THE CATHEDRAL CHURCH OF YORK.

As we are informed that the details slready given have been found useful by a certain number of our subscribers, it has been deemed advisable to extend the series.

The annexed examples are both from the outside of the church, at the west end. Fig. 14 represents a group of seven states

Fig. 14 represents a group of seven stateses on a buttress. The figures are 6 feet high, and 76 feet 6 inches from the ground. There is one of these groups on each side of the west window.

Figure 15 represents two niches. The height, from the ground to the moulding at the top, is 17 feet, and the width from the centres of the pilasters 3 feet 6 inches, they are 48 in number.

THE (LAUREL-CROWNED) ARTISANS OF THE PAINTED WINDOW OF THE CA-THEDRAL OF CHARTRES.

BY J. L-T.

It is with considerable pleasure that the readers of "THE BEILDER." will have perused those well-selected extracts and illustrations, by our talenated friend Mr. T. Wright, which appeared in the last number of this periodical. Certainly, architecture (building) is the very exponent and criterion of human civilization. But it is to be excused, as it lays, at the same time, beyond the *limits* which Mr. W. has assigned to his rescateve, or such as are connected with the royal craft of masonry, or modern nocial actence. The, ballding, of the megnificent cathedral

The ballding of the megnificent cathedral of Chartres is coeval with those of Strasburg, Cologue, Vienne ; and we know full well that at the latter cities (at.]east); existed those mediaval, secret: associations.pf.:masonry which may well be traced back, and are certainly analogoue, to those which existed at the time of the building of the temple of Solomon. Under such circumstances, nothing extraneous to, and incompatible with, the customs and

habits of our present artisans can astonish us, or he difficult of explanation. If the *whole* of those painted windows of Chartres were to lay before us, we should certainly recognize some of the well known symbols of that ancient association, to which the problematic laurelcrowns might be referred. Besides, those good and democratic olden times were equally famous for the many national festivals (and sports) in which the artisan had his adequate share. The laurel crowns, therefore, may also be marks of bonourable distinction, which their bearer might have obtained on such occasions — nay, perhaps, the very mark of their proficiency or *mastership* in their own art.

What Mr. Wright has also not taken notice of is, the tidy, regulated, cleanly appearance which the garments of these artisans exhibit a atriking antithesis of that shreddy, disorderly, and slovenly attire our present working men exhibit in their hour of work. But "the work a man performs ought to be holy to him"—and such it was with our happy and blessed forefathers. Goethe (the shrewd— *German* Goethe) expatiates in one of his works on mediavel physiconomics—those also of the humbler classes. "Look at them"—says he— "as they stand before us in their works of statuary and painting !—they are serene, elevated, tranquil, composed." Would this were also the characteristic of our present age of civilization !

The data which Mr. Wright has brought forth, about the wearing of gloves by the workers of those times, are rather novel—still, at the same time, a libel on us moderns. The workers of the middle ages wore gloves to protect their hands from the inroads and injuries of work; their hands, therefore, were probably like their faces—those of human beings. The workers of the present age wear no gloves during work—reality is nothing with them; they thrust their hands in kid gloves on a Sunday—to hide that abnormity, or ugliness, which our forefathers chose rather to prevent. "The times are worse than we usually are inclined to think"—says a friend of the working classes, Lamarkine.

A PUBLIC meeting to promote this object was held at Willie's rooms on the 22ad inst., when the Duke of Cambridge took the chair, and made an urgent appeal for further subscriptions. The selected plans are now being adapted to the site purchased, near Whitechapel, and will provide more than 100 baths, and nearly 200 wash-tubs.

It is proposed that there shall be two classes of baths—the cheaper at ld. for a cold bath, and 2d. for a warm bath; the dearer at 3d. for a cold bath, and 6d. for a warm bath. The charge for the use of the wash-tubs, and drying and ironing rooms, is proposed to be 1d. for the first four hours, with an increase for a longer time. The committee have reason to believe that with these charges the establishment will become self-supporting in the course of the second year after its opening, and for subsequent years will afford a surplus, applicable to the support of smaller establishments. For the parchase of the land and the crea-

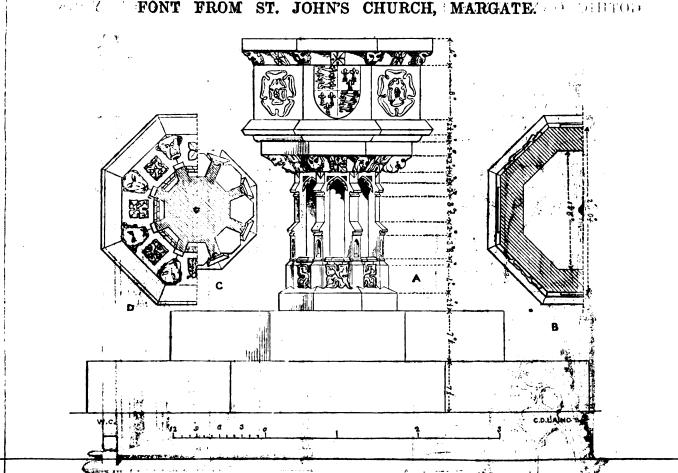

For the purchase of the land and the erection and fitting up of the premises about 16,000J. will be required.

The subscriptions already announced an orare to 7,358/. Ss. Sd., and the committee call on the public to aid them in raising the remainder. Lord John Manners remarked at the mean

Lord John Manners remarked at the meaning alluded to, that he folt the greatest interview in the success of their undertaking, and he did trust that it would be carried out to comppletion, unless, indeed, it was intended that we, with all our bousted eivilization, should still remain in the commonest matters of life, far behind ancient Rome and Greece, where ample provision was made for the necessities of the people in this respect, and whose imagmifacent baths remained, even yet, proofs of the interest which they took in the social comdition of the people, and monuments of the height to which the building art had at that period arrived. The model of part of the proposed establishment, of which we spoke some time ago, was submitted to Prince Albert that week, and may probably be seen by subscribers on application at the office, in Grosby-square.

BATHS AND WASH-HOUSES FOR THE LABOURING CLASSES.

THE BUILDER.

FONT FROM ST. JOHN'S CHURCH, MARGATE.

THE church of St. John, Margate, is a very The church of St. John, Margate, is a very large structure, but is particularly devoid of architectural beauty: it contains little worthy of potien, except the subject of the present illustration, the font; which is a good speci-men of late Perpendicular. It is an octagon of plab, with shields and roses on alternate sides: the only shield which remains intelli-gible, is that shewn in the engraving, having the arms of England quartered with those of France. Hasted, in his "History of Kent," states that other shields bore the arms of the Cinque Ports. The top of the font appears unfinished, or as if it had been deprived of some modifies. A, shews the elevation. B, half-plan across

SIR JOHN RENNIE'S CONVERSAZIONE.

10000 THE new president of the Institution of THE DEVICE THE LEAST STREET OF THE LEAST STREET OF THE LEAST STREET OF THE LEAST STREET OF THE STREE

hadion with painting, by Mr. Sang, *—oncore* Mr. Sang, *—who* we have no doubt feals as much surprised himself at being put over the heads of English artists as we know his comtymen abroad are at the favour with which he has, been visited. Why, in the world, we about go to Germany for decorations such as these, pretty as they may be, it puzzles one to disgover. There are decorators in Bavaria who gan do fine things, and might advance us if they, ware to work here for a time; but as to the painter in question-lud! what foolish

People, wa Englishers are! This, however, is not to disparage Sir John Bennie's elegant room and profuse hospitality. Auwings, bronzes, models of bridges, steam-engines, and stmospheric roads filled every table and the busic was convided with the man angines, and atmospheric roads filled every table, and the house was crowded with the men

Lighthouse, by Messrs. Walker and Burgess; Captain Boswall's plan for harbours built with arched piers; the original design, by Mr. Stephenson, for an iron bridge of two arches, each of 360 feet span, to carry the Chester and Holyhead Railway across the Menai Straits, but which is now to be superseded by the sus-pended tunnel-bridge, formed of wrought-iron; the Folkstone Viaduct, by Mr. W. Cubitt; a cast-iron trussed girder bridge, by Mr. Borthwick: and a model of a stone bridge, Cubitt; a cast-iron trussed girder bridge, by Mr. Borthwick; and a model of a stone bridge, with flat elliptical arches, designed some years since by Mr. Rennie, to replace Westminster-bridge. There was a fine model of the "Great Britain," and several of vessels to be propelled Britain," and several of vessels to be propelled by the screw, designed by Mr. Guppy; a steam-frigate, with direct-acting engines and screw-propeller, by Mr. Rennie; a beautiful pair of marine engines, by the late Mr. Henry Maudslay; Mr. Bodmer's proposed horizontal engines and screw-propeller; Mr. Hick's im-proved locomotive engine; and Messre. proved locomotive engine; and Messre. Grissell and James's combinations of a weighing machine and crane, to ascertain the weight of an object while raising it an object while raising it.

ECCLESIASTICAL ARCHITECTURE.*

"In the preceding portion of this article, we have described six existing types of the Augustan Busilica: a seventh remains, destined to exercise, even more than the Roman fabrics, a permanent influence upon Christian archi-tecture. In the Augustan Basilica, the horizontal principle (to adopt the term sanctioned by Whewell and Willis) predominated. Such a Basilica is a building consisting of single columns or bearing shafts, supporting either a continuous entablature, or a continuous range of arches, covered by an open roof connected by transverse beams. The Basilica of the Lower Empire consists of compound piers, to which columns are annexed, but more for ornaarches by which the edifice is roofed. This type completed what the others began. The Basilica of the Lower Empire is the remote

* See page \$33, anic.

who had designed them, and others who could appreciate. Amongst the models we may mention, Mittchell's screw-pile battery; the Air Point Lighthouse, by Messrs. Walker and Burgess; Captain Boswall's plan for harbours built with arched piers; the original design, by Mr. Stephenson, for an iron bridge of two arches, each of 360 feet span, to carry the Chester and Holyhead Railway across the Menai Straits, but which is now to be superseded by the sus-pended tunnel-bridge, formed of wrought-iron; the Folkstone Vialuct, by Mr. W. Cubitt; a cast-iron trussed girder bridge, by Mr. Borthwick; and a model of a stone bridge, with flat elliptical arches, designed some years since by Mr. Rennie, to replace Westminster-bridge. There was a fine model of the "Great of beauty, and the talent for sethetic decoration waned away, the science of architecture ac-quired a new dignity and a new power. The art of vaulting, now fully developed, was employed in the vast and complicated strucemployed in the vast and complicated struc-tures of the baths, the villas, the piscinas, the amphitheatres, whose ruins linger in Rome, or decorate the magic landscapes of the Bay of Naples, where some of the most remarkable specimens are found. Many difficulties were offered in these structures, when the architect was required to connect and combine the vali-ing with the supporting walk : but the hining with the supporting walls; but the hin-drance became a stimulant.

2591

The endeavours made by the architects to master these difficulties, brought the architects to vaulting to great perfection. Omitting less important examples, or buildings of which we do not possess sufficient details, we are fully enabled to understand the general scheme. Three of the great ruins of Rome will afford up the manifest hermitation of the cohome of Three of the great ruins of Rome will afford us the requisite knowledge of the scheme of construction. The great hells of the baths of Caracalla and Diocletian supply what is wanting to restore the ruins long considered by antiquaries as the Temple of Peace, --ruins now clearly ascertained by Bunsen to be the remains of the Basiliea erected by Maxentius, either in the vicinity or upon the site of the magnificent temple raised by Vespasian. If the vaultings of the Therms be added to the ruins of the Forum, we shall obtain an accurate idea of the Maxentian Basilies. The vast frag-ment of the bailding now standing is known to every one; other portions have been made out by excavations, and by uniting these remains with the analogous halls of the Thermse, fitting into the one the details furnished by the other. we shall completely understand the form which the Maxentian Basilica assumed. The nave, for so we will term it, consisted of three huge compartments of Roman vaulting, really resting upon piers, but apparently owing their support to eight magnificent columns, of which several remained till they were removed under the pontificate of Paul V. for the adornment of the church of Santa Maria Maggiore. On either side, the lofty arches opened into as many vaulted apartments, which, resting on one side on the piers of the nave, and on the other on the piers inserted in the wall, formed the side aisles. Windows (in the nature of clerestory windows) were pierced in these lateral walls of the aisles, whilst the inferior height of these collateral portions allowed, or rather required, the insertion of other windows in the walls supporting the arched roof of the nave. The nave terminates in the usual semicircular apse, but we also find in this Maxen-tian Basilica another apse, proceeding from the middle division of the side aisle. Bunsen supposes this lateral hemicycle to have been a subsequent addition: and in his plan he meets it, as it were, on the opposite side, by an entrance. Speaking, however, with entire respect for the opinions of so competent a judge, we see no reason for supposing that this second apse was other than an original portion of the building; and if we are to conjecture, we would rather suppose that, as required by symmetry, and as in some degree evidenced by what we shall term derivative buildings, there was an opposite apse, giving to the whole struc-ture somewhat the form of a cross.

This Maxentian Basilica is the only specimen now subsisting at Rome of the vaulted basilica of the lower empire. But the principle of construction which it elucidates, had become incorporated with architectural science.

Whatever may have been the original use of the structure so well known as the Palais des Thermes, the halls and chambers presented to the inhabitants of Lutetia the model afferded by the capital. Quitting the Seine we advance towards the Rhine. The same style prevailed in other portions of Belgic Gaul. One venerable city yet subsists (we shall soon arrive at it), in which we may behold the walls and arches of the baths, imitating, though humbly, the mansions of luxury provided by Caracalla; and here we trace, united with more recent constructions, the outline of a basilica, combining with the double apse of the Ulpian basilica the piers and vaulting of Maxentius. Whether the result of the imagination of another people, or the exertion of an inventive faculty, other buildings in the same locality, though erected under the Roman domination, display forms equally unknown to Rome;---double gateways--portals, rising in successive stages of decoration -- projecting towers, whose semicircle offers ranges of arches which may have been suggested by those of the coliseum, but which, in this example, aesume a totally different character, from the smallness of their scale.

In describing the basilica of Maxentius, we have, as it were, involuntarily described a Romanesque cathedral. The familiar terms of mediæval architecture convey the most intelligible notions of a construction which the technical nomenclature of the classical age cannot define. Alipius, who enjoyed the patronage of Julian, might have enabled us to describe in architectural phrase the interior arrangement of the Maxentian basilica: Vitruvius gives us no help at all. Whilst the origin of the Romanesque is un-

Whilst the origin of the Romanesque is unquestionably to be sought in the imitation the degradation, if you choose—of classical arehitecture, the character this style assumed beyond the Alps, shows a great independence of the Christian basilica of Rome. The Christian architecture of Rome and the Teutonic Romanesque are in the nature of cognate languages derived from the same mother tongue; whose characteristics testify their common origin, but establish their distinctive differences. The roots may be the same, but in each there is a diversity in the inflections, a variety in the construction, a nationality in the phrase."

The writer then proceeds to examine where the mode of building, which afterwards spread over the largest portion of western Christendom, arose.

"In the recollection of the traveller, the

scenery of the Rhine and Moselle will always be connected with the venerable ecclesiastical buildings decorating the banks of these rivers, and spreading on either side in the regions once possessed by the prince-prelates of the empire. Abounding with manifest imitations of Roman architecture, and therefore very analogous to those which he may have seen in England or in France, many peculiarities nevertheless shew that they belong to a distinct genus. Tall square bell-towers, consisting of many stories, divided from each other by corbel tables, falling down into semi-circular festoons, and these festoons running down at the angles into flat or slightly projecting pilasters, which panel the walls, afford the first lines which are inserted in the sketch book. The draftsman will then have to add the round arched windows, usually in couplets, supported by a short central pillar, nearly like what is found in some of the towers now considered to be Anglo-Saxon. Notwithstanding this one similarity, the slenderness of the German Glocken-Thürm, and its many stages, ending in a pyramidical roof, give it a character entirely different from our own structures. The sanctuary, presbytery, or choir, always ends in a portion of a circle or polygon. The exterior of the apse is ornamented by an open gallery; a range of arches, standing upon small columns or shafts, sometimes formed into groups, or shafts, sometimes tormed and grand-occurring at symmetrical intervals, or by panellings imitating the gallery. The larg churches exhibit a remarkable peculiarity. double choir, found in no other part of Christendom; an apse at the east end, an apse at the west end; and not unfrequently the transepts take the same form. Nor are those features confined to the immediate vicinity of the rivers; they extend through the whole of the ancient imperial dioceses-Cologne, Treves, Worms, Mayence, Spire, Constance ; and if we pass into the imperial territory now annexed to France, we shall find a specimen, and a very remarkable one, as far as Besançon.

As the traveller then pursues his journey towards Italy, crossing the Alps by the ancient passes of the Mont Cenis or St. Gothard, the same form still appears, excepting that the double choir is no longer apparent. Trent has double choir is no longer appearance her cathedral in this style. It extends over the whole of Lombardy, which includes the modern Piedmont, Parma, Piacenza, and In Tuscany this Moselle-Rhenane Basilica. double choir is no longer apparent. Modena. In Tuscany this Moselle-Rhennne style contends with the Roman Basilica. With some slight though distinctive alterations, which will first have become apparent in the St. Gothard's pass, the Glocken-Thurm annexce itself, though as an extraneous adjunct, to the Papal Basilicas. Tuscany displays the style in question, though more rarely. Lastly, it meets with and abandons us at Rome. U'n willing as the ancient capital was to adopt ultramontane taste, the usage of the bell compelled her priesthood to employ the Teutonic structure; and in one example at least, San' Giovanni e Paolo (of which Mr. Knight has given a plate and description, No. xxii.), the sacred structure originally raised by the Roman patrician Pammachius, husband of Paulina, St. Jerome's sister, was replaced by a building of which the design was brought from the colonies of Germany or Belgic Gaul.

Now this general similarity of style was not the result of accident, taste, or fancy. The buildings are, in the strictest sense, historical illustrations of the countries to which they belong. They are portions, so to speak, of its historical costume. Architecture is the dress of man in the aggregate, of human society. If the region in which this Teutonic Romanesque style prevailed be traced out upon the map, it will be seen to agree very nearly with that portion of the empire of Charlemagne which was assigned to Lothar, his grandson." At Treves the writer finds the one example

At Treves the writer finds the one example of a Basilica consecrated as a Christian church, in which you see the Corinthian capitals just displaying their foliage. This he considers the model for the structures which, far more than those of Rome, assisted in the development of Christian architecture.

For want of space we abandon the Romanesque for that to which it led :--

"Bunsen adopts a theory similar to that suggested by a reviewer of Mr. Knight's 'Sicilian Antiquities' in a contemporary journal (*Ed. Rev.*, vol lxix. p. 95). Gothic architecture was not the result of an accidental development of art, of obscure masons and labourers of the trowel and mallet advancing and halting in their attempts, until the work started into perfection; but the creation of the genius of some one great master, employing the forms and availing himself of the ideas existing in or suggested by the edifices of his age, but who combined them with that power which constitutes originality. He cast the Gothic style at one jet, with all its peculiarities. In what school was he trained? Evidence,

In what school was he trained? Evidence, we believe, exists, enabling us to conjecture the individuals under whose influence the talent of the *Protogoth* was fostered; but if we can guess at the teachers, we are denied the name of the disciple. Like so many other benefactors of mankind—for he was a benefactor who provided for future generations the hallowed glory of the sanctuary—he will probably always remain concealed.

In the continental Gothic, the main idea of the Basilica was consistently maintained. Compound shafts became clustered columns; ascending with increasing boldness, the vaulting rose amidst the pointed arches -but the main type continued unchanged. Each region, however, had some peculiarities. Berne and Lausanne may be compared with Aracceli and St. John Lateran for their plans. Both have the apse, but Lausanne the transept, copied from the Augustan Basilica. Although Rome did not adopt the Teutonic or Gothic style, still she constantly influenced her daughters But the changes in Liturgical usages naturally affected the buildings in which the rites were affected the buildings in which the rives were to be celebrated. The multiplication of altars necessitated a multiplication of chapels; hence the magnificent plan of Cologne, which ex-hibits a crown of chapels surrounding the apse of the Roman Basilica. The plan is very re-nearbable for Disa was evidently in the arrhimarkable, for Pisa was evidently in the archi-tect's mind. In England, our Gothic architects rejected the apse almost unanimously; at least we cannot recollect more than one un equivocal example to the contrary-Westmin-ster Abbey. In other cases, allowing for interpolations, and for the prolongation by the building affectedly (and often erroneously) called the Ladye Chapel, the east end of our Gothic churches terminates in a straight line, so that the national form of our choir and presbytery was rectangular. In Italy, the sp-sidal form prevails in all the Gothic churches; we doubt if more than one example can be found of a rectangular termination, and we shall soon see the importance of marking this contrast.

Mr. Knight has made the very important discovery, that Gothic architecture was introduced into Italy from England. The English traveller who enters the church of Sant' Andrea at Vercelli, will at once be surprised at beholding an edifice repeating the most familiar features of the style, to which the name of early English has been applied. The plan of Sant' Andrea is entirely English; pronounced and decided cruciform transepts; a straight-lined rectangular choir; lancet windows, supported by tall detached pillars; simple-foliaged capitals; the plain groined roof. There is somewhat of a foreign accent, if we may use the expression, apparent, if you closely examine the details; yet, in spite of this foreign accent, you might almost suppose yourself at Salisbury. If the traveller inquires who was the

If the traveller inquires who was the founder of this magnificent structure, he will hear a name which often occurs in the pages of Matthew Paris. It is that of the Legate, Cardinal Wala, or Guala, who appears as an influential statesman in English affairs during the eventful period of the last years of John and the accession of Henry III., when it seemed as if the crown of England might be transferred to a foreign dynasty."

Guala's architect was a French ecclesiastic named Thomas, but there is every reason to believe the working drawings were brought from England. The Duomo at Milan is a transplantation from Germany, with the same prototype as Cologne or Strasburg. Concurrent with the erection of this splendid specimen of the "Gotico Tedesco" in Italy, was the revival of the classic style as commenced by Bruneleschi, and here the writer ends the article from which we have so largely quoted.

SOMERSET LUNATIC ASYLUM.—In reply to various correspondents we are informed that the selected design for this building is by Messrs. Scott and Moffatt.

Ar an ordinary meeting of the institute, held on Monday evening last, Mr. J. B. Pap-worth, V.P., in the chair, Mr. Walker, late president of the Institution of Civil Engineers,

who was elected an honorary member a short time since, was admitted. Mr. Joseph Wilks, to whom the portfolio of the institute is much indebted, presented coloured representations of one of the stained glass windows from the church of Notre Dame des Secours, in the faubourg of Au, at Munich.

nich. Mr. Donaldson, in giving various points of information from France, drew the attention of the meeting to a premium of 501. left by the will of an individual, which is to be adjudged annually to a young architect who unites to ability and knowledge of his profession, the domestic virtues. Mr. Donaldson afterwards read a paper on the architectural and icono-graphical application of the form of the cross during the middle ages, from the French of Mons. Didron, prefacing it with a statement of his desire to let the members know what was going on abroad. The essay read forms part of a series published by the Comité His-torique des Arts et Monumens of France, under the startling title of "L'histoire du Dieu," and would satisfy the stanchest ad-mirers of Durandus and symbolism. The use of the form of the cross for the plan of eccle-siastical buildings was traced, and the numer-ous varieties of it adopted for decoration were explained.

An announcement in the bulletin of one of the French societies, that an English anti-quary had applied to them for advice respect-ing the investigation of Richborough Castle, ing the investigation of Richborough Castle, Kent, led to some comments. Mr. Britton being called up, wrged architectural students to lose no opportunity of investigating the an-tiquities of their country; and to make the study of them the recreation of their leisure hours. He mentioned Burgh Castle, near Yarmouth, as analogous in many points to Richborough Castle; and suggested it as an interesting subject for inquiry. Mr. Scoles remarked that they must make haste if they wished to investigate it; he had just now re-turned from that part of the country, and had learnt that those remains were in the schedule of a railway bill, and would probably soon be of a railway bill, and would probably soon be destroyed.

NEW MATERIAL FOR FLOORING, PAVING, AND ROOFING.

THE new material or compound, which forms the subject of a patent taken out by Mr. Cassell, of Millwall, consists of many varieties, Cassell, of Millwall, consists of many varieties, but possessing all these common properties— that they are perfectly impervious, very elastic, and (there is reason to believe) exceedingly durable. When intended to be employed for paving

or *flooring*, or other like purposes, it is com-posed of four varieties, which, for the sake of distinction, are designated as compounds No. 1, No. 2, No. 3, and No. 4, and are thus described :-

I prepare No. 1 compound in manner following :- I saturate a quantity of chalk, or marl, or lime, or loamy clay, or sandy earth, previously reduced to the state of a fine powder, with oil of tar, or mineral tar, or vegetable naphtha, or any other resinous, oily, or fatty matter. I take one cwt. of rosin, and melt it in a caldron exposed to a gentle fire, until all the water in it has evaporated. I then melt it in a caldron exposed to a gentle fire, until all the water in it has evaporated. I then throw into the caldron two cwt. of the satu-rated chalk or other earth, and mix it well with the melted rosin. I next add from 3 to 6 lbs. of liquid caoutchouc, or from 1 to 3 lbs. of essential oil of tar, or turpentine, or some other oily, or fatty, or cementitious substance (varying the quantity according to the degree of elasticity desired to be given to the ultimate compound), and after that, from 3 to 5 lbs. of sulphur; and finally, two cwt. of fine dry grit, keeping all the while the contents of the cal-dron well stirred, till the whole are thoroughly amalgamated. When cool, this compound is of a slatish grey colour, and of a close granular texture. No. 2 compound is prepared in the same way as No. 1, and composed of the same materials, and in like proportions, excepting only that lsubstitute for therosin, vegetable pitch, and use a larger proportion of sulphur, say

from 6 to 8 lbs. No. 3 is also prepared in the same way as Nos. 1 and 2, and composed of the same materials in the like proportions, excepting that instead of the rosin or vegetable pitch, I use equal parts of rosin and Stockton tar, and reduce the quantity of sulphur to about 4 lbs. No. 4 compound differs from No. 3 in the substitution of equal parts of rosin and mineral, or coal tar, for the equal

parts of rosin and vegetable pitch. These compounds may be used by them-selves—"being laid down in a hot and fluent state, and of sufficient thickness;" or they may be employed in any of the following states of combination :---

Firstly, they may be combined with any of

the natural asphaltes or bitumens, or any arti-ficial compound of a bituminous quality. Secondly, they may be formed, in combina-tion with small pieces of wood, into large blocks for use,

blocks for use, Thirdly. Any of the compounds before described may be used in combination with wood, in manner following, to form a flooring for the ground floors of buildings, which will be quite impermeable to under damp, and exceedingly durable. The ground is to be first covered over, to the depth of about an inch, with a layer of any of the four compounds be-fore mentioned (being previously well beaten down and levelled), and then small square blocks of wood of equal sizes are to be set in this composition while yet warm, with the grain uppermost, and placed in regular order, side by side. Any interstices which may be grain uppermost, and placed in regular order, side by side. Any interstices which may be left between the blocks are to be carefully filled up with the compound. Or, instead of using small blocks of solid wood, com-position blocks of a large size, prepared as follows, may be employed:—I take a num-ber of pieces of deal, from 3 to 5 inches wide, and from 10 to 18 inches long, such as may be picked out of the woods imported from abroad under the denomination of fire-wood, and which, paying a small duty, may be had and which, paying a small duty, may be had cheap, and lay them in sn iron frame or mould, in the direction of the grain, jointing them roughly together lengthwise, but so that they shall break joint transversely. I then cover them to the depth of one or more inches with any of the four compounds before de-scribed, in a hot fluent state, and leave this firmly united to the wood beneath. On re-moving this mass or block from the frame or mould, and fitting it into a piece of flooring, it mould, and fitting it into a piece of flooring, it is placed with the wood uppermost, which re-mains ever after beyond the reach of damp from beneath. For such a description of ground flooring no joists are requisite. The blocks may be made of any length or breadth most convenient; but I prefer making them of about 4 feet in length, by 2 feet 6 inches in breadth. When a very strong flooring of this kind is wanted, I cross the layer of wooden pieces before described with a second of ex-actly the same description, but laid the reverse way, and upon an interposed bed of one or way, and upon an interposed bed of one or other of the four compounds before mentioned. other of the four compounds before mentioned. The two layers are then pressed together; and when the compound which unites them has cooled and set, I pour over the whole another coating of the same compound, so as to cover completely the second layer of wood. In-stead of the blocks being all of one sort of wood, or of one colour, they may be of dif-ferent woods and different colours, so as to give the flooring a tesselated appearance. Of the suitableness of the material for road

Of the suitableness of the material for road paving there have been as yet but slender op-portunities of judging. In Kensington Palace Gardens there is a small specimen to be seen; and another in Camphine-road, Millwall, Poplar. It is laid down in blocks of about the dimensions of York paving stones, and

is pleasant to walk on. For *roofing*, and other purposes where lightness is desirable, Mr. Cassell makes use of a compound different from any of the others, which is called "No. 5 compound," and thus described :---

It consists of a mixture of 1 cwt. of rosin or getable pitch, or 1 cwt. of rosin and vegetable vegetable pitch, or 1 cwt. of rosin and vegetable pitch in equal proportions, or 1 cwt. of rosin and Stockton tar in equal proportions, or of 1 cwt. of rosin and mineral tar in equal pro-portions, 1 cwt. of fine grit, 8 lbs. of sulphur, and from 4 to 5 lbs. of cork cuttings or rasp-ings, the whole being compounded in the manner before directed, to be followed in the

preparation of the other cements, and thoroughly incorporated together. While yet hot, this compound is removed from the caldron and compound is removed from the caldron and formed into sheets, by subjecting it to strong hydraulic pressure between plates of iron per-forated with numerous holes, and having also channels or grooves in them, in order that any liquid matter squeezed out by the pressure may run over at the sides and ends. The sheets, when intended for roofing, should be reduced by the pressure applied to about one-fourth of their original bulk, say from 4 inches to 1, and should be coated with some anti-igniting sub-stance or composition. Where greater strength is required, each sheet may be covered with canvas or paper cemented to it, by any of the compounds, 1, 2, 3, or 4. The specification of the patentee explaine also how the material, in one or other of its

______261

also how the material, in one or other of its several varieties, may be applied to the forms-tion of pipes, casks, tanks, cisterns, garners, railway sleepers, &c.

ARCHITECTURAL MEMS. FROM THE COUNTRY.

THE Manchester Exchange-room is about to undergo very considerable alterations. The present room contains about 699 square yards, and, when completed as proposed, will possess an area of 1,414 square yards. A portico front-ing Bank-street is to be erected, to consist of a lofty colonnade of eight pillars, supporting a massive pediment. The design is by Mr. A. W. Mills, -----The Trinity House heard hears de present room contains about 699 square yards, massive pediment. The design is by Mr. A. W. Mills.— The Trinity House board have de-termined upon erecting a lighthouse at Trevose head, in the parish of Padstow, Cornwall. A road is already being prepared for the com-veyance of materials to the spot.— A sub-scription for erecting a church for the Tewkes-bury-road district, in Cheltenham, has reached the sum of 1,500. An additional 5004, is re-quired to carry out the work.— The small old chapel at Birch, in the township of Rus-holme, near Manchester, having been found inadequate to the accommodation of the grow-ing community in that district, the proprietor inadequate to the accommodation of the grew-ing community in that district, the proprietor of the estate, J. W. H. Anson, Esq., in com-junction with his brother, the Rev. George Anson, has determined on building a good church in its stead, towards which Mr. Anson has given 2002, and the land, and also land for a churchyard, and the Rev. G. Anson has con-tributed the munificent sum of 2.0002. In aid tributed the munificent sum of 2,000/. In side of these sums a grant of 500/. has been made of these sums a grant of 500% has been made by the Manchester and Eccles Church Build-ing Society. The site selected for the church is about twenty yards to the east of the present chapel. The church will be in the early Eng-lish style of architecture, —that which pre-vailed about the middle of the 13th century; —At Bury St. Edmund's, the spirit of im-provement has suggested to the inhabitants the restoration of their fine old Norman tower. A committee has been formed for the nurges of restoration of their line of a Norman tower. An committee has been formed for the purposes of obtaining from Mr. Cottingham plans and spe-cifications for the necessary works, and of ins viting builders to make tenders for carrying the same into effect.——Three new churches are about to be erected at Birkenhead; one at the sale erected of William Potters From the sole expense of William Potter, Esq., to be dedicated to St. John the Baptist; the second at the sole expense of William Jackson, Esq., at the sole expense of William Jackson, Eeq., to be dedicated to St. Andrew, and the third at the joint expense of Messrs. W. Potter; W. Jackson, John Laird, Macgregor Laird; and W. Laird. The site selected for the last-mentioned church is on the corporation road, in the vicinity of Wallasey-pool. Considerable improvements have recently been effected by the removal of an accumula-tion of earth from the basement of the north and south sides of Peterborough cathedral. and south sides of Peterborough cathedral. and south sides of Peterborough cathedral. This had been for some time a growing eyeo-sore to the admirers of the architectural beauties of this venerable pile. The fine Norman door is now seen, as no doubt it was originally intended, but which has for some time been in a great measure hid by this earth.—On Wednesday, the 21st inst., the opening took place of the Victoria schools erected at Chesterfield in commemoration of the Queen's passing through that town on her the Queen's passing through that town on her way to the seat of the Duke of Devonshire, at Chatsworth. The building is in the Eliza-bethen style of another of another of the Star-

room, Sc. ; 2007. have been already subscribed, and there is no doubt but the sum will be considerably sugmented. — At Melpash and there is no could but the sam will be considerably sugmented. —— At Melpash Green (midway between Beaminster and Brid-port) the foundation stone of a new church was laid last Thursday week by the Hon. and Rev. Somerville Hay. It is to be 109 feet long, 60 feet wide, and to have a steeple 60 feet high, with five bells therein. It is actioned to hold 400 persons. Mr. B. Ferrer. estimated to hold 400 persons. Mr. B. Ferrey, of London, is the architect.——It is in contemplation to make the village of Hun-stanton, in Norfolk, a very attractive and convenient place for seaside visitors, by approconvenient place for seaside visitors, by appro-priating some portion of its celebrated cliff and the fields adjoining to the formation of a village, with an hotel, bath-house, library, shops, and other buildings necessary for the establishment of a sea-bathing place. In the arrangements of the plan a site for a chaped is to be reserved, and a pleasant walk formed to the chalybeate spring, which is within a to the charge spring, which is within a mile of the village. The committee for the formation of public parks and play-grounds in Manchester have purchased Endham Hall estate, at Harpurkey, the re-sidence of Mr. Jonathan Andrews, for a sum of 7,9501 A fair works are the market of 7,250/. A few weeks sgo they purchased the Lario Hall estate, in Balford, from Mr. Wm. Garnett, far 7,000/.; and we believe these two properties will be taid out us parks, these two properties will be taid out us parks, and ready for corruption in the course of a few months. — His Grace the Dake of Cleveland has given 100%. to the schools about to be attached to the collegiste church, Wolverhampton, and become a subscriber of 20% per annum. — A meeting of the committee for promoting the establishment of public baths and places of recreation at Birmingham, was held on Tues-day weak, when it was resolved that steps day week, when it was resolved that steps should be immediately taken for the erection should be immediately taken, for the erection of two sets of baths. The restoration of St. Mary ds. Grypt Church, Gloucester, is to com-mence forthwith, the sum of 1,450%, having shready been subscribed. J. The Bishop. of Durham these contributed 500%, and the Rev. George Fichting, the inemabers, 100% towards the emisrgement/of St. George's Chupel, Bi-shop Auckland. The Collegists School at Mariborough increases we repidly in favour with the public, that it is found necessary to make very extensive additions to the buildings. make very extensive additions to the buildinge, without delay. The suite of rooms appropriated to the accommodation of the head has been made ready for the reception of addi-tional pupils; and amongst the additions now contemplated, a suitable residence for that functionary will be erested. The number of pupils at present in the establishment is upwards pupils at pr pupils at present in the establishment is upwards of 200, and the applications for admission are very numerous. — Dr. Warneford, who has already expended 7,000%. In the erection of charitable institutions in Birmingham, is now making arrangements for laying the founda-fion for a House of Recovery for persons afflicted with contagions diseases. Earl Howe has also subscribed 50%, for the same object.— The Rev. Dr. Warneford has just paid over to the Rev. Chancellor Law, the Rev. Vaughan Thomas, and William Sands Cox, Esq., his munificent donation of 500% toyards the addi-tional building at the Queen's Hospital. At a preliminary meeting held at Dee's hotel, Birmingham, last week, it was resolved to establish a public cemetery, for the town and neighbourhood, in connection with the Esta-blished Gaurds. The proposal has received the sanction of the Bishop of the diocese, and the principal church authorities of the town. The old houses at the west end of St. Peter's Church, Sudbary, are now levelled to the ground, this labour of many years having been completed last week, when that fine ecclesiastical edifice, so long encumbered by the encroachments of a tasteless age, was once more displayed in all its fair proportions. The munificent donation of 500% towards the addimore displayed in all its fair proportions. The church now stands entirely clear of all obstruc-The tions in the middle of the area; but the removal of these obstructions has disclosed the barbarous manner in which parts of the windows have been blocked up, and the orna-mental work has been defaced; and a large and will be necessary for its complete restosum will be necessary for his complete resto-ration......A. company has, been formed for the purpose of creating. a landing-pier and slip, at Weston-super-mare, in the Bristol Chanael. The pier is to be of solid masonry, commensing from the junction of the Knightstone-road, continuing in a north-west direc-

4

tion to the Isle of Bearnbeck, passing over the island and extending into the channel to dead low water, the whole length being little short of a mile, and of the width of 30 feet throughout. The approach from the channel will be at all times at a depth of water sufficient to insure the safe landing of passengers, being at lowest point not less than 18 feet, and will give a safe, speedy, and cheap mode of communication to parties visiting or trading to the western, Welch, and Irish coasts. It will be so constructed as to afford a delightful promeenade to visitors and inhabitants. The engineer is Mr. Daniel Horwood, of Bristol.

THE IRON TRADE.

THE reduction of 2*l*. per ton in merchantiron, announced in our impression of this day fortnight, has been general throughout the South Staffordshire district. The present price is probably not higher than can be steadily maintained until some of the heavy orders for rails are cleared off. The speculation in pig-iron in Liverpool received a very serious check during the past week. Many of the needy holders have pressed sales, and large parcels of Scotch pigs have been offered at 75s. per ton. Early in March, purchases were made at 110s., and none of the makers would take orders under 120s.

The feverish state of the present year's market is expected to occasion the iron trade a permanent injury, from the fact that the Americans are now strenuously endeavouring to produce more iron. The produce of iron last year in the States amounted to 500,000 tons; the estimate for the present year is much larger; and in ten years it is calculated that the make will reach a million of tons, unless the fall in prices in Great Britain should be such as to render it cheaper for the Americans to purchase our produce than to manufacture for themselves.

A correspondent of the Glasgow Herald, who we are given to understand has good means of obtaining accurate information as to the present and future prospects of the iron trade of Scotland, says that the quantity of pig-iron made at present in Scotland will amount annually to from 400,000 to 420,000 tons. Of this quantity about 100,000 tons are used for the manufacture of malleable iron in Scotland; of the remaining 320,000 tons, 50,000 tons, or thereabouts, turn out to be what is called white or forge pig, which is not used for making castings, so that the present annual production of pig-iron in Scotland, suitable for foundry purposes, is 270,000 tons. There are ten new furnaces in the course of erection, some of which may be in blast this year. These furnaces belong to the present manufacturers of iron, and, when all in operation, will add about one-eighth to the present production; but, as the manufacture of maleable iron is on the increase in Scotland, a large additional supply of pig-iron will be required for this purpose. It is obvious, therefore, that the statements which have recently appeared, as to the increase in the make of pig-iron in Scotland, are incorrect; and it must be kept in view that, while the present makers are erecting new works, the preduce of the older ones must decrease, in consequence of the exhaustion of the supply of materials.

TO CURE THE DISEASES WHICH ARISE FROM THE USE OF LEAD IN CERTAIN TRADMS. — Take two baths of soap and water every week, occasionally adding a little sulphur, and carefully wash the uncovered parts of the body with soap and water at every interval between your working hours. You must drink one or two glasses of lemonade, made with sulphuric acid, every day, according to the greater or lesser quantity of dust or poisonous vapour with which the surrounding atmosphere may be charged. At the same time you should be more careful than the followers of any other trade, to abstain from the use of spirituous liquors. The efficacy of this preventive treatment is easily explained by the fact, that the mineral poison absorbed is thus converted into a soluble, and therefore innoxious salt (sulphate of lead), and the saturnine particles deposited on the surface of the bedy are taken away.

. jv. 2

BRITISH ASSOCIATION FOR ADVANCE-MENT OF SCIENCE.

THERE seems every reason for believing that the approaching meeting, to be held in Cambridge next month, will be brilliant and successful. A local subscription has been commenced with good spirit to defray the expense of the requisite preparations for receiving the association, and all the necessary arrangements are in progress. The attendance of distinguished foreigners is expected to be great. A programme has been issued to members, from which we learn that the general committee will meet on Wednesday, the 18th of June, at one o'clock, for the election of sectional officers, &c. From Thursday, the 19th, to Wednesday, the 25th of June, inclusive, the committees of sections will meet daily at ten precisely; and the sections will meet from Thursday to Tuesday at eleven precisely. General evening meetings will be held on Thursday, the 19th, and Wednesday, the 25th, at eight o'clock. A room will be provided for the reception of philosophical apparatus, and specimens of natural and artificial products, which may be brought for the purpose of illustrating particular communications, or for exhibition to the members generally. We would remind the public of what the Dean of Ely stated in the Town-hall, namely, that persons may be admitted to the sectional meetings only, on being nominated in writing by a member, and paying 1*l.*, and that ladies' tickets may be had, through the application of a member, on payment of the same sum. Strangers need be under no sort of appreheasion on the subject of lodgings: accommodation will be secured for them by the committee at a perfectly reasonable rate.

at a perfectly reasonable rate. One of the local papers says, "Extraordinary as the statement may appear, we claim credit for entire accuracy when we state that the Town-hall of Cambridge is undergoing a process of cleaning and smartening-up. The presenting of such a miserably shabby old place to the members of the British Association would have been a disgrace which Cambridge, we are glad to say, is now likely to escape. The plasterers, carpenters, and psinters are hard at work, aniting their efforts to make the place presentable, and in a week or two its most intimate friends will scarcely recognise it."

Correspondence.

BRICK AMATEURSHIP.

"Quot Homines, tot sententise."

S18, — Your correspondent, "Mr. John Phillips," is a thorough English amateur of brickwork, with all its "reticulated or decussated pieces of work, with interstices between the intersections," as Dr. Johnson has said on another occasion: but lest all the world in such case should be thought to let judgment go by default, because they do not offer any opposing opinion, I beg to say, as one of the architectural and fine-arts-loving public, that to my eyes nothing more outrages good taste and deforms English towns and English landscapes than these structures of brick-building amateurs, whose deformities in blazing rcd, dirty yellow, or plastery while, destroy the picturesque in eity, town, or country; and though I do not rejoice in unsound ucalls, yet I think it quite compatible with sound work to employ stucco, where marble or stone is precluded from necessary views of economy; and I hope and trust the day is fast arriving when people will only let brick walls be seen where they can afford to have nothing better.

Hoping to find more "sympathisers" on my side of the question than that of your worthy correspondent "Mr. John Phillips,"

I am, Sir, &c., W. MASON.

CEMENT ON IRON.

S1R,—I shall feel greatly obliged to any of your correspondents who will inform me of the best cement I can use for running mouldings on iron girders; I am afraid to use plaster of Paris for fear of corrosion.

I am, Sir, &c., U sm, Sir, &c., Worcester. SUBSCRIBER.

THE BUILDER - ----

Afiscellanea.

MOVEMENT IN SOCIETY OF ANTIQUABLES. At a meeting held on the 22nd inst., Dr. Bromel, in order to induce stricter attention to the business of the society than has latterly been given, handed in a draft for a new statute, enacting that the council shall meet at a cer-tain hour of one fixed day of every month (the first Tuesday for example), and that it shall not separate except by a vote of two-thirds of the members present. We are glad to find that the remarks which appeared in our last and a former number, have been received with the same kind feeling with which they were written. All agree that something must be done to meet the times and prevent disrup-One of the first steps should be to make tion. the library useful to the members, and facilitate access to it. At present it is very nearly useless.

CHURCH DECORATIONS .- The Bishop of Norwich, in his charge delivered lately at Woodbridge, says, with regard to this subject, that—"He admired the motive of those who sought to repair the ruined and dilapidated condition of those venerable places of worship, many of which were utterly unfit for the sacred purposes to which they were devoted. the advocates of a less-enlightened re-In this. ligion had displayed a zeal which those who boasted of a purer faith might have done well to avoid. He could not exactly comprehend the arguments of those who could oppose the development of their acquirements to their fullest extent in the service of Him from whom they derived their talents. On that ground he would encourage the taste for decorations, whether external or internal. Who could behold without gratification the finest specimens of art, whether architectural or pictorial, or regard without pleasure the productions of the painter or the sculptor, and not feel that religion had patronised these sister arts ? There was, he admitted, an antiquated objection to such decorations, because they had formerly been the objects of superstitious worship. In a previous age, when men's minds were under the control of superstition, when they were enslaved by the priesthood, such an argument might have had some weight; but in the pre-sent more enlightened era there was little foundation for such apprehensions. The friends of the Protestant church might now look without danger upon what had been once dangerous, and they should have no sympathy with the spirit which went forth as the de-stroyer of all that was beautiful.

WELSH LEAD MINES.—English manufac-turers derive great benefit from the Welsh mines; it is from the purity of the galena of lead ore, purer in Wales than any other, that the Staffordshire pottery has maintained its superiority in foreign markets, as it produces a finer glazing, and makes a more beautiful por-celain than any other. Wales is rich in fossiliferous marble,- the carbonate shell marble of South Wales, and the encrinitic of North Wales: the serpentine of the Rhos Kolin is equal to the verd antique of Genoa. It is not generally known that schools of metallurgic chemistry existed in Wales before the wars of Edward the Third: the college of Pherillt, in Dinaraon, on Mount Snowden, was celebrated for a school of this order that gave the British name of Celvydda Pherill to these arts; they were in possession of eminent books on these sciences, now lost. Another school of this order was founded in South Wales-a branch from Dinas Emrys .- Chester Chronicle.

BAZAAR AT COVENT GARDEN .--- The free trade bazaar having closed, the directors in-vited a large body of their friends to a musical promenade on Wednesday evening last, and provided them profusely with amusement and refreshments. We should not consider it our province to speak of the occurrence (admirably managed as it was), but that it gives us the opportunity of directing attention to the beau-tiful specimens of cast-iron from Colebrook Dale, which were exhibited and which equalled many French bronzes sold at three times the price. The Art-Union of London, who have materially assisted to advance the production of bronzes in this country, and are now about to aid the porcelain manufacture, would do well to turn their attention to these castings in iron, and to give those who have produced them, a commission for the purposes of the society.

NEW PAVEMENT .- The surveyors of Manchester have recently laid down, in Hanging Ditch, a novel kind of pavement, or rather a combination of macadamised stone, profusely intermixed with asphaltum. A local paper states, that from the time it occupied in its formation-twelve days and nights- it ought to be a really durable job: whether it will prove so, time alone can tell; but the expense has, no doubt, been much greater than the ordinary pavement would have been. The street has already attained great firmness and coliding solidity.

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our readers however, they are entered in a book, and may be seen on application at the office of "The Builder," 2. Nork-street, Covent-garden.]

For the erection of the Borough Gaol, Birmingham.

For the performance of the necessary works in the construction of a New Dock in the Borough of Kingston-upon-Hull.

For a quantity of proof chain 2; 1, 1, 1, 4, and inch, wanted by the Universal Salvage Company.

For Building the Carcasses of certain first-rate Houses, with Shop Fronts, in the new line of

Houses, with Shop Fronts, in the new line of Oxford-street, leading into Holborn. For executing Works on the Leeds, Dewsbury, and Manchester Railway, being a distance of about 44 miles. The principal work on this division is the summit Tunnel, near Morley, which is upwards of 3,000 yards in length.

For supplying the trustees for repairing Gros-venor-place, and the squares and streets adjacent, with the best Pit Flints, Kentish Rag-stone, Pit Gravel, Chalk, Aberdeen Granite Kerb, York Pav-

ing and Guernsey Granite, &c. For building Two National School Rooms, at Saffron Walden, Essex. For the erection of Schools, and a Master's

House, and also a new Farm-house and Offices, on the Estate of the Rev. E. K. Benyon, near Bury St. Edmunds, Suffolk.

For constructing about 450 feet of new Wharf, along the River-side, in the Town of Wisbeach, and for erecting a new Crans and Wardhouse for the Corporation of Wisbeach. So and Wardhouse for For the erection of Farming Premises, at Brad-field Combust, near Bury St. Edmands.

For supplying, laying down, and bedding, in proper Mortar, any quantity that may be required, not being less than 1,000 feet run of Aberdeen Kerb, 12 inches by 8, and not less than 7,000 feet (super.) of York Paving, two and a balf inches thick, the Commissioners of the Kentish Town District.

For supplying the Commissioners of Kentish Town District with Materials for Road-making. For the Repairs to the South Aisle, Roof, &c., of

St. Jame's Church, Bury St. Edmunds. For Building a Sewer in the King's Road, St. Pancras, of the dimensions of 4 feet 6 inches by 2 feet 9 inches, for a length of 250 feet.

For the supplying of certain Mines in Cornwall, for twelve months from Midsummer next, with Nor-way Timber, half Dram and half Longsund, of good quality and average length. The probable quantity required is 710 loads.

For Line-washing and Plastering (when re-quired) twice in the year, the interior of the Union Workhouse, Long Ashton.

COMPETITIONS.

Plans, sections, and elevations for a Termin and other requisite accompanying offices, for the Great Southern and Western Railway, Ireland.

A premium of 80 guiness will be presented to 68 party offering the best plan of Docks, capable of admitting ships of 1,000 tons burden, to be special at Burnham, in the Bristel Channel.

263

Designs for houses to be erected at Dow . . ground is nearly seven scree in extent, and lies one ground is nearly seven scree in extent, and lies one gentle slope between the south-west boundary of Dover Castle and the town. A premium of fifty guiness is offered for the set that may be most approved of.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

The timber and other trees now standing upon the estate at Woodseaves, Salop. By order of the Lord Chancellor made in the cause "Dickin s. Barker.

Barker," At Eversden Wood, Cambridge : 80 Oak Timber Trees, clean, sound, and of useful dimensions. At Bourn, Cambridge : a capital Fall of prime Oak Timber, comprising about 100 Trees of good

dimensions.

At Monik Sherborne Brick Kiln, Basingstoke, At Branden, near Coventry: several Thousand prime Oak Trees, and a quantity of Phanke and

Quarterings.

At Winston, near Debenham, Essex : 400 feet 14-inch Elm Plank, 400 feet 14-inch Ash ditto, 600 feet 2 insh, 24-inch, 35-inch, and 4-inch ditto, 21 4-inch Beech Planks, 120 feet Sycamorn Quarters, &c.

At Eversden Wood, Cambridge ; 110 espital clean Oak Timber Trees; all lying close to good roads, and are acry long, straight, and clear, At Bourne, Cambridge : 63 Oak Timber Trees;

many of them are of very excellent quality, of great length, and particularly clean and straight. At Waybridge Wood, near Ellington ; a consi-derable fall of Oak Timber in Honey Hill and

Lower Woods : the whole being of large dimensions

and excellent quality. At Halstead, Essey: a quantity of clottal Ook Timber, &c.; in Great Spanacy's Wood, Wear Halstead, and to make sid attwitted order Halated, and to make all astronomy inter-

DUTY OFF ORNAMENTAL WINDOW GLASS.

CHARLES LONG begs to inform his Friends and the Public, that he can now supply Orna-mental Glass from 1s. 3d. per foot superficial; and borders from 9d. per foot, run; and having just built two of the largest Kilns in London, is enabled to execute extensive Orders with unprecedented dispatch, 1, King-street, Port-man-square.—Terms, Cash only.

DUTY off WINDOW GLASS. — On April the 6th, Squares stouter and of better make than formerly for Glazing purposes at 6d. per foot.

than formerly for Glazing purposes at 6d. per foot. NURSERYMEN, MARKET GARDENERS, AND OTHERS requiring Small Glass, will find a greater variety of aizes (a large Stock of which is constantly on hand) than is kept by any other house in London, from 4d. per foot. Flattened Sheet, Stained, Fluted, the BIRMINGHAM Sheet Plate (superior in all respects to every other make), and Ornamental Glass of every description. Complete Lists of Glass, Lead, Colours, &c., at ready-money prices, may be had (gratis) on application to R. Cogan, at the Western Glass, Lead, and Colour Warehouse, 5, Prince-street, Leicster-square, London. SLIMUVOUNS CONTRACTORS FOR DIFFLIC

SURVEYORS, CONTRACTORS FOR PUBLIC WORKS, and the TRADE generally, sending specifica-tions of quantities required, will receive by return of post an invoice at the very lowest cash prices.

A parcel of very Superior Spruce Oker, suitable for PLASTERERS AND PAINTERS, to be sold at 6s. per cwt.

MARTIN'S PATENT CEMENT. TO ARCHITECTS, BUILDERS, AND PAINTERS IN FRESCO.

FIRESCO. STEVENS and SON, PATENTEES and SOLE MANUFACTURERS, beg respectfully to announce that this beautiful cenent has now arrived at a degree of excellence far surpassing their most sanguine expectations. For all internal work it possesses a great superiority over every article hitherto in use; it is now being used extensively by Government in the British Museum and other public buildings. IT DOES NOT THROW OUT ANY SALT, but presents a beautifully plain and perfect surface, which may be painted upon dry work within four days without peeting. It is equally applicable for walls or lath, for mouldings, architraves, skitnig, or flooring; and is admitted to form the best ground for fresco painting, having been used for many of the prize frescos lately exhibiting in Westminster Hall. It will bear an intense heat without cracking, and for hardness, durability, and economy, cannot be equalled. 186, DRURY-LANE, LONDON.

186, DRURY-LANE, LONDON. Agent for Liverpool and Manchester, Mr. R. Part, 11, Atherton's-buildings, Dale-street, Liverpool.

THE BUILDER.

A FRINSON'S CEMENT.—The public is respectfully informed, that the price of this very ex-cellent Cement, which has now been in use for Architecture and Engineering works upwards of thirty years, is reduced to 2s. 3d. per bushel, and may be had in any quantity at Wyatt, Parker, and Co.'s Wharf, Holland-street, Surrey side of Blackfriars-bridge. N.B.—This Comment bushest of the street of the s TKINSON'S CEMENT .- The public is

N.B.—This Cement being of a light colour, requires no arti-ficial colouring or painting, and may be used for stucco with three parts its own quantity of sand.

To ENGINEERS, ARCHITECTS, AND BUILDERS. TO ENGINEERS, ARCHITECTS, AND CEMENT. -The Metallic Sand, from its chemical qualities, forms, when mixed with blue lias lime, a metallic cement of great strength and density; the iron, which is one of its deposited, and communicating to it a greater degree of hardness than can be obtained by admixture with any other known material. Concrete and mortar in which the metallic sand has been used are more durable than any other, continuing to indurate with time, and not being affected by damp, otherwise than by increasing in hard-ness from the oxydation which is thereby occasioned. Employed as a cement to turn water from birkwork in tun-nels, sewers, and other underground works, the Metallic Sand is found cheaper, and from its eminent albesive gualities to form a nore solid and hydraulic body, in com-bination with the brickwork, than any other cement at present substitute for pozzolano that has ever been presented to the public. As an external stucco, the Metallic Cement assumes a rich stone-colour without the aid of paint or tint of any kind, does not vegetate, and is entirely free from cracks and durability by exposure to the weather. The Proprietors refer with confidence to works in which the Metallic Sand has been extensively employed as concrete and mortar, specified in the prospectus, where also will be found refe-rences to very extensive erections which have been stuccoded with the Metallic Cement. Further information will be given, and specimens shewra, on application to Mr. C. K. Dyer, 4, New Broad-street; and

Further information will be given, and specimens shewn, on application to Mr. C. K. Dyer, 4, New Broad-street; and at the Metallic Cement Wharf, King's-road, opposite Pratt-street, Camden New Town.

Keer, canner new rown. **KEENE'S PATENT MARBLE** to refer to the British Museum, the Royal Exchange, the new works at Bethlem Hospital, Greenwich Hospital, and the Co-liseum in the Regent's-park, as buildings finished or in pro-gress, in which Keene's Cement has been used as an internal stucco. Its superiority to common plastering consists in its extreme hardness, and the rapidity with which it dries, which qualities fit it to receive paint or other finishing sooner than other water Cement. When employed for skirtings, architrave, and other mouldings, in place of wood, it checks dry-rot, is impervious to vermin, prevents the spread of fire, and is more eco-nomical in its application than the material for which it thus becomes the substitute. Confirmation of these statements is to be found in the slmost universal adoption of Keene's Cement for Skirting and Hall flooring in the new houses on the fiftee Park Estate, where its application is to be seen to the fullest advan-tage. In Liverpool and Manchester, Keene's Cement has in

Where its application 2 are tage. In Liverpool and Manchester, Keene's Cement has in several cases been used for the covering of the fire-proof warehouse floors, where its lightness and hardness give it the preference over tiles and flazging, which are much heavier, and necessarily leave the floor intersected with numerous joints, whilst Keene's Cement is laid down in one unbroken surface.

Surface. The high polish and marble-like hardness of which this Cement is susceptible render it the most suitable material for the manufacture of Scagliola. Patentees, J. B. WHITE & SONS, Millbank-street, Westminster, Manufacturers of Roman and Portland

Depôt in Liverpool, 36, Seel-street ; James Woods, Agent.

O ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MER-CHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL. то

JOHNS and CO.'S PATENT STUCCO JOINTS and CO.'S PATENT STUCCO CEMENT.—The following are the positive advantages possessed by this Invention over every Cement hitherto in-troduced:—It will effectually resist Damp. It will never vegetate nor turn green, nor otherwise discolour. It will never crack, blister, nor peel off. It will form a complete Stone casing to any Building covered with it. It so closely resembles Stone that it is impossible to detect it. It never requires either to be painted or coloured. It will keep fresh and good in the cask in any Climate for any number of years. It is the only Cement that can be depended upon for export. It is the only Cement that can be depended upon for export. It is the only Cement that can be used with confidence by the Sea-side. It may be used in the hottest or coldest Climates at any season. It will adhere to any substance, even to Wood, iron, or Glass. It will carry a larger Proportion of Sand than any other Cements begin to perish. It may be worked through the Winter, as frost has no effect upon it. It may be used on the Inner Walls of new Houses, which may be papered over or painted directly. Roofs laid or pointed with this Cement will remain undamaged by the severest Storms. Any Plasterer may apply it, the Instru-tions for use being very clear and distinct. The first cost of this material does not exceed that of the cheapest Cement now in use; but with all the above-named extraordinary and valuable advantages, nothing can approach it in point of economy. Architects and Builders who have used this Cement have

economy. Architects and Builders who have used this Cement have declared that it requires only to be known, to be universally performed. preferred.

declared that it requires only to be known, to be universally preferred. Specimens may be seen, and a Prospectus fully describing the Cement and its mode of application, together with a volume of Testimonials from every part of the Kingdom, may be obtained on application to MANN and CO., SOLE AGENTS for the Patentees, 5, Maiden-lane, Queen-street, Cheapside, London: of whom also may be had, JOHNS and CO.'S PATENT STONE-COLOUR STUCCO PAINT, expressly intended for Painting over ex-terior Walls of Houses that have been covered with Roman or other Cements, and which have beene dirty and disco-loured. It is in every way better suited for this purpose than White Lead Paint, which will frequently come off in flakes, MESSIES. JOHNS and CO.'S PATENT PAINT having an affinity for Stucco, binds itself with it, stopping the auction, thereby rendering a pure stone-like effect, produceable by no other Paint whatever. It is cheap in its application,—and may be used by any Painter, in any climate, even in the most exposed Marine situations.

PUBLICATIONS.

Just published, price 5s., neatly bound in roan, with tuck, gilt edges, and lettered, a Pocket Edition of CYCLOPÆDIA of the NEW ME-TROPOLITAN BUILDINGS ACT, together with the Act itself, a Folio Table of the Metropolitan Districts (old and new), a List of the Surreyors, with their Residences and Offices, and a Table of Fees to be paid to the Registrar for services performed. In the Cyclopædia all the details of the Statute are arranged Alphabetically, so as to be instantly found, and accompanied by extensive references and counter-references to the sections of the Act itself and its minute provisions.

By the late A. BARTHOLOMEW, Eaq. F.S.A., Architect, Surreyor of the Hornsey Dustrict. Published at the Office of "The Builder," **3**, York-street, Covent-garden; and to be had of all Booksellers.

Just Published, a New Edition, Price 4a. AXTON'S BUILDERS' PRICES, con-taining the alteration of the prices in the GLAZIER in consequence of the remission of the duty. ATariff of Plate Glass is given, shewing the prices of plates from 12 by 12 to 84 by 140 inches. This work contains nearly 11,000 PRICES and MEMORANDA, and the whole of the new Metropolitan Buildings Act.—To be had at the office of "The Civil Enzi-neer and Architect's Journal," 145, Strand; Weale, High Holborn; and Simpkin and Marshall, Paternoster-row. * The new prices of the Glazier, price 6d. can be had separately.

separately.

THE ART-UNION, Monthly Journal, for June, contains a Critical Notice of the Exhibition of the Royal Academy, with Remarks on between four and five hundred of the Works of Art therein contained, and serving as a Guide to the Visitor. The Art-Union also contains a Series of Twelve Large Woodcuts, illustrative of a Visit to the Louvre, being copies of the best pictures contained in the Salon, 1845. Also, an Example, beautifully executed in Lithography, of the School of France. Also, four pages of Engravings, from the Shakspeare Illus-trated, by Kenny Meadows. Also, an illustrated Essay on Head-dresses in England, from the earliest times.

trated, by Kenny sceauows. Also, an illustrated Essay on Head-dresses in England, from the earliest times. And also sundry engravings, illustrative of the Progress of Manufactures in England. May be obtained of the publishers, Chapman and Hall, 186, Strand; S. Clarke, publisher, 13, Pall-Mall East, oppo-site the Royal Academy; or by order of any Bookseller.

ANALYSIS OF GOTHIC ARCHITECTURE. ANALYSIS OF GOTHIC ARCHITECTURE. This day is published, No. 12, containing five plates, impe-ral 4to, and a List of Subscribers, price 2s. 6d., AN ANALYSIS OF GOTHIC ARCHI-BIANDON, Architects. The object of this work is to illustrate in a practical man-ner the various features of Ecclesiastical Architecture, inclu-ding roots, metal works, &c., &c. Pelham Richardson, 23, Cornhill; and all booksellers. Review.—"This work contains five excellent plates in line Lithography, which are well and professionally got up, with every requisite section of moulding and plan and details."— The Ecclesiologist. "A cheap and valuable periodical."—P. A. Paley's Guide to the Churches round Cambridge.

THE CHEAPEST ILLUSTRATED PUBLICATION IN THE WORLD. Yesterday was published, price One Penny, with Numerous original Woodcuts, No. 15 of

THE LONDON JOURNAL, and Weekly Record of Literature, Science, and Art. CONTENTS: -1. Narrative of an Arctic Voyage-2. Disraeli's New Work-3. Etiquette for the Million, by G. W. M. Rey-nolds-4.  BRITISH CHURCH ARCHITECTURE.
 MANUAL of GOTHIC MOULDINGS:

 a Practical Treatise on their Formations, Gradual Development, Combinations, and Varieties; with full directions for copying them, and for determining their dates.
 Illustrated by nearly 500 Example. By F.A. PALEY, M.A., Honorary Scretary to the Cambridge Camden Society. Other Works by Mr. Paley.
 The CHURCH RESTORERS, A Tale. Treating of Ancient and Modern Architecture and Church Decorations. Foolscap 800, 48. 6d.
 An INTRODUCTION to the STUDY of EC-CLESIASTICAL ARCHITECTURE and ANTIQUITIES.
 With many Illustrations. In Preparation. Other Works on Ecclesiology.
 BAPTISMAL FONTS. A Series of 125 Engravings, examples of the different Periods, accompanied with Descriptions. With an Introductory Easay by Mr. PALEY.
 INSTRUMENTA ECCLESIASTICA. A Series of Working Designs for the Furniture, Fittings, and Decorations of Churches and their Precinets. Edited by the Cambridge Canden Society. In Parts, price 26. 6d. (seven published), each containng sit quarto plates, with Descriptions; to be completed in one volume.
 WINDOWS of the DECORATED PERIOD.
 By EDMUND SHARPE, M.A., Architect. Each part, price 26. 6d., contains eight examples selected from the acompanying descriptions; the seventh and eighth parts will conclude the volume, and will be introductory, illustrated by wood-cuts, sections, &c.

conclude the volume, and will be introductory, management wood-cuts, sections, &c. PERRAN-ZABULOE; with an Account of the Past and Present State of the Oratory of St. Piran-in-the-Sands, and Remarks on its Antiquity. By the Rev. W.M. HASLAM, B.A., Resident Curate. Foolscap &vo., 4s. 6d. John Van Voorst, 1, Paternoster-row.

BED FEATHERS.—DUTY FREE.— HEAL and SON base reduced the price of Foreign Feathers the amount of the duty, and they can now ofter— Heat White Danzie 2a. 10d. | Heat Foreign Greys 2a. 0d. Irish White Gouse 2a. 0d. | Irish Grey Gouse.. 1a. 6d. Beat ditto 2a. 6d. | Best ditto 1a. 9d. Poultry...... 1a. List of prices of every description of bedding sent free by post.

by post. HEAL and SON, 196, opposite the Chapel, Tottenham-court-road.

HEN fatally destructive fires occur, such as those which during the last ten days have violently excited London, much is said about precautions and preventives; fire-

engines are put into working order, and fireescapes are shewn to answer perfectly well when applied experimentally, coolly, and quietly to a house not in flames. In another week the greatest apathy prevails, and continues till the destruction of more lives and property again causes some excitement on the subject, as temporary, however, as that which preceded it.

And all this time, even when fire-escapes are most talked about, and men, till that time improvident, are rushing to insurance-offices to prevent loss of - money, we continue to build houses as if to burn,-houses without a single means of egress besides the door,-houses of such a construction that, if once on fire, the chances are a hundred to one that all the interior must be destroyed.

The application of advice and moral precepts seems little regarded : "Thou art the man," must be whispered in our ears many times before we see the personal value of the lesson. That a similar event to that of which we have deplored the consequences in the family of another may happen to us, seldom enters our mind or leads us to adopt preventive measures.

The outlay for the latter is certain, though small; the danger, though great, is supposed to be doubtful, and the majority are willing to depend on the doubt.

Old Sir Henry Wotton says, "Every man's proper mansion house and home, being the theater of his hospitality, the seate of selfefruition, the comfortablest part of his owne life, the noblest of his sonnes inheritance, a kinde of private princedome; nay, to the possessors thereof, an epitome of the whole world; may well deserve by these attributes, according to the degree of the master, to be decently and delightfully adorned." Even much more so, however, ought it to be rendered SAFE, to the extent of his power, so that he may retire to rest without fear of being buried in its ruins or barnt in his bed.

For many years writers have urged the importance of rendering buildings fire-proof, but up to this time nothing has been effected. Count d'Espie's essay, " Manière de rendre toutes sortes d'Edifices incombustibles; ou, Traité sur la Construction des Voutes, faites avec des briques and du plâtre, dites voutes plates; and d'un Toit de brique, sans char-pente, appellé Comble Briquetè,"* has given a isist to modern architects in another respect, thas not led either to the adoption of the he proposed or of any better. A writer 1775, in a pamphlet called "Various Me-ods to prevent Fires in Houses and Shipiog," says,-

"As the city of London is so famous for merce, and merchants of experience and mibility, they ought to shew an example to her places to keep up their fame, honour, d credit in every thing that is convenient d elegant relating to trade and navigation.

Published at Paris in 1754, and immediately afterwards acdon, as translated by L. Dutens.

THE **BUILDER.**

Amongst such a number of gentlemen, learned and experienced architects, ingenious builders and craftsmen (who have both increased and improved the buildings of this metropolis beyond the common thoughts of men and the romantic ideas of imagination, where no expense is spared by our nobility and gentry to improve the plan), decorate the building and furnish the apartments, so noble, beautiful, and magnificent, far surpassing the very fancy and fairy-tale romances of our venerable forefathers.

But so strange and unaccountable are the little frailties of human nature, after all these expenses, decorations, and magnificence expended on the costly edifice, among a society of men, so sensible, learned, and ingenious in their several professions, there never was a single idea, or the plan of an hour's thought adopted, to secure the building or the family, who were continually surrounded and living in the middle of combustible wood, from falling a sacrifice to the most trifling accidents of fire; which building and family lieth every night in the year at the mercy of a drunken fellow, with the snuff of a candle, a handful of shavings lying in a bye corner, a little thoughtless boy and girl, or a sleepy servant-maid drying linen at the kitchen fire, besides many malicious accidents, to be entirely burned down and consumed before the morning. Many people wonder that a strong-built house should be so easily consumed ; but this wonder ceases when they consider that every thing about us is liable to catch fire; our houses are floored, our rooms partitioned, and the roof covered with fir, a wood full of turpentine, and enriched with two or three coats of painting in oil; besides all our furniture naturally made of wood, without the least material or contrivance to check its fury or prevent its rapid progress in the apartments, or to give us half an hour's warning to consult our reason or friends how to act with safety, in these pressing moments, against such a furious, merciless enemy. These are plain convincing proofs, that the master of every house and family, great or small, in town or country, should endeavour to make use of every precaution that art and nature can furnish to secure himself, his family, and substance from falling a prey to fire, or the sad misfortunes attending fires, to guard against these terrible accidents with all the care and thought of human prudence, to make us and our families live and sleep with safety in our houses, without the fear and dread of falling a sacrifice to these momentary accidents.'

The same writer proposed that iron plates should be nailed on the ceiling, doors, and sides of the room, especially on the partitions where lath and plaster are usually fixed. He further suggested that tiles might be used for the partitions and floors, instead of iron plates.

Various solutions have been proposed to render woodwork fireproof, and more recently iron joists, plates, and roofs have been invented and are-not used. Even the most simple preparation for escape by the roof is, in many cases, not made; and where it is practicable. so little thought is given to it, that in the event of accident, the means of getting to it would be found wanting in the majority of instances.

The Examiner, in an article on this subject, suggests that a sure and easy escape from every floor in rows of houses, may be obtained by means of balconies to bed-rooms fronting the street, as well as to drawing-rooms. "In the event of fire the weak and the aged would only have to step out on their balconies, and to pass over to that of the next house, with as little difficulty as getting over a stile. But then | side of the straits.

the objection is started, that such a mode of communication might be used for improper purposes. The drawing-room balconies, running contiguous, as they do in many streets, might be so used now; but it is not found that they are so used. The communications over the house-tops allow of abuse, but no inconvenience is experienced. A Pyramus and Thisbe might certainly make balconies dispense with a hole in the wall; but the question is, whether the danger of easier access by gallants here and there, or the danger of death by fire is the greater evil ? 'Where there's the will there's the way.' If people have resolved to come together, it will not be the want of a communication by a balcony, or the existence of it, that will determine the result; and we repeat that, to the extent to which such communications now exist-the space of a foot or two between not making a separation except to the eye-they are not found to be attended with any inconvenience to privacy or detriment to morals. On the other hand, there is to be considered their service to humanity, as the easiest and surest fire-escape. With balconies to the second-floor rooms of the generality of London-houses, the means of escape would be sufficient; the third floor, or the garrets, having the escape by the roof. Considering the common danger of fire, the great dread of it, and the deficiency of contrivances for escape, the expedient we suggest is entirely deserving of consideration."

What we are anxious to urge, however, at this moment is, the prevention of fire rather than the means of escape from it,-the avoidance of the immense annual loss to the community caused by its ravages, and the amount of suffering and degradation which follows. The subject calls for the most serious consideration of all who dwell in this " huge city of tinderbox habitations," and involves a number of points which we shall hereafter discuss.

As regards public buildings and edifices wherein large numbers of persons are brought together, no words are too strong to be used in condemning the want of provision in this respect. Hospitals, union workhouses, and other similar structures should invariably be made incombustible to the greatest practical extent. The new Buildings Act wisely provides with regard to these, and other public buildings within its jurisdiction, that the floors of the halls, corridors, passages, stairs, and landings, and all other ways of ingress and egress within the building, to and from all rooms or apartments used for public congregation, and all galleries connected with such room or apartment, must be wholly supported. made, and finished fire-proof. This will increase the chance of escape for the inmates; but we hope before long to see such a system of construction adopted, at all events in public buildings, as will render a general conflagration impossible.

We refer our readers to a communication on the same subject in the following page.

AERIAL TUNNEL OVER THE MENAL.-The project noticed at page 237 ante, to throw a hugh tube composed of sheet-iron across the Menai Straits for the transit of a railway train, has, we understand, been abandoned, owing doubtless to the probable disastrous effects of a gale of wind pressing upon such an extent of surface as so large a tube would necessarily present. It is in contemplation, we believe, to erect in its stead two bridges of solid construction, both of them uniting on the Britannia Rock, and to throw out piers from each

THE LATE CONFLAGRATIONS IN EUROPE AND AMERICA. BY J. L-**-**v.

"Thoughts must be-thought."

HOWEVER absorbed-nay dissolved men of the present age may be in matters of immediate the present age may be in matters of *mandealable* and momentary import; still, the Royal Ex-change, the Houses of Parliament and the Tower—Hamburg in fine, and Pittsburg, must startle the most placid and languid mind; events, to which the latest awful loss of life in Darm stread (and one was previous in Or. events, to which the latest awful loss of life in Dover-street (and one year previous in Ox-ford-street), form not less pitiful appendages. If such (material) losses of property, were to be considered merely in their material bearings — which, however, is always wrong — we might say, fifty millions sterling have, in these instances, been burnt, and if, say, a gold mine, or gold mines might have been discovered contemporaneously with these events—well, then the losses would have been repaid, restituted. But such is not the case. repaid, restituted. But such is not the case. Such conflagrations entail not merely material, but moral and social evils of the greatest import—and it is the duty of the "science of public architecture" (Staat's - Architektur), as well as other branches of public good, to consider these events attentively, and to devise, if possible, means against their recurrence. Amongst the moral and social evils, concomitant of such awful catastrophes, are to be reckoned—the loss of careful and loving parents and guardians, the interruption of education and domestic habits of a number of children—in fine, *all* the numberless evils following a more or less protracted existence of poverty, discomfort, disorder. Alluding here-by chiefly to the case of Hamburg and Pittsburg (at which latter place alone forty millions of dollars of property were consumed) — we may be told, that these cases are so distant, either in time or space, that they hardly deserve attention. How much, however, would that thus have deserved, who would have written thus at Pittsburg, before it was burnt ! God forbid, that we should wish to portend any such catastrophe to any place in these realms, or elsewhere. "As long, however, as the same causes exist, equal effects may be anticipated, or at least apprehended."

To speak boldly and unflinchingly-the main cause of all these (material) catastrophes, is the material tendency and belief of the age. We grasp at nothing but immediate, momentary enjoyment; and, therefore, it is so as we wish it to be-immediate but momentary; without any sure and safe basis, save its insecurity. As archi-tecture, however, is an important radius of this, or any other social and civilized condition—it is in its restoration, regeneration, that a more stable, sounder, securer state of society is also to be sought for. Let those who study (!) architecture, look at the work of Antonio Bosio — Roma sotterranea. Why, Why, they will see that the great sewer called Cloaca they will see that the great score called Cloaca maxima has been built by those sinewy ancient Romans with a greater degree of strength and solidity, than we moderns give (aye, and ever can give) to our royal palaces. Such really are (to approach near Pittsburg and Hamburg) the Doganas and Alfandegas of Genoa, Venice, Lisbon, &c. But we mo-derns the a slate and calculate thereon our derns take a slate, and calculate thereon our seven per cent., or nine and a half per cent., as the thing most essential. And then we call for some cobbler or botcher—because the architect builds for ages, and not days—and on he goes, to glue and patch together some struche goes, to give and patch together some struc-ture of gingerbread and pasteboard, as it were. Such are these warehouses, which have been, of late, subject to *periodical* conflagrations at Liverpool, etc. In fact, after the lady of a member of the legis-lature has been burnt in one of the best hotels of the metropolis-we are sorry to confess, that hardly any one is secure from similar accidents; and we call again upon those who have seen Italy, nay even Germany, to say, whether such could happen in any of the *locandas* or hotels of Rome, Naples, or even Frankfort. After such confagrations here, the houses present, almost generally, a gutted appearance, and even the staircase (made by contract of the most futile deal boards) has completely disappeared. Out of such structures, some one may get out his 71 per cent.; but those be-widowed and be-orphaned persons who have remained behind, have no bank to draw upon for any reasonable sort of palliation or consolation.

It is, consequently, the sacred duty of any architectural journal, which understands its high vocation, to strongly (albeit charitably and conciliatorily) protest against such a state of affairs, and to devise means how we moderns, without losing any of the advantages of modern civilization, can revert (retrograde?) to that solidity, and beauty, and sterlingness, which bursts on our eyes whenever we behold the structures of antiquity, be they even of the most common or subordinate use.

THE PRACTICAL STUDY OF GOTHIC ARCHITECTURE.

THE popular author of Coningsby, in a novel* lately published, has said, "The monks were great architects :--not the faintest idea is generally prevalent of the appearance of England before and since the dissolution ;—in England and Wales alone there were of these institutions, of different sizes—I mean monasteries, and chantries, and chapels, and great hospitals — considerably upwards of three thousand, all of them fair buildings, many of them of exquisite beauty." Our own opinion is, that the number of churches and buildings, judging even by the remains alone, is here considerably underrated. Standing on an emi-nence in any part of England, or with the map of any county before us, we can mark out a of any county before us, we can mark out a very great number of churches, all of them containing matter to interest and instruct, whilst the larger portion exemplify the best characteristics of Gothic architecture. The almost exclusive attention which, from their elaborate decoration and extent, the cathedrals and larger churches have absorbed, has prevented our paying to the humbler structure of the village, that due consideration so essentially requisite to a correct estimate of the value of the style. We hesitate not to say, that our wonder is more excited, and our admiration of the zeal of the old architects more commanded by the village churches of England than by the cathedrals-until within the last few years the only objects of investiga-tion. That cathedrals and colleges, monasteries and hospitals should rise in all the richness which wealth, and the resources of the art could command, was rather a thing to be expected, from the influence which each body of clergy possessed over a large circle of surrounding country. Thus no design was deemed too vast to be carried into execution : stone and timber acquired without expense, contributions from the dying, command of vast revenues, and the exertion at all times of every engine, which a powerful priesthood could so well call into play, added to the constructive skill of the freemasons, led to the completion of projects, the mere mention of which now would be heard with astonishment or ridicule Confident that others would finish what had been so sumptuously commenced, the medieval architects on the continent conceived projects of such immensity, that the reformation and the change of taste occurred ere the work had arrived at a conclusion. But that every village should possess a church, in whose features we recognize the same ardour in matters relating to religious worship, with corresponding scientific skill and elegance of design, only modified, and that most admirably, by the smaller resources and wants of the community -that in every obscure hamlet was the same spirit which animated the builders of cathedrals such as York and Salisbury,-is matter for admiration and amazement!

In a former number of this journal, t we endeavoured to urge the importance of a more careful examination of ancient models than architects are generally in the habit of devoting. Such an extended examination as we advocate would occupy more than a few months, but would probably afford an exact comprehension of the principles which guided the master architects of the middle ages, finally resulting in the practice of a style, at enmity with the true principles of pointed architecture, yet, at the same time, unmarked by that tame, fac-simile imitation, which is the staple of modern professors, which is acqui-esced in by them, and is too much fostered at our universities. To copy a window from this cathedral, and a buttress from that church is not the straight road to architectural excellence, nor the best means of supporting the

dignity of the professor, and advancing the progress of the art:--the proper value of ancient models is not shewn in imitating them after the Chinese manner, but is rather-in combinations and suggestions from many examples,-to produce works truly original, in conveying no suggestion of their origin, or of the course by which they were arrived at. And here we cannot quote from the "Discourses" of Sir Joshua Reynolds without expressing a wish, that architects would apply the princi-ples, which he endeavoured to inculcate, and which are as much applicable to their art as to the kindred one of painting. After speak-ing of the advantages to be derived from works of art, he says, "From the remains of the works of the ancients the modern arts were revived, and it is by their means that they must be restored a second time. The fire of the artist's own genius, operating upon those ma-terials which have been thus diligently collected, will enable him to make new combinations, perhaps superior to what had ever before been in the possession of the art; as, in the mixture of the variety of metals, which are said to have been melted and run together at the burning of Corinth, a new, and till then unknown metal was produced, equal in value to any of those that had contributed to its composition.†

The stay-at-home architects, who study from "the Glossary," and design with Britton's and Pugin's works upon the table, have entirely mistaken the character of Gothic architecture. They have fostered an opinion, not yet done away with, that the style is necessarily an expensive one, while they have begotten a an expensive one, while they have begotten a manner, unlike any preceding, and inconsistent with all correct notions of propriety. The same pinnacles from Beverley minster or Salis-bury cathedral—the same door from King's College chapel—all which they had never seen except in engravings—they have repeated again and again in church and meeting house, even in encode where for the cases where funds would barely suffice for the most ordinary objects. Had these "gentlemen of England" studied the true character of of England " studied the true character of pointed architecture, where it only can be learnt, from the building itself, they would have discovered that every variety of eccle-siastical structure had a peculiar purpose, and was erected in a peculiar manner. They could not have foiled to learn that it was proper to not have failed to learn, that it was proper to impress a character upon each in accordance with its purpose, its situation, the component materials, the general amount of decoration, and the total cost. The parapets and pinnacles, which may be excellent in the cathedial, might be quite out of place in the village church, and the very mouldings may be re-quired of different design. In the latter structure, except in the case of a small oratory or chape the building always scems to have been de-signed for the locality, and not, like many of our modern Gothic churches, as though transported from some other place. It is a key to the history of the neighbourhood, and of the people who there dwelt; and whilst the oratory was who there dweit; and whilst the oratory was enriched in a degree becoming the wealth and lineage of the lord of the manor, the nave was unadorned, and accordant with the condi-tion of the tillers of the soil. To erect a town church in the country, and a village church in a crowded thoroughfare, is often destructive of the *genius loci*, and convictive of an artist the genius loci, and convictive of an entire ignorance of the unerring rules of art. Plan and elevation, perspective outline, and the pro-portion of parts, details of battlement, basemould or string course, all should receive the greatest degree of attention from the architect. The education required involves a larger outlay of time than most architects are prepared to devote thereto; and thus, " content to dwell in decencies for ever," many exhaust their single idea in every church they have to execute, whatever be its situation and other circumstances of the case. A painter does

^{*} Sybil, or the Two Nations. † Vide page 217 ante, art. "Ancient Models."

[†] In another place we find the following :--^w I cannot help imagining that I see a promising young painter equally ni-gilant, whether at home or abroad, in the streets or in the fields. Every object that presents itself is to him a lesson. He regards all nature with a view to his profession, and com-bines her beauties, or corrects here defects. He examines the countenance of men under the influence of passion, and often catches the most pleasing hints from subjects of tur-bulence or deformity. Even bad pictures themselves supply him with useful documents; and, as Lionardo da Vinci has observed, he improves upon the fanciful images that ar sometimes seen in the fire, or are accidentally sketched upon a discoloured wall. The artist who has his mind thus filled with ideas, and his hand made expert by practice, works with came and readines."-Reynolde's Discourses on Painting.

not learn the practice of his art from engravings, nor a sculptor from models in minia-ture, nay, in architecture, the actual examination, in Italy and Greece, of the beautiful structures in those countries, is deemed all but essential to the acquirement of a correct taste. But in the Gothic style, which has taken the place of every other for ecclesiastical pur-poses, we are content to learn at second-hand poses, we are content to learn at second-hand from mere graphic illustrations, or from a day's visit to a cathedral; though at our very doors are the best teachers — models with which the land abounds, and capable of adaptation to every object in ecclesiastical architecture. The importance of a complete examination of ancient models is more especially to be urged in Gothic architecture, in which the variations are so numerous, and comparatively so little understood, and in which the true value of precedent is so much a matter of speculation. Whilst our knowledge of actual examples is w nuss our knowledge of actual examples is so meagre, we are restricted to the constant repetition of some few details, for which we know there is authority; but a familiarity with all existing details might produce a style in which originality would of mone characteristic, or which would at least present a greater variety of forms than are at present met with.

