8ATURDAY, JANUARY 4, 1845.

ADDRESS.

E issue to-day the hundredth Number of THE BUILDER, and commence with it a new year. Our progress up to this time has been in the highest degree

satisfactory; friends have grown up around us on all sides; the goodness of our purpose has been universally recognized; and we consequently now find ourselves in a position to effect much more than we have yet attempted. Of this position we shall vigorously avail ourselves, and will spare no pains or outlay to render this journal the organ, par excellence, of the numerous and influential classes interested in architecture, building, engineering, archæology, practical science, and the decorative arts.

We are making such arrangements as will ensure for our readers the earliest and most authentic information on all subjects whereof THE BUILDER treats, both foreign and domestic, with sound and impartial opinions on the various matters which may come before them. New buildings, new materials, new processes, and new books, will be described and illustrated. As regards the latter, it is a constant complaint amongst provincial architects and builders, that having nothing to guide them in their purchases, they are led to order from London works which are of no use to them, and more often to refrain from buying those which, if they had a general notion of their contents and worth, they would gladly possess. We shall endeavour to supply this deficiency : and being untrammelled by any connection with publishers, shall do so fearlessly and honestly; with a disposition at all times to hold out a friendly hand to rising merit, and to give praise rather than censure, but with a resolute determination to shew no mercy to the shallow empiric or the egotistical pretender.

The properties of materials, and all new andes of construction, we shall be anxious to investigate; and we invite the earliest intelligence on these points, so that we may place the result of inquiry before our readers.

The new Metropolitan Buildings-Act, which came into operation on the 1st instant, will necessarily be liable for a time to various readings, and will offer some disputed points. Our pages will be open for the discussion of them, and consideration will be given to such

form a prominent feature in our journal, and we shall aid resolutely every endeavour that may be made with that end in view. Against faulty modes of construction, unfortunately numerous and general, we shall continue to wage war,one great object of THE BUILDER being the introduction of sound principles in building. and the dissemination of practical know-

is an object of national importance. Close pursuit of the useful will not, however, prevent attention to the beautiful, indeed the connection is too intimate to admit legitimately of separation.

ledge. The improvement of dwelling-places

"Taste never idly working, saves expense." It must be constantly remarked that architecture as a fine art is much less understood by

the public than as a useful art, whence it follows that our advance in matters of taste is much slower than in matters of utility. It will be our aim from time to time to diffuse a knowledge of the principles of architectural criticism and to cultivate the taste of our readers so far as it may be in our power to do so. The preservation of ancient remains, the proper conduct of societies devoted to architecture and archæology, and the due administration of competitions, will be specially regarded by us, and strenuously advocated. On all these points public opinion is now very different from what it was even ten years ago, and we believe we shall materially aid in obtaining a satisfactory result by concentrating information relating to them, and exposing unflinchingly, every instance of tergiversation which may become known.

We have a wide field, and strong determination : with that co-operation on the part of those interested in these matters that we have a right to expect, and which the present editor, commencing a new task, earnestly solicits, we cannot fail to effect much good. WE ASK THIS CO-OPERATION, KIND READER, FROM YOU YOURSELF.

MODEL (?) HOUSES FOR THE LABOURING CLASSES.

IN THE BUILDER for December 21st, we drew attention to a statement and engraved plan of fifteen houses for the labouring classes, recently issued by the society for improving the condition of that part of the population. From this we learn that :---

"The committee, feeling that no description or reasoning, however accurate, is likely to make such an impression on the public as an actual experiment, had resolved to build a certain number of houses as models of the between Gray's-inn-road and the Lower-road. Pentonville, on the estate of Lord Calthorpe, and had commenced, under contract, the erection of the buildings shewn on the plan.

"In the arrangement of these buildings, the object had been to combine every point essential to the health, comfort, and moral habits of the industrious classes and their families, reference being had to the recommendations of the Health of Towns' Commission, particularly with respect to ventilation, drainage, and an ample supply of water."

Anxious to examine the society's first work, constructed with such an end in view, we hastened to the site of the new houses-the model bouses near the Bagnigge Wells Tavern. We regret to say, unaffectedly and seriously, that our worst anticipations are confirmed. The arrangement is a disgrace to the society, and cannot surely have been seen by Lord Ashley, the chairman of the committee.

In the Buildings Regulation Bill, brought in by that excellent nobleman in conjunction with Mr. Fox Maule and Mr. Tufnell, Feb. 1842, it is set forth most justly "that it shall not be lawful to build any new court or alley (except mews and stable-yards) narrower than 30 feet, through which there shall not be an open and entirely open from the ground upwards." And in the new Metropolitan Buildings Act, it is actually provided that no court or alley shall be built without "two entrances thereto, each being at the least the full width of the alley." Will it be believed then, by our the alley." Will it be believed then, by readers, it certainly was not by ourselves w hen we firstsaw it even with our own eyes, that these houses now in course of erection, model houses remember, to which the society are to appeal when endeavouring to persuade some money-loving landlord to build in a manner more conducive to the health of the future occupiers than to the increase of his revenue, are actually arranged to form a court open at one end only, AND LESS THAN 23 FEET IN WIDTH AT THE WIDEST PART !! The plot of ground on which the fifteen buildings are crammed is so small, that, notwithstanding this proximity, the yard attached to each house is literally what its name imports in feet, or very little more.

We call most urgently on the committee and the shareholders to prevent the consummation of this most dangerous mistake, or they will rear a hot-bed for infection, and throw a great impediment in the way of that im-provement which they profess to seek. The houses on one side are nearly roofed in; those on the other side have merely the footings laid; and we trust our contemporaries of the press will aid us with their powerful voices in our endeavour to prevent the completion of the plan as at present contemplated. we vere not assured that the income derived from these buildings would be devoted to the general objects of the society, we should questions as may arise. The health of towns, to which this Act materially refers, has always received from us the attention that the import-sace of the subject demands : it will continue to

CURIOUS ARCHITECTURAL REMAINS IN BOW CHURCH-YARD.

At the Society of Antiquaries, on Thursday, 19th ultimo, a paper was read from Thomas Lott, Esq., F.S.A., noticing some subterranean architectural remains (being stone vaultings of substantial masonry) beneath the houses in Bow church-yard, City, of a very interesting character, although of a much later date than the celebrated Norman crypts at present existing under the church.

Beneath the house No. 5, occupied by Messrs. Grocock, is a square vaulted chamber, 12 feet by 7 feet 3 inches high, with a slightly pointed arch of ribbed masonry, similar to some of those of the old London bridge. There had been in the centre of the floor an excavation which might have been formerly used as a bath, but which was now arched over and converted into a cesspool. Proceeding towards Cheapside, there appears to be a continuation of the vaulting beneath the houses Nos. 4 and 3. The arch of the vault here is plain, not ribbed, and more pointed. The masonry appears, from an aperture near to the warehouse above, to be of aperture near to the warehouse above, to be of considerable thickness. This crypt or vault is 7 feet in height from the floor to the crown of the arch, and is 9 feet in width and 18 feet long. Beneath the house No. 4 is an outer vault. The entrance to both these vaults is by a depressed Tudor arch with plain spandrils, 6 feet high; the thickness of the walls about 4 feet 4 feet.

In the thickness of the eastern wall of one of the vaults, are cut triangular-headed niches, similar to those in which, in ancient ecclesiastical edifices, the basins containing the holy water, and sometimes lamps, were placed, instances of which are seen in Old Stepney Church, and many other buildings of the same period.

These vaultings appear originally to have extended to Cheapside, for beneath a house there, in a direct line with these buildings, and

close to the street, is a massive stone wall. The arches of this crypt are of the low pointed form, which came into use in the 16th entury.

There are no records of any monastery having existed on this spot, and it is difficult to conjecture what the building originally was; Mr. Chaffers thought it might be the remains of the crown sild, or shed, where the sovereigns repaired to view the joustings, shows, and great marching watches, on the eves of the festivals.

Accompanying his communication Mr. Lott had sent two old deeds, being grants by letters patent from Henry VIII., with impressions of the great seal attached, on which he had stumbled in his researches as to the existence of any monastery on this spot. One of these deeds excited great interest, inasmuch as the splendidly illuminated margin contained a portrait in colours of the king, which, from the care bestowed on its execution, and its resemblance to the heads on the coinage of the period, might possibly be a good likeness of the absolute monarch.

Mr. Lott also laid on the table the ancient silver parish seal of St. Mary-le-Bow, representing the tower of the church as it existed antecedently to the Fire of London, with its bows or arches of stone, and five lanterns therein, intended to have been glazed, and lighted at night to guide the passengers across the ferry of the Thames.

DISTRICT SURVEYORS' ASSOCIATION. "A chicl's amang ye, takin' notes, An' faith, he'll prent 'em !"

THE anniversary dinner of this association took place on Monday last, at the Freemasons Tavern, when forty gentlemen sat down, and Tavern, when forty gentlemen sat down, and H. E. Kendall, Esq., took the chair, supported by Professor Hosking, the official referee ap-pointed under the Metropolitan Buildings Act. Mr. Baker, hon. sec., read the friendly apolo-gies of Mr. Higgins, the other official referee, and of Mr. Symonds, the registrar, for their unavoidable absence unavoidable absence.

After the usual toasts, the Chairman alluded of Mr. Hosking gave to himself and to the meeting, and proposed the health of "The Official Referees and the Registrar." The toast having been received with cheers,

Mr. Hosking thanked the society for the compliment paid to him, and expressed much pleasure at having received their invitation; it was

an earnest that, under the new circumstances in which they would soon be relatively placed to each other, he should receive their co-operation; they would all shortly be in the same boat together, and when he considered the great experience of many members of the Association, and the attention which they had bestowed upon the new Act, he hoped to derive great benefit from their assistance. If, however, in the performance of his office, he should be compelled to differ in opinion from them, or to exercise any of the powers which the law gave him over their appointments and their duties, he was glad to have this opportunity afforded to him of shewing the usual feeling of an Englishman, who always shakes hands before the fight. (Cheers.) With some complimentary observations, he then proposed, " Prosperity to the District Surveyors' Association.

The Chairman having acknowledged the toast, briefly gave, "Mr. Donaldson and the y elected Surveyors.

Mr. Donaldson said, that the duties of the new surveyors would be comparatively light, for whenever any case of difficulty arose, he should not fail to call in Trafalgar-square for proper directions (a laugh); so that, what with following the example of the senior sur-veyors, and the advice of the official referees, the path would be clear, and easily pursued.

The Chairman then said, it would be recol-lected that, three weeks ago, Mr. Baker, the honorary secretary, had stated his intention to resign the office, and assigned his indisposi-tion alone as his reason for doing so. The The association felt that much was due to their esteemed friend, not only for the efficient manner in which he had for so long a period per-formed the duties of his office, but for his exertions at the formation of the society. A committee was therefore formed, and it was unanimously agreed to present him with a silver salver, having an appropriate inscription. However inadequate the gift, he now begged to present it in the name of the association, and to couple with it, a bumper to "Mr. Baker's health."

The toast having been received with cheers, Mr. Baker said, that though he had been led to expect this mark of kindness at their hands, he was, nevertheless, but ill prepared to express, in appropriate terms, his grateful sense of it. Returning thanks seemed, at first sight, an easy task, but when the heart was full, no one knew, until he tried, how difficult it was to clothe gratitude with words. On this account, he begged for their forbearance, for like Trotty Veck, he found "every word swelling in the throat to the size of the whole alphabet." Imperfect, however, as he might express it, he assured them that his gratitude phabet." was at least sincere, and that he felt deeply indebted to all,—to those whom an intercourse of many years had impressed him with the knowledge of their worth and their good fellowship, and also to those new members, who, uncalled for and unlooked for, but not uncared for, had voluntarily come forward on this occasion. He valued the inscription upon the plate more than the plate itself, and trusted that he should preserve his friends as long as he should preserve their testimonial. He could not relinquish the post of secretary without congratulating the association on its healthy and prosperous condition : there had been no quarrellings, no jealousies, or discontent, to induce one member to retire ; but all the meetings had been conducted in harmony and hemight add too, with discretion, when he recollected that the last act of the association was to appoint Mr. Pownall to the post of secretary (loud cheers), a gentleman thoroughly qualified for the office, and who had already entered on his task with activity and zeal. No wonder then that a body like this, associating together quite as much for the public good as for its own, should meet with the sanctioning presence of the gentleman on the right of the chair. I am delighted, concluded Mr. Baker, to see him amongst us, and as he has alluded to our heirs in the same here I provide him to our being in the same boat, I promise him that if, on the untried waters in which our vessel is to be launched on Wednesday next, he will steer steadily, we will pull heartily, and so the boat shall go merrily down the stream. (Loud cheers.)

"Mr. Allason and the visitors," "the Magistrates of Middlesex, Kent, and Surrey," and several other toasts followed. We must

not omit, however, one toast proposed by Mr. Pownall, who prefaced it by saying that the company had drunk the healths of new members and new friends, and right glad was he to see them, but that they ought not to forget a cer-tain good old friend who was about to part with them for ever. Many a time had this good friend, now seventy years old, done them able service; many were the debts of grati-tude due for these services; indeed those who had known him longest loved him best, and no one therefore would refuse to drink to "The Blessed Memory of the old Act."

ST. PAUL'S CHURCH, HERNE HILL.

ST. PAUL'S CHURCH, Camberwell, consecrated on the 21st of last month. was The building consists of a nave and side aisles, or chancel, and a tower and spire at the west end, placed in the centre. The nave has a clerestory, and is covered with a double roof, so arranged as to give the appearance of an open roof of lower pitch. The roof of the aisles is very simple and effective; it consists of boarding supported on a frame-work of timber which forms square panels for the ceiling, and is covered with asphalted felt and slated. The pulpit is on the north side of the chancel-arch, and is entered by means of steps from the chancel; the robing-room is con-tiguous. The pulpit is of stone, and is adorned with paintings of St. Peter, St. Paul, and other apostles, on porcelain tablets, drawn by Nixon, executed by the firm of Copeland and Garrett, and presented by the latter gentleman, together with the encaustic tiles with which the centre of the nave and the whole of the chancel are paved. The steps, formed also of porcelain confined by iron nosings, are ingeniously designed and arranged. One difficulty in the manufacture of encaustic tiles seems to be, that of making them all exactly of the same size, and so obtaining straight lines when they are A little more attention in this respect doubtless overcome it. The material laid. will doubtless overcome it. seems excellent.

The organ is placed in a small chamber formed over the north porch, so that the front is flush with the walls of the aisle. All the windows are filled with stained glass by Messrs. Ward and Nixon, and deserve commendation. The large east window contains figures of Matthew, Mark, Luke, and John, with the lamb, dove, and other emblems. Unsightly galleries, so often destructive to the effect of new churches, have been avoided, in consequence of which, although this edifice is in reality low, it has an open and airy appearance. The church is noticeable for the extent of

its coloured decorations, ably executed by Mr. Warrington. The roof of nave, sisles, and chancel, is elaborately painted in patterns, the whole of the wood-work having been first stained to represent oak. On both sides of the tie-beams of the nave-roof are Scripture sentences; those facing west, confirmations of the ten commandments, from the New Testa-ment; those east, proverbs from Solomon. On the spandrils of the arches separating the nave and aisles, is represented the vine, with scrolls bearing sentences of thanksgiving, and surrounding an emblem of the sufferings of the Saviour, the crown of thorns, the nails, &c. Originally the scrolls were supported by angels, and over the chancel-arch were painted figures of St. Peter and others, the size of life; but these, at the suggestion of the bishop, were church, we entirely agree. In an artistical point of view we may be anxious to see decorations of this description introduced in our churches,considered abstractedly no reasonable objection can be made to them; but when they are understood to be a banner of a party in the church bent on introducing dangerous changes, our artistical feelings give way to higher considerations, and we express our approval of the caution which would delay their introduction. On the subject of mural decorations and stained glass we shall shortly offer some general remarks.

The architect of the church, Mr. George Alexander, F.S.A., of the firm Messre. Stevens and Alexander, has displayed most praiseworthy care, and much ability, in rendering the whole consistent and homogeneous, and has succeeded in producing a very successful building. The

style adopted is that of the 15th century. If we were disposed to find fault, we might say that the mouldings of the principal arches in the nave are too large, and produce a heavy effect; they should have been out up into smaller parts. Where so much, however, has been done with comparatively small means, we are not willing to qualify our praise.

done with comparatively small means, we are not willing to qualify our praise. The body of the church is 80 feet in length, 51 feet wide, and 30 feet high, and affords seats (low pewing of oak) for 700 persons. The chancel is 19 feet deep; the tower and spire 120 feet high. The amount of the estimate, including the stained-glass windows in the clerestory and chancel, was 4,500%. Some extra works and alterations amounted to 100%. The painted decorations cost 205%; but this was defrayed by the drawback obtained on timber, glass, and other materials not liable to duty when used in the construction of a church. The boundary wall and gates cost 450%; the organ, 270%, and the hot-water apparatus (by May) 153%; so that the whole expense, exclusive of the stained-glass windows in the aisles (which were all presented, and cost about 15% each), the encaustic tiles, the porcelain decorations, and architect's commission, was 5,473%. The Church Commissioners contributed 700%, and the remainder of the sum was obtained by subscription. The exterior of the building is of Sneaton stone (Yorkshire), hammer worked, with free-stone from Box for the dressings.

Mesrs. Howard and Son, of Newington, were the builders; and it is but justice to them to say, that the works are well executed.

CHURCH ARCHITECTURE IN PARIS.

THE church of St. Vincent de Paul, in the Place Lafayette, which has been many years in progress, from the designs of M. Pere and M. Hittorff, is now completed, with the exception of some external and internal paintings, and has obtained considerable praise as well for all the artists who have been employed upon it, as for the architects themselves. It was commenced in 1824; but for several years the works were suspended altogether. The building is very advantageously placed, being on a considerable elevation above the surrounding ground, and is approached by extensive flights of steps (with semi-circular terraces branching off on either side with a gradual descent for the approach of carriages), which produce a striking effect. An Ionic portico of six columns, three intercolumniations in depth, and the two towers 181 feet high, are the principal features of the entrance front.

risal features of the entrance front. The width of the building is 123 feet 6 inches; the depth, 298 feet 6 inches; the height of the nave is 96 feet. The interior is divided by four ranges of columns into five parts, the centre being the nave, the adjacent division on each side the aisles, and the outside divisions the chapels. The nave and aisles are two stories is height, the latter having a gallery over them. The nave is covered with an open timber roof, as was generally used for the Roman basilica: the building is terminated at the east end by a semicircular absis, embracing the whole width of the nave and aisles. Painting and sculpture, stained glass, cast iron, and all the contemporary arts, have been employed with the new of rendering the whole perfect. Erected at the expense of the city of Paris, money seems hardly to have been considered: it has cost no less than 156,0002, exclusive of the steps and terraces, which cost 9,6001.

A French writer, speaking of this church, sys, "that although it fully recals the beautiful types of antique architecture and the primitive ages of Christianity, it is in no degree as imitation, except in the application of the principles which presided at the conception of the noble monuments of Greece and Rome." "We find in it (the writer continues) no direct plagiarism; none of those counterfeits of ancuest fragments, the introduction of which, under other circumstances, will be always oppred to those principles which regulate that, in architecture, the true and the fitting can alone produce the beautiful."