Every lover of Gothic architecture should be a good pedestrian : thus his attention will not be confined to the towns which lie on the line of railway, but, knapsack on back and sketch book in hand, every mine will be open to his researches, and every store for him to glean An enthusiast-and what student is therest. therest. An enchusing and what student is not-will discover a new pleasure, such as Xerxes never dreamt of, in every object he sproaches. We have, ourselves, had such experience of the salvantages, in mental and bodily vigour, to be derived from pedestrian init the source of the so visits to some of the counties of England, that we are led to urge every student, who hopes to stand in advance of his time, to engage in the study of his art in the like manner; and, as the pleasure and advantage of a pedestrian trip is in some degree dependent upon previous arrangements, it may perhaps not be thought foreign to our object if we give a few hints on such points: we may perhaps occupy space that could have been otherwise filled, but an old traveller will know that our suggestions are not entirely valueless.

Some slight review of the history of Gothic architectures, and the practical method of de-termining dates, will be desirable, even in the termining dates, will be desirable, even in the student of some years' standing; and the pub-lications of the Cambridge Camden Society have so much the merit of conveying a great deal in few words, that they should not be neglected: — one called "A Few Hints on the Particular Status of Feederical Architectures and the Status of Statu the Practical Study of Ecclesiastical Archi-tecture," will be a desirable companion for reference. It contains a list of the embleme of saints, and a similar list is to be found along with other information in the Archæological Journal. These lists may be referred to in many objects of interest in stained glass and monumental brasses. From the same sources may be learnt the method of "Tubbing' brasses, which does not involve so much time as materially to retard the more immediate objects of the journey, and often affords hints in ornamemt frequently available. A solid sketch book of convenient size, with the et cateras of the delineating art, is not likely to be forgotten. A walking-stick may contain the five-foot rod, which, if dimensions are taken, can hardly be dispensed with. Other essentials are, good maps, a compass, a note book, a tape, a pocket case of instruments, and tracing paper for copying stained glass. If, too, we descend into the matter-of-fact de-tails of coat and inexpressibles, we may there, too, add to the comfort of our voyageur. first-mentioned garment should be made of waterproofed cloth, with seven or eight pockets, the principal ones being large enough to con-tain the "one shirt off" and the sketch book in case of rain, double-breasted, to button to the throat if required. The "porticipans" the throat if required. The "pantaloons should also be of waterproofed material, and not exactly of the best kerseymere. These habiliments will defend from Jupiter Pluvius; but he is not an experienced traveller who would venture abroad without other protection ; and this we carry in the shape of a great coat, strapped to the back, in the place of a knapsack. The straps do not pass knapsackwise, but through strong loops sewn to the

back of the smaller coat: and, with good walking-boots and a change of stockings, our pedestrian is equipped, and, when he has got a mile from London, does not fail to thank us for these hints. The load on his back is no great burthen, and the plan of carrying his *impedimenta* will be found preferable to the knapsack, which is often very harassing to the shoulders. He will also find many essen-tials necessary which we have not space to enumerate, but which will readily suggest themselves, as, an apparatus for sewing on buttons and mending stockings; and some little pupilage in these difficult arts, under some of his fair acquaintances, would be highly de-

ot nis tair acquaintances, would be highly de-sirable. The question of cap versus hat is one which should also be present to his mind. And now, our traveller, being fully equipped, dons his cap, and, stick in hand and sketch book under arm, with a light heart and little other luggage, leaves London behind him; ouitting the study of study of a behind a behind the study of the study of study of study of the study of th quitting the study of stucco and chimney-pots with the prospect of health invigorated and knowledge greatly enlarged. The argumentum ad hominem, which doters many from undertaking frequent visits to objects of interest in England, is that of expence. The coffers of architectural students are always shallow ones, and, under the idea that this is universally a land of expensive inns and dissatisfied waiters, the practical study of the art is postponed to some expected distant visit to the continent, where sous go as far as pence, and breakfasts are thought to be had for asking. But we know that, with a little tact, by avoiding large hotels, and spending the greater number of nights in village inne rather than those of the towns, the thing may be contrived at as low a rate as we can live for in London. At most rate as we can live for in London. At most villages an excellent bed may be got for a shilling, and sometimes — our readers may smile—for sixpence; and if our pedestrian requires his tea from Twining's, he had better

stay at home, unless he can carry a full purse. The "Church Schemes" of the Camden Society will be found very useful; the method of using them may be learned from the pamphlet before mentioned, and, if our traveller is a writer of short hand, he may note down every particular of each church in as little time it will take him to walk over it: and he will be led to the discovery of points which might otherwise have escaped him. How far photography, and other aids to art may be called into his service, we must postpone the consideration of to some future period. We repeat—in conclusion—Gothic archi-

tecture is not to be learnt from books and illustrations, but from examples themselves; and from the rising generation of architects is expected a style of art consistent with the true principles of the architecture of the middle ages, and at the same time with the requirements and characteristics of the English people and the present age. Е. Н.

MUSEUM OF ECONOMIC GROLOGY. --- II having been found that the present premises of this institution are far too small for the rapidly increasing collection of specimens illustrative of the application of geology to the arts and manufactures, the Government have determined on appropriating a large space between Piccadilly and Jermyn-street, near St. James's Church, for a commodious building sufficient for the accommodation necessary for the Museum, the Mining-Record Office, and the purposes of the geological survey of Great Britain. The Athenaum states that the architect to the office of Woods and Works, Mr. Pennethore, has furnished plans, by which a frontage in both the above-named streets, of seventy feet, is ensured, and a depth of one hundred and fifty feet; which will be occupied by galleries for the exhibition of geological and mineralogical specimens, models of machinery, and illustrative produc-tions of the arts and manufactures.

CITY APPOINTMENT OF ASSISTANT SUR-BYOR -The Commissioners of Sewers of the City of London having resolved to appoint an assistant surveyor, will meet, for that purpose, at the Guildhall, on Tuesday, the 17th instant. Gentlemen desirous of becoming candidates for the appointment must be possessed of adequate knowledge as surveyor and engineer, must give up the whole of their time to the duties of the office, and will not be allowed to carry on any private business.

267

VENTILATION.

WE hear many complaints against Dr. Reid's system of ventilation as carried out in the temporary Houses of Parliament, but nothing better is promulged, nor do we hear of any endeavours being made to improve it. The proper ventilation of buildings does not receive that share of attention which its importance demands. Impure air still con-tinues to kill its thousands quietly and in secret, and because it is in secret we look on passively and make no endeavour to stop the progress of the insidious destroyer. In well-built modern houses, where there are few crevices by which air can get access, systematic ventilation is absolutely necessary. Evidence of the strongest kind proves not merely the fatal effects of breathing air grossly vitiated, but that the absence of a full supply of pure air induces comsumption, or renders the constitution less able to resist any disease by which it may be attacked.

The desideratum is, to introduce fresh air in sufficient quantities in such a manner as not to produce perceptible currents. The Health of Towns' Commissioners say,

in their second report :--

"Notwithstanding the apparent difficulties with which the ventilation of private dwellings is surrounded, a minute examination of the circumstances of the case has assured us that no field of improvement holds out a more promising result than that which may be anticipated in future from the more successful ventilation even of the humblest dwellings. The progress of science has explained its nature and importance. Sanatory measures for draining and cleansing will effect at least one-half the remedy by removing those impu-rities that have hitherto so largely polluted the atmosphere in towns, more especially in the habitations of the poor. Less air is requisite for ventilation in proportion to its purity, and consequently, the risk of offence from currents must be diminished where adequate ventilation is provided.

These considerations give us great co fidence, in the expectation that ventilation will be much improved in proportion as its nature and importance is better known; more especially when plans for warming and ventilation shall be minutely studied, and incorporated in original designs, instead of being merely applied, as is too often the case at present, to applied, as is too often the case at present, to buildings already constructed or designed without reference to this important object. This is the great and paramount object that should be pressed upon the attention of archi-tects and builders. If structural arrange-ments are provided in public buildings and private dwellings, ventilation will then attain that facility and accompany of execution with that facility and economy of execution, with-out which its general introduction cannot be anticipated to the extent that its importance requires. But exclusively of such systematic improvements as may justly be anticipated in new buildings, where this subject is fully considered, we have reason to look forward to additional improvement in this department. The very simple fact, that vitiated air always rises, under ordinary circumstances, shews that if two apertures be provided in every apartment, one below, and another above, and valves be arranged so that they may be adand justed with facility and accuracy to the cir-cumstances of the moment, the natural laws that regulate the movement of vitiated air will induce a perpetual change, and prevent that extreme contamination which is so often observed. Extended systematic ventilation, with all its peculiarities and powers of adaptation, can only be obtained and is only required in public buildings or other large establishments; but it cannot be too strongly pointed out that many just objections to ventilation, as it is at present effected, arise from the fact that the feet principally are subjected to a cold current, in ordinary apartments, while the head may be in a hot stagnant atmosphere loaded may be in a hot stagnant atmosphere loaded with vitiated air, and saturated with moisture, pro-duced by the breath, by combustion from lamps and candles, and from other sources. A supe-rior aperture, and the most moderate attention to the noint selected for its introduction will to the point selected for its introduction, will secure the admission of fresh air without the secure the admission of fresh air without the current being perceptible to the human frame, and prevent it from attaining that condition where, by long continuance in a beated atmo-sphere, slight movements of air become offen-sive."

268

We have nearly as much confidence as the commissioners "in the expectation that ven-tilation will be much improved" as its im-portance becomes better known; but we portance becomes better known; but we greatly fear that a long time will elapse before the public are fully roused to its importance. This can only be effected by constantly bring-ing the matter before them, and pointing out the results of inattention to it. We extract the following useful information on the subjeot from Bernan's valuable "History and Art of Warming and Ventilating Buildings,"* to which we have referred in previous numbers of our journal :---

"Not the least remarkable example of the power of habit, is its reconciling us to practices which, hut for its influence, would be consi-dered naxious and disgusting. We instinctively shun approach to the dirty, the squalid, and the diseased, nor use a garment that may have been worn by another; we open sewers for matters that offend the sight and smell, and contaminate the air; we carefully remove impurities from what we eat and drink, filter tur-bid water, and fastidiously avoid drinking from a cost that may have been pressed to the lips of a friend. On the other hand, we resort to places of assembly, and draw into our mouths air loaded with effluvia from the lungs and this each other hand, we resort to skin, and clothing of every individual in the promisouous crowd: exhatations are offensive to s certain extent from the most healthy individuals, but when rising from a living mass of skin and lung in all stages of evaporation, disease, and putridity, and prevented by the walls and ceiling from escaping, they are, when thus concentrated, in the highest degree dele-tarious and heatherme terious and loathsome.

This poisonous exhibition is one of the effects of the consumption of fourteen ounces of charcoal that Dr. Liebig says is burned daily within the body. The share of impurity conwithin the body. The share of impurity con-tributed by each hving furnace has been variously estimated. From experiments with men of different stature, Dr. Menzies found that from fourteen to eighteen respirations were made in a minute ; and others have found them vary from thirteen to twenty-two ; the average vary from thirteen to twenty-two; the average generally assumed is twenty respirations in a minute. The quantity of air drawn into the lungs at each inspiration varied from 40.7 to 46.7 cubic inches; and under all the circum-stances, Menzies considered 720 cubic inches about the average quantity of air inhaled by a healthy man in a minute. A woman may in-spire, on an average, about 500 cubic inches; a mean inspiration from a healthy pair of the species will not, probably, exceed 612 cubic inches in a minute. inches in a minute

The quantity, however, varies not only in the sexes, but in the same individuals placed in different circumstances with regard to rest and motion, to health and illness. During great exertion it will exceed the average; dur-ing rest, and in delicate and siling persons it will fall under it; so that if 600 cubic inches be reckoned as expired in a minute by each individual in a mixed company, it will be a fair

The fresh air, before it is taken into the lungs, is composed of 23.2 per cent. of oxygen, 75.5 of nitrogen, and about 14 per cent. of carbonic acid, and a variable quantity of vapour of water. After it is has been expired from the lungs, in which it remains from ten to twelve seconds, it contains a larger quantity of twelve seconds, it contains a larger quantity of vapour, the same quantity of nitrogen, from 11 to 12 per cent. only of oxygen, and between 8 and 9 per cent. of carbonic acid; so that nearly a half of the oxygen or vital element of the air has been changed into carbonic acid. If atmospheric air contains 3.5 per cent. only of this gas, it is unfit to support animal life. Air, therefore, which has been expired from the lungs contains 2.4 times this quantity: so that a person who inhales 600 cubic inches a minute, renders 1,440 cubic inches unfit to be breathed again.

The amount of exhalation from the skin also varies in different individuals, and from the same person at different times—a hand emitted same person at different times—a hand emitted ‡ grain in a minute, at another trial ½ grain, and in a third experiment it exhaled ‡ of a grain of vapour in a minute; which is 12, 30, or 45 grains a minute for the whole body. If one of each sex be taken, the mean will be about 23 grains each in a minute. The skin emface of a men being shout force source for surface of a man being about fifteen square feet,

* George Bell, Floet-street, 1845.

1.5 grains of vapour will be exhaled in a minute from each superficial foot of his body, or 3 grains from each cubic foot of his mass. Besides water, carbonic acid, acetic acid, phosphoric acid, muriate of soda, and a peculiar odorous matter are contained in the vapour emitted from the surface.

This copious cuticular discharge is seldom porceptible to the eye, although it is to the the nose. Boerbaave made it apparent in the warm weather by immersing his hand in air cooled by ice, which then seemed to smoke like a boiling kettle; and he amused himself with the notion, that if winter's cold was produced in the midst of a crowded summer assembly, each individual seething in his own steam would appear like a heathen deity wrapped in his peculiar and appropriate cloud. The emanation from lungs and skin is carried

from the body by diluting it with atmospheric air, which at a certain temperature can hold in suspension a certain quantity of vapour, the amount of which is shown in the following table; the first column gives the temperature of the air, and the second column the number of grains of water a cubic foot of it will contain, in the form of vapour, at that temperature :

| Tempera- ture. | Grs. of water in a cubic foot of air. | Tempera- ture. | Grs. of water in a cubic foot of air. |
|-------------------|---|-------------------|---|
| 3°3 | 2.43 | 40 | 8-23 |

| 61 | 6.30 | 83 | 19-95 |
| 62 | 6.57 | 84 | 12.71 |
| 63 | 6.29 | 85 | 13.08 |
| 64 | 7.01 | 86 | 13.42 |
| 65 | 7*23 | 87 | 13.82 |
| 66 | 7.44 | 89 | 14.53 |
| 67 | 7.66 | 89 | 14.01 |
| 68 60 | 7-89 8-13 | 84 | 30.00 |

According to the table, a cubic foot of air at the freezing point can retain 2.53 grains of water only; if, therefore, it contain one grain only, then each cubic foot will absorb or carry off 1.53 grains of vapour from a moist surface, which may be the insensible perspiration from the surface of the body. If this air be heated to 60° , a cubic foot of it will carry off 5.22 grains of moisture from the skin; for it is seen from the table, that air at 60° can suspend 6.22 grains of water. To carry off 23 grains of in-sensible perspiration per minute, will therefore require about 15 cubic feet of the colder air and about 4.4 cubic feet of the warmer air. If less than this be supplied, the moisture will accumulate on the skin, and the air of the room become saturated with vapour. If the average temperature of the room be

taken at 64°, with the dew point about 50° , or with 4.53 grains of water in each cubic foot, then about 9.25 cubic feet of air will be required per minute for the imsensible perspiration, and, in addition, one cubic foot nearly for the excess of moisture from the lungs not the excess of moisture from the lungs not carried off by 1,440 cubic inches allowed for the dilution of the carbonic acid gas; so that about 10.25 cubic feet of pure air a minute must be allowed to ventilate each person. But if a greater proportion of moisture is added artificially to the air, this quantity must be increased. In every case, vanilation should

be increased. In every case, ventilation should be regulated with reference to the hygrometric condition of the warmed air.

Dr. Reid states, that he never gave less than 30 cubic feet of air a minute to each member of the House of Commons when the room was crowded, and on one occasion he introduced for weeks successively 60 cubic feet a minute to each member, and that, to give the neces-sary moisture, 5,000 square feet of moist evaporating surface was exposed to the air; and subsequently, as stated in a previous essay, the air was made to flow through jets of water; and this saturation probably it was that rendered

this quantity of ventilation necessary and pleasant.

In whatever way the air of a room is heated. it is cooled by coming in contact with the glas of the windows, by the walls, ceiling, and floer absorbing the heat, and by cold air entering at doors and windows, and the crevices round them, and sometimes by the chimney when it is left open.

Each square foot of glass in a window will cool about one cubic foot of air as many degrees per minute as the temperature of the r per minute as the temperature of the external air. If a window has five square feet of gias, and the temperature out of doors be 32° and the room 60° , then five cubic feet of air will be cooled 28° in a minute. Of the quantity of cold air admitted at the crevices round the window-sashes and round the door, no definite estimate can be given; it depends on the pesi-tion of the window above the floor, on its fitting, on the difference of temperature between the room and the air outside, on the force of the wind, and other causes. If three times the width of the sash added to twice its height be multiplied by 3, it will give about the number of cubic feet of air cooled from this cause. The crevices round the sashes of a window four feet wide and eight feet high, will coel about 8.5 cubic feet in a minute. Twice the width added to the height of a

door multiplied by '26, will give the cubic feet of air cooled per minute for that opening when well made: a door three feet wide and seven feet high will cool about 5.2 feet in a minute.

The absorption and radiation of heat from every 200 square feet of wall, ceiling, and floor, may be taken on an average as equal to cooling one cubic foot of air per minete as many degrees as the internal is warmer than the external air.

When wax or tallow lights are burned, about •25 cubic feet a minute must be allowed for each.

With the air at 64° and dew point at 50°, every inhabited apartment must therefore hav the following allowance of heated air per minute :--

Cubic Fee •83

or heat equivalent to raising 161.9 cubic feet of air per minute. To this must be added one quarter cubic foot per minute for each light: should the air contain more than 4.53 grains of vapour, the quantity for ventilation must be increased. If, for example, the air at 64° held six grains of water in suspension, then 232 cubic feet must be allowed to carry off the personal exhalations, instead of 16 feet."

DECORATIVE ART SOCIETY.

On Wednesday (28th of May), a general consideration of geometrical figures, as the foundation of graceful outline, was commenced; foundation of graceful outline, was commenced, and although this may not be strictly true as a theorem, it afforded an opportunity for the recognition and development of some of the leading principles by which the best works of ornament are regulated. The varying eleornament are regulated. The varying ele-ments of form peculiar to different epochs were noticed and explained. It was considered that the importance of the subject rendered it deserv ing of continued attention ; and it was, there-fore, determined that it should be brought before the society monthly, until further notice

On Wednesday (June 11th), a paper will be read "On Stained Glass." And at a meeting to be held on the 25th, the consideration of geometrical figures will be resumed, by discus-sing the properties of the over.

THE PROPOSED CARLTON CLUB-HOUSE COMPETITION.

Sin,-The recent proceedings of the Carlton Club appear to call for some comment on the part of the profession, and I have drawn up a statement from documents in as calm a manner as possible, feeling that a bare announcement of facts is often more eloquent than a long treatise. I think the insertion of it in THE BUILDER may do good, and call attention to the necessity of some protective measures being taken by architects, if they do not wish to be kicked about like footballs at the caprice of every committee, whether composed of tradespeople or of the high and mighty of the land, in whom, alike, when a favourite is to be served, all proper feeling seems to be lost; and therefore architects should set their faces against the present mode of proceeding adopted by committees, whereby competitions are mere farces-flimsy blinds to screen some intended favouritism.

I have stated nothing which cannot be sub-stantiated; and my own observations are, 1 hope, only such as one jealous of the reputation of his profession would be expected to make.

It has been just decided, by a ballot of the whole club, that Messrs. Basevi and Sydney Smirke are to be the architects to carry out the proposed alterations. A slight sketch of the proceedings of the club in the years 1844 and 1845, relative to the competition, may not be uninteresting to the profession, and would appear to call for some decided steps to be taken, with a view to a thorough understanding in future of the real position which architects should occupy when required to enter into competition.

In consequence of the Carlton Club having resolved to purchase the two adjoining houses in Pall-Mail, with a view to enlarge the (14) of seniest architects should be invited to send in plans for the elevation and internal to send in plans for the elevation and internal arrangements of the necessary alterations and additions; the plan which should be most approved to receive a premium of 2001, "in case it should not be adopted by the club;" and that which should be considered the second best a premium of 1001. "in case the first should be adopted." Eight only of the architects who were invited to compete sent in place various in

Eight only of the architects who were invited to compete sent in plans, varying in estimated expense from 22,000% to 40,000%. The first premium was adjudged, by ballot, to Mr. Salvin, for a plan in the Elizabethan style, of which the estimated cost was 31,800%; and the second premium was adjudged, in the same way, to Mr. Hopper, who, for his elevation, had copied that of Inigo Jones's Banqueting House at Whitehall, and whose estimate was 22,000%. In their report months various plane that had

In their report upon the various plans that had been sent in, the special committee (consisting of the Marquis of Salisbury, Mr. Henry Hope, and Mr. Gally Knight) had observed, with regard to Mr. Salvin's, that "while of its beauty there excludes the sent science of the beauty there could be but one opinion, they doubted whether such a design was well adapted for a London atmosphere, or for the position it was to occupy;" and further, that they considered it inadmissible, from the circonstance that the entrance at the north-west corner was reasonably objected to by the nextdoor neighbour.'

Respecting Mr. Hopper's plan, they had re-ported that "the north front had considerable merit; that it offered a succession of good morning and writing rooms to the north, east, and south; with a large coffee-room extend-ing from Pall-Mall to Carlton-gardens, and having a cupola and central skylight which would render the room very light, capable of a Variety of useful arrangements and give it a variety of useful arrangements, and give it a handsome appearance," &c.

The instructions were issued to architects on the 19th of March, 1844, and the plans were sent in by the 1st of May; and certainly up to that time no such intimation had been given as that which follows, which appears on the 18th of June, when it was for the first time declared to the architects to whom had been awarded the two premiums, "that the club was not to be considered bound to adopt either should be considered bound to adopt eriter ske., to which the prensitions might be awarded should become unconditionally the property of the club." And in the report, dated

10th May, 1845, it is stated that "the com-mittee desire to observe that the club, having acquired the property of these two plans, are entitled, if they should think fit, to make any use of them, without employing either Mr. Salvin or Mr. Hopper as their architect, which is perfectly understood by these gentlemen." The words in italics constitute an extraordinary assertion, and one not borne out in the instructions or correspondence up to the time that the plans were sent in; and surely the interpretation, according to the rules of common sense and common justice, of the conditions annexed to the two premiums could only admit of one meaning, viz., that Mr. Salvin was to receive 2001. for his plan (the first), if not receive 2004. for his plan (the first), if not adopted; but that if the first was adopted, Mr. Hopper was to receive 1004. for his plan (the second); but here, whatever they may have intended further to stipulate, the committee stop short; but the argument goes on, and therefore it is impossible, if words are to have any meaning at all, to escape from the conclu-sion that, as Mr. Salvin's plan was not adopted, Mr. Homer cought (instead of being paid Mr. Hopper ought (instead of being paid the 100/.) to have been employed. Instead of so doing the club have now decided the choice of the architect by a ballot, each member being at liberty to place in the ballot, ing-box the name of the architect he would

prefer. prefer. The following is the result of the ballot:----Messers. Roberts, Nelson, Beazeley, and Blore had one vote each; Mr. P. Hardwick, two votes; Mr. Railton, four votes; Mr. Burns, five votes; Mr. Cockerell, six votes; Mr. Taylor, nine votes; Mr. Hopper, fifty-seven votes; Mr. Salvin, eighty-nine votes; Mr. Barry, 210 votes; Messers. Basevi and Sydney Smirke, 220 votes; Messers. Basevi and Sydney Smirke, 220 votes ;- about half only of the members of the club voting on the occasion. It must be observed that Mr. Barry had de-clined to enter in the competition for plans in 1814, and that Messrs. Basevi and S. Smirke were among the unsuccessful candidates on that occasion.

The point to which the attention of the profession should be called is, to ascertain whether certain rules of conduct should be laid down by which competitions (if such things must be) should be guided, --a code of honour formed which should be binding on professional men as gentlemen, so that fair and honourable contests should take the place of gladiatorial com-bats; that those who have toiled to win the prize should not have the wreath snatched from them in the moment of victory, and find, after all their exertions, nothing left for their consolation but the poet's line,-

"The reward is in the race we run, not in the prize."

The history of the Carlton Club competition is only one more addition to the list of cases of the kind which have already been noticed in THE BUILDER, in which interest is made to ride in the ascendant, since it is notorious that a most active canvass was set on foot for the architect of the Reform Club and those of the Conservative Club, between whom in fact it was understood the race was to be run, and which will account for some of our most eminent men having so few votes.

Something must be done to put the competition for a high and honourable prize upon a different footing to a contest for the post of beadle or sexton, with the adherents of the parties calling out, "Vote for Wiggs," "Vote for Snooks." If, however, architects are con-If, however, architects are content to be placed on this footing they must not feel surprised at any conduct which may be pursued, and they must be prepared to expect that committees will advertise for plans, and will receive the collected talent of competitors, not one of whom is to have a chance of ultimate success against some favoured party. The remedy is in the power of the profession, if proper steps are taken to secure that treat ment which is due to it from the high ground which it ought to hold in public estimation. SPERO MELIORA.

JEFFREY'S MARINE GLUE .- A report of a French commission, charged to make experiments on the marine-glue, at the port of Tou-lon, has just been published, and asserts the superiority of this material for caulking vessels, its power of preserving wood from the punctures of marine insects, and their opinions that trials on a large scale ought to be made forthwith.

MASONRY.— Walling is executed with mortar at ls. 3d. to ls. 8d. per perch (a perch is 7 yds. by 2 ft. thick and l ft. bigh). Dry-walling, 9d. to 10d. per perch. If scaffolding is required, from 2s. to 2s. 6d. per perch.

The above are the prices usually paid in is town. I am, Sir, &c. Brecon, May 23, 1845. B. BAYLIS. this town.

.* We are much obliged to Mr. Baylis, and hope we may be farnished with similar in-formation from other parts of the country.

GUNPOWDER AS AN AGENT.—The Whiting Shoal, in Limehouse Reach, which extends nearly half a mile in the centre of the river, and has long impeded the asvigation, was lessened last week by means of gumpowder. A hole was bored some distance in the shoal, in which was deposited a tin case containing 45 lbs. which was deposited a tin case containing 45 lbs. of gunpowder, and it was fired by a galvanic battery from one of the Government lighters, ander the command of the harbour-master. The effect is described as being very singular. A large body of water was thrown up in a dome-like form, and the shoek was plainly felt on both sides of the river. After the opera-tion it was found that some forty feet of the shoal was displaced. The usual dredging machines had previously failed. In the same week the Ewart Rock, so long a dangerous impediment to vessels navigating the Solway Frith, was blown to pieces with gunpowder by Frith, was blown to pieces with gunpowder by direction of the trustees of Maryport Harbour. The accomplishment of this object forms one of the many suggestions by Captain Denham, for facilitating the approach to and otherwise improving the harbour of Maryport, and which are being carried out under the super-intendence of Mr. Abraham Middleton, civilengineer.

MAUSOLEUM OF THE ORLEANS FAMILY.

THE accompanying engraving represents the sepulchral monument, now nearly completed, at Dreux, in Normandy, for the Orleans family. It was constructed from the designs of Messrs. Fontaine and Lefranc, architects, and presents a curious, though not ineffective mixture of styles. We should be glad to obtain some accurate particulars of its construction and dimensions, and to learn the character of the details.

Our engraving was made from a Daguerrotype plate, obligingly placed at our disposal by Professor Donaldson, at the moment he received it from France.

The presence amongst us of a member of the illustrious family for whom the monument was erected (the Duke de Nemours), gives the engraving additional interest at this moment.

THE GOVERNMENT SCHOOL OF DESIGN.

Some short time ago we referred to the course of study pursued in this institution, and alluded to the opinion which exists that greater opportunity for the study of the figure should be given than is now permitted, and urged that to deny to artisans the full means of study for fear of their becoming artists was unwise and nonsensical.

Relative to this point there is, unfortunately, considerable dissension in the school; Mr. Wilson, the director of the institution, being arrayed against Mr. Herbert, the master; the figure school has been shut up and some of the students suspended. It is quite time that the question was settled one way or the other.

The following report of the progress and state of the school has been recently submitted to parliament:— "The School of Design at Somerset-house

was established at the commencement of the year 1837, by and under the superintendence of the Board of Trade, for the improvement of ornamental art, with regard especially to the staple manufactures of this country. The number of applicants for admission every month exceeds, by about fifty, that which the limited space in Somerset-house will accom-modate. In connection with the head school at Somerset-house, schools have been formed in many of the principal manufacturing districts, namely, in Spitalfields, Coventry, Bir-mingham, Manchester, Sheffield, Nottingham, York, Newcastle, and Glasgow; and applica-tions are at present under consideration for the establishment of others in the boroughs of Southwark and Lambeth, in Norwich, in the Staffordshire Potteries, and in Dublin. The students commence with exercises in elementary outline, pencil drawing from lithographic prints of geometrical and ornamental forms, and proceed to shading with chalks, first, from shaded prints, then from casts of ornament. The human figure, in connection with ornament, is studied anatomically, by successive exercises in drawings from prints, models, and casts, of the most appropriate an tique statues and reliefs; and the principles of drapery are taught by means of a draped lay figure. A numerous class of the students are occupied in painting from various ex-amples of art, from casts, and from natural objects, which form materials of ornament in water colours, in tempera, and in oil; and

modelling in clay and wax forms an important part of the business of the school. As a gene-ral principle, each student is taught, as far as rai principle, each student is tudent, as har as possible, with reference to the promotion of the particular object for which he joined the school; and the practical application of the instruction which is given is shewn by refe-ence to numerous and valuable examples of orrommetal and decorting art arbibited on ornamental and decorative art exhibited on the walls of the rooms. The more advanced students are exercised in original designs and composition; that is, in forming new combi-nations of the materials of ornament, and are taught to apply to various practical purposes the knowledge and skill they acquire. It is the duty of the director and masters to see that only the best examples are used, and to enable students to form correct ideas of the printhe ciples, different styles, and importance of ornamental art, and of its practical application to particular departments of manufacture and decoration. Besides the use of an extensive collection of casts to illustrate the history of art, and examples of every variety of ornamental manufacture and decorative work, the students have the advantage of reference to numerous costly books of plates, and the privilege of borrowing books from a lending library, containing such works as are especially fitted to promote artistical improvement and utten to promote artistical improvement and refinement of taste. The head school at Somerset-house includes, in a separate part of the building the building, a morning school for females, in which upwards of fifty young women receive instruction in the practice of drawing and designing for lace patterns, embroidery, porcelain, wood engraving, flower painting, and various kinds of ornamental work, in the execution of which females may be advan-tageously employed. The school for females is open daily from eleven to two, excepting

270

Saturday; and the applicants for admission constantly exceed, by twenty or thirty, the number to which the means of accommodation is limited. The school for males is open to the inspection of the public every Monday, between the hours of one and three. For the present year the sums offered for prizes exceed 1804. Male school, Somerset-house: morning, 4s.; evening school, 2s.; female school, 2s. The following abstract exhibits the numbers of students in attendance during the month of February last :-

| Head school | Somerset-house | 396 |
|-----------------|----------------|-------|
| Branch schools. | Spitalfields | 190 |
| " | Coventry | 106 |
| 17 | Birmingham | 257 |
| " | Manchester | 150 |
| ,, | Sheffield | 47 |
| ,, | Nottingham | 36 |
| ,, | York | 76 |
| " | Newcastle | 140 |
| ** | Glasgow | 360." |

Unfortunately this report does not touch the real question at issue-the efficiency, or otherwise, of the present system. Some further information must be elicited on this head, and if it be found that the system has failed to pro-duce a good result an alteration should of course be made.

FONT IN ST. MICHAEL'S CHURCH, SOUTHAMPTON.

THE font in St. Michael's Church, Southampton, represented by the accompanying en-gravings, strongly resembles that ancient and curious specimen of workmanship in Winchescurious specimen of workmanship in Winches-ter Cathedral, known as the *crux antiquari-*orum, or "the puzzle of the antiquaries." It is of black marble, and alluded to by Sir H. C. Englefield in his "Walk through Southamp-ton," who offers the following comment upon it: "It is curious to observe the effect of time on the black marble of which the fact. on the black marble of which this font is com-posed; a vein less hard than the rest runs through one front, and it is quite honey-combed by age, although it probably has always stood under cover."

The font is a square block, having in the centre an hemispherical bason, around the edge of which is a groove (probably sunk to receive a cover or lid); the top is ornamented by a ranning foliage, rudely carved, the angles being further adorned in the manner shewn by the drawing.

Every side is divided into three sunk circular Every side is divided into three sunk circular compartments, charged with figures in low relief, mostly bearing a resemblance to the one in the centre compartment of the side repre-sented; the figure to the left of the drawing appears to be a dove; that in the centre is supposed to portray a dragon; and in the third compartment the form of an angel is re-

third compartment the form of an angel is re-presented, clothed in a long robe, having around the head the *nimbus*, or glory, and with wings extended, that nearly fill the re-maining portion of the circle, reaching from the shoulders to the feet, which are naked. These figures, it is inferred, are emblema-tical of the saint or archangel, Michael, who is spoken of by St. John as fighting against the dragon and his host, and who is represented as the guardian of the Jewish and Christian churches, and by some imagine to be the Son churches, and by some imagined to be the Son of God himself. The font was originally supported by five

columns, the four at the corners being less in diameter than the centre one, which now only remains. Three broad leaves, one at the angle and one on either side, formed the capital of each of the smaller columns; that part of the base on which the smaller columns stood is sunk to receive them. Two iron eyes are fixed into the top of the font, for the purpose of fastening the cover or lid.

Although great doubts are entertained re-specting the age of the font in Winchester Cathedral, Mr. Britton ascribes it to the time of Walkelyn, bishop of Winchester, who died 1097; and, from the similarity between that and the font now described, they may be considered to be coeval.

Southampton. JOHN ELKINGTON GILL.

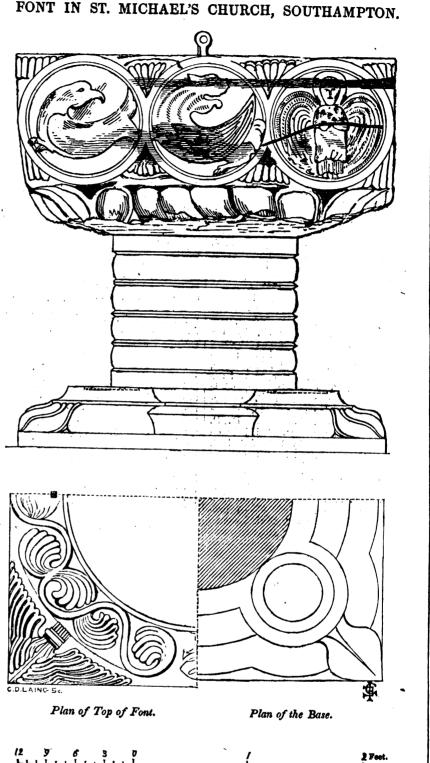

•.• The font in East Meon Church, Hampshire, is another example of the same class of fonts; it resembles that at Winchester so closely, that it is supposed to have been made by the same hand.

Plan of Top of Font. Plan of the Base. <u>у</u> с 3

ARCHITECTURAL MEMS. FROM THE COUNTRY.

THE Cotton-Mill Company at Kingston, THE Cotton-Mill Company at Augeon, Hull, have advertised for a site, preparatory to the erection of their proposed extensive factories, &c. The company starts with a capital of 200,000/.——A few days since the capital of 200,000.——A few days since the electric fluid struck the new church at Wal-ton, about three miles from Stafford. The steeple was much injured, a part of the church was unroofed, and two bricks were carried by the lightning through a cottage window, a short distance from the church.—Part of Dublin-street, Edinburgh, under which they are at present excavating the tunnel from Scotland-street to Princes-street, fell in on Thursday morning from the want of sufficient Scottand-street to rinces-street, left in on Thursday morning from the want of sufficient under-props to support the superincumbent earth. — A committee has been appointed at St. John's, Isle of Man, to carry into effect the building of a new church in that district, and the restoration of the ancient chapel. A plan has not yet been adopted; various archi-tects have been invited to supply designs, the committee being desirous of erecting a good

architectural edifice. -On Monday week (St. Augustine's day) the consecration of Hedon church, in the diocese of Ripon, took place. The restorations in the chancel conplace. The restorations in the chancel con-sist of new and elaborate oaken stalls; a floor of encaustic tiles, of beautiful pattern; an **early** English reredos, with illuminated tablets; and a figure of the Saviour, in stained glass.—The new line of railway communication between the Ogwen river and the Menai bridge is in active processes the Menai bridge is in active progress. Workshops are being erected, and operatives are pouring in preparatory to carrying out the contract taken by Messre. Jackson, at 246,000*l*.—An attempt is being made to raise sufficient funds for the purpose of erecting a new church in Sculcoates, Hull, to be dedicated to St. Paul. A sermon was preached last Sunday by the Bishop of Ripon, in aid of the fund, when 60% was collected. A further sum of 1,500% is required. new reredos to the altar of St. George's A new rereases to the anal of Su George s Church, Stamford, is about to be erected. The design is by Mr. Edward Browing, and the stone will be taken from the new quarry Dicitized by

THE BUILDER.

-The

of Mr. C. Bland, of Little Casterton.-Manchester committee has purchased from Lady Hoghton thirty-one acres of land, in the township of Bradford, for a third public park. The price was 6,200% or about 10d. per square yard.—On Saturday last the first stone of the new railway dock, at Hull, was laid by Mr. Huffan, the secretary of the company, in the presence of Mr. Lane, the resident engineer, Mr. Murray, of the firm of Bowers and Murray, the contractors for the work, and several hun dreds of spectators. Mr. Huffam, in lieu of putting some money under the stone, placed a check for the benefit of the workmen upon it. It is thought that the dock will be com-pleted in about twelve months. We understand that the laying the first stone of the Victoria dock, in the same town, will take place in about three months from the present time, and that it is intended to be a public cere-mony.——The churchwardens of Worksop have determined to make very considerable alterations and improvements in their venerable parish church.——A public meeting of the in-habitants of Wakefield has recently been held, to consider the propriety of applying to Parliament next session, for an act to improve the Borough. A committee was appointed to draw up clauses for the proposed new act, which are to be submitted to a general meeting of the rate-payers for their approval.——The new church at Leven, in Yorkshire, was consecrated, on Wednesday-week, by the consecrated, on weanesauy-week, by the Bishop of Ripon. The church is in the early English style, and contains 450 sittings; it is of stone brought from the Headingly quarries, near Leeds. The seats are all open, and are stained dark oak. The roof is open, and is also stained in the same manner. The structure presents a massive appearance, and was executed under the direction of Mr. H. D. Chantrell, of Leeds, architect. It is built on an entirely new site, given by Richard Bethell, Esq., lord of the manor, and is in the centre of the village, a full mile from the site of the old church. The cost of its erection is about old church. The cost of its erection is about 2,400*l*, which has been defrayed principally by the rector. Mr. J. Wilson, builder, of Hol-beck, Leeds, was the contractor.—A pro-posal to erect and endow a "York Yeoman School," has been lately put forth under the sanction of the Archbishop of York. The sanction of the Archbishop of York. The sum required for the purchase of ground, and for a building capable of accommodating about for building capable of accommodating about fifty boarders, is estimated at 3,000%. The pro-posed school is intended for the sons of persons in the middle classes, and more especially for the sons of farmers. As soon as a suffi-cient sum has been collected, a meeting of the subscribers will be called together to appoint trustces for the ground and building, and to adjust other preliminaries. The donations already amount to 1,700/.

ARTESIAN WELLS.

On Friday, the 30th ult., Professor Farraday lectured at the Royal Institution on this subject, stating that the term artesian was applied to overflowing wells, in consequence of the first well of this character being subk at Ar-tois, in France, but that now the term was applied to very deep wells whether they overflowed or not.

Object.—His object was to shew the practi-cability of supplying London with water in greater abundance, of a better quality, and at a less cost than it is at present supplied with. This being the case, his remarks had reference to the geological peculiarities of the London basin.

Safety .- He stated that, provided such wells be properly sunk, no danger need be apprehended. The anticipated evil of leaving the superincumbent strata unsupported, by pumping up the sand, and thereby endangering the sta-bility of the surface ground, was worthy of very little consideration in our present state of knowledge on the subject. No such evil could accrue if the boring were carried through the sand, and some depth into the chalk. The difficulties hitherto met with in the construction of deep wells in London were all to be traced to the error of discontinuing the process of boring on arriving at the sand. Economy. — Mr. Farraday stated that the

expense of the works in connection with the wells recently sunk in the front and rear of the National Gallery, that is, the cost of the

deducting every thirg connected with the foun-tains, amounted to 9,000*l*. The yearly cost of supplying 100 gallons per minute by the engine and through the pipes was now contracted for at the sum of 500%. For the same water Govern-ment had been paying 1,000%, yearly. Then, by some short calculation, it was proved that the new system was one of economy, effecting a saving of some hundreds annually, and worthy saving of some hundreds annually, and working of general adoption. The contractors and en-gineers are Messrs. Easton and Amos. He further stated, that in any neighbourhood, if 700 or 800 householders would unite, they might have a well of their own, and thereby a larger supply of better water than thereby a larger supply of better water than they now have for little more than half of what they now pay. The distance from the surface of the ground to the water is 150 feet. *Consequences.* — Mr. Farraday anticipated the probable consequences of sinking many

such wells in London; and combated the idea that by the daily extracting a large quantity of water the supply would in time be exhausted. Before such an evil could present itself a number of the smaller rivers in the neighbourhood of London must be exhausted, such as the Wandle and the Colne, which are nothing but the overflowings of the water in the sand strata, and consequently placed above the source of the proposed artesian wells.

A correspondent remarks, "With all due deference to the judgment of Dr. Farraday (and perhaps I maybe under some misapprehension) some statements on the economy of wells were made, that I can hardly agree with. I understood Dr. F. to say, that the expense of the works, as before stated, amounted to 9,0001.; now to take this at an interest of 3½ per cent. as he did, is manifestly much too low. I should perhaps hesi-tate in determining what would be a fair per centage for money laid out in this kind of work, but I should say it certainly should not be less than 7 per cent., taking repairs, and wear and tear into consideration, and that in the course of years substantial repairs will be required. Seven per cent. will amount to something like 6391. per annum, which, added to the 500%, will make rather more than the 1,000% before mentioned

I may be in error, or the superior quality of the water may, perhaps, be some compensa-

sation for the extra expense. The subject of artesian wells is now becom ing so important, that every information is valuable, and may therefore excuse these valuable, remarks.

The new machine, brought forward by Pro fessor F., for raising water, is certainly beauti-ful in principle, but, unfortunately for those who lay claim to the invention, is of old date. None the worse for that, however; and the principle may be applied with very great benefit on some of the low lands of England. The description of this machine may be found in a tract by Venturi, containing his experiments on the motion of fluids, translated from the French by W. Nicholson, the second edition of which was published in 1799, headed thus :---" It is possible, by means of a fall of water, to drain a piece of ground without the help of machines, even though the ground should lie on a lower level than the established current below the fall." The principle, I believe, was carried out by Venturi, in one of the Italian states. M. G."

ANOTHER ARTESIAN WELL. — A plan is being entertained by the benchers of Lincoln's Inn to re-erect the fountain which formerly stood in the centre of the square which now forms the new plantation. It is proposed to sink an Artesian well, and to supply the whole of the chambers in the inn with water, which can be done at a much more reasonable rate than the present supply.

WINDOW CLEANING .- The following me thod of cleaning windows has been forwarded to us, and, if correct, possesses many advan-tages over the old system of using whiting, .:-The window is first dusted with a bunch of feathers or a dusting brush, and when all the dust is thoroughly removed, a bowl of boiling-hot water is placed at the base of the window, the steam immediately covers the glass, which is removed by a wash-leather, and finished off with another quite clean and dry. This method saves time, prevents that cloudy appearance the National Gallery, that is, the cost of the engine and of laying pipes to the different sites, and durable polish than any other.

THE PREVENTION OF SMOKE.

THERE are few nuisances more generally offensive, or producing a greater amount of discomfort, than the dense smoke allowed to issue from steam-engine and other furnaces. To those who live near such, it is, moreover, the cause of much expense; in fact, all the inhabitants of a town, where there are many furnaces, suffer very materially in their pocket, if not in their health. Every endeavour to remedy it deserves serious attention.

We have recently seen in operation one of the patent boiler-furnaces, put up by Chanter and Co. In order to prevent smoke all that is required is, to produce perfect combustion, by which, of course, a saving is effected; and it seemed to us that this was effected in a conside-rable degree by the furnace in question. The arrangement has two objects ; first, to prevent the formation of clinkers, by the action of moveable bars, and secondly, to supply heated fresh air to the unconsumed gases about to pass up the chimney, and, by throwing them back on to the flame to ignite them. The means used are simple. The bars of the grate in contact, dentated on their upper surface, are moved, by hand or by other power, for-wards and backwards in their horizontal position; the alternate bars in the same direction and oppositely to their immediate neighbours. This breaks up the caking coal, and keeps the fire brisk and clear. The bars thin down to the lower edge, which is circular in form, and through their mass are round holes to diminish the weight of the bars, and to render them more durable by constant cooling. Each indent of the toothed surface is bevelled down to where the bars separate by decreasing thickness: and thus the access of air through the ness: and thus the access of air through the whole fire is very diffused. As to the second object—where combustion is not perfect, the unconsumed gases rise above the flame, and pass on with the draught. These, in Messra. Chanter's arrangement, are met above the bridge of the furnace by air heated from a chamber below, and let down upon them from a hollow arch. Thus they are forced down upon the flame, mingled with air necessary for their combustion, at a suitable temperature. their combustion, at a suitable temperature, and so consumed.

THE ERECTION OF STEAM ENGINES.

SIR,-Having seen an account in the news papers of an explosion of a steam-boiler at a flour-mill adjoining the Surrey Canal, near the bridge in the Old Kent Road, this after noon, my curiosity led me to the spot. The building which contained the steam-engine, I should think, from its form, was origi-nally a wind-mill, built of brick of cir-cular plan. From the information I ob-tained of one man who lived near the spot. he said, from the noise it made by the explosion, he thought it was an earthquake, but he was soon informed by a neighbour that the mill-engine had exploded. The destruction of the round building which contained the engine is complete, and an adjoining building very much shaken, but little damage is done to the buildings that are adjacent; the only person injured was the proprietor of the milt, and he is going on favourably. The boiler was sent into the air a great height, and descended on the other side of the canal, at distance of nearly 200 feet, sinking in the ground a considerable depth. On going to the other side of the canal to view the boiler, which was one of the tubular make, I there saw the machine, which had apparently pitched head first into the ground with the whole of ome side, under the tube being rent along the rivets and likewise away from the end plates, and the whole pressed up into the air upwards of 6 feet from the bottom plates.

My first impression was, that too much stress plates, which I dare say when new were 4-inch. had been upon the boiler; but, on examining the came to the conclusion that the engine had been improperly managed, as the builer gave sufficient evidence of having been worked with little or no water at various times; the plates under the tubes varying from Tothe to ths of an inch: the bottom plates appeared burnt and much thinner than the other plates : the valve of the safety-pipe worked with ease. The cause of the accident, I have no doubt, was, that at the time of the explosion the boiler being without water, the plates being $\mathbf{U}\mathbf{U}$ U 8

red-bot had generated gas, combustion then took place, and the result ended in the destruction of the mill,-a severe injury to the pro-prietor who worked the mill (probably quite ignorant of working a steam-engine, judging from the nature of the accident); and, further, a severe loss, by the destruction of his pro-perty and loss of business.

There were three respectable individuals on the ground at the same time as myself, and one, in particular, appeared to know somewhat about ateam-engines; a highly respectable gentleman came to the spot about the same time, and all appeared to be of one opinion as to the cause of the accident, and that was, as I have before stated; but one of the three, whom I will describe as Mr. A., said to the gentleman, Who is to pay for the damage done the different buildings? Oh! said the gentleman, the miller must. Mr. A. said, He is a poor man; he was a poor man before this accident, and I am sure this will make him in a much worse condition : the bodily injury he has received, and the working of his mind, are, I think, sufficient punishment for him. Now, Sir, from this accident, and this conversation, I turn my attention to the question of protection.

It seems that the fire-insurance establishments in London will not take any insurance ments in London will not take any insurance where a building contains a steam-engine, for less than 4s. 6d. per cent., and persons occu-pying premises adjoining steam-engines have to pay large premiums. Of late my professional occupation has been such as to lead me into localities where different manufacturing businesses are

carried on, and I was surprised at the number of steam-engines employed in London, varying from one-horse to twelve-horse power. Now you will ask me, by whom are these steam-engines worked? Why they are worked by any person, no matter what trade he is, so that they can get one for the least amount of wages, and not by engineers or men of science! Then why should we be surprised at accidents of this description occurring? and who are to pay for the damage done by these explosions? Most of the small engines are put up in the cheapest way possible, and the proprietor is often without capital. From the insurance office they do not obtain any cash, as the accident is by explosion and not by fire ; and then to sue these men is making Then, do not these steam-engines bad worse. and steam-boilers, in general, require Govern-ment authority? We cannot build a house or ment authority? We cannot build a house other building without the inspection of 8 district surveyor, to see the law carefully carried out, for the safety and general welfare of the community at large ;—a railroad cannot be worked until inspected and certified by a Government officer that the same is properly done, and in a fu state for the use of the public safely; --but steam engines, and steam-boilers, that affect the lives of the people in general, and the safety of buildings, are under no control, nor even the men that work them. Why should there not be a district surveying engineer, to inspect the making and erecting of these engines, and also steam-boilers, for whatever purpose they may be used; and a monthly inspection of them to see their working order, and that proper men are working them ? and these men should be licensed and numbered in the same way as public stage drivers; and the erecting of steam engines, and steam-boilers, and all alterations should be in the steme-bouers, and all alterations should be in the same way as houses, by the Buildings Act, under control. Such a course, I think, would put a stop to many accidents; it would im-prove the working order of small engines, bring into employ a proper description of men, and make life and property more accurate than it is at present. secure than it is at present.

The dimensions of the loiler.

13 ft. 7 in. long.

5 , 2 ,, dismeter of the boiler. 2 ,, 0 ,, do. of the tube, at one end. 1 ,, 6 ,, do. do. at the other. Man-hele, 16 inches by 11 inches. The hole in which the valve-pipe was fixed, 11 in.

diameter.

Hoxton, May 23rd. ABCHI.

CHEAP GAS .- The two existing gas companies in Liverpool have pledged themselves te reduce the price of gas, on the 1st of January next, to 4s. 6d, per 1,000 cubic feet.

ON THE MARBLES OF IRELAND.

MR. WILKINSON has laid before the Dublin Geological Society some valuable information on the marbles of Ireland, with the view of inducing architects to employ them in their designs rather than resorting at all times to those of Italy. We are glad to assist in circulating it.

Although the use of marble or ornamental stone in internal decoration is as yet very limited, there can be but little doubt that with the advancing improvement of the country, marble will hereafter be more extensivel brought into use, and made to contribute both to the ornsment and solidity of our edifices much beyond the present practice; and there is no doubt that with greater use much im-provement would be made in the mode of working the material. To those who may be of opinion that the labour of converting the material to use may be an impediment to its more general adoption, it may be proper to make a comparison between the labour encountered in completing the almost innumerable sculptures which remain to us of ancient Egypt, worked out of the hardest basalts, granites, porphyritic rocks, and the difficulties encountered by ar-tists in the use of marble rocks, the difficulties bearing about the same relative proportion as the use of marble would to that of plaster. The use of marble at the present day, and for the purposes to which it is most commonly applied, is very different from the practice of a former age. Every one must be familiar with the ordinary mode in which marble is applied in the construction of common chimney-pieces consisting of nothing more than the division of the block into a number of slabs, which, by the aid of plaster of Paris and iron holdfasts, are secured together in imitation of a solid mass. However sufficient this may be for ordinary purposes, it is certainly very inferior to the construction from the solid enduring stone. In all the ancient domestic buildings of the country we find the solid chimney pieces constructed of limestone or dark man rbles of the locality, and where undisturbed these are ge-nerally still in a sound and perfect state. Old street-buildings in the west of Ireland, and at Kilmallock in particular, present examples of this construction, and possess a very pleasing outline. Instances will very often occur in country mansions or public buildings in the vicinity of which local marbles are attainable, in which such constructions might be imitated with great economy and effect, and where for many architectural purposes it might with much advantage be very extensively applied.

The physical or external character of the marbles constitutes the chief consideration with reference to their use for decoration or ornamental architecture, their colour and in-ternal structure being the most important. Their chemical character has reference more to the facility with which they may be converted into use, and their capability of receiving and retaining a certain polish. In their simplest and purest state, marbles chiefly consist of carbonate of lime, which is of a white co our; the whitest kind, however, is fre-quently associated with quartz or silex, which more or less deteriorates it. This is more or less united both chemically and mechanically in various ways with nearly all the marbles. The variations in colour arise chiefly from accidental causes, in the greater or less ad-mixture of carbon, or the stains of various metallic oxides, or the sectional outlines of embedded fossils. Magnesia enters largely into the serpentine variety of marble. The more chrystalline and least earthy marbles are the least durable. The compact or finely granular crystalline marbles being superior to those which are largely crystalline or of a slaty texture. Almost all the varieties burn into quick lime; several of them, however, exfoliate in the conversion before they become caustic, and fall into sand when exposed to the ordinary mode of separating the carbonic acid; such qualities are, therefore, very inferior for ordinary cement, as they make a costly and meagre mortar; it is, however, to their use as materials for decoration that the present observations are chiefly intended to relate.

The colours of the marbles of Ireland are almost as numerous as those obtained from Italy. The dark colours vary from jet black to dark dove colour, purple, blue, and grey. The light colours vary from the pure snow- beds of black marble are frequent.

white to the celined, cream-coloured, pink, and light grey. The variegated, consist of the serpentine, black and white-veined, mottled, and those marked with fossil organic remains. The serpentine is here included from its common use for the purposes to which marble is applied, and from its being so commonly called the "green marble," although it is not, strictly speaking, a marble. The black marbles, which are those of most value The in Ireland, are extensively met with, and belong to the formation familiarly known as the lower limestone. The merchantable beds of the best quality are met with in the counties of Galway, Limerick, Carlow, and Kilkenny; in the counties of Mayo and Waterford black marble is also met with. At the former places they have been extensively worked.

The best quarries are considered to be those close to the town of Galway, near the bank of Lough Corrib. It occurs there in three beds, varying from about 9 to 12 inches in thickness. One of these is called the London bed, most of the black marble raised from it being exported to London; blocks are raised from it of an average size of about 5 to 10 feet in length, and 4 to 5 feet in width; blocks of the size of 20 feet long may be raised. Some in length of 16 feet have been exported, and converted at the Esher-street marble-works in London into a magnificent staircase for the Duke of Hamilton, in Scotland; the wide steps, large formed of this marble worked balustrades being formed of this marble worked to a beautiful jet-black polish; and, doubtless, when bril-liantly lighted, and surrounded by various other brilliant accessories appertaining to a palatial residence, will produce an effect of princely grandeur, which to a contemplative mind would originate reflections on its present use, and the countless centuries it has laid dormant in its native beds, where it has been protected by the overlaying limestone from the violent disturbance which its broken and rugged surface exhibits; nor in a less degree would it originate reflection on the rude labours of those who, ignorant of its destiny, have raised it from its native bed, and the numerous hands and skilful artists it has given employment to in its passage to its present destination. The marble beds are covered in the new quarries by about twenty feet of limestone, the raising of which adds much to the expense of obtaining it, although a considerable sale occurs of the limestone for common building purposes. Except near the marble beds the quarrying of it is effected by gunpowder. A considerable quantity of this marble is sawn by water power into slabs, and exported from Galway in that state to Eng-land and America. These marble beds most likely embrace a considerable area, and also continue under the water of Lough Corrib, with which they are now nearly on a level. At Oughterard, the western extremity of the limestone formation, and in several other parts of it, similar marble beds are met with and worked; those at Oughterard, in the opinion of the marble-workers in London, contain more or less silica, which renders them less valuable. At Limerick considerable quantities of black marble are raised, and both used in the lo-cality and exported. At Carlow and Kilkenny very fine black marble is raised; at Kilkenny the best beds, which were very thin, have, I am informed, been nearly exhausted. Most of the marble obtained from Kilkenny abounds with shells, and which become more marked and conspicuous as the marble becomes dry and exposed. Chimney-pieces made from the Kilkenny marble are to be met with in most parts of Ireland, and are familiarly known, an extensive use of this marble having at one time prevailed : that which is a jet black, and free from shells, is now more generally esteemed. The polish of black marble is considerably affected by dampness, and is much preserved and improved by being kept

dry. Wherever the black marble beds are met with they are assorted with the limestone beds, and the difference in quality appears almost accidental; some of the over or underlying beds often present a strong contrast in the quality of the stone. In other places there is a gradation in character from the adjoining ordinary limestone to the fine marble. In the impure limestone formation of the calp series, They are

generally more or less marked with fossils, and inferior to those beds belonging to the lower or light-coloured limestone formations, and seldom receive a good polish. Wherever the limestone formation prevails in which the marble beds occur, the economy of raising it is dependent on the depth of overlaying rock or soil which requires to be removed, and of the demand which exists in the neighbouroood for the common rock, either for masonry or burning into lime. In some localities limestone rock itself more than repays In some localities the the cost of removing it; and in those localities where this formation prevails these considerawhere this formation prevaits these considera-tions and the quality of the marble beds deter-mine the economy of raising it. Except at Galway and Limerick, where much of it is expected it is almost solally used in the surexported, it is almost solely used in the surrounding localities for ordinary purposes, and most extensively for large grave stones, for which purpose it is sawn into slabs of three or four inches thick, and for this the demand is very considerable. The best qualities, howvery considerable. The ever, are seldom so used.

Dark yray and dark mottled gray marbles Dark gray and dark motiles gray marvies are met with chiefly in the King's County and several parts of the county of Cork. Near Tullamore, marble is obtained in large blocks capable of receiving a fine polish, and con-siderable use is made of it for chimney-pieces and work of that kind. The limestone around Cork produces easy working marble of a light gray or dove colour, and more or less light gray or dove colour, and more or less mottled, and receives a good polish. In the primary districts of the county Donegal, a light gray and bluish-gray coloured marble, of close grain, is met with to a great extent; most of it, however, hard to work from the quantity of silex it contains. The same kind, and of a bluish tint, is also met with very frequently in Connemara. Marble of this description is common to most primary disdescription is common to most primary dis-tricts; it is compact in texture, but does not tricts; it is compact in texture, but does not often produce a satisfactory polish. Most of the primary limestones are met with in ex-posed ridges of surface rock, alternating with or embedded between rocks of the slate formation, and the strata generally possess a vertical or strongly inclined direction. In the northern portion of the county of Donegal it is, however, very frequently met with in suc-cessive horizontal beds and easily quarried. In the counties of Donegal and Galway primary limestone of a coarsely crystalline texture is abundant, polishes very well, and varies in colour considerably. Most of the limestones of the country which are of a fine grain are highly crystalline, are susceptible of a polish, and produce a light gray and bluish-gray colour. Of the light coloured limestones the pure white is most esteemed; it is met with in Connemara, and in several localities is exceed-ingly compact and hard: it is found in narrow limestone of a coarsely crystalline texture is Connemara, and in several localities is exceed ingly compact and hard; it is found in narrow, vertical or highly inclined seams between the slate rocks, and contains veins parallel with the vertical face of the seams, which prevent any cubical masses beyond a small size from being obtained-its great hardness in conversion, and the difficulty of quarrying it renders its use very limited.

White marble occurs in the western portion of the county Donegal, and differs much from that of Connemara; it is coarsely granular, of comparatively easy conversion, can be obtained comparatively easy conversion, can be obtained in cubical blocks and in great quantities; its very coarsely granular texture, however, is pre-judicial to it for many purposes. Some of this marble has been employed in sculpture, and has appeared in the exhibition of the Hibernian Academy. In comparison with the value Academy. In comparison with the v hite marbles of Italy, and that from Carrara, which is the kind chiefly imported into Ireland, the white marbles of Ireland are certainly inferior for sculpture and the ordinary uses to which white marble is applied; where, however, it can be boldly used in these localities where the expense of carriage would be much avoided, there is no doubt that it may be frequently employed with much advantage for many purposes.

At Chevy, near Dungannon, very delicate At Chevy, hear Dingannon, very dentate cream-coloured marble is obtained; very com-pact in texture, receives a high degree of polish, and blocks of great length can be pro-cured. The coarsely crystalline and fossili-ferous limestone at Ardbraccon produces light coloured marble of easy conversion. Of the variegated marbles of Ireland, the sienna of the best quality is, perhaps, the most beautiful; it is met with in the King's County in several places.

The best I am familiar with is veined or mottled sienna, obtained near the Seven Churches. Some of it has been wrought into chimney-pieces and other ornamental purposes at the works at Killaloe; it is susceptible of a high polish, and exhibits many bright and distinct colours. Marble of the same character also prevails, differing in colour, having a dove-coloured ground veined or mottled with the sienna colour. In the county Armagh a sienna, or rather brownish-red marble, is met with, containing great numbers of fossil shells, with which it is strongly marked; several varieties of colour from a very light reddish brown to a rather dark red are also met with, and more or less marked with shells. At Pallaskenry, in the county Limerick, a dark red and mottled marble is abundant, and has been much used. A red-coloured marble, of a compact but slaty texture, occurs in the county of Cork, extendfrom the city in a narrow seam, as far as ing from the city in a narrow seam, as an all ballincollig barracks, a distance of several miles; it is hard to work, and dull in colour, time extensively used. The but was at one time extensively used. The serpentine or green marble of Connemara is, some of it, very beautiful; generally, however, it is of a dull green colour—the injudicious mode of raising it by blasting with gunpowder, has much injured most of what has been has much injured most of what has been raised, and considerably prejudiced the sale of it. Blocks of considerable size, from which large slabs can be obtained, can be raised, and many are found lying on the surface of the ground near where the rock is met. The difficulty of conveying it over bad roads, and the too high price asked for it by the proprie tors, in comparison with what green conti-nental marble can be obtained for, are impe-Black diments against its more extended use. and white marble, and that of a mottled character, occurs in several localities; it is quarried near Cork, in the counties of Waterford, Longford, and Kerry, and some of the varieties are beautiful. That obtained near Mitchelstown is well marked, and receives a high polish. The limestone obtained near the Seven Churches in the King's County, when polished, produces a good marble of an even gray colour. It is strongly mottled with very nu-merous fossil organic remains, which, in the opinion of many persons, gives it a very pleasing appearance. It is easily worked and raised from the quarries in their beds. It may be remarked that this marble in a polished state, has been used in the construction of one of the principal ruins at the Seven Churches. Some of the stones retain their polish to this time; others exhibit decay, and thereby the variable quality of the different beds.

THE BROAD AND NARROW GAUGES.

A CONTEST between the advocates of these two methods adopted in the construction of railways, is exciting considerable interest at the present time in several Parliamentary committees. The broad gauge is almost ex-clusively confined to the western districts, and the question is, whether it shall be extended the northern railways now under coninto sideration. It appears that there are 333 miles of railroad on the broad gauge in regular miles of railroad on the broad gauge in regular working, and 600 more proposed to be con-structed; while of the 4-feet 81-inch there are 1,530 miles in existence, and 1,264 more in contemplation. At the time of constructing the Great Western line it is probable that the general connection of railways with each other was hardly contemplated, and the uni-versal adoption of a uniform gauge not con-sidered of that importance it has since proved to be. To remove this difficulty Mr. Brunel has invented a machine for shifting luggage from one gauge to the other, and on Saturday last its practicability was tested at the Paddington terminus of the Great Western Rail-way. The place of exhibition was a brick building, carrying a set of levers which lift a pair of rails on which a traversing frame works. From each corner of this frame there descends a hook. These hooks are attached below to the waggon body, which has to be lifted from one gauge to the other. The waggon bodies on the narrow gauge are carried upon the usual waggon frames employed by narrow-gauge companies, and when shifted to the broad gauge are placed in iron waggons constructed for the Great Western Company at their works at Swindon.

The mode of working this traversing frame from one gauge to the other may be thus de-scribed.-A head of water 55 feet from the scribed.—A nead of water of feet from the line of rails acts in a cylinder, and a set of valves throw a pressure of water either above or below the piston. When the pressure is above the piston it elevates the traversing frame, and when below it causes it to descend. A counter-balance is also employed, and acts in connection with the water power. The cylinder is $19\frac{1}{2}$ inches, and the water pipe $5\frac{1}{2}$ inches in diameter. When the traversing frame is at rest it is perfectly horizontal, but, during the action of lifting, it assumes a slight inclination, under the controul of the man who works the levers. By this means the load which has to be moved traverses from one

line to the other by its own gravity. Thirty-two tons of coke were shifted from one gauge to the other in seven minutes, and on another trial 10 tons were shifted in a minute and a half. General Pasley has, we understand, inspected the machine and highly approves of it. The cause of contention may, therefore, be considered as removed, and the question now before the public is simply that of expense in the construction and working of the respective gauges. The difference in the cost of the broad over the narrow gauge is 61 per cent in earth work, and 7 per cent in the purchase of land, with a larger expenditure in the construction of carriages, &c., and with increased weight; to counter-balance which Mr. Brunel contends that it provides a more rapid, safe, regular, and luxu-rious mode of transit, and is in every respect superior.

INSTITUTION OF CIVIL ENGINEERS.

JUNE 3. - Sir John Rennie, President, in

the chair. The first paper read was "On the Corrosion of Metals," by Mr. R. Adie, Liverpool. The object of the communication was to give an experimental proof of the fact of water, when saturated with common salt, preserving to a great extent the surfaces of oxidizable metals from corrosion, by the joint action of air and from corrosion, by the joint action of air and water; and also to shew that water, or water containing a saline solution, does not act as a corroding agent without the aid of the oxygen of the atmosphere. These positions were de-monstrated by the details of several series of very interesting experiments, which were purely of a chemical tendency, leaving to the engineers the application to practice of the results obtained. The details were also given of some experiments made to ascertain the quantity of oxygen dissolved by water under different circumstances : whence it was shewn that brine, and some other saline solutions, contain much less dissolved oxygon than sea or ordinary water; the discovery of this fact suggested the experiments on the application of brine as a preserver of iron. The object of the last set of experiments was to determine, by trial, the rates of corrosion of metals in fresh-water, sea-water, and saturated brine. The results demonstrated that sea-water corrodes the quickest, fresh-water less rapidly, and brine very much slower than either. The circumstance was incidentally mentioned of the use of common salt for preserving ships' timbers, for which purposes the spaces between the ribs of some of the North American ships are frequently packed with rock salt, and the effect has proved very advantageous to the duration of the timber without affection of the

adration of the timber without sheetion of the metal fastenings, as would have been supposed. A paper by Mr. W. Gale (Glasgow), pointed out the advantages of the moveable jib crane, for the purposes of building. It was stated to have been originally invented by James Watt, for the Bell Rock Lighthouse, but in a communication from Mr. R. Stevenson (Edinburgh) which was also read, with ex-tracts from the history of that lighthouse, the invention was claimed by Mr. Stevenson. It appeared that the crane was used very ex-tensively, but that some defects existed in its construction, for which the author suggested remedies which he had applied successfully, and for which he gave the necessary details of calculation and drawings, without which they would be with difficulty comprehended.

The monthly ballot took place when Messrs. Frank Forster, T. L. Gooch, and W. Lewin were elected as members; and Messrs. W. P. Marshall, W. Lawford, G. Lawford, and W. B. Buddicom, as associates.

Correspondence.

LANDING STAGES, LIVERPOOL.

SIR,-Some time in March last I forwarded a design for the approval of the chairman and committee of the Liverpool Docks, in answer to the advertisements for the best plan for a landing stage at George's Pier head. This is now upwards of two months since, and as yet no one seems to have heard a single word more about the matter. Whether any deci-sion is arrived at or not, I think that, where the time is so protracted as it is in this instance, the secretary of the committee should have forwarded some reason for the delay, either to THE BUILDER or other periodical current smonget us.

Perhaps the premiums are not to be given at all, and we shall yet see some favourite carry-ing out piecemeal the gathered ideas from the 200 designs, which number it was rumoured were sent in ! I sincerely hope, for the credit of such a respectable body as the committee of the Liverpool Docks, nothing of the kind will take place.

Through your numerous correspondents you may be able to furnish us with some infor-mation of the actual state of the case.

1 am, Sir, &c., A. I. C. E.

the 6th of February last, awarded premiums to the 6th of February last, awarded premiums to two of the designs for landing stages, which, though they cannot either of them be acted upon, appear to possess the fewest objections in principle, and to approach the nearest in general idea to what will have to be adopted, do hereby give notice to the several unsuc-cessful competitors that their respective designs will be returned upon application being made for them; or the committee are willing to al-low the use of the spare rooms in this building, without charge, for a limited period, for the purpose of exhibiting the designs to the pub-lic. Competitors desirous of having their designs exhibited, are therefore requested to appoint from among themselves some party or parties to take charge of and to be responsible for them, and signify their wish to the undersigned, within fourteen days from this date, in order that the necessary steps may be taken. All expenses connected with the exhibition to be borne by the competitors."

CEMENTS .- CEMENT ON IRON.

Siz, - A correspondent in Number 115 wishes me to explain the difference in the pro-Portland stone Cement, and Austin's Stone-colour Cement, they all being described as a close resemblance to Portland stone. I do not undertake to explain the properties more than I have done in my former article; but I may say, in answer, that two out of the three a close resemblance to Portland stone, are not and, indeed, I was not aware that there was a cement in use called Austin's Stone-colour Cement. I herewith send you a piece of Pulham's Portland-stone Cement, not made for a specimen, but cut off, after being in weather six years, where an alteration was made, and that you may decide which is an imitation of Portland stone, as you will pro-bably have an opportunity of seeing some of Maude's Portland Cement, as in Threadneedle-street, and Austin's vases, &c., in the New-road.

I should be glad to see the question an-repaired with Roman cement, the bottoms being laid with Maude's Portland Cement; for,

as he says, it would be well to know. A subscriber, who wants to know the best cement for running mouldings on iron girders, should be told cement or plaster is not run on iron girders; they must have battens or ledges dinary way, and then plastered. Hoddesdon. JAMES PULHAM.

1

ŝ

•** We may not venture to institute comparisons without a longer acquaintance with the cement referred to. Its appearance is good

As relates to running mouldings on iron-girders, another correspondent says this can be safely done if care is used, with Johns' Stucco Cement.

Miscellanea.

ETON COLLEGE CHAPEL .- Plans are being prepared by a limited number of architects, in competition, for the perfect restoration of this chapel. The competitors are said to be Messrs. Buckler, Butterfield, Elmslie, Deeson, Derick, and Ferrey. Mr. Shaw and another architect are to decide on their merits. Mr. Shaw being the attached architect of the college, the whole proceedings seem somewhat singular.

VACANCY IN THE ENGINEERING DE-PARTMENT AT HULL.—The appointment of resident engineer to the Dock Company at Kingston-upon-Hull, will shortly become va-cant by the resignation of Mr. M. Lane. Candidates are to forward their testimonials to the secretary of the company on or before the 14th instant. The salary is upwards of 300/. per annum. BRONZE WORKS OF ART.-Some misunder-

standing having lately taken place on the part of the Custom-House authorities, as to the meaning of the resolution of the House of Commons admitting "bronze works of art" duty free, it has been decided that all works of art, whether composed of bronze or other metal, are to be delivered free of duty.

LIGHT FOR ALL NATIONS. - The stupenduous undertaking of erecting a lighthouse on the Godwin Sands is at length completed. Mr. Bush, the engineer, has determined upon throwing it open to public inspection during the present month, in aid of the funds of the Royal Free Hospital in Gray's Inn-road. The terms of admission are 2s. 6d. each person.

RAILWAY SPEED .- The distance between London and Birmingham was lately performed in one hour and forty-five minutes. One hundred and ten miles in one hundred and five minutes!

THE NATIONAL GALLERY .- Mr. Eastlake R.A. has addressed a letter to Sir Robert Peel, pointing out the unfitness of the present build-ing for its purpose. We shall revert to it next week.

Tenders.

TO CORRESPONDENTS.

"S. C."-Engravings in outline would not satisfy all our subscribers, though they might be preferred by the section represented by our obliging correspondent. We endeavour to meet the requirements of several distinct classes.

" Discontent."- Our correspondent, and many besides, should read the charming little story, called "Old Jolliffe" (published by Wright, Pall-Mall.) "There is much grief in the world, much trouble, but it should be our endeavour to teach all who are suffering that it is good to be so afflicted ; for such a thought will create a contented spirit which will carry them through all their trials and pain !

"F. E. G."-The stone laid with ceremony as the foundation stone is not always the first. shall be glad to hear from him on other matters.

"James Jones."-The description shall appear. "W. Ray."-The statement shall receive atten-

tion. "Works in France." - A correspondent anxious to have some information as to the works by London builders now going on in France.

"History of a Competition."—The statement f "A Looker On" being entirely personal, we must decline inserting it.

"A Journeyman Plasterer" is also declined,

with thanks. "W. B." says :- As many toll-houses are about to be erected in various parts of South Wales, I shall feel obliged if some of your numerous falented architectural correspondents will favour us with the most approved design for those constructions; one which will combine usefulness and economy with picturesque effect. The material generally used is masonry.

"A Subscriber."—If an opening be made in a wall dividing properties, the owner of the land on the other side may block it up.

"I. T."-Johns' patent stone-colour stucco cement is probably the material inquired for. It may be obtained at Mr. Man's, 5, Maiden-lane, Cheapside.

Young Builder."-If the buildings were bonâ fide commenced before last January, sanc-tioned by the district surveyor, and are to be finished as first proposed, an additional thickness of walls cannot be insisted on.

"A Builder" (as to power of official referees) and "P. W." next week.

Received : Kelland's excellent edition Kecceved: Reliand's excellent edition of "Young's Lectures," part 5 (Taylor and Walton), -"The Westminster Review," for June,-Coghlan's "Hand Book for European Tourists" (Hughes, St. Martin's le Grand),-"Pietorial Gallery of Art," part 5 (C. Knight),-"Old England," part 18,

ADVERTISENCENTS.

Board of Ordnance, and other public bedies, at the LONDON COLOUR, LEAD, GLASS, OLL, and VARNISH WAREHOUSE, 27, Coleman-street, City. *,* Country Orders must be accompanied with a re-mittance, or reference for Payment in London.

HOLBORN AND FINSBURY SEWERS, MIDDLESEX. THE COMMISSIONERS of SEWERS for the LIMITS give NOTICE, that their Office, Hatton Garden, is open daily between the hours of Ten and Four, where information can be obtained (gratis) by persons about to Purchase or Rent Houses or Property, or take Land or Building purposes, of the situation and level of the public Sewers, capable of affording sufficient Drainage, and which they recommend all such Persons to apply for at the above Office. By the Court, STABLE and LUSH, Clerks.

COURT OF SEWERS FOR WESTMINSTER, AND PART OF MIDDLESEX, No. 1, Grock-street, Sobe-

NO BUILDERS and Others interested in

The SUILDERS and Others interested in buildings or in ground for building upon, within the district under the jurisdiction of this Court, drained by water-courses falling into the river Thamas, between the city of London and the parish of Fulham. The Commissioners hereby give notice, that by an Act of the 47th Geo. 111. (chap. 7, local) it is required that, pre-viously to the making of any new sewer in any street, lane, or public way, or in any part intended to become a street, lane, or public way, or to carry off or drain off water from any house, building, yard, or ground, into any sewer under their management, or within their jurisdiction, a notice in writing shall be given to them, or to their clerk at their office, and commissioners, and form as shall be directed by the said Commissioners, and not otherwise. And, in order to prevent the serious evils and inconveni-being excavated at too great a depth, the Commissioners have directed that, upon ary lication being made at this office previous to the excavation of such ground, information shall be given as to the lowest depth at which the same can be drained. And the Commissioners do also give notice that, when-

he given as to the lowest depth at which the same can be drained. And the Commissioners do also give notice that, when-ever the lower floors or pavements of buildings aball have been laid so low as not to admit of their being drained with a proper current, they will not allow any severa, or drains into severs, to be made for the service of such buildings. It is recommended to all persons about to purchase or sake houses, or other premises, to ascertain whether such premises have separate and distinct drains into common severs. All petitions must be delivered at this office at least three clear days before they are presented to the Commissioners ; and all such petitions will be called on in the order of their appli-cation, and the name of any party not present when called on to support the application will be struck out, and the pro-ceedings must in consequence be commenced de novo. All communications made with any sever without leave of the Commissioners will be cut off, and the parties making the same will subject themselves to a fine. By order of the Court, LEWIS C, HERTSLET, Clerk.

THE BUILDER.

SATURDAY, JUNE 14, 1845.

UR readers will remember that in October last a cotton mill at Oldham, in Lancashire, fell, destroyed twenty persons, and injured many others.⁺ Sir Henry De la

Beche and Mr. Thomas Cubitt were appointed commissioners, by her Majesty's command, to collect evidence respecting its fall, and "to investigate into the causes connected with the structure of that building, or of certain parts thereof, which led" to the loss of life on that occasion. An inquiry into the circumstances which occasioned the failure of a part of the prison at Northleach, in Gloucester, was also referred to them. After examining the premisses, and hearing such witnesses as were likely to afford the required information, they, at the end of February last, reported their proosedings and the results of their investigations.

This report is now before us: it contains some very valuable information, especially as to the strength of cast-iron beams, and some suggestions by Mr. Cubitt which should be acted an forthwith. In addition to parties ownested with the buildings in question, they examined Mr. Fairbairn, Mr. Eston Hodgkinson, and others, who have given attention to the forms of beams and the nature of iron, and have printed the minutes of evidence: the commissioners have further appended the results of a number of experiments made at Thames Bank, to shew the comparative strength of iron beams of different forms, already referred to in our pages.⁺

"It would appear that the Messrs. Radeliffe, who carry on an extensive business, had considered it expedient to add to their mill or factory, and for this purpose had undertaken the erection of two new buildings upon the principle termed fire-proof; that is, so combining iron, commonly cast-iron, with bricks or stone, as to exclude, or nearly exclude, wood in their erection, thereby rendering the building, as such, incapable of being consumed by fire. One of these buildings was erected over the space or area occupied by the boilers of the steam-engine, adjoining the old portion of the mill; the other, of larger dimensions, was, and is, to a certain extent separated from it.

and is, to a certain extent separated from it. At the latter and of October last the building over the boilers was completed, one 274 feet high, including the roof, 77 feet long, and 41 feet wide. The other building, of larger dimensions, being unfinished, as it now is, though in a more advanced state than at that time. Prior to the former addition to the mill, the boilers, six in number, were covered by a fire-proof floor, formed of brick arches resting on cost-iron beams, the whole supported by the walls and east-iron columns; and above this fire-proof floor there was a clear story, roofed with wood. This portion of the building had been erected eight years since by Mr. John Milnes, iron-founder, of Oldham.

When it was thought desirable to form an addition to the factory in this direction, enlarging that part of the old mill, the roof above noticed was removed, and the new work was carried up based upon the old (15 feet high). The same plan with respect to the arrangement of beams and arches was followed in the new floors, five in number, as in the old floors, the beams being, however, of less weight in the new work than in the old. Thus the building was a compound of work executed eight years since with that commenced in May last, the foundations and 15 feet of the height above the ground being of the former date."

* See BUILDER, Vol. II. p. 563. † See p. 49 ante. "It was stated that the beams were all proved, that is, subjected to pressure to ascertain their strength, the pressure being usually beyond the weight which it is calculated that they would have to support, in accordance with the stipulation made with the founders, Messrs. Sevelles and Woolstanbolme, by the Messrs. Radcliffe. The proof required was a load upon the centre of each beam, 14 feet long, equal to eight tons. The proof actually given is stated to have been equal to 94 tons. John Swailes, joiner, in the employ of the Messrs. Radcliffe, and who made the patterns for the beams, deposes to have seen about twenty beams proved, a weight of 94 tons being, he was informed at the time, applied to the centre of each. The same witness also states that he saw many of the beams cast, and that several were removed red-hot from the sand.

When not resting on the walls, where they were laid upon large stones, the beams were supported by east-iron columns, cylindrical and hollow, 6 inches in diameter externally, and varying in weight from about 6 cwt. each in the lower floor, to about 5 cwt. each in the upper floors, those in the former having a core or hollow 4 inches in diameter, thus giving a thickness of l inch of metal; those in the latter, a core of 44 inches, making three-quarters of an inch in metal. The upper columns, fitted by a projecting portion of their lower ends, into a corresponding socket in the highest part of those beneath them, and the beams were fastened to the columns by clips of wrought iron, secured red-hot over ears or projections at the lowest floor rested upon iron plates, and these upon brickwork. The ties or rads connecting the beams together were about 44 feet apart on the average, of wrought Staffordshire iron, seven-eighths of an inch square, and passed through the upper part of the beams, within about 14 inch from the top.

The walls of the building were of the same thickness from the bottom to the top, 21 feet thick for the side walls, and 2 feet thick at the end walls, and were constructed with bricks, sound and good. Two tiers of bond timber, 41 inches by 3 inches, passed through the centre of the windows on each floor, and they were laid upon the same course, 41 inches from both the outside and inside of the walls.

The arches of the different floors were of bricks, built with mortar made with Derbyshire; lime; they rose in a span from $10\frac{1}{2}$ feet to $11\frac{1}{2}$ feet, and formed a regular segment of a circle. The upper course of bricks was wedged in tight with pieces of Welsh slate, and the whole was paved with flagging, about $1\frac{1}{2}$ inch thick."

Such was the general construction and arrangement of the building, when one of the arches in the upper floor was observed to have settled about 4 inches, and workmen were employed to take it out, and replace it. While this was in operation one of the beams broke close to a column (from the lateral thrust of the adjoining arch as it is considered), and the whole building was almost instantaneously destroyed.

Witnesses were of opinion that this breakage of the beam, though sufficient to cause much damage, did not properly account for the total destruction of the building which ensued: they considered there was not sufficient strength in the beams generally.

"They also advert to the injudicious position of the tie rods which, though sufficient in number and strength, were situated too high up for resisting the strain of the arch. To resist that strain, they point out that the maximum effect would be produced by their attachment to the bottom flange of the beam, but that being inconvenient, they recommend that the ties should not be placed higher than the soffet of the arch, where they would perforate the neutral axis of the beam, that is, where, from vertical pressure, the tendency of the lower part of the beam to be disrupted and opened out is balanced by the opposite tendency on the upper part of the beam to be crushed inwards, thus affording sufficient security to the arch without injury to the strength of the beam.

Though they observed imperfections in the cast-iron columns, arising from the variable

thickness of the metal, they were satisfied with them in other respects, at the same time stating their opinion that one inch more in diameter, with the same weight of metal, would have afforded greater strangth and security."

The iron, on examination of fragments of the beams, was found to be of fair average quality, but the central parts were more highly crystallized than the internal parts, which led to the inference that the former had cooled more quickly than the latter; cracks were also observed, due to the same cause.

"In the evidence of John Swailes it is stated, that several of the beams employed in the portion of the factory which fell were taken out red hot from the sand in which they were cast, a sufficient reason for the appearances we have noticed, more especially, when it is considered that the parts of the beams were of variable thickness, not only the upper and lower flanges differing in this respect, but also the vertical portion connecting them. Under an equal temperature such parts would tend to become solid at variable times, the thinnest parts first, and even under the favourable circumstances of protracted cooling there would still be a disposition in the particles to adjust themselves unequally, producing unequal strains, and an absence of uniform structure in the mass. A fact well known to iropfounders, who from it, endeavour to arrange their castings, so as to obtain as much as possible a uniformity of thickness in the different parts.

parts. The practice of removing beams of castiron, to be employed in sustaining weights, red hot from the sand, is very properly reprobated in the evidence of Messrs. Fairbairn and Whitworth. The former observes,— 'From my own experience, I am satisfied that fire-proof beams should never remain less then too hours in the send after they are cast.

'From my own experience, I am satisfied that fire-proof beams should never remain less than ten hours in the sand after they are past; and for heavy castings thirty or forty hours, or more, are somtimes necessary to assist nature in a perfect, and, consequently, a strong and compact process of crystallization.'

and compact process of crystallization.' We consider that even good cast-iron may be rendered comparatively brittle by sudden cooling, judging from what is known on the subject of the cooling of many substances, the more sudden application of cold to a substance in igneous fusion, producing the brittle quality, exemplified in the various glasses, more moderate cooling furnishing compactness, while more protracted refrigeration causes, in many bodies, crystallization, which may become of such an order from the occurrence of large crystalline planes, as to render fracture more easy in the line of such planes, being those of least resistance than in the intermediate state productive of compactness.

diate state productive of compactness. Unfortunately, it is considered a saving, particularly in small founderies, to remove castings red hot from the sand. Mr. Whitworth points out that not only is room acquired where it is so needed, in such founderies by this practice, but that a saving also is effected in the sand employed, which becomes burnt and destroyed near the castings while the latter are annealed in the cooling.

From at least several of the beams employed in the building which fell being, as stated by John Swailes, taken out red hot from the sand when cast, from the cracks and other corroborative proofs of rapid cooling observed by ourselves, and from having seen a beam cracked through the vertical portion connecting the upper and lower flanges, in the lower part of the larger fire-proof building now finishing, and in connection with the works of the Messrs. Radcliffe, this crack, or fissure, precisely of the kind that would be formed from an unequal tension of the thicker and thinner parts of the beam, more especially, if taken from the sand red hot and thus suddenly cooled; we are disposed to believe that such rents or cracks may have occurred in many other beams."

Considering the evidence correct, the commissioners believe that the lateral pressure of each of the arches successively fractured the adjacent beams.

"This happening on the upper floor, there is little difficulty in conceiving that the mass of bricks and iron thus suddenly thrown upon the floor beneath would crush it, and this again falling on the third, and so on, the accumulation of falling matter would be such from floor to floor, that after the failure of the upper floor, that in which the arch was under repair, the whole would appear to fall almost instantaneously, or in one great crash."

They therefore regard the failure of the arch in the upper floor, for which no apparent reason is assigned, as the primary cause of the accident.

The commissioners made inquiries into "the state of chemical knowledge connected with cast-iron generally," and are disposed to consider it imperfect.

"While referring to these and other researches on a subject becoming daily of more importance to the public, we abstain from all remark as to the forms which may at present appear best adapted for cast-iron beams, further than to observe that when calculations as to the strength of such beams are founded on the supposition that the cast-iron employed is of uniform texture, it would appear difficult to obtain this homogeneity except in castings of nearly uniform thickness in the various parts; that when cast-iron beams are suddenly removed red-hot from the sand in which they are cast, we should expect them to be comparatively brittle, however good the iron may otherwise be; and that some efficient proof of cast-iron beams is most desirable before they are employed in buildings, since, assuming effective forms and the use of good iron, every care having been taken to cool them properly, flaws may exist, not visible externally, rendering them unfit to support the weights they are intended to sustain."

"While on the subject of cast-iron for beams, we would state our strong conviction, founded on a general view of the subject, of the importance of substituting wrought-iron for cast-iron, whenever it can be accomplished, and we anticipate that wrought-iron will be rolled into a sufficient size for all the uses to which large cast-iron beams are now applied, judging from the present size of rolled pieces of iron. When this shall have been accomplished, a great advance will have been made in the use of iron, seeing that beams, or other large pieces of that metal may, with confidence, be relied upon. We consider that when wrought-iron can be thus rolled and employed, its use will become most extensive, and that the consumption of iron for building purposes would be greatly increased, to the benefit of an important branch of our national industry."

They urge with great propriety that experiments respecting the best and strongest forms of wrought and cast-iron beams and columns should be conducted by officers of the Royal Engineers, at Woolwich, or elsewhere, anticipating that such experiments would be of great public importance, by leading to highly beneficial and practical results, the more beneficial in proportion as a knowledge of them could be disseminated by publications of a moderate price.

At the close of the joint report Mr. Cubitt has introduced some remarks and suggestions which are so important, that we are induced to transfer them entire to our pages.

"And I would further humbly represent to your Majesty, that since the first introduction of iron into buildings, its use has progressively increased; and considering that it is desirable to encourage the erection of buildings that are composed of incombustible materials, affected as little as possible by the changes of weather from dryness to humidity, and free from the effects of dry rot, or the ravages of vermin, and cast-iron at present being one of the principal materials by which these advantages are conveniently secured, there is, it must not be disguised, great danger to be apprehended in its use in consequence of our limited and imperfect knowledge of its qualities and properties. Buildings constructed with floors of wood,

Buildings constructed with floors of wood, though at the mercy of an incendiary, and subject to many inconveniences, have at least this one advantage, namely, that an injudicious application of it in their construction is to be less dreaded than when cast-iron is the substance employed.

Wood being much more elastic receives, without injury, shocks which would be fatal to cast-iron; while its great flexibility adapts it to give warning of its own insufficiency, or of an undue pressure acting upon it, perhaps in time to avert danger; whereas cast-iron, from its nature, is incapable of affording the like demonstration of its weakness; and the fall of a building so constructed, from the weight and solidity of the material, is likely to be attended with far more disastrous consequences.

Yet, notwithstanding the many casualties to which cast-iron is liable, its introduction into buildings has been a great gain; and I believe that fewer accidents have happened, with all its[disadvantages, than might have been reasonably expected. And buildings very essential to the safety of the inhabitants of thickly-peopled towns, affording security against the devastations of fire, either by diminishing the risk of its first outbreak, or cutting off the communication with the adjacent burning houses, in order to stop the progress of the flames, could not be constructed conveniently, adapted to the purposes of trade or for public rooms, without the use of iron.

The erection, then, of such buildings being of the utmost importance to all classes of the community, and our knowledge of the best forms and arrangements of cast-iron beams not being based upon principles the correctness of which cannot be questioned, I do feel that any attempt by legislative enactment to control the erection of this kind of buildings might prove vexatious in its operation, from the difficulty there would be (in the absence of acknowledged correct data on which to found comprehensive rules for the regulation of such buildings, and amidst the conflicting opinions of persons who have thought much on the sub-ject), in selecting proper persons to whom authority might be given, who would have sufficient practical knowledge to ensure their decisions being always satisfactory, or who would consider the subject sufficiently alike to secure a uniform practice in the different dis-tricts, without which uniformity persons might be called upon to vary their manner of build-ing, if it happened to be in another district, according to the notions of the surveyor of each. If they were too severe, it would retard the erection of buildings intended to be fire-proof while on the other hand a false confidence might be given, that would prevent the careful consideration of the parties principally engaged, owing to their being relieved from responsibility.

It therefore becomes desirable that every possible facility and encouragement should be given to persons to improve and make buildings more safe and durable; and I should regret if any thing were done that might interfere with the use of iron so as to retard its more general introduction, as it appears to me to be a material the use of which it is of the utmost importance in every way to encourage.

Much, however, if not all the risk involved in using iron for beams would be avoided, by the substitution of wrought for cast-iron; but up to the present time, the anxiety for this change is not widely enough diffused to lead to any immediate practical result in the manufacturing of wrought-iron beams of such dimensions as are applicable to buildings of the largest size. And it may be remarked that the larger the building is, there is generally greater danger of failure, with more deplorable results; consequently the more urgent need there is for increased precaution in providing a corresponding amount of strength, the greater are the difficulties at present experienced, at least as regards wrought-iron.

The expenses necessary to the production of large masses of iron, rolled in the form of beams, being more than a private individual might feel himself justified in incurring for his own use, and the demand from an inadequate conception of their value not being sufficiently pressing or extensive to secure the manufacturer from loss, it is to be feared that it will take some time yet before we shall be in possession of the many advantages which it may be expected will result from their manufacture, unless some stimulus be given in order to hasten the attainment of this very desirable object.

object. I therefore humbly suggest for the consideration of your Majesty the expediency of deg

voting 1,000%. or 1,500% to this purpose, and would propose that premiums of such sums as it may appear advisable, be offered for the best and strongest rolled iron beams, calculated for the use of floors, to sustain a load not under 25 tons, with bearings not less than 24 feet apart. And in order to ensure a steady progress in

And in order to ensure a steady progress in the improvement of the manufacture of iron generally, perhaps an exhibition once a year of the best samples with new forms, will forward the attainment of this end. Such samples might be tested in a proving house, which it may be thought expedient to establish for the accommodation of the public generally, where parties may be allowed to have beams or chains proved at a moderate expense, by which the value of the commodity and its fitness for the proposed work may be ascertained.

The cost of apparatus for proving beams only, being heavy, and requiring much practice in order to make such fully available and to arrive at correct results, it follows that those persons only who are extensively engaged in building, provide themselves with means for testing the strength of iron beams, whilst those whose use of them is occasional have no convenient opportunity of proving them; and it would seem that such persons have greater need of this sort of assistance; than those who, from their extensive practice, become more conversant with the general strength of iron.

rom their extensive protect, extended a conversant with the general strength of iron. I would therefore beg leave to recommend for the consideration of your Majesty's Government, the expediency of providing a proving house, if not in every large town, at least in London, where any persons might send their beams, and rely upon their being correctly tested.

I believe that if facilities were furnished for getting wrought-iron of large dimensions, very few large timbers would be used in building; and as iron can be produced in unlimited quantities, and the whole of the cost of its production spent in employing the labour of this country, the benefit it would produce could hardly be calculated; for, in addition to that required for our own use, an immense demand would grow up for exportation, as it would provide the means of making safe and durable fire-proof buildings — what every person desires, but which at present is very difficult to attain.

Thus the community at large would be benefited by an extended manufacture of wroughtiron, and particularly all the public works under the immediate control of your Majesty's Government. All buildings, whether used as storehouses, barracks, or hospitals, might be rendered more safe and more permanent. Large beams of wrought-iron might be very advantageously employed in ship-building generally, and more especially for supporting the decks over the boilers of steam-vessels. And, to conclude, another step would be taken in order to secure to this nation that pre-eminence it has hitherto maintained in the manufacture of iron.

All which I humbly certify to your Majesty. THOS. CUBITT. London, 28th February, 1845."

We have confined ourselves in the present notice to those parts of the report which refer more particularly to the mill at Oldham, and shall return to the subject with reference to the House of Correction at Northleach, and the information to be obtained from the evidence generally.

THE WILTSHIRE TOPOGRAPHICAL SOCIETY.

THE anniversary meeting was held on Saturday last, to receive the report, audit the accounts, and elect a new council.

The second volume of this society's publications will be ready in the course of June; being "A Memoir of John Aubrey, F.R.S., embracing his auto-biographical sketches, a brief review of his personal and literary merits, and an account of his life and works; with extracts from his correspondence, anecdotes of some of his contemporaries, and of the times in which he lived."

For this work, which promises to be out of very great interest, the society are indebted to Mr. Britton, who has devoted to it muci time and labour.

GREENHOUSES, VINERIES, AND AVIARIES. AWARD UNDER THE BUILDINGS ACT.

THE official referees have recently made an award which will affect very materially the construction of greenhouses and such like buildings; believing it to be a matter of some importance, and that the decision should be known, generally, we print it entire.

"Whereas the official referees of metropolitan buildings, duly appointed in pursuance of the said Act, have received and duly considered the requisition dated the 3rd day of April, 1845, from Thomas Leverton Donaldson, the surveyor of the (South Kensington) district, whereby it appears that J. Weeks and Day were erecting the (described) greenhouse, and further that the said J. Weeks and Day declined to give notice thereof to the said Thomas Leverton Donaldson, as district surveyor, on the ground that the exception of the Act freed the same from all control, and whereby the said Thomas Leverton Donaldson requests the opinion of the official referees.

First, "as to whether such a greenhouse or conservatory as the greenhouse in question

be exempt; and, Secondly, to what extent the exception of the Act in schedule C, part 7, reaches; and, Thirdly, whether the district surveyor have

any and what control over greenhouses, vineries, aviaries, or such like buildings; and,

Fourthly, whether it be under section 8 or any other part of the Act; and, Fifthly, whether such buildings may be of

wood; and,

Sixthly, whether any difference as to the materials of which they are constructed will arise in the cases of their being attached to another building or completely detached from any other erection."

And whereas the said official referees have also received and duly considered the letter from the said J. Weeks and Day, dated the

from the said J. Weeks and Day, dated the 25th day of April, 1845; stating, That "they are advised that greenhouses and particularly one of the description of the one in question fall within the exception to schedule C, part 7, of the Buildings Act, and that the 8th section of mode to buildings of that the 8th section refers only to buildings of the same kind as those included in some one of the defined classes, and cannot be construed to apply to buildings expressly, and by name excluded from such classes." And whereas on the 7th day of May, 1845,

the said official referees did duly hear the said Thomas Leverton Donaldson and J. Weeks touching the matters of the said requisition, and thereupon the said J. Weeks did demur to the jurisdiction of the said official referees such like buildings were exempted from the operation of the provisions of the Metropolitan Baildings Act.

Now we, the said official referees, do here-by find, determine, and award as to the first question

That inasmuch as all buildings (except buildings comprised in schedule B), are by section 5, of the said Act, brought within its operation; the greenhouse or building in question must be deemed to be within the provisions of the said Act.

And further as to the second question-

That the exception in schedule C, part 7 must be deemed to apply only to the mode of determining the rate of such greenhouse or building, and the thickness of the walls, and any other matters dependent upon the rate of building.

And further as to the third question-That greenhouses, vineries, aviaries, or such like buildings, are within the jurisdiction of the district surveyor.

And further as to the fourth question-That such buildings are under the direction

of the district surveyor, under section 8 of the said Act.

And further as to the fifth question— That unless they be "insulated buildings," within the meaning of the said "Act, such buildings must not be built wholly of wood.

And further as to the sixth question— That such buildings, whether attached or detached from other buildings, must in either case be conformable to the provisions of the said Act.

And with regard to the costs and expenses attending this reference, we do hereby further award that inasmuch as the case was one of award that inasmuch as the case was one of reasonable doubt, the same be paid by the said J. Weeks and Day, and Thomas Leverton Donaldson, or by either of them, that is to say the sum of 41. 2s., as and for the fees and expenses of the office of metropolitan build expenses of the onice of metropolitan build-ings, to the registrar of metropolitan build-ings, at the said office, No. 3, Trafalgar-square, London, on or before the 2d day of June, 1845; and that the party by whom the said fees and expenses shall be paid be entitled to be reimbursed one moiety thereof by the other party.

In witness whereof we, the said official referees, have to this our award, on five pages of foolscap paper, set our hands this 24th day of May, 1845. (Signed), JAS. W. HIGGINS, WILLIAM HOSKING. Official Referees.

POWER OF THE OFFICIAL REFEREES.

Sir.-Have the kindness to inform me, and under the Metropolitan Buildings Act, to compel obedience to their dictum, in cases where building owners contend for their right to proceed with buildings commenced before the 1st January last, in opposition to their award made sgainst such opposition to their award made sgainst such buildings, upon the assumption that such buildings were not sufficiently commenced to take them out of the operation of the said Act?—If their course be by application to magistrates, do you not conceive that, as the Act defines no extent of commencement, the Act defines no extent of commencement, the builders may confidently rely on the general honour and integrity of that body (the magis-trates), to protect the building community from the limited views desired to be set up by the official referees in their letter to Mr. Allen of the 4th of Lenvers host? I note your the 4th of January last? I refer you to your ne 4th or January last 'I refer you to your page 154, containing the following observation of Mr. Jeremy, in a case reported to have been heard before him at Greenwich: "I must take the clauses in their literal interpre-tation;" by which straightforward reading, may it not be informed the meinteric will may it not be inferred, the magistrates will may it not be inferred, the magistrates will not lend themselves to any party (however influential), to the contravention of the express language of the Act, and the consequent injury to builders so circumstanced? Your consideration of, and reply to, this inquiry, will, through the medium of your journal, oblige a constant reader and subscriber. A BUILDER.

* The award of the official referees is as binding and conclusive against . every . person as if made under an order of reference of the Court of Queen's Bench, and may be enforced by that Court in all respects as if it were so made.

HEALTH OF TOWNS.

THE Fabian policy of Government with respect to the sanatory condition of towns and the consequent moral improvement of the industrious classes, challenges a remark at this advanced period of the session, the more so as nothing yet has been even proposed. Should this lethargy on the part of our rulers con-tinue a few weeks longer, filth and disease will have acquired an extension of their term of duration beyond what was expected. Her Majesty in her speech from the throne last February, *emphatically* said that it would be highly gratifying to her if Parliament could devise the means of promoting the health and comfort of the poorer classes of her subjects.

comfort of the poorer classes of her subjects. This gratification the Government appear disposed to withhold, at least for the present. They have already issued their fiat that light and air are still to be paid for, and have con-tented themselves with simply announcing that ageneral measure is in embryo, but when to be brought forth, or if at all, there is no pledge. We are much disposed to fear that autumn will find the health of towns in precisely the same condition as the spring did. Bills affecting the rich have been known to pass through their various stages with an almost electric speed; is there any enactment to prevent the same potent spell being applied to bills affect-ing the poor ? If not, then, there may yet be hope during the present session?

THE BRITISH ARCHÆOLOGICAL SOCIETY.

279

IF the amount of ill-feeling which has been generated by the unfortunate dissension in this association could have been calculated by those (be they on which side they may) who first fer-mented it, we are disposed to think they would have used their best endeavours to prevent disunion rather than to fan a trumpery spark into the violent flame now burning. More into the violent flame now burning. More annoyance has been caused to individuals than by any similar disagreement that has occurred for many years; and the whole course of the proceedings speaks very ill for the temper of the times.

the times. The virulence with which that portion of the original committee who appealed to a general meeting of the subscribers, has been assailed by the friends of the other portion, is quite unexampled, and the mode of attack adopted is fraught with dangerous conse-quences to society at large, and should be re-undicted by energy unright man. pudiated by every upright man. *Character* is the mark they have aimed at, and whispered calumnies, anonymous letters to connections caumines, anonymous letters to connections and superiors, published charges of almost swindling, which are found on examination to belong simply to the general question "are we right or wrong?" and do not attach to character in the slightest degree,—are the arrows which have been made use of. We do not hesitate to repeat, that it behoves every man who wishes to exercise an independent opinion in the world, to set himself resolutely against such a mode of proceeding.

Mr. Pettigrew, on whom much of the violence of the attack has fallen, has just now violence of the attack has failen, has just now published a letter to the very Rev. the Dean of Hereford "in reply to the publication of his correspondence relative to the affairs of the British Archæological Association." In this he refers in strong language to the attempts which have been made to fix on him individually as the person refusing to refund money subscribed, and not as the treasurer of an insubscribed, and not as the treasurer of an m-stitution accountable to the members for the proper employment of the funds. He says he "would gladly have avoided every harsh word; but the possessor of an honourable mind will not fail to acquit me for the strong expressions of indignation with which I repel such mean, dastardly, and villanous insinua-tions and assertions." Personally we have not the pleasure of much acquaintance with Mr. Pettigrew, certainly much less than we have with many of the opposing party, and have been impelled to make the foregoing remarks, without any reference to the general question, solely by a sense of public daty, and a desire to assist in preserving the right of dif-fering in opinion from others without being exposed to calumnious attacks on character.

MOVEMENT IN THE SOCIETY OF

MOVEMENT IN THE SOCIETY OF ANTIQUARIES. At a meeting of the Society on Thursday, the 4th instant, W. R. Hamilton, Esq., Vice-President, in the chair, it was announced from the council, before taking the ballot on Dr Bromet's motion, " that they had passed a reco-Bromet's motion, that they had passed a reco-lution to the effect that the council should meet once in every month during the sitting of the society, and oftener if necessary. Some of the members were anxious to adopt this as an amendment on the motion before the meeting, feeling that merely an order of council could of course be rescinded by the council at any time, but it was urged by Lord Mahon and others, that the meeting had no power to pass an amendment that night, but simply to say aye or no to the motion, of which notice had been given; and it was ultimately so ruled by the chairman.

On taking the ballot, twenty-six voted for the motion, and thirty-one against it, preferring in courtesy to take what was offered by the council rather than to exact more. The new resolution, if properly carried out, cannot fail to prove advantageous to the society, and will be speedily followed, we have little doubt, by some important changes. Mr. Disney, Mr. Pettigrew, Mr. Hawkins, Mr. Wyndham, and Mr. Wansey, took part in the debate.

^{• &}quot;The council shall meet for the dispatch of business in the usual place at three o'clock on the first Tuesday of every month (except during the months of September and Oc-tober), and such meetings shall not be adjourned unless by the votes of a majority of two-thirds of the council pre-sent."

THE LATE CONFLAGRATIONS IN EUROPE AND AMERICA. BY J. L--¥.

" Considerations must be-considered."

HARDLY has the ink dried off our essay in the last number of this periodical — than another catastrophe (in Fenchurch-street) startles our mind, and awakens painful sym-pathies in every breast. Besides the individual sentiments which may agitate us on such occa-sions—it is the honour of the country, it is the honour of our royal art, which are nigh being at stake, and a future Tacitus of our times may at stake, and a luture *Lactuus* or our times may strongly animadvert on a social condition, where such things could happen; on the state of architecture, in fine, which constructed buildings, where every conflagration might subject its dwellers to involuntary martyrdom ? These are stern words—but we know such thoughts exist in the highest quarters, and it is the sacred duty (!) of an honest journalist to give them unfinching utterance.

It is the besetting sin of the age to consider every radius of our social condition dis-jointedly, solitarily, isolatedly. Such, how-ever, is not the case. Our pasteboard and gingerbread and cobweb buildings are not momenta standing alone; such all is intimately and innermostly connected with every thing else around us—every thing the result of sheer else around us—every thing the result of sheer (atheistic) egotism and purblind grasping-ness. And then things become all a chance, a raffle, a lottery. Messrs. A. B. C. have made 71 per cent. by the building of the Yar-mouth Suspension Bridge—but the daughter, or niece, or son of Mr. A. B. or C. have perished on this very same structure, and no bank-check in the world will draw them alive bank-check in the world will draw them alive from out of their melancholy, watery grave. If men would think thus—extend the sympathies of consanguinity to every human being (Chris-tianity bids it), then we would at times cut off a one-half per cent. or so from our gains; and then, we sincerely believe, many things, all things would be better. all things, would be better.

But we may as well interpolate our own thoughts with those, which have been of late uttered at public meetings and elsewhere with regard to the late fires. "Fire-escapes"— have been again suggested, a multitude of have been again suggested, a multitude of fire-escapes, and a number of proper persons (this means, of course, conscientious, religious) to superintend and use them. Without wish-ing to detract from the adequate utility of this expedient—we must say that it is only a palliation and not a radical, curative remedy. This is the way in which we moderns proceed constantly. Our artisans possess no adequate constantly. Our artisans possess no adequate walks and play-grounds and public festivals and baths to make them healthy, hale, cheer-ful; but we throng hospital on hospital, inful; but we throng hospital on hospital, in-firmaries of all shades and colours, truss so-cieties, et hoc genus omne. The thing is heart-rending in the extreme, but an honest journal for the progress of any (mechanical) art, must broach such subjects, bearing on the welfare of the workers. Conceeding, there-fore, an adequate value to the introduction of a forest of fire sceness. We have cona forest of fire-escapes—we say, we have con-jointedly to look to "the regeneration of ar-chitecture," the royal art of old. But if we were to say no further, we would merely repeat one of those numberless (un-practical) commonplaces, with which papers are stained and blotched now-a days. It is the punctum saliens-it is the fulcrum of Archimedes (on which he challenged to move the world), which is to be found, in architectural or any other regeneration of our social condition. And thus we say, that many, many people could not *exist* at present without their seven and a half per cent. and so on. Of these, we may say with Dante: "guarda e passa." But there are others, many others, who are not in such (artificially) needy circumstances-besides, persons, wide-hearted, benevolent, bold, ambitious, even amongst those who speculate in and live on architectural pursuits; and it is to those to whom we exclaim and it is to those to whom we exclaim humbly, yet energetically: "speculate not on the chance and jeopardy of human life—be ashamed owning those mud and swallow-nest structures, unfit (aye, in many other respects) for the dwelling and living (!) in of human beings; set an example; restore architecture to its pristine, worthy state—not only to that of the (nagen ') Romans, but of only to that of the (pagan!) Romans, but of our Christian forefathers of former cen-turies!" But as any (legitimate) means are legitimate for good purposes—we go still approach to the Great Pyramids of Geza.

further, and will increase our philanthropic arguments by even speculative ones. Thus, builders of theatres, halls, hotels, inns, manu-factories, in fact any building, where numbers congregate, might considerably increase their congregate, might considerably increases in notoriety, popularity (and consequently gain), if they were to state that their property is freewood the staircases of stone, etc. To allude especially to hotels, the providing of stone staircases instead of those of (well-resinous) deal, could be done in London during the summer recess, etc.

We have introduced in our former paper the name of State's Architecture (Staat's Architektur), and we shall find that England is far behind countries in this branch of other public welfare. Not speaking of the Secretary of State for Public Works in France-even Austria, one-sided Austria, possesses very deep Austria, one-sided Austria, possesses very deep official contrivances in this respect. There is the supreme Aulic commission of public build-ings (Kais. Hof-Bau-Rath) at Vienna, with directors of building in each provincial capital: another department is superintending even the construction of capate dilece etc. even the construction of canals, dikes, etc., viz. the direction of aquatic works (*Was-serbau Direktion*). In Prussia, the late ideal Schinkel was at the head of the department of public buildings.

But as England possesses, after all, al-ready a Department (!) of Public Instruction, (every thing but the name of a distinct secre-taryship of state), another department of taryship of state), another department of public works is a thing not so impossible as many may imagine. But we are apprehensive, lest the extended (or rather mistaken) ideas of personal liberty might mar its exertions and scope. We call the hitberto current ideas of personal liberty mistaken ones, and if we come to know, that our humbler classes possess even the liberty of dying by starvation, we think we the liberty of dying by starvation, we think we have proved our assertion by a very few words. Thus we say, in the present instance —if any person or family chose to live in a house made of *fulminate of silver*, they are welcome to do so; well understood, on some sequestered spot of Salisbury plains, or Marston Moor! Butthey must *not* take any lodgers or servants with them, who being either injured or distressed by fire, may become chargeable or distressed by fire, may become chargeable to the parish — viz. the *nation*. Personal liberty does not go so far as to get 71 per cent., with the liberty of drawing on the public exchequer for those very accidents, which are included as it were in the obtaining of this *dividend*. Every house tenanted is worth individend. Every house tenanted is worth in-suring now, and can get insured. But this relates only to the *landlord*. No one seems to care, however, whether the artisan and working man, yielding the 7½ per cent., by the renting of some wretched hovel run up of wicker-work and deal, is insured or not. But if the head of the family has been burnt, or if they by the loss of furniture, tools, burnt, or it they by the loss of furniture, tools, and other utensils, get distressed, and eventu-ally sent to the poor-house, hospital, or pri-son (!)—who is, after all, the cause of all these calamities (still more so in their national aggregate) but him, who orders such struc-tures to be erected, the artist (?) who is so unfortunate as to be compelled to execute which (!) orders

such (!) orders. We believe, therefore, we have broached reasons, religious, humanitarian, artistic, and politic, for dissuading people to run on in the present way of futile, low, unsafe and ugly architecture—to make them feel, in fine, that it is unworthy of a *free people* to dwell in such structures; and that a bettering, an "improve-ment of our social condition," inculcated even from the height of the throne, must begin somewhere—be it even in architecture.

NEW WORK ON EGYPT .--- Dickinson and Son, of New Bond-street, are about to publish a collection of views of the most celebrated temples, &c. in Egypt, from drawings made on the spot in 1844, by H. Pilleau, Esq., 16th Lancers. It will comprise the following subjects:-The Island of Philæ, with a general view of its ruins; temple and propylea on the Island of Philæ; temple of Koum Ombou; temple of Edfou; interior of the great hall of Carnac-(Thebes); ditto from a different point (Thebes); ruins at Luxor; the two Colossi at Thebes; temple at Medinet Abour-(The-bes); interior of the temple of Denderah; and

EXHIBITION OF WORKS OF BRITISH INDUSTRY

THE importance of a periodical exhibition of our manufactures has been often urged and always admitted; and we are glad to learn that the Society of Arts and Manufactures are applying themselves to effect it. The following resolutions, passed at a recent meeting of the managing committee, will briefly explain the objects sought to be attained :-- " 1. That the experience of foreign countries has proved that great national advantages have been derived from the stimulus given to industrial skill by bringing the manufactures of different establishments into competition with each other, and by presenting honorary rewards to those who have excelled in each department; cheapness of production, and excellence of material, both in execution and durability, being assumed as the criteria of superiority." That by carrying out a similar principle in this country, founded on the experience of the past, but with more entensive views; still greater benefits may be anticipated .--- 2: That having regard to the objects promoted by the Society of Arts, Manufactures, and Commerce, it would appear to be their peculiar province to attempt to carry out such an object in Great Baitain on a scale commensurate with the magnitude of the interests involved .-3. That immediate preparations be commenced for such a periodical exhibition of works of for such a periodical exhibition of works be in-industry, at which the producers shall be in-vited to display their various productions." The details of carrying out this plan, on a comprehensive scale, were left to be considered at future meetings of the committee.

In the report read before his Royal Highness Prince Albert on the 2nd instant, when the society's rewards were distributed, this propo-sition was brought prominently forward. The sition was brought prominently forward. following animated picture (extracted from one of the daily journals) representative of an exhibition of the products of national industry, will bring home to the minds of those who have never witnessed such a display, a scene of extraordinary interest — "A display of the perfection to which we have brought the mechanical arts would include every manufacture of the empire. Each producer would have his stand crowded with the choicest specimens of his skill; china from Worcester and Darby: the first large would be the first and Derby; the finest lace from Nottingham; the most splendid brocades and silks from Spitalfields, the newest patterns from Manspitaineids, the newest patterns from Man-chester, from the raw cotton to the finest manufactured produce; glass, varying in shapes, from the spun fibres, for robes and vestments, to the most superbly cut chande-liers; the produce of Birmingham, from the common cut nail to the maniform the common cut nail, to the magnificent ormolu decorations for palaces; carpeting of brilliant patterns; a display of chronometers, watches; and clockwork; jewellery, of the rarest and most delicate devices; paper of the bighest quality the mill can produce; printing in illu-mination and gold; cloths, of all quality and all colours; the straws of Dunstable, the ribbons of Coventry, and the erockery of Matlock; the latest locomotive-that triumph of mehanical speed; the Cornwall condensing engine-that masterpiece of economic power models of iron steam ships for the Atlantic; of men-of-war, for the dominion of the ocean; of merchantmen, from the ports of London, Hull, and Liverpool; the finest qualities of arms, in guns, pistols, and watered sword blades; and the choicest specimens of carving and cabinet work. Such an exhibition would include all the varieties of articles produced by the skill of the vast body of English artisans —the most ingenious, the most patient, and the most persevering in the world—in a word, everything that could render the exhibition worthy of the industrial manufacture of a mighty empire."

A considerable sum has been already sub-A considerable sum has been already sub-scribed by the committee towards this impor-tant object. We cannot omit this opportunity of alluding in terms of praise to the present active and excellent secretary, Mr. Francis Whishaw, who, by his energy and skill, has been mainly instrumental in restoring the vigour of youth to the ancient society of arts.

TAKING UP PUBLIC PAVEMENT.

A FEW days ago Mr. J. Newson, builder, Grosvenor-mews, was summoned before Mr. Hardwick, Marlborough-street, by Mr. Richman, surveyor of St. George, Hanover-square, for having broken up the pavement in Curzonstreet, without license from the paving board, whereby he had incurred penalties to an enormous amount.

Mr. Richman said the defendant had obtained a license to make eight holes, for the purpose of erecting a hoard before the house of Colonel Merrick, in Curzon-street, where some alterations were being made. In addition to this, the defendant had constructed some cellarage, and had taken up the pavement to the extent of about 500 feet, without having first obtained a permission from the paving board. By this proceeding the defendant had subjected himself, under the 53rd clause of Michael Angelo Taylor's Act, to a penalty of 5*l*., or not exceeding 10*l*, per foot. The board of commissioners had, however, determined not to press for a heavy penalty, and, though the sum of 60*l*. was named, they would think the justice of the case met by a fine of 5*l*. or 10*l*.

The defendant said he had violated the Act quite unintentionally. He had been urged to use expedition in constructing the cellarage, and he had quite forgotten to obtain the requisite licence. He had since obtained it, and paid all that was required. The architect, who was present, said he was accountable for the breaking up of the pave-

The architect, who was present, said he was accountable for the breaking up of the pavement, as it was owing to the pressing directions be gave to the defendant to hasten the alterations that the pavement had been broken up. He thought, however, that the surveyor had mistaken the penalty imposed by law for this offence. He believed the clause empowering a fine of 5*l*. or not exceeding 10*l*. per foot, only applied to cases of wilful damage. To other cases the law affixed a penalty of 5*l*. or not exceeding 10*l*. If the defendant's case came under the 53rd clause, he would have incurred fines to the amount of between 5,000*l*. and 10,000*l*.

10,000*l*. The surveyor said the law evidently intended to apply the 63rd clause to such cases as the present one. Builders would cheerfully pay a 5*l*. or 10*l*. penalty for breaking up the pavement when they could by that means construct an area or a cellar.

a st. or 10t. penalty for oreaking up the pavement when they could by that means construct an area or a cellar.
Mr. Hardwick was of opinion that the case had been fully sustained, but as the paving board had suggested a penalty of 5t. he would make that the amount of the fine.

The money was immediately paid.

RIGHT TO ERECT LADDERS AND HOARDS.

An action was tried in the Court of Exchequer, on the 29th ult., brought by Mr. Davey, a bricklayer, against the surveyor of pavements for St. Anne's, Westminster, to recover compensation for the alleged illegal removal of a ladder and other articles; to which the defendant pleaded, as a justification, that the ladder, &c., were encumbering the footway of Newport-court, in his jurisdiction; to which the plaintiff replied, that he had the license of the defendant for his acts. At the trial before the Chief Baron a verdict passed for the defendant, his lordship being of opinion that the case required a license; that the license given did not justify the conduct of the plaintiff; and that the notice of action was not good, and need not have been pleaded. Afterwards the present rule was obtained to review that epinion; and now Mr. Jervis shewed cause.—The main ques-

Mr. Jervis shewed cause.—The main question was, whether a license is necessary, under the local Act 57 Geo. 3, c. 27, to authorize the plaintiff in erecting a ladder against a house, and whether the license here given—namely, "to erect a ladder on the footway of No. 14, Porter-street," is complied with by the erection of a ladder in the adjoining street, in which No. 14, Porter-street, had another front.

Mr. Humfrey and Mr. Corrie, on the other hand, contended that a license was only required under the Act in question for the erection of an enclosure, for the purpose of depositing materials therein with the view to the reparation of a house. As to the objection to the notice, whether it be good or not, it could not arise, for the want of it cught to

have been pleaded, and it had not been so done

here. The Court, after much discussion, made the rule absolute for judgment non obstante veredicto; it being the better opinion that no license was required for the acts of the plaintiff, and, further, that the want of a sufficient notice was the subject of a plea. At the same time it must be known that had the matter required a license, the terms of the license ought to be strictly followed. A license, for instance, under this Act, to "creet a hoard opposite No. 14, Porter-street," could not be construed into a liberty to put up a hoard in another street which that house might happen to front as well as Porter-street. Under the circumstances of the case, however, it was clear that no license at all was required, and the facts in the plea not affording any justification to the defendant, the verdict given for him thereon must be set aside, and judgment entered for the plaintiff notwithstanding it.

Judgment for the plaintiff accordingly.

ALLWORTH CHURCH, NEAR READING.

This interesting and almost unique specimen of our early decorated style, which has long been an object of interest to the antiquary and lover of church architecture, is now undergoing some necessary repairs; and an appeal has been made in the hope that all who delight in the reparation of our ancient edifices will be the reparation of our ancient colluces will be induced to lend a helping hand to restore it to somewhat of its original beauty. The struc-ture is of flint, and a very superior piece of architecture. The south aisle, on the east and west ends, and on the south side, contains users element windows of threa lists advanded very elegant windows of three lights, adorned with geometrical tracery. The sepulchral with geometrical tracery. The sepulchral effigies, nine in number, which occupy eight tombs in the interior are placed beneath large ornamented ogee arches, richly decorated with trefoils, crockets, roses, and quatrefoils, and form a very rare specimen of the orna-mental architecture of the early part of the fourteenth century. The whole has suffered very much from the violence of the troublous times of the Revolution, and has fallen into great decay. The parish (consisting entirely of an agricultural population) have not had the means of repairing the damage inflicted on it, but they are now expending a rate upon the edifice which will render the structure safe from any further dilapidation, and have raised a considerable sum by subscrip-tion among the landowners and others inter-ested in the parish, which will enable them to begin the work of restoration. The walls, begin the work of restoration. The wails, the windows, the arches, the canopies of the tombs, all require cleaning and consider-able repairs. The timbers of the roof must be relieved of their coat of plaster and re-stored, the whole of the interior re-paved, and the pews re-arranged, so as to shew the archi-tecture to advantage, and to afford increased accommodation to the poorer portion of the inhabitants; and an East window to corre-spond with the others should be inserted in the chancel in the place of the present modern light light.

BIRMINGHAM SOCIETY OF ARTS AND SCHOOL OF DESIGN.—The annual meeting of this society was held on Friday last, and was very numerously and respectably attended. Lord Calthorpe presided. The report stated, that the committee "are able, with great satisfaction, to advert to the circumstances of the past year, as affording a proof that the expectations of advantage to a large portion of the persons engaged in trade and manufactures, by the adoption of the present system under which the society is working, have been fully realised. Your committee can refer to the number of students attending the school, and the result of that attendance exhibited in the works of art selected by your committee as deserving premiums, as showing that in art alone, as connected with manufactures, considerable progress has been made, while the invariable attention, industry, and good conduct of the students are fully bearing out the anticipations of those who augured moral results might be reasonably looked for, from the enlargement of the plans and operations of the society."

FREEMASONS OF THE CHURCH.

JUNE 10.—The Rev. G. Pocock, L.L.B., in the chair.—The minutes of the last meeting were read and confirmed. The Rev. J. H. Brooks, M.A., Senior Fellow and Bursar of Brazennose College, Oxford, was elected an honorary fellow and one of the chaplains.

Mr. W. Papineau, directed the attention of the meeting to what he considered the bad taste exhibited by the directors of the railways in using the pointed style of architecture for engine-houses. Mr. Rogers exhibited an oak stall seat, carved by himself, for the Rev. Henry Boucher, of Thornhill House, Stalbridge, Dorset. Mr. T. Leeson exhibited an encaustic tile from Tintern Abbey. Mr. George Isaacs exhibited a circular reliquary of silver, gold, enamel, and precious stones, bearing the date 1247; also an enamelled jewel of the early part of the sixteenth century, enriched with rubies, pearls, and diamonds, and bearing in the centre a conventional "pelican in her piety;" and Mr. W. H. Rogers a silver-gilt chasuble button of the fifteenth century, perforated with a group of the crucifixion: also, an ornamental monogram of Jesus, by David Hopper, 1530.

A lecture was then delivered by Mr. George Russell French, "On the Sacred Architecture Recorded in the Bible," much of the substance of which has appeared in the BUILDER, under his initials. The lecturer noticed the erection of altars by Noah, Abraham, Isaac, and Jacob, the setting up of the single stones of memorial, most of which had names, as the Bethel of Jacob (whence the affinity was traced to the Bethal stones of Druidical times), the Ebenezer of Samuel, the great stone of Abel, the stone Ezel, Absalom's hand, and many of these stones remained for centuries after their dedication. Some of the stones were set up as witnesses of covenants, as Jacob's Galeed, and that of Joshua at Shechem. "The twelve pillars erected by Moses, Joshua, and Elijah, were probably in the form of circles, like the temples of Stonehenge and Abury, and, like them, surrounded by the vallum or trench, as was the case with Elijah's structure on Mount Carmel. The lecturer pointed out that Solomon's Temple agreed in its plan and details with those of Egyptian temples, rather than with the architecture of Greece, and the close connection of Solomon with the Egyptians, by marriage and commerce, sufficiently accounted for the style of his temple agreeing with their mode of building. The temple which excited so much admiration in our Saviour's days was neither that built by Solomon, nor that restored as described by Ezra, but it was that recently and entirely rebuilt by Herod the Great, and the account of the vast size of " the goodly stones" of which it was composed is borne out by the magnitude of some still to be seen at Baalbec. It was, therefore, Herod's Temple whose foundations were ploughed up by Terentius Rufus, fulfiling the prophecies of Micah uttered seven centuries beforehand.

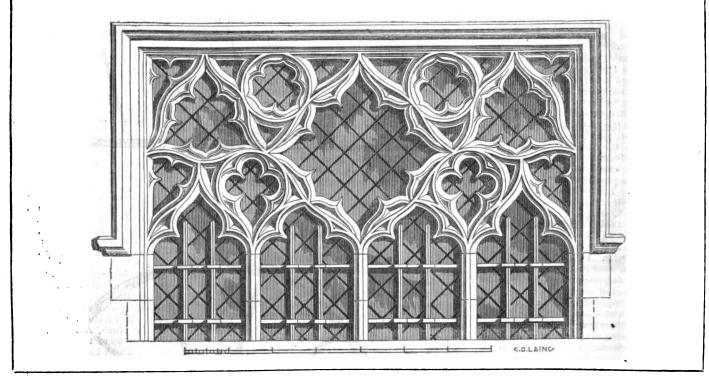

NEW ROAD TO HIGHGATE AND HAMPSTEAD.

A PLAN has been recently submitted to the office of "woods," for improving the means of access to Highgate and Hampstead. It is proposed to form a new road from the top of Swains-lane above the cemetery at Highgate, to the new street now forming from Farringdonstreet, taking the direction of Maiden-lane, without its windings, and raising or lowering the road as occasion may require to make a regular inclined plane, in a straight line, by which the hill may be ascended by horse or foot, without the rise being perceptible. The memorial sets forth that this line would have the peculiar advantage of rising gradually from Battle-bridge nearly the whole way on a natural embankment. "To make it complete two artificial embankments will be required; one across the fields from the top of Swains-lane, nearly in direction of the present foot path to the highest part of Maiden-lane, the other from thence to the new lodge, lately built at the Maiden-lane end of the Tutnell Park-road; and to cross the Junction-road that leads fro n the Holloway-road to Kentisk-town by an arch over it."

WINDOW FROM CHARING CHURCH, KENT.

CHARING CHURCH, KENT.

The picturesque village of Charing, in Kent, is situated about five miles from Ashford. Besides some interesting portions of ancient domestic architecture, there are considerable remains of a monastery or some such building adjoining the church. The latter structure is a large handsome building, but affords very little worthy the architect's remark besides the window represented above; this is in the south aisle, and appears with its square head, rather out of place. It is very large, being 6 feet 2 inches from the sill to the springing. Notwithstanding the decorated character of some of the tracery, I consider the date of the window must be placed in the late period of Gothic architecture. The window is very roughly worked, the design is ingenious, and the effect of it is very good. The church contains some of its old carved benches, with ornamented ends, but these, as well as the font, are not rich enough in character to be worth engraving.

worth engraving. The most singular portion of the interior is the roof, which is Elizabethan; the collar beams are richly carved, and a corbel ornament, like double consoles, is placed at the angle formed by the beams and the rafters. The whole is painted black and white, looking very odd and quaint. C. J. RICHARDSON.

THE NATIONAL GALLERY.

ARBANGEMENT OF PICTURE GALLERIES GENERALLY.

FRW buildings have received a greater share of abuse, just and unjust, than this last luckless effort of poor Wilkins, by which his life was embittered and his death accelerated. Mr. Eastlake, as we stated last week, has now taken the field against it, and, in a letter to Sir Robert Peel, points out its defects as a repository of pictures, and urges that a more suitable building ought to be obtained. The evils he points out are comprised under the following heads :--

"The inconvenient arrangement, or disposition, of some of the rooms.

Insufficient space for the due exhibition of even the present collection of paintings.

Insufficient room for the accommodation of those desirous of studying in the Gallery.

Want of offices.

The imperfect system of ventilating and warming the rooms." With regard to the disposition of the rooms,

With regard to the disposition of the rooms, it will be seen, by a reference to the plan (Fig. 1), which, through Mr. Eastlake's kindness we are able to introduce, that the two small rooms

A and B are ill-calculated for a public exhibition, chiefly from having each but one door, serving for ingress and egress. "The visiters thus passing and repassing are met by the additional streams ascending the staircase, or returning from the principal apartments: the threshold of the gallery is, consequently, often obstructed.

In summer, the effects cannot but be injurious to the pictures, which are exposed in a confined space, at once to a moist atmosphere, and to clouds of dust. Under such circumstances they appear to require cleaning daily (as often as the rooms are swept): this, it is almost needless to say, would be unsafe; and even the frames could not be so frequently dusted without injury to their appearance. The more effectual remedy required is proper ventilation."

As to remedy: —"Shortly after the present gallery was opened, it was proposed to throw the two rooms, A and B with the intervening passage, into one; the stairs would then have partly divided the space, as in the centre room at the British Institution, Pall Mall; but this arrangement, though it would be more convenient in some respects, would much reduce the space for pictures, since two walls would be thus taken away. If, therefore, this alteration was ever ad-

If, therefore, this alteration was ever advisable, it cannot be considered so now; want of space being an actual and increasing difficulty. For the same reason, doors could not be opened at C, D, without reducing the surface now hung with pictures by four times the extent of one of the spaces.

The communication between the larger rooms appears to be unobjectionable, as the doors, though single on each side, are of ample width. Nothing seems to be gained in a public gallery by two doors in the same side of a room, unless one of them is made to serve for ingress and the other for egress, and this would be an injudicious restraint in a picture gallery, where the visiter should be allowed to wander freely and retrace his steps as he pleases. It is also to be remembered that, in general, every door is twice the amount of its dimensions, deducted from the surface of wall available for the arrangement of pictures." The gallery is much too confined for its

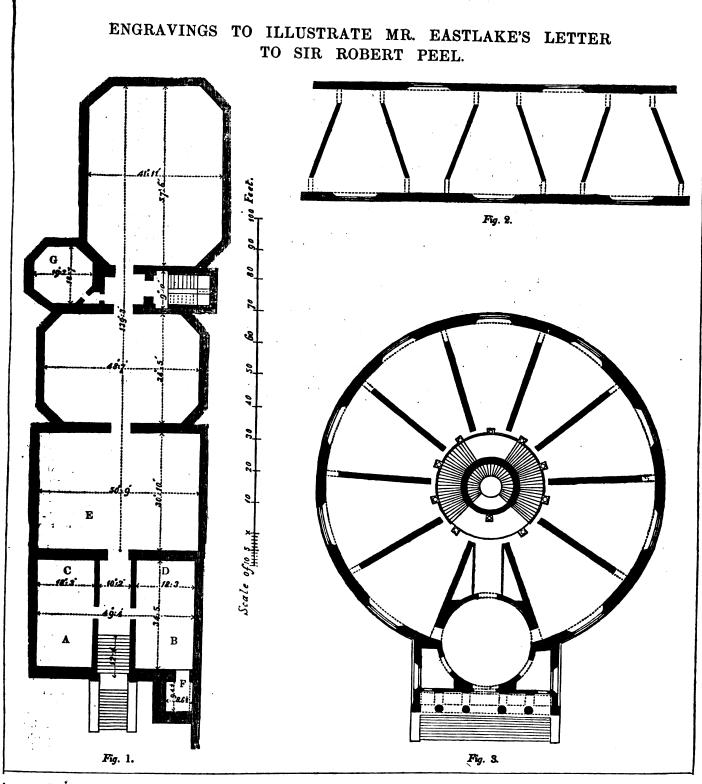

I need hardly observe that it is not desirable to cover every blank space, at any height, merely for the sake of clothing the walls, and without reference to the size and quality of the picture. Every specimen of art in a national collection should, perhaps, be assumed to be fit to challenge inspection, and to be worthy of being well displayed. It is hoped that there is little danger of pictures being purchased for the nation which will not bear this test; although the case may be sometimes different with regard to donations.

although the case may be sometimes different with regard to donations. The arrangement of pictures, with a view to their analogies of style, comparative merit, and dimensions (though unfettered by the considerations which must sometimes interfere with the placing of works of art in modern exhibitions), is an undertaking of no small difficulty. Some opinions on this subject, and on the modes of lighting picture galleries, are here submitted.

leries, are here submitted. Lofty rooms should, I conceive, be appropriated chiefly to large pictures, or to pictures with large figures. The upper part of the walls can be thus only properly filled. The space which may remain underneath, in such rooms, is not the fittest for cabinet pictures; although there may be sometimes examples, especially by Italian masters, which might be advantageously so placed. But small, elaborate, Dutch and Flemish pictures should, perhaps, in no case be far removed from the light of which the windows, wherever they may be, are always to be considered the source.

The fittest place for the windows, whether in the roof or in the wall, is a question on which much difference of opinion exists. Some are inclined to think that a skylight (always supposed to be furnished with ground glass, or with moveable blinds) is desirable for all pictures. This seems to have been Rubens's opinion; for Algarotti states that the museum which the great painter built for himself at Antwerp was circular, with a single light in the centre of the roof. But if a skylight be the fittest, it should still, for the reasons before given, not be too far removed from cabinet pictures, which require a strong light to exhibit their delicate gradations of chiaroscuro, and the beauties of their execution. Indeed, in a climate like this, and with the effects, moreover, of smoke to contend with, there should always be a superabundance of light; and whatever has been deemed necessary in this respect in the best lighted continental gallerics should be rather exaggerated in London. The form of the arched ceiling, next the skylight, is important with reference to this object. The flatter the curve (as tend-

THE BUILDER.

ing to efface the upper angles of the room), the greater will be the quantity of light reflected from it. In the new gallery at Munich this advantage, it appears, is more than counterbalanced, in the large rooms, by the great height of the curve itself, which has

the great height of the curve itself, which has the effect of removing the source of the light too far from the pictures. The inference which the foregoing state-ment seems to warrant is, that rooms of equal height are not advisable for large and small pictures; that, supposing a skylight to be the fittest on all occasions, elaborate cabinet pictures, in order to be near the eye, and, at the same time, near the light (for both condi-tions are essential), must be placed in less lofty rooms. This, it is admitted, might involve architectural difficulties. The problem of proarchitectural difficulties. The problem of pro-viding high and low skylights on the same floor (if desirable to have them on the same foor) would not be solved by adopting the form of the ancient basilica, or that of a church, in which the nave is much higher than the aisles; for the greater elevation of the central room would intercept a considerable portion of light from one wall at least of the side galleries. The diminution of light from the interruption of over-topping walls and chimneys may be

seen in the National Gallery, on comparing the different sides of the principal room; that where the celebrated painting by Sebastian del Piombo hangs is always the darkest, owing to the masses of brickwork above the opposite side. It would appear needless to say that a skylight for pictures should be free and uninterrupted, but the frequent violations of this condition prove that it may be forgotten. Supposing the rooms to be on the same floor,

Supposing the rooms to be on the same floor, but of unequal height, the best mode of ensur-ing the uninterrupted light in the smaller gal-leries would be to place the latter not parallel, but at right angles, or abutting endwise against the higher building, at the same time contriv-ing that connecting corridors (in which draw-ings might be placed), should have the effect of removing such smaller galleries still further from the higher neighbouring walls. If, again, the rooms should not be required to be on the same floor, there would be no difficulty whatsame floor, there would be no difficulty whatever in ensuring a perfectly uninterrupted sky-

light in every case. The well-known advantage of a skylight is, that the spectator, when near enough to in-spect a picture, is not dazzled by the source of the light; the picture is illumined, but the light itself is unseen. There is a mode in which

this end can be attained in a great degree, even with a lateral light. It was proposed some years since by Professor Magnus, of Berlin, but I am not aware that it has been anywhere adopted. A paper which he pub-lished on the subject at Vienna (in November 1839), contains the plan which is here copied,

Figure 2. He supposes a room so constructed to be at least five-eighths of its breadth in height; its least five-eighths of its breadth in height; its length to depend on the number of paintings to be placed in it; windows, reaching nearly to the ceiling and about five feet from the floor, are opened on both sides. The width of the windows, he proposes, should be a fourth of the breadth of the room, and also of the piers between them; screens are then intro-duced, placed at an angle of 62° with the wall, as shewn in the plan. The pictures to be placed on the screens require to be removed five or six feet from the wall; the useless space serving for doors of communication. In such an arrangement it will be seen that the spectator must almost turn his back to the window in viewing the pictures on the screens.

window in viewing the pictures on the screens. This principle is, unquestionably, best adapted for a circular building, since the oblique screens would then present no archi-

283

tectural irregularity, but would be in their symmetrical direction as radiating from a centre. The circular design of Professor Magnus is contrived according to the annexed plan, Figure 3.

Here again he supposes the windows to reach nearly to the ceiling. The extent of the screens from the external wall towards the centre would be regulated by the light, leaving a circular space in the centre for staircases. Opposite each window a statue is supposed to be placed; other details are sufficiently explained by the plan. The same contrivance would be available for more than one story, and might be combined with the employment of a skylight in the uppermost room."

This plan Mr. Eastlake considers to be the least objectionable mode in which a side light can be employed, although fitter for modern exhibitions than for a national gallery. "Nevertheless, it is fair to state that the side light, even with the picture-walls or screens at right angles to the main walls, and without reference to a circular plan, has its advocates. The directors of the Galleries of Dresden and Berlin (Baron de Friesen and Dr. Waagen) both recommend it. It has even been adopted at Berlin and (for modern pictures) at Dresden. The arguments in favour of this opinion seem to be inconclusive. Dr. Waagen, in a letter addressed to me in November, 1840, observes, "that kind of light which the painter considered the best for the execution of his work must also be the best to see it in." To this it may be replied "that, if a picture be painted with a side light from the left (and this is nearly always the case), we have only to show it with a side light from the right, to reverse all the advantages arising from this consideration. It may be added, that in the practice of historical, portrait, or still-life painters, the necessity of lighting the model or object to be copied, advantageously, is still more important than that of light ing the picture. A somewhat elevated light is by no means favourable."

"On the whole I see no reason to alter the opinion which I expressed on a former occasion," viz., that the window or source of light by which a picture is seen, and the picture itself, ought not both to come within the range of vision at the same time. This general condition may comprehend the side light under the restrictions before alluded to; but it may be safely asserted, that a light from above, if sufficiently abundant, is always the fittest for large pictures. With respect to the colour of the walls on

With respect to the colour of the walls on which pictures are to be hung, it may be observed that a picture will be seen to advantage on a ground brighter than its darks and darker than its lights, and of so subdued a tint as may contrast well with its brighter colours. The choice of that tint should, I conceive, be regulated by the condition of its harmonizing with the colour of gold, with which it is more immediately in contact; but this is not all; supposing the most advantageous hue to be employed for the wall, it is not to be concluded that boards painted of that hue will have a satisfactory effect. The refined and harmonious tones of pictures, and the soft splendness, or at least by a certain finish, in the appearance of what surrounds them. The whole question is of less consequence where painings are numerous enough nearly to hide the walls; but while the latter make a considerable part of the impression on the eye, that impression is not to be neglected."

We have given this portion of the letter at length, because the best arrangement of picture galleries is one of considerable interest and is still matter of dispute.

The want of room for the accommodation of artists and others copying in the National Gallery is then pointed out, and the conclusion is arrived at that a larger building is already absolutely necessary. "It is not for me to offer any suggestion as to the fittest place for such a building, but there are certain conditions which, with reference to the preservation of pictures and other requisites, should be borne in mind in selecting a locality.

The main question seems to be, whether

* Report on the mode of lighting the Randolph Gallery at Oxford,

it is desirable that a National Gallery of pictures should be in the heart of the metropolis, or in the suburbs. In the first case it is more accessible to the public at large-undoubtedly a strong point in favour of such a view. As suming such a situation to be the fittest, it would, I consider, be expedient to provide against the injurious effect before adverted to, of a sooty atmosphere. This inconvenience, looking to the experiments of Dr. Reid, could certainly be prevented; and it appears that the means employed to prevent it would not at all interfere with the light, as the circulation of air would be independent of the windows. is admitted that the evil in question—the accu-mulation of soot, would not be materially lessened (depending, as it does, on the direction of the wind) by selecting a site on the out-skirts of London; and therefore the precau-tions recommended would still be necessary, wherever the building might be, since it could in no case be very remote. But light and ven-tilation, if not freedom from dust, would untilation, if not freedom from dust, would undoubtedly be more secured by avoiding the thickly-inhabited parts of the metropolis.

In the event of a central situation being preferred, it might be a question whether the present gallery could be enlarged, as there is considerable space on the north side. I need not inquire how far it might be possible in that case for the skill of the architect to adapt the building to a larger plan; but to combine such an object with a sufficiently symmetrical design would perhaps be scarcely compatible with the existence of the present exterior. Abundant space is, at all events, necessary; for it is most desirable that the plan, however apparently comprehensive, should be capable of extension. This is one of the fortunate circumstances attending the site of the British Museum.

This last requisite would doubtless be more easily attained by removing to the suburbs. Hyde Park has been mentioned in Parliament as a fit situation. Supposing this site to be adopted, its advantages might be combined, as far as possible, with the condition of vicinity to public thoroughfares, by selecting the immediate neighbourhood of either of the roads that bound the Park."

Mr. Eastlake terminates his excellent letter with the expression of a hope that the National Gallery, while rich in the works of the great masters, may, by degrees, merit its designation in another sense, and that a portion of the new edifice may be dedicated to the reception of the best works of the British School. Mr. Eastlake has already done much to advance British art; unless we are greatly mistaken, he will soon be in a position to do more, and we have no doubt will avail himself of it to the follest extent.

ELY CATHEDRAL.

A CORRESPONDENT of the Athenæum said last week :--- "As you sometimes take notice of the repairs and improvements which our national architecture is undergoing, I thought some account of the present state of Ely Cathedral might not be unacceptable to you. When I visited Ely a year or two since, I could not help lamenting the serious dilapi-dations which the cathedral was daily undergoing, and the worse than useless repairs which in several places evinced a feeble attempt to arrest them. Every part of this edifice, which in splendour and extent hardly yields to any in the kingdom, has from time to time, failen under the degraded taste of ignorant economy, and instead of repairs accomplished in the spirit of architecture, we had brickwork in the place of stonework, pointed tracery under Roman arches, and Italian doorways inserted side by side with windows filled with zig-zag mouldings, and in the vicinity of the triumphs of Alan de Wal-singham. The work of restoration has at length I hope fallen into competent hands, and the present dean, whom your scientific readers will at once recognize under the more familiar name of Professor Peacock, has commenced the labour of restoring this noble edifice with a zeal to which its various interests entitle it.

When I entered the cathedral last week, I was surprised by the sound of masons, carpenters, cranes, and pulleys. In the choir a chaffern-fire was burning, tall scaffold-frames were standing near, and three or four workmen were rubbing and polishing pillars of Purbeck marble, while others were stopping the holes and gaps which had been perhaps wantonly hacked upon them. Outside the windows which light four sides of the celebrated lantern, several masons were busily engaged, and the south-western transept, where all the grandeur and solidity and variety of the Anglo-Norman architecture seems concentrated, was literally crammed with masons at their labours.

These are signs of better things. The endowments of Ely have been on a princely scale; but the conservators of its church seem to have been more than usually negligent. The puritan ordonnance commanding the destruction of images did much to despoil Ely, especially the admirable tabernacle work of its tombs and chapels, but on the whole it has perhaps suffered more from the neglect, or even the activity of its friends, than the bar-barous policy of its enemies. From the western porch to the east windows it is covered with one universal coat of stonecoloured with one universal coat of stone-coloured wash, if we except the six pillars of the ante-choir. These are of light-coloured Madrapore marble, and support some of the richest arch-work conceivable, all blunted and discoloured with ochrey wash. The whole of the choir has submitted to the same degradation, so that it was hardly suspected till lately that the pillars supporting the lower arches, and the slender shafts of the triforium with the foliated brackets and columns which sup-port the groining of the roof and the string-courses dividing each story, were all of beautiful Purbeck marble. Several of the shafts have been cleaned and polished, and those dividing the lancet lights of the east window are to follow. As in most of the other works of this period the Purbeck marble has only been partially used, the rest of the work conbeen partially used, the rest of the work con-sisting of quatre and trefoil ornaments, the moulding of arches, and the principal part of the clerestory being of Ketton stone and clunch. We cannot suppose that economy dictated this partial use of marble, when we see such unsparing richness in other parts of this cathedral, but are forced to appeal to some other motive, which may perhaps be suggested in the extreme darkness of the Purbeck marble, which, while it pointed out its partial use in connection with a lighter material, seems to have prevented its adoption for entire buildings oy giving them too dark and mournful an appearance. Associated with white, or nearly white stone, it gives distinct-ness to that fine gothic work which is some-times apt to be overlooked in its minuter parts; and when the degrading lime-wush, under which the sharpness and character of the choir at Ely is lost shall be removed, it may be readily conceived how admirable the colour as well as the clearness and design of this part of the cathedral will appear. The mouldings, foilage, and ribs have been so drenched by the brush and lime-pail that they appear as if they had emanated from a worn-up mould, whereas originally they must have presented the sharpest lines and finest contrasts.

Formerly the eight lancet lights that occupy the east end of the choir were filled with painted glass, which the parliamentary commands of the Commonwealth caused to be destroyed. Bishop Sparke, who died in 1833, left in his will a sum of money to be expended on their restoration, and they are to be forthwith commenced, as well as the four windows which occupy the alternate sides of the octagon. The effect of these, if properly executed, may be conceived by those who are acquainted with the purity and beauty of the architecture by which they will be accompanied. T. C.

ZINC THREAD.—The Moniteur Industried announces that an important discovery in the manufacture of zinc thread has been effected by M. Boucher, who, after many essays, has at length been able to produce zinc threads of any diameter, of great suppleness, and presenting all the qualities of an excellent metal thread. In all cases where a great tension is not required, this thread can be substituted with advantage for that of iron, brass, or copper. The price of zinc has doubled during the last few years, but, notwithstanding, M. Boucher vends his thread at a lower price than the galvanic iron thread, and considerably less than brass thread.

CONTEMPLATED IMPROVEMENTS IN WHITECHAPEL AND SPITALFIELDS.

THE fourth Report of the Metropolitan Improvement Commissioners has been published during the past week. It bears date the 23rd of April, 1845, and refers exclusively to the present defective communications in the locality of Whitechapel and Spitalfields. The report states that "all the houses

The report states that "all the houses required for the proposed improvement in Spitalfields have been purchased and pulled down; that advantage has been taken of the present state of the ground to build, throughout the whole extent from Spitalfields Church to the Thames, a sewer of large and ample dimensions, for the drainage of that district; and that it only remains for the commissioners in whom the execution of the improvement is In whom the execution of the improvement is vested to take the customary measures for the letting of the ground, in order to make it available for all the purposes at present con-templated by the legislature.

It is alleged, however, by the local com-mittee, that the objects for which this improvement was originally devised and recommended to Parliament are at present but imperfectly fulfilled. They advert to the existing communications between the immediate vicinity of Spitalfields Church and Shoreditch; they allege that if the line of street already formed is to be the main channel of communication between the Docks and the north and north-western portions of London, such outlets as these would be wholly inadequate to the exigencies of its increasing traffic; and they urge that, for purposes so important to the trading and other interests of the dis-trict, its northern terminus should be at once extended to the nearest leading metropolitan thoroughfare, and thence to the great leading commercial communications of Old-street and the City-road.

From the evidence appended to the report of the Select Committee of 1840, the ultimate expediency of this extension would appear to have then suggested itself; and a plan for lines of street from Spitalfields Church to the terminus of the Eastern Counties Railway in Shoreditch, and thence to the junction of the City-road and Old-street, to have been prepared for, and discussed by that committee. The estimated net cost of the first-mentioned of these improvements was 40,2091., and of the second 112,000%, upon the lines of which a plan is annexed to this report. Your Majesty's Commissioners have had

before them and examined Mr. Pennethorne, by whom these estimates were prepared and submitted for the consideration of that committee. Mr. Pennethorne, as the surveyor of the Commissioners of your Majesty's Woods, is intrusted with the superintendence of the various metropolitan improvements under their direction; and having since acquired extensive experience in the valuation of property in this district, he adheres to the opinion then expressed, that the ultimate cost to the public would not exceed the sums respectively mentioned.

Upon an attentive consideration of the reports and the proceedings of the several select committees on metropolitan improvements hereinbefore referred to, and after very careful inquiries instituted on the part of this commis-sion, your Majesty's Commissioners are of opinion that the communications in the eastern portions of the town are still exceedingly defective; that, in continuation of the improvement now in progress, the lines at present before them suggested the best and the least expensive that can be adopted; and that, ulti-mately, for the completion of that improve-ment, it may be found expedient to carry both of them into execution.

From the statements submitted to this commission by the parties whose memorials are appended to this report, your Majesty's Com-missioners are also fully disposed to believe that the same lines would effect a great amelioration in the general condition of the district

lioration in the general condition of the district through which they would be carried. But looking to the pressing circumstances more immediately suggested for their con-sideration, in connection with the line of street leading from Whitechapel to the front of Spitalfields Church,—to the very narrow

* A committee of the district of the Tower Hamlets, for watching the progress of Metropolitan Improvements in that neighbourhood,

and defective thoroughfares which at present form its northern terminus; to the near ap-proach of the period at which it will be opened for the reception of traffic; and to the ob-vious disadvantages under which, both on that account and until its final character and destination be decided, the letting and appropria-tion of the ground throughout the whole line of this improvement must be conducted,your Majesty's Commissioners are of opinion that the first portion of the plan suggested to the Select Committee of 1840, is that which calls for the more immediate attention of Parliament.

They recommend, therefore, that out of any moneys to be hereafter raised as a fund for metropolitan improvements, provision should be made for the completion of a line of street from Spitalfields Church to the station of the Eastern Counties Railway in Shoreditch, according to the plan and estimate referred to in this report."

OUR KNOWLEDGE OF CURVES.

SIR,-It appears that " elementary outline," and "geometrical forms" are a part of the instruction, or should be so, of the "School of Design." This, coupled with the "general consideration of geometrical figures," and the "discussing the properties of the *oval*" by the "Decorative Art Society," noticed in "THE BUILDER" of last week, induce me to direct attention to "the September of and "geometrical forms" direct attention to "the Septenary system of generating lines by simple continuous motion." The very word "oval" shews clearly the

want of information, and your beautiful engraving of the "Mausoleum of the Orleans Family," although made from a Daguerreotype plate, which no doubt was correct, shews us clearly that either your draughtsman, or engraver, or both, have the general incorrect idea of the representation of circles in different positions.

Much may be said, and ought to be said, on lines, as elementary instruction, both for design and construction. On the right line-the circle—the ellipse—the parabola and the hyperbola—the archoids—the cypoids and the cycloids. On the different characters the cycloids. On the unerent characters of varying lines, without contrary flexure, as well as on those variously and beautifully inflected and waved lines, which together, are the very A B C of design, and the mine for true lines of beauty; and on the simple means by which so many of these can be so easily traced.

The necessity for knowing practically something more of curves is becoming more obvious, and it will be found strictly true, that geometry is the true foundation of all that is graceful in outline, and the origin of true curves and correct taste in ancient art.

The elementary principles of the septenary system for producing curved lines upon a plan are few; viz., a point, a right line, and a circular line, the simple elements of geometry.

When any object in nature is seen most perfectly developed, what is more common than to say, in admiration, how mathematically correct !

It must not be supposed that it is considered every artist ought to be a mathematician, as word is more particularly understood. that The equation of a curve will not give an ar-tistical feeling to the consideration of a line; but, on the contrary, greatly increase the labour of investigation in that respect, when compared to the simple mode of knowing a curve (as you know your friend) by appear-ance, and by the method by which it can be traced.

The Geological Society, it appears, sprang from a small beginning,—a meeting at Dr. Babington's : and from a meeting to discuss the proportions of a few curves may arise a society for collecting information on the various characters of lines, the simple modes by which they may be traced, and their ap-plications to designs in every department of art. I am, Sir, &c.

JOSEPH JOPLING. 29, Wimpole-street.

THE PRESIDENT OF THE ROYAL ACADEMY. -Sir Martin A. Shee, in consequence of the state of his health, has resigned the office of president of the Royal Academy.

LIST OF NEW PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &c... GRANTED FOR ENGLAND.

Furnished by Mr. A. Prince, of the Office for Patents of Inventions, Lincoln's-Inn Fields.

[SIX MONTHS FOR ENROLMENT.]

Richard Prosser, of Birmingham, civil engineer, for improvements in the manufacture of metal tubes, and in the machinery and apparatus for producing the same. May 1.

Charles Attwood, of Bishop Oak, near Walsingham, Durham, esquire, for certain improve-ments in the manufacturing of iron. May 3.

William Radley, Laburnam-terrace, Kingsland-road, engineering chemist, for certain improvements in the production of gases, and for their application to purposes of general illumination, and in the apparatus and machinery to be employed in manufacturing, measuring, and distributing the same. May 3.

James Foreman, of Ranelagh-road, for certain improvements in the construction and manufacture of pipes and tubes applicable to

locomotive purposes, and to the conveyance of water, gas, and other fluids. May 6. Charles Wheatstone, of Conduit-street, is-quire, William Fothergill Cooke, of Kidbrooke, Blackheath, esquire, for improvements in electric telegraphs, and in apparatus relating thereto, part of which improvements are appli-cable to other purposes. May 6. Joseph Hill, of Ipswich, wire-worker, for improvements in the manufacturing wire fabrics for blinds and other uses. May 6.

for blinds and other uses. May 6.

George Duckett Barber Beaumont, of Sandy Combe Lodge, Twickenham, Middlesex, for improvements in propelling carriages. May 8,

Improvements in propelling carriages. May 8. William Prosser, jun., of Pimlico, Esq., and Jacob Brett, of Hanover-square, gent., for improvements in railways, and in propelling railway carriages. May 10. John Mellar Chapman, of Newcastle-upon-Tyne, banker, for improvements in the manu-facture of rails, and other parts of railways. May 10.

May 10. Frederick Ransome, of Ipswich, engineer, for improvements in combining small coal and other matters, and in preserving wood. May 10.

Thomas Wells, of Ware, whitesmith, for improvements in the construction of timber

and other jacks and floor cramps. May 17. Alexander Mc Dougall, of Daisey Bank, Manchester, gentleman, for certain improvements in the method of working atmospheric railways. May 17. Louis Antoine Ritterbrandt, of Gerrard-

street, doctor of medicine, for certain improvements in the application of heat to boilers for generating steam, which improvements may be

and applied to other purposes where heat is required. May 17. Henry Deacon, of Eccleston, for improve-ments in apparatus for grinding and smoothing plate glass, crown glass, and sheet glass. May 22.

eremiah Simpson, of Burslem, oven-builder. and Joshua Seddon, of the same place, earthenware manufacturer, for an improved method of constructing the flues and interior arrangeof constructing the nuce and interior manufac-ments of ovens and kilns used by manufac-turers of china and earthenware. May 24.

turers of china and earthenware. May 24. Richard Fell, of Crown-street, Finsbury, plumber, for certain improvements in the generation and application of steam, and in ob-

taining and applying motive power. May 24. Julius Adolphus Detmold, of the city of Joinus Adoiphus Detmoid, of the city of London, merchant, for improvements in the construction of metallic boats and other vessels having curved surfaces. May 24. John Constable, of the city of London, merchant, for certain improvements in the manufacture of gas for lighting and heating. May 24.

May 24.

William Prosser, jun., of Pimlico, esquire, and Jean Baptiste Carcano, of Milan, gentleman, for improvements in working atmospheric railways. May 24. Henry Pinkus, of Great Marlborough-street,

Middlesex, esquire, for improvements in ob-taining and applying motive power to impelling machinery. May 24. John Masters, of Welford, Leicester, gen-tleman, for certain improvements in trouser

fastenings, and in attaching the same, and also in the application of an elastic material or fabric to trousers and other articles of dress. May 31.

APATHY OF GOVERNMENT AS TO LOCAL IMPROVEMENTS.

THE Westminster Review, in an article to which we have already referred, remarks justly:—" It is yet but imperfectly understood that the test of all good government is local improvement. The spirit of British legislation is not comprehended by judging of it exclu-sively from the debates of the House of Commons. An intelligent foreigner visiting this country would find the data he requires less in the newspapers than in the streets. What is the true end of all social institutions but the social interest? What other meaning should have state policy, that that the people consti-tuting the state should be well fed, well clothed, well lodged, well educated, and well protected from every calamity that human prudence can avert? A walk from Whitechapel to Westminster, and a few inquiries by the way, will explain to a stranger how far this object has been effected better than whole volumes of Hansard; and yet so little are the practical results of legislation thought of, that when two noblemen, a year or two back, accompanied Dr. Southwood Smith to Spitalfields, to see with their own eyes the state of the poor, the fact was noted at the time as a marvel, and rather as a work of supererogation on the part of lawgivers than as a branch of duty. The reports of numerous commissions of

inquiry have awakened a general expectation of extensive measures of usefulness connected with home administration; but the little that has yet been done shews to a lamentable extent how far more engrossing are questions of party conflict, and the old worn out theories of diplomacy, than any consideration of prac-ticable benefits to the people, which might be realized by government almost without an effort.

Here are we, two millions of human beings, Here are we, two millions of human beings, crowded upon a little spot five miles square, whence, as from a mighty heart, an impulse is communicated to every corner of the globe;— inhabitants of a city which, from its influence in human affairs, will be remembered when even Rome shall be forgotten; and what does this government of ours, or the statesmen com-posing it,—busy with the cares of an empire upon which the sun never sets,—do for us ? Occupied with the regulations of Hong Kong, and the defence of British interests on the banks of the Columbia,—what share of the watchful vigilance of a British cabinet is enjoyed by us, here, on the banks of the Thames in the streets comprising two hundred and fifty-one thousand houses round St. Paul's ?

To answer the inquiry would be only to afford another illustration of the aptness of a large portion of mankind, while taking the warmest interest in the affairs of their neighbours, to forget the maxim of 'look at home.' But we doubt whether the history of the world would afford an example of the capital of a great nation more neglected in the national councils, less indebted to government aid for its growth and progress, as a place of civilized abode, than London.

In ancient times metropolitan improvement was an object for the ambition of kings. The was an object for the amotion of kings. The glory of their capital was considered as their own. 'Is not this great Babylon that I have builded?' was an exclamation of pride, but of pride not unreasonably directed; and if Baby-lon corresponded with the description given of it by Hordcrus we may pardon the invulse of it by Herodotus, we may pardon the impulse of vain glory which turned the brain of Nebuchadnezzar. Egypt found in its Pharaohs,-Athens in a Pericles,-Bome in a succession of emperors,-architects and sculptors devoted to great structural works of public utility and embellishment of their native cities; Eng-d only a George the Fourth. To no other the land only a George the Fourth. To no other British monarch does it appear to have occurred that great kings might be less worthily em-ployed than in planning streets; or that if palaces and churches were worth building, their environs should be something more than a mere province of brick ; and of late few per-sons of high influence or station appear to have troubled themselves with a thought about the matter. The royal patronage of Nash was the stimulus to which we may trace almost every improvement of importance since projected, or now being carried into effect. Regent-street, and the Regent's-park, created a taste for a better disposition of streets and buildings than had before existed, or than had then been commenced in Somers-town, and esta-

blished the precedent to which we owe the entire renovation of many parts of old London, the palatial magnificence of Eaton and Belgrave-squares, the improvements on the estate of the Bishop of London, and the more varied and picturesque squares and crescents of the

Kensington-park estate at Notting-hill. Since the death of George the Fourth, Government has taken no share in the initiation of corresponding measures; but the impulse given has been sustained by the public, and in some instances reluctant consents have and in some instances reluctant consents have been wrung from chancellors of the exchequer in aid of the general movement. The apathy, however, of Government upon all questions connected with either municipal organization or structural improvement, has been shewn during the present session in the debates upon public cemeteries, the window duties, and various important suggestions of the sanitary commissions; and is exemplified by the history of the private bill now before the House for a new line of street between Westminster Abbey and the Vauxhall Bridge-road. We allude to the bill lately introduced with the sanction of the Metropolitan Improvement Commissioners; and which appears likely to be the first fruit of their three years' deliberation. This bill is only to give effect to a project *twenty years* old, and which obtained the recommendation of a committee of the House of Commons as far back as 1832. Fifty thousand pounds (for which a dozen different projectors have been quarrelling) are to be voted in aid of the line; and this is all that Government has done from that time to the present for the improvement of Westminster, south of Pall-Mall, beyond rebuilding the Houses of Parliament on perhaps the worst site that could have been found in England for a similar edifice; a mistake has led to more money being sunk in which the mud of the river to secure a foundation than would have purchased the fee-simple of the whole mass of ruinous third and fourth-rate tenements between Millbank and Buck-

ingham Palace. It is singular that the immediate neighbourhood of royalty should be the worst built, and the worst drained district of the metropolis, and yet, now that St. Giles's has disappeared. so it is; and streets of infamous reputation, which it is scarcely safe or prudent to traverse even in open day, form the only avenues to Westminster Abbey, from Belgrave-square and Buckingham Palace.

A Government that would tolerate the Almonry at its very doors cannot of course be otherwise than indifferent to the state of Wapping, Rotherhithe, or Spitalfields; and we need not wonder that the promise of a Thames embankment has hitherto proved illusory. Inno other capital in Europe are the approaches of a noble river built up to the water's edge. To throw its banks open to the public between Blackfriars and Westminster bridges less money is required than would suffice for any one of the two hundred reilwoods now hofers one of the two hundred railroads now before Parliament; and Government cannot devise the ways and means. While perplexed with this difficulty, it can yet spend its millions to maintain the balance of power in Syria, to frighten Russia from Affghanistan, and coerce the ameers of Scinde into a respect for treaties.

At the present moment we are told that British interests require protection on the banks of the Columbia, nine month's sail from Greenwich. We complain not that such protection should be afforded, but lament that none can be spared for Greenwich itself, one of the suburbs of the metropolis. And yet what Londoner would sacrifice Greenwich Park for all the prairies in the Oregon territory, or Shooter's Hill for the whole range of the Rocky mountains? It will be happy for Eng-land when the physical and moral wants of her people shall obtain a tenth part of the attention which statesmen have hitherto bestowed upon the conquest and defence of distant and profitless dependencies. London in its most fashionable localities, west of Regent-street, gives but a faint indication of what the whole metropolis might become, and with it every town in England, if the duty of promoting public health, and of checking all abuses of local administra tion were made cabinet questions, in lieu of many others which absorb the time and energies of party leaders.

The imaginary difficulty of providing funds for local improvements is only an evidence of the want of earnestness in the will to provide

them. The local revenue of the metropolis, derived from rates and trust estates, for public objects, is three millions sterling ! Of these funds we believe a sixth are now wastefully or uselessly applied; but whether a sixth or six-teenth, no Government gives itself the trouble to inquire, and the existing municipal organization of the metropolis, with its innumerable vestries, boards of commissioners, perpetual churchwardens, and irresponsible trustees, its parishes of twenty houses, and parishes of twenty thousand houses,—each parish with its separate staff, and its separate Acts of Parliament, establishing different laws in different streets,--remains to this day a scandal to the legislation of the nineteenth century."

Correspondence.

NICHES IN BRICKWORK.

SIR, — I am employed as foreman of bricklayers on a rather extensive building, where four brick niches are required to be executed in gauged work. They are to be semicircular on the plan, each three feet in diameter, and the heads are to be semicircular likewise : consequently they will form, when done, a quarter of a globe. Now, never having been called upon to execute such a work as the above, I am rather at a loss how to proceed properly with it. Perhaps some one of your numerous correspondents will be so good as to undertake to inform me, through the medium of your excellent paper, how I am to get the moulds, and the proper method of execution, so that I may be able to make a good and neat I am, Sir, &c., P. W. iob of them.

SETTING OUT RAILWAY CURVES.

SIR,-Can any of your numerous corre-spondents inform me of the general method adopted in setting out a railway curve, and the rule by which the curve is found upon the ground ?—and oblige, Sir, Your obedient servant.

AMATEUR.

Miscellanea.

DISCOVERY OF A STONE COFFIN AND SKELETONS.—On Thursday week the work-men employed by Sir Wm. S. R. Cockburn, men employed by Sir Wm. S. R. Cockburn, bart., and Sir Henry Rivers, in making the new road between St. Stephen's and St. Saviour's church, found a tumulus; and, beneath a domed arch, of rude but substantial masonry, there was a stone coffin, containing portions of a skeleton, and surrounded by nu-merous bones. This is square in form, hewn out of a solid block of sandstone, resembling that so plentifully abounding on Farleigh Down, and must have been occupied by a person of good stature, the excavation measur-ing five feet eleven inches, and the entire length being about seven feet. The dead was enclosed with a massive stone cover; and further security was afforded by a valited arched chamber, reared above the coffin, the top of which was only 18 inches beneath the surface. The workmanship of the entire sepulchre was rude, but of a massive description; the arch alone contained two waggon-loads of stone, while the weight of the coffin could not have been less than one ton. only facts which can lead to a conjecture as to the date of interment, are the discovery of a coin lying on the top of the coffin, and of a spur which was found close to one of the adjacent skeletons. The coin has been examined by Mr. Harris, of Southgate-street, by whom it is pronounced to be the third brass coin of the Emperor Valens, A.D. 328, and U.C. 1081. It was found beneath a fragment of Roman brick, and had apparently been placed in this position as a clue to any who might in after days light upon the tomb. The coin and brick have been placed in the Museum, Terrace Walk. The entire spot apparently abounds with the decaying traces of human mortality. We are informed that no fewer than thirty skeletons, or fragments of skeletons, have been brought to light. Many of these were perhaps interred in wooden coffins; this we infer from the fact that large iron square-headed nails lay among the bones. The remains have been re-interred not far from the spot in which they were discovered .- Bath Chronicle.

CHURCH DECORATION .- Long before the eign of Charlemagne, the custom of painting the interior of churches was already diffused among the Gauls, and a curious passage of the poet Fortunatus* would seem even to prove that there prevailed a sort of emulation between the ultramontane and the national artists, or those of barbarian origin. The accession of Charlemagne, however, gave a fresh stimulus to the fine arts through the whole extent of his empire; the mission of inspecting the churches and the paintings made part of the attributions of the royal envoys who surveyed the provinces. Every recorded fact conspires to prove that the artists of this school, so far from being the imitators, more or less servile, of those of Byzantium or of Italy, as is sometimes asserted, had the advantage over these two countries in giving free scope to their own powers of cultivation, unencumbered with the load of old traditions which had so long impeded the progress of the ultramontane artists. Hence it is that the Byzantine and Italian productions, from the ninth to the thirteenth centuries will not sustain a comparison with the contemporary works of the Germano-Christian school, which was at once more happy in its processes, more pure in the choice of its forms, and more fruitful in inven-tion. In short, its tendency was rather historical than mystical. For the most part, the stirring scenes of the Old Testament were pre-ferred for representation in the decorations of manuscripts, as well as in those of churches and palaces. The synod of Arras, in 1205, had in some sort consecrated this direction, already so conformed to the national taste, by declar. ing that painting was the book of the ignorant who could read no other; thus the characters of this popular writing, as it may be called, were multiplied to infinity, in all dimensions and under every variety of form, insomuch that the magnificence and multiplicity of this kind of ornaments ere long induced the monks of Citeaux, in their pious simplicity, to believe it their duty to signalize as a perilous abuse the constantly increasing luxury displayed by the bishops, in rivalry of one another in decoration of the temples. About the end of the tenth century, two important discoveries were made, namely, the fabrication of tapestry for the adornment of churches, and the art of painting on glass. The glory of the last dis-covery entirely belongs to France; and assuredly it did not less contribute to the development of modern art, and to the majesty of Catholic worship, than to place the imagi-nation of the Christian in a state of prayer beneath the mysterious charm of that uncertain light which is so favourable to holy contemplation .- Dolman's Magazine.