IRON TRADE.—An advance of 10s. per ton bes taken place in the price of Welch iron, while the price of Staffordshire iron has advanced 11. The trade appears to be more steady than it has been for months, and it is said that a general advance of wages is not unikely to take place shortly.—Welchman.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE Institute will hold their next meeting (January 13th) in new apartments, although in the same building. The first floor of the house in Grosvenor-street has been fitted up to receive them, and arrangements have been made to give additional *éclat* to the proceedings. It is to be hoped that the members will come forward with the result of their experience and reading, to assist the council in carrying out the purposes of the society. We should like to see such men as Mr. Cockerell, Mr. Barry, Mr. Hardwick, Sir Robert Smirke, and others, communicating to their brother members new points of practice, or their observations on ancient building, instead, of as now, attending simply when vice-presidents for the year, if not totally absenting themselves. To say that they have no time to spare is but a poor excuse. They ought to consider it a bounden duty to maintain the character of the profession to which they belong, and to play their part in forming the minds of those who are to succeed them. We propose in chronicling the proceedings of the institute, not to confine ourselves to the papers which are read, but to notice such remarks as may be thrown out afterwards in discussion, so that our pages may become a more perfect record of the proceedings than exists at present.

The officers for the present. The officers for the present year are—Earl de Grey, president; Messrs. H. E. Kendall, J. B. Papworth, and George Smith, vicepresidents; Messrs. Booth, Foxhall, George Godwin, Grellier, Noble, Parker, W. F. Pocock, Roberts, and James Thompson, ordinary members of council; Messrs. A. Poynter and G. Baily, honorary secretaries; and Mr. T. L. Donaldson, foreign secretary.

RESTORATION OF GLASGOW CATHEDRAL

This fine old building is about to be thoroughly renovated. Workmen are busily engaged at present in removing the iron cages from the outside walls, and in lowering the soil, so as to shew the proper elevation of the church. When completed this will make the venerable pile look quite another thing outside. Inside the work of renovation and improvement is also going forward with spirit. The many and elaborately wrought pillars of the crypt, or old barony church, are being neatly mended wherever it is necessary, and the blackness settled down upon them in the course of years is being washed off by a solu-tion for the purpose. The effigy of St. Mungo, which had been very unceremoniously removed and laid on an adjacent window-sill, has once more been deposited in its proper place, on the raised shrine in the centre of the crypt, where there is very little doubt it originally stood over the grave of the saint. The elabor rate groinings and carvings of this portion of the building, most of which have been gilt and painted with various devices, is a theme of universal admiration since it was opened up to the public, and glass windows introduced instead of the blind ones. In this compartment of the building, and over a niche in the lower chapter-house, there is an inscription in Latin, which we translate thus :—"The House of Faith, the Chapel of the Lord." The arms of the founder, Bishop Lauder, are placed over the niche. Lauder died in 1425. In the different portions of the bosses of the roof of the lower chapter house, which was built by Bishop Cameron, we have his own arms, and the arms of Archibald Earl of Douglas, who endowed the cathedral with the church of Cambushlang. Next these are the Royal arms of Scotland, and the arms of Scotland and England on one shield. Above the original south door, entering to the nave, the groined arches are decorated with crowns, which we must say we never observed before, and would not have done so now, had they not been pointed out by our friend, Mr. Andrew Adie, than whom no man in all Glasgow has a more minute knowledge of every hole and bore about the cathedral. These crowns are beau-tifully carved, and amount in number to eight, inscriptions and mottoes, in the with English characters, which, we have no doubt, could be deciphered were a person near enough to trace the letters. On the arch next the ascent to the choir, on the south side, and to the right of the entrance door to Principal Macfarlan's church, the decorations of the roof

point it out as a chapel of consequence. Besides a great many devices and inscriptions, there is the figure of a man kneeling before a blazing altar, with the word "Maria," thereby indicating aftar, with the word "Maria, thereby indicating that this was the chapel of the Virgin. We have no doubt a splendid tomb stood here, and that were the pavement re-moved, and a search made, its foundation and When the other relics would be found. pavement was laying a short while ago, the workmen felt quite certain that there was something strange below, as it sounded quite "boss," or empty. The arch on the south aisle, next the high altar, is most elaborately decorated and carved. Amongst the carvings to be mentioned is an emblem of the Holy Trinity, and the five wounds of our Saviour, a crown of thorns, a cross, a scourge, &c. At the south door of the lady's chapel the tombstone of Archbishop Boyd attracts attention. It bears the date 1581, and lay originally on the steps of the high altar, just below where the pulpit of the very rev. principal now stands. When of the very rev. principal now stands. When removed in 1800, the skeleton of the archbishop was found in a very entire state, and wrapped in a silk, besides a worsted damask dress. **`On** the summit of the roof of the chapter-house, we observed, for the first time, a small stone slab, bearing the initials of Archbishop Law, and the pastoral staff. It was this archbishop who restored the lead roof of the cathedral, after its destruction at the Reformation, and bis monument may still be seen in tolerable preservation in the lady's chapel. He died in 1632. Blackadder's Aisle.—The workmanship here, and especially the groinings of the roof, are most elaborate and beautiful, The follow-ing is the style of the inscriptions over the tombs of those who are buried in the aisle, and it must be confessed the information furnished is not very great :--

| 1628 | | |

...

Mr. Kirkman Finlay, of Castle Toward, seems to have been the last interment in this sacred spot.

&c. &c.

The remains of the identical Strap, who makes such an interesting figure in Smollett's "Roderick Random," lie under a slate-coloured grave-stone in the yard, not far from the entrance to the church of the principal.

The whole of these works are being carried on at the expense, and under the superintendence of Government. A gentleman, sent down by the Woods and Forests, lately arrived in Glasgow, to make the preliminary arrangements, and to overlook a portion of the restoration.—Glasgow Constitutional.

METHOD OF DETERMINING WHETHER A STONE WILL RESIST THE ACTION OF FROST.

A FEW years since M. Brard communicated to the Royal Academy of Science, in Paris, a method of determining, by a few prompt and easy experiments, whether a stone to be used for building purposes is capable of resisting the destructive action of moisture and frost. The Academy appointed a committee to inquire into the merits of M. Brard's process, and to make a report thereon. We are indebted for the following extracts from this report to to a work recently published by Parker, and entitled The Useful Arts Employed in the Construction of Dwelling-houses :---

In the choice of a stone for building purposes, it is of the utmost importance to be able to determine, by a few prompt and easy experiments, whether the proposed stone is capable of resisting the destructive action of moisture and frost. The means of ascertaining this were difficult and uncertain, until M. Brard, several years ago, communicated his method to the Royal Academy of Sciences at Paris. This learned body having appointed a committee of their own members to inquire into the merits of M. Brard's process, and to make a report thereon, the united testimony of engineers, architects, masons, and builders from different parts of France was received, and proved so favourable as to its merits and simplicity, that the committee recommended

3

Digitized by GOOGLE

the plan to public notice and general adoption. From their report we select a few details which, hitherto, we believe, have not appeared in English.

When water is converted into ice an increase in bulk suddenly takes place with such amazing force that it appears to be almost irresistible. This is the force which cracks our water-bottles and ewers; splits asunder the trees of our forests; and destroys some of the stones of our buildings. But the action of frost upon stone is very gradual; it is confined to the surface, and when we see a layer of stone separated from the rock or the building, we see the result of the action of the frost during several successive winters, whereby the fragment is gradually thrust out of its perpendicular position, and at length falls. This natural process is repeated in our buildings: we rarely see squared stones split into large fragments by the action of frost except there be a cavity of some considerable size, in which a quantity of water can be collected. The usual action of the frost is at the surface, which is destroyed by the chipping off small fragments in consequence of the adhesion of the materials of the stone being partially destroyed.

All stones absorb water in greater or less quantities, and there is no rock that does not contain some humidity. The great difference between stones which is now to be considered is in their power of resisting frost. Stones of the same kind, nay, stones from different parts of the same quarry, are acted upon very differently by frost; for, while one stone soon begins to shew the destructive effects of its action, another remains uninjured during many centuries. It will, therefore, be convenient to call those stones, of whatever kind, which withstand the action of frost, resistant, and those which yield to its action, non-resistant. M. Brard's first idea, in order to test these

M. Brard's first idea, in order to test these resistant properties in building-stones, was, to saturate the stone with water, and then expose it to cold artificially produced; but this was found to be impracticable on a large scale, and the freezing mixtures and other means of producing cold were liable to act chemically upon the stone, and thus produce other effects than those of cold.

M. Brard was then led to compare water with those numerous solutions of the chemist, which, under certain modes of treatment, crystallize. The expansive force of salts in crystallizing is very great, and he saw no reason why water should not be regarded as a crystalline salt similar in its nature to those saline bodies which effloresce at the surfaces of stones, and in time destroy them and even reduce them to powder. He therefore tried, in a very large number

He therefore tried, in a very large number of experiments, the action upon buildingstones of solutions of nitre, of common salt, of Epsom salts, of carbonate and sulphate of soda, of alum and of sulphate of iron, and found that the stones cracked and chipped, and in many cases behaved precisely in the same way as when under the influence of freezing water. In the course of these trials, sulphate of soda (Glauber's salts) was found to be the most energetic and active, and to be the best exponent of the action of freezing water.

In order, therefore, to determine promptly if a stone be resistant or non-resistant, the following process was adopted. A saturated solution of sulphate of soda was made in cold water; the solution being put into a convenient vessel, the stone was immersed, and the solution boiled during half an hour : the stone was then taken out, and placed in a plate containing a little of the solution. It was then left in a cool apartment, in order to faciliate the efflorescence of the salt with which the stone was now impregnated. At the end of about twenty-four hours the stone was covered with a snowy efflorescence, and the liquid had either by evaporation or by abdisappeared sorption. The stone was then sprinkled gently with cold water until all the saline articles diappeared from the surface. After particles diappeared from the surface. The this first washing the surfaces of the stone were covered with detached grains, scales, and angular fragments, and the stone being one that the sulface draw frost, the sulface sulface of the substance of the stone being one that the sulface of the stone being one that the sulface of the substance of th that was easily attacked by frost, the splitting of the surfaces was very marked. But the experiment was not yet terminated : the efflo-rescence was allowed to form, and the washing

was repeated many times during five or six days, at the end of which time the bad qualities of the stone became fully established. The stone was finally washed in pure water; all the detached parts were collected, and by these the ultimate action of the frost upon the stone was estimated.

The behaviour of various non-resistant stones under this process was remarkable. Some were found to have deteriorated in the course of the third day; others to have entirely fallen to pieces; those of which the power of resistance was somewhat greater, held out till the fifth or sixth day; but few stones, except the hard granites, compact limestones, and white marbles, were able to stand the trial during thirty consecutive days. For all useful purposes, however, eight days suffice to test the resistant qualities of any building-stone.

The explanation of this process is very easy. The boiling solution dilates the stone and penetrates it to a certain depth, nearly in the same way that rain-water by long-continued action introduces itself into stones exposed to the severity of our changeable climate. Pure water when frozen occupies a greater bulk than when fluid, and the pores or cellules of the stone not being able to accommodate themselves to the increased bulk of the water, great pressure is exerted between and among them, whereby a portion of the water is driven to the surface, and in doing so rends and detaches small portions of the stone. The same action takes place with the saline solution; it is introduced into the stone in a fluid state, from which passing into the solid it occupies a greater bulk, and a portion of it appears at the surface. The repeated wash-ings have no other object than to allow the salt to exert its greatest amount of destructive action upon the stone. There is a striking analogy between the effect of congealed water and that of the efflorescence of salts, in the disintegration of non-resistant stones; namely, that pure water acts on the stones destructively evidently proceeds from the interior to the exterior like the saline efflorescence; which water at the surface of the stones may freeze into hard ice without injuring them, just in the same way as the salts, which may crystallize upon stones without exerting any injurious action.

The experience of several engineers, extending as it does over several years, fully proves, of a large variety of stones whose qualities were well known, that the action of M. Brard's process and that of the long-continued frost exactly coincide.

It is not the least interesting part of the inquiry to know that this process may be applied with perfect success to ascertain the solidity and resistant power of bricks, tiles, slates, and even mortar. From a mass of minute detail, we will select a few general results.

During one winter season M. Vicat composed seventy-five varieties of mortar, the difference between any two consisting in the proportion of sand and the method of slaking the lime. In the following June these mortars were exposed to the disintegrating process. Most of them were attacked in twenty-four hours; almost all of them in forty-eight hours; and all except two in three days. This gentleman also found that a mortar made ten years previously, of one hundred parts lime which had been left exposed to the air, under cover, during the whole year, and then mixed up into a paste with fifty parts of common sand, withstood the trial admirably during seventeen days, while the best stones of the neighbourhood speedily gave way. In this case the solution was saturated while hot, which is so powerful in its effects that stones which have resisted the action of the frost for ages, soon give way when exposed to it. M. Vicat calculates that the effect of the

M. Vicat calculates that the effect of the sulphate of soda upon a non-resistant stone after the second day of trial equals a force somewhat greater than that exerted by a temperature of about 21 degrees Fahrenheit, on a stone saturated with water.

The action of the process upon bricks proved that, whatever their qualities in other respects, if imperfectly burnt, they are speedily acted on. The sharp edges of the brick, and then the angles, are first rounded, and finally the brick is reduced to powder. Such is precisely the action of frost often repeated. Wellbaked bricks, on the contrary, retain their colour, form, and solidity by this process, as well as under the influence of frost. Ancient Roman bricks, tiles, and mortar, and hard well-baked pottery resisted the process perfectly; as did also white statuary marble of the finest quality, while common white marble was soon attacked. In Paris, portions of buildings which had been exposed to the air during twenty years without undergoing the least alteration, were submitted to this ordeal, and the experiment agreed with observation. In one extensive series of experiments on stones from different quarries of France, the action of the salt was continued for seven days, and the results noted down; it was then continued for fourteen days, and the results compared with the preceding ones, which only served to confirm the judgment first given, for those stones which were noted as of bad quality crumbled to dust or split into fragments, while those noted for their good qualities had experienced no sensible alteration.

One of the great advantages of this process is the power it gives to the architect of choosing a hard, durable stone for those parts of the building most exposed to the action of the weather, when the funds are insufficient to admit of the whole building being so constructed. Thus the cornices, the columns, and their capitals, are struck in all directions by rain, and hail, and damp air, and are consequently far more exposed to their destructive action than the flat surface of a wall, which offers but one plane to the air.

In the course of this inquiry a very curious case arose. During the erection of a church in Paris, the architect required a good durable stone for the Corinthian capitals; and many circumstances disposed him to select it from the neighbouring quarry of the Abbaye du Val. But, on seeking the opinion of two brother architects, he was surprised to find their estimations of the stone to be totally at variance, for while one declared that he had employed it with the greatest success, another said that he had seen it yield speedily to the effects of frost. On visiting the quarry it was found that two beds of stone were being worked, an upper and a lower bed; specimens of the stone were taken from each, and on submitting them to a hot saturated solution, it was ascertained almost immediately that the upper layer furnished excellent stone, while the lower one supplied that of which the architect had so much reason to complain. But it is remarkable that the stones from the two beds had precisely the same appearance in grain, colour, and texture; so much so, that when brought into the mason's yard it was impossible by ordinary tests to distinguish the good from the bad stone.

At the conclusion of the inquiry of the committee, the Royal Academy of Sciences proved the high estimation in which they held this contribution of science to the useful arts, by directing to be published the following practical directions for repeating the process, for the use of architects, builders, mastermasons, land proprietors, and all persons engaged in building. 1. The specimens of stone are to be chosen

1. The specimens of stone are to be chosen from those parts of the quarry, where from certain observed differences in the colour, grain, and general appearance of the stone, its quality is doubtful.

2. The specimens are to be formed into twoinch cubes, carefully cut, so that the edges may be sharp.

3. Each stone is to be marked or numbered with Indian ink or scratched with a steel point; and, corresponding with such mark or number, a written account is to be kept as to the situation of the quarry, the exact spot whence the stone was detached, and other notes and information relating to the specimen.

4. Continue to add a quantity of sulphate of soda to rain or distilled water, until it will dissolve no more. You may be quite sure that the solution is saturated, if, after repeatedly stirring it, a little of the salt remains undissolved at the bottom of the vessel an hour or two after it has been put in.

5. This solution may be heated in almost any kind of vessel usually put on the fire, but perhaps an earthen pipkin may be most convenient. When the solution boils, put in the specimens of stone, one by one, so that all may be completely suak in it.

6. Continue the boiling for thirty minutes.
 Be careful in observing this direction.
 7. Take out the cubes one at a time, and

7. Take out the cubes one at a time, and hang them up by threads in such a way that they may touch nothing. Place under each specimen a vessel containing a portion of the liquid in which the stones were boiled, having first strained it to remove all dirt, dust, &c.

8. If the weather be not very damp or cold the surfaces of each stone will, in the course of twenty-four hours, become covered with little white saline needles. Plunge each stone into the vessel below it, so as to wash off these little crystals, and repeat this two or three times a day.

9. If the stone be one that will resist the action of frost, the crystals will abstract nothing from the stone, and there will be found at the bottom of the vessel neither grains, nor scales, nor fragments of stone. Be careful in dipping the stone, not to displace the vessel.

If, on the contrary, the stone is one that will not resist the action of frost, this will be discovered as soon as the salt appears on the surface, for the salt will chip off little particles of the stone, which will be found in the vessel beneath; the cube will soon lose its sharp edges and angles; and by about the fifth day from the first appearance of the salt, the experiment may be considered at an end.

As soon as the salt begins to appear at the surface its deposit is assisted by dipping the stone five or six times a day into the solution.

10. In order to compare the resisting powers of two stones which are acted upon by the frost in different degrees, all that is necessary is, to collect all the fragments detached from the six faces of the cube, dry them and weigh than, and the greatest weight will indicate the stone of least resistance to the frost. Thus, if a cube of twenty-four inches of surface loses 180 grains, and a similar cube only 90 grains, the latter is evidently better adapted than the former to the purposes of building.

LAW OF DILAPIDATIONS.

THERE are few points of architectural jurisprudence which interest so large a number of persons as does the question of dilapidations. Whether to landlord or tenant, surveyor or operative, the matter is one of importance, and several attempts have consequently been tmade to reduce the laws which relate to it to some sort of certainty. Being in many cases a question of degree, law cannot always be made to apply; and custom, and the experience of the surveyor, must be appealed to. "Still," as Mr. Gibbons remarks in his "Treatise on the Law of Dilapidations," "it is important that the surveyor should have some knowledge of the principles of law, in order that he may know the points to which he has to apply himself in framing his survey and estimate, and may not labour in vain. The great discrepancy in the evidence of different surveyors, and the little esteem in which their testimony is consequently held, arises in a measure from inattention to legal principles; and if, in making their surveys, they were to govern themselves by the settled rules of law, and not proceed upon their own vague notions of right, they woold be more useful to the administration of justice, and their opinions more respected."

The attention of the council of the Institute of Architects having been directed to this subject, as one on which the opinion of the institute might be expressed with advantage; a committee, consisting of Messrs. George Smith (Mercers' Hall), John Newman, John Bull Gardiner, W. F. Pocock, and W. Rogers, was appointed to investigate and report on the practice in valuing dilapidations, and on the state of the law by which such valuations are effected. The Report of this committee is now published,* and forms an exceedingly useful document. We do not hesitate to recommend it to our readers. In the preface to the Report, the council remark that it appears "to be an inherent defect in the general mode of preparing leases, that they are drawn from antiquated precedents, without an attempt at the modifications necessary to meet modern improvements, or to provide for "pecial cases or contingencies. A tenant bound to repair, uphold, support, and maintain

• Weale, London, 1844.

a new house, is obviously in a very different position from one upon whom the same condition is imposed with respect to an old and nearly worn-out, though tenantable fabric, and yet the distinction is unheeded in the repairing covenants of any form of lease commonly adopted."