PROSPECTIVE REDUCTION IN THE PRICE BUILDING MATERIALS. - Mr. Charles OF Lindley, the owner of five stone quarries in the neighbourhood of Newark, stated last week, before the House of Commons' Committee on the London and York Railway, that Mansfield stone in London and rork Railway, that Mansfield stone in London was now 31s. 2d. per ton; and the cost of it, if it were conveyed by the proposed railway, would be 24s. per ton, which would give a saving of 7s. per ton. He had no doubt but that the railway in queetion would be used extensively for the . con· veyance of stone. In his neighbourhood was to be found the best building lime in England; and that lime would, he believed, he conveyed in great quantities to Peterborough, Cam-bridge, Boston, London, and other places by the proposed railway, and at a greatly reduced rate as compared with the existing cost of conveyance. The price of Mansfield lime was now 30s. 7d. per ton in London; the price would be 20s. 10d. per ton if it were conveyed by the proposed London and York Railway; so that there would, in that case, be a reduc-tion in the price of that lime in London to the amount of 9s. 9d. per ton. RCYAL INSTITUTE OF ARCHITECTS. — At an ordinary meeting, held on the 9tb instant, Mr. Kendall, V.P., in the chair, a paper was

read "On Ventilation and the prevention of Smoke," illustrated by Mr. James Kite's appa-Smoke,' ratus. We shall probably print the paper at length next week. By the permission of General Monteith a series of drawings of Indian buildings was exhibited, and will be described at the next meeting.

MAKING CLEAN THE OUTSIDE .--They are cleansing St. Paul's of the soot and dust of many years. Washing won't serve the purmany years. Washing won't serve the pur-pose: walls and pillars are scraped and holy-stoned; the church gets a "dry scrub"—like Nicholas Nickleby when the well was "froze." At this moment the façade resembles nothing so much as one of those portraits, clear carnation on one side of the face, and smirched with asphalt on the other, which dealers in paintings expose to shew how well they can store" pictures. Of course, the dean " restore" pictures. Of course, the dean and chapter know too well the maxims of their own religion to rest satisfied with mere external purification; the cleansing outside is only typical of a more thorough scrubbing to be begun within. And within there is an cumulated dirtiness, of which the outside smoke and weather stains give no idea—the dirt of mammon-rusted souls. The buyers who were scourged out of the temple did not venture to make the privilege of seeing it a matter of purchase and sale. The only person on record who sought to earn something by shewing the view from the pinnacles of the temple was one whom the dean and chapter would scarcely venture to take into their service. And yet what was never done in the temple of the Jews, except by the Devil him-self, is daily practised by the servants of a Christian cathedral. The dean and chapter pay their menials, as tavern-keepers do, by permitting them to levy contributions on visitors. At the threshold of St. Paul's, at every landing-place on its stairs, in every dim gallery, the luckless visitant is attacked by some extortioner in the shape of an old man or older woman. Even during the reading of prayers these semi-ecclesiastical showmen continue to gather pence in the aisles. It will be a most unchristian act in the dean and chapter to spend so much money in making clean the outside of the cathedral, if a few wheelbarrows are not hired at the same time to carry away this moral muck from the interior. - Spectator.

THE NEW ROYAL GARDENS .- We learn from the United Gardeners' Journal that the new royal garden at Frogmore, the formation of which was begun in the spring of 1842, is at length completed. The space within the boundary walls, which are twelve feet high, comprises an area of twenty-two acres; there is also an inner wall of the same height, distant about a hundred feet from the former, and extending round three sides of the enclosure, the north side of which, for the space of nearly a thousand feet in length, forms the site of a magnificent range of metallic forcinghouses, &c. which have been recently erected by Mr. Thomas Clark, of Birmingham. Each wing of this extensive range consists of a spacious vinery in the centre, one hundred and two feet nine inches in length, two peach-houses, each fifty-six feet eight inches long; two pineries, each fifty-three feet; and a green-house, fifty feet: the latter forms the terminus of the wing, the various divisions of which communicate with each other by means of five intervening corridors or lobbies, each of which is seven feet long. It is said that this assemblage of horticultural buildings combines every valuable improvement which has been introduced during the last half century, amongst which are contrivances for ventilation, which are at once simple and original by the turning of a small windlass (which a mere child may do) it is said any quantity of air may be introduced, and increased or diminished at pleasure, over the whole interior surface of the buildings. The total length of the entire line of buildings, when completed, will be 936 feet, or 312 yards; an extent which, for a single range, is believed to be without a parallel in the horticultural world. Relative to the system of ventilation adopted we should be glad to hear more.

A COMPETITION FOR YOUNG ARCHITECTS The committee of the Hull Mechanics' Institute are making extensive preparations for a grand polytechnic exhibition, to be held early in the month of August next. With a view to encourage emulation, they have offered various premiums; among them is one of 21. for the best architectural drawing, plan, elevation of a public building." All the or elevation of a public building." All the productions sent in for competition should be original, and will be on view during the time the exhibition remains open.

ON BUILDING-RUBBISH AS MANURE.-The rubbish of clay, lime, or stones, obtained by the repairing or pulling down of old buildings, may be used to advantage as a manure, espe-cially if derived from buildings which were tenanted by either men or cattle; because in that case it will contain saltpetre and ammoniacal salts, as these are always formed where animal putrefaction and decomposition animal putrelaction and accomposition is going on. Previous to being carried on the field it must be well mixed, broken in small pieces, and freed from large stones; it is also to be protected from much rain, which would soon extract the saltpetre and the ammoniacal salts. The amount of lime, loam, and even gypsum, which it contains constitute its value, well as regulate the quantity which is to be brought on a certain area. At times it may be advantageous to mix the rubbish with humic earth in a compost-heap, in which case it must be well broken to pieces and sifted. A still better manure is the rubbish of burnt-down buildings; because it consists of wood-ashes, soot, much ammonia, saltpetre, lime, gypsum, roasted and burnt clay, &c. It is to be broken into small pieces, freed from wood, stones, &c., and soon used, else it would lose some of its ammonia.

ST. JOHN'S COLLEGE, NEW ZEALAND.— An attempt is being made to raise, by subscrip-tion, funds sufficient to erect of solid and enduring materials the fabric of St. John's Col-lege, Bishop's Auckland, New Zealand. It that, in consequence of the low is estimated price of building materials in the colony, re-quisite buildings of stone can be erected for 5,000*l*., including theological college, collegiate school, native teachers (adult) school, native boys' school, infants' school (including orphan asylum), and hospital. OXFORD ARCHITECTORAL SOCIETY. — At

OXFORD ARCHITECTURAL SOCIETY. — At the annual meeting of the Architectural Society, held last week, the Master of the University in the chair, a paper was read by Mr. Sewell, of Exeter College, on the Early Ecclesiastical Antiquities of Ireland. The report of the society was then read, from which it appears that the society is strictly reaclyed to confine itself to its proper duties resolved to confine itself to its proper duties and not suffer itself to be seduced, like a kindred society, into matters irrelevant and controversial.

NOTICES OF CONTRACTS.

We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our resders however, they are entered in a book, and may be seen on application at the office of "The Builder," 2, York-street, Covent-garden.]

For executing Works on the Leeds, Dewsbury, and Manchester Railway, being a distance of about 44 miles. The principal work on this division is the summit Tunnel, near Morley, which is upwards of 3,000 yards in length.

For the execution of a New Harbour at Greenock.

For the supplying of certain Mines in Cornwall, for twelve months from Midsummer next, with Norway Timber, half Dram and half Longsund, of good quality and average length. The probable quantity required is 710 loads.

For building the intended Somerset County Lunatic Asylum.

For the construction of Two Divisions of the Chester and Holyhead Railway, being Nos. 8 and 12. No. 8 contains a length of 7 miles and 54 No. 12 contains a length of 5 miles and chains. 26 chains.

For the erection of a Building in London for a highly patronised purpose, at the estimated cost of about 30,000/.

For supplying from 3,000 to 4,000 cubic yards of Broken Gurnsey Granite or other hard stone, for the repair of the Roads of Regent Street, White-hall, &c., and for 1,500 yards of the same material

for the repair of the Albany Road, &c. For the erection of a Governor's House, and alterations of the Chapel, at the Worcester County Gaol.

For supplying the St. Marylebone Vestry, with materials for keeping the Foot-way and Carriageway in order.

For the several works contingent on Warming and Ventilating the Chester Castle County Gaol. building

For excavating and levelling Land, For excavating and leveling Land, building Sewers, making a new Road, &c., on the Wheatley Estate, Erith, Kent. For Bricklayers', Carpenters', Smiths', Plumb-ers', Painters' and Glaizers' Works, required to be done for one year, from the 24th instant at the

done for one year, from the 24th inst., at the Churches, Chapels, Court-house, &c., of the Parish of St. Marylebone Google

 [&]quot;Quod nullus veniens Romană gente fabrivit Hoc vir barbarică prole peregit opus." Lib, ii. Carm 9.

[•] For lowering and making certain Improvements at the Yeuston Hill, Henstridge, Somerset.

288

For laying down a short Line of Railway, upon Pilbrow's Atmospheric principle, and for two Cornish Engines.

For Building Sewers in Bartholomew-close and Carthusian Street, within the City of London.

For erecting New Buildings and repairing others, on the farms belonging to the Trustees of the Denston Estate, at Wickhambrook, near Newmarket, Suffolk.

Market, Sumoik. For Plumbers' and Glaziers' Works, at the Hackney Union Workhouse, for one year, from the 24th inst.

For Building a New Parsonage House, at Castle Cary, Somerset.

For Building a Poor Girls School, Mistress's House and Offices, in Wells Street and Short Brackland, Bury St. Edmunds.

COMPETITIONS.

Designs for houses to be erected at Dover. The ground is nearly seven acres in extent, and lies on a gentle slope between the south-west boundary of Dover Castle and the town. A premium of fifty guineas is offered for the set that may be most approved of.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

The timber and other trees now standing upon the estate at Woodscaves, Salop. By order of the Lord Chancellor made in the cause "Dickin v. Barker."

At Letts' Wharf, Commercial Road, Lambeth; 150 Loads of Oak Timber, 20 Loads of Oak Scanting and Plank, 40 Loads of Elm Timber and

Boards, &c. At the Sussex Arms, Brandon, near Coventry; several thousand prime Oak Trees, and a quantity of Planks and Quarterings.

At Brandon, near Coventry: several Thousand prime Oak Trees, and a quantity of Planks and Quarterings.

BY TENDER.

A Virgin Forest of Valuable Timber in Walachia. The principal part of the Trees is Oak. The said Forest may produce about 500,000 cubic feet of Timber.

At Little Bentley Hall, Essex : several Acres of Plantations, consisting of superior Firs, Larc Spruce, &c., to be taken down by the Purchaser. Larch.

MEETINGS OF SCIENTIFIC BODIES During the ensuing week.

MONDAY, June 16. — Statistical, 11, Regent-street, 8 P.M.; United Service Institution, White-hall-yard, 9 P.M.

TUESDAY, 17.—Linnæan, Soho-square, 8 P.M.; Civil Engineers, 25, Great George-street, 8 P.M. WEDNESDAY, 18.—Microscopical, 21, Regent-street, 8 P.M.; Eihnological, 27A, Sackville-street,

8 р.м. THURSDAY, 19. - Royal, Somerset-house, 81

P.M.; Antiquaries, Somerset-house, 8 P.M.; Numismatic, Somerset-house, 7 P.M. (anniversary), SATUBDAY, 21. — Asiatic, 14, Grafton-street,

TO CORRESPONDENTS.

"W. Ray" is wrong in considering that the Metropalitan Improvement Society in longer ex-ists; the office of the society is in Bedford-street, Covent Garden.

Covent Garden. "J. F."—We shall be glad to see one of the popers of which our correspondent speaks. If shall be affely returned if unsuitable. "Suggester."—The site of the Fleet Prison is

and considered large enough for the proposed new Completer. See report of Committee in Times of 11th inst.

"J. K."-We have received our obliging correspondent's paper, and will give it early attention. "C. M. J.";

"C. M. J."—Shall appear next week. "Abram L." differs from our correspondent Col. Mason, and directs attention to the brickwork and "truly beautiful." "A Church for Postage Stamps."—In reference

A UNUTED FOR THE POSTAGE Stamps."—In reference to a paragruph under the head of "Absurdity," which appeared in "THE BUILDER" a fortnight since, a correspondent offers 51. worth of postage stamps as his contribution, if the statement be really true

stamps as his control of the stamps as his control of the stamps of the the injuations proposal to build out of order of the minster Abbey, and prevent its isolation for many years, has forwarded to us a petition proposed to be presented to the House of Commons. It lies at "THE BUILDER" office for signatures.

"T. J. M."-We shall probably print his let-ter next week, notwithstanding his request.

"Iron Cement."-A correspondent wishes to know how to form the best and most durable iron

cement for joints. "H. J.'s" inquiry has not escaped us; it will be answered in an article next week. "W. H." came too late for consideration this

week.

week. "H. F." query "F. H."—We are obliged to our old friend for his suggestions, and will give them due consideration. "Window Cleaning."—"W. C." thinks the bowl of hot water would be found troublesome, and recommends the use of the wash-leather, and disuse of whiting. After washing the window, the leather must be squeezed nearly dry, and used for nolishing the glass.

the tearker must be squeezed nearly ary, and used for polishing the glass. "Mr. D." (Mornington Place).—We shall be glad to see some of the subjects mentioned, and to know what arrangement is desired. Received: "A Mason."—"A Bricklayer."— "G. Wood."

*** We are unavoidably compelled to postpone "Geometry of Brickwork," "History of Art by its Monuments," "School of Design," (Constant Reader), and several other articles, for which the respective writers must pardon us.

ADVERTISEMENTS,

TMOSPHERIC RAILWAY, Daily at Work, carrying visiters, at the ROYAL POLY. TECHNIC INSTITUTION. This interesting Model is lectured on by Professor Bachhoffner at One o'clock daily i o'clock, and on the evenings of Mednedsys and Fridays at Eight o'clock, and on the evenings of Mondays, Tuesdays, and Thursdays at Nine o'clock. The working of the Model always follows the Lecture. It is also worked at Four o'clock, and at other convenient times. The other interest-ing Works and popular Lectures as usual. Admission, 1s.; Schools, half-price.

BED FEATHERS .- DUTY FREE.-BED FEATHERS.-DUTY FREE.-HEAL and SON have reduced the price of Foreign Feathers the amount of the duty, and they can now offer-Best White Dantzie 2s. 10d. | Best Foreign Greys 2s. 0d. The Anti-corrosion Paint for every description of outside work, resisting all kinds of damp, and it never blisters or peels off; it has now stood the test for the last sixty years, and has been used by the Government in most of the Colonies and Dock-yards, having received the approbation of the Hon. Board of Ordnance, and other public bodies, at the LONDON COLOUR, LEAD, GLASS, OIL, and VARNISH WAREHOUSE, 27, Coleman-street, City. ** Country Orders must be accompanied with a re-mittance, or reference for Psyment in London.

TO BUILDERS AND OTHERS requiring Scantling, Quartering Deals, Battens, Sawn athing, will find a large quantity for Sale at OLEMENT'S ARD, Horse-ferry Branch-road, Commercial-read East.— by letter, to Mr. HARTLEY, 13, York-terrace, Commer-al-road. Scantling from 1d. per foot.

BATH STONE. E. WELLER, of STEEL-YABD WHARF (late Dreve's), begs to inform Stone Merchants, Contractors, &c., that he can supply them with best FARLEIGH-DOWN STONE on lower terms than ever before offered. — Depdt for immediate supplies, DRUCE'S WHARF, Chelsea.

MANOR IRON-FOUNDRY, MANOR-STREET, KING'S-ROAD, CHELSEA.

KING'S-ROAD, CHELSEA. HAWORTH and Co. beg to represent to Builders, Engineers, and the public generally, that, having made considerable improvements and additions to their Premises, and conducting their business on economical principles, they are enabled to offer CASTINGS of every de-scription at least 10 percent. below the price of any other boose in town. Brass Castings, Builders' Smith-work, Borgings of every description ; Paliading, Railing-front, Bleony-rail-ing, Verandahs, Bell-hanging, and all other iron-work, exe-cuted with the greatest despatch, and st exceedingly low prices. prices.

TO ARCHITECTS AND BUILDERS,

TO ARCHITECTS AND BUILDERS, DOOR SPRINGS AND HINGES. GERISH'S PATENT DOOR SPRINGS, for CLOSING every description of DOOR, consists of Single and DOUBLE-ACTION BUTT HINGES in Brass and Iron for Doors to open one or both ways, and Raing Hisges for the convenience of Doors opening on unsven Floors. Like-wise Swing Centres, which consist of a combination, of power unequalled by any made at present. Manufactured by F. W. Gerish, East-road, City-road; and sold by all pe-spectable ironmongers in the United Kingdom.

TO ARCHITECTS, ENGINEERS, BUILDERS, AND OTHERS

OTHERS. AND OTHERS. A HANDSOME DOUCEUR, or a Re-gular Commission, will be allowed by the advectage to any gentleman connected with either private or public works, who would recommend business, contracts, or jobs to an old, extensive, and highly respectable factory in London, capable of executing engineering works to any extent consisting ha brass or iron, and machinery of every description; the ut-most secrecy may be relied on.-Apply to D. G., care of W. THOMAS, British and Foreign Advertising Agent, 31, Ca-therine-street, Strand.

VARNISH.—It has long been a desideratum amongst the consumers of Varnish to obtain a good and genuine article; brilliancy, facility of drying, hardness, and durability are the qualifications necessary, but these are seldom if ever found united. The experience of a life-time devoted exclusively to the manufacture of this article, the great and important discoveries of modern chemistry, and the daily improvements in machinery, have enabled Messars. George and Thomas Wallis to produce Varnishes (both ail recommend them to the trade, as deserving of notice both in price and quality. Builders, Coachmakers. Painters, and others may depend

price and quality. Builders, Coachmakers, Painters, and others may depend on being supplied with a genuine and unadulterated article. Fine Oil Varnish, from 10s. per gallon; best White Spirit Varnish, 21s. ditto; Rest Spirit French Polish, **39s**. ditto; White Lead, Oil, Turps, and Colours of every description at the very lowest prices.—WALLIS'S Varnish, Japan, and Colour Manufactory, 64, Long-acre, one door from Bow-street. Established 1750.

WALLIS'S PATENT LIQUID WOOD WALLIS'S PATENT LIQUID WOOD KNOTTING. - This newly-discovered Liquid Composition which Messrs. Geo. and Thos. Wallis bare the satisfaction of introducing to the trade, possesses the im-portant qualification of effectually stopping Knots in Wood, however bad, and preventing them eating through and dis-figuring the paint above. Many substances have been used and much time spent in endeavouring to find a cure for a bad Knot, but hitherto without success. Messrs. Wallis therefore feel much plea-sure in offering to the public an article so long and anriously called for.

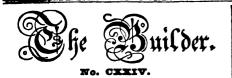

called for.

called for. In the application, skill is not required; a boy can use it as well and effectually as the best workmen: it is put on to the work with a brush like common paint, can be used in all climates and situations, and does not require hest.

Sold wholesale and retail, by Messra. G. and T. Wallis, arnish, Japan, and Colour Manufacturers, No. 64, Long cre. Price 20s. per gallon.

TO ENGINEERS, ARCHITECTS, AND BUILDERS. PATENT METALLIC SAND CEMENT. TO ENGINEERS, ARCHITECTS, AND BOILDESS. DATENT METALLIC SAND CEMBNT. The Metallic Sand, from its chemical qualities, forms, when mixed with blue lias line, a metallic curnant of great strength and density; the iron, which is one of its principal constituents, combining with the bed in which it is deposited, and communicating to it a greater degree of hardness than can be obtained by admixture with any other known material. Concrete and mortar in which the metallic sand has been used are more durable than any other, continuing to indurate with time, and not being affected by damp, otherwise than by increasing in hard-ness from the orydation which is thereby occasioned. Employed as a cement to turn water from brickwork in tun-nels, savers, and other underground works, the Metallic Sand is found cheaper, and from its eminent athesive qualities to form a more solid and hydraulle body, is com-bination with the brickwork, than any other ement at present known; and in all cases the Metallic Sand is found the beast a rich stone-colour without the aid of paint or tim tof any kind, does not vegetate, and is entirely free from cracks and blusters, and continues to improve both in appearance and blusters, and continues to improve both in appearance for with confidence to works in which the Metallic Sand blus the durability dergosure to the weather. The Proprietors refer-with confidence to works in which the Metallic Sand has been extensively employed as concrete and mortar, specified in the prospectus, where also will be found refe-rences to very extensive creations which have been stuccoed with the durability end by the fourd street's and the static event.

Further information will be given, and specimens shewn, on application to Mr. C. K. Dyer, 4, New Broad-street; and at the Metallic Cement Wharf, King's-road, opposite Pratt-street, Camden New Town

SATURDAY, JUNE 21, 1845.

AST week we examined the Majesty by Sir Henry De la Beche and Mr. Thomas Cubitt, chiefly so far as it related to the fail of the

mill at Oldham, appending thereto, some general suggestions of great practical importance with which the report concluded. Relative to the former, however, we omitted one remark which should not be passed over; and that relates to the far too common custom of placing the boilers of steam-engines within the factories themselves, rooms filled with the workers being above them.

The Commissioners say justly, they consider this mode of placing the boilers (adopted chiefly to make the most of the space), very objectionable, remembering the accidents which have happened in such cases through the carelessness of the engine-man, or from imperfections in the boilers or the pipes connegted with them. "Where the boilers so placed are near the street, as was observed to be the case in a factory now erecting in Manchester, the danger of loss of life is increased, since accidents from explosion may not only cause the death of those employed in the factories, but of those passing in the street. This is a point to which we would earnestly request attention when Building Acts may be under the attention of the legislature."

Mr. Hodgkinson, in his evidence, pointed out several instances in point wherein considerable loss of life was caused.

We proceed to extract that part of the report which refers to the failure of the part of the prison at Northleach. It appears that an addition having been considered desirable for the purpose of containing six prisoners, a plan for a small building was prepared by Mr. Fulljames, the county surveyor for Gloucestershire, and a contract to execute the works was entered into by Mr. Thomas Haines, of Cheltenham :-

"The building was to have been 28 feet long, 25 feet wide, and 22 feet high, divided into six cells, 13 feet by 7 feet, having stone walls, with brick arches for ceilings. The arches covering the lower cells were 44 inches thick, rising 10 inches in a width of 7 feet. The uncertainty of the lower cells were 44 inches thick, rising 10 inches in a width of 7 The upper arches were 9 inches thick feet. with the same rise. The height of the cells on the ground floor to the crown of the arch was 9 feet 3 inches, and in the upper floor 9

feet. The building was commenced in the middle of May 1844, and carried on until the accident on the 13th of November, when the whole had so far advanced, that the upper arches were finished, and a covering of concrete laid upon them.

According to the evidence of Mr. Pugh, clerk of the works, the lower arches were finished when the building was up one story, and the upper arches were constructed when the walls were sufficiently high, which was about the 7th of September. The arches were built with mortar.

There were no ties or braces across the arches of the lower story, but two iron ties, each divided into three portions, crossed the upper arches, so as to divide their length into three equal portions. These ties were fastened to the side walls, and those dividing the cells, by means of iron plugs sunk into large stones, and secured into them by lead, the plugs coming through eyes or holes at the end of each portion of the ties. The ties were

placed above the arches. The arches are described as having been put in during good weather, but subsequently much rain prevailed and soaked through the concrete above the arches and through the latter, so that the whole was in a wet state.

THE BUILDER.

A crack was observed on the north-east corner of the building, at the latter end of October, and this was watched. It would appear that at the beginning of November the arrangements for tying the upper arches were considered, under all the circumstances of the case, insufficient; for orders were given to insert other ties which should connect the side walls through the springing of the upper arches. It was while John Aust, a mason, was employed making a scaffold for preparing holes to pass braces or ties across the building on the 13th of November, that he considered the arch above him unsafe, and before he went to his breakfast he marked it, to see if it were settling. On his return, he saw that the arch had sunk a quarter or half an inch, and of this he apprized the clerk of the works, who called off the men from their labour. This was scarcely accomplished before the six arches fell, and fortunately without injury to those employed on the building. We attribute the fall of this small addition

to the House of Correction at Northleach partly to the insufficient arrangement of the iron ties, placed too high for the strain, and partly to the want of protection of the building from the long continuance of wet weather, the rain having softened and partially washed out a portion of the mortar of the arches. From these circumstances, and the wet and uncon-solidated state of the walls, there was no sufficient cohesion of parts to resist the general pressure, the walls were forced so far out as to permit the upper arches, with their load of unconsolidated concrete, to fall on the lower arches, and these readily giving way, the six arches were destroyed, leaving the walls in a But for the effect of the rain damaged state. the arches would probably not have fallen."

It is due to the architect to state, as it appears in evidence, that the contractor was bound to protect the building from the weather, and that the ties were not placed at the spring of the arch because they would then have appeared in the cells, which was highly objectionable.

The erection of fire-proof buildings, by means of iron-girders and brick arches, is becoming general, especially in Manchester and Liverpool, and it is of the utmost consequence that sound information on the subject should be disseminated. "The increase of fire proof buildings at Manchester," says Mr. Fairbairn, "has been steadily progressive in this district for the last thirty years, and I have no doubt, as the security and durability of these structures are better understood, that a much greater increase will take place; and that eventually every description of public building, and probably dwelling-houses may be constructed fire-proof.

At Liverpool, they have commenced building the warehouses fire-proof, and I can see no reason why the principle should not be ex-tended to almost every description of building, particularly public edifices, such as the Houses of Parliament, Royal Exchange, &c., which, in my opinion, should have been constructed cast-iron beams and arches, and made with perfectly secure from fire.

Generally speaking, I am averse to legislative interference with the industrial resources of the country, but in cases such as cotton mills, and large public buildings, wherein numbers of people are congregated, the utmost caution should be observed in the structure, and probably it might add to the public safety as well as the security of property, if some controlling power was at hand, to advise and correct mistakes, in which the most perfect and well meaning are sometimes involved.

The greatest danger, however, arises, not from any desire to save expense, but from funcied security in people trusting either to their own knowledge of subjects they do not understand, or, what is still worse, to the gross ignorance of mere pretenders, whose position and opportunities for information precludes their advancement in either theoretical or practical science.

A knowledge of the strength of materials, and particularly of cast-iron, is but imperfectly understood; it is a subject which requires great labour and deep research, and even with those who have devoted the greater part of their lives and fortunes to these inquiries, it not unfrequently happens, that their labours are not always appreciated by those whom they are intended to serve; when I use the word ap-preciate, it is not in the sense that individuals and the public are indifferent to the value of such discoveries; but the force of prejudice, and attachment to preconceived notions, which in many cases are absolute imperfections, induce many to forego considerations of this kind, and to shut their eyes against demonstrative truths, calculated on the one hand to save considerable outlay in the cost of material, and what is of much greater importance, the security of life and property on the other.

As respected the arrangement of columns, beams, and tie-rods, it was impossible to lay down rules which would provide for every contingency. Mr. Fairbairn observed "that in fire-proof buildings for manufactories, the sectional area of the tie-rods should not be less than three square inches for every 20 feet in the width of the mill, and for warehouses and similar buildings five square inches will be a fair average proportion.

The walls should, in my opinion, never terminate with less than two bricks thick on the top story, and for every two floors downwards the increase should be an additional half brick, including an extra thickness of 41 inches in the walls of the ground floor. For factory purposes the above proportions will be quite sufficient, but for warehouses and other buildings calculated to sustain heavy weights, an additional half brick in thickness to every story, terminating at the top with two bricks as before, will insure perfect safety. With these proportions, care must, however, be taken to flush or grout the walls; using at the same time the proper bond, and spreading the base of the foundations to at least one and a half times the thickness of the walls in the bottom story."

To shew the importance of scientific knowledge, it will be sufficient to mention, that a beam with a single flanch at the bottom thus 1, which will support a weight equal say to 1,000, may be broken if reversed and the flanch put upwards, thus T, with a weight equal to 340.

"It is well known, or it ought to be known, to every person giving instructions for the form and construction of iron beams, that the strength is nearly a proportional of the sec-tion of the bottom rib or flanch; and, according to Mr. Hodgkinson's experiments, a bottom flanch of double the size will give nearly double the strength.

These facts having been proved by direct experiment, it is important to all those concerned in the construction of fire-proof buildings, in which the lives of the public and the property of individuals are at stake, that the form of beams and the section of greatest strength should be perfectly and thoroughly understood ; and, to those unacquainted with the subject, we would beg to refer them to Mr. Hodgkinson's paper on the strength of iron beams, in the fifth volume, second series of the 'Memoirs of the Literary and Philosophical Society of Manchester.'"

In every description of arch supported by iron beams, it is essential to have the tie-rods as low as possible; it is generally inconvenient to have them in the line of the chord of the arch, or at the bottom flanch of the beam, but they should never be higher than the soffit of the arch.

The strength of cast-iron columns is very little understood by builders; they use them of certain dimensions, because they have been used before of that size and have not failed; the difference in their strength which is found

when one end is rounded instead of flat, or when a column is not exactly perpendicular, with many other points of the greatest consequence, are seldom considered.

Mr. Hodgkinson in the report before us gives the following results of a number of experiments made by him on the strength of castiron pillars. The experiments were made by means of a lever compressing the ends of the pillar, which stood upright between two flat surfaces of hardened steel always parallel to each other.

"lst. It was found that a long pillar, with its ends flat and perfectly immoveable, was about three times as strong as another of the same dimensions with the ends rounded, so as to be capable of turning as on a universal joint. When one end of the pillar was rounded and the other flat, according to the definitions above, the strength was an arithmetic mean between that of the other two. In other words, if three long pillars be formed, all of equal diameter and length, and one pillar has both ends made round, another one end round and one flat, and the third both ends flat, the strength of these pillars will be as 1, 2, 3, nearly.

Some of the pillars with flat ends had discs upon the ends, to give them an increased breadth of bearing; but this, however necessary in practice, added very little to the strength.

2nd. A long pillar, with both ends flat, or firmly fixed, has nearly the same strength as one of the same diameter and half the length, with both ends rounded, as above.

with both ends rounded, as above. 3rd. If a solid pillar, be enlarged in the middle to $\frac{3}{2}$, or upwards, of the diameter of the ends, and taper from the middle to the ends like frustums of two cones, whose bases are united in the middle, the strength will be increased more than the weight of the metal by about $\frac{1}{2}$ of the whole. This will be the case whether the ends are rounded or flat. 4th. Similar pillars. If long pillars be cast and turned perfectly similar, the diameter being to the length in a constant ratio, the strength was found, from a mean of several ex-periments, to vary as the 1.865 power of the

periments, to vary as the 1.865 power of the diameter, or any other lineal dimension. It varies, therefore, nearly as the square, but somewhat lower.

5th. If a pillar with flat ends be so placed, that the pressure it sustains acts diagonally from the extremity of the diameter at one end to the opposite extremity of the diameter at

to the opposite extremity of the diameter at the other, the strength is reduced to one-third, as was proved by several experiments. It is easy to infer, that this is a case ana-logous to that of a pillar with rounded ends. 6th. Relative strength of columns of dif-ferent materials. Representing the strength of columns of cast-iron by 1000, I found the strength in wrought-iron 1745, cast-steel 2518, Dantzic oak 108°8, red deal 78°5. 7th. The properties of columns, enumerated above, apply to such only as have the length so

above, apply to such only as have the length so great that fracture may be considered as having been produced wholly by the flexure of the column. They apply, as appears from my ex-periments, to all cast-iron columns with rounded ends. in which the length is more than 15 times ends, in which the length is more than 15 times the diameter; and to all, with flat ends, in which the length is more than 30 times the diameter, or upwards. If the pillars are shorter than this, fracture takes place partly by flexure and partly by crushing; and the properties are more complicated than as here described.

In reply to the inquiry, "Have you not given formulæ for calculating the strength of cast-iron pillars or columns?" Mr. Hodgkinson said,—I found the strength of long cast-iron columns, with rounded ends, to vary as the 3.76 power of the diameter nearly; and those with flat ends as the 3.55 power of it; the length in each case being given. When the length varied, and the diameter was the same, the strength was inversely as the 1.7 power of

the length, nearly. Taking 3.6 as an approximate term between 3.76 and 3.55, and the co-efficients, as ob-jects.

tained from my experiments, we have, for columns fixed at the ends.

W=44.16 $\frac{D^{3-6}}{L^{1-7}}$ =strength of a solid cylinder.

W=44.34 $\frac{D^{55}-d^{3.5}}{L^{1.7}}$ = strength of a hollow cylinder.

where W is the breaking weight in tons; D, d the external and internal diameter in inches;

and L the length in feet. If both ends of the pillars are rounded, the strength will be $\frac{1}{3}$ of that given by the formula.

strength will be $\frac{1}{2}$ of that given by the formula. If one end be rounded, and one flat, the strength will be 3 of that in the formula. The preceding formulæ are applicable to columns whose length is more than 15 times the diameter, when the ends are rounded; and more than 30 times the diameter, when the ends are flat.

If the pillars are shorter than as above, they will be crushed as well as bent; and the value of W will require to be modified by the fol-

$$W' = \frac{W c}{W + \frac{3}{4}c'}$$

where c is the weight which would crush the pillar, in tons, if it were so short as to be broken without flexure. To find c multiply the arca of the section of the pillar in inches by 49; since the iron I used (the Low Moor No. 3) required 49 tons to crush a prism of it where here were back severa " it whose base was 1 inch square."

Mr. Hodgkinson considers the mean crushing strength of cast iron 47 tons per square inch, and that this is on the average, six and a half times the force necessary to tear the body asunder; the tensile strength being 7.2 tons per square inch nearly.

In conclusion, we congratulate the commissioners on the quantity of valuable information which they have brought together in their report, and express a hope that the suggestions made by Mr. Cubitt may be immediately adopted.

CHIMNEY-SHAFTS FOR BOILER FURNACES.

SCHEDULE F of the Buildings Act, after setting forth that no chimney-shaft (except that of a steam-engine, brewery, distillery, or manufactory) must be built higher than eight feet above the slope, flat, or gutter of the roof which it adjoins, unless such chimney-shaft be built of insured this pass and a forth which it adjoins, unless such chimney-shaft be built of increased thickness, and so forth, says, "And as to the chimney-shaft for the furnaces of any steam engine, or for any brewery, distillery, or manufactory, such shaft may be erected of any height, so that it be built in such manner, and of such strength and dimensions as shall be satisfactory to the offi-cial references upon energial application in each cial referees, upon special application in each case."

In consequence of this, the district surveyors will not permit the erection of any chimney-shaft for such purpose, whether of greater height than that allowed for ordinary shafts or not, without a certificate and instructions from the official referees. The mode of proceeding is to forward a drawing of the proposed shaft to the registrar, and a letter requesting permission to execute it. In reply to this requesting permission to execute it. In reply to this a certificate is granted (on payment of the fees), containing certain instructions. These, of course, vary with circumstances: an examination, however, of a dozen or more certificates of the sort, already granted by the referees, above the following requirements:

topmost five feet in cement. It must be bonded every six courses with

It must be bonded every six courses with hoop-iron lapped at the angles. The base of the footings must be one-half longer than the base of the shaft, and be placed as low as the base of the footings of any adjoining wall or building. If the shaft be square, the height of it must not exceed ten times the length of the side at the top of the footings : if circular, twelve times the lower diameter. The abeft must diminish in size unwards.

The shaft must diminish in size upwards, and be at least one-third less at the top than it

is at the bottom. The projection at head of the chimney, if any, must not exceed three-fourths of the thickness of the brickwork from which it pro-

The shaft must be lined with fire-bricks to the extent of 6 feet at the least above the opening from furnace. The fire-bricks must not be tied to nor made to support the brickwork of the structure, but be removable at will.

The shaft must not be tied to any existing building or wall, and no wood-work must be fixed in or to it.

We have given these particulars in full, not merely to enable those who may have occasion to build furnace-shafts within the limits of the Act, to prepare their plans so as to avoid being called on to make alterations, but that others may have the opinion of the referees as to the manner in which furnace-shafts whether

bere or elsewhere, should be constructed. To the former, it may be useful to suggest, that when they obtain the certificate from the office they should examine how far the instructions given by the referees clash with their own particulars. The district surveyors have determined not to exercise the slightest discretion in the matter, but simply to see the referees, certificate rigorously carried out; so that, for example, should any precautionary measure stated in the applicant's particulars be rendered even obviously unnecessary, by some additional requirements on the part of the referees, unless the former be specially excepted, the district surveyors would insist on the execution of both.

RETROSPECTIVE REVIEWS.

THOUGH the desire for knowledge exists in this age in a degree previously unparalleled, it often occurs that the best sids to inquiry are entirely overlooked. The extraordinary extent, to which a taste for magazine literature has spread, has given an influence to ephemeral publications, which ought rather to have been retained by a literature of standard excellence. A month often suffices to consign a really meritorious work to complete oblivion, and a modern compilation, issued in periodical numbers, has a better chance of obtaining readers than the most original conception of an old author. Even the pursuits of the an-tiquary have received something of the prevailing tone, and researches in progress, and volumes on fine art, damp from the press, excite a larger amount of interest, and are more frequently consulted, than the not less important records of a year gone by. In architecture, as in other sciences, many of the most important doctrines, broached as new, were promulgated in time past; but in this art, whose especial sphere it seems, to create new combinations on a foundation of recorded fact and existing precedent, it does appear mat-ter for regret, that many important old works, and some of late date, exist in an oblivion, from which an affirmation of their merits would be sufficient to remove them. It appears to us not less the object of an architectural journal to preserve the sources of knowledge journal to preserve the sources of knowledge already possessed, than to record the progress of science and art; and we shall therefore endea-vour, from time to time, to call to mind the existence of certain valuable authorities, which, in the active practice of an arduous profession, and the exclusive interest absorbed by recent publications, may have escaped the notice of our readers. Our limits will not allow us to enter very deeply into the subject-matter of works often voluminous and elabo-rate. our object being rather to indicate where rate, our object being rather to indicate where information is to be sought, than to criticise where criticism has already played its part.

D'AGINCOURT'S HISTORY OF ART BY ITS MONUMENTS,

FROM ITS DECLINE IN THE FOURTH CENTURY TO ITS BEVIVAL IN THE SIXTEENTE.*

The influence of the beautiful on the mind of man is exerted in other directions than is evident to the superficial observer, or is manifested in the conceptions of poetry and fine art. Not less the gift of nature than the sense of sight, or the faculty of reason, it is often potent, when other endowments are obscured or debased. The sensibility to melancholy emotions, and the sympathy with misfortune, which intercourse with the world does not entirely remove from the most callous, cherish and renovate the perceptions, and produce works which interest and delight the multitude. The study

* 325 plates, 6 vols. Paris, 1823, (" Histoire de l'Art par les Monumens," &c., &c.)

of history, and the examination of antiquities excite an interest, distinct from the unquestionable advantages that accrue, and the less commendable pursuit of the mere collector. Lapse of time, and evidence of decay associate with the crumbling ruin, or the misshapen fragment, an impression of beauty, which physically they might have failed to excite, and connect the scattered dust of cities with recollections of the fall of empires, and decline of states. The early state of a nation, or the period of abasement, may be not less important in their results than the most brilliant epoch in its progress, and are equally deserving of the attention of the historian. On the 15th of October, 1764, a traveller,

sojourning at Rome, whose name has now become familiar to every Englishman as the come familiar to every Englishman as the name of potentate or general, sat musing amidst the ruins of the Capitol. The sound of vespers rose from the church of the Francis-cans, once the temple of Jupiter; his mind reverted from time present to time past, and the design of writing "The Decline and Fall of the Roman Empire" started to his mind. Years elapsed ere the plan was matured; but the work at length completed the history of the work at length completed, the history of the period, from the most uncertain, became clear and distinct. To this period the atten-tion of other investigators had turned, and it is worthy of notice, that whilst the work of Gibbon traces the history of Rome from the Antonines to the extinction of the empire in the east, and to the time of Sixtus V. in Italy, that of D'Agincourt, on the "History of Art," that of D'Agincourt, on the "History of Art," surveys a period commencing not quite two centuries later; and it seems likely, that as D'Agincourt and Gibbon both visited Paris during the same year, and were both on terms of friendship with Buffon, and other savans of the French capital, that the two authors were acquainted, and that the French antiquary may have gained the suggestion of his work from the Englishman, to whose history he has made reference. The period of the decline of art is taken by M. D'Agincourt to commence at the time of Constantine the Great, in the fourth century, and extends to that of Henry VII. in Eng-land, and of Julius II. in Italy, and of Albert Durer, and Leonardo da Vinci, in the sixteenth. Durer, and Leonardo da Vinci, in the sixteenth. It has of late years met with increased notice, and in Hope's "Essay on Architecture" and in the magnificent work of Mr. Gally Knight has been admirably illustrated. As the fore-runner of the Gothic style it is especially inte-resting. The architecture of the empire, supported under Augustus by the skill of Grecian artists, declined under his successors; laborione, avecution and extravagent decoralaborious execution and extravagant decora-ration were substituted for elegance of form ration were substituted for elegance of form and proportion, till beauty was crushed under a load of riches. The lives of the emperors, rendered contemptible by every degrading vice, admitted of no very healthy influence upon architecture : it became either the outlet to articarearch emilipion or the means of to extravagant amibition, or the means of blinding the populace to their enslaved state. **Ornament** grew over every moulding, colossal dimensions, and difficulties of execution were sought, but not for the proper object of the art

The time of the Antonines was one of temporary quiet, and other emperors left structures of vast extent in every portion of their dominions; but the art of architecture was gradually tending to a decline, and all powers of decoration were exhausted under Caracalla and Diocletian. Constantine destroyed the works of his predecessors to form other buildings, the principal of which were the churches of the new religion. The misfortunes which attended the fall of the empire, overwhelmed the arts in the general ruin. Many innovations were introduced, which, subsequently modified, became important features in Gothic architecture. Such were arches springing immediately from the capitals of the columns, thus used in the basilica of St. Paul, without the walls, the most considerable of the buildings of the fourth century,* and in which the old form and appellation of the basilica, or court of justice, were revived for the purposes of a Christian church. Many of the columns were taken from the mausoleum of Hadrian, and from other edifices, and are of a style of art greatly superior to the rest. At this period, columns were frequently lengthened by an additional member, and subse-

* It was erected by Theodosius, A.D. 386.

quently, in some cases, they were supported on the backs of animals; all these schemes originating in the want of ability or inclina-tion to erect new works adapted to the pur-pose. In the church of St. Agnes we find three stories, exactly like the arrangement of the Gothic cathedral. The lower story has arches springing from the columns; above these is the gallery corresponding with the triforium, and used for the same purposes; and above this, the clerestory windows. The above this, the clerestory windows. The early period in the decline of art is rendered of great interest by the catacombs, in which the early Christians placed the bones of the martyrs, and in which they themselves often found refuge from persecution, and which the subsequent toleration they enjoyed contributed to render of the highest interest, and available for decoration. The catacomb had become more and more like the church, being used for the purposes of worship; and the motives of religion, which drew the early Christians to erect their churches over the graves of the martyrs, produced the arrange-ment of the upper and lower church or crypt, which became so usual at a later date. But the church itself was sometimes in imitation of a sepulchral chamber, as in a church at Ravenna. The church of St. Clement, at Rome, is believed to have been erected towards the close the fifth century, or beginning of the sixth, and exhibits the disposition of the primitive churches: the plan being similar to that of basilicas. The building is terminated by an apsis, where is placed the episcopal chair. The close of the fifth century saw the Goths, under Theodoric, masters of Italy, — some change took place in the style of architecture; but Ravenna, their principal seat, contains no remains which we can call Gothic, if the pointed arch is to be considered the leading feature in that style. The mausoleum of Theodoric is a fine work of construction, but otherwise has a low rank as a work of art. The form of the voussoirs to the arches is cu-rious, and there are similar instances in England. The Ponte Salario, three miles from Rome, was constructed by Narses, in the thirty-ninth year of Justinian's reign, A.D. 565. The prin-ciple of solidity, which has preserved this work to the present time, seems never to have been lost by the Roman architects; but its orna-ments are of such a character as would dis-grace any school of art. The causes of this corruption had been multiplied: the difficulty of finding artists, who had studied the prin-ciples of the fine arts had increased from day to day, till a complete ignorance was the re-sult, and the effect was visible upon all styles of architecture. Another course was the necessity of remodelling old forms to make them conformable to ecclesiastical rites. One of the consequences of the insufficiency of the architects was the transformation of pagan temples into Christian churches: thus the ancient temple built of brick, situated near the circus of Caracalla, underwent this change. The seat of the Greek Government at Ravenna brought the influence of the Greek taste into Italy, and the church of St. Sophia became a model frequently adopted. The church of St. Vitale, at Ravenna, was erected under the ex-archate of Narses, and is remarkable for the construction of its vault, which is formed of pots arranged spirally, each one bearing on the one below it. The tribes which Narses had collected to assist him in the conquest of Italy succeeded about the middle of the sixth century in establishing themselves there. They introduced a style often bearing close resem-

introduced a style often bearing close resemblance to our own Norman architecture, and called the Lombard style. "We have examined,"says M. D'Agincourt, "three stages of decline: the stage first removed from the time of perfection, was characterized by a prodigality of ornament, imprinted with the Asiatic luxuriousness, which produced embarrassment and confusion. The second stage was marked by a forgetfulness and absence of the same ornaments. The third stage, of which we are speaking, is marked by the immoderate use of a multitude of accessory parts, which, far from meriting the name of ornaments, are as reprehensible for the place they occupy, as for their superabundant quality and execution. This last disorder was the general system of architecture, till the establishment in the eleventh century of that other system, to which has been given the name Gothic." The career of

Charlemagne in the eighth century was marked by a fostering care for the arts, and architecture for a moment appeared to alter its whole character; but the change was but temporary. The infusion of Greek taste at Pisa and Venice also passed away: in the latter city the cathedral of St. Mark was erected by foreign artists in imitation of that of St. Sophia. According to M. D'Agincourt, the first indication of the style which afterwards swelled into the Gothic architecture of the thirteenth and fourteenth centuries occurred during the ninth century in the church at Subiaco, near Rome. But Mr. Knight, with more reason, shews there is cause to doubt whether this church is of so early a date. During the first half of this century architecture made some progress, but long before the tenth century, and during the whole of that period, its progress was completely arrested.

swelled into the Gothic architecture of the thirteenth and fourteenth centuries occurred during the ninth century in the church at Su-biaco, near Rome. But Mr. Knight, with more reason, shews there is cause to doubt whether this church is of so early a date. During the first half of this century architec-ture made some progress, but long before the tenth century, and during the whole of that period, its progress was completely arrested. In the eleventh century the art was in a state of activity, for which it was indebted to Greek artists, who were employed in every part of Italy. Many of the churches in Lom-bardy are of this date, and they were cha-racterized by large porches, and alternate courses of different colours. In the twelfth century, the cloisters of St. Paul, without the walls of Rome were built, in which were in-troduced twisted columns of every variety. To this date is also assigned by D'Agia-court, the complete adoption of the Gothic style. In the thirteenth century, Gothic ar-chitecture was the prevailing style. Mr. Knight considers there is no doubt, that the pointed arch first entered Italy in this century from the north; a singular fact, as it had previously been employed for two centuries by the Nor-mans in Sicily. The first church which had been employed for two centuries by the Nor-mans in Sicily. The first church which had any influence upon the style of art in Italy was that at Assisi, which is Gothic in all its parts. The fourteenth century was the period of the principal buildings of Europe, but the Italian architects never caught the true spirit of the style, or overcame the tendency to the horizontal, so inconsistent with the cha-racter of pointed architecture. It was an imitation imported by the people rather than by the artists, and there is perhaps but one building, in which it can be said to have found building, in which it can be said to have found place in Rome. Its most striking feature is marked by the prevalence of the sister art of sculpture, in which the Italians had made greater progress. The style remained in Italy till the close of the fourteenth century, and Brunelleschi introduced a different manner in Brunelleschi introduced a different manner in the fifteenth. The earliest works of the re-vival may be said to bear some resemblance to those of the decline, but greatly surpassed them. The art at once gained a new vigour; and as the Gothic of Italy had not the merits of the style in other countries, we cannot regret the change. Alberti, an architect of refined and educated taste, by his example and precents. hastened the progress, and and precepts, hastened the progress, and under Bramante, in the sixteenth century, a school of Italian architects commenced, which

school of Italian architeots commenced, which has existed till the present time. The work of M. D'Agincourt is a monument of human industry. It is not confined to the art of architecture, but devotes a space, even greater, to sculpture and painting. The progress of the arts is traced, in every change of taste, from the time of Constantine to that of Michael Angelo. There are three volumes of plates, and an equal number of letter-press. The monuments of art illustrated are 1,400 in number. Several plates exhibit the gradual progress of the art, and its decline: one gives a chronological series of arches, and others shew the state of architecture in the east. The Gothic architecture of Sweden, and the Arabian architecture from the eighth to the fifteenth century are illustrated. One plate is entitled "Conjectures on the origin of the pointed arch," and illustrates some curious theories. The comparative forms of detached baptisteries, of the fronts of buildings, of vaults, cupolas, and columns, and the various modes of construction, are very clearly shewn, as well as the styles of Brunelleschi, Alberti, Bramante and Michael Angelo. The life of M. D'Agincourt was spent in the preparation of his great work, of which he did not live to see the publication.

Born at Beauvais, April 5th, 1730, he commenced his career, under the especial protection of Louis XV., in the military profession, but left it at the instance of that king, who determined to place the brothers and nephews of M. D'Agincourt under his care. Devoting himself to the welfare of his family, the amiability of his character, and his taste for the arts, made him sought and cherished in the most distinguished circles of the capital. Having completed the duties he had undertaken, he was free to follow the bent of his inclinations. Desirous of remaining in France, he preferred a responsible post under government at home to employment in a foreign country. His reputation and talents soon drew around him some of the most celebrated men of the French capital and he employed a part of his income in the formation of a cabinet of de-signs, pictures, and antiquities. The study of natural history was not less an object of his attention, and he numbered amongst his friends, Berhard de Jussieu, J. J. Rousseau, Buffon, and d'Aubenton. His wit, and power of amus-ing, made him welcome at all the soirées of Paris; and his more solid attainments recommended him to men such as Marmontel, Saurin, Destouches, the younger, La Harpe, Suard, Morellet, and Voltaire. In fact, the life of M. D'Agincourt is the history of an intercourse during half a century with the most distin-guished men of Europe. Passionately fond of the arts, he cultivated them as a man of taste; he designed and engraved with facility, and was on terms of intimacy with the best artists of his day. The friendships he formed only of his day. The friendships he formed only augmented his ardour in matters relating to the arts, and his desire to learn their history. At length, Louis XV. being dead, be no longer felt any obligation to refrain from the project of travelling through Europe, and especially of exploring Italy. In 1777, he visited England, Belgium, Holland, and part of Germany; after-wards returning to Paris, he remained there till the latter part of the next year, when he started for Italy. He was then forty-eight years of age. Having traversed Savoy and Piedmont, he went to Genoa, and thence to Modena, where he secured the friendship of the illustrious Abbé Tiraboschi, author of the "His-tory of Italian Literature." He then made a stay of some months in Bologna, to examine and delineate the curious monuments in that town, having already conceived the vast pro-ject, which became the object of all his re-searches, and the principal occupation of his life.

In passing through Belgium, Holland, and Germany, M. D'Agincourt had directed his attention to the numerous monuments of Gothic architecture, with which these countries abound. He had studied the march, and traces of art during the "dark ages," and in the midst of bizarro), but often original and bold. In Lombardy and the Venetian country, monuments, more ancient still, appeared to him imprinted with traces of the fall of art from the time of the Greeks and Romans, whilst in those which belonged to the age bordering upon the renaissance he believed he saw the "barbarism" of the middle ages dissipating little by little, and the genius of the arts, like a new Titan crushed under an immense weight, seeking to remove the burden which overwhelmed it, darting through the interval brilliant scintillations, and soon taking a new life, shaking off the dust and rust which over-whelmed it, disengaged from its chains, full of vigour and youth, again astonishing and charming Italy, and returning to the polished world noble pleasures, the most perfect enjoyments, sweetness of manners, and enduring glory. Such were the observations, which gave to M. D'Agincourt the grand, but difficult idea of tracing the history of the arts through the aberrations, into which they had been carried by the removal of the seat of empire to Constantinople-the mixture of Asiatic taste, and the fusion of styles brought, from the north by the Goths, and the south by the Arabs. The thread abandoned by Winckelmann, at the fall of art, had never been entirely broken, and the materials for regaining it might be found amongst monuments, the least important, the most shapeless and fragile, as miniatures in manuscripts, registers and archives, in certain structures, in the bases of more modern edi-fices, and even in the bowels of the earth, in catacombs and labyrinths, whose origin, use, and singular ornaments, have occasioned so many conjectures, and will again occasion so many researches and discoveries. Such was, from this moment, the principal object of the labours, the journeys, and the studies of

M. D'Agincourt. Towards the middle of the year 1779, he visited Venice, and remained with the Abbé Morelli, librarian of St. Marc's library. He afterwards returned to Bologna, but shortly left for Florence, and passed some months in visiting, on foot, different works of the ancients, with a view to discover the systems adopted. In November, he arrived at Rome, where he took up his abode in the house formerly inhabited by Salvator Rosa. Eighteen months hardly sufficed for him to gain a general idea of the ancient, and modern works of art. In 1781, he visited Naples, Herculaneum and Pompeii, Pæstum and Salerno, and at the end of the year returned to Rome. The labours he had undertaken were conducted with the greatest assiduity, and to bring his enterprise to perfection, he spared no labour, no expense; he directed most ex-tensive researches in Italy and the rest of Europe, and had illustrations engraved under his own eyes of an immense number of works of art. In 1782, notwithstanding the representations which were made to him, he determined to make a detailed examination of ancient catacombs. Besides those previously examined, he had several, which had never been examined, opened at his own expense, and his researches were not unattended with danger. The labours of M. D'Agincourt, his libe-rality in placing their results at the disposal of others, spread his fame throughout Europe, and the world expected with impatience the work, on which he had been so zealously en-Louis XVI. had interested himself gaged. in it, and the plates had been sent to Paris, when the disorders of the revolution induced the friends of M. D'Agincourt to send them back again. Bubsequently, the political horizon having cleared up, he confided the publication of the work to M. Dufourny, a member of the Institute, who had made researches in conjunetion with his own. But the appearance of such a work was attended with extraordinary expense, and the calamities of the revolution had hardly left the author sufficient for the wants of his old age. M. M. Treuttel and Wurtz hesitated not to acquire the right of publishing so important a work, and remunerated the author in such a manner, as to secure his future comfort. The wars which preceded the restoration of the Bourbons, and the difficulty of communications, retarded the publication, and the *livraisons* appeared at such extended intervals, that M. D'Agincourt could not hope to see their completion. He employed himself at this time in the publication of a work, styled "Recueil de Fragments de Sculpture Antique en Terre Cuite," containing upwards of 300 subjects. This had hardly appeared, when his lust illness commenced, and finally he expired on the 24th September, 1814, at the age of 84. His corpse was followed by the French Ambassador, and by artists and literati of all nations, to the church of Saint Louis des François, where some time afterwards a monument was erected to his memory. His work filled a lacuna in the history of art, and has been the foundation of some, more recently E. H. published, and better appreciated.

BUILDING GROUND, WHITE KNIGHTS, READING.

Our readers are aware that the late Duke of Marlborough's magnificent estate, known as White Knights, was purchased last year by parties who propose to divide it for building purposes, and that plans for laying out the property were obtained by the offer of premiums. The land is now coming into the market, and when we consider its surpassing beauty and its contiguity to the Great Western Railway, by which it is reached from London in less than an hour and a half, there can be little doubt that it will be speedily covered with villas. We had occasion to visit the spot last week, and are induced to think there is nothing like it in England available to the public. The botanic gardens with their magnolias and conservatory; the wilderness, filled with American plants now in full bloom; the lake, bridges, China cottage, valley and fountain, offer a succession of pictures of extraordinary beauty; and these are to be reserved for the enjoy-ment of those who occupy houses on the estate. Mr. Mocatta and Mr. George Godwin are appointed architects.

THE SCHOOL OF DESIGN.

SIR,—From your observations at the bottom of the report of the progress and state of the school of design at Somerset House, it would appear that you suspect "something rotten in the state of Denmark," stating, as you do, that some further information must be elicited to prove the efficiency of the present system.

I can give you a little information, but I am sorry to say that it is to prove its inemciency. The report sets forth that each student is taught as far as possible with reference to the promotion of the particular object for which he joined the school : further, that the more advanced students are exercised in original designs, and composition, &c., and are taught to apply to various practical purposes the skill they acquire. Sir, excuse me if I pause,-I am overpowered when I think of the talent required to carry all this into execution. Here would be a task for Cellini if yet alive ! for the Italian arabesque painters -and Raphael himself-a glorious task for the old French designers Messonier, De la Fosse, and others of that school, or for Percier and Lafontaine, or for such of our English architects as have made decorative design their study; but it would at least be a task for a practical designer of twenty or thirty years' practice in the art of design for manufactures and for decorations ; so at least most people would think, but not so the council of the school of design. A master who had studied the ornamental art would require a studied the orhamental art would require a salary of two or three hundred pounds; but a portrait painter — a Spitalfields' weaver — a mechanic will do the work for 120*l*.; so they have sent down a portrait painter to Birming-ham—a mechanic to some other part of the country-and installed, with great parade, s weaver at the Spitalfields' school of design for 1001. per year, to instruct the people in all those wonderful things which the report would have us believe are taught in the school. It is impossible to say what may follow: men will soon gather grapes on moors, and figs on thistles. What folly in any man to give a guinea to Copley Fielding at every lesson, when any person could teach as well by shewing merely a few good drawings, and at one-tenth the expense; or why give 400d. with a boy to a noted architect, when any brieklayer would instruct him as well for a trifle ?---or why give much with a boy to a respectable, clever tradesman? The fact is, that the council maintain that, with the various examples in the school, any man may play the master, and save the money of an experience teacher. Time will shew, but I am very much afraid that the cry in the Times newspaper, of "what is the school of design about?" will be re-echoed before low be re-echoed before long from one corner of

the country to the other. The director, Mr. Wilson, is a man highly qualified for the post he fills—his talenta, his urbane and courteous manners, render him most valuable,—but he is fettered by a council perfectly ignorant of the qualities which ought to accompany a teacher in a school of design, and of the methods which ought to be adopted to make practical draughtsmen; for I find fault too with the immense time lost in making chalk drawings, which ere perfectly useless to practical draughtsmen. I find fault too with the vague and indefinite manner in which the drawings for competition are specified, there being no common-ground given to run the race upon—the same failing which is so much to be deprecated in architectural competitions.

Having found as much fault as I can, I must now say something in praise, and for that purpose, turn with pleasure to those students who study the frescoes, and whose copics are beautiful, and very much surpass Sang's style of painting for finish; and with designs furnished by competent architects or designers, they might soon drive him out of the field —but neither they, nor Mr. Sang, nor any man living, will ever be able to paint by the yard, and design and draw too. I am, Sir, &c.

A CONSTANT READER.

GREENHOUSES, VINERIES, AND AVIARIES. AWARD UNDER THE BUILDINGS ACT.

SIR,--In my last to you on the subject of a pigeon-house, situate in the back-yard behind my dwelling, Princes-road, Bermondsey (see BUILDER of 31st of May last),* I promised to forward you the result. I beg leave now to state that I have had notice to take up the award; and protesting against the jurisdiction of the referees over such, I did not take it up at the time appointed. On the following morning, early, the district surveyor called with the award, and desired to know how I intended to act; my answer was, as before, "You have no jurisdiction, and may take what course you please."

The following is an abstract of the award :-"We do hereby certify and award that the "We do hereby certify and award that the said building is contrary to the said Act, and we do further certify, that although green-houses, aviaries, and such like buildings are exempted from the rules and provisions of the said Act, as to the walls and other requisites of attached buildings and offices, and although no express provision is made as to the walls of the buildings with each attraction. such structures, yet such structures, and the walls thereof, must be so placed and so con-structed, as not to be dangerous to the adjoinstructed, as not to be dangerous to the adjoin-ing premises, nor to communicate fire to the interior of the buildings to which they belong. And with regard to the costs and expenses attending this proceeding, we do further award that the same be paid by the said W. S. Hol-lands, the sum of 34. 5s. 8d."

lands, the sum of 3l. 5s. 8d." For the benefit of the public, I beg to give you a description of this bird-cage or enclo-sure. The part alluded to is an enclosure round a few pigeon holes, or what are termed dove-boxes, which rest against a 9-inch wall— no fastening whatever; this enclosure is 7 feet by 6 feet, and 4 feet high, uprights 14 inch thick, and lattice sides, diamond work; it took about one and a half bundles of laths. The top is covered with zinc, it has no connection with the dwelling, and there is a 9-inch brick with the dwelling, and there is a 9-inch brick (sound best stocks) well built wall between. Leaving your readers to judge for themselves if or not I take the proper course, I am, Sir, &c. Bermondsey Square. W. S. H.

Bermondsey Square. . The award on the subject of greenhouses, which we published last week has excited much commotion. The question now is, how greenhouses and conservatories are to be constructed i whether or not the district-surveyor is to be called on to decide in each case, according to his own views, what may or may not be erected. The award in Mr. Holhands' case, which bears on the same point, defines the referees' views a little more closely than the first-mentioned did, and perhaps be-fore long they will consider it necessary to isene some express instructions on the subject.

TO LESSEN THE COMBUSTIBILITY OF HOUSES.

Sin,-Though conscious that you are much Six,—Though conscious that you are much pestered with projectors and projects, I must increase the number of your tormentors by one. I have a project for diminishing the combustibility of houses. A simple one, as you will'see, when I tell you that it is merely the substitution of iron for wooden lathing in all cases where wooden laths are now used for partitions, ceilings, studding, &c., &c. In every house that is burnt the lathing supplies the train. The fire creeps up the walls, ignites the joists and floors, and in short pre-pares the bonfire with perfect pyrotechnic art. pares the bonfire with perfect pyrotechnic art. No fire could possibly pass from a room with-out combustible laths on wall or ceiling (or out combustible laths on wall or ceiling (or wainscotting, which is rare in modern houses) to any other room. I know nothing of the comparative expense of wooden and iron laths, but I see that hoop-iron is very cheap, and laths being much thinner might be made much cheaper: the difference in cost there-fore could not be very considerable, and I know that I would joyfully pay 10/. addi-tional in rent for the house for which I now pay 120/. rent, if I knew that all its lathwork was of *iron*, and that there was a moral im-possibility that I and my family should ever be burned in our beds. This additional 10/. per annum may represent builder's profit for 150/., but I think I am safe in assuming that the

* Page 256 ante.

difference between iron and wooden lathing would not amount to one-third of the money All the projects of fire-proof houses that I have seen propose to substitute metal for walls, joists, and rafters, and some suggest floors; but this is all folly; walls, joists, and rafters, never begin the fire, or conduct it in its early stages of progress, and floors very seldom : it is the light work that begins the mischief, and carries it on. I am, Sir, &c., Gordon-square, June 16. A CITIZEN.

•... We withhold our remarks on the above, we shall probably be led to some general observations on the construction of fire-proof dwellings before long. If our correspondent will refer to our leading article of June 7th (p. 265, antc), he will see that his suggestion is not entirely novel. It is satisfactory to observe that much interest has been excited by what has already appeared on the subject in

what has already appended to the prospectus of a "Fire We have received a prospectus of a "Fire Protective and General Buildings Improve-ment Company," formed for the purpose of introducing improved modes of constructing buildings, secured by letters patent, on prin-ciples combining the preservation of life from fire, property from robbery, and improved ventilation, for the promotion of future inventions and improvements connected with building, and the establishment of rooms for the exhibition of models and for other purposes connected with the building trade: but are at present uninformed as to the plans proposed proposed.

PUBLIC PARKS AND WALKS AT MANCHESTER.

WE stated a few weeks since (page 203, ante) that a deputation from the committee appointed to carry into effect the object of providing public parks and places of recrea-tion in Manchester, had waited upon the premier, with the view of obtaining a grant from Government in aid of their design. Sir Robert Peel then offered the sum of 3,000/., which the deputation felt bound to decline, as partaking rather of the character of an partaking rather of the character of an eleemosynary dole than being a liberal and appropriate grant consistent with the import-ance of the object in view, and the relative position of the parties to it. A reconsidera-tion of the matter has induced the committee, through the medium of the Mayor of Manchestor, to address a letter to Sir Robert Peel, in which they state that they think it their duty to accept of the sum of 3,000%, but in-dulge the hope that it will be considered by her Majesty's ministers and by Parliament as a portion only of that assistance which a community like Manchester may reasonably seek at the hands of the Government; and, after referring to the great personal interest which the premier has manifested in the success of the experiment, they state that the sum paid into the bank to the credit of the committee amounts to 27,409%. 2s. 11d.

The following is a copy of Sir Robert Peel's answer :-

Whitehall, May 29, 1845.

Sir Robert Peel presents his compliments to the Mayor of Manchester, and begs leave to acknow-ledge the receipt of his communication of the 26th instant.

Sir Robert Peel will give directions for the issue of the sum of 3,000*l*, in aid of the voluntary con-tributions raised in Manchester and its neighbourhood for the purpose of providing public parks and places of recreation, but he does not feel himself justified in giving any assurances on the subject of a further additional grant. Sir Robert Peel is much obliged to the Mayor of

Manchester for the information conveyed in his letter respecting the progress made by the com-mittee, and offers his best wishes for the successful progress of their useful labours.

GEM ENGRAVING .- The committee of the Art-Union of London in their last report drew the attention of the public to the neglect into which gem-engraving had fallen in this country. To follow up the subject they have now offered three premiums of 60%, 30%, and 151. for the best cameos in profile of the head of Minerva, having a sphinx on the helmet, in the collection of bronzes at the British Museum. They must be cut in onyx of not less than two strata, and be at least one inch in length.

THE NEW ROAD THROUGH WESTMINSTER.

SIR,-I have read the remarks in [THE BUILDER respecting the improvements from Pimlico to Westminster Abbey with almost painful interest. It is certainly most lament-able that a gentleman holding so responsible an office as the Earl of Lincoln does, in a commission of taste, improvement, and embel-lishment, should have pledged himself so hastily to carry out any one plan without con-sulting the wishes of the community at large. I see by the voluminous Second Report of

Metropolis Improvements of 2nd August, 1838, that Mr. Rigby Wason joined a number of gentlemen in the purchase of all the property from Brewer-street to the Broadway, in the line of the intended new street, with the pa-triotic view of aiding in these improvements; and it would perhaps be unjust to alter the plan so far as their purchases extend, *i. e.* from Broadway to Brewer-street. But surely there one he no impropriate in modifying the plan can be no impropriety in modifying the plan of the new street from Broadway to the Victoria Tower.

As the Bill is now before Parliament, no time should be lost in endeavouring to procure an alteration in the Bill or the plan of the street, or the insertion of a clause to reserve the power to Government of improving the vicinity of Westminster Abbey at some future time. The dean and chapter do not like to be disturbed; but when they are gone, any new appointments might be made with an understanding that their residences would be removed across the road, and subterraneous passages formed to the Abbey cloisters for their convenience.

I think that arcades across a road on the south side of the Abbey, as recommended by the Metropolitan Improvement Society, would in some measure obstruct the view of the two in some measure obstruct the view of the two principal buildings, viz., the Abbey and the Victoria Tower. A subterraneous passage, on the contrary, would leave the road open, be much more private, and being made on the same level as the cellar floors of the present old houses, and of course also of the new, the alteration of the residences would scarcely be foll but the in herbitate. And if the read be felt by their inhabitants. And if the road-way were raised at that spot only two feet (a rise that would be quite imperceptible to pas-sengers) it would admit of a good height for the passage ceilings, at the same time that the floors would not interfere with making the main sewer of a proper height and depth.

I really wonder at the commissioners, that they should so far forget themselves and their they should so far forget themselves and their office, as to wish to build out of view the vene-rable towers of Westminster Abbey and the splendid new Victoria Tower; but it is just like our forefathers (and we must blame them no more) who built out of view the noble ca-the deal of St who when there one sted their thedral of St. Pauls, when they erected their narrow, crooked, Ludgate Hill. Although I am a stranger in London, I

feel so great an interest in having the improvements well done if done at all, that I have written a petition to the House of Commons and signed it, and I take the liberty of send-

ing it to your office for public signature. I do hope and trust you will exert your in-fluence and stir up the friends of improvement, to use dispatch in this matter, for no time should be lost. I remain, Sir, &c. T. I. M.

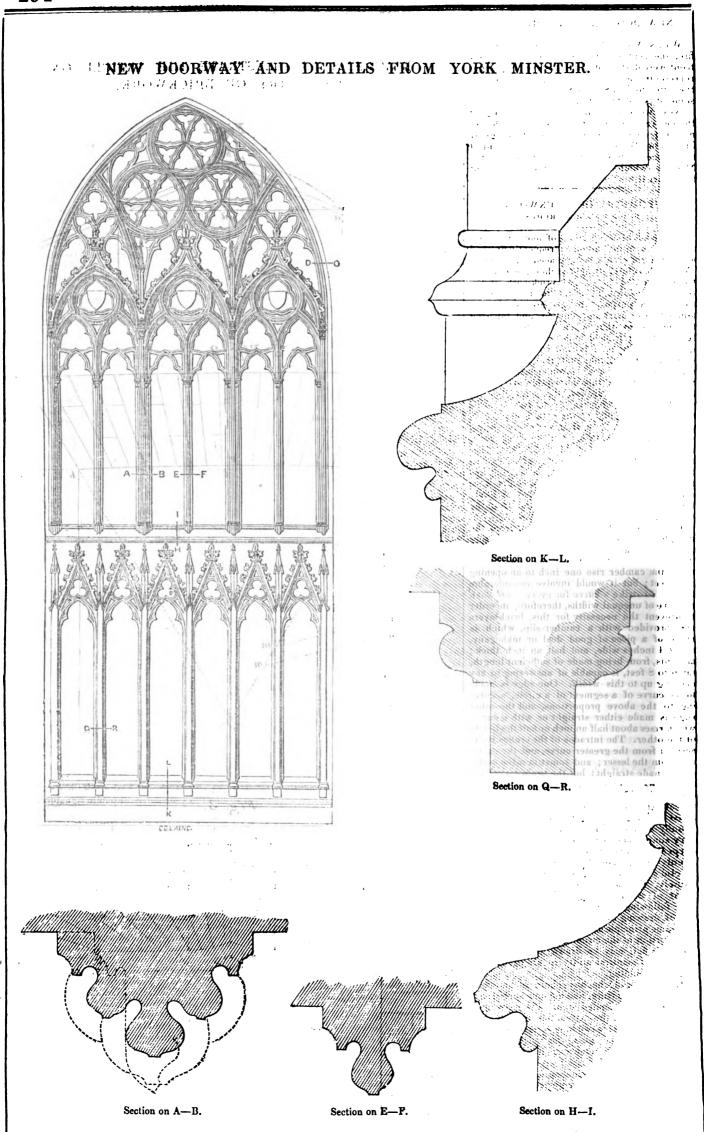

. The petition lies at the office for signatures.

CEMENT ON IRON.

In reply to your correspondent at Worcester, all cements mixed with water are objectionable all cements maded with water are objectionable as applied to iron; the most effectual mode is to run the mouldings with Hamelin's Patent Mastic, manufactured by Messrs. Charles Francis and Sons, Nine Elms, London. This mustic is mixed with linseed-oil to the consistency of damp sand, and, previous to the application, the iron girders should be well saturated with *boiled* linseed-oil. Hamelin's Mastic has been in use for upwards of thirty years, and sticks most tenaciously to all kinds of hard substances : I have even used it upon glass. It requires an expert workman to ma-"mastic hand." However, the manufacturers However, the manufacturers will, if requested, send ample directions for the use of the material.

FRANK TYRRELL. Newcastle-upon-Tyne, June 12th, 1845.

NEW DOORS AT YORK MINSTER.

WHEN York Minster was last attacked by fire, the centre and south doors of the west front were destroyed. The anaxed engraving represents the new door designed to replace the latter, by Mr. Sydney Smirke, together with some of the details at large.

Next week we shall give an engraving of the centre door, with the scale and all the remaining details. They are from drawings by Mr. James Wylson, who wrote the account of the recent fires and restorations at the Minster, which appeared in former Nos. of this journal.*

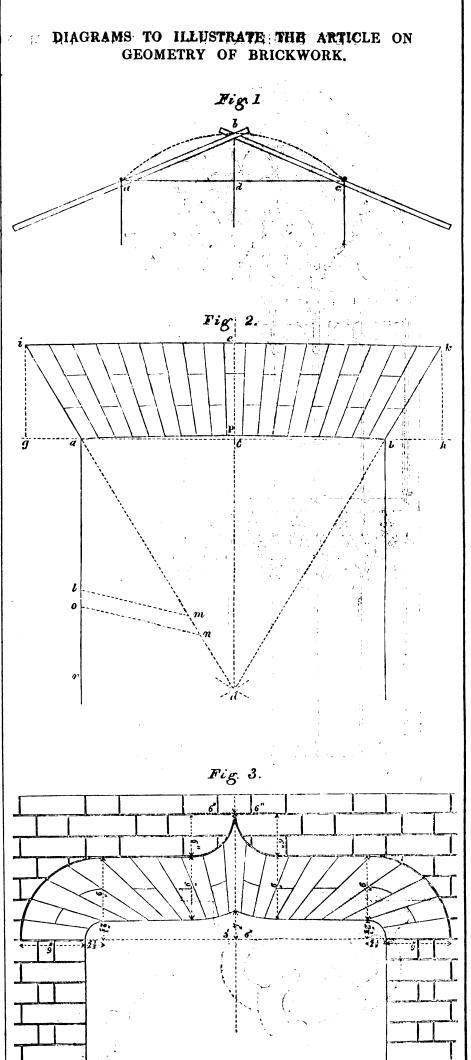

GEOMETRY OF BRICKWORK. BBICK CANBER ARCHES.

THE heads of the apertures of doors, windows, and other openings are most frequently finished with straight arches being placed across them. When, therefore, straight arches are required to be executed in gauged brickwork, it becomes necessary, in order to adapt bricks to such a purpose, to prepare moulds or templets for marking, cutting, and tapering the bricks so that when the bricks have been cut and rubbed and brought to correspond with the moulds, and are arranged and set in their places, they shall then form strong, neat, uniform, and symmetrical arches. Straight arches of this description are usually termed cambered arches, the soffit lines of which are made concave, or to rise upwards from the springing points with a curve. A perfectly straight line, from some optical illasion, always seems to bend or sag downwards, and it is principally for this reason that what are called straight arches are cambered so as to prevent them from having a sagging appearance; and, moreover, if the soffits were not executed with a camber, it is very likely that they then would become round from the shrinkage and settlement of the work.

shrinkage and settlement of the work. The degree of camber, or rise, from the straight line which connects the springing points of the arches varies with the widths of the apertures. It is the usual practice to make the camber rise one inch to an opening of 8 feet; but it would involve considerable trouble to strike a curve for every arch when they are of unequal widths, therefore, in order to prevent the necessity for this, bricklayers are provided with a camber-slip, which is made of a piece of good deal or mahogany, about 4 inches wide, and half an inch thick; and this, from being made of sufficient length, say 6 to 8 feet, is capable of answering to any opening up to this width. One edge is made to the curve of a segment of a circle, according to the above proportions, and the other ledge is made either straight or with a curve, which rises about half an inch or half the height of the other. The intrados of the arches is deacribed from the greater curve, and the extrados from the lesser; and sometimes the extrados is made straight; but the proper way is to make it of the lesser curve. Now in arder to obviate the necessity of striking the curve of a camber-slip with a radius, that otherwise must be of great length, another method is usually adopted for that purpose, which is very simple, and is well known to almost every carpenter. The principle is deduced from the twenty-first proposition of the third book of Euclid's " Elements of Geometry" (which see) namely, that all angles in the same segment of a circle are equal to one another. The following description will shew the manner of drawing the curve in question; and by the same principle and varying the proportions, any portion of the circumference of any circle however flat, may be drawn by it; and it is at times of manifest utility to all persons enmaged.

gaged in building. Let a c (fig. 1) be any chord of an arc or width of an aperture, and d b any versed sine or rise of the intended arch. Place two pins or small nails at the extremities of the given chord a c, and place two long rulers or straightedges against the nails, the rulers crossing each other and intersecting in the point b, forming an angle, a b c. They must then be fastened together at the lap b, and also by a brace across on the straight-edges, so as to retain this angle. Bring the point b of the intersection of the straight edges to the point a,

* See pp. 158 & 175.

and then hold a pencil in the intersection, and slide the edges of this instrument against the nails, and the pencil will describe the arc a b cas required. Each of these straight-edges must be somewhat longer than the chord a c, otherwise the whole of the curve cannot be drawn at one operation.

The bricklayer, then, being provided with a camber-slip, which ought to have a line marked or finely cut-in across it at the centre of its length, we will now shew him the manner of preparing the moulds and getting the bevils, for the purpose of cutting and rubbing the bricks by, so as to form a camber-arch. Draw an indefinite straight line, gh(fig. 2), and upon it take any point, c, and make the length, ca and cb, each equal to one another, a b being the width of the open-ing, which in this example is equal to 3 feet inc, which in this example is equal to 5 rest 2 inches. At right angles to a c draw d c, and produces it indefinitely beyond e. A perpen-dicular from the point c may be drawn with a square, or by taking a and b any two equal distances from c, as centres, and with any rest in the palf a c describing area indistances from c, as centres, and what any radius greater than half a c, describing arcs in-tersecting each other in the point d, then drawing a line through the points d and c, and it will be the perpendicular required. Now set off on each side of the centre line of the camber-slip two equal distances, similar to c d and c b, and apply the soffit edge of the camber-slip, so that these distances shall co-incide with the points a and b, and draw the intrados a p b. Take a point g, outside the point a, the distance from which it is intended for the arch to rake or skew, which in this example is equal to 7 inches, and make bhequal to a g. On the points g and h erect perpendiculars, g i and h k, and make g i and h k each equal to the intended height of the arch ; this should be equal to four courses of bricks less the bottom joint, or 114 inches. When the width of the opening is about 5 feet and opwards, it is the usual practice then to make the height of the arch equal to the height of five courses of the wall, less the bottom joint. Then with the lesser curved edge of the camber-slip, placed on the points i and k, draw the extradomal curve, iek. Join ia and k b, and produce these lines to the point d. Procure two thin and narrow straight-edges of wood, about 20 inches long each, and also another piece of wood about 3 inches wide, and the same length as the others; this is for a mould or templet to mark the bricks, and ought to be of well-seasoned hard oak, for the purpose of better resisting the wear upon it. Now, in order to ascertain the taper of the mould for cutting the bricks by, find the lengths of the lines $i \in k$ and a p b, the former being, according to this example, equal to 52 inches, and the latter equal to 38 inches, and the thickness of the upper part of a course of bricks of an arch being nearly equal to 21 inches, then, by the rule of three direct, as 52:38::2.75:2.01, that is 2 inches nearly,

the thickness of the bottom. Now draw a line square across the intended mould near to one end, and at 111 inches (the height of the arch) from it, draw another similar line; then from the edge of the mould set off 2inches on the upper line, and 2 inches on the lower, and make the inclination of the mould according to this proportion. But the same inclination may be got geometrically by finding a fourth proportional, which is from the twelfth proposition of the sixth book of Bachid's "Elements of Geometry," thus: take two straight lines, as a d, and a r, forming any angle d a r, and upon a d make a m equal to i o, and a l equal to a p, and join l m; make The second seco they are but approximations, but they are pretty they are but approximations, but they are pretty near the truth; and by adopting the one or the other the bricklayer will save himself much trouble, which must otherwise arise in bring-ing the moulds even to this degree of aclog into incluse even to this degree of the constraint how many courses of bricks can be got in the arch, and in order to find this, we must measure the length of the line i k, which is equal to 52 inches, and then try how many times 24 inches the set in the set is the set of the line in the set of the s there are in 52 inches; it will be found that 19 courses are required. And here we would remark that it is desirable in a gauged brick arch to have an odd number of courses, so that the odd courses may stand in the

centre, and form a key to the arch; and the bottom, or sofit brick, of the key-course should always be a stretcher. We have assumed 24 inches as being the size of the top part of a course of bricks in an arch, but any other dimension, either more or less, may be taken instead, as bricks vary in thickness; and therefore a thickness must be taken according to the size the bricks will hold. And although we have been thus particular in shewing the manner of finding the taper of the mould, yet sometimes it is the practice of bricklayers, when the inclination of the skew-back is not given, to assume a taper for it at once, and without any attention as to how much the arches are to rake or skew from the perpendicular; this of course obviates the necessity of some of the previous performance. Now fix on a point on the edge of the mould

or templet, where its width corresponds with the bottom thickness of a course of bricks of the arch, which in this example is equal to 2 inches. Find the centre of the mould at top and bottom, and draw a line along it through these points. Then place the mould in the situation of the key course, so that the centre line on the mould may coincide over the centre line of the arch, and also that the point on the edge of the mould may come over the line forming the soffit of the arch, and on the left side of the centre line. Now place one of the straight edges against the left edge of the mould, and then remove the mould, and place the second straight-edge against the edge of the first, that is in the place of the mould; now remove the first straight-edge, and slide the mould against the second straight-edge, until the point on the edge of the mould coincides again with the soffit line of the arch; and proceed in this manner to the last course, or to the line a i, and if the mould falls short, or runs beyond this line, the process must be repeated, in the former case by taking a point on the edge *above*, and in the latter case *below* the first point, until the last course coincide with the line a i; and if the mould should not be parallel with the line a i, a few shavings must be taken off the edges with a plane, either at top or bottom, so as to make it taper accordingly. When the templet or mould has been brought to the proper taper, it should be once more traversed, and the joints of all the courses marked as it proceeds. It may also be ob-served, that the joints of all the courses will radiate to the point d, where the inclinations of the skew-backs meet. It is necessary to state that particular attention should be observed in firmly holding the straight-edges, so as not to let them slip, while traversing the mould, as otherwise it may be the means of creating great confusion, and probably spoil the work.

Now, having got the mould to the proper size and taper, something less than this thick-ness must be taken for the purpose of getting in the putty joints for bedding the courses. Place the mould in its proper position at the key course, and then place the straight-edges one on each side of it, and close to it. Then push the bottom of the mould upwards, and place, in the vacant space, between the left hand straight-edge and the mould, at top and bottom, two equal substances of a thickness which a putty joint is to be of, and push the mould downwards, closely pressing against them. Remove the straight-edges, and make a mark on the edge of the mould below the former, and directly over the soffit line. All the soffit bricks are to be marked and cut from this point, which should be cut in, what we shall now term, the top edge. It is the practice sometimes to make a mark on the edge of the mould where its width is equal to the top thickness of a course of bricks, and then to traverse the mould along the top line of the arcb.

The next operation is to find the bevil for the soffit of each course of bricks from the skew-back, including the key; and to find the lengths of each course from the soffit to the top. These processes are very simple. Place the two straight-edges perpendicularly on each side of the extremities of the skewback, and upon them firmly fix the camberslip, so that it coincides with the points, and exactly with the soffit line of the arch; now commence with the first course next the skewback, by placing the narrow end of the mould under the camber-slip, and bring its top edge to correspond with the line of the first course, and, with the point cut on the edge over the

point at the soffit line. Hold a knife or pencil against the soffit edge of the camber-slip, and make a mark across the mould, this mark, with the bottom edge of the mould, is the angle, or bevil for the first course. Now make a mark on the top edge of the mould at the extreme upper point of this course, that is, on the extrados of the arch; and the distance from the lower mark to this is the length of the top of the first course. The bevils of all the other courses, and their lengths as well, can be taken off by the same processes. The bevil of the skew-back is taken by laying the mould above the line g a, with the lower edge straight with it, and the larger end projecting somewhat over the line *a i*, then, by laying a ruler across the mould, straight with and over the line *a i*, and drawing a line across the mould by the edge of the ruler, this line, with the edge g a of the mould, will be the bevil or angle of the skewback. In order to form the skew-back bricks, the stock of the bevel is applied against their bottom outer edges; the blade laying agross their faces being a guide to the tin saw in marking them; then, apply a square against their faces to the lower and upper points of the bevils, and mark the bottom and upper beds across; then cut away the superfluous material at the ends to these marks, and afterwards rub them on the stone until they suit the bevil. Sometimes the top bricks of the arch are not cut to their lengths till the last, when the arch is laid down on a bench, and the lesser curved edge of the camber-slip being laid upwards on the arch, the tops of all the bricks are then marked by it and cut. In the excern-tion of camber arches it is desirable that the whole of the courses of bricks should be of uniform thickness. This is requisite, net merely for the purpose of obtaining a regular appearance, but in order to sdapt the bricks to the work, and to prevent them from being cut away and wasted. According to the foregoing method of striking out a camber arch, all the courses of bricks will be of equal thickness; 4; for if lines be drawn from the points of the soffits, and at right angles to the joints, the square ends thus cut off will all be of equal thickness.

.....