To obviate this difficulty they propose that previous to the execution of a lease the premises should in all cases be surveyed, and that a schedule should be drawn up, signed by the lessor and lessee, specifying the actual state of every part of the buildings, by reference to which the dilapidations should be assessed at the end of the term.

As to the definition of the term dilapidations, the report says, "dilapidations are, in usual practice, considered to be those defects only which have arisen from neglect or misuse; and not to extend to such as only indicate age, so long as the efficiency of the part still remains. But if the effects of use or age have proceeded so far as to destroy the part, or its efficiency in the structure, this argues neglect or misuse; it being the presumption that at the commencement of his term, the tenant was satisfied that every part was sufficiently strong to last to its close."

tenant was satisfied that every part was sufficiently strong to last to its close." In cases of yearly tenancy, the usual practice, says the Report, is to require the tenant to make good all works damaged, or any waste committed during his tenancy; but not to make good injuries arising from fire, use, or wear, or lapse of time; "in fact, he is only bound to such repairs as are necessary to keep a house or building wind and water-tight." This latter statement is not correct, or all events is ill-expressed, and does not agree with that which precedes it. If paper-hangings be torn by a tenant, a hearth broken, the mosing of a step *knocked* off (not worn), or any other waste committed, he must make good the damaged work. Even if external wood-work decay for want of painting sooner than it otherwise would do, the tenant is bound to restore it.

As regards ecclesiastical dilapidations, the Report states, the usual practice "is to consider that (independently of the obligation to compensate for actual deficiencies) the representatives of a late incumbent are liable for the value of repairs equivalent to, or consonant with, the extent of those which, in civil cases, a lessee would be called upon to perform on taking a lease for twenty-one years, under an agreement to put the premises into complete and substantial repair at the commencement of such a term."

But it points attention to a case wherein it was ruled that the incumbent was not bound to supply or maintain any thing in the nature of ornament.

The Report afterwards says, "An incumbent is in many instances bound to keep the chancel of the church in repair; and the liabilities to repair it may be considered as amounting to those above stated with respect to the other premises held by him."

The law is more stringent than is here stated. Excepting through special custom, the incumbent is bound in all cases to repair the chancel and maintain it in a proper state for divine service. By the 35th of Edward I., statute 2, the incumbent is permitted to fell timber growing in the church-yard for this purpose, and may, if he please, do so for the relief of the parishioners when the body of the church needs repair.

FALL OF A SCAFFOLD THROUGH OVER-LOADING IT. On Monday last a melancholy event occurred

On Monday last a melancholy event occurred at the corner of Jermyn-street and Duke-street, St. James's, involving the loss of one human life, if not more. During the last few weeks, the house at which the occurrence took place had been pulled down, and was nearly rebuilt. At the time of the accident the workmen were employed in raising a large cornice stone, weighing between six and seven hundredweight, and on its arriving near the top of the building, the stone was over-balanced, and fell with the scaffolding, striking aworkman named Francis, a mason's labourer, and two other workmen, John Perry, a mason, and William Smith, a labourer. The poor follow Francis was killed on the spot, and fell into a well which was in the area, the depth of several feet, whilst Smith and Perry were so frightfully injured, that they were conveyed to St.

George's Hospital in an almost dying condition; Smith, in particular, had his skull fractured in a shocking manner. On the recovery of the body of Francis from the well, he appeared literally crushed to an almost indistinguishable mass, and those who saw the sad spectacle were so paralysed, that for some time they were unable to render assistance. At the inquest upon Francis, the following evidence was given :-James Sanderland said he was a labourer in the employ of Mr. Archbutt, the builder, of Chelsea, and was at work that morning at the house rebuilding for Mr. Slater, at the corner of Jermyn and Duke streets. Deceased was in the same employ, and worked there also. Shortly after nine o'clock he was on the scaffold when it gave way. The deceased, with the other two injured men, were on the scaffold at the time. There were two stones on the scaffold, weighing between fourteen and fifteen hundred-Witness was engaged with the others weight. in lifting one of the stones, weighing six and seven hundred-weight, when some part of the scaffold gave way, and both pieces of stone fell suddenly, and deceased and the other two men with them. Could not account for the accident, and thought the scaffold perfectly safe before. Most likely it was the puttors gave way. They were not very strong, at least they did not appear to be. Mr. Edward Foster did not appear to be. Mr. Edward Foster deposed that he was clerk of the works for Mr. Archbutt, at the house, 47, Jermyn-street. Was in the building at the time, and heard the scaffold break. He ran from the place where he was standing, and saw the poor fellows, Perry and Smith, lying in an excavation made for vaults. They must have failen at least from 60 to 80 feet. He could not assign any reason for the accident, as the scaffold was a good one, although only a bricklayer's scaffold. The putlocks might have given way, but he thought that could only have been caused by the working of the stone with the mallet on the scaffold; that would considerably increase the weight. The strength of the scaffold was not increased on account of the stone being raised upon it. It was considered safe, as on Saturday the scaffold had upon it three times the weight of stone it had to-day. The jury, after constone it had to-day. The jury, after con-siderable discussion, returned a verdict of Accidental Death. They, however, added their strong opinion that the scaffolding had been used for the purpose of suppoting a much greater weight than was proper.

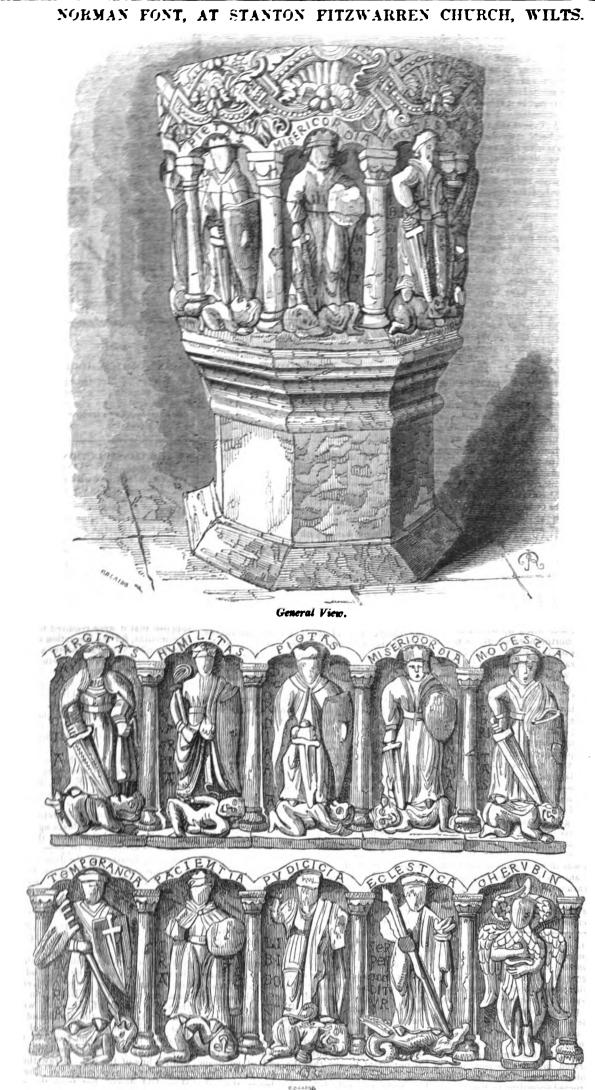

New METHOD OF SILVERING GLASS.— At a meeting of the Chemical Society, Mr. Warrington described a new method of cover-ing glass, by precipitation, with a coating of metallic silver, the invention of Mr. Drayton. It consists of partially precipitating, and thus neutralising (to use the inventor's own words), a solution of nitrate of silver, by spirit of hartshorn, and adding to the clear solution, after subsidence, oil of cassia, previously dis-solved in spirits of wine. This compound mixture forms the silvering menstruum, and is mixture forms the silvering menstruum, and is to be poured on the surface of the glass, or into the vessel intended to be silvered, the surfaces having been previously rendered per-fectly clean. Oil of cloves, dissolved in spirits of wine, is then to be gradually dropped over the surface of the silvering solution, or the two solutions may be rapidly mixed and then applied immediately. In the course of about fifteen minutes a faint purple cloud appears, and this gradually spreads through the whole of the solution, and deepens in tint until it becomes opaque, when the operation is complete, and a most beautiful mirror is obtained. As thus produced, the reflecting surface is darker in its aspect and more similar to the brilliancy of a very highly polished speculum. The risk of breakage attendant on the usual process, by means of tinfoil and mercury, is also avoided, particularly where very large looking-glasses are being constructed; and the great advantage obtained of being enabled to silver uneven surfaces, as of lenses or cut glass.

BISHOP KEN'S TOMB.—A subscription has been opened for the purpose of renovating the tomb of Bishop Ken in the churchyard at Frome, and, as a tribute to the memory of the good bishop, restoring, in strict accordance with ecclesiastical propriety, the adjoining chancel of Frome church. In furtherance of these objects, the family of Longleat have subscribed 250%, the Bishop of Salisbury, 10%, and there follows a long list of contributors.

Elevation of Figures round the Font.

ANCIENT NORMAN FONT AT STANTON FITZWARREN CHURCH, WILTS.

THE small church of Stanton Fitzwarren, in which the fine font represented on the other side, is to be found, is situated about three miles from Swindon, in Wiltshire. The font has, only within the last three years, been relieved from a load of whitewash, which had so completely filled up the carving, that it looked like a rough stone. This cleaning out was super-intended by the Rev. J. Trenchard, the rector, and he certainly has been rewarded for his trouble, as a more interesting font can scarcely be found. The date is probably that of the late Norman. The illustrations scarcely require any description, except to state that it is termed an emblematical and inscribed font, representing the Triumph of the Virtues, with the aid of the Church, over a variety of curious hob-goblins termed Vices. On one side of the font, opposite to the figure emblematical of the Church, is a kneeling stone, no higher than the slanting moulding at the base. The sketch was taken with the camera lucida while a strong light was on the object. The church is said to have been a very

curious structure, but it has now, from being either compoed or refaced, the appearance of a modern building. The interior has a chancel arch, which bears the reputation in the neighbourhood of being Saxon, but it is in reality a fine early Norman specimen. C. J. R. a fine early Norman specimen.

DESCRIPTION OF A HOUSE IN DAMASCUS.

In order to give me an opportunity of seeing his house, the Effendi politely sent a message te the ladies of his establishment, announcing the presence of a stranger, on which they withdrew to the upper chambers. The Mulatto having duly informed us that all was in readimess, we rose, and passing through another dark passage, found ourselves in the courtyard of the harem. Then, and not till then, did I understand the warmth with which travellers had spoken of the beauty of the Damascene houses : we seemed to have passed from Purgatory to Paradise. The pavement of the immense yard was of polished marble of various colours, beautifully inlaid. A fountain in the centre, thirty feet in length and half that breadth, into which brazen snakes' heads poured a copious supply of water, was over-hung by orange, citron, and pomegranate trees; and an immense vaulted recess (*leewan*) at the further end was fitted up with a divan, which, having a northern exposure, is never subject to the rays of the sun. As in Egypt, the ground-floor was of stone, and painted in alternate layers of white, blue, and red: this, with the rich dark green vegetation of parterres divided by slabs of Carrara, produced the most brilliant and captivating effect on me. The space between the basin and the recess was elaborately inlaid, and the marbles of rarer quality than in any other part of the court-yard. The principal apartment, which opened off the lower part of the leewan, was lofty, extensive, and of dazzling magnificence. Every part of the wall was of stone, cut into arabesque ornaments, the most curious object being a miniature recess of white marble, supported by tiny columns with gilt capitals, between which the Saracenic honeycomb luxuriated in all its istricacy. The raised floor was covered with a rich Persian carpet, and the divan that ran round the room was in satin, embroidered with flowers. Large antique China bowls displayed themselves in various shelves; and altogether feit that the often sought but rarely found splendour of the Arabian Nights' Entertainment was at length realized.—The Modern Syrians.

BONNER HALL .- Last Monday week a sale took place, by order of the Commissioners of Woods and Forests, of the ancient residence Woods and Forests, of the ancient residence formerly belonging to Bishop Bonner, called Bonner Hall, which is situated on a part of the site of Victoria-park. The portion remaining, which is stated to have been a part of one of the wings of the original palace, is about 120 feet long and shout 20 feet in width, the external walls being the same that were first erected. This building has for several years past been separated into five houses, one of which was a public house. These have been internally constructed according to the modern style of architecture, and there is very little to denote its former state.

THE BROMPTON PAROCHIAL NATIONAL SCHOOLS.

THESE Schools, represented above, are the designs of Mr. George Godwin, by Mr. situated on the north side of Knightsbridge, and will accommodate 200 girls and 200 boys; rooms for the master and mistress are attached, rooms for the master and mistress are attached, additional works came to 8*l*.; the forms, boxes, on either side. The building was erected from and desks cost 48*l*.

FIRE FROM OVERHEATED FLUES.

MR. BRAIDWOOD, the superintendent of the Fire Brigade, accompanied by a surveyor, made a close examination of the ruins of Mr. Farey's house in Great Guildford-street, recently burnt down, with the view of ascertaining, if possible, the cause of the fire, for the information of Mr. Wakley and the jury; and the former gentleman expressed his decided opinion to be, that it was occasioned by a hot-air flue becoming overheated, and setting fire to a beam in the back parlour. The death of the unfortunate persons he attributes to the falling in of the upper stories, through the insufficiency of the building, the timber, and joists, &c., having been (as he says) too light for so capacious a residence, as was the case in Lord Hillsborough's mansion in Gros-venor-street last year, which fell in before it was burnt to the lower stories. Mr. Braidwood is confirmed in this opinion by several sur-veyors. Mr. Farey differs from Mr. Braidwood as to the particular flue in which the fire originated. In addressing the jury Mr. Wakley observed, "If this inquiry should have the effect of drawing the attentiou to flues in general, great benefit may be derived from it, and future accidents be prevented. Too much attention cannot be paid to them, and I am really surprised that intelligent people in this country as we are should allow such fires to be continually occurring without taking measures to prevent them." At the inquest, Colfe, of the Fire Brigade, remarked that "even hot-water pipes would set fire to beame. Such an instance had recently hap-pened at Day and Martin's Warehouse." The coroner said "this was something new in science," but, we are sure, if he had reflected, he would have seen it was nothing new, and was perfectly correct. In an open vessel, water cannot be heated above the boiling point, all the surplus caloric goes off in steam; but in a close boiler the case is very different. It may be made red-hot, so to speak, and would ignite wood. Two or three speak, and would ignite wood. Two or three years ago this fact excited considerable attention, in consequence of a fire at Manchester which was attributed to the hot-water apparatus on the premises. Persons having stoves with iron pipe flues, should be certain that the pipe is not in contact with any ignitible material. In the construction of chimneys it is important to see that the end of no b eam rounds, no deal wedges be driven through. To the subject of fires generally, we shall

return before long.

ON THE CONSTRUCTION OF HAND-RAILS OF STAIRS. BY MR. GEOBGE RIDLEY.

Bonnin, Jun., in little more than four months.

The amount of the contract was 1100/., the

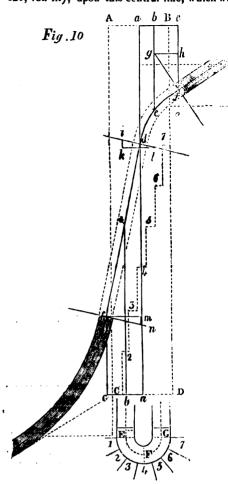

No. III.

25. FROM the combined properties of the tribedral and the cylindric solid, as shewn in our former remarks on this subject, we are enabled to make their use subservient to any purpose relative to the formation of the face mould; and from the properties of the trihedral alone, we can ascertain, to the greatest degree of accuracy, the bevels for the buttjoints in the wreathed portions of the handrail. In order, however, to make the use and application of these solids more clear, let us suppose that it were required to lay down the face-moulds, for the formation of the wreathed portion of a hand-rail, where a flight of seven winding steps intervenes between two ranges of flyers. Let the semi-circular well-hole, around which the winding steps radiate, be 3 inches in diumeter within the perpendicular planes of the outside surfaces of the rail. Let the rail itself be 3 inches wide and 21 inches deep; also let the treads of the flyers be 10 inches wide, and the height of each step 7 inches.

26. The first thing to be done is to lay down a plan of the rail, as shewn by fig. 10, where-in the circular line, E F G, is taken as the mean line for the radius of our cylindric surface mean line for the radius of our cylindric surface (see article No. 11, page 620, vol. ii.); next proceed to lay down a development of this cylindric surface, by obtaining the length of the circular line, E F G, in the manner de-scribed in article No. 10, page 619, vol. ii., or, hy having ascertained the diameter, E G, which in the negative former in the manner form in the present case is 6 inches, we may, from the well-known properties of the circle, obtain the length of one-half the circumference, thus, $\frac{11 \times 6}{11 \times 6} = 9 \frac{1}{10}$ inches.

the length of the line, $E \in G$, sufficiently near for practice. Make the line, C D, equal to $E \in G$; let the point σ in the development correspond with the point F on the plan. At the point C lay down the riser and tread of the last step in the first range of flyers, draw the parallelogram, A B C D. Upon D B set off the entire height of the seven winding steps, and next lay down the tread and riser of the first step in the second range of flyers; also lay down the treads and risers of the winding lay down the treads and risers of the winding steps, as they occur immediately beneath the central line of the rail. Draw the inclination of the rail over each of the flyers, as thus laid down; but from the steepness of the steps, at the narrow ends of the winders, it is usual to bring forward the rail, as shewn

in the figure. Draw the line shewing the thickness of the rail, and draw also the central line of the rail on the development (for which cause see article 13, page 620, vol. ii.); upon this central line, which we

have designated as the line of heights (see article 15, page 620, vol. ii.) case of the abrupt angles, caused by reason of the different inclinations of the rail, in the manner described by article 13, page 620, vol. ii. Next determine the points e and e of the development of the cylindric surface, through which the cutting plane of the face-moulds are to pass; the mode of ascertaining these points is described by articles 16 and 17, figs. 5 and 6, page 620, vol. ii. Having done this, draw the lines fc, be, and ad, which represent the heights for our guidance in laying down the face-mould.

27. In article 16, page 620, vol. ii. we have noticed that the division of the wreathed portions of the rail should not, as far as regards the economy of the material, exceed one-fourth of the revolution around the entire cylinder; it is therefore necessary to mark off, on this developed surface, the position of the butt joints; thus, the lines fn, il, and fg are made as near as possible at right angles to the inclination of the rail. The line fn is fixed at a sufficient distance from the circular surface of the cylinder as to admit of the joint being entirely free from the wreathed part of the rail, and the line fg should be similarly arranged for the same purpose; but when convenient, it is best to have this butt joint at the commencement of the straight rail, as shewn by the engraving. From the points f and f draw the lines fc and fc, each parallel to B D and A C; but the height or distance fc, which regulates the line A B, should always be sufficient, to avoid confusion, in laying down the lines for the facemould, as will be seen in figs. 11 and 12. 28. Having thus far completed our development of the line of the joints, we are next to lay down such portions of the plan of the rail as pertain to each of the divisions of the wreath respectively; for this purpose, let the central

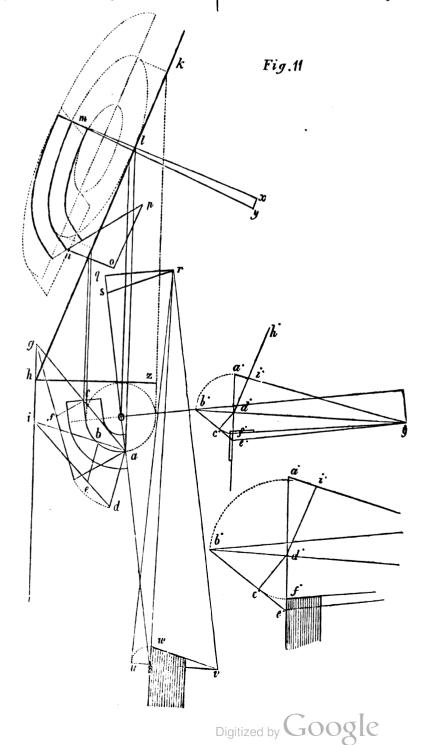

28. Having thus far completed our development of the line of heights, we are next to lay down such portions of the plan of the rail as pertain to each of the divisions of the wreath respectively; for this purpose, let the central line, $a \ b \ c$ of the plan in figs. 11 and 12, represent the line $E \ F$ in fig. 10, with the addition of the straight portions of the rail, as shewn in the development by the line $B \ c$ and $C \ c$. Fig. 11 shews the mode of obtaining the face-mould for that portion of the wreath contiguous to the lower range of flyers, and fig. 12 shews that which is required for the wreath adjoining the upper range of flyers. In both figures, each portion of the plan is similar to the other, but varying in the heights and

inclination of the rail; by reason of which, the angles as well as the bearings in each figure will be found to differ widely; in each case, however, the same principle and mode of construction may be traced throughout by the letters of reference which apply to both figures.