The bricks which are to be cut for the arch are first rubbed on a stone, and made square ; the bottom outer arrises being also made as straight and fine as possible. 'Is bommenring de 25 a course of the arch, the bevil of the soffit brick is first marked across the face near to one end; a square line is then made from the lower point of the brick across the bottom; a bevil line is then marked in on the back face from the point of the square line where it cuts the bottom back edge. The super-fluous substance being now cut off, the end is then rubbed, and made as clean and uniform as possible, properly adjusted to the bevil, and . square from the outer face. The brick is then laid on what is termed a bedding stone, which is usually a piece of this marble about 9 in-ches wide and 2 feet long. It is then marked with a small tin saw, or a nail, from the mould, which is placed against the front and back sides of the brick; the fixed point cut in the edge of the mould being always brought so as to coincide with the upper point on each side of the soffit. The marks on the front and back faces at the points next the soffit are joined. with a line which is cut in the end of the soffit, and is thus made parallel with the bed. The brick is then turned on edge with its face up-wards, and the tapering mould is then placed against the soffit with one edge kept about inch above the brick. The edge of either the header or stretcher side of a thin, oblong templet of wood, whose angles are made per fectly square, the width of the header being 33 inches, and the width of the stretcher being 71 inches, is then placed against the mould, the other edge being the guide for the tin saw, in marking either the beader or stretcher with. By this manner of proceeding, it will be seen that both the headers and stretchers are marked off parallel with the soffits. The superfluous brick at the end and top side is now cut away with the brick-axe; but the utmost care should be taken to cut the ends of all the bricks as square as possible from the outer face, as want of care and neglect in attending to this important particular is very often the cause of arches settling and bulging outwards, and the centre bricks dropping out of their places. For when the courses are being set, all deficiencics are usually packed up with mortar;

which, from not being of sufficient solidity to bear the weight of the superincumbent pressure, yields to the impressed force, and, therefore, causes the arches to crack and give way. After the amperfluous material is axed off, the brick is then rubbed on the rubbing-stone, and great nicety is required to be observed in this particular, so as to bring the upper edges of the brick, both at the back and front faces as well as at the end, to the exact gauge, as then the joints will not only be of equal thickness throughout the arch, but the whole of the bricks when set will be better calculated to sustain and distribute equally among them the pressure under which they are liable to be subjected.

The soffit brick, then, being finished, the next step is to prepare the upper brick. The end which is to be placed next the soffit-brick is to be cut and rubbed square from the face, and made to suit the bevil of this course; it is then placed against the end of this soffit-brick, and marked both on the back and front face with the tapering-mould, its length being taken from the mark which corresponds to the length of this course. The bevil is then to be placed against the top edge of the brick to the mark, and its length marked across to the bevil with the tin saw, the ends being marked southe stars, and its length marked across to the bevil with the tin saw, the ends being marked southe stores also. The angles which the end market before the brick is tapered are equal to those of the other end, and although there will arbet some little irregularity in the tops of the upper bricks of the arch, arising from the difference of eurvature between the extrados and intrados, still it will be found to be so very slight; as not worth noticing in actual practice. The superfluous material of the brick in queetion is then to be axed off, and the brick, as cut, must then be rubbed carefully on the stone so as to correspond with the taper of the soffit-brick and the mould. The same operationes are then to be gone through with the tiones are then to be gone through with the soffit-brick and the mould.

""Sra,---Will you be so kind as to inform a briethayer the proper method to strike out an arch, of which the enclosed is a sketch as near as I can make it, so that it can be executed in brietwork, and set in patty. The opening is 3 feet 6 inches, the rise 4 inches, the face 9 inches, and soffit 43 inches, and you will oblige your humble servant, H. J."

We have somewhat altered the original rough sketch, as sent us, in order to make the arch more suitable for execution. All the courses of bricks of an arch of this description are to be struck out upon precisely the same principles as are those of the foregoing camber arch. The courses, as arranged in the apnexed arch (fig. 3), were traced and marked from a small paste-board mould by following the soffit curve. An approximation to the proper taper for the mould was obtained by infining the lengths of the extradosal and intradosal lines; then, as the length of the extrados : the length of the intrados :: the thickness of a brick at the top : the thickness next the soffit. From what has been said in reference to the execution of a camber arch it is supposed that no difficulty will arise in striking out and executing an arch similar to this. The centres and dimensions are sufficiently definite and need no description.

The courses of bricks of both two and four centred arches are usually arranged upon the same principles as the camber arch; a taper is generally assumed for the mould, which is placed in the situation of the key-course, and unversed downwards until it coincides with the springing line. And sometimes the courses of bricks of elliptical arches are formed by the same method; but we intend by-and-by as our time will permit, to give a general description of forming and executing gothic, elliptical, semi-circular, segment, and other arches, as well as niches.

With reference to the manner of setting gauged work generally, we must also leave that until another occasion.

JOHN PHILLIPS.

INSTITUTION OF CIVIL ENGINEERS.

A7 at a meeting held 10th June, 1845, Sir John Rennie, President, in the chair, the paper read was by Mr. James Stirling, and described an ingenious air-engine, invented by his brother and himself. The movements of this machine are founded upon the well-known pneumatic principle, that air has its bulk or pressure increased and diminished in proportion as its temperature is raised or lowered. The application of this principle was exemplified by drawings, and a model, exhibiting a machine composed of two strong or tight air vessels connected with the opposite ends of a vertical cylinder, in which a piston works in the usual pended two air-tight vessels or plungers, filled with non-conducting substances, and attached to the opposite extremities of a beam capable of moving up and down alternately, to the extent of one-fifth of the depth of the airvessels. By this motion of the plungers the air, which is in a heated state below, is moved to the upper part of the vessels, and in its transit traverses a series of vertical capillary passages between thin metallic plates, which absorb the greater part of the caloric; the remainder is taken up by a refrigerator of tubes filled with water; the air at the heated end is at about 700°, and has a proportionate pressure. When it arrives at the cooled end, it is reduced to about 150°, and the pressure diminished to a corresponding extent. Therefore, as the interior vessels move in opposite directions, it necessarily follows that the pres-sure of the condensed air in one vessel is increased while that of the other is diminished. A difference of pressure is thus produced upon the opposite ends of the piston, and a reciprocating motion results, which is communicated through a beam, connecting rod, crank, and through a beam, connecting rou, trains, and fly-wheel to the machinery when driven. Machines upon this principle were stated to have been worked for some years past at Dundee, with considerable saving of fuel, as compared to a steam-engine of similar power, and compared to a steam-engine of similar power, and doing the same work. It is now proposed to adopt it to marine purposes, to which, from its simplicity and slight expenditure of fuel, it appears well fitted. The theory of the expansion of air, and its practical adaptation as a moving power were very fully discussed, as were the mechanical difficulties which appeared to have been very ingeniously overcome by Mr. Stirling, who attended the meeting, and explained his invention. The engine ap-peared to receive the approval of the members who were evidently not prepared to find so perfect a machine, and one so practically useful.

On the 18th instant a paper was read by Mr. G. Edwards. It described the method employed for breaking up the shoals in the river Severn, between Stourport and Gloucester. These shoals consist of marl rock, so compact and tough, as to resist all attempts to break it up with the steam-dredger, or by prize-bars, or with a powerful species of subsoil plough. Recourse was therefore had to blasting with gunpowder, and the process of these operations formed the subject of the paper. It appeared that during the summer months there was in some places only 2 feet depth of water over some of the shoals; and the navigation was therefore greatly impeded. In 1842 an Act was obtained for the im-

In 1842 an Act was obtained for the improvement of the Severn; and under the directions of Mr. W. Cubitt the various works were commenced. The object was, to obtain a channel with a depth of at least 6 feet of water at all times throughout the river. Messrs. Grissell and Peto were the contractors for the work, and for them Mr. Edwards designed and executed the blasting operations. A series of rafts were moored in a line over the shoal parallel with the bank of the river. Along the centre of each raft, there was an opening through which wrought-iron tubes 34 inches diameter, were driven down at intervals of 6 feet apart through the gravel down to the marl; withinside these tubes the workmen used the chisel-pointed jumperbars to make the short holes to a depth of 6 feet below the surface. The loose stuff was extracted by an auger-tool, a cartridge of canvas, well pitched and tallowed, containing 3 lbs of powder, was lowered through the tube into the hole, which

was well rammed with loose marl. The charge was then fired by means of Beckford's fuse. There was generally but little apparent external effect from the shot, except lifting the pipe a few inches, but sometimes a column of water would be driven up through the pipe to the height of 40 or 50 fest. It was found that each shot loosened a mass of marl of conical or parabolic form, of which the borehole was the centre and its bottom the apex, so that four adjoining shots of two parallel lines would leave between them a pyramidal piece of marl, which was removed by the dredging machine with the loose stuff. This operation of blasting was repeated in parallel lines down all the shoals, and the stuff was dredged up at the vate of 200 to 300 tons per day. The cost of the blasting was about 95. 94. per oube yard. It was stated that the six principal shoals had all been successfully operated upon, and great credit had been given not only to the design but also to Mr. Edwards for the systematic and complete manner in which he had arranged and conducted the operations.

An excetlent working-model was exhibited, by Mr. Siyde, of the steam-excavator. Several alterations appeared to have been made in its form and the mechanical parts of its combination, adapting it for dredging under water. It was much improved, and seemed now likely to become a useful instrument in engineering operations.

SUSPENSION BRIDGES.

SIR,-I have but this moment seen THE BUILDER of the 31st, and should have been astonished at the attack upon my plan of bridges if I had not known the source of your information. The first part is from a letter by "An Old File," which appeared in the *Mechanics' Magazine*; this is a direct false-hood, and for proof that it is so L refer you, and such of your readers as may be interested in the subject, to the number of that excellent periodical that was published on the 31st. The second part I think is from the Mining Journal, which is also equally filse, and is re-futed by calculations in the last number of that periodical. But lest this may not be the particulars to which you allude, I will give you a list of the bridges that have been and are the Leven, in Scotland, for Sir James Colquohoan; two for the Earl of Caledon, in Ireland; one across the Bam, at Banbridge, Ireland; one across the Dam, at Damoiner, in Ireland; one for G. S. Harcourt, Eeq., at Wraysbury, near Windsor; one for H. Miller, Eaq., at Frome; one for the river Lea trustees, at Bow, Middlesex; a county bridge in the parish of Hexton, Wilts; and a pri-vate bridge for Col. Wroughten Stowal, vate bridge for Col. Wroughten Stowal, Wilts. Besides these I have upwards of 30 copies of plans, &c., in my office at the present time for bridges in contemplation, or about to be crected, in various parts of the world, with which I am connected. I also refer to all I have written upon the subject, and shall be happy to hear and to consider any objections that may be raised against either of the bridges that I have erected, or any that are in contem-plation, or against any thing I have written upon the subject; but I must beg the favour of argument being used rather the an assertions.

I do not wish to criticise any other part of yoar remarks, for this is all that concerns me, yet still I will hazard a few observations on them. I must object to your position, that calculations are not always to be relied on, it is the abuse and not the use of them that mislead men. The accident at Yarmouth would not have happened if the engineer had calculated the forces of that bridge, for I find from the data given it was capable of resisting a weight on the platform of only 40 lbs. per square foot with safety, whilst at any time it was liable to a load of 70 lbs. There is another point in which I differ from you, though I grant percussion, &c. may alter the internal structure of iron and weaken it, yet in a bridge which is perfectly quiescent, nothing but being strained beyond the limits of elasticity can effect the structure, the determination of which is a matter of calculation,

SNOKE PROHIBITION BILL. — Last week, on Mr. Mackinnon moving that the House of Commons resolve itself into a committee to further this measure, it was observed that only 29 members were present, when an adjournment immediately took place!

and if adhered to, nothing need be appr hended. I could instance several suspension bended. I could instance several succession bridges that have stood many years in this country without injury, whose limits of elas-ticity do not exceed 30 lbs. per square foot, whilst at any time they are liable to be loaded to 70 lbs., which they may bear once or twice, but it would permanently cripple and weaken-the structure, and repeated loading eventually destroy it. I must also differ from you in sup-posing that a suspension is more liable sud-denly to give way than a compression bridge; in proof of the contrary I will instance the fall of the bridge across the Mill Fleam, at Derby, to 70 lbs., which they may bear once or twice, those at Ashton-under-Lyne, and several others that have occurred lately by which lives have been lost. The fact is, the erroneous principles upon which both suspension and compression bridges are constructed of necessity compel their failure directly any part, however grivial, yields. This for several years I have been trying to impress upon the public, and have at trying to impress upon the public, and have at last succeeded. And though there are still many persons who object to my plan, yet I am happy to know that eventually, they must ac-knowledgefit to be correct." For mon what natural principle can it be argued that the failure of a single part, however, trivial in itelf, should destroy the whole.

It is impossible but that some parts must be weaker than others, and the weakest part will always be proportionably most strained, and should at any time the pressure on these parts exceed the limits of elasticity, it yields, and the bridge fails also. What argument then can be brought forward to support a principle that reduces the strength of the whole to that of the weakest part. And I tell the mathema-ticians (for as I know something of that science, without presumption may I tell them so) that the principle is wrong—and not all the reasoning in the world can make it right—and that a bridge should no more be destroyed by the failure of a single part than a limb of a tree should fall down by lopping off a part from it; the fractured and in both instances would fail, but the rest should remain as firm as ever.

I am, Sir, &c., JAMES DEEDGE Bath, June 16th. JAMES DEEDGE. N.B. The Montrose Bridge did not fall at the opening, but a long time afterwards at the time of a boat-race.

notwithstanding that a threat of an action for libel if we did not do se accompanied it, and had nearly lad us to adopt a contrary course.

SIZE OF MAIN DRAINS UNDER BUILDINGS ACT.

SIR,--I am at a loss to know what size to Sin,—I am at a loss to know what size to make the main drain for carrying off soil. In the Act it mentions, that it must be in trans-yerse section at least equal to a circular area of 9 inches diameter. Now, as I am not sufficiently competent to understand such ambiguity, will you, in your next number, make the point clear, for I find many other parsons nuszled consults as much as your persons puzzled equally as much as your humble servant, A BRICKLAYER.

** We wish no part of the Act was more ambiguous than the clause quoted. A. 9-inch barrol drain (or larger) may be used, or a drain: of any other shape provided it afford water-way (area) equal to a: 9 inch barrel drain. The area of the latter is 5 inches and 3 parts, so that, for the sake of example, a rectangular drain not less than 9 inches by 7 inches may be used, or one 12 inches by 54 inches, since the area of either of these is equal to that required.

ARCHEOLOGICAL CONGRESS AT LILLE. Members of the French Archœological Congress held at Lille, visited Tournay on the Sth inst., and examined all the antiquities of that very interesting town. They were re-They were received with extraordinary demonstrations of respect even to the ringing of the great bells of the cathedral. Relative to this, the bishop of Tournay who received the congress in the epis-copal palace said, "The bells you hear gentle-men, sound but for God and our princes : you are the princes of science, and I have thought it right to make them utter your welcome.' Our countryman, Dr. Bromet, is the only representative of England mentioned, and is described as the *president* of the Archæological Society of London. Next week we shall give a few particulars of Tournay and its cathedral.

BUILDER, THE

RAILWAY STRUGGLES:

SIR.

-In No. 122 of your valuable periodi-

cal, you allude to the expansive contest now being carried on between the "broad and narrow gauges" and the interest it excites in the Parliamentary Committees and the railway world. Being a looker-on and unconnected with rallways, and without entering further into the question of the gauges than to state, into the question of the gauges than to state, that it appears the difference in cost of earth-work between the broad and narrow gauge is 64 per cent. 7 per cent. land, with a larger expenditure in bridges, earriages, &c., and an additional expense in the upper works to carry the heavier locomotives, &c., as well as extra lines of rails to auit the traffic of the narrow gauge, it appears to me that the difference gauge, it appears to me that the difference of the cost of construction would amount to at least from 20 to 25 per cent. in favour of the narrow gauge. With reference to speed, the express trains on the London and Bir-mingham Railway exceed one mile per minute, and it has been stated with regard to the news of density that since the work the power of draught, that ninety-five wag-gons in one train, each containing seven tons, have been conveyed on the narrow gauge, and I have yet to learn the superiority of the broad gauge, or that more has been accom-plished by it. It appears to me, Mr. Editor, that the Government and the legislature are exceedingly culpable in looking on with apathy and indifference, while thousands are squan-dered in these fruitless contests, and although a department of the Board of Trade was oba department of the board of frace was or viously appointed to investigate the merits of the various lines of railway before being sub-mitted to Parliament and to report thereon, mitted to Parliament and to report thereon, opposition seems to be carried on to a greater extent and with greater virulence than before. The appointment of the Railway Department of the Board of Trade has not, I conceive, ef-fected the purpose contemplated, for the old channel is still open to railway promotion, with all its expensive paraphernalia; and bills pass through or are rejected by the parliament-ary committees, notwithstanding the reports of the Railway Department of the Board of the Railway Department of the Board of Trade being in favour of or against them. It evidently has been no check either upon reckevidently has been no check either upoo reck-less speculation or inveterate opposition. The reports of the Railway Department of the Board of Trade, although very able docu-ments, were in general unfavourable to those lines that would compete with existing lines of railway so that in meany instances imprire railway, so that in many instances important places would be connected with rather circuitous routes; certainly the great speed attained on railways has in a measure almost annihilated space, but still I very much question the policy recommended in preferring such routes, at an additional expense to the traveller, when direct once can be obtained, merely to uphold monopoly, nor do I believe from the spirit of the age the public would long submit to any such arrangements. Railway companies with such arrangements. Railway companies with little delicacy deprived turnpike roads and canals of the whole, or at least, a great por-tion of their traffic, and now if the pub-lic interest requires it; diffy cannot com-plain of a little fair competition in their own way. The Romans in laying out their roads adopted a straight line between termini without reference to intermediate obstacles, and our own engineers in setting out compleand our own engineers in setting out canals and turnpike roads, secured the most direct route the nature of the country would admit of, and even important alterations and improvements have been made to shorten the distance between places of considerable traffic. So I suppose the improvement of railways will be suppose the improvement of rainways will be left to the next generation, who, enlightened by our errors, will perfect the system we so erroneously and injudiciously began. Again, the most approved system for working railways seems to be very imperfectly understood, some eminent engineers advocating the loco-motive, others the atmospheric system (amongst the former are the Stephensons, Macheill, and others; the latter Brunel, Cubitt, and others), and each party asserting the superiority of its own hobby; but in the present state of the question the public at large are incompetent to form an opinion. As the present time would be a good opportunity of investigating the well as that of the gauge, the construction of railways, their upper works, &c., I would suggest the propriety of a commission being pointed, with adequate powers to collect app evidence or conduct experiments, composed of . 1

eminent men possessed of great scientific attainments and extensive experience, who would be qualified by an intimate knowledge of the subjects at issue, to grapple with them in all their different and difficult bearings.

1 am aware that implicit dependance is not to be placed upon the opinions of our en-gineers, as they are not infallible (besides many of them, like those in other professions, many of them, like those in other professions, do that they are required to do and are paid for doing); and, as a proof of what I state, at the completion of the Liverpool and Man-chester Railway, fifteen miles per hour was considered by engineers to be the maximum speed for a locomotive engine and train, the gradients worked successfully now were considered to be impracticable then, as were other sucrea to be impracticable then, as were other points that are now established, which would extend this communication to too great a length for the columns of your journal. As many millions of money are at stake in these railway projects, and as the best prin-ciples of construction and promision many to

in these railway projects, and as the best prin-ciples of construction and propulsion seem to be but a mere matter of opinion, I conceive, Mr. Editor, the subject is of the utmost im-portance to the community at large, and, I respectfully submit, worthy the consideration of the legislature and the Government of a great commercial country like ours, who should emulate the rulers of the kingdoms of ancient mulate the rulers of the kingdoms of ancient Greece and Rome in the zenith of their glory, and turn their attention on a broad and comprehensive scale, more particularly to the improvement of our means of communication, and the better development of the internal resources of our common country. B. B.

I am, Sir, &c., B Brecon, South Wales, June 16, 1845.

NEW CHURCH, NEAR RAMSGATE.

NE 1010 2

TRINITY Church, Mount Albion, St. Law rence, near Ramsgate, was consecrated on Wed-nesday, June 11, by the Archbishop of Canterneeday, June 11, by the Archbishop of Canter-bury, who arrived at eleven o'clock, and was received by about 20 clergy, the committee, trustees, and churchwardens. After the service a capital cold collation was haid at the vicar's, where 40 clergy and others met the Archbishop, who looked well, and commended the church and its promoters. Flags were flying at St. Law-rence, and triumphal arches erected. The church is in the perpendicular style (the style church is in the perpendicular style (the style of the fifteenth century), and will accommo-date 779 persons. It is 75 feet 6 inches long, and 52 feet 6 inches broad internally, and is divided into naves and airles by octagon pillars, carrying a clerestroy. "The dellings are all boarded and open. The pellings and free-seats, uniform, low, not painted, but varnished. There is a four-light painted, but varnished. There is a four-light painted, but varnished. There is a four-light painted plass window to the chancel, with figures of St. Mathew, Mark, Luke, and John, paid for By subscription; and a two-light window pre-sented by Mr. W. E. Smith, the builder of the church, at the east end of the south airle, both church, at the east end of the south aisle, both

church, at the east end of the south aise, both made by Warrington, of London. The building is faced with flints, with free-stone quoins. The cost of the whole, includ-ing all expenses, was under 3,0004, being less than the architect's estimate; of this about 2000, when here wind for the state the 1,600% only has been raised, for the rest the promoters are responsible. The ground was presented by Mdlle. D'Este. The archiects are Messrs. Stevens and Alexander, of London.

GLASS ROOFING .--- We learn from the newspapers that within the last few days a rather novel importation has been made in the port of London. This is a small quantity of glass tiles, similar in point of form to the common clay tile for roofing buildings, the advantage clay tile for rooms buildings, the avantage held out being their lightness, and being per-vious to the rays of the sun. The latter quality is presumed to render them suitable for the roofs of greenhouses, as they will not in -terrupt the heat and light, whilst they are sufficiently strong to resist the effects of hail-storms, which will much reduce the cost of insurance on greenhouses for the importeinsurance on greenhouses, &c. The importa-tion is made from Antwerp, and they are chargeable with a duty of 14s. per cwt. under the present tariff. They have the appearance of the common green glass, and if the experi-ment is found to succeed, it demands the im-We shall be glad to learn where these glass tiles can be obtained.

DRAKE'S MODEL OF ST. PETER'S AT ROME.

THE St. James's Bazaar, which "in its time plays many parts," moment a fine model of contains at this

" the dome,---the vast and wondrous dome, To which Diana's marvel was a cell;'

It is made in wood by Mr. Drake, of very large size, and is well worthy of examination. It was the work of seven years, and must have required a stock of patience, as well as skill, larger than is usually possessed. In the ante-room is exhibited a very good panorama of Rome, "the city of the soul," — the "lone mother of dead empires," which will serve to prepare a traveller for the disappointment which is usually experienced 'on first entering the eternal city.

"The goth, the Christian, time, war, flood, and fire, Have dealt upon the seven-hilled city's pride ;

- She saw her glories star by star expire,
- And up the steep barbarian monarchs ride, Where the car climb'd the capitol; far and wide Temple and tower went down, nor left a site :
- Chaos of ruins ! who shall trace the void,
- O'er the dim fragments cast a lunar light, And say, 'here was, or is,' where all is doubly night?"

In addition to the model and view, there are some original sketches by Michael Angelo, Sangallo, Bramante, and other architects connected with the building, and which, though slight, are very interesting.

APPLICATION OF DIFFERENT STYLES OF GOTHIC ARCHITECTURE.

SIR,-My attention was attracted last week to a paper in your magazine bearing the sige E. H., and to a remark met there, to natur the intent that the architects of the present day were expected to study the example of the middle ages, and to design their works in accordance with the true spirit of that remark-able period of barbarism and refinement. I do not quote serbation, but I believe that my impression as to sensa is correct. To do this, it is well said that we must visit the objects themselves, and there learn to feel the beauty of the styles we intend to design in.

This seems, indeed to be an ege of adapta-tion, - the solema character of the Egyptian, the grace and beauty of the Greeian, Roman, Goth, and Middle Age are united in one age But I have often thought that there is one circumstance which adds considerably to the striking effect of some of our finest old Eng-lish structures, which is, that all improvements or additions were made in the prevailing fashion of the time. The diversity thus occasioned has often furnished a theme for admiration: Early English, Decorated, or Perpendicular arches were inserted in Norman walls, and it very frequently happens, that the old Norman doorway is the only relic left of the original church.

This circumstance has been of great use to the antiquary, who builds his ers on the fushion the antiquery, who outles his era on the random of carvings, mouldings, and forms of arch and tracery. But returning to the idea of the beauty of non-uniformity, let us take, for in-stance, a large church with transepts, — the chancel and choir Perpendicular or Decorated, the transets - i contract to your approximate. the transepts and centre tower semi-Norman or Early English, and the nave Norman. Other combinations may of course be chosen, but I think that a union of styles would give more of the correct feeling of the middle ages than to carry out our large works as all of one period.

Viewing such a church as suggested from the nave, we have a bold foreground, the vista gradually becoming more adorned till, at the eastern end, the beauty is complete; then stained glass and rich decoration should finish the picture, and satisfy the eye.

The arrangement just contemplated will be found in some of our finest cathedrals, - Dur-ham in a degree, Lincoln better, and others might be named, perhaps, where the feeling is more fully expressed.

It has been said that invention in architecture has ended, that we can but copy now. Whether the elements of design are exhausted or not, there seems to be a general feeling against every thing new in architectural design; and unless we have a precedent for what we do, it is not correct and does not please. In the other branches of the arts we are pro-

grassing; bat perhaps, it may even be impossible to catch the genius of the early world, when man had every thing to design, and revelled in the luxury of an open and untrodden-field. Now we are told of every suggested idea, "Why that is as old as the hills." The rail appears the only road to favour at present. C. M. J.

Correspondence.

SP. MARY'S NOTTINGRAM.

Sin,-Doubtless for some years past you have heard of the contemplated restoration of this magnificent pile, and, unfortunately, it has only been hearsay, for nothing has been done. You will also probably recollect that about four for, and there was every prospect of the build-ing proceeding under the able hands of Mr. Cottingham. Thus far all the world has Cottingham. Thus far all the world has heard, but in this, as in many other cases, more remains to be told. Here is another instance of an nurestricted competition, and I am afraid it will end in another failure. I believe four tenders were delivered; three were very close together, about 5,000/., and very near architect's estimate, the fourth was 2,400. ! By begging and praying, the builder who named that sum obtained leave from the committee to amend his estimate, and went through it with the clerk of works to see what was absolutely left out, and then sent it in at 2,800%. which the committee allowed. Mr. Cotting-ham, as a matter of course, disliked having his designs murdered by such a tender, believing the works could never be done for the money; so of course he objected to it, and therefore the committee discharged him; and this prolege of theirs is to carry out the works, while Messrs. Scott and Moffatt are to step into Mr. Cottingham's shoes.

I have, I fear, already trespassed too much on your patience, and will merely subscribe myself.

AN UNINTERESTED PARTY, BUT A LOVER OF JUSTICE. Nottingham.

PURIFICATION OF WATER. Sin,-I am much annoyed with the water I raise from a well in which is fixed a vast iron pump; the soil or bottom of the well is composed of gravel, and so is that of the whole neighbourhood.

The water is bard, but what I chiefly suffer from, is the water that is pumped at night being of a red or rusty colour, the next morning with a strong metallic smell, and a coat-ing of a metallic substance on the surface of water.

the water. The kindness of a suggestion to remove this evil from any of your subscribers, will be highly esteemed by Yours, &c.

A. X. Y. Exeter, June 17th

Miscellanea.

CANNEL COAL .--- It is not generally known that Cannel coal can be employed in the fine arts, and that for the bases of statues, plinths, and a variety of other purposes, for which black marble and other fossil substances are used, this fossil can be substituted at a less cost and with less difficulty in the cutting or care ing. A very elegant vase of this material, something in the shape of the well-known Warwick vase, but flatter and partaking more of the patera shape, has been lately cut out of a block of Cannel coal, or rather "turned" out of the block by means of the lathe. The artist is a Mr. J. Dallaway. The vase stands on a fluted column of the same material. It we believe, been shown to his Royal Highness Prince Albert, who has expressed his satisfaction, both with the design and the workmanship of the artist. The polish that the material of which it is composed receives with very little labour, is surprising. The with very little labour, is surprising. The block came from the estate of the Duke of Norfolk, near Sheffield.

THE NEW PADDINGTON HOSPITAL.-His Royal Highness Prince Albert will lay the foundation of the new hospital at Paddington on Saturday, the 28th instant, at three o'clock in the afternoon. Mr. Hopper is the archi-tect. We understand the choice wavered for tect. We understand the choice wavered for some time between that gentleman, Mr. French, and Mr. Alfred Lang,

"BRISTOL AND' CLIFTON DRAINAGE .- The local papers 'say the Report of the Government sioners on this most important subject Commis has aroused the inhabitants to form a Drainage Company. Clifton was gradually being ruined by the abominable cesspools made around the houses; and from the strata of the rocks, it is proved that all the wells are, more or less, affected by the overflowing of these cesspools! The calculations shew that for a small sum from each house (one quarter the expense of emptying the cesspools) a per centage exceed-ing 104, per cent. will be realized.

ing 102, per cent, will be realized. NEW CHURCH AT HULL. —A meeting of the subscribers to the Hull Church Building Fand was held last week to decide on the best plan for the proposed new church to be dedi-cated to 'St. Paul, when that of Mr. William Hey Dikes, jun.; was selected from a great iber that had been sent in and exhibited in number that had been sent in and exhibited in the large room of the dispensary three weeks prior to the meeting. The church is designed to seat 1,200 persons, without galleries, and the walls are to be entirely of stone, without plaster. BH. Dikes, we believe, is a native of Hull, but at present located at Wakefield. FARL br AFLOOD IN a MILL. A few days since soon store the inducement of a selo

since, soon after the commencement of a sale by auction in Dean Mill, Yeadon, near Leeds, the second floor on which the company were assembled gave way, and upwards of 50 per-sons were precipitated into the room below along with a great quantity of wood, ma-chinery, and other weighty property. There were upwards of 100 persons in the room when the accident occurred, yet, astonishing to say, not a limb was broken, nor any ้อท่อ seriously injured.

FOUL AIR IN WELLS AND CESSFOOLS Mr. Green, of Sudbury, has been rewarded by the Society of Arts and Sciences for a method of purifying wells, &c., from the foul air which so often accumulates in them when long closed, and has not unfrequently been destructive of life. The plan is simply to throw into the well a quantity of unslacked linie, which, as soon as it comes in contact with the water, throws up a column of vapour, diffing before it all the deleterious gases, and rendering it perfectly safe for the workmen to descend immediately. DESTIMONT OF REPERT TO MR. JOHN

GRAVICITE EXCENSION This gentleman, who has been she resident engineer of the Hull and Selby Ruihway lever since the com-pletion of the line, had het week presented to him by upwards of 150 mechanics and workmen under his superintendence, an elegant silver tea and coffee service, on the occasion of his resigning his appointment for a more lucrative one on the London and Brighton

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, &c., are to be addremed. For the convenience of our readers however, they are entered in a book, and may be seen on application at the office of "The Builder," 2, York-attect, Covent-garden.]

atter, Covent-garden.] For executing Works on the Leeds, Dowsbury, and Manchester Railway, being a distance of about 42 milds. The principal work on this division is the summit Tunnel, near Morley, which is upwards of 3,000 yards in length. For the execution of a New Harbour at

Greenoek.

For the construction of Two Divisions of the Chester and Holyhead Reilway, being Nos. 8 and 12. No. 8 contains a length of 7 miles and 54 chains. No. 12 contains a length of 5 miles and 26 chains.

For the erection of a Governor's House, and alterations of the Chapel, at the Worcester County Gaol.

For supplying the St. Marylebone Vostry, with materials for keeping the Foot-way and Carriageway in order.

For the several works contingent on Warming and Ventilating the Chester Castle County Gaol.

For excavating and levelling Land, building Sewers, making a new Road, &c., on the Wheatley Estate, Erith, Kent. For Bricklayers', Carpenters', Smiths', Plumb-

ers', Painters' and Glaizers' Works, required to be done for one year, from the 24th inst., at the Churches, Chapels, Court-house, &c., of the Pariah

of St. Marylebone. For lowering and making certain Improvements at the Yeuston Hill, Henstridge, Somerset. For laying down a short Line of Railway, upon Pibrow's Atmospheric principle, and for two Cornish Engines.

300

For Building a New Parsonage House, at Castle Cary, Somerset. For the Removal of several Wrecks in the

Thames. For Excavating and Carting away the Soil and Rubbish, and making a Brick Barrel Culvert in

Coventry. For the Erection of a Dwelling House, Offices, and Farm Buildings at Bourton, near the Shrivenoam Station, Berks.

venoam Station, Berks. For Repairing the Roofs of the Union Work-house and Offices at Thornbury, and for the Paint-ing, Colouring, and Whitewashing the Exterior and Interior Walls, Wood-work, Railings, &c., of the

same building. For the Erection of Schools, and Teachers' Resi-dences, for the Trustees of the Worfield Charity, near Wolverhampton.

For the Erection of a New Church in the parish of Whitechapel.

For the Erection of Schools and a Teacher's Residence in connection with the new church of St. Jude, Whitechape).

SATURDAY, 28 .- Royal Botanic, Regent's-park, 4 р.м.

THE BUILDER:

TO CORRESPONDENTS.

"Prevention of Fire."-C. W. remarks that the balusters of a staircase when of wood greatly assist the progress of fire, and urges that iron should be used instead. The importance of having a staircase wholly incombustible cannot be over rated. Wooden staircases seem specially contrived to spread a fire when it does happen, from the

bottom of the house to the top. "P. A. T. H."—The letter alluded to, refer ring to fire-proof staircases, has not reached us. We never omit to acknowledge communications. Perhaps our correspondent will favour us with a copy of it. "Prudence."—The British Mutual Life As-

surance Office is in Bridge-street, Blackfriars.

"A Constant Reader would be obliged by being informed through the correspondents of THE BUILDER the best and most durable polish for

BUILDER the best and most durable points for elate, and mode of application. "Curves." In Mr. Jopling's communication on this subject, last week, after the word "kyper-bola," for "archoids" and "cypoids," read, "the cardioids, the conchoids, the cyssolds." The Decorative Art Society should solicit our able correspon-dent to explain his system at one of their meetings. "M. C. C."—It would be invidious to mention

"M. C. C.,"—It would be invultous to mention one foundry where castings are not removed red-hot from the sand, as we hope the contrary prac-tice, very properly reprobated in the report from Sir Henry de la Beche and Mr. Cubitt, is the exception rather than the general rule. "J. D. Wyatt."—We shall be glad to receive considerable produced in a other ordinary

occasionally a notice of proceedings at the ordinary

meetings. "F. T."—The latter paper mentioned by our correspondent would be more likely to meet our views at this moment than the former, as we have already had occasion to refer to the Minster in our

pages several times, and must do so again. "B. B., a Reader."-Weale has published a work which gives the information sought, as to

ELLP-TIC STOVES with Inside Backs, 3d. per inch.; Registers with Inside Backs, 7d. per inch. Exery other description of Ironmongery at prices equally low.

DUTY off WINDOW GLASS. -- 101

DUTY off WINDOW GLASS. --- On April the 6th, Squares stoutes and of better sake than formerly for Glasing purposes at 6d, per foot. NURSEYMEN, MARKET GARDENERS, AND OTHERS requiring Small Glass, will find a greater variey for sizes (a large Stock of which is constantly can basel) then is kept by any other house in London, from 4d, per foot. Flattened Sheet, Stained, Fluted, the BIRMINGHAN Sheet Plate (superior in all respects to coury other smith), and Ornamental Glass of every description. Complete Ling Glass, Lead, colours, &c., at ready-money prices, may be had (gratis) on application to R. Cogan, at the Wester Glass, Lead, colours, Warshouse, 5, Frinces-street, Ciccenter-square, London. SURVEYORS, CONTRACTORS FOR PUBLIC WORKS, and the TRADE generally, sending specifica-tions of quantities required, will receive by return of post an invoice at the very lowest cash prices. A parcel of very Superior Spruce Oker, suitable for PLASTERERS AND PAINTERS, to be sold at 6. per

POLONCEAU'S BITUMEN PAVE-MENT for paving Foot walks, Terraces, Garden walks, Stables, Coach Houses, Granaries, Corn Stores, and Sait Warehouses. For the erclusion of Damp and Vermin in Basements it is particularly stapted, and for Roofing Dwell-ing Houses, Porticos, Balconies, and Sheds. Price 32. 6d. per square pard. BITUMEN for covering the Arches of Bridges, Culverts, &c. &c. on Railways and other places (with instructions for laying it down), may be had at the rate of 48s. per test, by applying to JOHN PILKINGTON, 18, Wharf-road, City-road.

TO ARCHITECTS.

TO ARCHITECTS. IN consequence of many complaints having been made to the Company, by Architecta, of a spurious material having been used in the camoutoe of Works where the STYPEL APPRALTE had been specified for, the Directory, with a view to ensure the falliment of any much specification, have authorised CERTIFICATES to be granted to Builders where the SEVERFI ARPIALTE

SEVSEL ASPHALTE

SEVSGEL ASPHALTE has been used. For the purpose of securing the use of the Genuine Article, Architects and others are recommended to insert in their specifications the "Seymel Alphalte, Cla-ridge's Patent," and not merely "Asphalte," or "Bite-men," as in many cases where these terms have been used, gas-tar and other worthless and offensive compositions have been introduced. Bridge, Jan., 1845. Books of Instructions for Use may be had at the Office of "The Builder," and of all Booksellers in Town and Country, price 1s.

"The Builder," and of all Booksellers in Yow and County, price 1s. •,* In proof of the necessity of the above advertisement, it may be mentioned, that it has come to the knowledge of the Directors, that in certain works which have been executed by Messrs. Curtis, builders, of Stratford, a spurious material has been used by them, contrary to the specifications, which expressly mostioned, that "Claridge's Asphales" was to be used.

SATURDAY, JUNE 28, 1845.

HE recent discussions, or rather conversations, in the House of Lords, respecting the new Houses of Parliament, will, it is to be feared, greatly affect the success-

ful execution of the works, and must be regarded with considerable interest by the profession, if not by the public at large. Their lordships, the Peers, it seems, are not conveniently located; their temporary house is found, when they assemble in any number, to be confined and ill-ventilated, to say nothing of its want of grandeur and effect; and they are therefore most anxious, and have been for a long time past, to force forward this portion of the general design, quite irrespective of the other parts. A committee, appointed by their lordships, have from time to time examined Mr. Barry, and, Mr. Grissell the contractor, to ascertain the progress made, and have led the former, by their urgency, to promise the completion of their portion of the building earlier than, under the various circumstances which control him, was possible.

"Would it not go on faster," said the committee, "if every man and every stone now employed on the building generally were ap-plied to the House of Lords alone ?" And when the architect said "Yes," in reply, they ordered that every man and every stone should be so employed. If Mr. Barry had been an older practitioner, and had felt himself sufficiently firm in his position to brave the displeasure of the committee, he would at once have told their lordships that such a proceeding was quite out of the question; that he had other mesters to regard, - the Commissioners of Woods and Works, the Commissioners of Fine Arts, the various officers of the Houses, all pressing their several claims ; that he had the public to consider, and his own reputation as an artist; moreover, that it was not simply unwise, but impossible. As it was, however, he seems to have allowed the committee to consider that their instruction would be complied with, and was induced, under pressure, to name an earlier date for the completion of the House of Lords than he should have done.

As regards the general progress of the works, the most casual examination of the structure, with due consideration of the elaborate nature of the carved decorations, unexampled in modern days, will serve to shew that no time has been lost or efforts spared. It is now four years since Grissell and Peto laid the first stone (the foundations being already formed),—what are four years for such an undertaking ?—and from that time to this 400 men have been constantly employed on the ground, with many more in preparing elsewhere, and have never been kept waiting by the architect.

Some persons think, if we may use the word where no thought is really given, that when an architect has produced the design for a building his work is over, and that it may, without further thought, be forthwith carried out. Nothing is more erroneous, especially as regards Gothic architecture: it is then that the architect's labour commences, and his skill is proved. In such a work as the Houses of THE BUILDER.

Parliament, every superficial yard demands the closest thought, and requires as many detailed drawings as for the whole of an ordinary dwelling-house. Every ornament, every moulding, every line, must be produced and delineated; and over all these does Mr. Barry's own pencil pass. An architect careless of his reputation may get through any amount of work, by deputy; but if determined to execute it to the best of his power, strive as he may, he can only produce a certain quantity, and we will venture to say that the architect of the new Houses of Parliament finds little time for other occupations or recreation from early on Monday morning till late on Saturday night. The wear and tear must be immense.

The life of an architect even under favourable circumstances is one of toil and anxiety; and he needs to have no extraneous circumstances to harass and perplex him. We have heard a member of the lower House declare his ability to write poetry by the mile; we may probably find one of the upper House profess the power to design gothic details by the acre, and laugh at the idea of limits to a man's power in so simple a matter. They would be equally entitled to credence : we should merely say they were exceptions from the general rule.

In judging of the asserted delay, which, according to Lord Brougham, has given Mr. Barry the name of delay (as Quintilian said of Tully, that he was not only an orator, but the name of eloquence), the public should bear in mind that the river front which they see is only one-third of the whole structure, much of which they cannot see. The buildings altogether cover eleven acres, and their cubical contents have been estimated at half as much more than the contents of St. Paul's Cathedral, which occupied about five and thirty years in building, without any material interruptions. They should also know that the whole building is made fire-proof, and that the difficulty of combining this with Dr. Reid's extraordinary arrangements for ventilating the structure and taking off the smoke, has been immense. Over these latter the architect has up to this time had no control; but so much delay and inconvenience has been caused by them that a rupture has occurred, and it now rests with the ruling powers to establish the supremacy of one party or the other. We do not wish ourselves to throw any blame on Dr. Reid; the whole is an experiment, and its magnitude is so great as necessarily to demand much deliberation, but it is too bad that an architect's operations should be suspended, his designs altered, and his views interfered with; and then that he should be blamed for what has been done against his will. The work in the lobby of the House of Lords was delayed six whole months because the system of ventilation there was not determined on.

The Peers now insist on having their house ready for occupation in February next, and the greatest efforts are consequently being made. All the walls and the ceiling are to be covered with carved wood-work of the most elaborate character, and this is being forced on by 150 additional workmen much more rapidly than is desirable. It will probably be ready for fixing about October, and instead of remaining as it should do in the drying rooms during the winter ready for fixing in the summer, will be taken into the new building in the bad weather, and probably be irreparably injured. Do what they will, moreover, the House of Lords cannot be completed by the time named, nor is it desirable that it should be. Surely, if their lordships would consider

that this building is not simply for some immediate or temporary purpose, but is intended to last for ages, and that the great object should be not to do it quickly but well, they would restrain their impatience and allow the architect to work out efficiently the whole design. If the present accommodation is bad, let it be made better; re-construct the temporary House of Lords during the ensuing vacation, and persuade them to put up with the indignity yet a little longer, so that their order may be worthily lodged ever after. The architects of the middle ages produced the noble works to which we now appeal with pride, slowly, by degrees, and as works of love; at least let us give the ninetsenth century one chance, and not by unnecessary and child-like haste, risk adding another failure to the crowd which already disgrace it.

ILLUSTRATIONS OF ARCHITECTURE FROM THE BRITISH MUSEUM.

THE XANTHIAN MARSLES.

WE have directed attention, in previous numbers of THE BUILDER, to the want of a museum for British antiquities, and those of the middle ages generally. But if we men-tion the continued want in this particular, it is right to recollect, that excellent provision is made, at least, for the antiquities of the ancients. The general arrangements of the British Museum are conducted on a scale of munificence, productive of the greatest benefits to all classes. The collection has become to all classes. The collection has become so extensive, that it is quite impossible to be acquainted with all the treasures it coneven in one particular line of study, tains. whilst the most valuable fragments can neve be examined without suggesting fresh points for inquiry. It will be our object in some future numbers of this journal to direct the attention of the architect, and the decorative artist, to such portions of the collection as bear upon their peculiar pursuits. The art of sculpture occupies a large space, but most of the examples are equally interesting to the architect, and afford even the forms of the furniture, and of many utensils of the ancients. Lately the collection in the Elgin room has been enriched with casts from some remaining portions of the Parthenon. Amongst these is the sacred owl of Minerva. There is also a cast of the capital, from the monument of Lysicrates. No one can examine the figures from the temple, which are at present de-posited in the Museum, without wonder at the careful execution in objects so far removed from the spectator; but the wonder is greatly increased on finding from the work of Revett and Stuart, that the Elgin marbles form a very small part of those formerly existing. This may also be seen on referring to a restoration of the pediment, or to the large models of the temple in its present, and its original state, now constructing in the Elgin room. But the most important acquisition, which the Museum has received, since the Phigalian frieze, is that of the Xanthian marbles. These have pre-viously been described, but their architectural interest leads us again to refer to them.

The country of Asia Minor occupied an important position in the ancient world, and one strongly contrasted with its present state, regarding which there is still great want of information. Few have contributed more to a knowledge of its ancient state than Mr., now Sir Charles Fellows, to whom we are indebted for the transmission of the Xanthian marbles to England, and who has published two journals of his visits, and an account of the proceedings at the ancient city. The tombs of Asia Minor are probably as curious as the receptacles for the dead in any country, not only from their immense number, but their forms and workmanship. Whilst the character of their sculptures proves many of them to have been of the best age of Greek art, their architectural character is often singular and unintelligible. There are among them, not only isolated constructions, but also, and perhaps in arombs of Petra. Many of them shew a closer similarity to timber construction, than is observable in the Doric temple of the European

Greeks, and in fact they resemble the huts of the present inhabitants of the country. This is of servable in a fragment carved in imitation of the cross poles, projecting from the eaves of the hut. A roof having its section in the form of a gothic arch is common. Many form of a gothe arch is common. Many of the monuments are each nothing more than the frustum of an obelisk, with a few large fillets as cornice. The monument called the "Harpy Tomb," of which there is a model in the Museum, was of this form, and it was decorated with the sculptures, supposed to redecorated with the scurptures, supposed to re-present the story of the Harpies flying away with the daughters of King Pandarus. But the most interesting monument is one erected to commemorate the conquest of Xanthus by Harpagus, the general of Cyrus, in B.C. 546, as described in Herodotus, book i.• When dis-covered it was a mass of ruins, but has lately been restored in a model, placed in the Mu-seum. This trophy consists of a lofty base-ment, supporting a peristyle. The former was surrounded at the foot, and beneath the cornice, by the bas-reliefs,—representing the siege of a walled town, and a contest of horse and foot combatants,-which are at present in the collection. The edges of these portions shew the contrivance for procuring a perfect joint; the meeting surfaces are perfectly smooth for the breadth of an inch at the front, but within are left rough for the mortar. The perfect cohesion obtained was equally favourable to the stability of the mass, and the beauty of the work; indeed the joints were sometimes so close that a knife could not be inserted, and it has even been asserted, that many of the Greek temp/es were constructed entirely with-out mortar. The cornice of the basement, in the monument under consideration, is curious from its two ovolos, which are placed one immediately above the other; they are en-riched, and have beneath them an enriched riched, aud have beneath them an enriched bead, the whole being decidedly of Grecian workmanship. The top bed of this cornice shews the position of the column of the peristyle which was fastened into the block, probably by a copper plug. It is, however, certain, that a wooden pin was often employed, and one of these was lately presented to the Institute of Architects by Mr. Hamilton. The peristyle has fourteen fluted columns of the Ionic order, supporting a nedimental roof and inclosing a has fourteen fluted columns of the Ionic crder, supporting a pedimental roof, and inclosing a small "cella," which, however, appears from the *model* to have been built solid. The porticos are tetrastyle, and the intercolumniation areo-style. The bases are peculiar from their ex-treme height. They have the reeded torus, as in the Erectheum, and beneath it two hol-lows separated by beads; but the hollows are not like the scotia of the attic base, and, as in Grecian examples, there is no plinth. as in Grecian examples, there is no plinth. The frieze is ornamented with sculpture, as are the pediments, and also the frieze of the cella. Parts of these friezes represent the guests seated at a banquet, probably the ca-rousal after the victory. The angles and apex of the pediments have figures in motion, and there are also figures of men and animals in the intercontent of the presidue. The in the intercolumns of the peristyle. The antw of the *cella* have very beautiful capitals enriched with pateras, and waterleaves; and are, as in most Greek examples, of less breadth in flank than in front. The order has no ar-chitrave; the only moulding beneath the frieze being similar to the tænia in the Doric frieze being similar to the tania in the Doric order. The pieces of the entablature were bound together by copper cramps (into this form), run with lead, as may still be observed. The crowning member of the pediment (*sima*) has been continued along the flanks and orna-mented with lions' heads, being in this re-spect like the Roman system; the Greeks were in the habit of stopping it at a short distance from the front. The dentils are unusually large, and the slabs of the roof covering in the model are also extremely large; is there the model are also extremely large; is there authority for these peculiarities in a building so essentially Greek? The greatest interest cannot but be felt in

The greatest interest cannot but be felt in the examination of these remains,—their beautiful workmanship, the fine treatment of the sculptured decorations, place them as second only to the finer works from the Parthenon. They were produced in a country, which had greater influence upon other nations than any other, Athens not excepted. Asia Minor was the nurse of Grecian philosophy and art, and it is melancholy to reflect upon its present debasement. E. H.

* Sce BUILDER, page 03, ante.

THE BUILDER.

ON THE SHAPE OF HOUSE DRAINS.

Sin,—Having some time since recommended, through the medium of THE BUILDER (pages 593 and 606, vol. ii.), that in the construction of house drains it would be extremely desirable to employ good, strong, and well-burnt cylindrical pipes, made of clay, and glazed inside, in lieu of the present method of building them, both cylindrically and rectangularly of common bricks, I cannot but regret that you in your judgment of this matter should have thought it desirable to have somewhat suggested in answer to your correspondent, "A Bricklayer," last week, that the construction of house drains might be of a rectangular or square angled shape; and that they might be thus built of certain sizes equal to a circular area of 9 inches diameter, in order to comply with a clause to that effect in the New Buildings Act.*

In this age of improvement it is highly desirable to promote and enlarge the adoption of scientific principles as much as possible, because the more we have recourse and conform to such principles the more certain and correct will all subjects to which they are applied, be in their results; and upon no subjects, and in no case, are the principles of science more applicable, and more required, than to the improvement and correction of the false principles of drainage. It appears to me that a very great error was committed in framing the clause in question, by leaving the forms, sizes, and construction of house drains so undefined; and also in not declaring at once that for the future all drains should be made of a cylindrical shape, or that their bottoms should be made concave or semicircular, and as even and uniform as possible.

The arrangement and construction of housedrains may seem, and no doubt it is to many builders, a very trifling and worthless affair their formation being considered of very little consequence, and indeed the manner in which consequence, and indeed the manner in which they are generally executed proves this state-ment to be a fact. No parts of a building re-quire more attention, and more nicety in pro-ducing perfection in arrangement and con-struction than should be observed in the building of house drains. It is by the means of proper and efficient drains that animal and ware the fully correspond in dwelling buyes vegetable filth engendered in dwelling houses is usually carried off; and the discharge of this becomes the more certain and perfect according to the paius taken in producing accuracy of form, size, arrangement, and con-struction of the drains. The building of drains struction of the drains. The building of drains is a subject of great and serious consequence, in reference to the effect they are calculated to produce on the health of the inhabitants of dwelling-houses, and, therefore, their utility and efficacy are of the utmost importance to the sentery or production the sanatory condition of the population. The valuable evidence which has been elicited by the inquiries of the Health of Towns Commission, with reference to the subject of drainage, and the impetus that has recently been given to the propriety of providing good and perfect drainage in places where none exists at present, and the agitation which has resulted from its publicity, has had, in a great measure, the desirable and salutary effect great measure, the desirable and salutary effect of arousing the attention of the public mind to the evil effects of bad, and the necessity and great importance of good and efficient drainage of dwelling-houses. So far as the metropolis is concerned, the New Buildings Act has provided, and that very considerably, for the extension of drainage, by obliging persons to build sewers in front of, and to lay drains into them from all houses that shall here five the here he any sewer or hereafter be built, if there be any sewer or open watercourse under the jurisdiction of any of the Metropolitan Commissions of Sewers within 100 feet of such intended new buildings. This is certainly one grand and ex-cellent step towards providing for the exten-sion of house-drainage; but this Act does not provide for the formation of sewers in populated districts where none now exist, nor for obliging persons to build sewers for the drain-age of premises or new districts. If the points where sewers have already been carried up, and which are hidden and buried, and the water courses and other places, under the jurisdic-

* The remark to which our correspondent refers was made simply to explain the meaning of a clause in the Buildings Act, and to shew what *might* be used, and had no reference whatever to the best form.

tion of the various commissions of covers, be narrowly and strictly watched by the district surveyors, all or most of these points may fall within the distance stipulated by the Act, namely, 100 feet from the intended buildings; and were these points known and properly defined they could be made subservient to the extension of drainage. I think it would be a good and desirable plan to ascertain and mark all these various places and points on a good-sized map for the use and reference of these gentlemen; as otherwise buildings may be allowed to be carried up without any, or an improper drainage, from the surveyors not being properly acquainted with these particulars.

The employment of common bricks in the construction of drains, and especially drains of rectangular formation, cannot be too highly reprobated. Drains of rectangular construetion are not only calculated not to afford a powerful resistance to the pressure of the ground which is filled in around them, and therefore are liable from this cause to disarrangement and destruction, but such a form rangement and destruction, but such a form is also contrary to hydraulic principles, as the energy, action, and power of the streams in lifting and carrying along substances in sus-pension with it, is materially retarded and de-stroyed by such a form and arrangement, as might very easily be proved. The means of carrying off the animal and vegetable matter from dwellings is entirely dependant upon the quantity and power of the water which passes into the drains; and the mechanical action and power of the water may be rendered altogether inefficacious for this purpose by the sluggish-Inclineacious for this purpose by the sluggish-ness of their falls, their sizes, and their forms. It is really surprising to observe how persons go on from day to day, and from year to year, forming these things, when they are known to be exceedingly bad in principle and inefficient in action, because such formations have become a business of habit; and also, as is too often evinced, from a stubborness grainst introducing improvements. The use against introducing improvements. The use of pipes in the construction of drains is ren-dered the more necessary in consequence of the notorious carelessness of brickiayers in building brick drains; for let it be taken as an axiom that whenever a bricklayer has to exe-cute a piece of work which is to be immediately covered over and hidden, without being watched, the chances are that he is sure to perform it in an unsound, slovenly, and improper manner. I have often observed drains being laid through houses in the following manner two parallel lines of two or three courses of bricks were laid flat, or on edge upon one another, and at about seven inches apart, and sometimes without any mortar; no other bottom or channel being formed or provided for the passage of fluids and substances along them, than what was afforded by merely the *bare* carth. And yet no means are available in preventing such reckless and abominable pro-

preventing such reckless and accumuator preceedings. Of all the routine of construction in buildings, the arrangement of the proper sizes and falls which drains should be of, and their construction as well, are least cared for, and less thought of; so long as there be an aperture and channel formed, whether it be multangular, rectangular, or however various its form may be, it is considered sufficient to answer the purpose; indeed, this too is notorious, and can be proved to the satisfaction of any one if he will only take the trouble to examine their interior constructions. The interiors of drains are usually parts of a building which are unseen; indeed, this is actually the case even during the time of their execution; and the best and only manner of properly observing their state and the way in which they have been built, is by examining their insides from the interior of a sewer; and as this mode of examination does not fall to the lot of hut very few persons, I take leave to say that, whan thus observed, their appearances are traits abominable. From the improper and imporfect manner in which the brickwork is usually performed, and the bad way in which the ground is filled in around them, the drains are invariably squeezed and crushed into almanner of shapes and sizes; and sometimewhile building, their interiors are left half fulof either brick rubbish, clay, or gravel, which lays upon their bottoms so long as the draitsexist, or till they become entirely choked by th deposition and accumulation of matter, and

are cleared out. Besides, the bottom halves of brick drains are usually laid dry on the ground without mortar or cement, and the consequence is that the greater part of the fluid which passes into them percolates through the joints of the bricks and is absorbed by the subsoil, and from this cause a drain cannot be considered otherwise than as a long and narrow line of cesspool. From the uneven manner in which the bricks are usually laid along the bottoms, and from the rubbish and piec mortar that are left within them as well, these protrusions present a succession of internal irregularities and stoppages; so that at every inch or so along the bottom and sides, the water, and animal and vegetable matter which is carried along in suspension with it, becomes arrested in its progress to the sewer; and consequently the soil becomes deposited upon the bottoms of the drains, and these, from this and other circumstances before referred to, ultimately become choked, and are thus rendered of no utility and service whatever in assisting the discharge of the sulliage through them to the sewer. During the time the matter is collecting within the drains, and this may be going on for months together, the inhabitants are very much annoyed, and incessantly complain of foul vapours and stench, which emanate from the decomposition and fermentation of the accumulated matter through the various vents within and about the houses, and effluvia of the most filthy, noisome, and malignant description, are inhaled by them. It has very often been shewn clearly and forcibly that wherever bad drainage exists the surrounding atmosphere becomes vitiated and charged with malaria and poisonous gases, which have a most injurious effect upon the health of all those persons who reside in such places, and, very often, these gases are the cause of the production of virulent fevers. The use and abuse of cess-pools have very often been spoken of, but I really cannot see what difference there can be between a cesspool, and a long line of ill-constructed drain, which runs under a house, and retains all, or nearly all, the filth which is discharged into it, and has to be cleared out periodically, precisely the same as a cesspool.

If drains are to be made at all, the workmanship should be made as clean, smooth, and perfect as possible, otherwise a cesspool is nearly as effectual: and it is only a waste of time and money in building drains of time and money in building drains without particular attention be observed in these points, and also in making them so as to prevent foul air and fluids from escaping through them. I have seen the interiors of tube drains whose calibre is exceedingly small, and have been in use many years, per-fectly free and clear from deposits and ac-numulations while the bottome of large heigh cumulations, while the bottoms of large brick drains contiguous, were half-filled with de-posited matter; their size and roughness causing the matter to lodge within them.

To all persons who are any way engaged in the formation of drains a knowledge of the scientific principles of statics and hydraulics is highly desirable; indeed, no drainage could be properly laid down and conducted without this knowledge and the dependance and manner of applying these principles to it. The proper and efficient drainage of a very great many houses in all parts of the of a very great many houses in all parts of the metropolis are rendered altogether ineffectual from the circumstance of the bad and impro-per construction of their drains; and the facilities afforded by the sewers in carrying off the sulliage are by this means of little or no avail. And the improvements which are yearly taking place in the metropolis by deepening and reconstructing the sewers, and otherwise affording good, efficient, and perma-ment drainage of premises, are in very many nent drainage of premises, are in very many instances of no service, because no control is allowed to be exercised over the manner of forming and constructing private house-drains. It may appear somewhat difficult to legislate for the arrangement and construction of pri-vate drains, but most assuredly considerations and difficulties ought not to have any weight when it is observed that the building of a private drain and a sewer are so mixed up and blended together that the efficiency of both are rendered reciprocal, and are thus mate-rially dependant upon their proper falls and constructions; for whenever the one is badly arranged in these respects the other is ren-dered almost useless in consequence. I have

very often been applied to and asked where the drain pipes in straight lengths and curved drain pipes in straight lengths and curved junctions, and of the description and strength which I have suggested could be procured. But from not knowing where such are to be obtained, if at all, I have not been able to give a direction, and thus recommend, and ensure their actual application to practice.

From the great impetus that is expected to be given to the manufacture of glass, in conse-quence of the repeal of the duty, I see no reason why cylindrical drain pipes of various diameters should not be made of glass, as such a form and the emochance of this meterial a form, and the smoothness of this material would afford facilities in accelerating the dis-charge of the drainage of houses into the sewers, that no other material could so well There is no question but that they could do. be made of sufficient substance and strength to enable them to resist very great pressures; and that they could be made with proper joints, and in lengths both curved and straight, with proper curved collateral junctions, convenient for using. The interiors of drains cannot be too smooth, for smoothness of surface and proper falls and sizes are the principal points to be observed in their construction. Good, thick, well-burnt cylindrical drain-pipes were very much in use in England about a century and a half ago, for I have seen and taken up many that were laid down about that time; and with all the boasted science and skill which has of late been shewn on the subject of drainage and sewerage, we are still considerably behind hand with what was done and generally practised by the Romans, especially in the drainage of their villas. This people used pipes of earth very extensively, both in the conveyance of water from springs and aque-ducts to their houses, as well as in carrying off the drainage therefrom into the main

Whatever may be said in reference to the subject of tubular drains, it can have no other effect than of promulgating their enciency, and of clearing the way for their use. As for the originality of proposing tubes for drains, it would be the height of absurdity and plagia-rism in me to claim it, for what Pliny says in his natural history on the subject of drain-pipes would appear to set this matter at rest. He effect than of promulgating their efficiency, says that " If a man would convey water from says that "It a man would convey water from any head of a spring, the best way is to use *pipes of earth* made by potter's art; and the same ought to be *two fingers thick*, and one jointed within another, so as the end of the upper pipes enter into the nether, as a tenon into a mortaise, or as a box into the lid : the same ought to be united and laid even with quicklime quenched and dissolved in oile." And he says further that "the skill and knowledge of pottery is more antient than founderie or casting brasse;" and again " how beneficial is the earth unto us in yeelding us *conduit* pipes for to convey water into our bains."* Now, whether any one else can lay claim to anticipation, invention, or originality in pro-posing the use of conduit or drainage pipes after this, I leave to competent and impartial judges to say. I hope, Mr. Editor, you will take every opportunity of recommending the employment of proper cylindrical tubes for the construction of drains, instead of the present mode of building them with bricks, so that by mode of building them with bricks, so that by these means better drainage from houses may be produced, which must tend very much to sanatory improvement. Drains should never be constructed of a rectangular form, but should always be made circular, at least their bottoms should where the water runs; for if I take a barrel drain say of 9 inches diameter, its area is equal to G3-617 inches; and the side of a square drain having the same area is equal to 7-976 inches: therefore, now supposing that the quantity of water running through each the quantity of water running through each of these drains to be equal and half full, then of these drains to be equal and half full, then the semi-circumference being equal to $14\cdot137$ inches, the length of the base of the square added to half its height on each side is equal to $15\cdot952$ inches, or nearly 2 inches more. So that we have an actual re-tardation and loss of power in the stream through friction of nearly 2 inches by using the rectangular drain. And this is not the only loss of power in the stream, for the denth of the water in the square drain is the depth of the water in the square drain is less than that in the circular one by more than

* Pliny's "Natural History," translated by Philemon Holland, 1634,

half an inch, for in the former the depth is equal to 3.963 inches, and in the latter it is equal to 3933 inches, and in the latter it is equal to 4.5 inches, the difference being equal to 537 of an inch. The hydraulic mean depth of each can be found by dividing the transverse area of the water expressed in square inches by the border of the secin square induces by the bolder of the sec-tion minus the upper surface of the water. We have a considerable loss of power in several ways by adopting a rectangular shape for a drain, therefore their use should be entirely abandoned; and I think no drains can be better formed, or can afford means of better and more effectually carrying off the animal and vegetable refuse from dwelling-houses than can be done by smooth cylindrical tubes. This letter has run out to a length that I originally did not contemplate, but the magnitude and importance of the subbut the magnitude ject must be its excuse. I am, Sir, &c.

JOHN PHILLIPS.

THE BRITISH ARCHÆOLOGICAL SOCIETIES.

WE continue to receive many letters relative to the dissension, the majority of which urge that members really anxious to effect a junction, should publicly pledge themselves not to attend either meeting at Winchester unless some arrangement be previously made. One gentleman, who signs himself "E. N."

Says:--" SIB,-" SIR, - Your very excellent observations from first to last relative to the Archæological Association are so very suitable to the occasion, and have so much enlisted my sympathies, that I beg to submit to you the question, whether the best mode of bringing the petty squabble to an end would not be for the nominal members to desire their names to be erased from the list; for my own part I thought it so discreditable to remain connected with a society so divided, that I have requested the secre-tary of each party to erase mine. It must be much regretted by every one who values an-tiquity, that from want of a business-like constitution the advantages that might have resulted from the co-operation of so many able antiquarians have been prevented."

Mr. Wansey, F.S.A., has addressed to us the following letter, which has also appeared

which exist amongst us to our discomfort, in-jury, and reproach, I have been hoping some influential members would have come forward publicly to try and heal them. Anxious for the well-being of our association, I respect-fully recommend,—that we stop not to inquire who is right or wrong; two rival societies together cannot be for good, and one is tempted to say 'a plague on both your houses:' while the world will jeer, and cry out, 'Tan-tæne animis cælestibus iræ?'

Suppose both dissolve, and men the most considerable amongst us for character and station undertake to draw up laws to be submitted to a general meeting, for the govern-ment of one new society, embracing all, to be then constituted : officers, &c., to be chosen as usual. 1 see no better way of getting out of our present undesirable position, and take this mode of addressing you, as the most practicable.

Arborfield, near Reading, June 19, 1845."

We have the names of more than a dozen influential members who would willingly aid in restoring unanimity. It is said to be in restoring unanimity. common in one part of India when there is any dissension between church and state, for a man to go to the top of a certain pagoda, and vow that if the quarrel be not terminated in twentyfour hours that he will return and throw him self off; and they further relate, that sooner than have the blood of the man upon their heads, both sides usually yield a little, and so the difference is adjusted. Can we not find some devoted friend to peace and quiet to try this move on Westminster Abbey, and thus literally, precipitate an amicable result? If it succeeded, we should claim a daily allowance of milk and honcy fore the rest of the year.

THE OFFICIAL REFEREES.—Mr. Higgins has resigned the office of referee under the Buildings Act.

ST. MARY'S MARYLEBONE AND PADDINGTON HOSPITAL.

-As one of the three architects men-SIR,tioned in the paragraph respecting "The New Paddington Hospital" in last Saturday's Paddington Hospital" in last Saturday's BUILDER, I beg to say that the passage in question does not convey a correct impres-sion of the state of the case. Mr. Hopper is the "Honorary Architect" of St. Mary's Hospital, the committee having thankfully accepted the offer of that gentleman's valuable gratuitous services in aid of the charity. Mr. Lang and myself, as members of the com-Lang and myself, as members of the com-nittee, having also placed our professional assistance at the disposal of the committee, were requested to take part in a *friendly* con-tribution of plans with Mr. Hopper, in order that the committee might not be restricted in their choice to one set of plans, they having determined (wisely in my opinion) that no competition for the employment of the architect should take place, whereby they would have been deprived of Mr. Hopper's services, and would have exposed themselves to all the heart-burnings, jealousies, suspicions of favouritism, and other unpleasant results usually at-tendant on competitions. Mr. Hopper's plan was unanimously preferred, and even then, with the kind consideration he has always shewn towards his juniors in the profession, that gentleman suggested that Mr. Lang and myself should be allowed to produce elevations which here which was exceedingly done but to his plan, which was accordingly done, but the committee not feeling at liberty to expend their funds upon mere decoration, resolved to adhere to the design submitted by Mr. Hopper which is of a plain character (in ac-cordance with his own stipulation upon acespting the office of honorary architect), but thoroughly suited to the purpose, and which it is expected will be effective from its very simplicity of design and breadth of proportio

Thus it will be seen that there never was any intention to compete (as might be inferred from the paragraph in question), among the three parties named, for the situation of architect to the charity, consequently there could be no "wavering in the choice," when there was no choice to be made; and whilst I will always maintain my own right when assailed, I will equally disclaim any attempt to give to me or to any other party that position which justly belongs to another. Having from the first supported the propriety of the charity availing itself of Mr. Hopper's services, I have felt it to be a pleasure as well as a duty to render him all the assistance in my power, in sharing his labour and anxiety to promote the interests of the charity, in carrying out the contemplated building for the hospital. GEORGE RUSSELL FRENCH.

18, Sussex-gardens, 23rd June, 1845.

LIGHTHOUSE ON THE GODWIN.

Mr. BUSH after having surmounted every obstacle in the erection of the building to con-tain the "light for all nations," is now contending with the greatest difficulty, namely, its useful application. The Trinity Board has the exapplication. The Trinity Board has the ex-clusive privilege of managing the lighthouses on the English coast, and although this pri-vilege was originally granted for the public good, it has now, like many more, become subservient to private interests. The elder brethren are jealous of their rights, they cannot brook the intrusion of a bold, per-severing and clever man succeeding where they have failed, and they appear more diathey have failed, and they appear more dis-posed to visit the offending party with their displeasure than to hail the success of the undertaking, and to reward the skilful engineer for the additional protection he offers to the lives and property of our merchants and seamen. We understand that it is the intention of Mr. Bush to take up his residence, with his wife and family, in the lighthouse, and to have the highest chamber illuminated with a pale blue light for his own use. Of course, how-over, this will at the same time have the effect of warning ships, and a telegraph is crected to signalize vessels at the back of the Godwin. As the lighthouse stands 36 feet above high-water mark, it is Mr. Bush's intention, in order to protect his new residence, to discharge rockets in dark nights, or sound a gong in foggy weather

TOURNAY AND ITS CATHEDRAL.

TOURNAY, lately visited by the French Ar-chæological Congress, as mentioned in the last number of THE BUILDER, is situated close to the French frontier, towards the western extremity of Belgium, and is a singularly interesting old town. It was one of the first places in Belgic Gaul where Christianity developed itself, and has a long and curious history. The architectural student will find there much to engage his attention and stimulate investiga-Within a very short distance of each tion. other he may find specimens of the different styles of building which prevailed during several centuries, and see almost at a glance the progression of the changes which took place : I allude more particularly to dwelling-houses. There is one very ancient specimen near the church of St. Brixe. The whole is of stone, and terminates in a gable. The windows, about five feet high and four feet wide, are each divided into two openings by a small column with plain leafed capital. One of the lower windows has simply a rectangular mullion down the centre, the edges of which are chamfered to within a certain distance from the top and bottom. The string courses, consisting merely of a square member and a hollow, continue through the whole front, and form straight window heads, over which are introduced discharging arches. The adjoining front is precisely similar. In the Rue des Jesuits there are some houses of the same character, but of a somewhat more advanced period. The columns and caps are nearly the same as those before mentioned, and the upper part, perhaps 50 or 60 feet in extent, consists wholly of windows and small piers alternately.

a set the application of pointed architecture to a street front, at the beginning of the 16th century; and near the Eglise de Château is a large building, now the Horse Infirmary for the artillery, which would seem to be an example at a later stage of the decline. It is constructed of red brick and stone, and presents gables, pointed headed windows, other square windows divided by mullions, and large dormers in the roof. The mouldings, however, are Italianized, the discharging arches, partly stone and partly brick, which occur even over the pointed headed openings, are made into adornments, and all the ornaments which appear are of mixed design. Later still, the line of the gable became altered into a scroll, the mullions of the windows disappeared, and the Gothic panel-ling on the face of the building gave place to sters and entablatures elaborately adorned pil with figures, fruit, and foliage, as may be seen in numberless examples remaining in most of the towns.*

Some of the churches are exceedingly in teresting, but the great point of attraction is the cathedral (Notre Dame de Tournai), which is unquestionably one of the most important buildings in the country, whether regarded simply as a specimen of the architectural skill of two different periods of time, or as re-calling by association the events of many centuries,— a sublime souvenir of the middle ages.

Seen from a distance, with its forest of towers high above the surrounding buildings, its effect is very striking; nor are the pleasant anticipations so raised in any degree lessened by a close approach. In form, it is a Latin cross, with five towers; namely, one on the east and one on the west side at each end of the transept, and one at the centre of the cross. The transept is terminated at each end by a semicircular absis, similar to many churches in Cologne and other parts of Germany. The nave has an aisle on each side, separated by piers and small columns bearing semicircular arches, which in various parts approach the horse-shoe form. + Above these, is a second range of piers and arches of similar or greater height than the first, forming the front of a

* Lille, a French town, but close to the Belgic frontier, and where the congress met, displays a great number of houses of this character, of great richness, and, in some cases, much beauty. † The piers occupy a square of 6 feet on the plan, set diagonally. The openings are 13 feet 6 inches wide, and about 11 feet 6 inches high to the springing of the arch. There are nine such compartments on each side of the nave.

large gallery, extending the width of the aisles Over these is a series of arches against the wall, springing from short piers. The clerestory and the valied ceiling were the work of barbarous repairers in 1777, and took the place of the ancient wooden roof: they will shortly be restored to their original appearance.

All the capitals of the lower columns in the nave are sculptured to represent folisge, and are exceedingly sharp and clear. In earlier times, they were all painted and gilt, and further decorated by scripture mottoes around the abacus. Much of the stone-work is rough and has been covered with stucco : the columns and other parts that were exposed, are of Tournay stone polished.

The four great arches at the junction of the cross are pointed, and have also been embel-lished by colour, much of which is still visible.

The interior of the semicircular abeis, terminating the transept at either end, is exceedingly beautiful, and produces a very striking effect. At the bottom a series of six lofty columns 2 feet 8 inches diameter, and about 24 feet high, built up of ten courses of stone, and placed at a short distance from the wall of the absis, support narrow semicircular arches raised on legs. Over these are two triforis and a clerestory, and the whole terminates in a half dome with plain ribs converging to a point. The capitals of the columns coasist of volutes and of leaves. The base of each pillar has four sculptured leaves at the angles of the pedestal.

Originally the choir was about one-third the length of the building, and terminated in an absis similar to those of the transept in form and style. This portion of the building, however, was rebuilt, as is mentioned hereafter, and is now an exceedingly fine specimen of the pointed style, resembling in some respects

the choir of Cologne Cathedral, although exe-cuted much before that wonderful building. The present choir has an aisle and a series of small chapels on both sides, which continue round the east end. Lofty columns, bearing acutely pointed arches, separate the aisles from the choir. In each spandril of these arches is a circular ornament in mosaic-work, and above rise a very elegant triforium and lofty clerestory. Behind the triforium is a series of peculiar quatrefoil lights, blocked up and unknown until lately (as indeed was the whole of the triforium), but now again filled

with stained glass. The choir is elevated above the nave by three steps for about one-third its extent, and then by a fourth for the remainder of the length, and is paved by black and white marble in squares. . The The high altar has four additional step pillars in the choir were originally constructed with that daring which characterizes many of the earlier efforts of pointed architecture, md soon gave symptoms of insufficiency. They were then strengthened by additional masonry at the back, and even now are remarkable for They their lightness and elegance. It may be mentioned that when the choir was rebuilt, the old chancel arch, which was probably semi-circular, was cut away to make room for a pointed arch, as also was the case at the entrance from the transept to the aisle of the choir on each side. Painting and gilding have been used throughout as a means of decoration, and will probably be again resorted to when the whole of the substantial repairs have when the whole of the substantial repairs have been executed.§ A series of flying buttresses surround the choir externally, and it is between these that the chapels are formed, terminating in gables.|| The roof of the choir above the vaulting is of oak, and of great height height.

Round the outside of the clerestory of the

The galleries in ancient churches were used for the pur-torse of separating the sexes, and even different ages of the ame asz. This was perhaps rendered necessary by the ustom of saluting, which then obtained amongst the 'faithful.'

custom of satuting, which then obtained amonges use 'faididi.'' † During the whole of the eighteenth century continued injury was done to the building by injudicious endeavours to support the fabric; many openings, especially in the transcept and the clerestory of the choir, were bricked up; the capitals of the columns and other decorative portions were covered with whitewash, and the freecoes which adorned the walls destroyed. ¹ These values are formed of rubble work, under a wooden roof, and are less than two feet in thickness. ¹ These fixing but side of the choir, the spandrils of an areade are painted to represent angels bearing scrolls. ¹ These fixing buttresses are double. The upper arch was apparently formed first, and this being found insuff-cient, the lower arch was then added.

nave there is a continuous gallery, formed within the thickness of the walls, and faced by small octagon columns and arches of the Tournay stone, originally polished * Else-Tournay stone, originally polished.* Else-where there are various galleries in the walls, so that all parts of the building are practi*é*able.

The same stone is employed in the construction of the building as the rock consists of on which it stands, so that it may be said to be a continuation of the solid substratum. Nevertheless, there are many very serious fissures and settlements, especially in the transept and choir, which need extensive repair. The west front of the building has been disfigured by various alterations; a groined porch in the pointed style extends the whole length of the front and show is a state whole length of the front, and above it a large pointed window has been introduced so as to destroy entirely its original character.† There is a variety of scalpture under the porch, but the greater part of it is modern and very uninteresting. The cathedral is entered by two doors, one on the north side of the nave, and the other on The south, adjoining the transept. The north door is of the transition period. It consists of a semicircular archway beneath a pointed trefoil arch, the whole profusely adorned with f sculptured figures, animals, and On each side of the light which tanges of sculptured foliaze. occurs between the circular and the pointed arch is a small twisted column. The four towers of the transept are each different in detail, and have been executed at different They all display, however, a mixture times. of pointed and semicircular arches. The whole length of the cathedral within

the walls is, as nearly as I can estimate it, 420 feet. The transept, which is nearly in The centre of the building, is 212 feet from horth to south. The with of the nave in-cluding the aisles, is 70 feet; the choir is a few feet wider. The height of the choir is 110 feet. As a datum for comparison, it may be mentioned, that Salisbury Cathedral, according to Mr. Britton, is 450 feet long within the walls, 78 feet wide in the nave, and that the height of the choir is 81 feet; in other words, it is 30 feet longer, 8 feet wider, and 29 feet lower than that of Tournay. Concerning the age of the cathedral there

has been some controversy. Mon. B. C. Dumortier, a member of the Belgic Chamber of Representatives and of the Royal Academy of Brussels (and in company with whom the writer had the good fortune to examine the building), published first in 1837, some re-marks on the cathedral, and then in 1841, a second pamphlet, 9 with a view to prove that the nave of the existing building belonged to the sixth century. These essays display much learning and ingenuity, but more enthusiasm, and this latter has served to blind the writer to all that militated against his desire to obtain unlimited reverence for his favoarite building, and, like an unruly Pegasus, has carried him far away from the goal he sought, namely the truth. Absence of direct statement by early writers that the nave was destroyed, serves to prove to M. Dumortier (as in some similar cases it has been urged by other continental antiquaries) that it has not been rebuilt, and so far from the fact that pointed arches form an essential feature in it being deemed sufficient to weaken his opinion, it is proof strong as holy writ that the system of pointed architecture arose in Belgium, and that in the cathedral of Tournay is to be found its first out-budding. In confirmation of his opinion, M. Dumortier informed me, that a charter had been recently discovered, dated 1257, proving that the architect of Cologne Cathedral was a Belgian. It sets forth that the monks of Cologue, in consideration of the services performed by Master Gerard, of St. Trond (Gerardus de Sancto Trudone), in directing the construction of their cathedral, had assigned to him a certain estate of land.

There is sufficient evidence to induce the belief that the cathedral was founded at the end of the third century, and rebuilt about the middle of the fifth century, with the aid of

Clovis, by St. Eleutherius. Chilpérie in 578. endowed the cathedral largely, and his original deed of gift, "cum sigillis," remained among the archives of the chapter until they were burnt in 1566 Louis le-débonnaire added to the cloisters of the cathedral in 817, and Charles the Simple further endowed it. Soon after this, however, namely in 882, the Normans ravaged Belgium with fire and sword, and inspired such universal dread, that the people, adding to their prayers "from the fury of the North men, Good Lord deliver us," fied in all directions. Tournay, rich and important as it directions. Tournay, rich and important as it then was, did not escape; the walls and the chief buildings were destroyed, and the inhahitants were forced to abandon the town, to which it seems they did not return until the beginning of the tenth century. At the time of this invasion there can be little doubt the cathedral was pillaged, and partly, if not wholly demolished; and it is probable that its re-erection was not attempted until quite the close of the tenth century, in which the inha-bitants returned, or rather the beginning of the eleventh. All analogy shews that earlier than this, the nave and transepts could hardly have been commenced, and that it was probably much later before they were completed.+ analogy, however, were deemed insufficient to remove the ground for controversy respecting the age of the cathedral, it would seem to be destroyed by the recent discovery of a MS. entitled "Ritus Officii divini ecclesiæ Tornac," and dated 1656. This gives a list of the various fêtes formerly celebrated in the cathedral, and points out the 9th of May (which was then annually celebrated) as the anniversarv of the dedication of the church, in the following words : " Dedicatio ecclesia, est festivus dies in populo intrà muros. Triplex est cum octavá et duplex primæ classis ;" and then, Videliscet novæ, anno 1066." Monsieur T. Le Maistre d'Anstaing, who mentions this MS. in his very interesting work on the cathedral, remarks that doubtless there were more consecrations than one, as for example that of the choir, and those after partial restorations; but that this being the first, was properly regarded as the most important, and, being duly ob-served, had been handed down to the date of the MS. alluded to.

In a comparatively short space of time after this date, if the historian Jean Cousin is to be believed § the choir becoming too small and probably being injured by the events of troublous times, was cleared away to make room for a more magnificent structure.

troublous times, was cleared away to make room for a more magnificent structure. • The decds must have been very numerous, if we bellere a contemporary writer, who says that the melted wax from the seals formed a stream down the hill. • It is but fair towards M. Dumortier to give in his own words, his argument aguinst the assumed destruction of the ca hedral by the Normans :---' L'histoire de la translation du corps de Saint Eleuthöre sous l'évêque Hédilion en 876. immédiatement avant l'invasion des Normans, nous fait connaire qu'à cette époque l'on avait démoit la chapelle de Saint Etienne, qui était située à la suite de la cathédrale. Voici comment s'exprime la chronique écrite au XIe siècle : Presulatum tornacessis ecclesiar Herdelone, tiro prudenti ef-justo possidente, busilieu beati Stephani, prothomartyris, que aita est post ecclesium Christi genitricis semperque virginis Maria destructa est. (a) Le soin que prend le chronique an ous apprendre la de-struction de la chapelle de Saint Etienne annexée (?) a la exthedrale, indique clairment la conservation de celli-i. Si ce vaate monument, dont l'existence est démontrée et au VI et au IXe siècle, avait été détruit lors de l'invasion des Normands, le chroniqueur se serait-il borné à nous apprendre la destruction d'une de ses parties? C'est ici que s'applique se vieil adage ; fanctisie unius, scelusie alterius. A nin Il demure démontré que la cathédrale de Tournai ne fut pas detruite à cette époque, et qu'elle resista à l'invasion Nor-mande. En effet, celui qui a vu ce noble édifice, et consi-déré l'épaisseur, des colonnes de sa partie romane, la solidité des maiériaux employés a sa construction, n'hésiters pas à reconnaitre qu'avec de tels matériaux il existait des conditions de duré que l'on ne retrouve pas dans les églises des pro-vinces Khönanes, et qu'ainsi s'explique pourquoi Nôtre Dame de Tournai a pu résister à lune égoque où tan d'autres édifices religieux onts eucombé. Au lieu d'être construite construite es calc

(a) Elevatio corporis beati Eleutherii tornacensis episcopi et confessoris ; MS, in Libro Sancti Martini Tornacensis.

Cousin states, that the first stone of the new choir was laid in 1110; and that it was finished about 80 years afterwards or more. His au. thority for this statement, however, does not appear. According to certain old chroniclers quoted by M. d'Anstaing, it was vaulted in 1242, at the expense of Walter de Marvis; but it would seem that divine service had been performed in it previous to that date, its dedication being ascribed to the year 1200.

At the end of the twelfth century, pointed architecture was but just developing itself, so that we must conclude either that the choir of the cathedral of Tournay is one of the earliest monuments of that style, or that the received statements are erroneous. I am inclined to believe the former.

The restoration of this noble monument has been proceeding for several years past at the expense of the nation, and is approaching to completion. There is a rough sketch of to completion. There is a rough the building by the writer in the sixth volume of the Civil Engineers' Journal.

GEORGE GODWIN.

FATAL ACCIDENT AT THE GREYFRIARS' CHURCH, EDINBURGH.

It will be in the remembrance of our readers, that in January last, the old and new Greyfriars' churches were partially destroyed by fire. The authorities having resolved to restore the former building, its repair was undertaken by Messrs. Turnbull and Thompson, as contractors, in accordance with a plan submitted to, and approved of by the town council, by Mr. James Smith, architect. The works had been in progress for several weeks prior to the 14th instant, when at a few minutes before 9 o'clock A.M., two pillars and three arches of the church, together with a large quantity of mason-work, fell down with a tremendous crash, burying in the ruiss four workmen, one of whom we regret to say lost It is worthy of remark, that notwithhis life. standing the melancholy and sudden occurrence of this catastrophe; it was not altogether unforeseen, for it appears that one of the workmen had noticed the impending position of the walls, and intimated to his employers that he would, in consequence, work no longer, and that the man took away his implements a few minutes before the event happened.

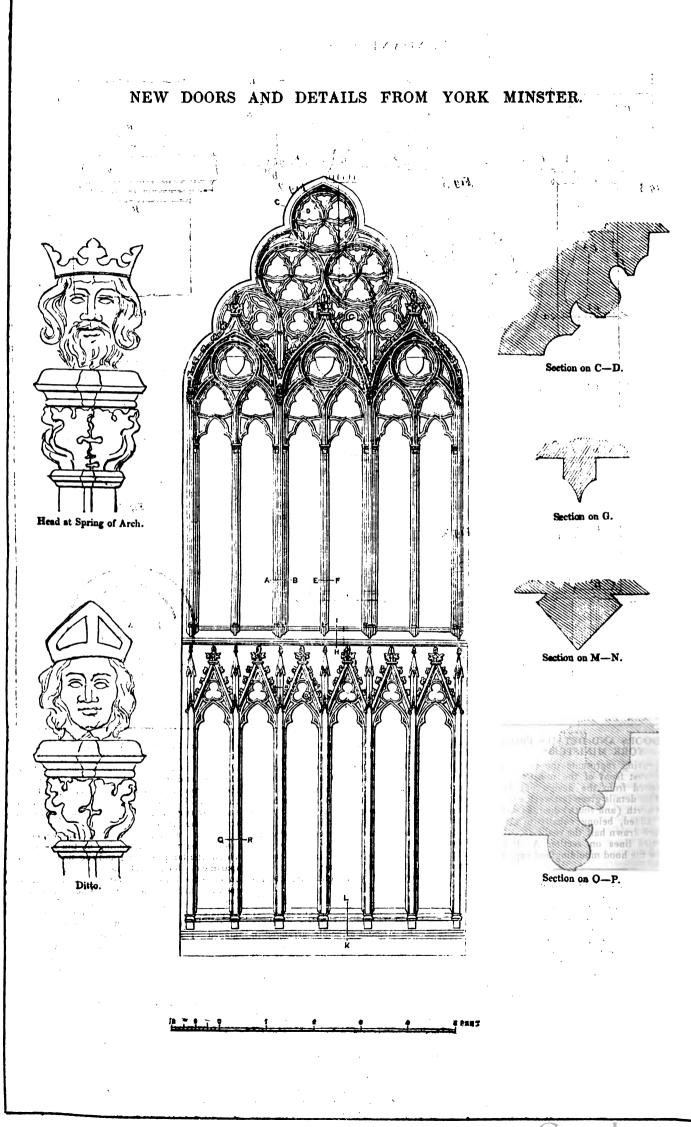

To convey a correct idea of the cause of the accident and the precarious position in which the workmen were placed, we may state, that the inside of the building is divided into three compartments, by two rows of pillars of the pointed style, the space between the two rows forming the main area of the church, while in the spaces between the pillars and the outer walls stood the galleries, north and south re-spectively, before the late fire. Not only had the wooden work been completely consumed by the conflagration, but the masonry was also much calcined and corroded by the flames, while the pillars in particular were so destroyed by the same devastating element, that they were completely pulverised, the stone and lime being dried up and quite friable. It was on one of the pillars of the northern row that the men were employed. The masons who were occupied in tombing or squaring who were occupied in tomoing or squaring down the wreck of the former pillar so as to give it a fair exterior by the aid of outward liming and other patch-work, were thus gra-dually depriving it of the little strength it retained, till the power of support having been destroyed, the frail fabric instantaneously gave way, carrying with it the adjoining pillar, the mason work of three arches, and a great mass of superincumbent material, and involving the unfortunate men in the ruins.

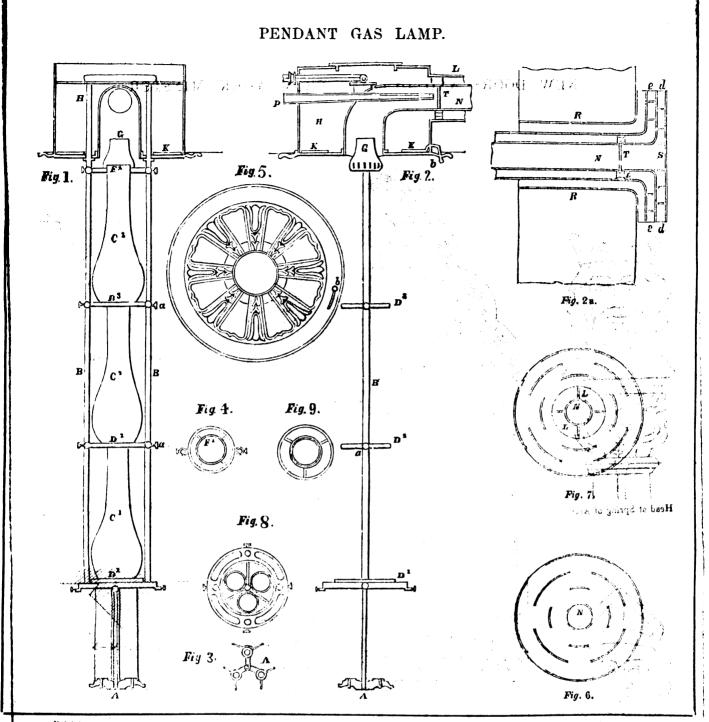

The Edinburgh Advertiser says, that much blame is attributable to the town council in this affair; and the public voice very generally condemns their injudicious and, as it has now turned out, fatal parsimony in adopting a plan on so limited a scale as not to admit of the secure and efficient restoration of the churches.

^{*} There is a curious gallery of this description round the Eglise de Chatcau in Tournay. † The west front had originally two small towers at the angles. These towers at the extremity of the west front are found in many buildings in Belgium, at the Eglise de Chatcau hefore mentioned, St. Bavon. Ghent, &c. ; Revue de Bruxelles," Dec. 1837. § "Dissertation sur l'age de la Cathédrale de Tournai." Bruxelles, 1841.

TESTIMONIAL TO MR. BRITTON. - The dinner is fixed to take place, at the "Castle," Richmond, on Monday, July 7th, the Right Hon. Thomas Wyse, M.P., in the chair, and we shall hope to see a numerous gathering of those who are interested in the architectural antiquities of the country.

THE BUILDER.

NEW DOORS AND DETAILS FROM YORK MINISTER.*

OUR engraving represents the new centre deor in the west front of the minster, as re-cently executed from the design of Mr. S. Spirke. The details given last week with our view of the north (and south) door, as well as those now added, belong equally to all the doors and are drawn half the real size.

The dotted lines on section A-B (last week), shew the hood moulding and capitals.

PBNDANT GAS LAMP.

WE have received the following account

from Mr. Jones, the inventor, and insert it as bearing on the subject of ventilation :--This mode of burning gas, to which the inventor directs attention, is the subject of a registration, and presents a system of discharg-ing the deleterious gases in many respects superior to ventilated gas lights, which have preceded it. It is peculiarly adapted for con-suming gas highly carbonized by Mr. Lowe's materix process of naphthalizing, owing to its suming gas highly carbonized by Mr. Lowe's patent process of naphthalizing, owing to its being raised to a high temperature previously to combustion at the burner. It is intended to use, in conjunction with this light, the earthen-ware pipe and conical glasses patented by Mr. Grant, for the purpose of causing a more rapid discharge of the vitiated air, and also to diminish the quantity of radiated heat atten-

* See p. 294, ante,

dant upon the use of metallic pipes. It will be observed from the accompanying diagrams, that not only are the products of combustion completely discharged, but the apartment in which the light is fixed is thoroughly ventiwhich the light is fixed is thoroughly venti-lated and kept at any degree of temperature at pleasure. Back draught is avoided by the construction of the external wind-guards, thus ensuring an atmosphere at once healthy and under perfect control. It may be as well to state that this mode of lighting is equally applicable to a public building, or a private apartment, any quantity of light being obtain-able from one focal point. Fig. 1 is a front elevation, and fig. 2 a side elevation of this lamp and its appendance.

elevation of this lamp and its appendages. A is a compound burner consisting of three burners on the Argand principle, arranged in ourners on the Argand principle, arranged in one plane, so as to produce one strong column of light, as shewn in the separate plan of this part of the spparatus given in fig. 3. B B are two tubes, which conduct the gas from the supply-pipe downwards to the jets of the burner

C¹ C² C³ are three bulb-shaped glass chimrevs. rising one above the other, and resting, just below their greatest diameters, on rings $D^1 D^2 D^3$, which is connected to the supply-pipe, E E, which are pendent from the roof, and common to all three. A plan of the lowest of the two lower chimneys, C¹ C², rises a little way within the chimney immediately above it; the height to which each is so raised being P is a small conical draught-pipe, which is

adjustable at pleasure by means of the thumb-screws a a. Within each of the rings, D° and

385

adjustable at pleasure by means of the thirms-screws a a. Within each of the rings, D° and D° , there is an inner ring, F^{1} (fig. 4), which encircles and serves to keep steady the tops of the chimneys C^{1} and C° . The top of the chimney C° is also encircled and steadied by a similar ring, F° , which is attached by radial arms to the funnel G. H, is a ventilating head, or cap, which is inserted between the seiling of the room in which the lamp is hung and the floor of the apartment above. It has openings on the spartment above. It has openings on the apartment above. It has openings on the spartment above. It has openings on the apartment above. It has openings on the spartment above. It has openings on the fig-plate, by turning which round, by means of the knob b, the different apertures are opened or closed, and either wholly or par-tially, at pleasure. L is a pipe, which is carried from the head H in a lateral direction, through the wall M, to the external atmo-sphere. sphere.

sphere. The metal funnel G opens into a pipe N, which, passing up the centre of the head II, turns off at a right angle, and terminates in the wind-guard (fig. 2a) on the outside of the building. While the more immediate products of com-

While the more immediate products of com-bustion pass away through the chimneys C, Funnel G, and pipe N, the heated and vitiated

carried from the outside of the building, through the ventilating head H, into the funnel-pipe N, terminating just beyond the right angular bend of the latter. The cold air rushing through this pipe serves to impart a great increase of velocity to the column of heated air and vapours escaping through the tube.

R is an opening for the escape into the atmosphere of any heated air which may accumulate between the ceiling and floor.

T is a ring by which both the outer and inner pipes are joined; an edge view of it is given in fig. 9.

S (fig. 2 a) is an external cover or windguard, affixed to the mouth of the pipe L, by which any back draught is prevented. A section of this wind-guard on the line d, is given separately in fig. 5, and a section of it on the line e, in fig. 7.

EXAMINATION IN CONSTRUCTION AT UNIVERSITY COLLEGE, LONDON.

On the 24th instant, the students in architecture under Professor Donaldson were examined and received prizes. The examination took two shapes; first, in architecture as a fine art; secondly, as a science. As the questions put are very suggestive, and may serve to induce a self-examination on the part of some of our younger readers, which cannot fail to prove useful, we insert those which relate to the latter part of the subject, and shall next week give the course of examination in architecture as a fine art.

To those who had attended the first year only : --

VARIETIES AND QUALITIES OF TIMBER.

1. From which quarter of the globe do we ehiefly derive our timber for construction? 2. Name the principal countries and ports in each respectively. 3. Sketch a section of the trunk of a tree, and affix the names to the several parts. 4. State the purposes and qualities of the several parts of the section. 5. How is the wood formed, and what general evidence does it afford of its age? 6. Which timber tree principally shews the medullary rays? In what direction do they radiate? 7. State the purposes to which it is applied. 8. What is the nature of the decay by dry rot in timber? 9. What portion is most probably the seat of the disease? 10. What is the substance that produces the rot, and how does it act? 11. What external causes promote dry rot? 12. What application may reffectually prevent decay? 14. Describe the three most recent processes proposed as applications for that purpose.

APPLICATION OF TIMBER TO CONSTRUCTION. 15. To the action of what forces is timber subject in construction ? 16. Is the resistance of timber to these definite or indefinite ? 17. Which are the proper measures of resistance for practical purposes ? 18. Which are the principal modes of placing a piece of timber to carry or support a weight? 19. What proportion does a weight, placed in the centre of a piece of timber supported at both ends, bear to the same weight if distributed over the whole length ? 20. To what force are the upper fibres of a loaded beam subject, and to what the lower? 21. What is the object in designing the frame of a roof? 22. What is the effect of superabundant material ? 23. Sketch a king and a queen truss complete with the gutters and slating, and put the names to all the parts, and mark the straps and bolts. 24. What are the respective uses of the different parts? Draw the articulations of the junctions of the timbers. 25. What is a principal? 26. How far should principals be apart? 27. Sketch a Gothic collar roof, and put the names to the several timbers. 28. How many clusses of floors are there? Sketch and describe them respectively. 29. How do you find the greatest point of pressure upon the centring for an arch or vauling? 30. How do you determine the position of the straining-piece? 31. At what angle do voussoirs of an arch begin to slide or slip? 32. Sketch the centrings for a semicircular arch, scheme and elliptic arches. 33. Describe the scaffolding used for placing the statue of Napoleon on the Colonne Vendôme

at Paris. 34. As also that for erecting the Luxor Obelisque in the same city.

LIMES, MORTARS, CEMENTS.

35. What is the basis of all mortars? 36. In what division of stones does it prevail? Give the names of the classes of that division of stone. 37. In what proportion does it exist in those stones where most abundant? 38. What chemical test proves the presence of lime in a stone? 39. How is a stone con-verted into lime? 40. What does the pro-cess throw off? 41. What are the phenomena, and what the effect of the addition of water to quick lime? 42. Give the chemical analysis of hydrate of lime. 43. State the different modes of slaking lime. 44. How much weight does a stone lose by calcination? 45. Will lime alone produce a mortar that will set? State the reason. 46. State the names and number of classes of substances which combine with lime to produce mortar. 47. De-scribe Traas and Pozzolana; whence pro-cured; how prepared and applied; and for what purpose used. 48. Under what general head may be classed the varieties of cement stone similar to that of Sheppey? 49. What is the distinctive difference of that class of stone? 50. By whom discovered, and when? Describe the varieties, and where found. 51. Describe the properties of this cement, and the purposes to which it is applicable. 52. Is the strength increased or diminished by addi-tion of sand? wherefore? 53. What are the colours of the Sheppey and Harwich cements? 54. State the component parts and proportions of the cement stone. 55. How may the ce-ment be tested? 56. In what time will it set? 57. Who made experimental brick beams with cement? 58. Was any bond used in these beams? 59. Describe the materials and process by which artificial cement is made. 60. Name the leading writers on the subject of mortars, and the dates when they flourished.

Second Year.

1. Of what does the crust of the globe consist? Give a section. 2. State the two leading formations into which geologists divide the crust. 3. Describe the constituent parts respectively of granite, statuary marble, sandstone, limestone, Portland, Bath. 4. State the parts whence they are derived, and the formations to which they belong. 5. Describe the chemical and mechanical causes which contribute to decay in each of these stones, and the parts most liable to decay and disintegrate. 6. Which are the best tests for limestones and sandstones? 7. What are the characteristics of good and bad Portland? 8. Which are stratified, and which are unstratified? 9. Should there be any relation between the position of a stone in the quarry and in the work? if so, why? and are all stones subject to the same law? 10. Will every stone once placed in construction be strong enough for all practical purposes, if so, what proof is there of that fact? 11. Which stones are generally the strongest and hardest?

MASONRY.

12. If isolated supports have a great weight to hear, what must be the nature of the material?
13. Which are the most ancient edifices? those which are lightest, or those of heaviest construction? 14. What proportion does the crushing weight? In what the precautions to be taken when it is used? 18. Describe the causes of settlement in the French Pantheon, Paris. 19. Should any precautions be taken as to quoin stones? 20. What is the greatest inclination at which a mass may be without falling? 21. In what direction do all bodies tend to fall?
22. How are bodies best upheld? 23. On what practical circumstances does the solidity of masonry mainly depend? 24. State the forms and describe the use of cramps, plugs, and dowels. 27. Which are the best metals for such purposes? State the reasons. 28. Sketch and describe the instrument inserted into a block of stone for the purpose of raising

it. 29. Describe the precautions used as to vertical joints and joggled joints. 30. Into how many classes may be divided the stability of edifices? 31. Is the greatest thrust in those covered by a vault, or by a trussed timber roof, and why? 32. Give a section of the treasury and why? 32. Give a section of the treasury of Atreus, shewing the direction of the joints of the stone. 33. Give a plan and section of the cupola of S^a Maria dei Fiori at Florence, and state by whom and when built. 34. What is the principal substance of which bricks are made, and what are the properties which render it fitted for the purpose? 35. State the earliest applications of brick for constructive purposes. 36. Which nations used the sun-dried and which the burned bricks? 37. Enumerate the different sorts of bricks used in London, and describe the purposes to which they are applied. 38. Describe the various sorts of bonds used in brickwork. 39. Give examples of hollow walls 9, 14, and 18 inches thick. 40. Describe the different sorts of lead used on roofs, the purposes for which each is fitted, and the proper weights under different circum-stances. 41. Specify the best mode of constructing the gutters; and give sections thereof with dimensions of the fall and drips. 42. De-scribe the various qualities of iron. 43. From what is iron extracted, and generally in what proportion? 44. What is Tredgold's remark as to permanent alteration of form? 45. Is resistance to flexure or to permanent alteration of form the safer criterion in construction, and under what circumstances? 46. What is the best section for an iron beam or girder? 47. Which is the best form for economy of material, which the best for stiffness? 48. Give the names and sizes of the slates generally used for roofing in London. 49. Describe the process of zincing galvanized iron, the object to be obtained thereby, and the application to constructive purposes. 50. Specify the component elements of bronze, and name the most celebrated bronze monuments of modern times.

COST OF SEWERS IN THE HOLBORN AND FINSBURY DISTRICT.

THE following tenders for sewers lately contracted for by the Commissioners of Holborn and Finsbury, and the Tower Hamlets, afford some useful data.

For sewer in Warner-place: 4 feet by 2 feet 6 inches; 2967 feet in length :--

| Hill | £2,34 |
|-----------|--------|
| Ward | . 2,34 |
| Munday | |
| Blackburn | 2.220 |
| Stewart | . 2.21 |
| Crook | . 2,19 |
| Curtis | . 2.19 |

Wellington-street to Silver-street: 4 feet by 2 feet 6 inches; length 1915 feet.

| Ward | 21.4 |
|-----------|------|
| Curtis | |
| Stewart | 1.4 |
| Munday | 1.4 |
| Blackburn | |
| Crook | |
| Hill | 1.3 |

Wentworth-street: 4 feet by 2 feet 6 inches; length, 660 feet:---

| Blackburn | £675 |
|-----------|------|
| Hill | 615 |
| Curtis | 584 |
| Stewart | 570 |
| Crook | 539 |
| Livermore | 538 |

Rhodeswell: 4 feet 6 inches, by 3 feet; length. 200 feet: ----

| Livern | ore | •• | • • • | •• | • • | •• | ••• | £167 | 0 |

THE NEW HOUSES OF PARLIAMENT.— Messrs. Foley, Marshall, and Bell have been selected by the Commissioners of the Fine Arts to execute the statues of Hampden, Falkland, and Clarendon, for the New Houses of Parliament.

ARCHITECTURAL PROGRESS AT HOME AND ABROAD.

The annual report of the council, about to be distributed to the members of the Royal Institute of Architects, contains the following interesting *resumé* of architectural proceedings during the past year :--

during the past year :--"On the Continent, our honorary and corresponding members have afforded striking evidences of their abilities by the completion of some fine works. The church of S. Vincent de Paul, at Paris, by M. Hittorff, has just been opened for divine worship." He has, with much ingenuity, adopted various means of producing effects, by the introduction of coloured decorations in enamelled plates, and this example is rendered the more valuable by the publication by that gentleman, in a pamphlet, of the principles which have guided him in this conception. Our friend, Herr Zanth, of Stutgard (the colleague of M. Hittorff in the valuable work on the Monuments of Sicily), has just completed an edifice in the Moresque style for the King of Würtemburg, which has been noticed in the foreign journals as highly successful.

The French have also completed some re-The French nave also complete doubt for markable works of architecture, which the energy, taste, and liberality of their ancestors had begun. The Hotel de Ville, at Paris, a had begun. The Hotel de Ville, at Paris, a work of the 16th century, has for many years been in a course of enlargement and completion. The exterior is now entire, and the in-terior is in progress with all the richness of embellishment of which the "Re-naissance" affords such splendid examples, and to the production of which the genius of its architect, M. Serrure, is fully equal. This edifice is now the worthy municipal palace of the French capital, little, if at all, inferior in grandeur of arrangement and decoration to that of the sovereign. The Prefect of the Department of the Seine, in carrying out this fine conception, has felt and acted as the chief of not merely a locality, but of a powerful, an enlightened, and an art-loving community. Our own metropolis has, also, within the last twelve months, been improved by various public works, of which some are completed, and some still in progress. The new Royal Exchange, with its accessories, forms an imposing feature of the city; the completion of Trafalgar square, with its terraces, flight of steps, fountains, basins, and triumphal column, shews that a feeling has arisen in the public mind for rich and effective combinations of objects of a monumental character. The thorough fare near Leicester-square, those from Oxford-street to Holborn, and from Long-acre, northward, and that near Whitechapel, with the lines of lofty houses in progress, already add considerably to the appear-ance of the Metropolis, and cannot but contribute essentially to its greater comfort and healthiness. The street architecture of Paris is on a scale of more grandeur than ours, and the facility of employing a cheap stone affords the French architect greater scope for his fancy and the opportunity of giving the houses a more imposing character than brick is capa ble of producing. It cannot, however, be deined that, notwithstanding the disadvantages imposed upon it, not only by the inferiority of our materials, but likewise by our domestic habits, the street architecture of London has of late years assumed a new and more impor-tant character.

Within a few days the Conservative Club-House, the production of two of our fellows, has been opened. It is another evidence of the increasing importance of architecture, and gains additional interest as a work of art, by the bold application of polychromatic embellishment judiciously and fearlessly introduced throughout its principal apartments, important as tending to improve the taste of many, who may, in their own residences, carry out the art of embellishment to its full devolopment.

The progress made in the arrangement. The progress made in the arrangements for improving, at least partially, the banks of the river Thames, may lead us to hope that the construction of a line of public quays in the heart of the metropolis, will, at no distant period, secure to us the advantages in the ornamental, which this ample stream already possesses in a commercial point of view, to a greater degree than that of any other capital in the world.

The important Act for regulating the build-

* See Buildas, p. S.

ings of the metropolis and its environs, passed during the last session of Parliament, came into operation at the beginning of the present year. The object of its framers has evidently been to guard against unsound construction, to prevent as much as possible danger from fire, and to insure a greater degree of healthiness in a class of dwellings hitherto too much neglected. It is to be hoped that similar benefits, modified to suit local exigencies, may be extended to other parts of the country, where too often the humbler classes become the victims of ill-drained and ill-ventilated habitations.

A great movement has lately been made, in regard to providing for the health and amuse-ment of the humbler classes, whose physical and intellectual condition is now occupying a large share of sympathy and attention. In many of the principal manufacturing and commercial towns and cities, liberal subscriptions have been raised for the purchase of plots of ground, and for the formation of public gar-dens. A society has likewise been formed in London for the erection of public baths and lavatories. We can hardly expect to vie with the ancient Romans in the construction of their thermse; but it is to be hoped that in the erec-tion of the baths of the British metropolis, their frequenters will not be regarded as insensible to the beauties of architecture, and that the art will be employed in aid of utility. Why should not the million have the privilege, in their places of public resort, of refining their taste, and exciting their imagination P why should they be bound down to cold sentiments of mere utility? May they not also unite the agreeable with the useful, and feel that they have minds to be improved, tastes to be cultivated, and sensations to be excited by the contemplation of beauty and harmony, as carried out in the productions of the artist. Let us hope, then, that our public baths may be monuments of art, and an evidence of the taste and intelligence of the present day.

The propositions which have been urged for some time, on the propriety of establishing local museums of art throughout the empire, was made the subject of a paper read at a recent ordinary meeting of the Institute, by Mr. Wilson, director of the Government School of Design. Nothing could contribute more essentially than local museums to local improvement, as exciting attention, habituating the eye to fine form and correct detail, and promoting a comparison between objects good and bad. Thus, the mind, brought to think and to discuss comparative merits, and to investigate the sources of true intellectual enjoyment, must rise to a higher and healthier tone, and be satisfied only with the purer objects of

In connection with this subject, it may be observed, that we possess, scattered throughout the country, numerous monuments and monumental effigies of the dynasties which have reigned in England, of the importance and beauty of which we may form some estimate from those in Westminster Abbey. It is to be regretted that they are allowed to fall into ruin, without any attempt on the part of our rulers to establish some general system for their preservation and maintenance. Never at any period have these styles of art been better understood, nor have our artisans ever been so able to restore these monuments faithfully to their ancient splendour.

It is to be remarked, that the Minister of the Interior, in France, has just applied to the Chambers for a grant of about 85,000%, to be applied in the restoration of several historical monuments of that country.

NEW BUILDINGS AND IMPROVEMENTS IN EDINBURGH.

SINCE the building of the new town of Edinburgh, there has never been a time so rife in new buildings as within the last few years. The Edinburgh Evening Post gives the following particulars :---

The city, highly picturesque and beautiful before, has received several fine improvements in its appearance. Sir Walter Scott's monu-ment, newly finished, is a grand object, and its great elevation overcomes the disadvantage arising from the somewhat low site on which it is erected. The spire of the Assembly Hall, a charming piece of architecture, is now one of the principal landmarks of the city. The only pity is, that the building is in a neighbourhood which does not at all harmonize with it in any thing, if we except some new edifices in the Elizabethan style, on which the old gloomy houses of other centuries seem to frown displeasure. It is nearly opposite, and down a close too-and that close the abode of poverty -that Mary of Lorraine, the mother of our beautiful but unhappy Mary had her palace and oratory. On the Calton Hill there is being erected a debtors' prison: the building is to the east of the gaol and bridewell, and will be included within the sweep of the same wall. Talking of this wall, we ought to observe that it is built exactly in the style of the battlements of an ancient fortress, and with its abutting watch-towers, harmonises well with the rocky elevation from which, on the south side, it rises. On witnessing the good taste indicated here, one cannot help contrasting it with the gross blockheadism which was unaccountably allowed to perpetrate the new barracks erected in Edinburgh Castle. They remind us of a manufactory or union workhouse, and one could almost wish they would tumble down when the inmates were engaged elsewhere. Additions are being made at the end to the north of the advocates library. It strikes us that this building has been too much doctored—that it is spoiled and deteriorated by the patchwork addenda which are inflicted upon it. A new edifice would have been the preferable, perhaps the cheapest exbeen the preterable, perhaps the cheapest ex-pedient of the learned faculty. The new Physicians' Hall, a fine building on the north of the New Town, is nearly finished. The front will be highly ornamented, and will form a choice acquisition to Queen-street, rather wanting in striking buildings. The Commercial Bank, erected on the site of the former Physicians' Hall, in George-street, is advancing. It will add another attraction to advancing. It will add another attraction to a street already one of the finest in Europe. It appears to be designed in the Italian palace style. Near it some striking improvements have been made in the buildings intended for public companies and banks. Nothing can be finer than the light, graceful, and ornamental fronts which we meet in this locality.

Donaldson's Hospital, to the west of the city, is progressing rapidly. It is a truly grand and noble structure, and nothing could have been more judiciously chosen than the fine elevation which forms its site. We un-derstand that no less a sum than 100,000% is to be expended in getting up the building, and adapting its internal economy to the purpose for which it is extended. A new Heriot's is nearly finished. The "Political Martyrs" monument in the Calton burying-ground is so far advanced, that it can be seen from the North Bridge. Additional erections-stations of railways, and other buildings are soon to be set agoing. And we believe that in addition to the commodious and elegant villas, and other buildings existing at Newington, a large number of houses are to be erected by one of our banks, which has recently obtained the greater part of the ground. A better site for, building cannot be imagined, with its delight-ful southern exposure and salubrious air. It is a peculiar feature of the present era of improvement, that houses in streets occupied by the highest order of gentry who keep man-sions in Edinburgh have been converted into shops and business establishments. This is particularly observable in George-street. The stream of rank has a tendency to flow north-ward in the direction of the back part of the New Town. The shops in several parts of Edinburgh have, in many cases been improved to a high degree of elegance, and, in some cases, decorated with very fine ornaments; One great evil has been removed from the

HISTORICAL PAINTING — PREMIUM ONE THOUSAND POUNDS.—A notice with this heading has been put forth during the present week, and to it are affixed the names of Thomas Bell, Don Alkali Works, South Shields, and Charles Hill Roe, Hermitage, Aston-road, Birmingham. The competition is for an oil painting of the Baptism of Christ, to be not less than 12 feet by 10, nor larger than 15 feet by 12, and two years are allowed for the sending in of the paintings. We know nothing respecting the parties whose names are affixed to the notice, nor of the ultimate purpose for which it is issued, it will therefore be at least discreet on the part of artists to obtain further and more satisfactory information before they risk their time and substance.

city, in the covering up of that huge, unsightly stream of dirty water which passed to the sea through the Queen's Park. A sad infliction it was. The laying out of the splendid carriage road, and the excellent arrangement of the grounds, will form permanent attractions to this delightful promenade. A wall around a part of the royal domains is still wanting, and should be set about: miserable hedges of whinstone are out of keeping in such a place. It is the felicity of Edinburgh, that close at hand to its busy streets and closely-wedged buildings are solitudes such as Zimmerman might have envied. From the park under notice a very short walk conducts to scenes as still and picturesque as are to be found in the secluded spots of the Grampians, while, at some point suddenly attained, there bursts forth the full majestic spectacle of a great and sublime city, and the hum of voices falls upon the ear like soft and distant music.

THE IRON TRADE.

THE evils resulting from the late inconsiderate rise in the price of iron are daily developing themselves; they are great and numerous. The unsettled state of the trade in South Staffordshire is attended with the most inconvenient, if not ruinous, consequences. The manufacturers, especially the makers of heavy goods, are suffering under the depression caused by the recent extraordinary advance on the raw material, although there is an abundance of orders from Canada, and the United States, in Wolverhampton, Birmingham, and Walsall, the completion of which cannot be longer delayed.

The home market suffers in the same degree from the same cause. Travellers for factors now on their journeys in all parts of the kingdom are in many instances unable to take, and their employers at home unable to exeoute, orders for manufactured iron goods, on account of the uncertainty, in the price of iron. But bad as this state of things is, the mischief does not end here. At the time of the advance, the iron-masters considerately raised the wages of the workmen, and now, as a matter of course, some of them are proceeding with the reduced price of the article to attempt a corresponding reduction of the price of labour. A partial turn-out in the districts of Bilston and Wednesbury has been the consequence, and one riot of rather a serious character has already occurred.

From Newport we learn that sales of bariron have been effected as low as 71. 5s. per ton.

ELECTRIC TELEGRAPHS.

THE recent thunder storms, both at home and on the continent, have elicited some interesting phenomena connected with electric telegraphs. One of the needles on the dial at the Southampton terminus became unfitted for use by its polarity being destroyed, and the attendant who was working the machine at the time received a smart shock from the handle. At Rouen, the atmospheric electricity, combining at times with the current conveyed along the wires, impeded or precipitated the movements of the needle, giving to the composition the effect of dropped letters and occasionally destroying the sense of the intended phrase. M. Masteucci of Piss, who is well known for his experiments in galvanism and electricity, has announced his belief that the electric telegraph can be made use of between Dover and Calais, the wires being sunk deep into the sea. He has arrived at this conclusion, from having succeeded in passing the fluid along wires immersed in the waters of the Arno.

A similar ides, only on a grander scale, of course, has been started in America. The New York Tribune proposes to run a copper wire, well covered and as large as a pipe stem, from Nova Scotia to the coast of Ireland. The writer says, "Its gravity would sink it to the depth where water was so dense as to be of equal gravity, and consequently beyond the reach of any kind of collision." While on this subject we may mention an experiment that was tried last week at Brussels, in the presence of the Minister of Public Works, by which the dispatch was written with a pen by the mere action of the fluid; it is stated to have been entirely successful.

DEATH FROM THE USE OF LEADEN PIPES.

An inquest has been lately held at Malvern Wells, on the body of an agricultural labourer named Richard Wilkins, who came by his death it appears from having drunk a quantity of cider which had been con-veyed in leaden pipes from the cider-house to the place where it was drawn for use. It ap-peared that the deceased, with several others of Mr. Benbow's farm servants, had, after partaking of this cider, been seized with illness resembling the painters' colic, which it is known arises from the constant use of lead in their business. Mr. West, surgeon, of Mal-vern, at first attended him, but Mr. Hamilton, of Malvern-wells, attended the deceased at the time of his death, which happened on Saturday last. Mr. West explained that the deceased died of apoplexy, brought on, he believed, by drinking the impregnated cider. Mr. Benbow, the deceased's employer, explained to the coroner the circumstances under which the which the circumstances under which the pipes had been laid down. He had employed Mr. M'Cann to lay down pipes of the proper white metal, tin, or composition; but he (Mr. M'Cann) had substituted lead, saying it was superior for the purpose. On the discovery of the mischiercus effects produced the use of of the mischievous effects produced, the use of the pipes had been discontinued. The jury acquitted all parties of blame except Mr. M'Cann, and returned a verdict "that the de-ceased died of apoplexy, induced by congestion of the brain." The coroner intimated that, after an investigation like this, every farmer and publican using such pipes would be sub-ject to a verdict of manslaughter or murder in the event of a similar catastrophe.

The fact is well known that leaden pipes and cisterns become dangerous when the water which fills them is soft and pure. The lead, however, which the water takes up may be removed by filtering the water through paper, a circumstance which has been explained by supposing that the oxide of lead is not really dissolved in the water, but merely suspended in it. At a recent meeting of the chemical society, Lieut.-Col. Philip Yorke stated that the oxide of lead is taken up by the substance of the paper and combines with it, from an affinity such as subsists between the same metallic oxide and cotton fibre; the last taking the oxide from solution in lime-water, and lead being often fixed as a mordant on cloth for dyeing in this way, according to the statement of Mr. Crum. He stated also, that the power of the filter may be exhausted, and that therefore it would be unsafe to trust to the action of a filter to separate oxide of lead from water for an unlimited time.

THE BURIAL GROUND NUISANCE.

THE manner in which the action brought against the parties concerned in the Spafields burial ground has terminated has astonished all persons who are interested in the matter. Immense trouble had been taken by individuals, and much expense incurred, especially by Mr. G. A. Walker, and by Mr. Watt who lives near the ground; the former was in court prepared with evidence which would have frightened the country into some change in the system, but the whole was frustrated by the course pursued by the counsel for the crown, a course which we find it very difficult to account for. It is to be hoped that Mr. Walker, to whom the chief merit of laying bare the enormities of the system belongs, will not be disconraged in his praiseworthy efforts to abate one of the most serious evils existing in the metropolis.

SONNET ON LINCOLN MINSTER.

I've seen the Lyncolne Mynster and the hill Which for long centuries it hath ycrowned, And in beholding, such delight have found As our forefathers' pious minds did fill At the evolving from th' inspired will, A work yet onward endlessly renowned. Acthereal Fancy ! thou art here unbound Roving from human deeds of subtle skill, (Pillar and lancet-arch, and tracery rare, Proportion, whose perfection bears a spell ! The Votive Chapel, proofs of holy care, With roof by worthy Willson carved well) Unto the destination of my prayer, Where our great God, beneficent, doth dwell.

THE ROUND TOWERS OF IRELAND.

S1R,—Now that the subject of the origin and uses of the ancient round towers of Ireland is again before the public, I shall deem it a favour (as an old correspondent) to be allowed to offer a few observations upon it through the columns of THE BUILDER.

I may premise that some of our most learned antiquaries have promulgated opinions in regard to those towers quite inconsistent with an actual inspection of these interesting memorials, connected as they are with the adjoining ecclesiastical ruins,—for the ruined church and the old tower are invariably found near each other. Now the periods assigned to the erection of the old churches seem scarce a matter of dispute; in fact, their dates of construction are given with as much precision as of yesterday, whilst no notice appears to be taken of their "next door neighbour," the old tower.

On this omission on the part of early writers I shall hazard an opinion: it is simply this, that the date of the tower and that of the adjoining little church are one and the same, for reasons which I shall give before con-cluding. Should this assumption appear probable, for direct proof is out of the question, it follows that much of the obscurity connected with the earlier notice of our old ecclesiastical edifices may be cleared away, by considering the tower as a part or in direct connection with the church. Viewing the brief and simple notice of the old chroniclers, we find it seldom went beyond naming the founder of the church, the period of erection, and the name of the locality where erected, and passed over all architectural details as apparently unimportant. To the scanty materishs thus supplied by early historians in re-spect to the towers, modern commentators have not hesitated to supply details; as many of the fanciful theories advanced by our antiquaries rest on the analogy between certain Phænician and Egyptian antiquities and the round-towers; while others still more numerous draw all their resources from some antiquated glossary of the Irish language having reference to the derivation of names said to belong to the old towers.

Many of these learned inquiries were carried on in the study or library of the antiquary, and the result when before the public was attacked and instantly demolished by some contemporary, by precisely the same mode of reasoning as that adopted by his opponent, neither parties bestowing a single thought on the stone and mortar of the round-towers, beyond the undeniable fact of their being well built, Aghadoe, near Killarney, though apparently wanting in character from being what is deno-minated a "Stump," or ruined tower, is nevertheless not without interest, arising from a comparison of the quality of stone with which the outer casing of the tower is constructed (pale yellow sandstone), and the stone employed in the door and window-jambs of the ruined cathedral or church close by, the stones referred to in both buildings being precisely of a similar class of rock : and here I may observe that no yellow sandstone rock is nearer Aghadoe than 30 miles. Having had ample opportunities of comparing the stones in both ruins during a stay of seven months at Killarney, I found the angles or ornamented parts in the church shewed more signs of decay than the stones of the round-tower; but this is easily accounted for from the circular form of the tower; the ashlare having no exposed ends or joints, are less liable to be acted on by changes of the atmosphere than the stone used in the church.

To understand the matter fully, it is necessary to offer a suggestion not heretofore made. Whoever proposed to build a castle, abbey, church, &c., without first consulting their architect? That our ancestors had wisdom and sagacity enough to follow a similar course there cannot be a reasonable doubt. The object of such consultation would naturally be to look to the locality, the site, water, and, in the *then* early days, the procuring of *efficient workmen* and materials. These preliminary steps settled, the architect, who in all probability was an ecclesiastic, would, as a matter of necessity, say how am I to protect my work-people, collected here with great difficulty, from the assaults of the marauding Dane, and the not less dangerous attacks of the turbulent natives? The project of the

round-tower was a noble idea, it affording lodging for the architect and masons; here he could at a glance have a bird's eye view of his little church as it progressed towards completion; here he kept his people under his eye in a circle, propounded his plans, and, " though last not least," was safe from any nightly attack, from the elevated position of the door-No doubt it afterwards formed a useful way. appendage to the church as a depositary for books and other valuables of the church, us well as affording a certain landmark (by its lofty proportions) in a country nearly covered with wood to the weary pilgrim and traveller. It is easy to make objections, as by asking "Where did the architect and work-men reside, or how guard themselves from men reside, or how guard themselves from attacks from hostile parties, while the tower was in progress of building?³ To such ob-jections I will merely say, the zeal shewn by the people in every great undertaking, and that for a religious purposo being best calcu-lated to excite the feelings, might have the effect of collecting a body of persons not only able to excite in the work but by able to assist in the work, but by their numbers to overawe any hostile parties daring to approach. That such laudable zeal at last to approach. That such laudable zeal at last may have gradually died away it is but reasonable to conclude, but then one great object was attained, the building of the tower. Hence I conclude, the tower and the ad-

joining church are of one and the same age and period.

Gorey, June 7th, 1845. J. K.

Correspondence.

FIRE-PROOF STAIRCASES.

Sin,-The late fatal fires in Dover and Fenchurch-streets fully prove the absolute necossity of especially constructing staircases freproof, by which the inmates could make a safe retreat from a dreadful death. Al-though I am neither an architect nor builder, I really cannot see any great difficulty in following out this efficacious plan, it only re-quires any man of note in that profession to adopt it, and then all houses would quickly be rendered sufe. Why could not the whole well of the staircase, its sides, ceiling, and flooring, be made of thin iron plates let into frames of the same metal; then again the stairs, halusters, hand-rails could be also constructed of that material, and here there would be great scope for ornamental castings. There is no doubt that the staircase forms the chief flue to a bouse when on fire, and as wood feeds the flame, so does the staircase the fire, allowing it to make its way into rooms leading on to the staircase, therefore I would suggest that all such doors should be of iron; they need not be heavy, the object being to keep the fire on one side only, and to prevent its spreading. I hope that some of your professional readers will take up this matter with spirit, for we must remember that the staircuse is always the place first sought for when these accidents occur, and moreover we ought ever to bear in mind, that fires may and do take place in houses in which every possible care is taken to avoid its presence. Gas, sparks, flues, often being the primary causes of destruction of life and property by fire. I am, Sir, &c.

June 23rd, 1845. P. A. T. H.

COST OF LOCOMOTIVE ENGINE.

SIB,--I should be obliged if any of your correspondents could inform me, through the medium of your columns, the cost of a three or four-horse power locomotive engine. It is proposed to be used for drawing loaded carriages down, and empty ones up, a line 11 mile in length. I presume a tender would not be neccessary, as sufficient fuel might be kept in depôt at each end of the road. Also, what quantity of water (rather a scarce article) rould be necessary for the supply of the boiler for that distance, I am, Sir, &c.,

21st June, 1845. J. F.

FIRE-PROOF COMPOSITION.

SIR,-Is there not a patent for some material which if used instead of plaster will prevent houses from burning? I am, Sir, &c., A. B.

PASSAGE OF WATER THROUGH PIPES. SIR,-I wish to know the quantity of water that would be discharged through a pipe of that would be discharged through a pipe of one-inch bore per minute, the head of water being kept level with the top of the pipe, with the least force possible; and also what would be the increased discharge per minute, the head being raised from one to twelve inches. I am, Sir, &c., F. E. H.

Aliscellanea.

WASTE OF STRAW IN THATCHING. -- It would be impossible, after having entered so generally into all the various details connected with homesteads, to omit one most important consideration respecting them, I allude to the habit, too often in use, of thatching buildings, This cannot be too generally reprehended. The arguments against it are endless; it en-tails considerable expense, robs the land, creates danger from fire, is a harbour for creates danger from fire, is a harbour for vermin. Either of these objections is a sufficient reason for stopping this monstrous practice. If landlords reflect upon this, they will see that they ensure an injury to their land by compelling their tenants to repair with straw; whereas tiles or slates are preferable in every way. It is only the first out-lay which is to be considered; by adopting which, robbery to the land and unceasing ex-pense to the tenant are prevented. In the buildings lately pulled down at Peckham, there must have been nearly an acre of thatch, and they harboured vermin enough to stock a whole county. There are instances in the Weald of Kent, where nearly the whole straw of the tenant is used for his house and buildings, a fact lamentable in every view of the question. If straw is to be taken from the land, let it be sold, and the money laid out in artificial manure; but it is most desirable that it may soon cease to be used for such improper purposes .- Lord Torrington.

THE USE OF IRON .-- A correspondent of the Mining Journal in writing on the general utility of Iron says, "The immense destruction of property occasioned by fire, in most of our large manufacturing towns and cities, would be rendered less disastrous if warehouses and other depositories for merchandise, were constructed of iron, formed in different compartments and made secure. How lamentable it is to hear of the almost daily occurrence of some conflagration by which property to an immense amount is destroyed in this kingdom, when all public buildings would be more safe, as well as more durable, if constructed of iron, whilst the architectural beauty need not be diminished: the pointed spire, however or na-mental, on all newly-erected or repaired churches, would be placed there with iron cheaper than any other material. The fame of our great statesmen and England's unconquerable heroes, might be perpetuated to the latest posterity in the erection of monuments constructed with iron, indeed the whole transactions of the British nation, in all her great mercantile pursuits, might be recorded on iron. I myself have written upon paper manufactured from iron, and seen a book, with both leaves and binding of the same material.

THE RELATIVE FREQUENCY OF PHTHISIS IN CERTAIN TRADES AND PROFESSIONS.-Among those persons engaged in the different professions at Geneva, 114 fell victims to con-sumption out of 1,000. The average varies; in some professions it is higher than others; in the varnish painters it is as high as 37 in the 100, in the gardeners as low as 4. Among polishers, plasterers, sculptors, stone-cutters, watch-hand-makers, it reaches to 116 in the 1,000; and among the tailors, engravers, printers, clerks, &c. even to 141 in the 1,000. The average falls in carpenters, blacksmithe, slaters, and agriculturists, to 89 in the 1,000; in butchers, tanners, and candle-makers, to 73 in the 1,000; in weavers, dyers, bleachers, and watermen, to 53 in the 1,000; and in persons of easy circumstances it falls us low as 50 in 1,000. M. Lombard found that the age of the stone-cutter averaged 34 years, the sculptor 36, the miller 42, the painter 44, the joiner 49, the butcher 53, the lawyer 51, the surgeon 54, the mason 55, the gardener 60, the merchant 62, the Protestant clergyman 63, the magistrate 60.— Hastings on Consumption.

PRINTERS' ALMSHOUSES .- A meeting was held last Monday evening, in the theatre of the Mechanics' Institution, of the friends and subseribers towards the building of almshouses for decayed printers. The chair was taken by Luke James Hapsard, Esq., who not only ably advocated the cause of the association, but was announced as a subscriber of the liberal sum of 50%. The report, which was read by the secretary, proved in the most satisfactory manner that the object which the committee have so assiduously prosecuted for the last four years will ere long be fully realised, and another of those benevolent institutions be erected which reflect so much honor upon the working-men of the present day. The amount of subscriptions, &c., received since the last report was announced to be 3351. 2s. This added to the sum previously in hand makes a total of nearly 1,500%

SINGULAR DISCOVERY OF LEAD ORE IN AMERICA.-As Mr. Booth, who is an experienced miner, was sinking a shaft near Dubuque, through successive layers of hard sandstone, when about 25 feet from the surface he suddenly found himself in an immense cavern, which has since been accertained to be 1000 feet in length, from 15 to 40 feet wide, and the height varying from 12 to 40 feet. In one place the roof almost reaches the floor, and divides the whole into two immense gloomy chambers, where, probably, Nature has been at work for an animaginable series of ages: The strata is formed of stratified silicious limestone, with crystalisations and stalagmite hanging from the roof and sides. The prin-cipal portion of the lead ore contained in this cavern is found beneath the floor; small shafts have been sunk at intervals along its whole length, and the ore is found in detached masses, some probably weighing 1000 lbs., embedded in red silica, the total value of the deposit is said to be incalculable .- Mining Journal.

NEW CHURCHES .- At a meeting held last week of the Society for promoting the en-largement, building, and repuiring of Churches, it was determined to crect seven new churches, it was determined to crect seven new churches, namely, in the districts of Portland town in the district parish of Christ church, Maryler bone; at Waterhead in the parish of Oldham, Lancashire; at Middleton, in the parish of Rothwell, near Leeds; at Clydach, in the parish of Llangyfilach, near Swansea; at Faila, worth, in the parish of Manchester; at Wick. parish of Liangyniaco, near Swansea, at rains, worth, in the parish of Manchester; at Wick, in the parish of Wick, and Abson, near Bristol, and in the district around Peter street in the parish of St. John, Westminster. The and in the district around Peter-street, in the parish of St. John, Westminster, The churches which are to be rebuilt, enlarged, or otherwise altered, are the parish churches, of East Ardsley, near Wakefield; Nettlebed, near Henley-on-Thames; Beeford, near Drif-field; Sandford, near Woodstock; Stert, near Devizes; and the Chapel of North End, Fulbar Fulham.

FLOORING FOR PIGSTIES .- At a late meeting of the Agricultural Association, in answer to an inquiry as to the best mode of laying down an asphaltic or bituminous flooring in pigstics, Mr. Parkins informed the Council that he had found the following composition very useful for that purpose, namely, liue or pounded chalk mixed with so much coal tar from gas works as will leave the mixture in a state not too soft for ramming, adding a suffig cient quantity of sand or fine gravel to bind the whole. Mr. Parkins stated that these mate-rials not only formed a hard basis for pigsties, farm-yards, &c., but made good walke, on which weeds would not grow, and answered the pur-poses generally for which as halte was commonly employed.

GERMAN HOSPITAL IN LONDON. -- An attempt is being made to establish a German hospital in London, and from the patronuge and support it has already received there apmeeting has been held, at which the Duke of Cambridge presided, supported by several of the foreign ministers, &c. The sum of 5,000. will be required for the establishment of the institution, and the needful annual expendi-ture will amount to 1,200%, or 1,500%. Already upwards of 3,0001. have been subscribed.

PINE Logs -Dr. Bowring last week moved in the House of Commons that the duty on pine logs not exceeding 10 feet long and 11 inches square be reduced to 12s. 6d. a load. Sir G. Clerk opposed the motion, and it was withdrawn.

A NEW GLASS.-Styrole is a volatile oil, obtained by distilling the balsam styrax or storax, although only in small quantity, and has a general analogy to benzoin. In one property styrole is, perhaps, the most extraor-dinary of substances; a limpid fluid at ordi-nary temperatures, it becomes a transparent colourless glass when heated up to a certain point, and remains so when it again becomes cool—a circumstance which will draw the attention of optical inquirers to styrole. In distilling storax to obtain this liquid, 20 parts of storax are mixed with 7 parts of carbonate of soda and water put into the retort. In one experiment, 41 pounds of balsam yielded 12 ounces of styrole; in another, 27 pounds yielded 3 ounces. The fresher and softer the storax, the more productive is it of styrole .-Mechanics' Magazine.

THE ARCH KNOWN TO THE GREEKS .- Mr THE ARCH KNOWN TO THE GREEKS.—Mr. Page has lately presented to the Institution of Civil Engineers sketches made by himself of two arches at Cape Crio (Cnidus, Rhodes). These arches are semicircular, built of large stones, regularly radiating from a centre, without any mortar in the joints, and stand among Cyclopsean remains, of which they apparently form a part. He is of opinion that the Greeks were aware of the properties of the arch. They evidently appreciated its form, for it must have been noticed by all travellers how frequently the flat lintels are travellers how frequently the flat lintels are cut out on the under side; several specimens of this exist in the sepulchral remains now in the British Museum. At Athens he has no-

the British Museum. At Athens he has no-ticed a very considerable excavation of a regular arched form through solid marble. PLANK ROADS IN CANADA.—The experi-ment of planking public roads has been successful in an eminent degree in Canada. One between London and Port Stanley, 30 miles long, is already finished, and another now constructing between Port Dover and Hamilton, 50 miles long, and a third between London and Hamilton, 80 miles in extent, are now under contract. They are laid for double and single tracks, the expense of the former and single tracks, the expense of the former being 4,000 dollars, and the latter at 3,000 dollars per mile. The roads already con-

structed are expected to last ten years. VENTILATION OF COMMONS' COMMITTEE ROOMS.—It is surprising that members can be found to subject themselves to the evils resulting from the want of ventilation in the present committee rooms. As one honourable member observed to us lately, if a workhouse could be found as ill ventilated as these rooms are, the journals would blazon it all over England, and force an improvement.

THE ROYAL RESIDENCE AT COWES .first stone of the new building about to be erected at Osborne House was laid on Monday last by her Majesty and the Prince of Wales.

Works of FINE ART IN WESTMINSTER HALL.—This exhibition will be opened to the public on Monday next. There is a private view to-day, Saturday.

NOTICES OF CONTRACTS.

We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our readers however, they are entered in a book, and may be seen on application at the office of "The Builder," 2, York-street, Covent-garden.] [We are

For the execution of a New Harbour at Greenock.

For the construction of Two Divisions of the Chester and Holyhead Railway, being Nos. 8 and 12. No. 8 contains a length of 7 miles and 54 chains. No. 12 contains a length of 5 miles and 26 chains.

For excavating and levelling Land, building Sewers, making a new Road, &c., on the Wheatley Estate, Erith, Kent.

For lowering and making certain Improvements at the Yeuston Hill, Henstridge, Somerset. For the Removal of several Wrecks in the

Thames. For the Erection of a New Church in the parish

of Whitechapel. For the Erection of Schools and a Teacher's Resi-

dence in connection with the new church of St. Jude, Whitechapel.

For the Repairs to the South Aisle, Roof, &c., of St. James's Church, Bury, St. Edmunds. For the Erection of New Schools at Great

Chesterford, Essex. For the supply of 2,500 Yards run of flat

Granite Curbing for the Parish of St. John, Hackney. For some additions to the House of Industry at

For the supply and erection of a Steam Cooking Apparatus at the New Workhouse at Cuckfield. To be capable of cooking food for 450 inmates, and providing Hot and Cold Water in the Scullery, Bath-rooms, and Wash-house, with a Closet for drying linen

For furnishing and fixing an Engine Pump at the Sevenoaks Union.

For Paving certain of the Foot-paths of the Parish of St. John, Hackney. For Building the intended Somerset Lunatic Asylum. (Time extended).

For taking down and removing the House, Out-building, and Offices, erected by the Rev. W. H. Gorton, in a field at Portisham, Dorchester, and rebuilding the same on the glebe land adjoining the Church-yard there.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

In the parishes of Terling and Fairsted, Essex : 215 Capital Oak, and 11 Ash Timber Treses, many of them of large dimensions.

At Norton Hall, and Purleigh Round Bush Farms, Essex: an assortment of Oak, Ash, and Elm Timbers and Whips.

At the Crown and Anchor Im, Ipswich: the Martello Tower, situated on the point of Bawdsey, Suffolk. The materials arising therefrom could at a triffing expense be conveyed to any part of the kingdom.

At Dinton Park, and Lutton Mandeville, Wilts :

At Dinton Park, and Latton Mandeville, whits : 93 capital Oak Trees, some of large dimensions, 250 Oak Flitterns, 200 Ash and other Poles, &c. In Shirley Park, near Croydon: 2,000 straight Poles, and 8,000 Bavins, Fir, Oak, Elm, Chesnut, and Alder, but principally Larch of 35 years' growth.

At Sibley's Farm, Chinckney, Essex : 40 fine Oak, 47 large Elm, and 50 Ash Timber Trees. Most of the trees are of large dimensions and good quality. At Blois Farm, Sible Hedingham : about 800

Oak Trees

At Fyfield Farm, near Pewsey, Wilts : 60 Oaks, 111 Elms, and 103 Ash and Abeles. They are of extraordinary dimensions and fine quality.

ADVERTIGERETTS.

Just published, price Ss., neatly bound in roan, with tack, gilt edges, and lettered, a Pocket Edition of A CYCLOP/EDIA of the NEW ME-TROPOLITAN BUILDINGS ACT, together with the Act itself, a Folio Table of the Metropolitan Districts (old and new), a List of the Surveyors, with their Residences and Offices, and a Table of Fees to be paid to the Registrar for services performed. In the Cyclopædia all the details of the Statute are arranged Alphabetically, so as to be instantly found, and accompanied by extensive references and counter-references to the sections of the Act itself and its minute provisions. By the late A. BARTHOLOMEW, Esq., F.S.A., Architect, Surveyor of the Hornacy District. Published at the Office of "The Builder," 3, Yorfi-treet, Covent-garden; and to be had of all Booksellers.

ROYAL POLYTECHNIC INSTITU-ROYAL POLYTECHNIC INSTITU-TION.—A WORKING MODRL of the ATM OS-FHERIC RAILWAY, capable of carrying visitors, is lec-tured on and exhibited daily, and also in the cremings. During the week Dr. Ryan will lecture daily at a quarter part Three, and on the Evenings of Monday, Wedneaday, and Friday at Nine, on the causes of STEAM-BOILER EX. PLOSIONS; and especially those arising from incrustation, with the means of prevention. Among the Novalties recently introduced is a full-sized Cast from the CENOTAPH of GALEN, in which the PORTLAND VASE was found; a curious MECHANICAL HAND; new and beautiful Objects in the Chromatrope, Phisicscope, Protoscope, &c. New Dissolving Views; Skoola, half-price. A Class for instruc-tion in Mathematics is about to be formed under the direc-tion of Mr. A. W. Hobson, B.A., of St. John's College, Cambridge.

NOTICE TO INVENTORS. OFFICE FOR PATENTS OF INVEN-TIONS and REGISTRATIONS of DESIGNA, 14, Lincoln's-inn-fields.—The printed INSTRUCTIONS gratis, and every information upon the subject of PEOTECTION for INVENTIONS, either by Letters Patent or the Design Acts, may be had by applying personally, or by letter, pre-paid, to Mr. ALEXANDER PRINCE, at the office, 14, Lincoln's-inn-fields.

Lincoln's-inn-fields. PRIZES IMPORTANT TO INVENTORS AND PATENTEES. GOLD MEDAL, value 100% and a SILVER MEDAL, value 100% and a SILVER MEDAL, value 50%, will be given by Mr. M. JOSCELIN COOKE. The Gold medal for the best Patent, and the Silver medal for the bost Design taken out or Registered at the OFFICE for PATENTS and DE-SIGNS, 20, Half-Moon-street, between the 1st of Norem-ber, 1844, and the 1st of June, 1846. The Prizes will be awarded by competent judges on the 19th June, 1845. The conditions to be observed, together with instructions, charges, and every information for obtaining Patents in England or Foreign Countries, or Registering Designs, will be forwarded gratis, on application to Mr. M. JOSCELIN COOKE, at the Office for Patents and Registration of Designs, 28, Half-Moon-street, Piccadilly, London.

Moon-street, Piccadilly, London. WARNISH.—It has long been a desideratum amongst the consumers of Varniah to obtain a good and genuine article; brilliancy, faility of drying, hardness, and durability are the qualifications necessary, but these are seldom if ever found united. The experience of a 555-time devoted exclusively to the manufacture of this article, the great and important discoveries of modern chemistry, and the daily improvements in machinery, have enabled Messer. George and Thomas Wallis to produce Varniahs (both oil and spirit) unrivalled in every respect, and they confidently recommend them to the trade, as deserving of notice both in price and quality. Builders, Coachmakers, Painters, and others may depend on being supplied with a genuine and unsulterated arcele. Fine Oil Varnish, from 100. per gallon; best White Spirit Varnish, 21s. ditto; Best Spirit Branch Polish, 30s. ditto; White Lead, Oil, Turps, and Colours of every description at the very lowest price.—WALLIS'S Varnish, Jagam, and Colour Manufactory, 64, Long-acre, one dose from Bow-street. Established 1750.

WALLIS'S PATENT LIQUID WOOD KNOTTING. - This newly-discovered Liquid satisfaction which Micsars. Geo. and Thoe. Wallis have the satisfaction of introducing to the trade, possesses the im-portant qualification of effectually stopping Knots in Wood, however bad, and preventing them eating through maked in-figuring the paint above. Many substances have been used and much time spent in endeavouring to find a cure for a bad Knot, but bitherto without success. Measr. Wallis therefore feel much plea-sure in offering to the public an article so long and enviced called for.

called for. In the application, skill is not required; a boy can use it as well and effectually as the best workmen: it is put on to the work with a brush like common paint, can be used in all climates and situations, and does not require heat. Sold wholesale and retail, by Messrs. 6. and T. Wallis, Varnish, Japan, and Colour Manufacturers, No. 64, Long Acre. Price 20s. per gallon.

STUCCO FRONTED HOUSES THAT STUCCO FRONTED HOUSES THAT WANT PAINTING.—The only Paint expressly in-vented and adapted for this purpose is—JOHNS and Co.'s PATENT STONE COLOUR STUCCO PAINT: it is far better for Stucco Work than White Lead—is much more durable and less costly—its colour is that of pure Bath Stone. MANN and Co., Agents for the Patentees, 5, Maidemlane, Queen-street, Cheapside.

Autor and consistent of the final of the second sec

BUILDER: THE

SATURDAY, JULY 5, 1845.

E stated in the middle of last April, when speaking of the necessity which existed for a museum illustrative of our national architecture, that Mr. Wyse was about to

bring the subject before Parliament, and we urged all those who felt how valuable such a collection would be, to petition the legislature and otherwise assist the endeavour as far as they might be able."

The attempt has since been made, and we are sorry to say has failed. Following these remarks, our readers will find a report of the proceedings in the House of Commons on the necession, and will see that a proposal of an address to her Majesty, that she would be pleased to establish a museum of national antiquities, and appoint a commission for the conservation of national monuments, was NE-CATIVED WITHOUT A DIVISION.

Mr. Wyse introduced the motion eloquently. as he always does, but we think the honourable gentleman did not display his usual taot in selecting the mode and moment in which it was brought forward. It came upon the artistical public unexpectedly; no evidence was sought, no opportunity was given for the expression of opinion upon it. Mr. Wyse feeling, and justly, that his case was a strong one, relied solely upon it, and asked no aid. He seems even to have neglected recognized evidence that was before him, and to have given up a foundation already prepared on which the new structure might have been raised. We refer to the report from Mr. Hume's Committee on National Monuments and Works of Art, appointed in 1841, which contains important evidence on the value of ancient monuments, the injuries to which they are exposed, and the necessity that exists for protection.

The Chancellor of the Exchequer's objection to the general question was singularly weak. He mid it should be remembered that abroad matters of this sort were the object of the care of the government, but that in England custom left them to the tender mercies of private individuals: in other words, because the English Government never had given any sort of attention to our national atructures or to works of art, they never merg to do so, although the result of this noninterference was seen to be most disastrous and unwise.

In France, ten years ago, M. Guizot urged to his sovereign that the history of the arts ought to occupy a place in the minds of those who regulated the social and political state of a nation,-and why is it less true here than there? "Perhaps," continued he, "no study reveals to us more clearly the social state and true spirit of past centuries than that of their monuments, religious, civil, public, and domestic :- than that of the varied ideas and laws which presided at their construction ; the study, in short, of all the works, and all the varieties, of architecture, which is at once the commencement and the resumé of all the arts." We hope that Mr. Wyse will renew his motion next session, and that in the meantime

* See page 181, ante.

THE BUILDER.

the architectural and artistical public will express their views on the subject. Before leaving the House of Commons, we are led to mention briefly a conversation which took place there a few nights since, on the grant for repairs and other expenses connected with public buildings being proposed. Dr. Bowring wished to know if there were any hope of improving the external appearance of the National Gallery. If any proposition were made for that purpose, he was sure that all parties would cordially concur in supporting it, (Cheers.) Mr. Warburton trusted that the right hon. baronet would be prepared in the course of next year, as the cheapest mode of obtaining a good collection ofpic tures, to recommend the erection of a suitable building to contain the great national collection. (Hear.)

Sir R. Peel was quite willing to admit that we had thrown away the most magnificent site in Europe, No one could tell until he stood on the steps of the National Gallery what a magnificent site it possessed. He thought they would do little good, however, in now laying out money in ornamenting the exterior of that building. They might, it was true, make some improvement in the cupola, and they might make the little turrets somewhat more beautiful than at present; but still, that would not contribute to what was, after all, the main point in the construction of a gallery,-the mode of lighting the pictures. It was, no doubt, a matter of great consideration. (Hear, hear.)

Mr. Hawes wished to put in one word for the modern school of painting by our own countrymen. Their works, he believed, if wisely selected, might form a collection which would compare with any gallery that had ever existed. Lord Mahon suggested the propriety of procuring a collection of portraite of eminent men distinguished in the history of this country. Such a collection might exercise a most beneficial influence upon the rising generation, whilst it could be procured probably at little expense.

It is so seldom that our legislators talk about art, as legislators, that we must not omit reference to it when they do,

MUSEUM OF NATIONAL ANTIQUITIES.

On Friday, the 27th ult., Mr. Wyse, pursuant to notice, rose to "move an address to her Majesty, that she will be graciously pleased to give directions for the establishment and maintenance of a Museum of National Antiquities, in conjunction with a commission for the conservation of national monuments." He did not complain either of the application or results of the expenditure dedicated to the purchase of Greeian or Roman works of art; what he wanted was, the foundation and maintenance of a gallery for the preservation of those monuments and specimens, either of skill or feeling, which characterized the arts and history of this country. It was only by a juxtaposition of the monuments of art connected with the different epochs, from the earliest to the latest, that they could either duly estimate the past or produce for the future. It was a cardinal mistake to call on artists to produce historical works, without the means of cultivating their powers, and ascertaining the spirit of the sge they had to represent. These means ought to be afforded represent. These means ought to be afforded in a liberal and ample manner, worthy of so great a nation. Hitherto our artists had but small means; although their enthusiasm had been great, their education had been limited. Much labour had therefore been misapplied, and a large expenditure of time and money forced upon them; and thus not only individuals but the nation had been deprived of opportunities of excellence which a little previous arrangement might have secured. There was no place provided for the reception of

British antiquities. Throughout the country a gradual dilapidation of public monuments was going on. In their architecture alone many of the finest old buildings were injured by neglect or injudicious repairs; many speci-mens of their best artists no longer existed; and, where they had been repaired, they had too often witnessed the destructive results of the "beautifying" of churchwardens and others who had no knowledge or feeling of art, and who had no knowledge or leeing of art, and whose labours exhibited a spirit of Vandalism existing in the midst of a Christian and civilized community. He mentioned the neg-lect with which many specimens of old church architecture had been treated, among them St. Saviour's Southwark, and the Cathedral of Durham; and in Ireland, Glendalough and Cashel. He quoted an extract from the essay Cashel. He quotea an extract from the ensay of Mr. Petrie, on the Round Towers of Ire-land, in which that gentleman states, that he was induced to undertake his researches solely from an ardent desire to rescue the antiquities of his native country from unmerited oblivion, and from a hape that, by making them generally known, some stop might be put to the wanton destruction of those remains, which threatened to lead to their total annihilation. The same efforts should be made to preserve the ecclesiastical and historical monuments of the kingdom, and he was sure there was no one who would not co-operate with the govern-ment for the purpose, if the government was disposed to assist them. He adverted to the destruction that fell on the monuments and antiquities of France during the tempest of the revolution; but the nution had at last become conscious of the misfortune. Like ourselves, the people could complain of seeing their old buildings dilapidated, or injudiciously re-paired. Many of the monuments of the country were disappearing from the soil, and remains of great value, in the precious metals, or in painted glass, were being transferred to the stranger. In a memoir of the Com-mittee of arts and mouuments it was stated that the Cathedral of Nôtre Dame, at Paris, was sadly shattered, that in very recent times some of its beautiful imagery and earvings had been broken or taken away, even the ancient inscription which re-corded the date of its erection was almost effaced; and that it was made the place where the children of the neighbourhood assembled to amuse themselves, to the great injury of the fabric. To remedy these evils a provisionary school was instituted for the purpose of awakening attention to the subject of ancient art; the plan became more developed, and, to the honour of France, it was not long before the Government exerted themselves in the matter. The present minister of that country took up the question zealously, and the committee of historical monuments and arts was appointed. The church of St. Martin des Champs, one of the oldest in Paris, was selected as a repository for monuments and specimens of ancient art. In consequence of the exertions of this committee a new spirit had been aroused in France for the illustration of every period of the progress of Christianity both in that country and throughout Europe; and there was a general desire among the people to give the fullest effect to the intentions of the Government. He hoped that not only would the historical remains of France be preserved from further injury by this committee, but that all Europe would be benefited by the liberality with which their museum was thrown open to every class of strangers. These exer-tions were not confined to France alone; similar efforts were making in Belgium and Germany. He reminded the House that for the decoration of the new Houses of Parliament they were going to resort to Christian art, dealing with the poetry and history, not of the ragans, but of a Christian people. Was he not justified, then, in calling on them to imitate the example of France, and to found a museum of national art, combined with a commission for preventing the further decay and destruction of national monuments? He was confi-dent the public would assist them, nay, that public liberality would outstrip their own. He knew more than one gentleman who would willingly present their collections to the public if the Government would make them ac-cessible, by providing a place in which they might be deposited. These collections were of great value, as they were not acquired at auctions, but by a long life of research and

labour. Such were the collections of Mr. Brittion, and those in the studios of many other affists and antiquaries. He believed that in founding such a museum they would be supported by a general feeling out of doors that it would not be a lavish expenditure of public money, but one in harmony with their past money, but one in harmony with their past and present efforts, one they were called on to make by the present position of the arts in this country, one to which they were invited by the general voice of Europe. The hon. gentleman concluded by moving an address to her Majesty to appoint a commission to inquire into the best means of preserving the national monuments and antiquities.

Mr. Hawes seconded the motion. Mr. Bernal said the inquiry called for by the hon. ¹ Mr. There member was absolutely necessary. There was, unfortunately, too great an apathy in this country with regard to such subjects as these, because they had not the interest of personality and strong political feeling. If the state of the Treasury did not allow the right hon. baronet to give the public money for the pro-motion of these objects, a public subscription ought to be opened for the purpose. We were the only country in the world which left these matters to private enterprise and taste. At the member was absolutely necessary matters to private enterprise and taste. At the Louvre there was a large collection of middleage relics, but we had no such public collec-tion. He thought the the most fully a such public collection. He thought that the motion of his hon, friend was somewhat too confined-that it ought to extend to antiquities generally, which were analogous to and coeval with the antiquities of this country,—for instance, those which were to be found in Brittany. There ought to be an institution where the student could see the dresses, weapons, costumes, and antiqui-ties of past ages. It was true that there was ties of past ages. It was true that there was the Geological Museum, but it was confined in its objects. And at the British Museum there were vast collections of most interesting objects, which, however, either from want of room, or want of good will on the part of the conductors of the institution, were not pro-perly accessible. He was satisfied that if a periy accessible. He was satisfied that if a national museum were once established, pri-vate individuals would immediately contribute to it. Such an institution would have the best effect on the manners and morals of the

people. The Chancellor of the Exchequer said, of course it was out of the question to expect any co-operation from the Government in the course of the present session, after the supplies had been voted. With regard to the general had been voted. With regard to the general question, it should be remembered that abroad these public institutions were the object of the these public institutions were the object of the care of the Government, while in England custom left the advancement of such objects to private individuals. He believed that a greater number of works of art and of anti-quity could be found in this country than were to be account of the private state of the set of th to be seen in foreign countries, and he doubted very much whether the collection of all these very much whether the collection of all these into one institution would be so advantageous as to leave them as they were. With reference to the appointment of a commission, he thought that for such a purpose it was open to considerable objection; at all events until after very great consideration. \rightarrow Mr. Borthwick thought it extremely desirable that increased would be bettered upon the preservition care should be bestowed upon the preservation of the religious and ecclesiastical monuments of this country, even to the comparative neglect of those of pagan and profane anti-quity. The state of our ecclesiastical archi-tecture was such as to call for much greater attention, though greater expense should thus be incurred than had hitherto been devoted to it. The hon, gentleman adverted at some length to the exaction of fees from persons visiting cathedral structures, and strongly expressed his disapproval of the prac-tice. of the religious and occlesiastical monuments tice

Mr. Ewart said it was a mistake to suppose that the right hon. gentleman (Mr. Wyse) wished to have existing monuments despoiled; he only desired to have them concentrated in one establishment, instead of mouldering in one establishment, instead of modeleting in various public edifices. He entirely concurred in the view which had just been taken in reference to cathedrals. Forming, as cathein the view which had just been taken in reference to cathedrals. Forming, as cathe-drals did, part of the history and religion of the country, it was the duty of the Govern-ment to do all in its power to secure their being open to the public without any charge whotever whatever.

Mr. Wyse having replied, the motion was put and negatived without a division.

THE FUTURE DEVELOPMENT OF STYLE IN ECCLESIASTICAL ARCHITECTURE.

As the history of former nations is being illumined by the labours of their successors, much that we were priding ourselves upon as new, is proved to have originated in time, more or less gone by. The wisdom of the Egyptians is placed on evidence, more convincing than assertions of the classics, and the learning which did exist in Europe during the middle ages is made manifest, shewing that that period was not entirely one of darkness and ignorance. Indeed, we are gradually dis-covering, how unsafe it is to form general opinions supported on the evidence of only isolated facts; and may shortly be compelled to allow, that the standard of knowledge has been placed, in this century, at too great an elevation. But it is not the less obvious, that the discoveries at this epoch are of such a nature, as would at one time have seemed too wonderful for mortal agency, and subjected their authors to terrors of the dungeon and the inquisition. Still, the age is essentially a matter of fact age, one more inclined to for-get that "the race is not always to the swift," get that "the race is not always to the switt," than to pursue the path, which is laborious but certain. It is an age of anomalics, feverishly excitable as to the future, and probing into the records of the past; an age in which advanc-ing science, and the study of its former state find equal votaries. The Anglo-Saxon scholar, and the learned in modern languages, the archeologist, and the professor of science. archæologist, and the professor of science, meet in every circle, and excite a like interest in their labours. But the future object is pursued with too slight knowledge of previous attempts, and too little considera-tion as to the best course; whilst the an-tiquarian pursuit is still one of mere observation and curiosity, less than reasoning and de-duction from examples, towards their bearing upon present time. To such or other singularities, we must attribute the peculiar state, in which the art of architecture finds itself, for perhaps the first time in the bistory of the world, a state alike irreconcilable with the desire for progressive improvement, and with any useful application of previous discovery, a state often commented upon, but yet un-altered. It is still held to be an axiom, that architecture is the only art, which has reached its perfection, and is now no longer progres-sive. The works of the ancients we must admire and study, but not deviate from. Our Gothic architecture must be the architecture of former centuries, when the style is sold to have been in uncensing search of movely, yet never attaining the desired excellence, and to have expired from mere insuition, the table is

It is assumed, that our churches should be, if not copies, at least such as might have been erected at a particular period, and might have been mistaken for works of that date. But why should we say that the intellectual vigour in architecture is dead? Did Shakspeare and Miltun exhaust all the fountains of a sister art, and are not the stars of heaven, and the flowers of earth as pregnant with associations which conduce to poetry, as before Dryden, Pope, or Byron wrote? And though art has known, days, — can this century, before all others, deem that architecture has no future being, a century, in which the whole range of archi-tectural history is beheld, and understood with a clearness before unknown, which possesses all the pawers of investigation, yet deems a good result beyond attainment, and in which the resources of science are not wanting to produce, as the works of architecture were never executed before. And in gothie architure, which had the power to conceive, and the principles, but sometimes lacked the means to carry out, we have, in the study of ancient models, and in inherent resources, the latent skill to produce works, in design more won-derful than the cathedrals of Cologne or Beauvais, and in stability far surpassing those structures. The means for studying the prin-ciples of the mediaval architects are around us, the knowledge of the chemist, and the geologist, with that in every other department of science and art is, for almost the first time. open to us, and shall architecture remain insensible to these advantages? With so many inventions, available for the construction and decoration of buildings, it would appear that the art is rather about to commence, than to

have reached the height, from which there is no advancement.

have reached the negat, from which there all at no sdvancement." If the progress of other styles, feel certain that gothic architecture of least is not to be improved upon, yet preserve that style for imitation. The writer in a latt number of this journal, who has done is the honour to notice some of our previous 're? marks, seems inclined to such opinions, shift we can only wish that his pen could be confided in what we deem a sounder line of argument? Doubless, existing examples convey more fin-struction, and excite a larger amount of pleasure in the beholder, when constructed in a mix-ture of styles, harmoniously blended, thain work should shew any such discrepancy, any more that we down any such discrepancy in the value of all examples in the style of one particular date; but we cannot consider, that a modern work should shew any such discrepancy, any more that we down any such discrepancy in the value of an examples in the secondly to fits in the people from whom it originated. The first object is the pursuit of the artist, the second that of the antiquarian analysis, filled trative of the time in which it was eracted, first but in estimating the value of a model, which is not to be neglected by the architect, but in estimating the value of a model, if its pecause the rist of ages has thivested the fabre with an interest, which we do not take the with an interest, which we do not take the with an interest, which we do not take the with an interest, which we do not take the with an interest, which we do not take the with an interest of ages has thivested the fabre with an interest of ages has thivested the fabre with an interest of ages has thivested the fabre with an interest of ages has thivested the fabre with an interest of ages has thivested the fabre with an interest of ages has the But there are some who, without broaching by an imitation to create a like interest. We omit the consideration, that the modern pile will no longer be an exponent of its age, and will therefore be deficient in precisely that value, which the original possessed, while, in general rank as a work of art, the original may be inferior. The universal principles of art hold the highest place, to which the investiga-tions of antiquity are but the stepping stenes; and in aiming at the wrong goal we miss both. The heads of Edward III. and Queen Philippa when used in a modern church (wide due; n. 183) active to mark the invitation of a barp. 183) serve to mark the initiation of a par-ticular period, but seem to as illustrations of the improper application of medieval arc. So the fleur-de-lis of the Tudor period, no longer a national badge, and the letters, which even a cannot always-read, may be Gothic architeet

With all the interest, which we feel in the antiquarian and bistorical part of aveilacture, antiquaritin and instorted part of architecture, and alloun admiration of forbic, architecture, in its former, state, our desire in not leasened, for a style of art, which we can truly call for own." If modern be as fertile in investion as, ancient days, the barrier, which excludes that investion from our art should be insurmount. invention from our art, should be insurnound; able. That excellence, it not to be hitained by a neglect of existing examples, as some work a neglect of existing examples, as some working argue, but is to be gained by pareful examina-tion of those remains, and from full concention of the principles which guided their erections. An opposite opinion would be founded on an illogical basis, assuming that all executes works, whether good or bad, could give an is-struction, and that the art must recommence a long and experimental course. The main reason of the present, initiative state of tasta-is, that the purely antiquarian possesses an updue influence over the art, to which in the parault of architecture, it should the entirely subry servient. servient.

The infusion, of new and besutiful features The infusion of new, and besutiful features into Italian anchitecture, (which, , gonaisteni, with the *azimus*, of the art, should yet give an entirely new character to that atyle, would give the name of the architect a place, among at the greatest in its days of splendour. Why should invention in modern Gothic architec-ture not be deemed an equal merit? . We must guard against the possible mistake, that the study of ancient models is unnecessary. Whether it be, that the principles of art are difficult of discovery, or that we acquire a love of certain forms, and desire their reproduction, or that, without the chain of rules, our fancy would be apt to draw us in search of novelty into the singular and ridiculous, it is true that rules, deduced from the examination of ex-amples, are never so necessary so in the infancy of the art, or the pupilage of its pro-fessors. We deem this the infancy of a use style of art; and that Gothic architecture was not exhausted in the sixteenth century; that,

irmsh the comhined exertions of individuals in the systematic examination of ancient models, a my style of, flothic architecture may arise, the origination of this architecture of provident of this are, and not interior to a systematic examination, so the architec-ture of listy declined at the establishment of the christian, religion, and at last appeared to be single, if did, Review of d'Agincourt's His-ture of listy declined at the establishment of the christian, religion, and at last appeared to be single, if did, Review of d'Agincourt's His-ture of listy declined at the instrument of the systemation in the north, Byzantine in a set, a distinct style at Pisa, and the in-ture, the the frecian stock had been ex-ture, the the Grecian stock had been ex-ture, the the decline of the empire, the reput of a national style, and to free the mary in the decline of the empire, the state in the decline of the provent and interest is the treat of the provent and interest is an envire of the provent of its of the provent of a style of the interest is the decline of the models of its of the provent of a style of the recently, discovered with of the succession. Mr. Bun-

worm-wheel, as populiarly adepted for raising or lewering ell such abutters. In Mr. Ban-nett's improved shutter each lath or strip of iron overlaps and lies in close contact with the one below it, so as to form a firm sheet of iron, which not only concealed the joints or hinge but also effectually secured them from external viblence.

The utility of Mr. Bunnett's invention was duly appreciated by the public, and his revolving shutters came at once into most extensive use, being adopted by nearly all well as bankers and insurance companies, as by numerous tradesmen and others in the metropolis, and in the principal towns through-out the kingdom. The demand had gone on progressively increasing, and for a period of eight years the patentes were allowed the un-disputed monopoly of their patent right. In 1844, however, the defendant Stillt made and put up eight shutters in a building in George-street. Mansion-house, belonging to Messrs. Smith, Payne, and Co., which were considered to be a direct infringement of the plaintiff's patent; and an application was made for an injunction to restrain the defendant from proceeding with his infringement. The Vice-Chancellor, Sir L. Shadwell, deferred granting the injonction, making the usual order, and directing the plaintiff to establish the validity of his patent in an action at law.

The evidence of Mr. Carpmael, Mr. F 'arev. Mr. Laxton, Mr. Cottam, and Mr. Baddeley went to shew the novelty and usefulness of the plaintiffs' invention as well as the sufficiency

of the specification. The defendant's record contained the usual pleas of want of novelty, utility, &c. An attempt was made to prove the former by reference to two patents granted to Mr. Michel and Mr. Whiting in the years 1818 and 1819 (both for wood shutters); and that the defendant's shutter was an improvement upon, and not an infringement of, the plaintiffs' patent. The trial lasted nearly two whole days, and after a deliberation of upwards of two hours, the jury returned a verdict for the plaintiffs upon all the issues, with damages, and his lordship certified that the right to a patent came in question, and that it was a proper cause for a special jury.

THE LATE CONFLAGRATIONS IN EUROPE AND AMERICA.* BY J. L-

" Prevention is the best remody."

Aushouda every thing gets now-a-days drawned and engalphed by the overfleeding of an exeberant (and in many cases useless and unnearing) public press-wet; the later awful calamities have been uble making some im-pression on the public mind; a reason why we resume this subject, to bring it to a final close. Having in our preceding paper arged "the regeneration of architecture," as the surest and soundest remedy for the preventing of calamitous fires a moral agency withal, of calamitous fires a moral agency withal, at least in its leading principle; we have to state now, that notwithstanding the fragile and futile (main) buildings, in which people con-descend, or are compelled to live—we are most anxious to fill such frait receptacles with every sort of equally futile and combastible tawdrinees; such as huge bed and window curtains, table covers, earpets and rogs, and drapery and trappery of every kind. But we do not wage war against comfort and opsament, but against its abuse and "lilegitimacy." In this respect also our forefathers were the better mon-their furniture was made for centuries, like their buildings for ages." But a such most futile tumber is often sequired by very most futile lumber is often scouired by very heavy sacrifice (aye, cook of principle), we say, let us not go too far that way; let us somewhat retrograde to the noble and stern and pure etrograde simplicity of our forefathers; and, we are sare every loving parent will approve of our sag-gestion, "let your children sleep in a safe house, even if their hed be without ourtains." Another cause of fires (it comes always to principle) is the careless atheistic way; in which den is beaded end matematic her not

which fire is handled and managed by, not alone servants, but even by masters, who ought to know better. The criterion of atheistic belief is to consider ourselves as the centre and sole aim of every thing around us. "We

* See pp, 200 and 280.

have heard of Hamburg and Pittpburg and this street and the other in our neighbour this street and the other, in our neighbours-hood-but such accidents, happen, only, to in-significant vermin around us they never will or can reach met.". If other means have been found, unavailing...to check such belief, and acting ...noon .it, .the. legislature ...ought ...to step in ; ...as ...tr, is really .too. matues ...ought ...to step in ; ...as ...tr, is really ...too. matues ...ought ...to ther bill may amount to .54, or .104.; ...while, they will set the bad-curtains on firs, and ...auther the loss of property, hundredfold that amount, with a few human lives into the barrain. A sthere with a few human lives into the bargain. As there ought not to be even an accidental homicide without a judicial procedure, no more ought there to be an accidental arson (!) without itand if persons were to know, that they will be subjected to, at least, annoying proceedings by subjected to, at least, annoying proceedings by setting the bed-curtains or any part of a hotel or other place on fire, they will be more careful than hitherto. Moreover, we think, where the bast negligence or carelessness can be proved, such party ought to be subjected to either heavy fine or other punishment-and if malice (on the part of servants on others) can be traced, then, certainly the party should be indicted for either miademeanour or even felony. The too far extension, and lax organization of fire insurances has had that disadvantage, that fires are only considered as material accidents; but the moment that the public would be made aware that they (in most cases) entail moral evils, the thing would be different.—It is, after all, again our favourite seven and a half per cent. Capitalists get, their dividend, and the uninsured poor is assigned over to the poorhouse or other. "public" charity, which, to say it again, has to pay (in all cases) part of any axces. sive dividends.