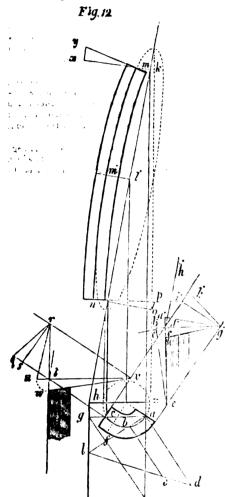

letters of reference which apply to both figures. 29. We shall, however, confine ourselves to fig. 11 (which is here laid down to a scale of $\frac{1}{2}$ th part of an inch to the inch), wherein the line a b c, represents the plan of the cylinder with a portion of the straight line of the rail attached thereto; let the distance from a to b on the plan be the same as the distance from a to b on the line A B of the development in fig. 10. Here let the student refer back to article 23, fig. 9, page 632, vol. ii., and article 9, fig. 2, page 619, vol. ii., where the mode of determining the position of a plane, cutting obliquely through three given points on the surface of a cylinder, and the mode of performing the contour of the ellipse, produced by the cylindric section, are described; it will be observed, that the same methods therein propounded must be adopted. In the present case, the line abc is the base line of the cylindric surface, the three heights cf, be, and ad fig. 10, are the perpendiculars which give the position of the cutting plane over the points c b and a respectively. In laying down the intersecting line $i\lambda$, upon the plane of the base of the cylinder it is of little importance whether we take the entire length of the lines cf, be, and ad, or of any proportionate part of each, inasmuch, as we arrive at the same result by substituting one-half or one-fourth of the entire height of each ; in the present case, as will

be seen from the lines ad, be, and cf, in fig. 11, they are taken at one-fourth of the entire heights of each of the lines ad, be, and cf, in fig. 10. The elliptic curve of the cylindric section, which forms the central elliptic line of the face-mould, will require the same method of procedure as that adopted in article 9, fig 2, page 619, vol. ii., by which rule also the inner and outer curves of the section of a hollow cylinder, whose shell is equal in thickness to the width of the rail, may thus be obtained; these curves we have shewn in fig. 11 by the dotted elliptic lines, which surround thecentral line sm of the face-mould ; but if our face-mould (in such a case as the present) were constructed so as to form a perfect section of the shell of a hollow cylinder, and the outline thereof were marked upon the faces of the plank at the proper pitch, so that by cutting the cylindric surfaces of the quadrilateral solid (as referred to in articles 4 and 5, page 619, vol. ii.) out of the plank, by means of the saw-cutting in the direction of the vertical surfaces of the cylinder, we should find (however strictly scientific the process may be) that much waste of material would be made by the requirements rendered necessary in the formation of the joints. We may observe, however, that it is only in cases like the present, where a great number of winders are introduced, and where small well-holes are adopted, that it becomes necessary to deviate from the general rule.

30. Hence, then, by articles 16 and 17, page 620, vol. ii., we have shewn the proximity which exists between the line or arris produced by

winding the development of the line of heights read the surface of the cylinder; and that, which is produced on the same surface by the intersection of the cutting plane, made to pass through any three given points which ap-proximate nearest to the line of heights. From this it will be seen that the central line m s of the face-mould approximates very searly to the centre line of the hand-rail; and as our line of heights is made to pass through the centre of the rail, it therefore follows, that if we mark off a parallel width of 11 inches (one-half the width of the rail), on each side of the central line mn, we shall have a facemould, which, when marked on both surfaces of the plank, each face being brought directly opposite the other, the solid may cut out of the plank, of substance sufficient for the ation of our rail when moulded to its faished shape.

31. But we are first to determine not only the width for a face-mould of this description, but also to lay down such lines as may enable us to work the butt-joints with accuracy. Having already determined the points m and n, in the central elliptic curve of the face-mould, let us proceed to find the bevels, not only for the ends of the face-mould, but also the bevels of the ends across the thickness of the plank. Thus to find the bevel for the end of the wreathed portion of the rail, contiguous to the straight part of the rail, over the upper range of flyers—in fig. 10, take any point he in the line fc draw hg perpendicular to fc, cutting the line of the butt-joint fg in the point g: in fig. 11, draw a line from O in the centre of the In bg. 11, draw a line from O in the centre of the circle on the plan of the rail through the point b; also draw the line e g parallel thereto; draw any line ea parallel to the intersecting line h i; make the perpendicular distance of the point d from the line eg, equal to hg in fg. 10. Through the point d draw the line b g at right angles to e e; make d a equal to hf in fg. 10; join a g, and draw the line d h parallel to h f in fg. 10; join a g, and draw the line d h parallel to h f in fg. 10; join a g. to k, intersecting the line $a^{i}g^{i}$, as shewn in the figure in the point *i*. From this point of intersection, and with one point of the compusses section, and with one point of the compasses in the point d, describe the dotted circular line, cutting the line b g in the point b; join b e from which let fall the perpendicular line c d; and with d as a centre, describe the circular line c f, cutting $d \cdot e$ in the point f; join $f \cdot g$, and the angle $e \cdot f \cdot g$ is the bevel which is to be applied to the end of the face-

mould in forming the butt-joint across the

thickness of the plank. 32. Again, to find the bevel or end of the face-mould for our guidance in marking the face of the plank : having already drawn the ordinate line, on, at right angles to hk, make the distance on equal to $d \cdot o$, also make the perpendicular line, o p, equal to $b \cdot d$, and through the points, n p, draw the line across the end of the face-mould, as shewn in the engraving, which is the end of the face-mould required. The bevels for the opposite end of this face-mould are obtained in a similar manner. Let the line of the butt-joint, through the point d of the development, fig. 10, form the hypothenuse to a right-angled triangle, whose base, $k \cdot l$, is parallel to the line A B. In fig. 11 draw a line through the centre O of the circle and the point a of the plan of the rail; let this line be produced to the distance of the let this line be produced to the distance of the points t and q, as shewn in the engraving. At any distance from the point q, draw the line, r v, parallel to q t; make the triangle, q r s, in fig. 11, similar, in all respects, to the triangle, k l i, in fig. 10; parallel to g i draw the line r t, cutting the line q t in t; from the point t, draw the line t v at right-angles to the line r t, and cutting the line r v in the point v. Then, with the line rt as base, form a right-angled triangle, whose perpendicular, t u, make equal to gs. With the point t as a centre describe a circle touching the nearest point of the hypothenuse, r u, and cutting the line rt, produced in the moint m icin ar s and the angle produced in the point w, join w v, and the angle which it forms with t w will be the bevel to be applied across the thickness of the plank. 33. The direction of the oud of the f

The direction of the end of the facemould through the point m may be ascertained in the following manner :- Produce the ordinate line through the point m to x, make the distance, m x, the same as r t; from the point which, when produced across the width of the end there are the position of the end thereof.

34. The bevels for the other portion of the wreathed rail may be obtained in a similar manner to those here shewn.

35. The more important use of these bevels are for the purpose of constructing the joint-ing-box (which we shall hereafter describe), without which it will be next to impracticable, by the use of the plane and the bevels only, to work to that degree of truth which the nature of the work requires. The shaded parts in the figures shew the thickness of the plank, on which a centre line is drawn, also shewing by the end thereof what allowance should be made beyond the centre of the butt-joint for the obliquity of the planes of the butt-joints with the planes of the faces of the plank

PROPOSED NEW PARK AT BATTERSEA.

PUBLIC attention has recently been directed to the formation of a new park in Battersea-fields. It has been ascertained that 500 or 600 acres of land might be purchased there at very moderate price; and if half of it only were appropriated to the public as a park, the other half would, if let for building, most likely produce sufficient rental to pay all expenses; and it would make a valuable place of recreation to the public, who could get easy access to it from the most crowded parts of London. The steam-boats have become a very important means of transit; they still appear to be in-creasing very much, and probably they cannot have too much encouragement. By diverting the busy traffic of our streets to the river, they relieve the crowded thorough fares of the town, and they have been during the busy traffic of the town. and they have already proved themselves to be important auxiliaries in the cleansing of the river and its shores.

By means of these boats this park would be accessible to a vast number of all classes of persons who live on both sides of the Thames, including the whole extent of London, a length of 7 or 8 miles. The poorer class of persons could get there by the steam-boats at a less expense than they can get a change of air in Another of the advantages connected with

the purchase of this land at Battersea, would be that from its position by the side of the Thames, there would be facilities for making large pieces of water. In summer these might be changed, if necessary, every tide; and they would furnish an excellent bathing-place for

the working population in hot weather. present the working classes have no means (or at best very limited means) of bathing. These baths might be so inclosed by plantations as to prevent them from being in any way offensive, and on that account would be much fitter for the purpose than the Serpentine River, where the bathing is always a great nuisance, and so offensive, as to drive many persons from the park, and where, even if this objection did not exist, there is not a tenth part of the space requisite for these purposes. Besides, any bathing-places made here would not only have the advantage of the water being frequently changed, but they might be so regulated as to be perfectly free from danger, by standing at any desired depth, being affected neither by dry weather nor by floods.

A further advantage, it is obvious, which would result to the population of London of all classes (and one which would be attended by not one shilling additional expense), would be the very perfect skating-ground which these pieces of water would afford in winter. Now the ground is of comparatively little value at present, and therefore very extensive means of promoting the health and recreation of the public could be acquired for a small sum. The number of persons who would take advantage of it would be immense, and however desira-ble it may be (and it undoubtedly is so) to widen our crowded thoroughfares, and to im-prove our over-populated districts, yet some outlay would not be missenplied in the acquisi outlay would not be misapplied in the acquisition and inclosure of spaces on the immediate outskirts of the town where there is little if any building at present to remove; and where, consequently, improvements could be made at comparatively small expense, to make good communications and airing places to which the public would be tempted to resort, and above all, in the selection, when opportunities offer, of sites having the river for their leading highway—a highway subject neither to the wear and tear, nor the expensive repairs, hor the dusty and inconvenient transit in dry

the dusty and inconvenient transit in dry wea-ther of ordinary roads, and by which it is obvious no one can travel without, by that alone, whatever may be his occupation, en-larging his stock of health. Mr. Thomas Cubitt, the eminent builder, has the credit of having first proposed this improvement. The daily observation and extensive intercourse which this gentleman has with artisans and working people of all sorts, his means of knowing their rea-sonable wants and their real value, and the unusual interest he takes in whatever con-cerns the health and comfort of the poorer classes of our population, evidently poorer classes of our population, evidently led to the idea, and induced him to submit his philanthropic proposal to the considera-tion of her Majesty's Commissioners for the Improvement of the Metropolis, who, in their second report (the first being exclusively devoted to the embankment of the Thames), will doubtless refer to it at length.

ENGINEERING IN EGYPT .- On the 28th of November, a dry dock at Alexandria, which has been about eight years in execution, and has cost Mehennet Ali half a million sterling, was opened, and the first vessel hauled in. According to the *Times*, it is constructed in deep water; and the engineer, a Frenchman, of the name of Mougel, had great difficulties to contend with from the nature of the soil, besides labouring under a peculiar disadvatage, owing to there being no tides in this port. The dock has been made on the model of that of Toulon; its length is 243 feet, and its width 72 feet, taken on a level with the sea. M. Mougel will shortly leave for France, and it is said that he has received from Mehemet Ali instructions to take all the necessary measures for the construction of the "barrage" of the Nile, which work, if ever completed, will be a great boon to Egypt. The site fixed upon, at present, for this purpose is the point of rami-fication of the Rosetta and Damietta branches of the river, about ten miles below Cairo. It will consist of two bridges, one over each branch of the Nile, both joining at the extreme point of the Delta. The bridges will be formed of a certain number of arches, and one arch of each bridge will be made with a lock, for the purpose of navigation. In the centre of the Delta, will be opened several canals, to which the water of the Nile will be allowed ingress, as it may be required.

The Church Restorers : a Tale, treating of Ancient and Modern Architecture and Church Decorations. By F. A. PALEY, M.A., Hon. Sec. Cambridge Camden Society. Van Voorst, London: 1844.

v corst, London: 1844. THEER years ago, when the Cambridge Camden Society had but commenced the publication of their opinions, the Dublin Review, a Roman catholic organ, said their position was most inconsistent, and that "the good men who were so earnestly labouring for the revival of catholic church architecture must be charineed that we must have the arthelic must be convinced that we must have the catholic must be convinced that we must have the calholic service revived, in the first place, before any real good could possibly be accomplished." At that time they resolutely *denied* any such con-viction, but the tendency of their views was nevertheless sufficiently apparent to all who looked beneath the surface. Now a days they speak out more plainly, or at all events indi-vidual members do; and when each indivi-dually says the same thing, and the society, when they do speak collectively, coincide, it would be absurd to make any distinction; would be absurd to make any distinction; even though, as in the present case, the author state carefully in his preface, "that neither his publisher, nor the society with which he is connected, can be in the remotest degree responsible for any opinions expressed in the narrative."

The little book before us is one of those which have been justly termed "engines of polemical theology." Its intention is to prove the "meanness of protestantism" (p. 3), "the descerations and profenities of protes-tantism" (p. ix), "the desolation of protes-tantism," and to shew what "hell-hounds of destruction" (p. 62) were let loose by the Reformation — the glorious reformation, as the author satirically terms it; and glorious it unquestionably was, notwithstanding the expresses which disfigured it, or the sneers of a disguised jeauit. The advantage of daily mass, cressets constantly burning, incense, and holy water, is quietly hinted. He cannot hope that we "shall yet get back our monasteries" (p. 179); he urges the propriety of prayers The little book before us is one of those (p. 179); he urges the propriety of prayers for the dead (p. 22), and devotes several pages to induce a more unlimited belief in miraculous cures at holy fountains, and the preservation of saints' bodies "entirely incorrupt,"

than is at present general. The deep chancel, the screen to separate the clergy from the laity,[•] the rood above it, and all the other fittings and arrangements in use when the church was Rome's, are to be intro-duced in our new edifices. And with these duced in our new edifices. fittings, Mr. Paley does not blink it, the rites and ceremonies in accordance with the rites and ceremonies in accordance with them are to be restored also. He says (p. 190), "In Christian architecture, we find a definite use for every single part of a secular as well as of a religious edifice. Now the question is this; can we retain the form, irrespective of the use, without violating the fundamental prin-ciples of architecture?" and then he answers

unequivocally, "Clearly we cannot." Far be it from us to speak disrespectfully of a creed because it differs from our own (our conviction of the weakness of human judgment, of our own fallibility, would prevent us); and if this book were written by an honest Romanist, we should have little to do, perhaps, but to thank him for some zealous efforts to protect old memorials of Christian art from the injuries of time and the ignorance of men. As it is, however, we say that it is a disgrace As It is, nowever, we say that it is a disgrace to its author and the college to which he belongs, and denounce it as an insidious attempt (one of many, or it would not require notice) to introduce theological opinions of the most dangerous character.

Conversationslezicon für bildende Kunst. Band I. Williams and Norgate, Henriettastreet, Covent-garden : 1844.

THIS work promises to be a very complete encyclopedia of architecture and building, and embraces all the arts and sciences con-nected with them. The volume now before us, consisting of 640 closely-printed pages pro-fusely illustrated, is occupied solely by letter A, and contains some able articles on Greeian and Egyptian art (Aeginetische kunst ; Aegyp-

* "Do we not instinctively feel that while the nave is, as it were, the vestibule, the chancel is the palace of the Great King "(reserved solely for the clergy ?). "The chancel is the choir of the angels, the church triumphant, the Holy of Holies."-p. 105.

tische kunst), acoustics (akustik), &c., &c. When it is further advanced, we shall examine it more carefully, and transfer to our pages some of the information it contains.

To such of our readers as are acquainted with the language in which it is written, we do not hesitate to recommend the book itself. A knowledge of German, by the way, has become almost indispensable to architects, in conse-quence of the numerous excellent works relating to their art which have been recently published in that tongue. Architectural students who wisely seek to diversify their evening studies, cannot do better than apply themselves vigo-rously to it. Recreation may be found in change of labour.

Companion to the Almanac for 1845. Charles

for the public, Mr. Charles Knight, contains its usual amount of information. The "Com-panion" to it, which more immediately concerns us, presents a general view of public improvements and the erection of new buildings, and although necessarily brief, forms, with preceding volumes, a valuable record. It contains views of the Royal Exchange, new church, Lever-bridge (executed in terra-cotta), Nunhead Cemetery Chapel, Lincoln's-inn new Hall, the Conservative Club, and the new Guildhall in progress at Bristol.

Description of the New Royal Exchange. Effingham Wilson, London: 1844.

A VERY pretty little volume, containing an historical notice of the former edifices, a de-scription of Mr. Tite's new building, and a Companion to the Almanac for 1010. Knight, London. THR "British Almanac" for the new year, published by that able and enterprising caterer published by that able and enterprising caterer brief memoir of Sir Thomas Gresham, the founder of the original burse. It is illus-trated by eighteen woodcuts, and nicely printed. The fol-lowing engraving, which we

lowing engraving, which we introduce, includes a view of Gresham's tomb, in St. Helen's Church, Bishopsgate street, a singularly interesting structure. Without explanation, which the work does not give, the reader would be led to conclude that the monument with columns and arches belonged to Gresham; this, however, is in me-mory of Sir William Pickering, who is said to have been the finest gentleman of his time " for worth in learning, arts, and warfare." We don't read the words "fine gentlemen " so now-a-days. Gresham's monu-mont is in the farther corner. It is a large sculptured altartomb, covered with a marble slab, on which is inscribed, "Sir Thomas Gresham, Knight, buryd Decem^{br} 15th, 1579.'

GRESHAM'S TOMB.

METROPOLIS IMPROVEMENTS. (From the 21st Woods and Forests' Report, not yet Published.)

W?

IN the several lines of improvement autho-rized by the Acts 3 & 4 Vict., cap. 87, and 4 Vict., cap. 12, we have, since the dates of those Acts respectively, completed purchases to the amount in the whole of 457,844. 15s 10d., and have contracted for further purchases to the amount in the whole of 191,6171. 153. 10d.; and besides these, the purchases now remaining to be made in order to clear the whole of the ground re-quired for completing the several lines of im-provement, it is estimated will cost the further sum of 54,256l, 5s., or thereabout, viz. :

1. In the line from Oxford-street to Holbern we have completed the purchases to the amount for further purchases to the amount of 56,979%. 3s. 4d., and besides these there remain to be made purchases estimated to cost the sum of 14,5711. 15s., or thereabout.

2. In the line from Bow-street to Charlottestreet, Bloomsbury, we have completed pur-chases to the amount of 70,958/. 18s. 3d., and have contracted for further purchases to the amount of 3,000%. 11s. 9d., and besides these there remain to be made purchases estimated to cost the sum of 17,5951, or thereabout.

3. In the line from the London Docks to Spitalfields Church, we have completed purchases to the amount of 96,7421. 16s. 11d., and have contracted for further purchases to the amount of 30,2361. 8s. 7d., and besides these there remain to be made purchases estimated to cost the sum of 6,7401., or thereabout.

4. In the line from Coventry-street to Longacre we have completed purchases to the amount of 77,078/. 5s. 10d., and have con-tracted for further purchases to the amount of 89 2021 12a 9d and havidan these there 89,2021. 12s. 2d., and besides these there remain to be made purchases estimated to cost the sum of 8,097*l*. 10s., or thereabout.

5. In the line from East Smithfield to Rosemary-lane we have completed purchases to the amount of 1,420*l*., and have contracted for further purchases to the amount of 12,2001., lines with the Than and besides these there remain to be made first-rate property.

purchases estimated to cost the sum of 7,2521. or thereabout.

By a statement of receipts and expenditure in respect of monies applicable to these im-provements, it appears that of the sum of provements, it appears that of the same 500,000% mentioned in our nineteenth report to have been borrowed of the Equitable Assurance Company for the purposes of these improvements, upon the security of certain portions of the land revenue of the crown in the county of Middlesex, and of monies arisen from interest on exchequer-bills and profit on the purchase and sale of those bills, in which part of that loan was temporarily invested, from the sales of old materials, and from rents of property purchased for the purpose of these improvements, there remained a balance of 1,420%. 6s. 63d. These funds being, as will be seen by the

These funds being, as will be seen by the statement above-mentioned, nearly expended, we are taking measures for obtaining a further loan of 250,000*l*., which, we find, it will be necessary to raise for the purpose of making the several remaining purchases requisite for the completion of these improvements.

TOLLINGTON PARK NEW CHURCH, HORNsEy.—The trustees of the Metropolis Churches Fund have contributed 1,000% towards the

rund have contributed 1,000% towards the erection of this church; the Marquis of Nor-thampton has intimated his intention of con-tributing 50%, and the Rev. Mr. Venn has presented 200%. WEST LONDON RAILWAY. — The London and Birmingham Railway Company has agreed to pay the existing liabilities of the West London Railway Company, amounting to 60,000%, and to allow the shareholders one-fourth of the gross proceeds arising from the traffic or of the gross proceeds arising from the traffic on the railway and Kensington Canal. Applica-tion will be made to Parliament when it tion will be made to Parliament when it meets, for powers to extend the fine to the Thames and to Knightsbridge. In its present incomplete state this railway has seemed to those who were ignorant of its real purpose a fit subject for ridicule. There can be little doubt that, when fully carried out, so as to give to the Great Western and the Birmingham a west-end terminus, and connect both these lines with the Thames, shares in it will become

Correspondence.

ARCHITECTURAL COMPETITIONS.

TO THE BDITOR OF THE BUILDER. SIR,—I received a very oily letter from the Borsar of Magdalen College, stating that the College, "after long and painful deliberation," had decided in favour of Mr. Derrick's design for the Choristers' School, and terminating with some further civilities by way of thanks without a word as to the very extraordinary favour granted to the successful (?) competitor.

favour granted to the successful (1) competitor. If you or I were to break an agreement, we should be immediately proceeded against "with the utmost rigour of the law." Now, as the "Instructions to Architects" is to all as the "Instructions to Arcuneuts is to an intents and purposes an agreement, cannot all the competitors proceed against the College for the value of the drawings sent to them in pursuance of that agreement? For, in fact, the designs sent at the time appointed by them—and not a fortnight after—were to be them—and not a fortnight after—were to be considered as exclusively those in bonia fide competition. The law may not help me in this case, but equity should do so. Perhaps you or some of your correspondents will oblige me by stating your opinion in your valuable paper. By-the-bye, don't you think this is a proper subject for the Institute to take notice of? I wish they would wake up a little; their slumbers have been very long, and, if I may judge by the little notice that has been taken of them, undisturbed.

ONE OF THE DUPED. Dec. 30, 1844.

[We believe our correspondent is correct in saying the law will not help him. If, however, some of our legal friends will look carefully into the matter, and give us the result of their examination, they will earn the thanks of the profession. Few competitions are decided, wherein the agreement (morally, if not legally, binding) is not broken. In the case of the "Hospital for Consumption" last year, the committee threatened to refuse examination even to any design likely to cost more than the advertised amount, and yet ultimately selected a plan, the estimated cost of which was half as much more. They fancy, from the time which has elapsed since their scandalous decision, that they have escaped the castigation they deserved; they may find themselves deceived. -ED.]

ESTIMATES FOR WORK NOT TO BE EXECUTED.

SIR,—As much has been written in your valuable publication on the aubject of the ignorance and partiality exhibited upon the decisions of architectural competitions, fully sympathizing with those who have spent their talents and time to gratify the curiosity or cupidity of self-appointed committees, I do hope the exposure in THE BUILDER of the system will be the means of checking the evil. To assist in so desirable a work, allow me to record on your pages a method (I trust a solitary one) of victimising the builders.

During the past autumn, a gentleman prac-tising one of the liberal professions, not 50 miles from this place, conceived the idea of having a residence built suitable to the importance of his station in life ; an architect was elected, and Elizabethan the style adopted. Plans were prepared and builders solicited to tender, but as the sanctity of the architect's office could not be invaded, tracings of the drawings with copies of the specification were to be with copies of the specification were to be furnished, upon each competitor paying down five guineas!! with the privilege of obtain-ing a copy of the quantities for four guineas more!!! which latter charge may be considered moderate, as duplicate and in some instances triplicate estimates of certain parts were to be made, the architect not having decided whether certain parts were to be worked in stone or cement. Seven builders were to be worked in stone or ement. Seven builders were caught, taken in, and nicely done for; three of whom, I believe, paid the nine guineas; the rest only paid five each, for the privileges of making estimates of a building not likely to be exe-cuted, as the estimates of the builders exceeded that of the architect, who of course was the

test informed upon the subject. Now, Sir, if the architect was paid by his mployer, and did not go upon the speculation of being paid by those who were willing to give up their time and experience, to enlighten bin upon the cost of carrying his design into execution, I think they should receive back

their money. The several amounts were as under :-

| Ashby £2.200 | 0 |
|-----------------------------------|-----|
| Grover 2.109 | 9 |
| Haynes & Co 2,100 | Ō |
| Wood 1,997 | ŏ |
| Coleman 1,913 | |
| Sanham | - |
| Kirk 1,767 | - |
| Should you consider the foregoing | ata |

Should you consider the foregoing state-ment worthy a place in your columns, I should feel obliged, as an original subscriber, A BUILDER (NOT ONE OF and

Dartford. THE VICTIMISED).

[We agree with our correspondent, that if the building be not erected,—if no prize be given, for the chance of obtaining which the builders each bought a ticket, so to speak,— their money should unquestionably be returned. We cannot vouch for the accuracy of the statement; indeed, we hope our correspondent may have been misled, and that one of those who tendered may yet be employed .- Ed.]

TEMPLETS AND MOULDS.

SIR,-A joiner and carpenter contracted for his branch in building a church, finding all timber and workmanship, and in his contract bound himself to make all moulds and templets of timber that might be wanted for the stone work. He has done so, and completed his contract satisfactorily; to whom do the templets and moulds belong β If you would be kind enough to insert the answer in your next number, you will confer a favour on me, and set the question at rest. C. [To the carpenter.--ED.]

CARPENTERS' PRICES. CARPENTERS' PRIDES. SIR,—I beg leave to inform you that your list of prices for timber and deals is apt to de-ceive the builders; for instance, the present price of Quebec red pine timber is 85s. to 90s. per load at first hand and by the cargo; Que-bec oak is also from 105s. to 150s. ditto; spruce deals are from 171 to 211 par 120. Christiang bec oak is also from 100s. to 100s. onto, sprace deals are from 171. to 211. per 120; Christiana deal 301. to 321 per 120 as 12 fs.; second pine planks are now 111. to 121. standard.—Your obedient servant, W. CLEAVE.

[No pains are spared to obtain a correct list, but prices vary so much, and are so influenced by circumstances, that the utmost we can do is to give an approximation to the truth.-ED.]

LEEDS BOROUGH GAOL. SIR,—In the last number of THE BUILDER, it is stated, under the head of "Tenders," that we are the "inspectors for the committee," of the new gaol now erecting at this place; this is incorrect: we are the architects of that building, and no other party is, or has been employed in that capacity.

The building is being executed according to a design made by us, and approved by Sir James Graham, on the recommendation of

Major Jebb, inspector of prisons. There is another inaccuracy in the paragraph which mentions only three branches of work as being the third contract (C), whereas the plasterer's work, slater's work, plumber and glazier's work, painter's work, smith and founder's work, form part of the said contract and tenders were sent in for these branches also; the amount of the whole contract being

when information is sent for insertion in your useful journal, it is the duty of those who furnish it to ascertain its correctness, in justice to the parties concerned and the public: if this course had been pursued by your corre-spondent, we should have had no cause to tresass upon your time with this explanation.

We remain, Sir, your most obedient servants, PERKIN AND BACKHOUSE. Leeds, Dec. 31st, 1844.

LIST OF NEW PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &c., GRANTED FOR ENGLAND.

SIX MONTHS FOR ENROLMENT.]

Louis Antoine Ritterbandt, of Gerrard-street, Soho, doctor of medicine, for certain improve-ments in preventing and removing incrustation in steam boilers and steam generators. cember 2.

William Henry James, of Clements'-lane, London, civil engineer, for certain improve-ments in carriages for the conveyance of pas-

sengers and goods, and in the means of work-

sengers and goods, and in the means of work-ing the same. December 2. James Winter, sen., of Wardour-street, Sobo, upholsterer, James Winter, jun., of the same place, upholsterer, and William Lane, of Bed-ford-place, Russell-square, gentleman, for an improved scaffold, or mode of scaffolding, ap-plicable also as a fire-escape for life and pro-nerty. December 2

perty. December 2. James Nasmyth, of Paticroft, Lancaster, civil engineer, for certain improvements in machinery or apparatus for hewing, dressing, splitting, breaking, stamping, crushing, and pressing stone, or other materials. December 2.

Benjamin Seebohm, of Horton Grange, York, merchant, for an improved mode of manufacturing certain description of chains. December 4.

John Ryan, of Liverpool-street, surgeon, for certain improvements applicable to or in the construction of casks, barrels, or other vessels intended to contain wine, beer, fermented liquors, or other liquids or substances which are liable to fermentation or decomposition from exposure to the action of the atmosphere.

December 7. William Wilcocks Sleigh, of Saint James's-William Wilcocks Sleigh, of Saint James's-square, M.D., for the hydro-mechanic appa-ratus, which, by a certain combination of hydraulic and mechanical apparatus on well-known philosophical principles, is intended to supersede the use of fire and steam in working and propelling all kinds of machinery and engines. Decomber 7 engines. December 7. Joseph Weiger, of Vienna, doctor of medi-

cine, and surgeon-dentist, for improvements in the amalgamation, alloying and soldering of certain metals. December 12.

Charles Louis Felix Franchot, of Paris, engineer, for improvements in engines, to be worked by air or games. December 12.

William Malins, of Mansion House-place, London, ironmaster, for improvements in constructing roofs and other parts of baildings of iron or other metals, and in the preparation of the materials of which the same are or may be

constructed. December 12. Robert Heath, the younger, of Shidsgrove; Stafford, coal agent, for improvements in heat-ing ovens and kilns used in the manufacture of chins, bricks, tiles, and other earthenware. December 12.

Moses Poole, of Searle-street, London, gen-Moses Foole, of Searle-street, London, gen-tleman, for improvements in the construction of fids for ship's masts and in the means of setting up ship's rigging. Being a communica-tion. December 12. Warren De la Rue, of Bunhill-row, manufac-turer, for improvements in covering the surface

of paper and other materials with colour and

other substances. December 12. Nathaniel Fortescue Taylor, of Vauxhall, engineer, for improvements in apparatus for measuring gas. December 18. Arthur Wall, of Bisterne-place, Poplar, sur-

geon, for certain improvements in the manu-facture of steel, copper, and other metals. December 18.

Benjamin Biram, of Wentworth, Yorkshire, entleman, for certain improvements in oscillating engines, worked by steam, water, or other fluids, which are also applicable to the raising or propelling of fluids. December 21.

Charles Johnstone, of Southampton, Hants, engineer, for certain improved arrangements for raising ship's anchors, and other purposes. December 21.

Miscellanea.

NEW LUNATIO ASYLUM, &C. WARWICK .-The following motions will be submitted by C. H. Bracebridge, Esq., at the next Warwick Quarter Sessions: — "That the committee appointed at last Sessions do make every inquiry respecting the expense of erecting a county lunatic asylum, the probable number of lunatics, and a proper site."-" That the committee appointed at last Sessions, for the purpose of inquiring into the extent of alterations in the county prisons necessary to carry out the regulation of the Acts 4th George IV., c. 64, and 2nd and 3rd Victoria, c. 56, be continued, with power to confer with Mujor Jebb, and determine on the most feasible plan for altering the prisons, and to report at the Easter Sessions.

COMPETITION OUTLINES FOR ART UNION OF LONDON. - In reply to the advertised premium of 60% for the best series of designs in outline, the committee of this valuable association have received nineteen sets of various degrees of merit. So soon as the decision is made, we shall allude to them at greater length.

NEW CHURCH AT FARRINGTON GURNEY, SOMERSET .- This church was consecrated on the 23rd ultimo by the Bishop of Salisbury. It is built from the design of Mr. Pinch architect, of Bath, in the Norman style, and consists of a nave, 35 feet high, with a clerestory, supported by round pillars and semicircular arches; a deep chancel at the east end, and a tower, 55 feet high, at the west end. The whole length of the building is 91 feet, and the width 42 feet. The proportions and general effect of the interior appear to great advantage in consequence of the absence of galleries, excepting one in the tower for the singers. The chancel is lighted by a triple window, and one on either side, intended to be filled with stained glass. There is ac-commodation for about 350 persons in low, open scats, three-fourths of which are free and unappropriated for ever; the whole of these, with the gallery, altar-rail, desk, and timbers of the roof, are in imitation of dark oak. The pulpit, altar-piece, and font, are executed in Bath stone. The execution of the work was intrusted to Mr. John Thatcher, of Wellow, and Mr. David Aust, of Bath, whose contract for the building was under 1,2001.—Somerset Gazette.

MONUMENTAL BRASSES. - A monument lately erected in Stonehouse Church, Glou-cestershire, to the memory of the Rev. Washington Hallen, hus excited a good deal of attention. It is in imitation of the monumental brasses prevalent several centuries since, except that in the present instance the metal used is lead, which has apparently been molten and run into the sculpture. In the centre of the slab is a pedestal supporting a cross, which is bordered on the four sides by an inscription, the letters of which are formed of the above the letters of which are formed of the above metal, as follows:—"Here rests Washington Hallen, a priest of the Anglican Church, born into this life 1797, departed 1837. Pray we, as our Holy Mother teaches, for the perfect consummation of his bliss, both in body and soul, through Jesus Christ." In addition to the principal genue content in the perfect in the perfect the principal centre cross, there is a small Maltese cross at each corner of the slab, and the whole effect of the monument is a revival of the antique models. - Gloucester Journal. [Yes; and an attempted revival of something more than antique models.—ED.] LIVERPOOL SAILORS' HOME.—

An associa tion has lately been formed in Liverpool similar to the one in the eastern part of the metropolis for the purpose of providing a suitable dwelling for sailors while ashore. The first meeting of the members was held last week, and presided over by James Aiken, Esq. The subscriptions and donations announced amounted to 13,193*l*, among which was one of 400*l*. from Messrs. Brocklebank. On the motion of Mr. Cotesworth, seconded by Mr. Henderson, the following gentlemen were appointed trustees : - Mr. Robertson Gladstone, Mr. Rulf Brocklebank, Mr. Willian Potter, Mr. Duncan Gibb, and Robert Rankin. In reply to a question put by a subscriber, the chairman stated that buildings north and south of the town had been spoken of and various plans had been suggested, but nothing could be done until they knew the result of their appeal to the public. On the motion of Mr. J. B. Yates, seconded by Mr. E. Molyneux, it was decided that the committee be recommended to take steps for obtaining the patronage of her Most Gracious Majesty to the institution.

ALTARS IN THE EAST .- There is no canon that I know of, says Bishop Heber, for placing churches with their altars eastward; and though this custom is certainly most ancient and usual, there have been many remarkable exceptions to it, from the cathedral of Antioch, built in the age immediately succeeding the apostles, down to St. Peter's, at Rome, which has also its sanctuary we-tward.

For Bodies, Wheels, Axles, Axle-boxes, Guards, Guard-plates, and Springs for 200 Coal Waggons, for the Taff Vale Railway. January 6.

For laying the Pipes required in the Hull New Water Works.-Thomas Thompson, Esq., Town Clerk, Hull, or Mr. Thomas Wickstead, Old Ford,

hear London. January 6. For the supply of the following stones for pavements, namely, York Flag of 3 inches and 24 inches thick, at per yard superficial; Castle Hill Stone, 24 and 14 inches thickness, at ditto; Rock-hill of like respective thicknesses, at ditto; Aberdeen Granite, half sovereigns, at per ton; Devonshire Kerb, at per yard run, &c.-Francis Southgate, Clerk to the Paving Commissioners, Milton, next Gravesend. January 7. For the execution of certain alterations at the

Workhouse of the Coventry Union.—Thomas Hine, Clerk to the Board of Guardians, Coventry. January 8.

For Re-pewing Leverington Church, near Wisbeach.—The Rev. Henry Jackson, Leverington, or Mr. W. Adams, Architect, Wisbeach. January 7. For Four Locomotive Engines and Tenders.— George King, 62, Moorgate-street, January 8.

For a Survey Plan and Valuation of the Township of Kimberworth, in Rotherham Yorkshire.-George Taylor or Mr. Richard Rhodes, Over-M seers of the Poor. January 8.

For taking down the present Bridge at Carrick-on-Shannon, and constructing a Stone Bridge of five segmental arches, with its approaches; building quays and harbour, forming wharfs, and deepen-ing the bed of the river.—Edward Hornsby, Secre-tary, Shannon Commissioners' Office, Customtary, Shannon Commissioners' Office, Custom-house, Dublin. January 8, 1845. For completing the Railway from Bishopstoke to

Salisbury.—Alfred Morgan, Secretary, Nine Elms Station, Vauxhall. January 10. For building a Sewer in Vine-street, Minories.— Joseph Daw, Sewers' Office, Guildhall. January 14.

For the erection of a Wesleyan Chapel at Hythe. - Mr. T. Pilcher, Stationer, &c., Hythe. uary 21. Jan-

For making a Sewer in the town of Cambridge. The sewer to be cylindrical, and 2 feet diameter in the clear, the length will be about 385 yards, and the average depth about 9 feet .- Frederick Randall, Town Hall, Cambridge. January 21. For the erection of the Railway Works between

Leeds and Bradford, including fencing, earthwork, masonry, roads, and permanent way.—William Clarke, Secretary, Hunslet-lane Station, Leeds. Jaouary 27, 1845.

For the execution of Works on the Chester and Holyhead Railway.—1st. A distance of eight miles, or thereabouts. 2nd. A distance of twenty-two miles, or thereabouts. 3rd. A Tunnel through the promontory of Penmaen Back, near Conway.-George King, Secretary, 62, Moorgate-street. January 29, 1845.