An unpleasant (!) secret has lately come, out, at Hamburg, which will lead us to another, phase of our subject. It has been observed, that a certain merchant had burnt down his premises twice even since the great fire for which he obtained his premium—and it was first considered a strange coincidence (!) that it was the same gentleman, on whose premises the great fire originated. Similar hists have been thrown out in this country in one or two instances. What punishment ought or two instances. What punishment ought, to be awarded to a brute, which, for the sake of a mean and pitiful lucre of a few thousand pounds—will distress a whole city—human imagination (or human philan-thropy) can scarcely desire. Still, such awful cases exist— Hamburg and Pittsburg have followed each other, at any rate, too close, and we say boldly and unreservedly: "let ua be prepared for, or rather guarded against, similar occurrences — at London, at Bir-mingham, &c." But this is neither the time mingham, &c." But this is neither the time nor place to write (a book) on "public estab-lishments for preventing conflagrations." We, many throw out some broad hints, and must leave it to the "discretion and conscience of; the people" to carry them out if they are found deserving. London, certainly (and other cities). have a fire brigade, but it lacks proper organihave a *fire brigade*, but it lacks proper organi-zation. Any body of men, who are called upon to act promptly, energetically, *concentra-tedly*, cannot do so without military organiza-tion; amongst which the hierarchy of privates, corporals, sergeants — up to the commander (in chief), for every city or district is included. The man who was drunk when he had to use, the fire-escape in Dover-street, has been dismissed, and very properly - nay, we say, he ought to have been tried for homicide. But do our respected readers know how these fireescape men are now situated ? They have to, attend, night after night, to their engine to them. Is it to be wondered that they are seized with *ennui*—tired out in fact? and then the resorting to a near public-house, and all the other et ceteras are the consequence. The first, therefore, would be to place the fireescapes at, or very near, the stations of the fire brigade, where the men attending them would have not only company, but be under the eyes nave not only company, but be under the eyes of the corporal, sergeant, and the inspecting officers. This leads us to another important item without which no body of men will ever be efficient. This is "the surprising system," as we boldly call it. This system has been resorted to by men like Sultan. Joseph II., Frederic the Greet greater concerns then that greater concerns than that however, holds

(fire) commander-in-chief, or any fire-major or captain get up occasionally and unpreparedly, and surprise and visit some or other posts of the fire-brigade or the escapes, and ha'll see (I'm sure of it) strange things going forward — but this only for a very short time. Because these gentry would soon find cut, that the eyes of their superiors are ubiquitous, and that they can-not gammon them. The public may have for-gotten it—but history has not, that when the large conflagration of the Tower took place, there was no water, for which, certainly, something might have been said to the constable on duty. If such destruction of (public-national) property ought to have had any result, it ought to have, at least, that of teach-ing mankind a lesson. But it seems, it does not. Even since the fire, other property has been consumed on account of the deficiency of, water — and none seems to think, that a stop ought or could be put to such scandal. Our suggestion on this score-the practicale of the surprising system is, that the fire com-mander-in-chief or other superior should appear ex tempore one fine night in a certain locality, and give an artificial alarum to the fire and water men. If, then, any defect should be discovered, say in the most essential --- the supply of water, the company, or whose-soever fault it is, should be made to smart for Oh! but where is the seven and a half it. per cent. then-may some of our readers ex-claim. To which we merely reply, "Beware of a repetition of Pittsburg or Hamburg!" The complaints, in fine, on our present social condition from the throne (here and elsewhere), the constant talk-large and smallin the legislatures, the thousand philanthropic and charitable societies, the tons and ship-loads of paper stained therewith, are becoming nigh disgusting, if not acted upon by every one in his sphere. Otherwise, it would be preferable, to at chose and openly declare our-selves Atheists-consider human (aye and cosmic) affairs as something adventitious and futile; continue barefacedly the hitherto gambling of life, where every sort of craft has a good chance of success, and leave the large mass of fools (the people) to shift as they best-may, and to have no more fuss about it.

EXHIBITION AT WESTMINSTER HALL.

³ In addition to six artists who were deputed to execute a cartoon, coloured sketch, and a specimen of fresco-painting, for subjects which eregiven, her Majesty's commissioners on the fine arts threw open the same subjects for general competition, and offered three premiums of 2004. each for the most worthy specimens. The commissioned pictures, as well as those specimens sent in competition, are now open to the public. Some of the newspapers have fallen into the error of expressing their surprise that none of the six artists selected last venr have obtained prizes on this occasion, overlooking the circumstance that they are each to receive defi-nitely the sum of 400% for their work. As regards the assignment of the fresh prizes, we do not hesitate to say the judges have performed their daty fairly and ably. It must be gratifying, in a high degree, to the com-mittee of the Art-Union of London again to find two out of the three premiums most worthily borne off by young artists whom they by honorary rewards for outline drawings have in some degree led forth, namely-Mr. J. Noel Paton and Mr. John Tenniel, jun. The third is awarded to Mr. E. Armitage, who distintinguished himself in a former competition.

Considering that England is an infant in the art of cartoon making, and still more so in fresco painting, she must certainly be allowed to be a precocious and apt scholar. The exhibition as a whole is deserving of the highest commendation, and must equal the hopes of the most sanguine. No. 5. by Mr. A. Aglio. The subject " Re-

ligion," is clever, more particularly in the upper part, but Faith, Hope, and Charity, want refinement. In the fresco this artist has shewn considerable ability.

11. "The Spirit of Religion," by J. Noel Paton. The idea is remarkably fine and is carried out with great energy and executive power. It will amply repay careful examina-tion. The specimen of fresco, which the

artist informs us is "the first experiment," plainly shews ability to do better next time;

this is one of the deservedly rewarded. 23. "An Allegory of Justice," E. H. Weh-nert. An excellent cartoon, the grouping and drawing are successful; the whole, though pervaded by Germanism, is true to nature, and

in parts unexceptionable. Mr. Buss's cartoon (29) is barely redeemed by the figure of Gascoigne, which has con-siderable dignity; the rest is weak and un-

meaning. 32. "The Baptism of King Ethelbert," J. Severn, is a falling off from his "Queen Eleanor!" The fresco is more happy.

Mr. John Callcott Horsley, one of the com-missioned artists, has produced a work of pure unaffected truth and refined sentiment in his cartoon of "Religion," of beautiful breadth cartoon of "Religion," of beautiful breadth and drawing. This work is a masterpiece. The freeco and coloured sketch are alike excellent.

cellent. 33. "Justice," by William Cave Thomas, another of the commissioned. This artist aims at the style of the earliest German masters. It is a grand work of time, labour, and much study; in parts strongly reminding the specta-tor of Albert Durer's works. The fresco The fresco shews knowledge of the material.

If excellence consisted in finish. Mr. Maclise's cartoon (4)) is the acmé of perfection. Never was finish carried to such an extent before in cartoon drawing. Each head, hand, and leaf, is a picture in itself. The shine of the armour, and strong light and shade which pervade it, render it somewhat confused, but the general drawing is truly beautiful, and the coloured sketch is as good a picture as he has painted for some years. The fresco is disagreeably coloured, particularly the flesh. Mr. Maclise is another of the commissioned.

A sketch by Edward Corbould (44) is excellent in colour, but does not tell the story. The fresco of Ethelbert's head is well executed.

"The Spirit of Religion," Edward Armitage, is broad, grand, and well-drawn; and characterized by high and religious feelings. The fresco and coloured sketch are much inferior. The cartoon has been most deinferior. servedly rewarded.

Mr. Cope, A.R.A., has produced an excel-lent cartoon of "Edward the Black Prince receiving the order of the Garter from Ed-ward III." (57), finely drawn, and effectively shaded, but the figure of Edward is rather exaggerated in action. The sketch and fresco

exaggerated in action. The sketch and fresco are both excellent, especially the former. "Prince Henry acknowledging the autho-rity of Chief Justice Gascoigne," by R. Red-grave, A.R.A. This is not satisfactory, the drawing faulty, and the fresco unworthy the painter of "Catherine Douglas." This is enother of the commissioned works is another of the commissioned works. "The Baptism of Ethelbert" (63), William

Dyce. An extraordinary performance, full of feeling and pure truth unalloyed by prettiness. This is one of the commissioned cartcons, and has high pretensions to perfection. To say more of the sketch and fresco than that they are worthy attendants of the drawing would be superfluous.

Mr. Bendixen's "Religion," is a mistake. The figure meant to represent the New Testament seems toasting some absent swain.

Mr. John Bridges exhibits a graceful and lever cartoon from the subject of "Prince Henry acknowledging the authority of Chief-Justice Gascoigne." It is accompanied by a most careful oil sketch, and an able production of fresco.

"An Allegory of Justice," (85) by John Tenniel, jun. This young artist promises to excel in the grand art of cartoon drawing; in this work he exhibits extraordinary talent for design, and power in the use of the cravon. Although but an outline, the parts are made out One of the pre-most justly. The with astonishing boldness. One of the miums has been awarded it most justly. fresco and sketch in colour abate nothing in excellence.

A good idea is brought forward by Mr. Brown in the cartoon of "Justice" (98): wellstudied and carefully executed ; it deserves considerable commendation. "Sketches of the Spirit of Chivalry, Reli-

vourite subject) is ably illustrated by John G. Waller in cartoon 108, the effect of which

is broad and clear. And again, by T. Y. Hurlstone: the figuré allegorical of Mercy is well expressed, although in rather an awkward position.

The sculpture, which forms an accidental feature in the exhibition, is in many in-stances remarkably beautiful; the works that chiefly excited our attention are "A Hunter returning Home" (117), by Frederick Thrupp; chiefly excited our attention are "A Hunter returning Home" (117), by Frederick Thrupp; "The afflicted Mother" (122), by John Evans Thomas; "The Dying Briton," and "The Or-phans" (123 and 124), by Felix M. Miller; "William Shakspeare" (127), John Bell; "Pastoral Apollo," and "The Wanderer's Home" (128 and 129), by Edward B. Ste-phens; "Abel and Thirga" (130), by Thomas Earle; "David" (131), E. Richardson; Mr. Mac Dowell's group of "Love Triumphant" (139); and "A Girl Reading," by the same excellent artist (140). excellent artist (140).

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

The fifteenth meeting of the Association has passed very pleasantly and very usefully, not-withstanding what may be said by its opponents, and will, there is every reason to believe, continue to pursue its course for many vears to come. Sir John Herschel, in his address as

come. Sir John Herscher, ... ____ president, eloquently observed :_____ "True science, like true religion, is wide-"True science, like true religion, is wide-the science of the science divide the worldly, and jealousies torment the envious! We breathe, or long to breathe, a purer empyrean. The common pursuit of truth is of itself a brotherhood. In these our sinual meetings, to which every corner of Britsinits representative some distinguished cultivator of some separate branch of knowledge : where, I would ask, in so vast a variety of pursuits which seem to have hardly any thing it com-mon, are we to look for that acknowledged source of delight which draws us together and inspires us with a sense of unity? That astronomers should congregate to talk of stars and planets - chemists of atoms - geologists of strata - is natural enough; but what is there of equal mutual interest, equally connected with and equally pervading all they are engaged upon, which causes their hearts to burn within them for mutual communication and unbosom-Surely, were each of us to give attering? ance to all he feels, we should hear the chemist, the astronomer, the physiologist, the electri-cian, the botanist, the geologist, all with dne accord, and each in the language of his own science, declaring not only the wonderfal works of God disclosed by it, but the delight which their disclosure affords him, and the privilege he feels it to be to have aided in it. This is, he feels it to be to have aided in it. This is, indeed, a magnificent induction - a consilience there is no refusing. It leads us to look on-ward, through the long vista of time, with chastened but confident assurance that science has still other and nobler work to do than any she has yet attempted; work, which before she is prepared to attempt, the minds of men must be prepared to *rcceive* the attempt,—pre-pared, I mean, by an entire conviction of the visdom of her views, the parity of her objects, and the faithfulness of her disciples.

Of papers which relate to subjects especially treated of in our journal, there was a dearth; in the mechanical section, for exam-ple, little or nothing was done. We have selected, however, a few items of information which will interest our readers.

ί

1

Strength of Stone Columns.-A paper on this subject was read by Mr. Eton Hodgkinson. He had experimented on columns from 1 inch to 40 inches long, and 1 inch and 11 inches broad. Care was taken that they were cut from the same block, and in the same direction of the strata. They were crushed between har-dened steel plates, by means of leverage, and a specimen of 1 in. square required a pressure 10,000 lbs. to crush it; in the crushing, it of was invariably the case that the piece operated upon split into wedges, with keen edges. A column forty times longer than wide or thick, was one-third weaker than a cubic piece, and in these long pieces the splitting always began at the ends; the practical utility of this know-ledge was, that stone pillars for buildings, sketches of the spint of Onivary, item gion, and Justice, to shew the relation be-tween the three subjects," (104) by Frank Howard, are clever ideas, well executed. "Justice" (which by-the-bye seems the fa-ut the ends than at the middle, to make the

periments. Coloured Glass.—Prof. Playfair, in the absence of Prof. Grahum, communicated the results of some experiments on coloured glass, by Mr. Splitgerber, and exhibited some speciments of white glass, containing gold, which coloured a deep red on the application of a certain heat, and loses this colour, though not entirely, on being heated to a point approaching fusion.

Production of Iron in Scotland.—Dr. Watt read a paper on the production of iron in Scotland. This paper shewed the improved state of the iron trade in Scotland, the increase of new works and additional furnaces, with every probability of continued prosperity. Dr. Watt stated that it required a million tons of coals to produce 400,000 tons of iron. Mr: Porter said that in the iron works in

Mr: Porter said that in the iron works in Great Britain, for one year, 1,396,400 tons of iron were made from 4,877,000 tons of coals; this shewed a discrepancy according to the statement of Dr. Watt.

Prof. Pryme thought the discrepancy might arise in part from the impurity of the ore; upon the purity of which a good deal depended as to the quantity of coals required.

A member said the introduction of hot blast had made considerable alteration in the iron works in Scotland. It once took seven tons of coals to make one of iron; consequently, the iron works were regarded as hardly profitible; but by the hot blast, the average of coal is about 21 tons to the ton of iron; and the profits of iron works have riseu in proportion. The refuse of coal, or small dust, which cost nothing, was used for hot blasting, and was not counted in the weight.

Mr. Porter, in adverting to the requirements upon the Iron works, said there was one district of railway now before the House which was calculated to require 851,000 tons of iron. Our export trade in iron had also become of itimense magnitude. In 1843, there was exported 460,000 tons of iron, and the use of this metal would be greatly on the increase if its price were kept moderate, as it was much used in the building of steamers, and found to answer well. One person had forty-five iron steamers in England, and another gentleman had informed him that he had had an iron it among the twenty-five years, and that it had not cost 50% for repairs the whole period, nor had it been haid up a week.

period, nor had it been laid up a week. Railway Gradients.—Mr. Fairbairn read a paper on the improvement which had been effected in railway gradients, from which we iske the following tables :—

The President said that, by these improvements, railroad companies would be enabled to lay out their money more economically on engines of greater power, and the stationary ones might be done away with.

A member stated that the single lines were now coming into use (as in the Peterborough Bailroad), with the electic telegraph, protected by which they were safer than the double ones. Looking at the saving of human life, this was a question of the deepest interest; and if, as on the Great Western, the electric telegraph were destroyed by the collision, there might be a second telegraph on the other side, to be worked in case of such accident taking place. In a pecuniary point of view, at this moment, when millions were about to be laid out on new lines, the improvements brought before the section were of the greatest importance.

Steam Pile-driving Machine.-Dr. Greene read an interesting paper on the Steam Pile-Driving Machine, recently invented by Mr.

Nasmyth, of Plymouth. At the last meeting of the association the steam hammer, invented by the same gentleman, was brought before the consideration of the mechanical section, and received its approval. The new instru-ment, which had only been put together within the last few days, depended much upon the steam hammer. It consisted of two uprights, each 80 feet high, such height being necessary, in consequence of the immense piles it had to take up and drive into the sea. These uprights were parellel to each other. There was a cap in the middle, through which the pile went, and the piston moved in the cylinder upwards by the force of high-pressure steam. It was self-propelling, and moved on a railway. Dr. Greene was happy to be enabled to state to the section, that he had received a letter, a day or two back, from Mr. Nasmyth, stating that he had just completed the instrument, and tried it, with the most signal success. The first pile driven down by it—and this into a bed of hard yellow clay— was 14 inches square, and 18 feet in length, and was done so in the space of 17 seconds. "It was truly laughable," said Mr. Nasmyth in his letter, "to see this gigantic machine running along, picking one monstrous pile after another, and driving them into the earth with as much ease, and almost as quickly, as a lady would stick pins into a pincushion. Dr. Greene exhibited the drawing of two piles-one bent, crookened, and split, after having been driven into the earth by the old method, with 20 hours' labour-and the other perfectly 20 hours' whole, after having been sent down by the new instrument in the incredibly short space of 41 minutes. The advantages of such an enormous power, he said, were incalculable in the saving of time, labour, and capital : and we should reap the benefit of them in all directions where great national works were going on, and especially in the formation of the harbours of refuge slong our coast, and recovering land from the sea. The enhankment at Devonport had a stubborn sea to contend against; and it was calculated that it required even yet 30,000 piles to be driven down to complete it, in which case the power and ad-vantage of Mr. Nasmyth's invention would be at once felt and acknowledged. One of the Lords of the Treasury had been very recently in his neighbourhood and having seen the instrument tried, expressed his approval of it; and he (Dr. Greene) was happy to add, the inventor received an ex-cellent Government appointment. Mr. Na-smyth, when his principle of the steam hammer was primarily developed, never anticipated that he should ever be enabled to carry it out to such a wonderful extent as he had succeeded in doing in the space of twelve months. The weight had been at first about from four to five tons ; but it was subsequently found that this was a great waste of power, and that one-fourth of it was all that was reand that one-fourth of it was all that was re-quired. The face of the hammer was parallel with the face of the anvil, and its power of sustension was wonderful. When tried the other day, Mr. Nasmyth, to prove this feature the more satisfactorily to some persons who went to see the instrument tried in all respects, said it should crack a walnut without crushing the kernel; but the walnut not being at hand, one of the workmen offered a small tin shuff-box, which being placed open under the hammer, the lid was delicately shut down, without dinge or injury. Mr. Fairbairn testified to the powers of this

Mr. Fairbairn testified to the powers of this wonderful hammer, having seen it tried. The velocity was in the ratio of the force of the steam; it might be made to strike from four to five hundred blows a minute.

The President said that he had had some experience in pile driving at Sheerness and the London bridges, and he could safely say that it took more hours to drive down a pile by the old method than minutes by the proposed one. He congratulated the section on what they had just heard; and he thought the lovers of science, and the country in general, were much indebted to Mr. Nasmyth. The next meeting of the Association will

The next meeting of the Association will be held in Southampton; Mr. Murchison is elected president.

IMPROVEMENT AT DARWEN.—Mr. Eccles Shorrocks intends to build, at his own expense, a spacious covered market-house, and Mechanics' Institution, at Darwen.

DECORATIVE ART SOCIETY.

317

ON Wednesday, 25th ult., the consideration of "Geometrical figures as the foundation of graceful outline," was resumed with more especial reference to the "properties of the oval."

From observations of the works of the Ancient Egyptians and Greeks, it was considerel that those nations were acquainted with a practical method of producing continuous curves which is not apparent in either Roman or modern art. The elliptical lines on which the beautiful outlines of the Etruscan vases were founded were supposed to have been selected from a series produced by some simple and convenient system, and are not to be altogether ascribed to the greater perfection of their skill in design.

An approximation to the forms of the ancient vases may be undoubtedly produced by mathematical arrangements of straight lines and segments of circles, as was shewn, but such systems were considered to be necessarily complex and unattended with that practical accuracy and freedom observable in the originals. The defects of our practice were instanced in the Tudor-arched heading of the windows to the new Palace of Westminster, where an approximation only to the beauty of a curved line is attained.

It was also argued that curves based on hexagonal proportions were the most graceful; and Mr. Jopling partially explained the "septenary system of generating curves by continued motion" through combinations of rotatory movements with those of an ordinary tranumel as invented by himself, and he exhibited drawings that certainly appeared to possess a variety, precision, and accuracy, much to be desired; he also affirmed, that for practical purposes, the expense of a couple of shillings would supply a workman with means to produce correctly any curve that might be required.

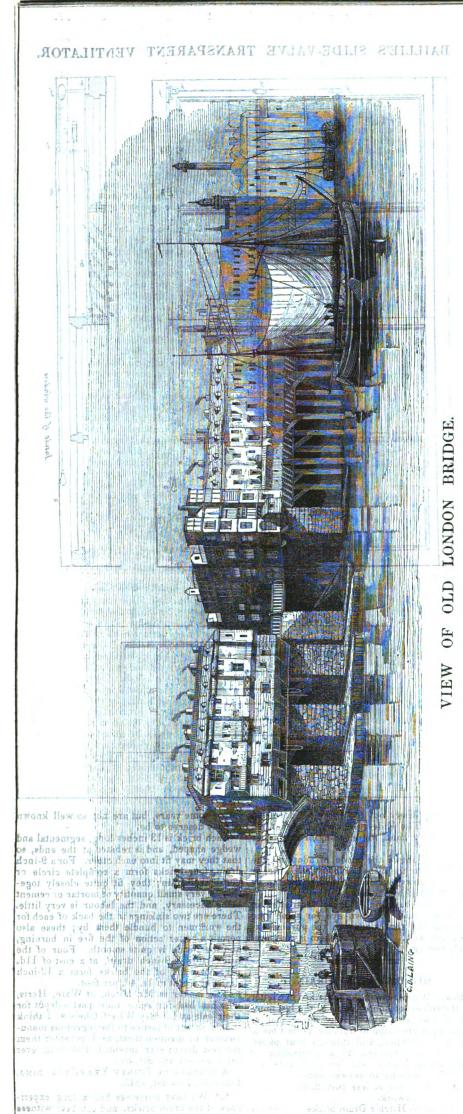

required. The discussion of this subject will be resumed on the 30th July, when the merits of Mr. Jopling's septenary system and the principles of spiral or serpentine lines will be considered.

ART-UNIONS. ----

A BILL has been introduced into the House of Commons, by Messrs. Wyse and Ewart, for revoking so much of the laws against distribud tion by lottery as may legalize the proceedings of Art-Unions. Reciting the recent circums stances in the history of these institutions, the hill enacts that all such voluntary associations for the purchase of paintings, drawings, &c., to be afterwards allotted by chance, now constituted, or which may hereafter be so, shall be deemed and taken to be lawful associations, --provided always "that a royal charter of charters shall have been first obtained for the incorporation of such associations, or, provided that the deed of partnership or other instrument or instruments constituting such associations, and the rules and regulations relating to the proceedings of such associations for such purposes as aforesaid, shall have first been submitted to the consideration, and he approved of, by a committee of her Majesty's most bonourable Privy Council, and a copy thereof de-posited with such committee; and provided such proceedings for such purposes as aforesaid shall have been conducted in strict conformity with the royal charter or charters which may have been granted, or the deed of partnership, or other instrument or instru-inents constituting such association, and the rules and regulations which may have been approved of, as hereinbefore set forth.

The newspapers, in mentioning this provision in the bill, have all storped short at the royal charter, and omitted the alternative, which is of considerable importance.

FALL OF A WALL, AND FATAL RESULT.--Last Saturday afternoon about 30 feet in length of a wall, bounding the premises of Mr. Davies, an emery manufacturer, in Richardson street, Bermondsey, was thrown down, in consequence of 100 tons of emery stones being piled against it. The wall was 10 feet in height, and 9 inches in thickness. Several children were playing near the spot, and one was crushed to death, while three others received severe injury.

In an ind that and the second representation of the second ob noitas which for several centuries encumbered and dis-figured it from one end to the other. The date of this bridge is much better authenticated than that of most buildings possessing claims to a remote origin, for we find in the "Annals of Waverley" (an abbey in the county of Surrey), the following entry :---- "1176. In this year the stone bridge, at London, is begun, by Peter, the chaplain of Colechurch." * in the stone bridge, at London, is begun, by Peter, the chaplain of Colechurch." * in the stone bridge, at London, is begun, by Peter, the chaplain of Colechurch." * into the bed of the river, and was 926 feet long, 15 feet wide, and 60 feet high. It had a draw-bridge, and twenty pointed arches, from 15 to 32 feet span, with massive piers from 17 to 30 feet thick, and of various lengths of from 26 to 115 feet. The longest pier stood in the middle of the river, and served as well for the bridge as for a chapel which was erected on it, and dedicated to St. Thomas-d-Becket. This chapel was a very elegant structure, and consisted of two chambers, an upper and an under one, or crypt, immediately on the starling: the communication batters figured it from one end to the other. The date structure, and consisted of two chambers, an upper and an under one, or crypt, immediately on the starling; the communication between the upper and under chapel was by a spiral flight of stone steps. The upper chapel was loity, and elegant, being supported by four-teen groups of clustered columns, and lighted by eight pointed windows. The crypt be-low was even superior, for, although it was not so lofty, the intersections of the pointed arches and windows were more beau-tiful. The length and breadth of each were the same, nearly 60 feet long and 20 feet broad; the height of the upper chapel was 40 feet, and that of the lower was 20 feet. This was the first building erected on the bridge, and was coeval with the structuret. At what period the other buildings were erected is uncertain, but it is generally supposed what period the other buildings were erected is uncertain, but it is generally supposed that the towers were built soon after the bridge was finished. In the year 1426 the tower at the north end of the drawbridge, over which traitors' heads, were usually exposed, was erected, but in 1577 it had become so decayed as to require removal. A new building was commenced, and the traitors' heads, amongst which were those of Fisher, Bishop of Rochester, and the celebrated Sir Thomas More, were placed over the gate on the Southwark side, afterwards called the Traitors' Gate. But the most splendid building that Gate. But the most splendid building that adorned old London Bridge was the famous Nonesuch House; so called from its having been constructed in Holland, entirely of wood, and constructed in Holland, entirely of wood, and brought over to this country in pieces, and erected on the bridge with wooden pegs only, not a single nail having been used in the edifice. It stood by the seventh and eighth arches from the Southwark end, projected considerably over each side of the bridge, and presented a very striking appearance from its varied and highly decorated architecture. In the year 1582 the first water works were erected by one Peter Morris, for the purpose of supplying the City with water, and size years afterwards three other water-wheels were erected at the Southwark end of the bridged for grinding corn. How long the latter mills remained is uncertain, the former existed until 1822, when an Act was passed for their entire

of the stand to th

remained is uncertain, the former of their entire 1822, when an Act was passed for their entire removal, and the proprietors received 10,000Z ; for transferring their rights to the New River

for transferring their rights to the New Fried Company. In 1754, the bridge requiring very extensive repairs, a wooden bridge was prected on the starlings, on the west side to the houses were removed, the centre pier, and two arches adjoining taken down, and replaced by one large arch, the bridge widened several feet, and finally opened to the public in 1759. These alterations are said to have cost 100,0004. The annual loss of life and property that The annual loss of life and property that

This church stood, until the great fire of London, on 11 north side of the Poultry, at the south end of a turning destrominated Conyhoop-lane, and was famous as the plase where St. Edmund and St. Thomas-à-Becket were presente at the baptismal font.
† From the same authority we have already quoted, namely the "Annals of Waverley." we learn that the remain of the plous architect of the bridge were entombed in the chapel. The passage runs thus : — "In 1205 died Peter the Chaplain of Colechurch, who began the stone bridge and he is sepultured in the chapel upon the bridge."

occurred through the dangerous state of the navigation under the arches, the fall being at times as much as five feet, and the perpetually recurring expense of keeping the bridge in re-pair, added to the rude appearance of the structure itself when contrasted with the fine bridges which had been recently erected over the Thames, suggested, about the beginning of the present century, its entire demolition, and the construction of one more in accordance with the taste and skill of the times, as well as with the princely character of the Corporation of London. Accordingly, surveys, reports, and estimates were made, various plans proposed, some for once more repairing the proposed, some for once more repairing the old bridge, and others for constructing a new one. The most eminent architects and engineers had their attention directed to the subject for upwards of twenty years. At last, in the year 1822, the corporation advertised for plans, and premiums were awarded to three of those sent in. After much discussion both in the city councils as well as in the House of Commons, Mr. Rennie's design was adopted and carried out.

On the 4th of March, 1824, Messrs. Jollife and Banks, the contractors for building the new bridge, commenced their operations : on the 15th of June, 1825, the first foundation stone was hid by the late Duke of York : and stone was laid by the late Duke of York : and on the 1st of August, 1831, his late Majesty William the Fourth, and the present Queen Dowager, were pleased to honour the opening ceremony with their presence. Shortly after this event took place, the work of destruction commenced on the old bridge, and within a few months, not a vestige was to be seen of a structure which had been very famous in its day, and the Chronicles of which illustrate most vividly the manners, customs, and events of London, during a period of six centuries and a half. J. H. a half. J. H.

BAILLIE'S SLIDE-VALVE TRANSPARENT VENTILATOR.

THIS ventilator consists first of a series of This ventilator consists first of a series of louvres of glass, which are permanently fixed at a certain inelination, so that the currents of air may be directed upwards and dispersed; and secondly, of a sliding valve, likewise of glass, which regulates the quantity of air ad-mitted, and which when closed, renders the openings perfectly air tight: the whole is con-tained in a neat thin frame, which may be readily adapted by a common glazier to any of the panes of a window; the frame itself, when thus fixed, seems to coincide with the sash bars, and the rest of the ventilator being quite transparent, the general appearance is by

san bars, and the rest of the ventilator being quite transparent, the general appearance is by no means displeasing. A Several advantages arise from having the louvres stationary, instead of being moveable, for example: — First, the draught of cold air is articled which in the sea of moveable louvres avoided, which in the case of moveable louvres enters through the interval that is required to be left between their ends and the sides of the frame. Secondly, this apparatus has no joints, nor other working parts where the dust can accumulate and become hardened so as to obstruct their action; but it may be closed in a perfectly air-tight manner, even in the most dusty situations. Thirdly, its construction is so simple, that nothing but rough usage could injureit; and if out of order, it may be repaired

by any ordinary workman. The annexed diagrams will serve to shew its appearance and action.

Figure 1 gives an elevation and a vertical section of a sash window with the ventilator section of a sash-window with the ventilator fixed in the position which is thought to be the best for avoiding draughts; aa, the fixed inclined glass-louvres; bc, the slide-valve for regulating the quantity of air admitted, which is moved by the cords (de); coinciding with, and hidden by the sash-bars, and passing over pullies (as at f, g, h, j), to any required posi-tion; in the sketch the cord is finally passed over a rack-pully (n), in the same way as in ordinary roller-blinds; but, when it is required frequently to pull down the top sash itself, frequently to pall down the top sash itself, the cord had better be furnished at its lower the cord had better be turnished at its lower end with a balance weight instead of passing over a rack pully; k, an eye screwed into the sash bead through which the cord runs; l, connecting socket which serves both to unite the cords (as shewn in the sketch), and also to stop (by means of the eye k) the slide-value

* "The Chronicles of London Bridge," Svo. 1827.

1256 Ĵ Fig. 1. Fig. 2.

from being drawn out too far or let down too violently. The slide-valve may, however, be lifted out by hand, for cleaning or any other purpose.

Figure 2 shews the mode of adapting the slide-valve to the sashes of basement, attic, or other windows, where the top panes can be easily reached by the hand. We have had one of these ventilators in

operation under our own eye for some time past, and find that it answers the purpose ex-ceedingly well. The cost of them is comparatively trifling.

HITCH'S PATENT DRAIN.

SIR,-With the remarks contained in a letter SIR, — With the remarks contained in a letter on the subject of house drains in the last num-ber of THE BUILDER I fully agree, but as drain-pipes are liable to fracture, permit me to call your attention, and through your paper, that of your readers, to a description of drain which I have used for some years, and have always found to answer admirably, and at the same time at lose cost then drains of at the same time at less cost than drains of

in use some years, but are not so well known

Each brick is 13 inches long, segmental and wedge shaped, and is rebated at the ends, so that they may fit into each other. For a 9-inch that they may fit into each other. For a 9-inch drain, four bricks form a complete circle or gun-barrel-drain; they fit quite closely toge-ther, a very small quantity of mortar or cement being necessary, and the labour is very little. There are two sinkings in the back of each for the workmen to handle them by; these also permit a better action of the fire in burning, and the inside is quite smooth. and the inside is quite smooth. Four of the bricks form a 9-inch drain, at a cost of 11d. per foot. Six of the bricks form a 12-inch drain, at a cost of 1s. 4d. per foot.

The maker is Mr. Hitch, of Ware, Herts, who has had for some time past a depôt for their sale at Lindsey Wharf, Chelsea. I think it only an act of justice to the ingenious manufacturer to mention them, as I consider them the best drains ever invented, and shall ever

use them.—I am, Sir, &c. A BUILDER OF THIRTY YEARS' STANDING. Lambeth, July 1st, 1845.

common brickwork. I allude to Hitch's Drain bricks, for which a patent has been obtained. They have been to their great excellence.

EXAMINATION IN ARCHITECTURE AT UNIVERSITY COLLEGE, LONDON.

Last week we gave the course of examination in architecture as a science: we now add the series of questions as relates to architecture as a fine art.

First Year.

GREEK AND ROMAN ARCHITECTURE.

1. What analogy has the column and its entablature with any object of early invention? 2. In what respects do its various parts corre-spond with those of its prototype? 3. What is spond with those of its prototype? 3. What is the use of the capital? the architrave? the cornice? 4. In which orders does a base form an essential feature? in which not? 5. State the general proportions of the Greek orders of architecture. 6. Which is the essentially distinctive feature of an order? 7. How many orders were there in Roman architecture? 8. In what respects does the Greek or Roman division of the orders approach nearest to the obvious classification of hysical distinctions, or to the relative proportions generally admitted to exist in all objects throughout nature ? 9. Should the axis of the solumn according to the Greek canons be vertical or not? 10. Quote the authorities, whether in writers or examples. 11. Sketch a profile of the Doric capital and the several varieties of anulete. 12. Sketch the varieties of triglyph heads. 13. Sketch and describe the essential differences in the entablatures of the Greek orders. 14. In what examples of Greek Doric buildings are the tryglyphs omitted? How are the gutte of the frieze then ar-tanged? 15. Sketch various forms of gutte. tanged? 16. What do the antse of Greek architecture represent, and where are they introduced, and what proportions? 17. Sketch the capitals of the antee of the Greek orders. 18. Did any the ante of the Greek orders. 18. Did any and what difference exist in those of Græcia propria and Asiatic Greece? 19. State the reasons for considering whether sculpture be or ba not an essential element of Greek edifices. 20. To whom does Vitruvius attri-bute the invention of the Corinthian capital, and on what occasion? 21. Is there any complete exemple of Greek Corinthian and complete example of Greek Corinthian, and where ? 22. Was the Corinthian, Ionic, or the Doric introduced or adopted as the leading order of any principal monuments in Græcia propria? 23. Which was the prevailing order in Asiatic Greece? 24. Give the names and state the orders of the most distinguished temples of European and Asiatic Greece. 25. Into how many classes may mouldings be divided? State the names of the divisions. 26. Draw the profiles of the first class with the names attached. 27. What is the purpose of the crowning mouldings in cornices? What is their usual angle of inclination in Greek buildings? 29. Draw combinations of mouldings. 30. Which were the usual crown-ing mouldings of the cornice of the Greek orders? 31. Was there any moulding peculiar to the Greek Doric and never used in any to the Greek Doric and never used in any other order? 32. Give the name and varieties of profile. 33. Under which class does it come? 34. In which periods of the art were mouldings sparingly and profusely used? 35. mouldings sparingly and profusely used ? .55. Should mouldings or plain faces predominate, and why? 36. Draw some of the sculptured decorations of mouldings with the names attached. 37. Sketch a plan of a Greek decastyle hypethral pseudo-dipteral temple, with the names of the parts attached.

- ... Edyptian Architecture.

^b 38. Which are the earliest specimens of Byptian architecture? 39. What are the general characteristics of Egyptian architecture? 40. Whence is their general impress derived? 41. Is it varied or uniform? 42. State the reasons. 43. Sketch a plan of one of the temples at Thebes. 44. Give a general description of the parts, and describe its chief accompaniments. 45. Into how many divisions may be classified the capitals of their columns ? 46. Give a sketch of two columns of different characters. 47. State the proportions. 48. Sketch and describe the proportions of an obelisk and its pyramidion; its material. 49. Illustrate the value in which obelisks were held by the anecdote related by Herodotus. 50. Describe the influences exercised by the conquerors of Egypt upon its architecture. 51. State the nations by whom Egypt was subjugated, and the periods of conquest. 52. Enumerate the leading works on Egyptian architecture.

THE BUILDER.

Second Year.

MEDIEVAL ARCHITECTURE.

I. At what period and by what Emperor was the Christian faith adopted as the religion of the Roman state? 2. What religious edifices did he construct for divine worship? 3 When were they erected? In what form? Give a general plan of one of the primitive Christian churches, with the names of the several parts attached. 5. Describe the pur-pose or destination of each part. 6. Had the position of these early churches originally any reference to the cardinal points ? 7. State the origin of the term Byzantine, and describe the characteristics of that style of architecture. 8. Give a plan of certain ancient Byzantine churches at Constantinople and Ravenna. 9. Give a plan and section of a Greek church at Athens. 10. Sketch the varieties in the cruciform plan adopted in the Christian churches. 11. By whom were baptistries first built? Enumerate the most celebrated ones. 12. Give plans of some, and state their relative position in regard to the church to which they belonged. 13. Give a plan of the baptistery and Church at Parenzo in Istria. 14. With what previous style is Norman identical, and in what respects? 15. What is the distinctly different feature which prevailed in the Norman and preceding style, as contrasted with that of the subsequent styles of mediæval art? 16. Sketch the varieties of the Norman arch. 17. Give the profiles of the mouldings, plans of columns, elevations of caps and bases 18 Sketch windows with single or double lights. 19. Sketch an elevation and section of a Norman buttress. 20. What was the general form of the altar end of a Norman church, and how called? 21. Sketch the primitive form of a Norman church generally prevalent in England. 22. Give the names of succeeding Gothic styles in this country, and dates of dura-tion. 23. Sketch the forms of arch prevalent in each style, and the varieties in the arch of each each style, and the varieties in the arch of each epoch. 24. Whence may it be supposed that we derive the pointed arch? why? and at what period? 25. State some of the theories of the origin of the pointed arch. 26. Were the caps and bases of the lancet circular or poly-gonal in plan? 27. Of what material were the columns? and why? 28. Sketch eleva-tion and section of buttresses; and in what particular did the lancet buttress present a particular did the lancet buttress present a character essentially different from that of the preceding style? 29. When did the succeeding style commence and finish? and state the origin of the name given to it by Rickman. 30. What is the peculiarity of the door at this period? Sketch one. 31. What peculiarity in the tracery of the windows? 32. Name the different parts of the tracery, and notice any peculiarities in the transoms of the windows. 33. What crowning enrichment exists in the cornice of the later periods, and in what respects does it correspond with a like feature in classic architecture ? 34. In what parts were heraldic embellishments introduced, and when? 35. State instances of heraldic punning in gothic architecture. 36. Sketch dif. ferent forms of shields in the order of their respective epochs. 37. Give a plan of a gothic cathedral, with the names of the parts attached. 38. Sketch plans and sections of gothic vaultings. 39. Define the different features and parts of arch-vaultings, and the classes of ribs. 40. What is the difference between a groin and a rib? 41. Name dis tinguished instances of vaultings. 42. Give a brief notice of mediæval architecture in Italy, and compare it in its progress and results with the architecture of northern Europe during the same period. 43. Lay down the general principles of composition as taught by Durand. 44. Name the most eminent authors on architecture, classified according to the subjects on they treated. 45. State the qualificawhich tions and studies to be acquired by the architect. 46. Give a tabular view of the history of architecture from the earliest periods.

NEW SURVEYOR OF THE DISTRICT OF ST. JAMES'S.—Mr. Charles Mayhew has been unanimously elected to the above appointment, rendered vacant by the death of his father. We feel much pleasure in being able to congratulate him not only upon his success, but also upon the good feeling displayed on this occasion by his professional brethren in not offering an opposition.

STIR IN THE SCHOOL OF DESIGN.

THE disorganized state of the School of Design, to which we have been forced to direct attention on several occasions, has been recently mentioned in the House of Commons.

Mr. Ewart, a few nights since, referring to the dispute which occurred in the School of Design, and which had resulted, he said, if the dismissal of the second master; and the withdrawal of the pupils almost without exception, wished to know whether the discord still continued, or whether there was any hope of its being settled?

ception, wisned to know whether the orscord still continued, or whether there was any hope of its being settled? Sir G. Clerk said, "a difference of opinion unfortunately arose in the early part of this year between the director of the school and some of the masters regarding the principles upon which the education of the pupils should be conducted. Several of the students joined warmly on the side of the master, and expressed themselves disrespectfully of the character and attainments of the director. The council, considering this to be a gross set of insubordination, felt it to be their painfal daty to interfere, by suspanding the pupils whe had so erred until they made an apology. The disagreement still continuing, the council felt themselves under the necessity of changing the second master ; who had accordingly been he would not say dismissed, but removed."

The question now is, how will this step operate as regards the state of things between the pupils and the director, and between the public and the school? Will it restore to this gentleman the confidence of the pupils which unfortunately he seems by some means or other to have lost? We are airsid not; any more than it will make a bad system a good one. The school as at present conducted does not produce such results as are looked for, and some alteration is unquestion: ably necessary. We have feedived a number of letters on the subject, mostly, it must be observed, from the students who objected to Mr. Wilson's system. Although *ex parte*, we insert two of them, in order that the complainants, and as it has proved, the sufferers; may state their own views:--

Sta,—Seeing in your columns a short time since, comments on the "School of Design," I beg to offer a few remarks, tending to shew, if, indeed, it can be more clearly shewn, the total inadequacy of the system pursued there to produce any thing above an humble class of copyists.

copyists. A defect which, in my opinion, lies at the root of the plan is, that no instruction whatever is given in the characteristics of the different styles. When the student enters, he is set to copy indiscriminately a number of casts and other examples, and having, I suppose, obtained a stock of ideas by this means, without any other preparation, he proceeds to "design," or, in other words, to produce a hotchpotch, having a portion of the forms of every, without the spirit of any, style. This is what we should be led to expect, and

This is what we should be led to expect, and this really is the exact character of the tawdry and frigid soi disant designs that are the only productions of the school. But what else could we expect of an institution where nature, the great storehouse of the beautiful, is entirely neglected; where the study of the human figure is suspended and interrupted; where the art of perspective is unknown; where the different styles of art and their respective characters are unexplained, and where even the library is fettered by such restrictions, that very few students can have access to it?

The difference between us and foreign designers is essentially this,—that while they produce real artists, we produce nothing more than partially instructed, half-formed draughtsmen. In fact, now that the only students of promise that the school could boast have been expelled, there is none at present designing of even attempting to design. The School of Design at present is nothing more than a cheap drawing school.

Casts and examples are certainly copied, but as the only end of this copying is to acquire mechanical dexterity, and as the peculiar beauties or defects of none are pointed out, Government might as well have provided bad casts as fine ones at such an expense.

Copies of Raphael's performances are to be found there, and give a pretty appearance to the room, but the grand principles of colouring upon which Raphael laboured are neither

Digitized by GOOGLE

explained nor exemplified: his peculiarities, his manner, his beauties, the student is left in ignorance of.—I am, Sir, &c., H. J. L.

The other writer says :-

SIR,—In your paper of the 21st inst. is inserted a letter upon the School of Design, many of the views contained in which are so thoroughly sound and practical, and much of the criticism so perfectly just, that I trust you will allow me to correct a few mistakes into which the writer has been led, by his being perhaps but a casual visitor at the school.

Your correspondent says very justly, that the conducting such a school would be a fit task for an artist of some twenty or thirty years standing, an assertion the truth of which no one can doubt. As a proof that the council really are of opinion that "with the various examples in the school any man may play the master," allow me to state, that the gentleman whom they have appointed director with a salary of 4000. per annum, is practically ignorant of design.

The writer's *ironical* praise is very just, but it is too bad to place the faults of others upon the back of the council, particularly as they have been recently filling up the measure of their mismanagement themselves; how can any persons, for instance, doubt their just appreciation of the talents necessary for a teacher, when they are told that the council have just dismissed Mr. Herbert, A.R.A., the late master of the figure class, and sub-director, under the plea that he is *too efficient*, and have lowered the salary attaching to that office, in order to insure a less efficient successor? Yet such is the case. In speaking of the students in the last portion of his letter, he is mistaken in calling the paintings, from which they are in the habit of copying, frescoes; they are copies in tempera from the arabesques of Raphael in the Loggia of the Vatican.

Now, Sir, such is the state of dissatisfaction on the part of the students, and of mismanagement on the part of the council, that three months since, all the students in the upper classes of the school felt it necessary to petition the council for a redress of their grievances; that the system laid down by the council in their report might be carried out, and that the instruction there promised might be given : for doing this the students were immediately suspended, and although they laid before the council a series of depositions proving their grievances, still no notice was taken of their complaints; until at last, without any inquiry into the truth or falsehood of the statements advanced by the students, the council issued a notice stating that they would not be re-admitted to the school without individually apologizing to the director for their conduct: thus placing their necks under the feet of the individual of whom they complain.—I am, Sir, &c., PHILO-ALPHA.

An inquiry into the results of the system pursued should at once be made, or we may go on spending money and have nothing but disappointment for our pains.

THE PATENT FIRE-PREVENTIVE PLASTER.

In reply to an inquiry made by a correspondent last week, for an incombustible substance to be used instead of common plaster, we have received a description of the "firepreventive plaster," for which patents have been obtained for England, Ireland, Scotland, and the colonies. It is asserted that perfect security from fire may be attained at a moderate cost by costing the timbers and floors with a thin stratum of the composition, in place of the ordinary lime plaster on the lathing of the ceilings and partitions. The composition is susceptible of all the ornamental forms of cornices and mouldings to which plaster, stucco, or carved wood-work are usually applied, and is capable of a fine polish, and may be painted. The works are in Upper Ground-street, Blackfriars Bridge.

A correspondent, who dates from Kensington, suggests that slate fixed to the underside of the joists to form a ceiling, would tend to prevent the spread of fire.

THE NEW PADDINGTON HOSPITAL.—The first stone of the new hospital (near the Great Western Railway Station) was laid on Saturday last by his Royal Highness Prince Albert. OSMASTON CHURCH, DERBYSHIRE.

THE newly-erected church at Osmaston, near Ashborne, was consecrated, agreeably to public announcement, by the Lord Bishop of Lichfield, on Friday, the 27th ult. This edifice, of which the first stone was laid on the 8th June, 1843, has been built at the expense of Francis Wright, Esq. (of Lenton, near Nottingham), and will cost, when completed, eight or nine thousand pounds. Mr. H. J. Stevens, of Derby, was the architect; Mr. William Evans, of Ellastone, was the builder. Was obtain the following constants of the 11

We obtain the following account of the old and new structure from the Derby Mercury :--

"To satisfy the archæologist and antiquarian, it may be as well to preface our descrip-tion of the new church by stating that the ancient structure, which was dedicated to St. Martin, and stood a few yards to the south-ward of the present building, did not contain any interesting features, either in form or detail; a very early date may be assigned to the original foundation of the church, and if the name of the village denotes clearly its Saxon origin, we may venture to imagine that a church might even have existed in that remote period. The old walls, however, exhibited no peculiar construction, or style of ornament, and the greater part were evidently of a comparatively recent date; some very unsightly modern ad-dition had been made some years since for the purpose of increasing the accommodation, but it was found to be still insufficient, and thoroughly inconvenient in arrangement. It was much out of repair, and therefore beyond its doubtful antiquity (which was much more than counterbalanced by its want of beauty), no good cause could be shewn why the liberal intentions of the founders of the new church should not be carried into effect—and the work of demolition commenced, and was carried on without regret; but, on the contrary, with confident expectation on the part of the parishioners that the latter house would greatly exceed the former house in convenience and beauty.

The old font, which is still preserved in the churchyard, as a memorial of the past, is so much decayed that little more than its octagonal form can be ascertained, and that it was probably of late perpendicular character. The new building is situated nearly in the

The new building is situated nearly in the centre of the ancient and unusually picturesque churchyard, in which some venerable yews and Scotch firs contribute largely to the general effect. The churchyard has been inclosed by a low lime-stone wall, which, from being only slightly raised above the level of the ground within the inclosure, and just affording a sufficient protection from the road, has the appearance of a substantial broad base to the church.

It is evident, from a general view of the structure, that the prevailing idea which the founders and their architect sought to carry out, were the principles adopted by our fore-fathers in the construction of the numerous village churches which form so many bright spots in this our beautiful country. It consists of a nave, ailses, chancel, west tower, south porch, and vestry; the material employed for the main portion of the external walls is the mountain lime-stone, from the property of Sir Henry Fitz Herbert, near Tissington, and freestone from the quarries at Stanton, near Ash-bourn, is used for the windows, doors, buttresses, and all moulded and ornamental portions of the building. The fine dark grey of the former is agreeably contrasted with the light tint of the latter, and is in excellent harmony with the grassy carpet of the churchyard, and the deep tones of the old trees. Black Westmoreland slates are used for the covering of the nave, chancel, porch, and vestry, the roofs of which are high pitched, with free-stone ridges. The aisles and tower are covered with ridges. The aisles and tower are concrete in lead. The general architectural character of the building and detail is the late decorated, or that style as it prevailed in this country during the middle of the fourtcenth century. The whole building stands upon a bold, doubleweathered base, with the addition of an extra base moulding in the tower. The aisles are divided by strong buttresses into four com-partments. The principal entrance door occu-

design. The walls of the aisles are not more than 16 feet high, and are crowned by a low parapet. In the cornice immediately over each buttress, which are double at the angles, carved heads have been introduced, in some of which, we recognize likenesses of the reigning sovereign, Prince Albert, the Archbishop of Canterbury, &c.

The quadripartite arrangement of the aisles is continued through the nave, which has a low clerestory, pierced on each side by squareheaded windows of two lights and trifoliated heads. Instead of a parapet to the nave, a beld cornice is introduced, with earved paterse at close intervals in the hollow of the same, and the spout is formed in the upper member. The walls of the chancel are 18 feet high

The walls of the chancel are 18 feet high with cornice and spout of similar character to that of the nave; the east end is pierced by a large four-light window, with flowing tracery in the head; the south front is divided into three compartments by bold buttresses, sloped at the first stages, and terminated at the line of the eaves cornice by weathered hoods, with crockets and finials, and deeply suck trefoil in the face; each division and that nearest the east end on the north front, is pierced by twolight windows, the modilings and design of which as well as the east window, being of a more elaborate character than other parts of the church.

The tower is entirely disengaged from the nave and aisles, and is in three stages, and 69 feet high to the top of parapet; there is a low door on the west front for access to belfry, w three-lighted window over the same in the lowest stage, a circular dial carved in stehe, of the south side—in the second—and a double two-lighted window, on each face of the upper stage; these windows are bold in character, and the slopes of the sills agule; the divisions of the stages are marked by free stone strings, and weatherings, whield reduce the width of the tower at the upper part; there are double rectangular buttresses at the angles, and a partially engaged octans gular stair turret at the north-west angle; the former are terminated by crocketted pinnecles; the latter by piercings on four of its facesy which rise slightly above the tower—crockletted gables on each face; and a comical reofy crocketted on each angle, and crowned by a bold gilt vane. The parapet of the tower is pierced, and the panoramic view from the top is very extensive and comprises scenery of no ordinary beauty.

The porch has a bold doorway with shafts; carved capitals and the hollows filled with ball-flower ornament; angular buttresses with considerable projection, terminated above the coping by crocketted hoods; a cornice and eaves with carved pateræ, and an cariches finial at the upex of gable.

The vestry is octangular and connected with the north side of the chancel, and the east end of the north aisle by a porch, covered with lead, in which the door for the minister is fixed. There are two light windows in two of the faces and buttresses at each angle, termis nated by sloped weatherings; the walls are crowned by a plain moulded cornice, and east angle of the conical roof is finished by a graduated moulding with large carved orns f ment at the apex.

Having completed our survey of the exiterior, we will enter by the south porch, which is 10 feet long by 8 feet wide in the clear; each side is occupied by a stone seat, with four arched recesses over the same. The roof is entirely open, and consists of three main and two wall ribs of bold dimensions, springing, from stone carved corbels in the spandrils of the arches. The entrance door is of oak, and derives its principal ornament from a pair of elaborately wrought-iron hinges, which nearly cover the door; lock, latches, handles, escutcheons, being all of massy and similar character.

during the middle of the fourtcenth century. The whole building stands upon a bold, doubleweathered base, with the addition of an extra base moulding in the tower. The aisles are divided by strong buttresses into four compartments. The principal entrance door occupies the westernmost division on the south side; the other three, the two central ones on the north side, and the east end of the south aisle, are pierced by three-light windows, the west ends of both aisles by two lights, the heads of which are filled by elaborate tracery of varied

The fittings are all of oak, and the doors, both external

THE BUE DEF

and internal, are of the same material, and hung with floristed strap hinges, with other iron-work to correspond. Returning to the west end, we find the lowes part of the tower open to the church, in which the westwindow has a very good effect. The accommodation for the children is provided in low one spats, of similar character to the remainder ; behind of similar character to the remainder; semina which, and under the tower, the choristers' seats are placed, the extreme back rising con-siderably higher than the remainder; forms a screet, and conceals the entrances to the belfry, There were one or two small old bells in the former tower ; they have been substituted by a fine peal of five, cast and fixed by Mears, of Whitechapel; a clock also is ordered, and there does not appear to be any thing forgetien which can conduce to the comfort and good feeling of the parishioners. We should state feeling of the parishioners. We should state in conclusion in the theodern's to capable of accommodating the whole parish, and that its internal dimensions are as follows : -- Nave, 46 fast longs 12 feet wide, 38 feet 6 inches high, to the point of roof; each alale 46 feet long, 11 fest 10 inches wide, 16 feet 9 inches high to 1481 40 inches wide, 10 test 9 inches high to the highest part of nonf; chancel, 28 feet long. 15 feet wide, 30 feet 3 inches high; tower, 14 feet square within, 26 feet high to the point of groin; vestry, 11 feet diameter, 22 feet 6 inches high to apex of roof; extreme length of church from east to west, 94 feet; extreme width of church from north to south, 45 feet 2 inches.

NEW CHURCH AT CLIFTON IN ASHBOURN. THE consecration of this church by the

bishop of the diocese took place on the 25th ultimo. No time has been lost in its erection, for the first stone was only laid on the 4th of September last. The Derby Mercury, in de-scribing the structure, says "It is exceedingly simple is plan, and the design evinces throughout a studious attention to economy. It con-sists of a nave 58 feet 6 inches long, 25 feet wide, south porch, and a vestry opposite the same on the north side; corresponding there-with. The style of the building is a transition from early English to desorated, and is built of Stanton stone. The actional face is not marked with a tool and that is market worked with a tool, and has a substantial effect. The roof in high pitched, and covered with Newcastle tiles; there is an octangular bell turnet constitution the sectst gable with bell turret constructed on The retest gable with a conical roof and vane. - The east gable has a floristed ernse. There are two single-light windows in the west end, and the flanks are pierced by windows divided into two lights, by a bold mullion, the spandrils, being filled in with trefoils and quatrefoils, the seat window, has there light of bold characteristic has three lights of bold character, similar to those, on the sides. The jambs of the porch doorway have shafts with capitals and bases. There is nothing worthy peculiar notice in the interior, the limited funds, not allowing much scope for architectural display. The roof is and has four main trusses of arched form, springing from stone corbels in the walls; the sease are low, open, and, as well as the roof, stained and warnished. The arrangement of the pulpit, reading desk, and communion rails, at the east end, is novel and satis-factory. The pulpit is of stone semi-hexagonal in form, and rests upon a low inverted pyramid. steps, constructed in a receas, the face of which arghes resting upon alender shafts. The font is of stane, and good dimensions, and all the other furniture of the church has been designed in a consistent style. An ancient chapel stoad on the site of the present building, parts of its foundations are now remaining. The churchfoundations are now remaining. The church-yard is well situated, and inclosed in a substantial manper by a stone wall,"

The architect was Mr. Henry J. Stevens, the same gentleman who designed the church described in the preceding article. The works were rescuted by Messre, John Wood and Edwin Thompson, of Derby.

HARRIS'S PERIDONEUS .- Under this title is registered an admirable arrangement for is registered an admirable arrangement for binding temporarily the current numbers of periodical works, loose music, or MSS. The buyers of THE BUILDER will find a peridoneus specially prepared for it at Kennett's in Yorkstreet.

SMOKE PROHIBITION BILL

time with the transmer

He was 2 "But, Mr. Dredge seems to be labouring under some error in his communication to your journal of last week relative to the nature of the accidents it Derby shid Autoni-under Lyne, which were not occessioned by erroneous principles of construction. The former, I believe, originated in consequences of the centres having been struck too early as from the extreme wetness of the season the mortar had not become sufficiently inducted. mortar had not become sufficiently indurated, the latter from defective workmanship in the piers. In the event of a failure, from defective workmanship or other causes, in the piers tive work manship or other causes, in the piers or towers of a suspension bridge, even on Mr. Dredge's principles, I am inclined to think it would be fatal to the structure. Notwith-standing the beautiful aerial appearance of suspension bridges suitable for some situations, I am vary much in favour of bridges of fixed principles for heavy, general traffic, where great strength and derability are required. If suspension bridges are so "perfectly quiescent," as Mr. Dredge would wish us to suppose, why are they not adapted on railsuppose, why are they not adapted on rail-ways, where lightness and economy of con-struction are considered so essential ? atri

Miscellanea.

'PALL OF HOUSES IN WELLCLUSE SQUARE. -Un Sunday morning last about 3 o'clock, the presestin the possession of the Rev. Mr. the prenarses in the possession of the feet. My, Smith, 17, Wellchose-square, and which were pecupied as a Mariners' Church and Sallors' Orphan Asykim, together with a public bound known as the Mabagany Bar, and the upper part of the adjoining premises, fell with a tremendous crash. It is stated that some months since, when a saloon at the rear of the public-house was being built, an excernation was made for a cesspool, and that several alors, ations affecting the stability of the same premises were also made. These facts, together with the dilspidated state of the buildings, afford a reasonable solution of the cause of the accident, akhough the immediate cause - ie stated to be the removal of the floor of the church. Most fortunately, all the isomates escaped unburt.

ENLARGEMENT OF NEWGATE MARKER A long discussion took place last week in the Court of Common Council on the enlargement of Newgate Market, as recommended by the Markets Committee in their report their pro-sented. Mr. W. Jones, the obstrain of the committee, informed the court in saling their committee, informed the court, in calling their attention to the report, that the limit of the amone which might be required to be be the market was 60,000Å. The report was did mately referred back to the committee with instructions to report the present area of Newgate Market, the space proposed to be added, the sum estimated to be exected. the plan of the building intended to be exected.

LIGHT FOR ALL NATIONS. A few days since Admiral Dundas presented a petition to the House of Commons from Mr. Bush, atating that he had constructed a column on the Godwin Sands, and praying that the work might be inspected by a scientific engineer, with the view of erecting a light-house and fortifica-tions for the protection of the trade in the Downs. It was referred to the committee on light-houses,

TO CORRESPONDENTS.

"G. R. F." has our best thanks, although we were unable to avail ourselves of the MS.

"D. M." (Exeter). - We shall be glad to receive the account offered, but cannot undertake the expense of an engraving.

"F. T. "-We regret that we cannot avail ourselves of the MS. sent. It shall be returned by post on receiving a request to that effect. Even as a voluntary contribution we could not insert the whole of it. As regards Maude's cement, obligingly aned in second letter, we have not had sufficient experience of it to warrant unqualified praise.

"J. 8." We should probably mislead our cor-respondent by replying to his inquiry without sce-ing the premises. He can reinstate the boarding spiece at a time without difficulty.

"Querente," suggests that we should publish the answers to the two series of questions which formed the architectural examination at University College. This would be to write a large book There are many points in them on which we should be glad to receive communications.

"H. T." Plasterer. — We regret that our ar-rangements will not permit us at this time to give the diagram he requires.

"W. G. P." (Blackheath.) — The district sur-veyor named seems bent on rendering himself and his office unpopular. We do not wish, however, to appear too severe. "A. D." "Amateur." "P. P." "Strict."

Our kind correspondents should bear in mind that, as we have before said, we have more than one class of readers to consider. They would be satisif this if they were to see each other's letters
even in the present case.
"W. A." (Yorkshire.) — The importance of a

"W. A." (IOKSDIPE.) — The importance of a good school cannot be over-rated. Such an educa-tion as our correspondent wisely proposes for his son would fit him to take a good place in the pro-fession and the world. We are unable conscien-tiously to name a school at this moment, but will inquire.

"Mr. Wood."—A parcel is left at the office : it is that be forwarded if Mr. W. will oblige us with his address. Many apologies are due to him.

"T. L.' Cooper and Son, founders, of Drury-lane, may be depended on for the iron girders required, and will afford every information.

"A. R.* (Pimlico.)-If we mistake not, an en-graving has already appeared elsewhere of the column sent.

"E. S."-We should be glad to insert a repr sentation of the new front, but think that the drawing sent is hardly effective enough. It is left at the office with many thanks.

et the office with many thanks. "J. C." complains with justice that few recent architectural works are to be found at the British Museum. By sending a list, as he proposes to Sir Henry Ellis, the principal officer, attention will be drawn to the circumstance in the proper guarter. It cannot be denied that the regulations in force press heavily on architectural authors, nor woodered at that they are evaded where evasion is vossible.

" J. E. G."-We have several fonts in hand at this moment, and cannot promise immediate atten-tion to the specimen sent. With our correspondent's leave, we will retain it a short time. "B. Green."—We are disposed to engrave the

diagram sent, but cannot speak positively at

present. "Veritas," "B. B.," and "C. Mallet" next week.

ADVERTISEMENTS.

SATURDAY, JULY 12, 1845.

RRANGEMENTS are being made, under the direction of Mr. Decimus Burton, preparatory to raising the colossal equestrian statue of

the Duke of Wellington, now nearly completed by Wyatt, to its illchosen destination,—the top of the triumphal archway leading into St. James's Park. A strong inverted arch is about to be formed under the opening, and other precautions are to be taken to prevent unequal subsidence.

We fear it is too late to strive against the unwise determination to place the group on the structure in question; the press, as reprecentatives of public opinion, were loud in their outcries against it at the time (1839) when a wooden model of the statue was set up, to the great alarm of wondering nursemaids and the crows; and, as their remarks were not then listened to, it is hardly likely, now that the arrangements are more forward, that the ruling powers will be induced to abandon their intention. Still we cannot avoid making one effort to that effect. The top of a triumphal arch, complete in itself, is not a proper place for a commemorative figure. One of two evils is certain to result : either the archway must be degraded into a mere pedestal, or the figure must lose its individuality and purpose, and become simply an adornment of the arch.

It was urged at the time we refer to, by those who wished to place the statue on the archway, that Mr. Burton, long before the Wellington statue was proposed, had suggested that a group of figures was essential to the completeness of his design; and it is very likely he did: but we will undertake to say he never desired a figure so large as entirely to destroy the importance of the structure, or, in fact, that it should be any thing more than an ornamental accessory. If they had made the structure the "Wellington Archway," and placed a quadriga, or figures, of a moderate size upon it, it would have been complete in itself and unobjectionable, excepting on the ground of situation ; but by placing one monument on another, as they are about to do, degrading one without advantaging the other, they are, to speak in the mildest way, depriving the metropolis of one additional adornment, and committing a grievous mistake.

We referred to the situation of the archway. When it was first proposed to place the figure there, the writer of the present no ice urged that it was objectionable as regarded the duke's own feelings. Behind Apsley House stands "Achilles," to the occasional embarrassment of him whom it honours; and now that his grace may have no means of escape by turning to the Piccadilly side of it, this second memorial is to be placed there to stare him and his graces out of countenance.

Observe, too, the position in which the group must stand; crossways, presenting the flank of the horse to all who pass beneath it,—as unprecedented as its effect will be unpleasant. Surely we have not so many public monuments in London that we can afford to sacrifice two at once? Let us leave the archway as it is, making it perfect, if you please, with accessory figures, and form a proper pedestal for the colossal statue in some of the many fine sites in London which require adornment. Look at it in which way you will, the present intention is full of objections, and, if carried out, will prove a great reproach.

HONOUR TO ARCHITECTURAL LITERATURE.

THE Castle Hotel, Richmond, was on Monday last the scene of the most gratifying meeting we have had to record, namely, a public dinner given to Mr. John Britton, the indefatigable antiquary and topographer. The numerous fine works which that gentleman has produced, illustrating the architectural triumphs of England, have led to a wellmerited expression of gratitude and admiration, not only from professors and students of architecture and engineering, but from literati, artists, and others.

To present Mr. Britton with a permanent testimonial of the high estimation in which his labours are held, a subscription has recently been opened, which already amounts to above 300%. The meeting on Monday was a supplementary feature of the project.

Owing to the unavoidable absence of Mr. Wyse, M.P., in consequence of the debate in the House of Commons on the Irish Colleges Bill, the chair was taken by the treasurer, N. GOULD, Esq., who conducted the business of the evening very efficiently. Near to him were seated Mr. Britton, the Dean of Hereford, the Rev. Dr. Ingram (President of the Trinity College, Oxford), Professor Hosking, W. Tite, V.P. of the Architects' Institute, Capt. Smyth, Lieut. Stratford, Mr. J. D. Harding, Dr. Conolly, Dr. R. Dickson, Mr. D. Roberts, R.A., J. B. Nichols, F.S.A., Mr. Lewis Pocock, F.S.A., Mr. Gaskoin, Mr. Wansey, F.S.A., and Mr. Rainy. Mr. Wm. Tooke, F.R.S., and Mr. Wm. Jerdan, the veteran editor of the *Literary Gazette*, acted as vice-presidents, and were supported by the Rev. Dr. Rees, the Rev. E. Tagart, Mr. Brayley, Mr. Maugham, Mr. S. C. Hall, F.S.A., Mr. B. H. Smart, Mr. Ingram, Mr. Corner, F.S.A., Mr. J. Timbs, and Mr. C. F. Whiting. There were also present, Mr. Fowler, Mr. Booth, Mr. Mair, Mr. Douthorne, Mr. Chapman, Mr. Herbert, Mr. W. Cubitt, Mr. Grissell, Mr. Dunnage, Mr. E. Hall, Mr. Crew, Mr. Sealy, and many others. After the usual loyal toasts had been given,

the CHAIRMAN, in proposing the health of Mr. Britton, expressed his regret that Mr. Wyse was prevented attending, as he would have been much better qualified to do justice to the subject. He, however, could speak of Mr. Britton from long acquaintance, having associated with him at a Board of Commissioners, to which for upwards of thirty years that gentle-men had been attached in the discharge of onerous duties, with their entire satisfaction and with honour to himself. Mr. Britton was not ashamed to have it known that he was of humble origin, and that he had not had the advantages of education in his youth; but he had been both the builder and the architect of his own fortunes, and by unwearied industry and perseverance he had succeeded, in spite of every disadvantage, in producing those works which had placed him in his present position. (Great cheering.) By a paper which he then held in his hand, he found that the number of those volumes was 66; besides numerous, almost innumerable, essays; that they com-prised no less than 17,122 pages; and such of them as had ever attempted to write even twenty pages would be able to appreciate the labour. The engravings in Mr. Britton's works were 1,866, and their beauty and accuracy were well known; and to come to a matter which he, as a commercial man, might be supposed to know more about, the money expended in these productions amounted to the enormous sum of 50,3281. (Renewed cheering). And all of these, it should be remembered, were essenthese, it should be remembered, were essen-tially useful and instructive. That day was Mr. Britton's birth-day; on that day he entered upon his seventy-fifth year; and his whole life had been actively and industriously whole life had been actively and industriously spent. He rejoiced to see amongst them on that occasion a gentleman whose name, in conjunction with Mr. Britton's, was well-known. He alluded to Mr. Brayley. (*Cheers.*) It was unnecessary for him to enlarge further on these topics. Whatever the testimonial to

be hereafter given to Mr. Britton might be, he was sure the committee would give it with the same sincerity as he then proposed his health and happiness. He only regretted that he had no son to whom his virtues might descend, and who in pointing to his many works, and to the record of the measures then in progress, might say with pride, "that was my father."

The toast was drank with the greatest enthusiasm; the cheering lasted for many minutes.

MR. BRITTON, with much feeling, addressed the meeting as his "kind friends;" and said it had been his intention to have given them some lengthened account of his struggles and his exertions; but he found old age creep upon him, and having been suffering for a week past from indisposition, he felt that such an effort would be imprudent. He had never had the advantages of a collegiste or aca-demical education; indeed, when he was about ignorant either of a grammar or a dictionary; but he was thereby induced to procure and study both books. He alluded to his confinement, in his youth, to the cellar of a wine-merchant, for six years, where he contrived by great industry to do as much work in six great industry to do as much work in six hours as his fellow-apprentice did in ten, enabling him to devote four hours so gained to mental improvement. Throughout his life his works had been received with much kind commendation; unkind remarks (which no man could escape), although he felt them at the time, only stimulated him to further exertions. He had consequently been able to publish the many works referred to by the chairman, and which he might say without arrogance were of utility and importance. Only one or two of them could be considered as of an ephemeral nature ; yet although he had always made every effort to ensure the strictest accuracy, none of them had completely satisfied his own judgment. With reference to the testimonial p posed to be offered in kind approval of his works and his exertions, he had at once refused to accept a piece of plate, or any com-pliment of a pecuniary kind. He had confided the decision on that point to a committee, who he was convinced would adopt some plan which while it would be gratifying to himself would combine some benefit to art and literature. He thanked them for the cordiality with which they had received the toast, and trusted that the younger of them would be led by these proceedings to acts of emulation, and that they would all feel, like him, delighted, honoured, and gratified in the last hours of life. (Great

арраизе.) MR. W. Тоокв proposed the "Society of Antiquaries" in a short but able speech, which was replied to by DR. INGRAM.

THE DEAN OF HEBEFORD, in proposing the health of the chairman, commented at considerable length on the works of Mr. Britton.

THE REV. DR. REES then gave the health of the honorary secretaries, Mr. Godwin and Mr. P. Cunningham, and took occasion to offer his testimony to the worth of Mr. Britton, and the value of his labours.

MB. GODWIN said, before he thanked them for the kind manner in which they had acknowledged the small services of his colleague and himself, he would, in pursuance of his duty as secretary, read a letter from Mr. Wyse, to shew that his absence had not proceeded from want of desire to be present. The letter was as follows:--

" House of Commons, July 4th, 1845.

MY DEAR SIR,—I have just learned from Sir James Graham, in answer to my question in the House this evening, that it is the intention of the Government to take the Colleges Bill (Ireland), the first of the orders of the day, on Monday. The bill being still in committee, demands the close and uninterrupted attendance of every Irish member, and I especially, from the long solicitude I have felt on the subject, feel myself more particularly bound to watch over its progress. This will compel me most reluctantly to sacrifice the honour and gratification I had anticipated in presiding over the dinner intended to be given to my friend, Mr. Britton. I cannot tell you or him how much I feel this disappointment; I had hoped it would have afforded the opportunity I have so long desired, of expressing my own sense of the many obligations which our

325

national antiquities owe to his zeal and intelligence, and have been the organ in so doing, of what I believe to be the sentiment of every one acquainted with his long and most meritorious and useful labours.

I also desire to be afforded an occasion, and none could present itself more favourable to the purpose, of calling the attention of the supporters and appreciators of our early arts to the want of which we all feel and deplore, of institutions for their preservation. The issue of my late motion in the House of Commons is proof of how much remains to be done, to place us in this respect in the position which we ought to occupy. The interest which the public takes is not, I trust, to be mea-sured by the apathy of public men, and I can-not but believe I should have found an echo

amongst the gentlemen whom I had hoped to meet, to my strong feelings on the subject. Though compelled by this mal apropos to give up the pleasure to which I had looked, I hope you will not less believe I most warmly sympathize in the object of your meeting, and hope I may be afforded, on some future occasion, the means of enlarging these expressions of regard and respect to the object of these honours-Mr. Britton.-I am, dear Sir, yours THOMAS WYSE. very truly.

The same cause, continued Mr. Godwin, had kept Mr. Home away, who had stated ín a letter that he "was desirous to shew that re-spect to Mr. Britton, which his long and va-luable services merit." He had also received luable services merit." He had also received letters regretting inability to attend from Lord Northampton, Lord de Grey, Mr. Cockerell, R.A., Mr. Barry, R.A., Mr. Uwins, R.A., Mr. Pickersgill, R.A., Mr. Neeld, M.P., Mr. Do-madson, Mr. Ludlow Bruges, M.P., Mr. Baily, R.A., and fifty others. The first-mentioned dis-tinguished and amiable nobleman said in a letter to Mr. Britton : "I must conclude by miching to Mr. Britton : " I must conclude by wishing that you may long live to remember it as a satisfactory proof of the sense of your coun-trymen of your important services to the knowledge of medieval architecture." As regarded the office of secretary, he (Mr. Godwin) had accepted it as a duty, —as a slight ac-knowledgment of the advantage he, in common with other architects, had derived from Mr. Britton's works. Every lover of our ancient Britton's works. Every lover of our ancient architectural glories, every man studying to acquire the power humbly to imitate them, was much indebted to him. By placing faithful representations of these buildings before the public, and rendering topographical literature agreeable as well as instructive, he had led them to appreciate these structures, and had mainly induced the present improved state of feeling on the subject. What should we know of many buildings now destroyed, if they had not been faithfully depicted and described, and how many more would have been destroyed but for the preservative spirit inculcated.

Out upon time, who for ever will leave, But enough of the past for the future to grieve, O'er that which hath been and that which must be : What we have seen our some shall see ; Remnants of things that have passed away, Fragments of stone reared by creatures of clay !

How much then we owed to those who had ravished these noble works from the grasp of time, and induced a general desire to pre-serve them. He should have felt gratitude for this even as a stranger, but having had the gratification of a long connection with Mr. Britton, and having always found him a warm friend and a good man, there was still stronger reason why he should give all the aid in his power to the present endeavour to gratify him. This was but the beginning of the end,— which end was to present to Mr. Britton some permanent testimonial of respect and esteem, and until that was effected, they might still command his services.

DR. CONOLLY proposed "The Royal Institute of Architects," and connected with it the name of Mr. Tite. In the course of an eloquent speech, the doctor mentioned amongst other services for which thanks and praise were due to Mr. Britton, was the restoration of the church at Stratford-upon-Avon, the burial place of Shakspeare, mainly brought

about by his remonstrances and advice. As regarded the Institute, he was glad to learn that it had served to bring the members of the profession more closely together, and to induce kind feeling.

MR. TITE in replying to the toast (which he did very ably), acknowledged, on the part of the architects of the country, the lasting debt of obligation due from them to Mr. Britton, strongly contrasting the present state of general information on the subject of ecclesiastical architecture with its position before his works were published. MR. GODWIN said he was deputed to pro-

pose a toast which could not fail to interest a meeting like that present, although from the lateness of the hour he feared to address them at any length. The toast was "the an-cient fraternity of Free-Masons." The freemasons of to-day were known only in con-nection with good dinners and very great charity, but in former times, as they well knew, the freemasons occupied a different position. It seemed clear that the greater number of the magnificent works produced in the middle ages were erected by bands of men having in some degree a religious cha-racter, and protected by certain enactments, who were in fact the freemasons, progenitors of the present lodges. Without going into a long story, this fact accounted for several phenomena observable in tracing the history of architecture, and which might have inter ested them if there had been time for comment. There were at the table (continued the speaker) several of the largest builders of the day, Mr Cubitt, Mr. Grissell, Mr. Herbert, Mr. Elger and many others, who each in themselves re-presented large bands of freemasons, — men who had built miles of sewers, covered new London with squares and terraces, and old England with interminable railways; and this made the toast more fitting still, especially as several of them were high in the mysteries. He did not know that they could still sing—

"High honour to masons the craft daily brings We're brothers of princes and fellows of kings :" but he did know that they practised charity and the virtues, and if they did not teach Euclid, they still inculcated morality. In order that he might bear witness to this, in at least one case, he would couple with the toast the name of Mr. William Cubitt, not simply because he was a distinguished member of the craft, but because he was an old and warm friend of Mr.

Britton. MR. WILLIAM CUBITT made one of the best speeches of the evening in return, but the hour was then so late, that to take notes was out of the question.

"The Royal Academy" proposed by the chairman, called up Mr. DAVID ROBERTS in reply, and Mr. S. C. HALL appropriately terminated the proceedings with some excel-lent remarks full of feeling, on the value of a kindly demonstration in favour of one who still lived, as compared with posthumous honours.

THE ARCHITECTURE OF VENICE ILLUSTRATED IN THE WORK OF CICOGNARA.*

WITHIN the memory of persons yet living a republic which had passed through many centuries unchanged, though often menaced by foreign and internal commotion, has ceased to exist. Its city was the centre of much en-terprise and traffic, and its children imprinted signs of their presence on the shores of distant lands. The Venetian masonry is found added to that of older date in every Grecian acropolis; and one of their castles is seen on the Red Sea in Arabia. The fugitives from the ravages of Attila in the fifth century, and from the invasion of the Lombards in the seventh, were the ancestors of those, who contested with Genoa more from mere motives of rivalry than the attainment of a definite object. The same "hundred isles," which are formed from only the slime of neighbouring rivers, were the seat of that people whose merchants were princes, and of the most brilliant school of painting, that the world has known .-

"The Rialto, where merchants most do congregate'

became the centre of a government, whose policy was the riddle and admiration of Europe, but was stained by the records of crime. From circumstances apparently ad-deducible, and in the midst of the islands in the Lagune-a surface of water from twenty to

• " Le Fabbriche più cospieue di Venezia misurate illus-trate ed intagliate dai membri della Venezia Reale Accademia di belle arti.-Venezia, 1815-20." In two vols. folio.

thirty miles across, but which, except where intersected by the deeper channels of the rivers, is seldom more than one or two feet in depth arose a state, whose dominion extended over half the empire of ancient Rome, and whose palaces, though shewing a peculiar style of architecture, are hardly surpassed in that city. The fall of Venice at the close of the last century, before the arm of that revolution, whose influence penetrated into every part of the world, exploded the mystery of centuries, and revealed the internal policy and condition of the state. In the works of condition of the state. In the works of Sismondi and the Count Darn, Venetian his-tory has been ably treated : and from the work now before us we gain an accurate conception of the several styles of architecture, and of the order of their influence. This elaborate work was undertaken by members of the academy of fine arts at Venice, under the presidency of Count Cicognara, and gives rapresentations of all the buildings of any impor-tance. The work is throughout of the most elaborate character, and, like many others appearing from the academies of Italy, suggests a slight contrast to the spiritless existence of similar bodies at home. Two thick folio volumes of plates, carefully engraved in out-line, and interspersed with letterpress, are de-voted to the subject. They consist, of plane, elevations, and sections, but have not the set-vantage of perspective views, in which per-ticular the book is inferior to the companion work on Genoa,* which we shall shortly take occasion to notice.

The earliest remaining architecture of Venice had that Byzantine character, which prevailed on the continent of Italy. The church in the island of Torcello has stilted arches, springing immediately from capitals of Byzantine taste. The cathedral of St. Mare, generally held to be the work of Greek artists, shews a still greater tendency to the Gothic style, in the crocketed and ogee canopies in its style, in the crocketed and ogee canopies in its exterior and interior. It has the plan adopted in the Greek church, occupying a space of ground nearly square, at the end of the piazes of St. Marc, where the piazetta joins it at a right angle. At one end of the latter is the detached Campanile, immediately opposite the cathedral, and at the other and next the grand or the Read Columns the alexating of canal are the Red Columns, the elevating of which gained so great honour for a Venetian architect. Immediately contiguous to the cathedral, is the Ducal Palace, having one front in the piazetta, and the other looking on to the grand canal. "The Bridge of Sighs" joins the palace and the prison, an embodi-ment of that contrast between festive pomp and ment of that contrast between festive pomp and the unrelenting vengeance in the name of justice, which every page in the annals of Venetian history discloses. Nearly opposite the palace, at the entrance to the grand canal are the Dogana and the church of St. Maria della Salute. The cathedral of St. Marc is most remarkable for its numerous domes, but which are not of the heat form and arrange which are not of the best form and arrangewhich are not of the best form and arrange-ment. They shew some knowledge of car-pentry, being entirely of timber construction, elevated above the lower dome. The latter has the proportions and construction observ-able in Sta. Sophia, at Constantinople, and is, as well as the whole building, profusely deco-rated. The timber dome was entirely a feature of effect, far more space being lost in the cavity than in St. Paul's cathedral, where this has been decemed a fault orinany other cathethe cavity than in St. Paul's cathedral, where this has been deemed a fault, or in any other cathe-dral in existence. The front is highly enriched, but still is ansatisfactory, much of the ornament being disproportionate to the façade. The se-micircular pediment, if we may so call it, which was so often used in later buildings over door-ways, is often repeated. The winged lion of St. Marc is displayed, as on all the public buildings, and here are the celebrated bronze horses, at length "bridled." Much of the internal decoration displays consideraof the internal decoration displays considerable beauty, particularly about the great altar, where there is the gothic character above alluded to. The Campanile is square in plan, plainer than some in other parts of Italy; it has a staircase in the thickness of the wall. The upper story, and pyramidal termination, were not parts of the original structure. In

P. Gauthier les plus beaux edifices de la Ville de Genes, folio, Paris, 1824-30.
 † "Before St. Mark still plow his steeds of brass, Their gilded collars glittering in the sun; But is not Doria's menace come to pass? Are they not bridled !" BYRON-Childe Harold, Canto 4.

the church of St. John and St. Paul, the nave has greater length, but the plan is still Greek. Subsequently, we find that the Gothic style, which prevailed in Italy during the 13th and 14th centuries, had considerable influence in Venice, but it must be confessed that the buildings in which it was used display little of that elegance observable in other parts of Europe, or even in other cities of Italy. The "Casa d'Oro" has gothic forms and arches, but has horizontal lines. The external eleva-tions of the Ducal Palace were in the main gothic, but had many peculiarities assimilating them to the buildings of Lombardy. Much beautiful carving is observable about the capibeautiful carving is observable about the capi-tals of the columns. The Porta della Carta, the gate of entrance to the Ducal Palace, belongs to the 15th century; it is still gothic, but has a square-headed door, apparently of the same date. The arch in front of the Giant's Stairs, in the same building, has some eurious pinnacles. In the Palazzo Foscari, horizontal lines prevail along with gothic fea-tures; and in the Palazzo Pisani there is the same character, with the addition of quoins, and a rusticated basement. The influence of gothic timete did not last longer in Venice than in other parts of Italy, and before the close of the 15th century, Italian architecture was the the 15th century, Italian architecture was the only style in use. In the 16th century, the talents of some of the most celebrated archi-texts were called into play during a temporary state of tranquility, and Sammicheli, Palladio, Antonio da Ponte, and Scamozzi, left the most remarkable buildings of Venice; whilst in painting we find the names of Titian, Gior-gione, Paolo Veronese, and Tintoretto. The Morentine Samsovino erected the mint, the library of St. Marc. and the Procuratie Nume. library of St. Marc, and the Procuratie Nuove, and sculptured the statues of Mars and Nep-tune, emblems of the military and naval power of Venice, which still stand at the Giant's Stairs.

The style of this period, though corresponding with that of the most important buildings in Rome, Vicenza, and elsewhere, had some local peculiarities, even in the hands of architects, who had practised in other cities. One of these was the extraordinary propor-

tion, which windows and clear openings bore to the general front. Indeed, it might seem that much more light was sought than would be desirable, even where the front was towards some narrow canal or street, but the peculiar feature is equally observable in palaces upon the grand canal, where light would be attain-able in abundance. It has been suggested, that this quantity of light was necessary to the effective arrangement of the numerous private festivals in this city of gaiety and wealth, but we cannot understand the force of the argument. We would venture the opinion, that ment. We would venture the opinion, that the preponderance of voids over solids was a precaution suggested by the questionable nature of the foundation; or perhaps it may be sug-gested, that as locomotion had its difficulties and drawbacks, it was necessary to provide a good view of the scene without, from the apartments. The Palazzo Grimani was the work of Sammicheli and displays the fourse work of Sammicheli, and displays the features alluded to. The arrangement of the cornice, in which height was given to the frieze, that In which height was given to the frieze, that member having windows and decorations, first practised by Peruzzi, was employed in the library at Venice by Sansovino. That beauti-ful building is of two orders in height, the columns being coupled transversely in the thickness of the wall, and the upper entabla-ture proportioned to the whole building. In the intercolumns we find the Vonetian In the intercolumns we find the Venetian window. The art of sculpture—at this period window. The art of sculpture—at this period —contributed to the perfection of architecture, and to render the buildings of Venice es-pecially remarkable amongst those of Italy. The extent of window-opening noticeable in palaces is not found in churches, which is an argument for the propriety of the view, last-mentioned above. Most of the churches were of a date, earlier than the palaces, and in their details are many singular points for notice. Sometimes the fascia was inclined in an exaggerated degree, and the patera of the Doric order was often mitred at the angle. The fronts had often no other opening but the door, Doric order was often mitred at the angle. The fronts had often no other opening but the door, and had frequently inscriptions and projecting panelling. The church of Santa Maria della Salute has the circular plan often employed at Venice, and a larger and smaller dome having a fine effect from all points of view. The thrust of the dome is resisted by a number of large scroll buttresses, upon each of which is a statue, giving the building a peculiar but pleasing effect. In the gate of the arsenal, the singular use of an angular modillion is found. We cannot do better than advise all, who

are interested in the history of Italian archi-tecture not to confine their attention to the graphic part of this fine work. The future state of Venice promises to be more prosperous than her late history, and the junction of the city to the mainland, by the viaduct of a railcity to the mainland, by the viaduct of a rail-way, will probably effect a great change in her condition. Let us hope, however, that such change will not obliterate the records of the past, records which have prompted the poetry of Byron, and afforded materials for the dramas of Shakspeare. E. H. dramas of Shakspeare.

-

CUTTING INTO CHIMNEYS.

AWARD UNDER BUILDINGS ACT, AND MODIFICATION OF A CLAUSE

THE following clause in schedule F. has occasioned some embarrassment.

"Cuttings into Chimneys.—And as to every chimney-shaft, jamb, breast, or flue already built, or which shall be hereafter built, in rebuilt, or which shall be hereafter built, in re-ference to cutting the same, no such erection shall be cut into for any other purpose than the repair thereof, or for the formation of soot-doors, or for letting in, removing, or altering stove-pipes or smoke-jacks, except as directed for building an external wall sgainst an old sound party-wall." This has been held to prevent an owner from enlarging his room by the *removal* of a chinney-breast against an internal wall even, unless he also took down the breast above, although the latter could have been securely

although the latter could have been securely supported without difficulty. The referees, by the following award, recognize the hardship of the enactment, and shew the considerate

view which they propose to take of it. We give first the surveyor's application to the referees on the subject, and his notice to the builder.

District of Saint John, Saint Thomas, and Saint Olave, Southwark, and Saint Mary Magdalen, Bermondsey.

12, Bermondsey-square, April 24th, 1845.

Sin,-I hereby request the determination of the official referees as to the following matters, concerning which, difference has arisen between the builder of the under-men-

Mr. Henry Horlock, of 11, Augusta-row, Spa-road, builder, has cut into, and cut away certain chimney-jambs, breasts, and flues, for other purposes than those allowed by the above Act.

Previously to the commencement of the works hereafter mentioned, a certain stack of chimneys existed back to back in an internal wall of a certain house, situate and being No.3, Grange-road, in the occupation of Mr. Teversham, and was built from the founda-tions which are below the surface of the basement floor upwards.

The whole or greater part of so much of the said stack as extended through the ground story has been cut away, and the upper part of the stack is now supported upon a brest-summer and two iron columns based upon the part of the stack still remaining in the basement story.

The notice of irregularities, of which a copy is hereto appended, was duly served on the builder, and the first-mentioned irregularity has not hitherto been amended.

I have the honour to be, Sir, &c., (Signed) Ковкит Низкитн. "To the registrar of Metropolitan Buildings.

(Copy.)

To Mr. Henry Horlock, of 11, Augusta-row, Spa-road, builder, or to the foreman or principal workman on the premises hereunder mentioned.

I do hereby give you notice, that the build-ing operations now in progress under your superintendence, situate at Mr. Teversham's house, Star-corner, in the parish of St. Mary Magdalen, Bermondsey, are not conformable to the statute in the portions thereof under mentioned; and I require you within forty-eight hours from the date hereof, to amend the same .- April 16th, 1845.

IRREGULARITIES REFERRED TO.

Certain chimney-breasts, jambs, and flues. baving heen cut into for other purposes than those allowed by the said Act; and certain timber being placed under the chimney openings, so that the same is, or will be within 18 inches of the surface of the hearth.

ROBERT HESKETH, District Surveyor. 12, Bermondsey-square."

The following is the award :-

With regard to the house in the occupation of Mr. Teversham, situate and being No. 3, Grange-road, in the district of St. John, St. Thomas and St. Olave, Southwark, and St. Mary-Magdalen, Bermondsey, within the limits of the Metropolitan Buildings Act, 7 and 8 Vict. cap. 84. Whereas the official referees of metropolitan

buildings, daly appointed in pursuance of the said Act, have received and duly considered the information of Robert Hesketh, the surveyor of the said district, against Henry Hor-lock, relative to certain works done by him at the said house, dated the 24th day of April, 1845, containing a copy of the notice of irre-gularity, from the said Robert Hesketh to the aid Heary Horlock, a copy whereof is hereto annexed.

And whereas on the 13th day of May inst. the said official referees did duly hear the said Robert Hesketh and Henry Horlock touching the matters of the said information, and did also proceed to view the said premises.

Now, inasmuch as the works in question have been securely done and are not dangerous as regards fire, and are entirely within the same premises, we the said official referees make no award thereon.

And with regard to the costs and expenses attending this proceeding, we do hereby award that the same be paid by the said Henry Hon-

that the same be paid by the said Henry Hon-lock, that is to say, First, as to the fees and expenses of the office of metropolitan buildings, that on or before the 3rd day of June, 1845, the sum of 24. 5s. 6d. be paid to the registrar of metro-politan buildings at the said office at No. 3, Trafefer-course London

Trafalgar-square, London. Secondly, as to the costs and expenses of the said Robert Hocketh, as such surveyor as aforessid, that on or before the said 3rd day of June, 1845, the sum of J. 1s. be paid to the said Robert Hesketh, at his office, No. 12, Bermondsey-square, or to the said registrar at the office aforesaid.

In witness whereof, we, the said official referees, have to this our award on two pages of foolscap paper, set our hands this 26th day of May, 1845. (Signed) JAS. W. HIGGINS. Off. Ref.

WILLIAM HOSKING. Off. Ref.

ARNOTT'S VENTILATING VALVE.

The clause above referred to prevented the insertion even of the ventilating valve, and the referees accordingly obtained a modifica-tion of it, as is set forth in the following document

"To all to whom these presents shall come, "I'o all to whom these presents shall come, greeting. Whereas by an Act of Parliament passed in the 7th and 8th year of the reign of her Majesty, entitled "An Act for regulating the construction and the use of buildings in the metropolis and its neighbourhoood," after reciting that for the purpose of prevent-ing the avarage provisions of the asid Act ing the express provisions of the said Act from hindering the adoption of improvements, and of providing for the adoption of expedients either better or equally well adapted to ac-complish the purposes thereof, it was enacted with regard to every building of whatever class, so far as related to the modification of any rules thereby prescribed, that if in the opinion of the official referees the rules by the Act now in recital imposed should be inapplicable or would defeat the objects of such Act, and that by the adoption of any modification of such rules such objects would be attained of such rules such objects would be attained either better or as effectually, it should be the duty of such official referees to report their opinion thereon, stating the grounds of such their opinion to the commissioners of works and buildings; and that if on the investigation thereof it should appear to the said commis-sioners that such opinion was well-founded. sioners that such opinion was well-founded, then it should be lawful for the said commissioners, or any two of them, to direct that such modification might be made in such rules as would in their opinion give effect to the pur-

poses of the said Act. And whereas the offi-clal referees have, by their report, in writing, bearing date the 7th day of March last past, certified to us that the invention denominated Dr. Arnott's ventilating valve is an improvement tending to increase the ventilation, and thereby produce a healthier atmosphere in apartments. And that it may be made so as not to counter-act the enactments for security from fire. And that there is no provision in the said Act pro-hibiting its being built into new chimneys, and therefore cuttings for its insertion into chimneys already built may be permitted. And that the present rules in the said Act are inappli-cable, and such as would hinder the adoption of the improvement denominated Dr. Arnott's ventilating valve. And that by a modification of such rules in schedule F. of the said Act such objects will be better attained. And having, on investigation of these grounds, and of the subject matter set forth by the official referees, considered them, and the opinion of the official referees to be well-founded, we, the undersigned, the said commissioners of her Majesty's works and buildings, do hereby direct that a modification be made in the rules of the mid Act. after the last existing clause in schedule F., as follows, viz. :---"And except for the insertion of Dr.

"And except for the insertion of Dr. Atmott's ventilating valve, provided that such cutting be not nearer than 9 inches to any timber er other combustible substance, and that the valve be so arranged as not to be capable of opening more than 30 degrees from its versical position. And that every part of the valve be made and fixed with incombastible materials."

Which modification being made in such roles will, in our opinion, give effect to the purperses of the said recited Act.

LAs witness our hands this 17th day of June, 1845. (Signed)

Commissioners of Gone, Works and Buildings.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

p:

AT an ordinary meeting held on the 23rd alt., Mr. Tite, V.P., in the chair, several presents were received, and Mr. J. Dobson, of Newcastle-on-Tyne, was elected a fellow. A paper was read by C. Parker " On the presenting of the Borne mach by Automatical Science and by Automatical Scienc Proportions of the Beams used by Ancient and Modern Architects." The paper commenced by showing the strongest heam that could be cut out of a round tree, and contrasting the proportions with the usual forms which ancient and modern architects adopted in beams, the former making the breadth, and the laster the depth, the element of strength. It then traced the views that different nations have held and practised in their constructive operations. It stated that the Egyptians pre-ferred the square form of bearing bean, which proportion was used in Solomon's palace, and that the Greeks and Romans used the rectangle placed horizontally. It then remarked that in the timber buildings erested before and after the Norman conquest, the breadth of a beam was placed to resist an opposing force, and so continued to be used in rebuilding of London after the fire in 1666. Prior to this date, the system of double framing was introduced on the continent, and changing the proportion of timbers made the depth preferred to the breadth, which view is now thought correct. The diversity of opinions thus shewn, induced the writer to institute a number of experiments, which were made with iros, from the difficulty of obtaining specimens in wood of equal strength.

The results of these were given; one curious deduction was, that two bars of equal size will not bear double the weight that one of them will support. The same bars formed into the reversed T shape ($\underline{1}$), would support twice the weight that they would carry placed side by side. Making a beam two, three, or four times the width does not make it proportionably stronger. In a conversation on the subject that afterwards occurred, Mr. Tite referred to the tables in Tredgold, and cautioned young architects against unlimited dependence on them; he believed the scantlings there given, to be too slight. The scantlings there given, given for a queen-post roof of fifty feet span were insufficient. He had made a roof in younger days with scantlings in accordance with Tredgold's instructions, and it had failed.

Much was often said of the smallness of timbers used now as compared with those in old buildings; for his part he believed our houses (that was, our properly built houses) were better timbered now than then. He regretted that Mr. Parker had not tried his experiments with timber, instead of iron, as the materials were not analogous. Mr. Godwin directed attention to the report recently made by Mr. Cubitt and Sir H. Delabeche as containing valuable information on the subject of iron beams. Mr. I'anson said the great point was to discover the neutral axis in beams.

A paper drawn up by Mr. G. Bailey, was afterwards read, descriptive of a series of drawings of buildings in Southern India, made some time since under the direction of General Monteith. The drawings comprised some elaborate views of the pagodas, and the palace and choultry of Tremail-Raig at Madura, a city on the Coromandel coast, and erected about the year 1623; likewise of the Great Temple of Shivven, on the sacred island of Ramisseram, between the Coromandel coast and the island of Ceylon, and but little known to Europeans. This temple and its appurtenances almost entirely cover an area of 830 feet by 625 feet. The building is of different periods, a small shrine or temple having existed on the island from a remote period, but the chief additions were made by the Rajah of Ramnad, about 150 years since. Mr. Moon offered some remarks on his improved chimneys. He stated that in consequence of the new Metropolitan Buildings

Mr. Moon offered some remarks on his improved chimneys. He stated that in consequence of the new Metropolitan Buildings Act, and in order to comply with its regulations, he had been compelled to new model the bricks, in doing which he had been enabled to simplify the construction. He observed that different opinions existed as to the space required for the emission of smoke, and that various sizes and diameters had been adopted. In his original formation he adopted three sizes, but experience and attention had brought him to the conclusion that one size was sufficient for ordinary purposes, viz., 10 inches diameter; which, bonded and worked in a wall two bricks thick, and complied with the stipulations of the Building Act, by leaving 4 inches of solid brick at the thinnest point.

4 inches of solid brick at the thinnest point. July 7th. — Mr. Pocock in the chair. A paper was read by Mr. Edward l'anson, jun, on a mosaic pavement in the cathedral of Sienna. Mr. Scoles afterwards made some remarks on columns.

THE CONSTRUCTION AND WORKING OF RAILWAYS.

-As you were kind enough to insert my former communication on railways, I beg leave to trouble you with a few more observations on the same subject. I observe that a commission is to be appointed by her Majesty, to inquire into the inconvenience attending the break of gauge, and the practicability of having a uniform gauge established throughout the country; and as the commission is to be composed of men of science unconnected with the Houses of Parliament, and, I hope, uninterested in any line of railway, I anticipate much good will result to the country from their labours. There cannot, I am sure, be two opinions on the subject of the inconvenience attending the difference of gauges of railways, and even Mr. Brunel's proposition to obviate the same, namely removing the train of car-riages from the broad to the narrow gauge, and vice versa, is but a clumsy and objectionable substitute to cover an acknowledged deficiency; for if we are to reap the full benefit of railway locomotion, we should not be subject to any such delays or obstructions as would be required to transport a whole train of carriages from one line to the other at every point of junction of railways of different gauge

In Ireland one uniform gauge might have been adopted, and even a different principle, if considered necessary, but I observe they are pursuing the same short-sighted policy as we are in England.

The evil consequences attending the difference of gauge was foretold by Mr. Hawkshaw, civil engineer, in his report to the Great Western Company in 1838, immediately after the Great Western Railway was commenced; he observed: "It will not be too much perhaps to say that three-fourths of England are already being traversed by railways of the narrow gauge. It follows then that any company deviating from this gauge will be isolating themselves to a certain extent, if not as regards their main line, yet as regards their branches; if not as regards their direct traffic, yet certainly as regards their collateral traffic. But in the present early stage of railway traffic it yet remains to be seen whether or not it may become a great evil for a main line to be thus isolated and rendered impossible of connection with the great lines in its neighbourhood. That it will be an evil in this sense as it regards the branch lines there can be little doubt, for they, or some of them, in course of time will of necessity run into the neighbourhood of other lines of different gauge; but with these, however vital the connection may be, all connection will be impossible.

In this point of view only it has become a serious matter for any company in this country to make their line differ as to dimensions from the majority of the lines around them. It is to a certain extent as if a canal company in a country of canals should construct a new navigation so, and with locks of such a obscapter as would totally shut out the boats of all the canals that surrounded it."

Although it has been remarked by a me of a committee of the House of Commons that no engineer would commit himself to similar what he considered to be the best gauge for railways, yet when we reflect that all the loss ing engineers of the day, with one or two ex-ceptions, are projecting railways on the nervour gauge principle, it is pretty conclusive evidence which system they prefer. I always judge of engineers by their works. I regret that the powers of the commission are to be limited to the subject of the gauge, and not extended to the construction and working of railways, a these appear to me to require scientific analysis and investigation as well as the gauge. There is now and will be as much squabbling between engineers about this construction of railways as there was formerly between, the disciples of Telford and MacAdam respective the correct principles of construction of turnpike roads ; and unless this subject, as well an the more important one of the moving power, be submitted to the mature deliberat a of 12 scientific commission of inquiry, a further sacrifice of the "sinews" of the country must be made to the great benefit of engineens and gentlemen of the legal profession. The great cost attending the progress of private bills through Parliament has frequently proved a source of serious and permanent injury to the works.

As the extent of railway on the narrow gauge principle exceeds nearly fourfold that of the broad, and as it would be streaded with a considerable expense to increase the width of the narrow gauge railways, isasmuch as the cuttings and embankments would requires widening, the bridges and tunnels enlarging, and the upper works reconstructing and strengthening, and as it is not too inte even now to obviate the evil of the difference of gauges, I would recommend the broad gauge to be reduced, which may be done at a comparatively trifling cost merely by laying down an additional line of rails to suit the narrow gauge traffic, and that the respective companies of the broad gauge railways could introduce gradually locomotive engine cartiagion, &c., on the narrow gauge principles as their old stock became depreciated or unit for mervice. As this alteration would be required for the public convenience, I think in justice the public treasury. B. B.

Brecon, June 30th.

* In the committee, on Wednesday, the 25th ult., Mr. Cobden moved the following resolution, which was afterwards agreed to :--" That, it having been represented to this House by petitions from various public bodies, as well as from merchants, manufacturers, and others, that serious impediments to the internal traffic of the country are likely to arise from the 'breaks' that will occur in railway communications from the want of a uniform gauge; and these representations not having been fully inquired into by any of the committees of this House upon private bills, and it being desirable that the subject should be further investigated, an humble address be presented to her Majesty, praying her Majesty to be graciously pleased to issue a commission to inquire, whether in future private Acts for the construction of railways, provision ought to be made for securing a uniform gauge, and whether it would be expedient and practicable to take measures to bring the railways already constructed, or in progress of construction, in Great Britain, into uniformity of gauge; and to inquire whether any other mode of obviating or mitigating the apprehended evil could be adopted; and to report the same to this House."

Her Majesty has since appointed Sir John Mark Frederic Smith, Lieutenant-Colonel of the Royal Corps of Engineers, late Inspector-General of Railways; George Biddle Airy, Esq., Astronomical Observator in her Majesty's Observatory at Greenwich; and Peter Barlow, Esq., Professor of Mathematics in the Royal Military Academy at Woolwich, to be her Majesty's Commissioners for the purpose stated.

INSTITUTION OF CIVIL ENGINEERS.

On Tuesday, June 24th, Sir John Rennie, president, in the chair, a paper was read by Mr. J G. Bodmer, "On the advantages of working engines with high-pressure steam expansively and at great velocities." The author based his observations upon the

The author based his observations upon the principle of a considerable area of piston being essential for taking advantage of the initiative impulse of highly elastic steam, in contradistinction to the idea of the percussive action which had some time ago found advocates. In order therefore to take advantage of this action, and be enabled to cut off the steam at an early period of the stroke, the piston at abort intervals, and consequently making a great number of strokes within a given time, must travel over a limited distance, that as little as possible of the heat, and consequently of the elasticity, should be lost.

It has been generally acknowledged that the action of a short crank and rapid stroke is very disadvantageous to the framing and founda-tions of ordinary engines. Mr. Bodmer has in constructing his compensating engines con-centrated the action, and confined the strain to the crank, connecting rod, and piston rod. By this construction he has been enabled to carry this consta the expansive principle to such an extent, as to deliver the steam into the condenser almost in a state of mere vapour, or within 3lbs. of a The saving of fuel must therefore be ettum. in proportion; and there must be a very con-siderable reduction of the actual weight of the machinery, and of the coals on board steam results on long voyages. The paper consi-dured at great length the reasonings upon these principles, and in tabular forms gave the somparative results of this and the ordinary megiaes. The peculiar construction of the compensating engines was illustrated by several models and detailed drawings, shewing the peculiar action of the expansion valves, and the two pistons in each cylinder. The great difficulty encountered appeared to have been in the valves of the air-pumps, which were destroyed by the extreme rapidity of the action; this was provided for by constructing an air-pomp without valves. By a peculiar arrangement of the air and water passages it became practicable to substitute for the ordinary cover a piston travelling through a very limited space, and for the air-pump bucket a solid pieton travelling the full length of stroke. The values were thus done away with, and the action of the engine became complete. This construction has been adopted with great suc-ores in several stationary and locomotive engines, and is now being applied to marine engines, to which it is peculiarly applicable, as it is of great importance to be enabled to work the Archimedian or screw propeller without the intervention of bands or wheel work.

Mr. J. Woods exhibited and explained the action of Siemens' chronometric governor. The centrifugal governor of Watt being acknowledged to be an imperfect instrument in consequence of its inability to adjust the valve to the altered circumstances of the load of the engine, Mr. Siemens invented the chronometric governor. The new instrument was stated to have been at work successfully for some time at Carpenter's Corn Mills, Shad Thames. It consists chiefly of a heavy pendulum which is allowed to move to a certain arc of vibration of chronometric revolutions, and it is connected with the horizontal pinion

above, which therefore moves in union with it : an endless screw is geared in contact with the horizontal pinion, and is drawn by a con-stant weight in a horizontal direction : it has therefore a tendency to produce revolution of the pinion and pendulum. This horizontal screw must be turned by the engine at the exact velocity necessary to insure its running in gear with the pinion, driven at the condulum; and should the engine succeed in turning the screw at the proper velocity no horizontal movement will take place, and the weight on the lever, before mentioned, con-tinues a constant driving power independent of the engine, for overcoming the existence of the atmosphere and the friction of the pendulum. It the load, or the supply of power varies, a tendency to alter the speed of the horizontal shaft immediately commences, and it takes up a new position, by having travelled faster or slower than the pendulum and its pinion, and it retains this altered position, and conse-quently the adjustment of the valve, by means of appropriate connecting levers, until the conditions of equilibrium of load and power are again varied.

The action of this governor is so sensitive, that no variation of the speed of an engine, when 40 per cent. of its load is thrown off, can be observed, for the entire change is performed in one fiftieth of the revolution of the flywheel; this change absorbs or adds a portion of the momentum of the pendulum, and slightly alters its arc of vibration, the limit of which is between 18° and 21°, and by the laws of pendulous motion this is shewn to effect the number of revolutions to the amount of only 8 per cent. of its velocity, and even that small variation in the extreme position of the pendulum ceases immediately the momentum is restored to its former condition.

This being the last meeting of the present session, the president addressed the members, with congratulations on the interesting character of the papers read the discussions at the meetings and the very full attendance of members and visitors; and impressed upon them the necessity of redoubled exertions in future in order to support adequately the elevated position which the Institution had attained. Mr. Walker, in a speech full of kind feeling, proposed a vote of thanks to Sir John Rennie for his devotion to the duties of president, his uniform attendance at the meetings, and the kindness and hospitality he invariably displayed to the members collectively and individually. The meeting then adjourned until the second Tuesday in January of the ensuing year.

In closing our notice of the proceedings during the session, we cannot omit a brief commendation of the energy and ability with which the present secretary, Mr. Manby, discharges the duties of his office, and materially conduces to the effectiveness of the association.

THE ACADEMY OF FINE ARTS, PHILADEL-PHIA.—On the night of the 11th of June, this establishment was consumed by fire, an event that is ascribed to the act of an incendiary. Among the very few works saved are Gilbert Stuart's full-length portrait of Washington, West's "Death on the Pale Horse," Haydon's "Christ's Entry into Jerusalem," and Alston's "Dead Man Restored to Life." LEVERINGTON CHURCH.

For some months past the church of Leverington, near Wisbech, has been undergoing repairs, which the fearful state of dilapidation into which it had fallen rendered necessary. These are now completed. The restorations, though they have not been so complete as they might have been, are yet very extensive, and have converted almost a ruin into a very interesting structure. We have not heard the exact cost which has been incurred, but believe the burden upon the parish is under 1,000*l*., as the rector himself contributed 500*l*.

Leverington is a good specimen of architec-ture, and contains valuable examples of the early English, decorated, and perpendicular styles, the tower is early English; the spire above it rising altogether to the height of 162 feet, is decorated and pierced with small lights. The base of the spire is flanked by four octagonal turrets, which somewhat awkwardly serve the purpose of the pinnacle and flying buttress in Louth and other celebrated spires. The body of the church is built in the pe rpendicular style, and is upwards of 200 feet long, presenting a very open and light appearances. Before the late alterations, abuse upon sources had been inflicted on the church. One part had been built off to form a coal-hole, at the expense of two beautiful perpendicular wind dows, one of which of elaborate design now forms a conspicuous feature in the west end. On the opposite side another large piece had been built off to form a vestry; and between shees unsightly incumbrances a very mean gallery had been erected, immediately in front of a rich early English arch, with foliated capitals, supporting the east wall of the tower. All these blemishes have been removed, and, by the exertions of the Rev. H. Jackson, the curate, the windows have been restored, and the floor of the tower thrown open to the news The south side of the church has been atmost entirely rebuilt; and two heavy brick bat-tresses, that seemed actually dragging the walls they were erected to support, have been taken down, and the architecture finished in its original taste. A new roof, braced by simple open work, has also been put up, and the whole church re-pewed, or rather re-seated. This has alteration will be a much ensured. last alteration will be as much appreciated by the inhabitants as any that has been made. No church had suffered more from the abuse of pewing, that grand abuse of English churches, than Leverington. Pews of the size of parlours encumbered its aisles, and even intruded into the middle width of the neve. Mr. Jackson has, however, fought and conquered the prejudices that were raised against seating the church, and the advantages will, we are sure, be appreciated even by those most hestile to it in the first instance.

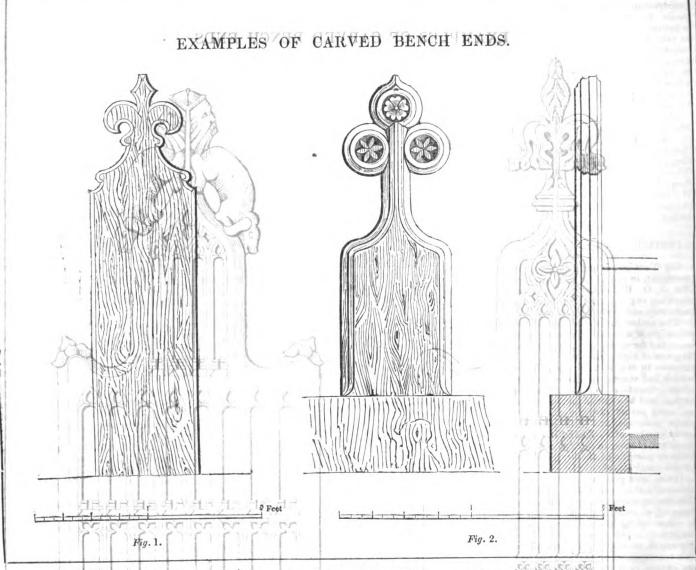

Leverington has several claims upon the antiquary. The font, which has been engraved in Van Voorst's work, is one of the fibest perpendicular fonts in England. It is octangular, and 8 niches with figures form its sides. The pillar is similarly ornamented, with eight emblems at its foot. Leverington has besides, the rather uncommon ecclesiastical curiosity of two credence-tables, attached to two portions of the aisles, which were formerly chapels. They are perpendicular, like most other parts of the edifice, and are in excellent preservation. The piscina of each chapel is also preserved. The south porch is one of the most remarkable parts of the building, and is, at the same time, one of the building, and is, pediment crocketed, and a very rich open parapetrum along the ridge of its stone roof. Over it is aparvise shamber whose sloping stone roof is broken into the pointed arch by the latter springing from nearly the centre of the slope, the space between the point of the arch and the meeting of the roof is perhaps singular in ecclesiastical architecture. There is also a piscina in this chamber,

There was formerly one entire window of rich painted glass in this church, but it has been suffered to be strangely mutilated, and is now only a wretched fragment. Several portions of painted glass are also inserted in the other windows of the chancel, which, together with the parts we have mentioned, and some costly monuments, make Leverington well worth a visit from all interested in our old ecclesiastical remains.-(From a Correspondent.)

THE BUILDER.

CARVED BENCH ENDS.

ALL SAINTS CHURCH, BRANSTON, RUTLAND. This church contains several bench ends, as shewn by the engraving, fig. 1. There is not any thing else worth remarking in this church, except the old Norman font, which having been discarded from the in-terior, now serves for a tank to catch the water which falls from the nave roof.

DICKLEBURGH CHURCH, NORFOLK,

Is on the road to Norwich, 41 miles from Diss; it is a very interesting church, dedicated to "All Saints," and consists of chancel, nave,

"All Saints," and consists of chancel, have, aisles, and chapels, and western tower. The accompanying engraving, fig. 2, shews "the character of the bench eads, which are "remerkably small, being only 2 facts inches in height, and 10 inches broad. There is a very house with external form in this chirah Beautiful octagonal font in this church.

NEWARH CHUBCH, NOTTS.

out 17

The accompanyin gengraving, fig. 3, repre-sents one of the seven different designs of bench (ends in the Church of St. Mary Magbench (ends in the Gburch of St. Mary Mag-dalen, at Newark, so well known for its elegant tower, and spire. This church was founded by Allan Flemyng, in the reign of Henry VI., to whose memory is the splended brass now on the wall at the back of the altar, but formerly in the south transept. It has shared the fate of most of our churches, in the way of huge galleries; some good stained glass still remains, and there is an excellent picture by Hilton, who was a native of Newark.

ST. GILES'S CHURCH, AT BALDERTON," NOTTINGHAMSHIRE,

Is entirely filled with open benches. The ends, one of which is represented by the engraving fig. 4, vary only in the animals and heads, the general outline being preserved throughout. They have a very beautiful effect. There is also a very fine Norman porch on the north also a very me-side of this church. Burwood-place. GEORGE TRUEFITT.

ART AND MANUFACTURES.

Art-Union Journal of the present THE month contains, in addition to its usual varied and valuable matter, a detailed account of the articles lately exhibited at the Free Trade Bazaar, viewing it as an exposition of the products of British industry,-as a first attempt to bring the various manufacturers of the country together, that they may compare the progress that has been made in the application of art to their several materials,—and as shew-ing the importance of design in enhancing the mercantile value of our manufactures. The account is ably written and profusely illustrated by wood cuts, and cannot fail materially to influence the healthy movement now being made by our manufacturers. At the conclu sion the writer urges, as we have already done, the importance of establishing forthwith a periodical NATIONAL EXPOSITION :- " Com mercially, viewed, such an enterprise would more than repay the cost and time of its pre-paration. We have heard large contributors to the Bassar assert, that the advertising effect of having their goods displayed in Covent-garden, under all the disadvantages of sale and arowding, wery meanly compensated the cost of the goods. It was asserted in the French Chamber of Deputies, that the sales of goods to the foreigners who crowded to Paris to see the Exposition last year, more than doubled the whole expense of the building and attendants.

A National Exposition in London would attract visitors from every quarter of the globe; and the rent which manufacturers would gladly pey for the use of the space necessary to the display of their goods would more than cover the cost, even if admissions were gratuitous. Such a project is worthy the combined efforts of the Board of Trade and the School of Design. They would be nobly supported by the country, and the Temple-Palace of British In-dustry would surpass any thing which this world has ever witnessed. A hint of this kind was given at the Bassar, and was received with an enthusiasm which left no doubt of the re-

sult, and just as little doubt that the enterprise will be undertaken by some public body, even if it should not be taken up by the Government.

We look upon such an Exposition as an important part of national education. Speci-mens of beautiful conception and artistic exe-cution cannot be contemplated without elevating the mind and improving the feelings. The Bazaar gave evidence of the benefit of such a display in improving and enlarging the sym-pathies. No one could avoid feeling a persona interest in the continued prosperity of those who produced such triumphs of ingenuity and industry, of taste and of intelligence. It wa scarcely possible to avoid reflecting on the consequences that would follow, if the looms which wove those shawls, carpets, and dresses were stopped; if the farmaces that produced those magnificent castings of iron were blown out; if the hanners that wrought this steel ceased to sound; or if the spindles that span this yarn ceased to turn. How many families would at once be consigned to misery! how many happy costages would be reduced to the deplorable condition of the rick-burner's home! We sadly want to be introduced to each other in this country, and to learn more of our mutual dealings and productions. The worker at the loom has much to learn from the worker with the hammer; the weaver of lace and the weaver of horsebair might communicate with profit; and the designer for inth might inter-change valuable bints with the designer for porcelain.

A more perfect National Exposition of the products of British Industry would lead to the display of high and noble feelings with greater intensity and wider extent. It is for this reason chiefly that we so strenuously urge the project we will be taken inductor. project. We value taste, we esteem industry, we love every form in which intelligence embodies ideality; but, above all, we estimate the influence of artistic beauty in developing emotions of moral loveliness, and the influence of the triumphs of Britain's industrial prowess in strongthening every man's interest in the prosperity of the British nation,

EXAMPLES OF CARVED BENCH ENDS, **XXXX** that the enterp who body, 1111 by the Gove xposition منب al equeation. and artistic deno. without ele 26. he feelings. R Poet. Feet. Fig. 3. Fig. 4.

The long night of darkness, in which Nations fought for vain shadows and derived their dereans of glory from violence and derived their dreams of glory from violence and bloodshed, has gone down the sky. "The dayspring from on high has visited us," and taught that "Glory to God in the Highest" is blended and identified with "Peace on earth, good will towards men!" Commerce must bind together the nations which were dissociated, and trade unite the races which blind and selfish jealousy dissevered. The soothing influences of Art, superadded to the usefulness of manufactured products, will give force and efficacy to those lessons of eivilization which it is the proud destiny of Britain to preach to the whole human race. In this career we see no goal fixed to our country's march of prosperity and greatness: her benefits to humanity will be coextensive with the wants of mankind; and her high reward will be a recognized supremacy in intelligence more glorious than the sway of the proudest empire that ever existed.

MONUMENT TO THE LATE SIR WILLIAM FOLLETT.—We understand (says the *Exciter Gazotie*) that it is in contemplation to erect a statue to the memory of our late respected representative, as the most fitting memento of the admiration of his genius and character entertained by the citizens of Forter entertained by the citizens of Exeter.

IMPORTANT TO ARTISTS.

THE Art. Union of London are about to offer a premium of 500% for a group in mar-ble, to be competed for by models in clay, the size of the intended work. These must be sent in by the 1st of July, 1846, and the work finished in marble by the 1st of July, 1847; 200% will be paid when the pre-mium is adjudged and the remainder on com-pletion. pletion.

As regards the historical picture for which a premium of 500% has been officred, the com-mittee request artists to forward by the 1st of December next (that is, a month before sending the cartoon), a sealed letter contain-ing name and address, and having on the out-side a motto by which the cartoon mast also be distinguished. The object of this arrange-ment is, that the committee may learn how many cartoons will probably be forwarded, so that they may provide sufficient accommoda-tion for the exhibition of them.

On Monday, the 15th of December, artists may learn by application at the office, the name of the place to which the cartoons are to be sent; 200%, will be paid on the selection

being made. We observe with regret that in consequence of the approach to the end of the session the

bill brought in by Mr. Wyse some weeks ago to place art-unions on a permanent basis has been withdrawn. A temporary bill of indemnification, however, has been brought in with the full consent of the Government, so that no practical inconvenience will result.

38Ŀ

THE PEERS AND MR. BARRY.

WE learn with gratification that our respectful remonstrance against undue basts in the completion of the new House of Péers,* to which the daily press gave increased circa-lation and weight, has received considerate attention in the proper quarter, and is likely to effect the desired end. Lord Brougham has since given notice that he will, on Mondây next, name a day for moving an humble ad-dress to her Majesty, praying that she would be graciously pleased to order the preparation of the House of Peers for their lordships' oc-cupation from the beginning of next session, with temporary fittings, and that care should be taken in providing the means of ventilating and warming the same'; that all risk from fire should be guarded against by making the building fire-proof. to which the daily press gave increased circubuilding fire-proof.

* See page 301 ante,

PAVING, CLEANSING, AND DRAINAGE.

A PUBLIC meeting of an association for the prometion of improved paving, cleansing, and drainage, was held on the 3rd inst. at the Hanover-square rooms, with the view of enforcing upon the public the fact, that if the streets, coarts, and alleys of towns throughout the United Kingdom were properly swept and kept clean, not only would the accumulation of mud and dust be entirely prevented at a trifling expense, but employment could be given to 40,000 labourers. There were upwards of 500 persons present, including a number of ladies. On the platform amongst others were the Duke of Grafton (who presided in the unavoidable absence of the Duke of Cambridge), the Earl of Charlemont, Lord Ranelagh, M.P., Sir Burgess Carnac, P. Borthwick, Esq., M.P., C. Cochrane, Esq., the President and Founder of the Association, B. B. Cabbell, Esq., &c.

Esq., &c. Mr. Cochrane, in detailing the objects of the association, divided his remarks into three distinct propositions, undertaking to prove, first, that the streets could be kept so clean, as to prevent the accumulation of any mud or to prevent the accumulation of any mud or dust; secondly, that by keeping the streets so clean, they might secure the employment of 40,000 of the able-bodied poor; and thirdly, that the public would be reconsiled to pay any extra expense entailed by raising rates through the parochial authorities towards the accomplishment of these ends. (Cheers.) In proof of the first proposition, he referred to the experiments which were made last winter in Oxford-street and Regent-street, when those streets were kept so clean, that a lady's shoe would not be soiled in crossing at any part of them, whilst some of the adjoining streets were little better than quagmires. With regard to the second proposition, he stated that most accurate calculations had been entered into, which were open to the inspection of any one who wished to examine them, and from which it appeared that each man could keep an area of from 1,500 to s,000 square yards perfectly clean. Upon that effectiation, about 330 men would be required for the city of London, 80 for St. James's partich, 140 for St. George's, from 500 to 600 partifh, 140 for St. George's, from DUO to DUO for St. Marylebone, and so on, giving through-out the whole country employment to at least 40,600 persons. (Cheers.) With regard to the third proposition, as to the expense, it had been calculated that in the city of London the expense entailed upon every housekeeper would be about 7e. per house per year, in ad-dition to what was already paid; or, upon individuals, the expense would be from 1d. to 1d. per head per month. Mr. Cochrane concluded by moving a resolution to the effect that it is essential to the community at large. in a sanatory, moral, and social point of view

that the greatest possible cleanliness should be maintained in the public thoroughfares. Mr. P. Borthwick, M.P., moved a resolution to the effect that the improved system of cleansing the public thoroughfares, while it would relieve parochial burdens by securing employment for the poor, who were compelled for want of work to ask for parochial relief, would also tend to the more perfect preservation of buildings and monuments, theimprovement of the morals and health of the people, and wrould also effect a diminution in the logges to how ebolders in furniture, goods, &c.

These resolutions, together with others of secondary importance, being carried unanimossly, and thanks having been awarded to the hoble chainman for his kindness is presiding and for his conduct in the chair, the meeting was dissolved.

STRE LL

Naws FOR CHUB ON BUILDING COMMITTEES. —An "divertisement has lately appeared in one or awo of the daily papers, stating that "A sum of money has been appointed by the will of a gentleman lately deceased, to be given (on certain conditions) in aid of the funds for building twelve new churches;" and informing parties wishing to put themselves in communication with the trustees how they can do so. The regulations of the stamp office do not allow us to publish the address of the party who advertises, but for the benefit of those who are interested in the bequest, the advertisement itself can be seen on applying to our publisher.

THE BUILDER.

THE STRENGTH OF STONE COLUMNS.

LAST week we mentioned a paper on this subject read by Mr. E. Hodgkinson, at the late meeting of the British Association for the Advancement of Science (p. 316). Our contemporary, the *Athenæum*, gives the following additional notes :--

"On the Strength of Stone Columns, by Mr. E. Hodgkinson. — The columns were of - The columns were of different heights, varying from 1 inch to 40 inches; they were square uniform prisms, the sides of the bases of which were 1 inch and 12 inch, and the crushing weight was applied in the direction of the strata. From the ex-periments on the two series of pillars it appears that there is a falling off in strength all columns from the shortest to the longest; but that the diminution is so small, when the beight of the column is not greater than about 12 times the side of its square, that the strength may be considered as uniform, the mean being 10,000 lb. per square inch, or upwards. From the experiments on the columns one inch the experiments on the columns one inch square, it appears that when the height is 15 times the side of the square the strength is slightly reduced; when the height is 24 times the base, the falling off is from 138 to 96 mearly; when it is 30 times the base, the strength is reduced from 138 to 75; and when it is 40 times the base, the strength is reduced to 52, or to little more than one-third. These numbers will be modified to some extent by the experiments in progress. In all columns shorter than 30 times the size of the square, fracture took place by one of the ends failing; shewing the ends to be the weakest parts; and the increased weakness of the longer columns over that of the shorter ones seemed to arise from the former being deflected more than the latter, and therefore exposing a smaller part of the ends to the crushing force. The cause of failure is the tendency of rigid materials to form wedges with sharp ends, these wedges splitting the body up in a manner which always pretty nearly the same; some attempts to explain this matter theoretically were made by Coulomb. As long columns always give way first at the ends—shewing that part to be the weakest—we might economize the material by making the areas of the ends larger than that of the middle, increasing the strength from the middle both ways towards the ends. If the area of the ends be the area in the middle as the strength of a short column is to that of a long one, we should have for a column whose height was 24 times the breadth, the area of the ends and middle as 13'766 to 9.595 nearly. This, however, would make the ends somewhat too strong; since the weakness of long columns arises from their flexure, and increasing the ends would diminish that flexure. Another mode of increasing the strength of the ends would be that of preventing flexure by increasing the dimensions of the middle. From the experiments it would appear that the Grecian columns, which seldom had their lengths more than about ten times the diameter, were nearly of the form capable of bearing the greatest weight when their shafts were uniform ; and that columns tapering from the bottom to the top were only ca-pable of bearing weights due to the smallest part of their section, though the larger end might serve to prevent lateral thrusts. This last remark applies, too, to the Egyptian columns, the strength of the column being only that of the smallest part of the section. From the two series of experiments, it appeared that the strength of a short column is nearly in proportion to the area of the section, though strength of the larger one is somewhat les the

than in that proportion. Prof. Challis inquired whether Mr Hodgkinson had found the columns to give way chiefly in the direction of the cleavages of the Mr. Hodgkinson replied that he had; stone and that hence the same size and shape of stone cut out of the same block, required very different forces to crush them across the grain from what they did with it. Prof. Stevelly said, that it was one peculiarity of Mr. Hodgkinson's researches, that they opened up so many collateral objects of interest and wide fields of in-quiry. It was easy to see that the present rehes might become important to the geoloseard gist, by leading him to the source from which originated the splitting up of extended rocks into beds and strata, and the contortions of them; for example, to some volcanic matter

forced up vertically in such a manner, as to exercise a crushing force upon even distant masses. — Prof. Willis shewed, by examples deduced from various styles of architecture, that the ancients must have been practically is possession of similar principles; and from several examples which he gave, it would appear that columns of a shape suited to these principles were again coming into use.

CHURCH OF THE HOLY TRINITY, BARNSTAPLE, DEVON.

THIS church, which was consecrated by the Bishop of Exeter on the 21st ult., is built in the style of the fifteenth century; the plan is cruciform and consists of a nave (without aisles) and transepts, a spacious choir and aisles. The tower, which is at the south-west angle of the building, is to be surmounted with a spire. The exterior walls are faced with a sort of sand-stone obtained in the neighbourhood; the dressings and windows are of Bathstone.

The large west window is a copy of the beautiful window at St. Mary's, Oxford. Oa entering the church, the choir, which is raised several steps above the nave, is seen through three lancet arches which divide it from the nave; and the view is terminated by the eastern window of three light filled is with stained glass, manufactered at Exeter by Mr. Bere. The arches and elustered columns between the nave and choir, are of Bath-stone; the two lateral arches being much narrower than the centre one; a low open panelled screen of oak between the piers of the arches divide the nave and chancel; the transepts which are lighted by windows of three light, are divided from the nave by arches of stone springing from corbels; the nave is lighted on either side by four windows each of two lights; the mullions, tracery, and jamba, are of Bathstone; the open timber-framed hammer beam roof, forms a principal feature on entering the church; the pulpit, reading-desk, and font, are all sculptured of Caen-stone by Mr. Rowe, of Exeter; the pulpit, and reading-desk, which are uniform, are placed at the easternmost angle formed by the junction of the nave and transepts, the pulpit being on the north side.

The pews are constructed of American oak; the framing is low, somewhat similar in con-struction to many of the old oak seats in the neighbouring churches, with the exception that they have a low door to each seat or pew, somewhat similar to St. Katherine's Church, Regent's Park; the pews will seat above 800 persons, out of which number 326 attings are to be free for ever; there is a small gallery at the western end of the church, capable of holding 150 persons; the front is of oak panelled; the internal length of nave, 77 feet by 34 feet 10 inches; chancel, 27 feet by 16 feet; chan-cel aisles, 35 feet by 11 feet 6 inches; transepts, 16 feet by 14; height from floor to springing of roof 27 feet; to centre of roof, 56 feet; the east window is 15 feet high by 7 feet wide in three compartments; the four top compart-ments of the tracery represent the emblemes of the four Evangelists; the remainder of the window is filled with stained and ornamental glass; the tower when completed will rise 100 feet with a spire on the top 56 feet high; there is ample room in the bell-chamber for there is ample room in the bell-chamber eight bells; the lancet-windows in the north and south chancel aisles are also fitted with ornamental glass, that in the south has the emblems of the Alpha and Omega; that in the north, represents the three pails and a crown of thorns encircling "J. N. R. J.;" it is pro-posed to fill the west window with stained glass with emblematic representations of the twelve apostles, at a cost of about 200 guineas. The font stands in the aisle near the

The font stands in the aisle near the western entrance, and has on the rim, in old English characters—"In the name of the Father, and of the Son, and of the Holy Ghost." An organ is in course of erection for the church by Houlditch of Sobo, and will be completed within six months. The nomination of the minister is in the hands of the Rev. John James Scott (at whose sole expense this church was built and endowed), his heirs and assigns for ever.

The church is capable of holding 1,200 persons, and built at a cost of nearly 8,000/. when completed. The architects are Mr. G. Abbott, of Barnstaple, and Mr. D. Mackintosh, of Exeter.

- 29 of NOTES IN THE PROVINCES. Indiana

BANNY church is about to be built in Beddlagton-road, North Brixton, the 1 Die meighbourhood of which has become a new which have been recently erected there. It is said that the Roman Catholics have obtained a lease of a large portion of ground at the head of Breatsfield Links, Edinburgh, for 'a seminary on an extensive scale. Their ent college at Blairs will be removed to it. It is further stated that the plans, which are now out of the hands of the architect, include the design of a magnificent cathedral. The same religious denomination are about to erect a splendid church, school, and presbytery, or primet's residence, in the immediate neighbour**bist's residence**, in the immediate nerghoour-listed of Burnley, at an estimated cost of a bist 6,000.—It is in contemplation to effect a theatre in Bridgwater. Some of the most respectable inhabitants have started the project of building it by shares. The want of such a place of amusement has for a long time been complained of by parties visiting the town, ---- A movement has been made in castle, with a view to the establishment and the public. They require an addition of as least 1,500% to the funds already subscribed, exclusive of 700% for a spire—The Stockton and Darlington suspension bridge across the river Tees, near Stockton, which was opened to the public in 1830, is now nearly taken down, the engines, coaches, and waggons, have for some time past crossed the river on the new bridge, which is crected at a short distance, in a more substantial manner. The demolition of this structure, once an object of general admiration, attracted thousands of persons to the spot.—The present Widford Bridge, on the road between Chelmsford and Ingatestone, in Ease having how procupated space to in Essex, having been pronounced unsafe, the county invited tenders for a new iron bridge, and Messrs. Cottam and Hallen, of Winsley-street, Oxford-street, obtained the contract at 730% and the old materials. It is to be completed in about two months from the present time, under the supervision of Mr. Hopper. _____The Durham Victoria Harbour, erected at the expense of the Fishery Board and town of Dembar, is now completed. The local com-mittee have been so much satisfied with the unwearied attention and anxious superintendence of Mr. David Ross, the inspector of works, that they have presented him with a handsome watch, bearing a suitable inscrip-tion. The contractors were Messrs. David Lyon, and Co.— At a meeting of the Litch-field Diocesan Church Extension Society, which took place on the 17th ultimo, the following grants were made :-

To Brockmoor new Church, in

Kingswinford£250 additional. To Leigh, for increase of accom-

| modation. To Boxley new Church, near | 60 | ,, |

The committee for the erection of the new district church of St. Thomas, in the parish of St. John's, Coventry, have nearly brought their preliminary arrangements to a close. The town council have agreed to grant one acre and twenty-eight perches of waste land, situate in the Summerland Butts, for a site in accordance with the suggestion of Mr. J. L. Akroyd, whose plans are to be carried out. The extreme dimensions of the new building will be 43 yards long and 24 wide. It is to contain 700 free sittings.—On Saturday last the Birkenhead Dock Committee commenced driving piles on the Seacombe side for the new river wall, which is to extend across the mouth of Wallasey Pool. The first pile was driven about 20 yards from the Seacombe-slip.-----On Tuesday week a meeting of the Yarmouth Haven and Pier Commissioners was held at their office, for the purpose of receiving ten-

I

THE BUILDER.

ders for the completion of the new drawbridge, according to the plans of Mr. Birch. The only tenders were, one from Mr. Peto, and another from Mr. Simpson. We have not tenders, but are assured that Mr. Simpson's was winder 20,0007. At the precise amount of the tenders, but are assured that Mr. Peto's ex-ceeded 32,0007. While Mr. Simpson's was under 20,000. — At the present time, in the diocese of Salisbury, the following new churches are in the course of erection : -At churches are in the course of erection :--At Chittoe, in the parish of Bishop's Cannings; Sedghill, in the parish of Berwick St. Leo-nard; Zeals, in the parish of Mere; and at Cholderton, near Amesbury. The following churches are undergoing thorough repairing and repewing, with a view to increase the ac-commodation :--Melsham, Tilshead, Stratton St. Margaret, Wanborough, and Stert, near Devizes.---The woolcombers of Bradford St. Margaret, Wanhorough, and Stert, ucas Devizes.—The woolcombers of Bradford Devizes.—The woolcombers of Bradford are prosecuting their inquiries with a view to the improvement of their dwellings, and thereby to increase their comforts, and to pro-mote their sanatory condition. A meeting of a few of the most influential gentleman of the a few of the most influential gentleman of the town was held in the Exchange on the 1st instant, for the purpose of assisting them.—— At a meeting of the Yarmouth Church Trustees, held last week, it was resolved to expend the sum of 1,250*l*., in the re-pairs recommended in the report of Messrs. Hilling and Norfor, the surveyors deputed to inspace the fabric of the variable short of St inspect the fabric of the parish church of St. Micholas.— The Newport Harbour Com-missioners, a short time since, addressed a memorial to the Trinity Corporation, reprememorial to the Trinity Corporation, repre-senting the disadvantageous situation of the present lighthouse, and soliciting that a new lighthouse, of similar construction to those at the Maplin Sand and at Fleetwood, might be erected 1,650 yards S. by E. from the mouth of the Usk. It appears that the authorities at the Trinity Board suspended proceedings in the metiluty monding arguments which are still the matter, pending experiments which are still in progress in respect of the best mode of ob-taining a permanent foundation for structures in situations similar to that pointed out by the barbour commissioners of Newport; and the Trinity Board have instructed Mr. James Walker to "examine the said proposed situation, and to report his opinion as to the de-scription of building which, in the event of the board's determining to accede to the prayer of the memorial, it may be most advisable to set up."——The general committee appointed at the last meeting of the Ipswich Town Council have elected a sub-committee, to whom is delegated the arrangements necessary to give *éclát* to the opening of the new custom-house. Several preliminary steps have been already taken, and measures are being adopted to raise the necessary funds by public subscription. The ceremony of the opening is fixed to take place on Monday the 21st of July: to be succeeded by a public dinner, and by aquatic sports, and a brilliant display of fireworks.—— The annual report of the Health Committee of the Town-council of Liverpool, made a few days since, states that the operations of the baths and washbouses for the poor during the past year were of a most favourable character. After paying all expenses a surplus of upwards of 50% was left. The new baths and wash-houses now being erected in the north end of the town will cost nearly 7,000*L*, they will not be opened till next year. The committee strongly recommend the erection of a third establishment in a central locality, and there is every prospect of its being carried into effect. Thus, while the Corporation of London have contributed only about 500% towards a similar object, the municipal authorities of Liverpool have spent 10,000%, and most likely they will soon devote 3,000% or 4,000% more to the same laudable purpose.——The railways are making such rapid progress in this country, that canal traffic cannot successfully compete with them. It is therefore proposed to convert certain of the canals into railroads. With this object in view, a meeting of the Kennet and Avon Canal Company was held on the 1st instant at the London Tavern, and on the 12th ult the pro-prietors of the Ellemere and Chester Canals met for the same purpose. In both cases there is every prospect of the conversion being made.——The Admiralty having refused the promoters of the South Wales Railway Bill leave to carry the line over the Severn by means of a bridge, Mr. Brunel proposes to effect the object in view by means of a tunnel under the river.—At the Warwick Quarter

Sessions, held last week, the presentment made at the last Sessions, stating "that the present Sessions, held last week, the presentment made at the last Sessions, stating "that the present prisons at Warwick ought to be removed, and that a new gaol and house of correction are necessary to be areoled in a more aligible size-ation near to the town of Warwick," was see-firmed on the motion of Sir John Merdeustar bart, by a majority of two, there being be in: its favour and 12 against it.

MANCHESTER, TEN CHURCHES 2011 ASSOCIATION.

Contractor of the local division of the loca

A MEETING of the friends and members of this association was held last week, the Bishop of Chester in the chair. The report, which was read by the hon. secretary, traces the progress of the church-building spirit in Manchester during the last fifty years. In the first twenty years from 1745 to 1815, not one church was consecrated in that immense parish. From 1815 to 1825, two churches only were conse-crated. From 1825 to 1835, five were con-secrated, four of which were built out of the million parliamentary grant. From 1835 to the present time, the number of churches conthe present time, the number of churches con-secrated, or in course of erection, or about to be built, the money being already subscribed, is no less than twenty-eight, including the en-tire re-building of three on a greatly enlarged scale. In 1835, the number of churches in Manchester amounted to exactly thirty, it has consequently nearly doubled during the past ten years. From the treasurer's account, it appears that the receipts during the past year amount to 20,4787. 10s. and the expenditors it amount to 20,4787. 10s. and the expenditure to 20,1834. 12s. 9d. In the fatter sum are the following items :-

in banker's hands, subscriptions growised, but uncollected, and cash recently received make a sum of 4,673/, 19s. 3d, to begin the current year with. The proceedings of the meeting terminated with a proposal to miss 25,000% for the erection and endowment of six other churches. And had

DR. RITTERBANDT'S INVENTION TO PREVENT INCHUSTATIONS IN STRAM BOILERS.

The process consists merely in converting all the carbonate of lime into chlorida of exclum, by the introduction into the boiler of a small quantity of chloride of ammonium. In this way, the lime remaining constantly in solution, the boiler cannot foul, and fuel is eaved to a great extent. Nor is this the ease merely with fresh water. Dr. Ritterbandt's experiments prove that when sea water is boiled, the first change is the liberation of carbonate of lime, the excess of carbonic acid being driven off by beat, and that the particles of that compound become nuclei for the adhesion of the crystals of common salt, &c., which begin rapidly to form in consequence. In preventing the formation of carbonate by the introduction of chloride of ammonium, the chemical effects of contact are obviated, and no salt can be deposited until the water is almost evaporated away. This invention will do away with the necessity of blowing off so very frequently, and will supersede the brine pumps, both attended with an excessive loss of heat and waste of fuel.

A NEW MODE OF PREPARING LEATHER.

To a commercial country like Great Britain, and indeed to the world at large, the manufacture of leather must always be a matter of the first importance, whether we consider its value in the construction of most implements of husbandry, its use in mechanical trades, in the multitude of innumerable engines and machinery of every description, and in our manufactures, or as an article of general con-samption in the production of those things which conduce so much to our domestic comforts and necessities. The article of lea-ther has always ranked in point of value and extent as inferior only to cotton, wool, and iron ; indeed, some statistical writers have gone so far as to consider it equal, if not greater, than cotton. From this circumstance, and an, according to the statement of those practically acquainted with the subject, 170 to 180 parts of leather might be obtained from 100 parts of dry hids, instead of 50, if every part of the gelatinous tissue could be made to combine with a full proportion of tannin, some inter may be formed of the advantages to be derived from any improvement in the art of tanning. And yet notwithstanding these im-portant facts, it is equally true that in this en-lightened age, when almost every other branch of the arts has made such rapid strides towards perfection, little, if any progress has been made in improving the art of tanning.

A patent for "a new mode or method of more speedily and effectually tanning bides and skims" has been recently obtained by Dr. Turnbull. The inventor seems to have been impressed with the important fact, that a knowledge of the disease was necessary to the cure, and to have brought to the study of his subject great scientific knowledge and research. In his specification, which is now before us, in pointing out the various difficulties in tanning, he says : "In preparing the skins and hides for the tanpit, they are steeped for a consider able time in a solution of lime to remove the hear and epidermis. In this process, the skin imbibes a considerable quantity of lime, which has the effect of either removing from the hide, or skin, a portion of the gelatinous substance in the form of soluble gelatine, or of altering the gelatinous fibre, so as to reader it incepable of speedily and effectually combining with the tannin or tannic acid, and the pores of the skin are so impregnated with lime, as to prevent the tanning principle from operating freely, or reaching the heart of the skins."

"And; after enumerating other obstructions, he observes that the great object to be attained is" to find out some means of removing these obstructions and antagonist principles, and of bringing about a speedy and effectual combination of the gelatinous fibre of the hides or skins, and the tanning matter, and thus produce, in a short space of time, leather superior in weight, quality, and durability to any yet produced. The object of my improvements is to remove these difficulties and obstructions, either by extracting the lime with which hides and skins are impregnated in the process of removing the hair, or removing the hair and

epidermis from the hides, or skins, without the use of lime, by means not hitherto attempted."

The doctor then states that by steeping the hides or skins in a mixture of sugar, or any other saccharine matter and water, for from two to four days, according to the size of the skin, the lime is entirely removed. "The action," says the doctor, "of the sugar and pyroxylic or wood spirit upon the lime is so rapid, that in the largest skins the lime is entirely removed and the skins are rendered fit to receive and imbibe the tannic acid, and thus the operation of tanning is perfectly accomplished in a very short time."

We know the immense prejudice which exists against all new methods of tanning, especially if the tanning is accomplished in a short time. This, we believe, has been engendered by the signal failure of almost every attempt at improvement. It is worth while therefore to inquire a little into the philosophy of the doctor's discoveries, and to endeavour to ascertain from known facts whether the doctor is likely to be more fortunate than his predecessors in the same line.

All great chemists have described lime as a solvent of gelatine; indeed the fact is easy of demonstration by placing a small quantity of pure gelatine or isinglass in lime water. No doubt therefore can exist when we reflect on the energetic action of lime on organic bodies, especially on animal tissue, that the destruction of a great portion of the most valuable part of the skin must be the result of employing lime in taking off the hair. The means hitherto employed to extract the

The means hitherto employed to extract the lime has been the application of an alkaline lixivium called "bate." This is composed of the dung of pigeons, and other domestic birds, but this mixture has been found not to remedy the evil, for the bate does not dissolve the lime, but merely destroys its causticity by converting it into carbonate or chalk. Besides which it causes the destruction of a portion of the gelatineous tissue by the fermentation created by the decomposition of the animal matter in the bate.

Sugar, on the contrary, is well known to be a great preserver of the gelatinous fibre; our domestic experience proves this beyond controversy, and it has been demonstrated by Mr. Ramsay, of Glasgow, in a series of experiments published in "Nicholson's Journal" for 1807, that sugar is a powerful solvent of line. We think therefore that we see in the doctor's discovery the means of removing "the antagonist principle, and of bringing about a speedy and effective combination of the gelatinous fibre with the tanning matter," and that the public may safely conclude that the doctor has been fortunate enough to discover the application of a remedy for an evil which has long baffled the skill of chemists and others, and which will go far to realize the enormous adwantages in the quantity and quality of leath er, to which we have before alluded.

THE WOOD-CARVERS .- At a general meeting of the profession of wood-carvers, held April 4th, 1845, it was moved by Mr. R. Moore, "that the services of Mr. W. G. Lock, wood-carver, in conducting the correspondence with her Majesty's commission on the fine arts, rela-tive to the decoration of the new Houses of Parliament, on behalf of the wood-carvers, have entitled him to the warmest approbation of the pro-fession. And this meeting, desirous to testify its estimation of the same, recommends a voluntary subscription throughout the profession, to present him with a suitable acknowledgment of the same." The motion was seconded by Mr. of ray, and carried unanimously. A committee of nine gentlemen were appointed to receive the subscriptions, and to decide on the nature of the testimonial, &c. Subscriptions were re-ceived from 221 wood-carvers, residents of London, Dublin, York, Cambridge, Hull, Manchester, Brighton, Leeds, Peterborough, Warwick, Leamington, &c. The result has been that the committee have publicly presented to Mr. W.G. Lock a splendid watch and ap-purtenances, engraved with a suitable inscription commemorative of the same. Mr. Lock has for some time past been acting as honorary secretary to the general body of wood-carvers, metropolitan and provincial, who have been in correspondence with the royal commission upon the subject of the decoration of the new Houses of Parliament with wood-carving.

Marresnondence......

THE ROUND TOWERS OF IBELAND.

SIR,---Will you permit me, through the medium of your paper, to make one or two nbservations to the writer of a letter in This BUILDER of June 28, on the round towers of Ireland, signed "J. K."

Your correspondent says that they doubtless were intended originally for the convenience of the architects employed in constructing churches, for he says, "That the towers and Now, churches are invariably found together." if he means to say that the towers are only to be found near churches, I can only say, that I have not found such to be the case. I have had occasion to visit Ireland frequently, and of course those memorials of the past, concerning which there is so much doubt occupied no small share of my attention. I have examined them carefully, and have not the least doubt as to their being of the same date as the buildings they adjoin. But I have found them near the castle quite as often as the church; so that I do not think they were originally built by the architect merely to protect his workmen and suit his own convenience, far from it. That suit his own convenience, rar from it. I hat they were erected as reconnoitring towers no one can doubt, but not for the special use your correspondent seems to think. They were th-tended as part and parcel of the building about to be raised (be it castle or church), as a necessary appendage for the safety and welfare of the inmates of the main building; the sta-bility of the workmanship is a sufficient proof thet it was for no temporary nurnee, but to that it was for no temporary purpose, but to last for ages. Further, I have observed that in nine cases out of ten they are within sight of others; so that in case of a general enemy appearing, signals to that effect might be conveyed from place to place, to rouse the natives to arms to repel the invading foe. Trusting you will pardon this intrusion on your time and attention, and give publicity to these few remarks,-I am, Sir, &c., VERITAE.

NEW DOORS AT YORK MINATER-STONE USED AT HOUSES OF PARLIAMENT.

Sin,—Perhaps it is only justice, in reference to your accurate and explanatory engravings of the western doors, York Minster, to name, that the framing and plainer portions were made by Mr. James Wallace, of Newcastle-upon-Tyne, and the carving by Mr. Scott of the same place; the latter artist is, one of the best carvers in wood of the present age, and is also an expert modeller.

To clear up a doubt will you have the goodness to state what kind of stone the axiernal ashlar work in the new Houses of Parliament' is composed of — whether lime or said stone? I mean the plain portions, without reference to the carved surfaces. P. Tyanet I. Tynemouth, near Newcastle.

•• Magnesian lime-stone, from quarries between Worksop and Mansfield, in Yorkshire, and called Anston or Norfal stone.

PROPOSAL TO CONVEY LETTERS 100 LEAGUES PER HOUR.—An original, if we cannot call it a clever, idea was: communicated to the Paris Academy of Sciences on the 23rd ult. by the Baron de Colonge an attaché of the French legation in Bavaria. The rate he proposes to convey letters is not so quick me that of the English inventor, who has taken out a patent for conveying them at the rate of 400 miles an hour through an exhausted tube, like Mr. Vallance's tunnel, which was to transport passengers from London to Brighton în 10 minutes; butit is quick enough— and how does the scientific baron propose to accomplish his feat? Listen, gentle reader, and wonder at the progress of science in this nineteenth century. He would build small bouses as stations, and provide each of them with a revolving lever, 300 feet long, which should throw the mail to the next station, and so on along the whole line. Would it not be more easy to adopt the school-boy plan of trap and ball? We need not say that the A cademy attached little importance to the communication of the Baron de Colonge, and that it is not probable a committee will be appointed to examine and report upon his scheme.

Miscellanea.

-22112648-00.00

PROPOSED NEW CHUBCH AT SEACOMBE. The amount required for the erection of this church is 3,000% of which 2,364% have been already contributed. So much difficulty exists in obtaining the remaining 636/, that the recfor of Wallassy (Dr. Byrth), at a meeting held at Parry's Hotel last week, stated that 500% of the amount subscribed was placed entirely at his disposal, and that if by the 10th of August next, the remainder of the money was not pro-vided money to held the provided, he should proceed to build Day, Sun-day, and Infant Schools, on a large scale, near his own church. He also said that a further portion would be withdrawn, and applied to the building of an Infant School in another part of the parish. He subsequently stated that a perthe parish. He subsequently stated that a per-sonal friend of his had allowed him to say, that if the subscription came within 100% of the sum required, he would add that amount to his already very liberal donation. Another conditional grant of 100% was made by Mr. Mainwaring, leaving 436% still deficient, for lack of which sum, there is every probability that. Seacombe for the present will remain without a church. without a church.

mense stimulus the trade of the country would derive from the formation of the contemplated derive from the formation of the contemplated railways, it is only necessary to state, that were 2,000 miles of the projected railways to be constructed, it would give employment to 500,000 labourers and 40,000 horses for the next four years. The necessary buildings, sheds, and permanent ways, would cover 20,000 acres of land, and to lay a double line of rails would require 400,000 tons of iron— Bristol Journal.

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our readers however, they are entered in a book, and may be seen on application at the office of "The Builder," 2, York-street, Covent-garden.]

For Building a New Farm-house at Swavesey, Cambridgeshire.

For 1,000 Tons of Scotch Pig Iron, and 500 Tons of Finers' Metal, to be delivered at Rotter-dam in the months of July, August, and Septem-ber.

For Building a New Church of Kentish Rag Stone and Caen Stone at Homerton (time ex-tended).

For the pulling down the present School House and erecting a new one at Chesterfield, Derbyshire.

For Lighting the town of Devonport with Gas for a term of fourteen years, to commence from the 1st day of October next.

For Building a Sewer of the first class (in length about 1,700 feet), at Little Chelsea, for the Parish of St. George, Hanover-square. For the Construction of Four divisions of the Chester and Holyhead Railway, comprising the entire line through the County of Anglesey. For the Erection of a Church at Zeals, in the marish of Marce Wilte

parish of Mere, Wilts.

For the Erection of a Church at Merthyr Tydvil,

in the County of Glamorgan. For Building Sewers in the Old Bailey, Hang-ing Sword-alley, and Crown-court; also in John-street, Crutchedfriars, and Cullum-street, all being within the City of London.

di lo Adosti COMPETITIONS.

Plans are required for Laying out and covering with Villa residences about 20 Acres of land having a frontage of about half-a-mile to the Queen's-road, Richmond, Surrey, extending from Spring-grove towards Richmond-hill, Premiums will be given of 25 guineas for the most approved plan, and 15 guineas for the second.

deilgmonTO CORRESPONDENTS.

"J. C. S." — Mr. C. J. Richardson's works are the best on the subject named. Weale, of Hol-born, would give particulars if applied to. "B. C." — We will make inquiries on the sub-ject suggested. "W. A." (Yorkshire). — The Rev. H. Carrow,

ject suggested. "W. A." (Yorkshire).—The Rev. H. Carrow, Loxton Rectory, near Cross, Somersetshire, has been named to us as likely to afford the education ought. If terms be too high for the inquirer's views, Mr. Emberton, Croydon, Surrey, might be applied to.

" A Constant Reader " (Aldgate) .- Much would depend on the instructions that were given and the nature of the specification. We might mislead him by replying in ignorance of these.

" J. J." (Belfast) .- We are obliged to him for the enclosure, but have not yet had time to examine

the enclosure, but have not yet had time to examine it. An account of the scaffolding, if peculiar, would be acceptable. "Col. M." has our best thanks for his kindness. "Mr. Wood."—A parcelis left at the office : it shall be forwarded if Mr. W. will oblige us with his address. Many apologies are due to him. "D. M."—The notice which appears in to-day's "BULLDER," was in type before the arrival of our correspondent's parcel. We believed it to be from him. him.

him. "A Subscriber" (Paddington), "J. L.," "Ten-ders," and "D. F.," next week. Received: "J. D." (Bath.)— "The Pictorial Gallery of Arts," Part VI. (C. Knight), — "Old England," (C. Knight), — Young's "Lec-tures on Natural Philosophy," edited by Kelland, (Taylor and Walton),— "The Illustrated Family Journal," Part IV. (Sherwood),— "The Illumi-nated Magazine," No. 1 of new series (a very good specimen), and the Natural System of Archi-tecture as Opposed to the Artificial System of the present day, by W. P. Griffith, F.S.A., to which we shall refer shortly.

ADVERTISEMENTS.

TO ARCHITECTS AND SURVEYORS. THE VESTRYMEN OF RICHMOND, THE VESTRYMEN OF RICHMOND, SURREY, are desirous of obtaining PLANS for lay-ing out and covering with Villa Residences about 20 acres of Land having a frontage of about half-a-mile to the Queen's-road, Richmond, extending from Spring-grove towards Richmond Hill, and within a few minutes' walk of the Terrace there. The Plans will be expected to include the laying out of grounds and suitable offices, but it is not expected nor re-quired that the elevations shall be uniform. — PREMIUMS will be given of TWENTY-FIVE GUINEAS for the most approved plan, and FIFTEEN GUINEAS for the second.— Lithographic plans of the ground and further particulars had on application to Messrs. SMITH and SON, Solicitors, Richmond, to whom the designs are to be sent before the lath day of August next.

MITH'S PATENT SASH SUS-S MITTH'S PATENT SASH SUS-PENDER, or SASH-CORD SHIELD.—Its purposes are for releasing cords from windows, giving a facility to take the sashes out, or to turn them for cleaning or repair-ing inside the room, thereby avoiding any accident, of which many daily occur from the present dangerous method of con-ducting these operations on the outside. The price within the reach of all classes—only One Shilling a pair for each asah.—To be had, with instructions, of all frommongers, or of the Proprietor, W. SMITH, Architect, Alnwick, North-umberland.

TO ARCHITECTS AND BUILDERS.

TO ARCHITECTS AND BUILDERS. BARTLETT, ARCHITECTURAL MODELLER, 33, DUNCAN-TERRACE, CITY-ROAD, begs leave respectfully to inform Architects, Builders, and others, that they may be supplied with any quantity of Cement and Plaster ornaments from his unlimited collection, consisting of Centre Flowers, Soffits, Bed Mouldings, Pateras, Trusses, Serolls, Ballusters, Gothic and other Shaffs, Gro-tesque Heads, Chinney-Pots, Corinthian and Ionic Capitals. Vases, Figures, Fountains, and every description of orna-ment for parks and gardens, at unprecedented low prices for cash.

THE CAUSES of EXPLOSIONS in STEAM-BOILERS, and the prevention of those arising from incrustation, is now lectured upon by Dr. Ryan daily at half-past Three, and on the Evenings of Monday, Wednesday, and Friday at Nine, at the ROYAL POLY-TECHNIC INSTITUTION. Professor Bachbofmer, lec-tures daily at Ten o'clock, and on Tuesday and Thursday Evenings at Nine, on the ATMOSPHERIC RAILWAY, a Working Model of which, carrying visitors, is exhibited daily and in the Evenings. A curious MECHANICAL HAND; new and beautiful Objects in the Chromatrope, Physioscope, Proteoscope, and Dissolving Views. Work-ing Models described. Experiments by the Diver and Diving-Bell, &c., &c.-Admission, One Shilling; Schools, half-price.

PRIZES IMPORTANT TO INVENTORS AND PATENTEES.

PATENTEES. GOLD MEDAL, value 1007. and a SILVER MEDAL, value 507., will be given by Mr. M. JOSCELIN COCKE. The Gold medal for the best Patent, and the Silver medal for the best Design taken out tor Registered at the OFFICE for PATENTS and DE-SIGNS, 20, Half.Moon-street, between the lat of Novem-ber, 1844, and the 1st of June, 1846. The Prizes will be awarded by competent judges on the 10th June, 1840. The conditions to be observed, together with instructions, charges, and every information for obtaining Patents in England or Foreign Countries, or Registering Designs, will be forwarded gratis, on application to Mr. M. JOSCELIN COCKE, at the Office for Patents and Registration of Designs, 20, Half-Moon-street, Piccadilly, London.

FREESTONE. - Noblemen, Gentlemen, **FREESTONE.** — Noblemen, Gentlemen, Engineers, Architects, Railway-Contractors, Builders, Grainstone-cutter, and others, are respectfully reminded of the admirable Freestone (a perfect colite), which may be ob-tained at the LITTLE CASTERTON QUARRY. The in-ducements for using this Freestone consist in its property of resisting the most intense frost, the facility with which it is wrought, and consequent great saving of expense, the uni-formity and beauty of its colour and texture and its low price. It has been used and approved for many years past by some of the first Architects in the Kingdom, and is now being used in the Stations on the line of the Elisworth and Peterborough Railway. The Quarry is situate in the County of Rutland, about one mile from Stamford and the River Welland, six from Wansford and the Nene, about ten from the Bourn Eau, and the same distance from the Quarry.-Apply to FRANCIS SIMPSON AND SONS, Stamford.-July, 1845.

CAEN STONE.

maxies and a second

LUARD and BEEDHAM have a quantity of the above stone, of the best quality, direct from their Quarries at Allemange, which may be inspected at the Norway Sufferance What, Greenwich. Further particu-lars at Ma. G. GATES', 18, SOUTHWARK-SQUARE, SOUTHWARK.

BENJ. FOWLER, 63, Dorset-street, Fleet-street.

PATENT WROUGHT NAILS .--These DATENT WROUGHT NAILS.—These Nails are submitted to the Notice of Builders and Contractors as being superior to any others, and cheaper. They have the toughness of the best hand-made nails, with far greater uniformity of make. The flat-pointed Rose Nails are particularly recommended wherever oak or other hard wood is used; being perfectly chiscl pointed, they require no boring, and will drive into the hardest wood without split-ting it, and their heads being very strong, do not fly off. The Patent Wrought Nails may be had of all Wildesald Ironi-mongers; and an ample stock of them is kept at the Warehouses of the Agents. HIGGS and GEORGE, 179, BOROUGH, LONDON.

CHUBB'S PATENT WROUGHT-IRON AND FIRE-PROOF SAFES AND DOORS. CHUBB & SON have constantly on Sale a large stock of very superior Wrought Iron CHUBB & SON have constantly on Fireproof Doors or Frames for strong rooms or closets, and Safes and Chests of all dimensions, and which from their arrangements in manufacturing they are lenabled to sell on such terms as will meet the approval of Architects and Builders. The whole are fitted with the new Patent Detec-tor Locks, throwing from three to ten bolts. Caution. As several imitations of the above are offered for sale by different makers, Architects, Builders, and the Public are respectfully informed that no fronmongers, Smiths, or Brokers are supplied with the above Doors or Safes; and that they can only be obtained direct from C. Chubb & Son, 57, St. Paul's Churchyard, London.

COTTAM and HALLEN, Wholesale Ironmongers, Manufacturers of Kitchen Ranges, Stores, &c., &c. Cottage Ranges:-32 in. 34 in. 36 in. 40s. 42s. 45s. each.

32 10. 34 in. 36 in. 40s. 42s. 42s. each. Best Register Stoves, at 7d. 9d., and 9d. per inch. Ditto Elliptic do. at 33d. and 4d. do. C. & H. having a large Stock of Rain-water Pipe, Gutters, and Sash Weights, purchased before the advance of iron took place, are selling at the old prices, AT CORNWALL ROAD, LAMBETH, and WINSLEY-STREET, OX-FORD-STREET.

VARNISH.—It has long been a desideratum amongst the consumers of Varnish to obtain a good and genuine article; brilliancy, facility of drying, hardness, and durability are the qualifications necessary, but these are seldom if ever found united. The experience of a life-time devoted exclusively to the manufacture of this article, the great and important discoveries of modern chemistry, and the daily improvements in machinery, have enabled Messrs. George and Thomas Wallis to produce Varnishes (both oil and spirit) unrivalled in every respect, and they confidently recommend them to the trade, as deserving of notice both in price and quality. Builders, Coachmakers, Painters, and others may depend on being supplied with a genuine and unadulterated article-fine Oil Varnish, from 10s. per gallon; best White Spirit Varnish, 21s, ditto; Best Spirit French Polish, 20s. ditto; White Lead, Oil, Turps, and Colours of every description at the very lowest prices.—WALLIS'S Varnish, Japa, and Colour Manufactory, 64, Long-acre, one door from Bow-street. Established 1750.

WALLIS'S PATENT LIQUID WOOD ALLIS'S PATENT LIQUID WOOD KNOTTING. — This newly-discovered Liquid composition which Messrs. Geo. and Thos. Wallis have the satisfaction of introducing to the trade, possesses the im-portant qualification of effectually stopping Knots in Wood, however bad, and preventing them eating through and dis-figuring the paint above. Many substances have been used and much time spent in endeavouring to find a cure for a bad Knot, but hitherto without success. Messrs. Wallis therefore feel much plea-sure in offering to the public an article so long and anxiously called for.

and the non-ring to the public an attended any can use it as well and effectually as the best workmen: it is put on to the work with a brush like common paint, can be used in all climates and situations, and does not require heat. Sold wholesale and retail, by Measrs. 6. and T. Wallis, Varnish, Japan, and Colour Manufacturers, No. 64, Long Acre. Price 30s. per gallon.

THE ENGLISHER ABCHITEOTS, AND CON-TRACTORS. TRACTORS. T

TKINBON'S CEMENT .- The public is A respectfully informed, that the price of this very ex-alient Coment, which has now been in use for Architecture and Engineering works upwards of thirty years, is reduced to a s.d. per bushel, and may be sad in any quantity at Wysts, arker, and Co.'s Wharf, Heilland-street, Surrey side of

Parker, and Co.'s WERT, HEIRINGSTOOL, GATEY and C. Blackfriars-bridge. N.B.—This Cement being of a light colour, requires no arti-ficial columning or peinting, and may be used for stucco with three parts its own quantity of sand.

MARTIN'S PATENT CEMENT.

TO ARCHIGHTS, BUILDERS, AND PAINTERS IN FRACO.

TO DECORATORS, GRAINERS, PAINTERS, PAPER-

STAINERS, GRAINERS, PAINTERS, PAPER-STAINERS, ARTISTS, AND OTHERS. STEPHENS' PREPARED IMITATION WOOD COLOURS.-The want of a maintenance of a project of the state of a maintenance of the state of the s STAINERS, ARTISTS, AND OTHERS. STEPHENS' PREPARED IMITATION WOOD COLOURS.—The want of a uniform system of preparing colours for imitating wood in painting, in which a correct abade and tone of colour are equally important with skilful execution on the part of the operator, is often produc-tive of serious inconvenience to the workman. Accustomed to mix on the spot various proportions of different colours, and using them when the sys has approved of the mixture, he is subjected to delay and the inconvenience of repeated trials, in order to match the colour, should he not have mixed sufficients to fasish his work, or should he not have mixed sufficients to fasish his work, or should he pot have this inconvenience, the inventor has prepared Imitation Wood Colours upon such exact principles that the operator will be able to obtain correct imitations at ence, prepared to his hand, thus saving time and preventing uncertainty. These colours how is use, thereby tflecting a saving in time and labour, and producing a more beautiful and perfect inita-tion of the oriansmital woods than can be obtained by any of the colours which workmen are in the habit of using. N.B. The above colours are prepared both in a dry and dams stats. The Damp Colours are convenient for imme-diate miding without grinding, for Paper Staining, and Graining in Distemper. Damp Colours sold in Pote, 6d., 1s., and 3s. each. Dry Ociours sold in Packots at 6d., 1s., and 2s. TRAL WHITE will be found a very superior atticle for TRAL WHITE will be found a very superior atticle for Statements and the above, STEPHENS' NEU-

1s., and ža. esch. Dry Ootours sold in Packets at Od., is., and 2s. As a valuable adjunct to the above, STEPHENS' NEU-TRAL WHITE will be found a very superior article for mixing with fine Colours, as its chemical nature is not incompatible with any colour, and it also works smoother and better than any of the Whites commonly used for such purposes. Also STEPHENS' LIQUID OAK, MAHO-GANY, and ROSE and SATIN WOOD STAINS, for rerving the faded appearance of old Carvings and Farmiture, and also for staining and Colouring Soft Woods, Composi-tion, Paper, Leather, &c., so as to imitate the Colours and appearance of Oak, Mahogany, &c. &c. Prepared and Sold by HENRY STEPHENS, 54, Stamford-street, Blackfriar-read. Sold also, by appointment, at E. M. NASH'S, 47, Marball-street, Golden-square. Specimens of the applica-tion of the above articles may be seen at either of the places above named.

SATURDAY, JULY 19, 1845.

N our number for the 5th of April last, • we alluded to the proposed restoration of that noblest of parish churches, --St. Mary Redcliffe, and stated the amount of sub-

scriptions received, and the desire of the committee to proceed immediately with the works to the extent of their means. We also reported the proceedings of a meeting held in May, whereat it was resolved that the committee should make early application to each of the subscribers for permission to apply his donation to the repair of the fabric forthwith. Since then this has been done, and some of the too-necessary works are to be commenced directly, under the direction of Mr. Britton and Mr. George Godwin. Mr. Britton, it will be remembered, had originally associated with him in this very interesting undertaking, Professor Hosking; and by them conjointly, the report was made on which the committee have been acting up to this time. When the latter gentleman was made an Official Referee, he felt it necessary to resign this work, and, at his recommendation, aided by that of Mr. Britton, Mr. Godwin was appointed by the committee in his stead.

In the first volume of THE BUILDER (page 106), will be found two engravings, representing the interior and exterior of the church in question, as originally proposed to be restored. They will serve to convey to the reader who is not acquainted with the edifice some notion of its style and character, but they give no idea of its extraordinary beauty. The genius, skill, and fancy, which it displays. cannot be conveyed by any small pictorial representation.

The tower is perhaps as fine as any thing in the world, and needs a long study before it can be fitly appreciated. The north porch, with its unique doorway, the boldness and variety of the mouldings throughout, the beauty and skilful arrangement of the groining inside, -are some of the many points which arrest the attention of the examiner, and compel him to admit what a fine appreciation of the beautiful the architects of the middle-ages had. In the latter particular, the groining, St. Mary's is, perhaps, unrivalled for variety and richness. The bosses, too, display extraordinary fertility of imagination, and will repay careful exemination; and, indeed, the same may be said of every part of the structure. Although exceedingly harmonious as a whole, it is the work of several eras. The inner north porch, for example, belongs to the beginning of the 13th century, the tower chiefly to the end of the same century or the beginning of the next, and the greater part of the body of the church to the 15th century, although we have ourselves little doubt that much of it was built considerably before that time

The material of which the building is constructed is an oolitic lime-stone from Dundry, and from various causes is in a dreadful state of decomposition, and in parts, of danger. The parapets are falling and fallen, the outline of mouldings is fast disappearing, the

crockets and finials of pinnacles are displaced by the wind, and the whole face of the stone is eroded to a considerable depth. There are, however, few forms at present, mouldings or sculptured ornaments, that could not be restored with truth; but every day will make the task more difficult, and if left for any considerable portion of time it will become impossible. One winter even, now that the stonework has reached its present state of disintegration, may do irreparable mischief. We need hardly say, therefore, that we in common with all who look with pride on the noble heir-looms received from our forefathers (Templa quam dilecta !) and are anxious that they should be religiously maintained, are well pleased to find that operations are to be commenced immediately. It is painful, however, to learn how small a sum, comparatively, has yet been provided for this noble purpose, namely, little more than 5,000%. nearly half of which, if we remember rightly, is the produce of estates vested in the parish authorities for the repair and support of the church. If St. Mary Redcliffe were destroyed by fire or otherwise to-morrow, so justly proud of it are all the inhabitants not merely of Bristol but of the neighbouring counties, that we are satisfied subscriptions would flow in from all quarters for its perfect restoration. Why, in York, after the destruction of the Minster by fire in 1829, forty-eight thousand pounds were collected in two months! And no less enthusiasm would be displayed in Bristol, Somersetshire, Gloucestershire, indeed all England, were any such calamity to befal Redcliffe church.

But while it remains whole as they believe, they are not roused to any act of munificence. They forget that time (*edax rerum*), is more certain than the flames, and they hardly know that if left alone only a short time longer, the object of their boast will be but a shapeless heap of stones.

The Diocesan Society when applied to, will of course afford a considerable grant of money towards the object in view, and the parent Society in the metropolis will doubtless do so too, but the bulk of the sum required must come from individuals, and we urgently call on the public for their liberal co-operation.