For the supply of Wrought Iron Rails and the requisite number of Chairs for about 15 miles of the Southport and Euxton Junction Railway. The weight of rails to be from 60lb. to 70lb. per lineal yards and 15 feet lengths, equal to 11 om 1,500 to 1,800 tons of wrought iron, and about one-third of that quantity of cast iron.—Woodcock and Part, Solicitors, Wigan. January 31. For erecting the Works of the third division of

the Main Line of the Great Southern and Western Railway, being 11 miles, 6 furlongs, and 75 yards Also for the first division of the Carlow in length. branch, being 10 miles, 7 furlongs, and 160 yards; comprising excavation, embankments, bridges, cul-verts, &c.-William Taylor, Secretary, 3, College Green, Dublin. February l.

For the supply of 11,000 feet of nine-inch castiron Pipes for a new line of Aqueduct to be laid in the Island of Malta.—Vin. Casolani, Collector of Land Revenue, Office of Land Revenue and Public Works, Valletta, Malta. March 31, 1845.

COMPETITIONS.

THE Committee of the Association recently formed in the Metropolis for the Construction of Baths and Wash-houses for the Labouring Classes, are desirous of obtaining Plans and Estimates for the Erection and Fitting-up of the First Esta-blishment. The general basis of the plan can be seen at the Office, No. 3, Crosby-square. The author of the plan considered the best by the Committee will be selected to execute the work.

Plans and estimates are required for a Pauper Lunatic Asylum for the County of Somerset; the building to accommodate 300 patients, and to contain two Storics. The Committee of Visiting Magistrates wish it to be of a plain, cheerful character, but will not further fetter the architect by suggesting any particular arrangement as to the terior, its ventilation, warming, or otherwise. The center, its ventilation, warming, or otherwise. The ground selected contains 36 acres.—The Clerk of the Peace, Taunton. A Premium of 1001. will be adjudged for the best plan, and 501. for the next best Langer 90 best. January 22.

to be done in a plain and substantial manner, without any expensive embellishments. architects' estimates to be sent to out any expensive embellishments. The plans and architects' estimates to be sent to Robert Mercer, the Clerk of the Clifton Union, Pennywell Road, Bristol, on or before the 17th of February next, and the Board of Guardians will adjudicate on the 28th. The architect producing the best plan in the estimation of the Board will be employed at a sum not exceeding 5 per cent. on the outlay, and a gratuity of 25 guineas will be given to the architect producing the second best plan in the opinion of the Board.

The Committee of the Art Union of London offer the sum of 5001. for an Original Picture illustrative of British History. Cartoons, six feet by four feet six inches, are to be sent in (as will be hereafter notified) by the 1st day of January, 1846, and from these the selection will be made. Artists must send specimens of their abilities as painters, if required so to do. The successful candidate must undertake to complete the finished picture, of the same size as the cartoon, by the lst of January, 1847, and to superintend the engraving. The Committee wish it to be understood that their object in giving so long a period for the preparation of the cartoon is for the purpose of affording artists sufficient time thoroughly to study the various details of their compositions, and to produce in the cartoon a completely finished and well-wrought study for the picture. The Committee reserve to well-wrought selves the right of withholding the premium if works of sufficient merit be not submitted.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

At Willesden: 318 Oak, Ash, and January 6. Elm Timber Trees .- Baker and Son, auctioneers, Manor Terrace, Kilburn.

January 7.- At90, Blackman-street, Southwark: 600 cut Deals; 3,000 Fir Boards; 250 Pine Plank; 100 Red Pine Deals and Plank; 100 Yellow Deals; 3,000 feet of Quartering; 1,000 feet of Mahogany; 20 load of Ash, Beech, Birch, &c.--Southey and Son, auctioneers, 191, Tooley-street.

January 7, 1845.—At the Hall of Commerce, Threadneedle-street: 1,232 logs of St. Domingo Mahogany of superior quality and large dimen-sions; also 3 logs of Satin Wood; 182 logs of pencil cedar; 850 lancewood spars.—Thomas Ed-wards, Broker, 1, Pinner's-hall, Great Winchesterstreet.

January 17, 1845.--At Garraway's Coffee-house, Cornhill: 10,000 Baltic and Swedish Deals and Battens; 10,000 Colonial Yellow Pine and Sprace Deals.—E. D. Warrington, broker, 15, New City Chambers.

TO CORRESPONDENTS.

"J. M. Newport."-Will our correspondent inform us in what respect his mode of drawing elliptiform us in what respect his mode of Grawing ellipti-cal arches of large span, by means of two figured rods working on pins at the two foci, is superior to the common mode, wherein a cord the length of the span, and secured at the two ends, occupies the place of the rods?

New Flooring Dog."-The model sub by Mr. Snowball, although ingenious, is not likely to supersede the present form. The lever is more effectual than wedges in driving the boards together The inapplicability of the new dog to joiste and trimmers of various sizes is likewise an objection.

The model is left at the publisher's, with thanks, "A Young Architect."—We will inquire. "John Howe" will find an answer in another part of the Journal. The official referees are Mr. James While Higgins and Professor Hosking, Trafalgar Square. "William John Lea."—The sketch is left at the

office, with many thanks.

"J. W. W., Jun," next week. "J. J. F." "H. G." "J. S." "H. S." and "Nauticus" received.

A correspondent wishes to know what form it is best to adopt in the construction of Pot Kilns for common red ware.

*** We have received several letters requ us to give, in a tabular form, a list of the New District Surveyors and their official residences; immediately they are all fixed and have received a Magistrates sanction, agreeably to the Act, it is our intention to comply with the wishes of our correspondents.

APPOINTMENT.

The Commissioners of Sewers for Westminster and part of Middlesex are about to appoint a Fourth Clerk of the Works at a salary of 120?. per annum. The appointment in the first instance best. January 22. Plans and estimates are required for a Work-house, to contain about 1,180 persons. The whole Tuesday, January 14.

NOTICES OF CONTRACTS.

CI.

SATURDAY, JANUARY, 11, 1845.

HE Metropolitan Buildings Act came into full opera-tion on Wednesday, the lat tion on Wednesday, the lat instant, and the new surveyors appointed under it came into authority. Their

duties are not light,-there is much work before them; as, indeed, there is much increase of work for the district-surveyors appointed under the old Act,-and they must apply themselves vigorously to their task.

According to the new Act, buildings begun before the 1st instant, " and covered in end rendered fit for use within twelve months thereafter," are exempted from its provisions. A knowledge of this circumstance led to the commencement of a vast number of buildings in the new districts at the end of last year, for the most part in an insufficient and faulty manner. Immediately preceding the frost, and in some places during its continuance, the bricklayers were at work without taking even ordinary precautions to prevent injury to the work, such as using the lime quite fresh, clean Thames sand, good bricks perfectly dry; and covering up the walls at night, so as to allow the mortar to set as quickly as possible. The great demand having made bricks scarce, and consequently very dear, the merest rubbish has been used, and mould, in many places under our own eyes, has supplied the place of sand in the mortar. The consequence is, that much of the work done is not sound, and should be taken down; in fact, in several quarters it has not waited to be taken down, but has fallen of its own accord. Except in extreme cases, however, we apprehend the district-surveyors will not be able to interfere. Where danger is actually apparent, they may perhaps treat them as ruinous buildings, under the 40th section, and with the aid of the overseers and official referees, may cause them to be strengthened or demolished.

Schedule E. provides, relative to projected buildings, that "such projections must neither be built with, nor be added to, any building, or any face of an external wall thereof, so as to extend beyond the general line of the fronts of the houses." In some of the new districts, where the houses stand back from the road, and have front gardens, shops have been hastily executed on that space, to the destruction of regularity, the annoyance of the neighbourhood, and the manifest injury of the adjoining houses. In Brompton (part of Mr. Donaldson's district), a number of such erections have been made, in rows of what have been private houses. Whether or not the owners of adjoining buildings will be allowed to come forward in the same manner, the value of the houses as private residences being destroyed, will depend on the surveyor, as by the section already referred to, what is "the general line of the fronts of the houses" may be determined by him.

The question of drainage is one to which the attention of district surveyors is now first directed, and a very important one it is. Schedule H. provides that the drains from all buildings (hereafter built) shall be completed before the walls are ten feet high; and shall be taken into a common sewer, "if there be

within 100 feet from any part of the building, or from the inclosure about the building, a common sewer into which it is lawful and practicable to drain."

Further on it provides, touching cesspools, that "if there be a common sewer within 50 feet from any front of or from the inclosure about any house or other building (hereafter built), then a cesspool must not be made for the reception of drainage from such house or other building, unless there be or shall be built a good and sufficient drain from such cesspool to such common sewer."

Insomuch, however, as the Commissioners of Sewers, who retain all their powers and authority, will not ordinarily allow drains to be taken into a sewer until it be brought up to the building about to be drained, this provision would seem to have the effect of compelling owners in many cases to build 50 feet of sewer :--- a sewer being within that distance, they may not form cesspools.

Every main drain must be 9 inches in diameter inside; and must have a fall of at least half an inch to every 10 feet, and be arranged so that it shall be wholly covered over under the lowest floor, and independently thereof. It must likewise be made airtight. In many new houses built "to sell," the pavement in the kitchen or passages forms the top of the drain: a most inefficient and improper mode of construction, which the foregoing provision will prevent for the All cesspools constructed under a future. building must be made air-tight. We need hardly say to our practical readers that in nine cases out of ten where the drains go into a sewer, it is much better to have no cesspool at all. With drains properly formed, sufficient water, and a good fall, cesspools are quite unnecessary, and should be avoided as a great nuisance.

Another important matter (so far as relates to public health) in which district surveyors are required to co-operate is, the prohibition of the use of buildings unfit for dwellings. No decided steps can be taken till the 1st of July, 1846; but overseers should already have re-ported to the official referees, the number and situation of dwellings in their respective parishes, wherein any underground room or cellar is occupied as a dwelling, in order that notice may be given to their owners and occupiers, of the provisions of the Act in this respect.

DECAY OF TIMBER-CAUSE AND CURE.

THE prevention of decay in the timber-work of buildings we may consider as being very much within our own power; for where due precautions are taken, in felling at the proper time, and thoroughly seasoning the wood itself, and in obviating the chances of harm which might accrue to it from contact with other materials, decay will rarely appear in any form. There are, no doubt, causes which induce decay, where the operation of those under the control of the architect or builder has been prevented : lofts are often filled with stores of a damp and musty nature; manufactures are carried on in which much water is used, much constantly spilt; very frequently, co-operating with this moisture in the work of destruction, is the heat of powerful stoves, which keep the air at a high temperature; painted and other floor-cloths are unsuspectingly and unsparingly spread and fastened down, intercepting the salutary action of the air, and retarding, if not totally preventing, such evaporation as may be wanted. But for such cases as some of these, extraordinary treatment is necessary, although much may be accomplished by mature pre-consideration of the intended purpose of the building, and an anticipation of its liabilities.

Among the most active agents of decay in the timber of buildings may be instanced deficient drainage and imperfect ventilation. Where these exist, even perfect seasoning will not be sufficient to ensure durability. Where a radical reform is carried out in them, timber,

even imperfectly seasoned, may better serve our purpose; for where damp is precluded, and thorough ventilation sustained, the season-ing must advance to perfection. It is in this conviction that we feel disposed to arraign the conviction that we feel disposed to arraign the whole system of building, as it has been pursued in later times; and to hail with gratulation a change which, though little more than begun, will progress surely, and the further the more rapidly; till, with the "wisdom of our ancestors," in this particular, in vivid light before our eyes, enhanced by the superior light before our eyes, enhanced by the superior state of science, a code of principles will be formed, infallible because founded on common sense. It will not long, we think, be cavilled with, that the existing (now passing) system of stuccoing, external and internal, however much talent, in many respects, it may display, is, in a great measure, contemptible and in-indicious. Comparing induces bed bond i bad judicious. Compoing induces bad bond; bad bond has given rise to bond timbers; these have been pent in by brick and plaster till they rotted away, and disunited the work they were meant to hold together. A niggardly anxiety to reduce the cost of carpentry, the most scientific and perhaps the most beautiful part of good building, has produced plaster ceil-ings, to the endangerment at once of the science itself, therefore of the stability of our walls, and of the durability of our floors, confining noxious and corrupting vapours. What can we more admire than the open timbering of an in-genious, skilfully-disposed roof, one worked with a view to its being left at all times visible? Which can we the more esteem, the palpable falsity of an ornamented plaster ceiling, that impends over our own heads and the brilliant scenes that shine around, or the more honest and safe, and equally ingeniously-elaborated timber soffit, not blandished over at fitful intervals with colour, but kept in healthy trim by good wholesome rubbing? But we must not diverge further from the straight line of our subject.

DAMP is a very active cause of decay: alternations of dryness and moisture are very **Ď**амр destructive, such as is the case with the supports of a wooden bridge, or any other timbers in similarcircumstances, weather boarding, or fencing, exposed to the vicissitudes of the weather, for example. Timber placed in a situation which is constantly damp, is also liable to rapid decay-especially when exposed to atmospheric influence.

The object, then, is so to prepare the wood by some saturation or coating, as to render it impervious to the moisture which assails it: for this purpose several compositions are em-ployed; but it must be remembered that while they are calculated to prevent decay in sea-soned timber, unless the wood is thoroughly so, the application of any such covering will produce just the opposite effect to that which is intended—inclosing sap, and preventing evaporation, being known to afford infallible facilities to internal decay, besides which, however well the timber may be seasoned, and its sides defended against external influences, if due attention be not paid to the ends, whatever the position, all the care otherwise bestowed will be unavailing; the pores will

admit the moisture, and decay will follow. It is found that the wooden posts introduced to support the impending portion of salt mines, are rendered in a great degree im-perishable by the constant and strong saline perishable by the constant and strong saline infusion which they imbibe; but notwith-standing this fact, it is obvious that timber seasoned by immersion in sea-water ought never to be employed for house-carpentry; for the impregnation which it has received will render it ever after most susceptible of damp, as indeed is any substance which con-tains salt; and while the particular timbers which had been so seasoned might contain within themselves principles exempting them within themselves principles exempting them from decay, they would most probably be the vehicle to bring destruction to the work around them : for the same reason the walls of buildings should not be built with mortar made with sea-water, or finished with plaster in which it is used.*

[•] If the mortar or parget with which a chimney-flue is to be plastered be mixed with salt, it will obviate any future temptation to contravene a very humane enactment —that which closed the particular channel for the pursuit of ku.d., which whilom invited the especial investigation of the climbing-boy; for with every spell of damp weather, the salt will liquify and disengage the soot, a property which in one recorded instance remained unimpaired after thirty years' operation, but whether to the advantage or disconfort of those immediately interested docs not appear. discomf appear,

In building on a damp soil, having pro-vided for the drainage of the site and its vicinity, the walls to a little above the groundline should be built with mortar incorporated of a hydraulic cement, or such as would set under water; otherwise the mortar will never properly harden, but be inclined rather to decompose, and will always facilitate the rise of damp into the walls of the superstructure. Where there does not appear imperative occasion for incurring this extra expense, and indeed in all other cases than the one named, it is well to introduce near, but out of contact with the ground, a course of some material which is of a nature much more impermeable to moisture than the generality of building ma-terials, a thin plate of some incorrodible metal for example, or a layer of hard slates in Roman cement, or of coal-tar and sand; either of these will intercept the rise of damp. In buildings of brick, it is the more necessary to have recourse to such measures, since that material is very absorbent in its nature, draws up damp to a considerable height, and retains it for a long time. Where the walls of a building in which no such precautions have been taken, have become damp, it would have a salutary effect to dig out the earth which lies against them, and apply a coat of concrete, or Roman cement, to the parts under the groundline, then fill in the earth again; the current would thus be effectually stemmed, and on the right side of the wall; and all short-sighted attempts to shut it out from within, by means of tarred-paper, or tea-lead, rendered unne-cessary. It is plain that where water is col-lecting, it must either run out or run over; and if an internal coating resists the percolation, the more is the pity, since the consequence must be the rise and spread of the mischief.

But where there is a sunk basement, and indeed in all cases, the best practice is to separate the walls from the surrounding ground by open areas, more or less wide as they can be obtained. Then, interiorly, the flagging should not be laid upon the natural earth or vegetable mould, but upon a stratum of concrete, or compact layer of ashes, stone-chippings, dry lime rubbish, or other material calculated to intercept humidity and destroy calculated to intercept humidity and destroy vegetative principles, a precaution which is of course equally essential under the boarded floors of the same story,—it being provided in the latter case that a clear space of 18 inches height, or more, intervene between the said finishing stratum and the floor-boards, and a thorough ventilation admitted by means of perforated iron castings in the plinth course of the external walls. Where sleeper-walls occur, little arched openings should be formed in them for the same purpose. In superior build-ings this method should be adopted for the flagging as well, as being the best for insuring a perfect exemption from damp,—the slabs being of large dimensions, assorted to certain widths, laid on dwarf walls with apertures, and their cross joints joggled or rebated for mortar to prevent any upward draught. Allusion need only be here made to the necessity which there is for making the right sort of provision, in the first instance, against the leakage of parapet gutters, down-pipes-whether soil or rain-water, cisterns, tanks, drains, &c.; the gutters named demand more care than is usually bestowed on them, and indeed can scarcely be made altogether perfect; and it is frequently from some of these causes, and where there is no damp foundation to blame, that timbers are rotted, and serious mischief mend the relinquishment of wood bond, and suggest also the invariable adoption of a method of inserting the ends of timber beams in lieu of the more common practice of building close about them. Arched recesses, larger in every way than the ends of the beam, and having stone cills flush on the face, some-what wider than the opening, and dovetailing inwards, should be prepared in carrying up the walls; the beams when laid in their places should be held there in one or other of the following ways; irons, say 2 feet long, should be bolted or screwed against the sides at each end, and turn down into mortises in the stone cill or templet, or dowels of iron or Valentia slate (if the latter, say 3 inches square by 4 long) should be let one-half of their length into the contiguous surfaces of the beam and templet-centrally in their width and as far

from the ends of the former as is compatible with the strength of the latter supposing a tendency in the wells to fall outwards, and the beam to fulfil the part of a tye. The former and more expensive method is best calulated for cases where damp, and consequently decay at the ends of the beam is to be feared, but where all other precautions have been taken, the latter, which is extremely simple, is suffi-cient. When it is inconvenient to place the beams at the time of carrying up the walls, there can in general be no obstacle to leaving the back of one of the recesses open that the beam may subsequently be pushed far enough through it to admit of its other end being introduced into the one opposite. This mode of placing beams provides for the circulation of air round their ends, which from the exusion there that proceeds from such vegetable moisture as happened to main and the table to be soonest affected; it supersedes the neces-sity for charring or pitching the ends, which, however excellent in cases where the timber however excellent in cases where the shows is perfectly seasoned, is injurious where it is not so; it also affords superior facility, should any deficiency take place, for splicing or entirely replacing them. J. W. entirely replacing them.

ROYAL INSTITUTE OF ARCHITECTS.

In the middle of last year the Institute In the middle of last year the institute offered medals for the best essays on the following subjects :---"On the system and principles pursued by the Gothic architects from the eleventh to the fifteenth centuries inclusive, in the embellishment by colour of the architectural members and other parts of the architectural members and other parts of their religious and civil edifices;" and "On the various species and qualities of slates, with an analysis of their component parts. their relative value and applicability for building purposes, and the best chemical tests for ascertaining their durability." They further offered the Soane medallion for the best design for a college in a university, of Roman or Italian architecture, with chapel. Roman or Italian architecture, with chapel, theatre, &c.; and required that the principal buildings should compose in a noble and imposing manner. We regret to learn that, in reply to these

we regret to learn that, in reply to these invitations, only two essays have been received, both on the qualities of slates; and that no design has been sent in. It is extraordinary to find so little emulation amongst the rising members of the profession, as is thus rendered

members of the profession, as is thus rendered apparent. We shall aid in rendering widely known the subjects proposed for the ensuing year, and hope we shall have to record a more satisfactory result. The merits of the essays now submitted remain at present unknown. At the next ordinary meeting of the In-stitute, which will be held in the new rooms on Monday next, a paper will be read by Mr. T. L. Donaldson, "On the history of archi-tecture, from the building of the pyramids to the revival of Italian architecture in the sixteenth century." sixteenth century."

RISE IN THE PRICE OF TIMBER .---- We are informed that the advance in the price of American timber, within the last twelve months, has been nearly 50 per cent. This extraordi-nary rise is attributed to the steady demand and the diminished stocks, caused by the great amount of shipping employed in the guano trade. The timber-carrying trade has not, for many years, been a profitable one, and though a great amount of tonnage will, no doubt, be employed next year, and tend to check the rise, still, as freights will necessarily be high, timber will, no doubt, for some time to come, command first-rate prices to the importers.----Glasyow Courier.

GIGANTIC BRONZE STATUE.-The Journal des Débats states that the gigantic head of the statue of Bavaris, a bronze statue, which is to be 68 feet high, was withdrawn from the mould in which it was cast at the royal foundry of Munich on the evening of the 14th ultimo, or Munich on the evening of the 14th ditimo, in presence of the king and queen of Bavaria, and a considerable number of distinguished personages. The beauty of the head of Bavaria, which is the work of the celebrated Schwanthaler, excited such enthusiasm amongst the mentations that they is including voices to a the spectators, that they joined their voices to a chorus of 300 of the Philharmonic Society of Munich, who chanted a hymn composed for the occasion by the Baron de Poissel, director of the Theatre Royal of Munich.

BUILDING SOCIETIES. LETTER V. BY WILLOUGHBY WILTON.

Wg hinted in our last that we should now touch upon the interest charged by these societies; this, however, must briefly give place to some matters equally important in our in-vestigations. If our readers will turn to page 589 of THE BUILDER (vol. ii.), they will find what interest is charged per cent. per annum. For example, a man takes 42 shares at the price of 70*l*., making 315*l*.; for these 315*l*. he cove-nants to pay in time 540*l*.; but till he does so, he is charged what is called "redemption monau or interest" per abare par mouth upon he is charged what is called "redemption money or interest" per share per mouth upon the sum he gives up to the society as a bonus for immediate cash. In the case before us, he submits to a deduction of 50% a share, or 225% for 315 + 225 = 540. This monthly payment the poor man deems easy; the rich man finds it the nimblest element in the improvement of his capital. For it is this : interest or redemption money at 4s. a month, i. e. on the bonus or sum which the man did not receive; this on 41 shares makes 18s. a month, which, with redemption money, 10s. a month, makes 34. 3s., or 374. 16s. a year; but 374. 16s. multiplied by 84, become 3214. 6s.; so it is made to appear that the man can within even 84 years pay off the loan with interest on the bonus by monthly instalments of 31. 3s. We must not, however, omit the ground-rent, 5*l*. a year or 50*l* in ten years, dilapidations, insurance of property, and loss of time in dancing attendance on the secretary with monthly payments, which we may here pass over, having already shewn the operation of these; nor must we omit the bonus of 225*l*, which must be made good even-tually, and which drags on the man's existence for some six years more than the 84 we have alluded to above, or in all about 144 years, as explained at large in our second letter, pages 601 to 603 of THE BUILDER. But it is shewn, page 626, column 3, that the bonus is as much as 55*l*, ; and in the same page, column 1, at the top, we quote the words of the loss of time in dancing attendance on the bonus is as much as 55*l*.; and in the same page, column 1, at the top, we quote the words of the "London and Westminster Society," which says, "the average bonus for such advances being 63*l*. 0s. 10*d*. per share;" so that in this case the borrower would receive in cash 56*l*. 19s. 2d., making himself answerable for 120*l*, on each share he takes up at this prac-tical relations of the price outront. tical valuation of the price current.

In the first case the man takes 70*l*, to pay 120*l*; in the second 65*l*, to pay 120*l*; in the third 56*l*, 19s. 2d, to pay 120*l*, in ten years; the im-possibility of which has been fully demonstrated.

strated. This constitutes what is termed the sale of shares, "for in full satisfaction of the share or shares he subscribes for of 1201. each," "he shall immediatly pay 11. per share in part of the subscription money, and charges payable thereon."• Moreover, "members not wanting money are liable to be ballotted to draw their shares, or be subject to a fine;" + but in "other societies the more general plan is to give power to the directors to dispose of money not wanted by the society in some profitable manuer," as in the Bridgwater Building Society, which makes "advances upon notes of hand," t "as the committee shall deem most conducive to the interests of the society."—"We think it highly expedient in societies where competition is allowed, to get a good number of capitalists." Here then we have proof of the inference deduced in our last letter, that these are more properly speaking Loan than Building Societies; and they identify themselves with the money-This constitutes what is termed the sale of

they identify themselves with the money-lending clubs in the manufacturing districts. Let us now consider the security for money advanced by the building societies. From all we can learn the property must be of "suffi-cient security to the society," or the borrower must find good men and true to join in their

must find good men and true to join in their common bond for the amount advanced, the parties agreeing "to accept the said share or shares, subject to the payments, rules, and regulations" of the society. If the party wish to build, one-half of the money shall be advanced when the building is covered in on paying half the premium; and the other half when the premises are finished, on paying the residue of the premium: but if

the party fail for six nights (monthly) to pay subscriptions, payment, and redemption money, the trustees shall absolutely sell the premises for the most money that can be gotten for them, and all loss shall be borne by the mortgagor. We see nothing objectionable in the party being made answerable to the society for the payments of the subscriptions and other charges, as the same shall become payable, after he consents to take its money at terms which must eventually prove his ruin to "the satisfaction of the solicitors and trustees for the time being."

The following plan has been suggested to render Building Societies really beneficial; and we cheerfully insert it on the principle, *audi alteram partem*; premising that our quotation is the result of its author's laborious calculation :--

tion :---"Suppose a member to require an advance of 4502, the following statement will shew the comparison between the present system and that suggested by the writer :---

"Now, if it were possible for the existing societies to close in ten years, the payments by the borrowers for a loan of 450*l*. would be 4*l*. 10s. per annum less to a society similar to that here suggested, than it would be to any of the existing societies, and there would be a difference in the total payments of 74*l*. 5s. The borrowers who paid the lesser sum would likewise have the advantage of only being required to give security for the amount they actually received; and, in the event of their failure in making their monthly payments, the property would not be sold for more than the balance remaining due of the amount actually advanced.

"In a society formed on this principle, it would be the interest of all the members to prevent the failure of the borrowers; at any rate, if such an event did occasionally occur, it would not have been caused by his connection with the society, or would they be liable to the imputation of having largely benefited by his ruin?"

Transfer of shares.—Shares may be transferred on payment of 10s. 6d. for each share transferred or sold, as a bonus to the society, and subject also to the premium at which the same shall have been purchased, and to all other fines, subscriptions, and charges, payable according to the rules of the society, all of which make a material difference in augmentation of the society's funds, and which we could not contemplate in our previous calculations of the capitalists' profits.

Members withdrawing.—" Protest, if you like," said Lord Ellenborough to William Hone, " and go about your business;" not so the building societies—if a member withdraw, we suppose he has protested—in the first year he shall forfeit one guinea per share, in addition to the entrance fee; if within the second year, a forfeiture of 10s. 6d. per share, in addition to the entrance fee, and so on; but " these forfeitures extend not to the widows and children of deceased members, holding not more than two shares in the society."

Power of the directors to borrow money for the use of a society.—This is very questionable, and, we believe, entirely at variance with the letter and the spirit of the Act of Parliament, inder which these societies are constituted, though that Act, s. 2, allows of "bonus on any share or shares, for the privilege of receiving the same in advance prior to the same being realized." Capitalists in these societies should not need to borrow; and a banker who would lend, at 4 or 5 per cent., to enable a society to discount "notes of hand," would, in Parliamentary language in the times of George IV., "urn his back upon himself."

1

)# •

> We may be associated with that "detestable case of wretches who oppose building so-

cieties ;"[•] but we would bear any obloquy if we could reform things amiss in these societies; and shew sensible men, who may be in their direction, that the borrowers are aggrieved, and, we believe, no two justices of the peace in Britain can gainsay our arguments, as to the profits of the lenders and the duration of these societies. It is the abuse, not the use of the thing, we speak about; and we discard all morbid philanthropy for the industrious classes in treating of the equity belonging as well to the rich as to the poor man. We would court justice for both; and we should recommend the directors to print their rules as the *Book of Justice of Building Societies*, and add thereto the *Catechism of Borrower and Lender*.

Sustee of Buttaing Societies, and add thereto the Catechism of Borrower and Lender. These observations, in allusion to the reformation of building societies, are suggested by the arithmetic of their managers, not by assumed data of our imaginings; and we find them responded to by the "Fourth Annual Report of the Liverpool Temperance Benefit Building Society," in which the average premium is stated to have been 581. 10s. 6d. a share; and while the society "had not the least difficulty in effecting sales of its funds," yet the withdrawals during the past year had increased, and the committee could not look upon this peculiarity in the history of the year gone by without feelings of pain; "but this is ascribed in so calamitous an extent every grade, but more especially the industrious classes of the community."

We might bring an array of figures, like the trees in an American wilderness, to dissect the balance-sheets of the several societies we have noticed, and of others we have not space to introduce, but we spare ourselves the trouble, and the societies the pain, this would inflict, being satisfied of this one thing, that the legislature will soon look into the management of these societies; for as sure as " the prayer of the humble pierceth the clouds; and till it come nigh he will not be comforted;" so will the appeal of men yet reach the ears of the legislature, who " will not accept any person against a poor man, but will hear the prayer of the oppressed, and will not despise the supplication of the fatherless, nor the widow when she poureth out her complaint."

In that of LAMBETH the borrower is said "to participate equally in the premium and interest given by himself and by all other borrowers," thus "reducing in proportion his amount of premium and interest, till at last, when the deeds of property are returned to him, he will find that he has paid the capital borrowed, that the premium has become a shadow,—

' Siste gradum, teque adspectu ne subtrahe nostro, Quem fugis ?' ''

"and the interest trifling." But we have done, observing that the people of Lambeth covet domiciles at Kingsland, where they have mortgages in six houses; the city, where they have one; Newington, one; Lambeth-proh pudor! one; and FOUR at Lewisham, which "are mortgaged for 6,600/.," or above 576/. a piece. And, in the balance-sheet, it is fairly stated that "3,556% are Dr. to premiums on piece. fifty-five shares taken up and secured on pro-perty," viz. the thirteen houses aforesaid mortgages on the Cr. side of the account. This, we presume to believe, makes it pretty plain that the bonus is treated as profit which the society has realized by its transaction with the borrower; and when we look at the very small sums allowed surveyors in the balance-sheets of the various building societies, we cannot lend our belief to the words of "W.," who has replied to Greenway Robins, that "Architects and surveyors are the gentlemen who most profit by these societies ;" professional menprofit by these societies;³³ professional men-save and except the lawyers, are not usually men of means to set on foot or sustain such societies; and we therefore still adhere to our opinion, that these societies could not make the advances they lavish without the assistance of capitalists; for to whom else would the Liverpool Banking Company advance 466*l*., the Hertfordshire Bank 414*l*., the Reading

* Kerr's "Advantages to be derived from Building Societies" rule axii.; (his commentary thercon), p. 73. Bank 9941.? Not to the man assuredly who bought 571. for 120 good sovereigns, to be paid within a given time.

We speak without prejudice and in a spirit of reverence in what follows, that the rules of these societies are "as the words of a book that is sealed, which men deliver to one that is learned, saying, Read this, I pray thee; and he saith, I cannot, for it is sealed. And the book is delivered to him that is not learned, saying, Read this, I pray thee; and he saith, I am not learned." Isaiah xxix. 11, 12. Learned men, good men, and men well skilled in commercial dealings, belong to these societies; they are their supporters. All other men who question their management are denounced "traducers" of building societies. But in a great country like Britain this should not be the language applied to these conscientious dissentients, who are not "found where parables are spoken."

"In order to terminate the society in ten years, a payment of 10s. per month, with compound interest and accumulations, must realize 120*l*.; and to accomplish this, the money paid in each year must produce twenty per cent. per annum, as is proved by the following calculation :—

INTEREST REQUIRED BY THE LENDERS.

| Payments each year. | Number of years' interest required. | Amount at 20 per cent. | Amount paid with interest at end of 10 years. |

"The borrowers pay two pounds per cent. on the nominal value of the share --viz., 120%; but as only 61% is received from the society, and the repayment is by monthly instalments, it is actually seven and a half per cent., that is, supposing these societies to terminate in ten years. If they continue for a longer period, the annual payments are to be added to the interest, which is thereby very largely increased.

creased. "If the fines and other extra payments amount to another two and a half per cent., making in all ten per cent., the monthly payments of ten shillings will, if constantly employed (which is very doubtful), in ten years only realize 90%, being but half the profit required to terminate these societies.

"In the Manchester society, those members who did not purchase shares had to pay 110/. before they realized the sum of 150/.; by the same rule, a monthly payment of ten shillings will, in the same time, only realize 75/. The members of the Manchester society paid fourteen shillings and eightpence before they realized twenty shillings, being five shillings and fourpence profit in the pound : and if the members of these societies have to pay in the same proportion, their duration will be fourteen years and eight months."

FIRES FROM FLURS AND HOT-WATER PIPES.—In Mr. Braidwood's report on fires during the ten days ending Jan. 1st, it is stated that out of twenty-six which occurred, in six cases the fires were caused by stoves or flues, one by unslacked lime, one by hot-water pipes used for heating the building, one by a malt-kiln, three by the ignition of curtains, and one by the breaking of a melting pot. In the remaining cases the cause was unknown.

THE TEMPORARY EXCHANGE.—Thisbuilding, which was erected about six years ago in the Excise-office yard, Old Broad-street, is to be sold next Wednesday, in one lot, by Messrs. Simson, of King's Arms-buildings. It is 140 feet in length, and 40 feet wide, supported on wood pillars, with wrought-iron girders, and slate roof.

ECCLESIASTICAL ARCHITECTURE.

MR. WIGHTWICK has recently published a letter on the determination of some principle for the establishment of an ecclesiastical style of architecture, expressing the reformed church of England, in consequence of a communication from the secretary of one of the churchbuilding societies, which seemed to indicate the prohibition of "any departure from ancient ecclesiastical example," and of the encouragement given to that prohibition by the Cambridge Camden Society. He says :--

"That the Diocesan Architectural Societies have effected great good in aiding to subvert the 'Carpenter's Gothic' of Batty Langley, it were most unjust to deny: but, if they have done this only to insist hereafter on the close imitation of the mere models, rather than of those motives of fitness, which guided our old RomanCatholic architects, they will tyrannically impede those progressive movements, which might, ere long, lead to the perfection of a form and style of architecture emphatically expressing the 'True and perpetual Church.'

"The magnificent cathedrals of our ancestors are admirable, from their perfect adaptation to the religious ceremonies which prevailed in the English Church before the Reformation; and it is said to have been in the hope of reviving the popish service, with its processional pageantries, that the Duke of York opposed Sir C. Wren's first design for St. Paul's cathedral, on account of its 'departure from ancient example;' thus precluding the only opportunity which has ever yet been afforded of our possessing a cathedral essentially Protestant."

essentially Protestant." Mr. Wightwick considers the positive requisites for a church to serve all the purposes of Christian worship as now established in England to be these :--

"First under the head of Convenience-

"I. A main space for public worship, &c., wherein a maximum number of persons[®] shall be commodiously seated without impediment to sight and hearing. Pillars, therefore, and galleries which must be supported by pillars, are prohibited. 2. An altar, as open as possible to the whole congregation, with the least practicable interception by the pulpit and desk. 3. A highly-raised pulpit, and a lower-raised reading-pew or lectern, having one desk for the Prayer-book, looking towards the altar, and another for the Bible, looking towards the people. Also a faldstool for the Litany, in a central position, directly facing the altar. 4. A font, within view of the assembled congregation; or, 5. A baptistery, united with the body of the church. 6. An organ-loft, at the west end of the church, opposite the altar at the east end. 7. Chapterroom, library, vestry, or other offices as required, near the chancel. 8. A tower, or towers, for the reception of bells, and as also useful in attracting the distant observer to the locality of the church.

"Secondly, under the head of *Expression*:----"9. The general plan to be cruciform, as prominently symbolizing the Christian faith. 10. The visible signs of Trinitarian belief to be indicated, wherever practicable, consistently with the unity of the whole. 11. The sentiment of Infinity to be observed in the adoption, or invention of a style most conducive to it, as affording the best opportunities for proportional loftiness and length of perspective. 12. The utmost respect to be manifested for our ancient examples, in the consideration (and, if practibable, in the adoption) of so much of their form, style, and particular features, as may be pure, and interesting in their connection with the progressive history of the 'Holy Catholic Church;' and equal care to be taken in avoiding the repetition of those architectural dispositions and decorative details which are proper only to the Romish Church."

In reference to Pointed architecture, and its fitness for ecclesiastical buildings, he says,— "The movement which Pointed architecture

"The movement which Pointed architecture has now taken, as most suitable to the Christian temple, derives additional impetus when we consider it as the positive offspring of Christianity itself. Churches have been built in almost all styles; but the Gothic Pointed architecture of Catholic Europe is exclu-

It has been found, by experiment, that not more than 2,000 sitters can be conveniently placed within a church (even where there are galleries), so as to have the advantage of perfect hearing; the sight being, of course, rendered imperfect by the pillars supporting the galleries.

sively Christian in its origin, progress, and perfection. In form, in detail, in mysterious effect, it proclaims the spirit of which it is the sign.

sign. "But, by that same authority under which our Saxon architects differed from those of the Constantinal era, by that under which the designer of the first Pointed church differed from the matured and established Norman model, and by that under which were practised all the successive modifications of Pointed architecture, from the Temple Church to the chapel of King's College at Cambridge, we claim the privilege of allowing our regard for present necessities and altered circumstances, to co-operate with our respect for ancient usages and forms, in the production of what shall have both a retrospective and prospective merit; nor will we be told that, because we may find it imperative to deviate from 'ancient example' in general form and proportion, we shall therefore exhibit a 'departure' from We have the spirit of our pious ancestors. We have looked minutely into the merits of Pointed architecture, and have vainly sought to improve on its essential principles and details, whether of construction or ornament; but we have now to provide for certain requirements which did not exist when our Gothic churches were built, and to avoid the mere imitations of such forms, , as are no longer necessary, but are rather hostile to our reformed worship."

ENGLISH SKILL AND CAPITAL EN-LIGHTENING THE CONTINENT.

IF we do borrow from our foreign neighbours singers, musicians, modes, and the polka, they have to thank us in return for much increase of comfort, and for the means of social advancement. Amongst the advantages conferred by England on continental towns there is none more evident than those afforded by the supply of gas.

the supply of gas. In France, Germany, Belgium, and Holland, English capital and English skill have laid down pipes, built manufactories, and still direct the supply of light to numerous towns. In Holland it was some time before the authorities could be induced to afford facilities for such undertakings, fearing the danger which might arise from opening trenches in their uncertain soil, and the difficulty of passing pipes through the canals and basins which occur constantly; but experience has shewn that these fears were groundless.

these fears were groundless. The last town visited by English enterprise for this purpose is the Hague, where the works, commenced hardly six months ago, were completed only a few days since. The local papers are full of compliments to English skill. Honour, says one of them, to the able and active engineer, Mr. Shepherd, who has directed the whole, and realized with so much talent and rapidity the idea of this vast undertaking! Honour to the clever manufacturers, Messrs. Goldsmid and Co., who have made so complete all the machinery of this fine establishment! and honour to our Ediles, who, enemies of routine and conquerors of prejudice, have given us the advantage of a useful discovery. The Hague is now the equal of the great cities of Europe,—like them, she too has a sun for the night.

NEW LUNATIC ASYLUM, SOMERSET. -At the Quarter Sessions held last week at Wells, a report from the Lunatic Asylum Committee was read. It stated that every thing was now nearly complete for the conveyance of the land selected as the site of the asylum, and that they had contracted for an additional four acres of land, which were considered necessary. They had advertised for plans for the building, but circumstances over which they had no control had delayed the appearance of the advertise ments, and complaints had been made that the time fixed for receiving plans was too short; it had, therefore, been extended to the 22nd of January. The committee would have increased difficulty in their choice of a plan, unless they knew the amount of money which would be granted; they were bound by the 26th section of the 9th Geo. 4, c. 40, to fix the sum which might be expended; and from the inquiries which the committee had made, they enter-tained the confident hope that 30,000/., the sum formerly stated as required, would not be exceeded.

FIRE-PROOF HOUSES.

THE attempts which have been made to render houses fire-proof are so intimately connected with the construction of dwellings, that it will be proper to give a few brief details on the subject. There are many difficulties attending these attempts; for so long as wood forms the chief inner frame-work of a house, there will always be considerable liability to destruction by fire. Most of the proposed plans have had relation to the coating of the wood with some substance which should render it less inflammable, while others have been directed rather to the rejection of combustible substances from the list of those used in house-building. So long back as 1775, Mr. Hartley made

So long back as 1775, Mr. Hartley made several trials in order to test the efficacy of a method invented by him for that purpose. Thin iron plates were nailed to the top of the joists: the edges of the sides and ends being lapped over, folded close, and hammered together. Partitions, stairs, and floors were proposed to be defended in the same manner. The plates were so thin as not to prevent the floor from being nailed on the joists in the same manner as if the iron were not used; and the plates were kept from rust by being painted or varnished with oil and turpentine. Mr. Hartley had a patent for this invention; and Parliament voted a sum of money towards defraying the expense of his numerous experiments. It does not, however, appear that the plan was permanently adopted.

About the same period, Lord Mahon, afterwards Earl Stanhope, a nobleman possessing a highly inventive tact in mechanical matters, brought forward another method having the same object in view. This method was of a three-fold character, comprising under-flooring, extra lathing, and inter-securing.

extra-lathing, and inter-securing. The method of under-flooring is either single or double. In single under-flooring, a The metuod of single or double. In single under non-common strong lath of oak or fir, about one-fourth of an inch thick, should be nailed main timber, supporting the floor which is to be secured. Other similar laths are then to be nailed along the whole length of the joists, with their ends butting sgainst each other. The top of each of these laths or fillets ought to be at an inch and a half below the top of the joists or timbers against which they nailed; and they will thus form a sort of small fillets are to be well bedded in a rough plaster These when they are nailed on, so that there may be no interval between them and the joists; and the same plaster ought to be spread with a trowel upon the tops of all the fillets, and along the sides of that part of the joists which is between the top of the fillets and the npper edge of the joints. In order to fill up the ìntervals between the joists that support the floor, short pieces of common laths, whose length is equal to the width of these intervals, should be laid in the contrary direction to the joists, and close together in a row, so as to touch one another; their ends must rest upon the fillets, and they ought to be well bedded in the rough plaster, but are not to be fastened with nails. They must then be covered with one thick coat of the rough plaster, which is to be spread over them to the level of the tops of the joists; and, in a day or two this plaster should be trowelled over, close to the sides of the joists, without covering the tops of the joists with it.

In the method of double-flooring, the fillets and short pieces of laths are applied in the same manner as here noticed; but the cost of rough plaster ought to be little more than half as thick as that in the former method. Whilst the rough plaster is being laid on, some more of the short pieces of laths must be laid in the intervals between the joists upor the first cost, and be dipped deep in it. They should be laid as close as possible to each other and in the same direction with the first layer of short laths. Over this second layer of short laths there must be spread another coat of rough plaster, which should be trowelled level with the tops of the joists, without rising above them. The rough plaster may be made of coarse lime and hair; or instead of hair, hay chopped to about three inches in length may be substituted with advantage. One measure of common rough sand, two measures of slacked lime, and three measures of chopped hay, will form in general a very good proportion, when

sufficiently beaten up together in the manner of common mortar. The hay should be put in after the two other ingredients are well mixed up together with water. This plaster should be made stiff; and when the flooring boards are required to be laid down very soon, a fourth or fifth part of quicklime in powder, formed by dropping a small quantity of water on the limestone shortly before it is used, and well mixed with this rough plaster, will cause it to dry quickly. If any cracks appear in the rough plaster work near the joists, when it is thoroughly dry, they ought to be closed by washing them over with a brush wet with mortar wash; this wash may be prepared by putting two measures of quicklime and one of common sand into a vessel, and stirring the mixture with water till the water becomes of the coasistence of a thin jelly.

Before the flooring boards are laid, a small quantity of very dry common sand should be strewed over the plaster work, and struck smooth with a hollow rule moved in the direction of the joists, so that it may lie rounding between each pair of joists. The plaster work and sand should be perfectly dry before the boards are laid, for fear of the dry rot. The method of under-flooring may be applied to a wooden stairease, but no sand is to be laid upon the rough plaster work. The method of extra-lathing may be applied to ceiling joists, to sloping roofs, and to wooden partitions. The third method, which is that of intersecuring; is very similar to that of underflooring; but no sand is afterwards to be laid on. Inter-securing is applicable to the same lathing.

parts of a building as the method of extralathing. Such is a general outline of the modes proposed by Lord Mahon for rendering houses fire-proof; in which it will be seen that the safeguard consists in the use of a non-combustible material with, and among, and between the pieces of wood forming the frame-work of a house.

. The more recent attempts to gain the same object by means somewhat similar have been very numerous; some of which we may here notice as examples of the whole.

An American patent was granted in 1837 to a Mr. Louis Pambœuf, for the invention of a fire-proof paint. The mode of preparing it is thus described. A quantity of the best quicklime is selected, and slacked with water in a eovered vessel; when the slacking is complete, water, or skimmed milk, or a mixture of both, is added to the lime, and mixed up with it to the consistence of cream. When milk is not used, a solution of rice paste is employed, obtained by boiling eight pounds of rice to every hundred gallons of paint. When the creamy liquor is prepared, alum, potash, and common salt are added, in the proportion of twenty pounds of alum, fifteen pounds of potash, and a bushel of salt, to every hundred gallons of the paint. If the paint is to be white, aix pounds of prepared plaster of Paris and the same quantity of fine white clay are added to the above proportions of the other ingredients. All these ingredients being mingled, and then ground in a colour-mill.

When roofs are to be covered, or when crumbling brick walls are to be coated, fire white sand is mixed with the paint, in the proportion of one pound to ten gallons of paint; this addition being made with a view to giving the ingredients a binding or petrifying quality. In applying this paint, except in very warm weather, it is prepared in a hot state; and in very cold weather precautions are necessary to prevent it from freezing. Three coats of this paint are deemed in most cases sufficient.

In another variety of this paint oil is the chief liquid ingredient. To prepare it forty gallons of boiled linseed oil are mixed with slacked lime to the consistence of a paint; and to this are added two pounds of alum, one pound of potash, and eight pounds of common salt; or good wood-ashes may be substituted for the potash. This paint is used in the same manner as other paint; and any colour may be obtained by adding the usual pigments to the composition.

The preparation of a kind of paint containing alkalies seems to have been a favourite measure among inventors of "fire-proof" composition; for many of the modern projects have had this for its basis. But in most cases there have not been means for determining the degree of efficacy possessed by these compositions.

Perhaps the mode in which we may more consistently look for the practical attainment of the object in view is by the adoption of some improved mode of building, in which either wood is not employed at all, or, where sparingly used, measures are taken to shield it from the action of fire. One such method is Leconte's, described as follows.

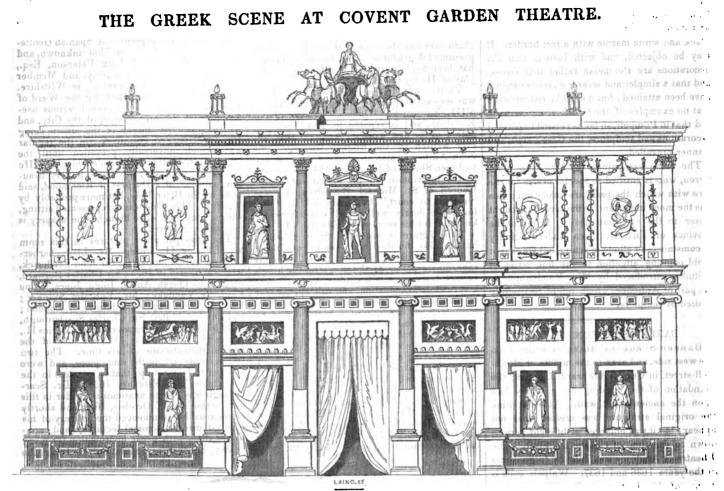

This plan consists in the employment of iron frames to receive concrete matter for forming the walls. The basement story of the building is constructed according to the ordinary methods up to one foot or more above the ground. On the basement so constructed is to be erected the patent wall, formed of frames entirely of cast-iron, in one or more pieces, or a combi-nation of cast-iron and wrought-iron plates. nation of cast-iron and wrought-iron plates. These frames are to be set one on the other until the required height is attained, the ne-cessary stability being obtained by means of steady pins at the corners of one frame fitting into holes made in the corners of the frame which is opposed to it. Suitably-shaped frames are amployed for the interval methics which is opposed to it. Suitably-shaped frames are employed for the internal partition walls, and for doorways, window-frames, &c. The flues of the chimneys are formed of iron or other metal pipes, placed in the thickness of the walls. When the required elevation is obtained a concepte of any suitable metricle obtained, a concrete of any suitable material is poured into the framing, and fills up the vacant space, giving firmness and solidity to the structure; the concrete being made of gravel and lime. To give steadiness, lead is to be introduced between the joinings of the iron-work. The doors and window-frames are to be fastened to the walls by any of the usual known methods. The main beams and cross beams of floors and roofs may be of cast-iron, or formed of iron and wood; or they may be formed of one or more pieces of plate-iron, bent up into an oval form, and straightened by an iron or wooden bar passing through them lengthwise, the upper edges of the metal being turned over to increase the strength. In the interval between the beams there are to be iron rods running in various directions, and supporting a metallic wire-work, which forms the foundation for the ceiling. Similar wire-work is to be employed in lieu of lathes for all plaster surface. All the iron-work is be all plaster surfaces. All the iron-work is be painted over with some suitable composition to prevent oxidation.

A plan for the same purpose has been proposed by Mr. Varden as follows :—"It appears probable that common fir or oak joists with their lower edges chamfered, and coated over with a mixture of alum, black lead, clay, and lime, or some similar composition, would (if closely floored above with earthenware tiles, bedded all round into the plastering, the joists being made air-tight) resist the action of flames, at least for a considerable time. Fire could not descend through such a flooring so as to communicate with the rooms below, till the tiles used in it had become red-hot; neither could it ascend until the tiled floor above gave away from the burning joists; which if coated, as proposed, would not take fire from below till the tiling over them acquired a sufficient heat to cause the distillation of the turpentine from the wood. In general, there is not furniture enough of a combustible nature in any room to do this. The battening against the outer walls might be of larch, as that wood burns less freely than most others; but if the walls were brick, or lined with brick, battening of any kind will be unnecessary. If this plan should be thought likely to answer the end proposed, houses built in the common manner might be altered at a moderate expense, by taking up the boarded floors, and substituting earthenware tiles."

Another plan, proposed by Mr. Frost, consists in forming the floors of rooms of hollow earthenware tubes embedded in cement, combined so as to form a sort of flag-stone, covering the whole floor. These hollow tubes are squares in section, about an inch and a half on the side externally, with a tubular space of an inch and quarter on the side internally; they are formed of brick earth, prepared in a superior manner, and pressed through moulds by machinery; and their length is about two feet. In forming a floor of these tubes, the centering, after being prepared and fixed in the usual manner, is first covered with a coating of cement of a quality sufficiently fine to form the ceiling of the apartment to be floored over; and if it is desired that there should be mouldings or ornaments in this ceiling or its cornices, moulds for them can be placed in the centering, so as to form a part of it. One or two coats of cement having then been laid over the centering, a stratum of the square tubes laid side by side, and breaking joint, is next embedded in fine cement, and the interstices between them also filled in with that material. One thin coating of cement is then laid over the whole stratum; and in a week, when this is dry, another stratum of tubes is laid over the first in a contrary direction, bedded and filled in with cement as before, and finished by a coating of the same material.

Mr. Loudon gives descriptions of two me-thods, the one for building houses in general fire-proof, and the other for imparting that property to houses already built. He considers the two main points for the consideration to be, to have staircases of iron or stone, or both combined, and to avoid having any hollow partitions or floors. A house having a stone or iron staircase, and having all the partitions either of four-inch brickwork, or of brick nogging, in whatever way it might be set on fire, could hardly be burned down, if ordinary exertions were made to extinguish the flames. One apartment might be est on fire, but before the flames could spread to the one under or over it, or to a staircase adjoining it, the fire might be extinguished. In a house so constructed there would be no piece of timber that was not in close contact with mortar, at least on one side ; and all the strong pieces of timber, such as joists, rafters, quartering in partitions, &c., would be closely imbedded in mortar on two sides. Where the partition could not be made entirely of brick, the interstices might be filled up with a mortar prepared of clay with a small proportion of lime. The same material might be filled in between the joists, and where it was desired to render the roof fire-roof, the rafters might be made of iron, or the space between wooden rafters might be filled in with thin mortar. This mode of proceeding would lengthen the time required for the drying of a newly-built house, and would also add somewhat to the expense; but it is conceived that the increased safety would more than counterbalance these inconveniences.

In respect to the means of giving a fire-proof quality to a house already built, Mr. Loudon remarks: — "All the interstices be-tween the floors, in the partitions, and in the roof, where there was a ceiling formed to the rafters, might perhaps be filled in with earthy matter in a state of powder. This powder might be clay or loam mixed with a small proportion of Roman cement; it might be injected into the vacuities, through small orifoces, by some description of forcing-pump or bellows, which, while it forced in the powder, would permit the escape of the air; and, while this operation was going forward steam might be injected at the same time so as to mix with the mortar and be condensed by it; by which means the whole mass would be solidified with a minimum of moisture. In short, in rendering houses fire-proof, the next important object to using fire-proof materials, is that of having all the walls and partitions, and even the steps of wooden staircases, filled in with such materials as will render them in effect solid. On examining into the causes of the rapidity of the spread of the flames in London houses when on fire, it would almost invariably be found, that whatever may have occasioned the fire to break out, the rapidity of its progress has been in proportion to the greater or less extent of the lath and plaster partitions, less extent of the lath and plaster partitions, the hollow wooden floors, and the wooden staircases. Were the occupiers of houses sufficiently aware of the danger from lath and plaster partitions, especially when inclosing staircases, they would never occupy such houses, or, if they did, they would not give such rents for them as they would for houses with brick powering partitions. It appears to with brick-nogging partitions. It appears to us to be the duty either of the general or local government or police to see that no houses are built without stone or iron staircases; and that no partitions and floors are made hollow; or, if they are, that the materials should be iron and tiles, or slates, or stones, or cement, or other earthy composition."-The Useful Arts Employed in the Construction of Dwelling Houses.

THE GREEK SCENE AT COVENT GARDEN THEATRE.

Amonest the Greeks and Romans, the theatres were regarded as important public buildings. Every citizen was entitled to admittance, and they were cousequently requized to be of large size. An arbour constructed of the branches of trees, or if in a town, a rude scaffolding, served in the early ages of Greece as a scene for dramatic representations; but these soon gave place to vast and magnificent structures in all the Grecian cities. As regards the decorations of them, there are no actual examples left; but from accounts which remain, and comparison with the theatres in Italy, it is believed that although the Greek and Roman theatres differed in some minor arrangements, they were similar in the general distribution of the parts, and were used in the same manner. The most perfect specimens remaining of the Roman theatre are those at Pompeii and Herculaneum.

Their form was semi-circular, and consisted of two parts, the cavea and the scena. The former was appropriated to the audience, and had seats rising one above the other, of such size and height, that the back of the seat of one row served as the foot-place for the row above. The seats were in three divisions, the lower being appropriated to the magistrates, the middle to the people, and the topmost to the women. The scena had two main divisions, the proscenium, or stage, which the actors occupied, and the orchestra, for the bacchanals and chorus. The stage was very shallow, as compared with that of our own theatres; the back wall of it formed the scene, and was nearly the only part of the Greek theatres which was erected, as they were generally excavated in a hill, and so formed at comparatively little expense.

The theatre was open at the top, but was at times protected by a velarium, or awning. This was sometimes of silk, but generally of woollen cloth. It is stated that Nero once covered | the scene were gardens and colonnades, some-

the Coliseum with a purple velarium sprinkled with gold stars to represent the heavens, and having the chariot of the sun embroidered upon it. The orchestra was semi-circular, and spread out from the stage to the first row of seats, and was in reality, therefore, in the position of our pit. In the centre of it was an altar inscribed to Bacchus, to whom theatres were dedicated, because the origin of dramatic entertainments was found in the solemn processions in honour of Bacchus and Ceres, which took place at the times of harvest and vintage.

Moveable scenes were not ordinarily introduced, but it is stated there was on each side of the stage a triangular frame for painted representations, which revolved on a centre, similar to some advertising carts which may be seen in our streets.

As a conventional mode of informing the audience the relative position and character of the actors in the piece, the latter were required to enter and leave the stage by particular entrances. The scene had a principal door in the centre, called the royal door, through which only the king, or chief actor, entered and retired; this was often situated in a semicircle, and was very richly decorated. On the right of this was a second door of less size and importance, for the next principal characters; and on the left a third door for the inferiors. Joining each end of the fixed scene was a lower wall, at right angles, in which on both sides was a door: that on the right leading to the city, for the citizens, &c., and that on the left, leading to the country, for messengers and strangers. The choruses entered the orchestra by doors at each side of it, on one side the strophe, on the other the antistrophe.

The scene was decorated with niches, containing statues, and, no doubt, as at Pompeii, so in Greece, it was painted in polychromy; as were the other chief buildings of antiquity, both Egyptian, Greek, and Roman. On the stage near the royal door was an altar to Apollo, and behind

times a temple, visible when the surtains of the doors were withdrawn. The access to the principal parts of the theatre was often from the back.

The theatre always faced the sea, if a sea was near, even though it might not be visible. The reason for this arrangement probably was that as a breeze generally prevails in the after part of the day from the sea, the voice of the actors was thus carried to the sudience.

We are led to make these few general remarks on the Greek stage by the production of a scene at Covent Garden Theatre for the representation of the "Antigone" of Sophocles, wherein the ancient arrangement is adhered to, as far as circumstances would allow, and which we recommend our readers to see. The manager very wisely consulted an architect for the design, and the result is a degree of completeness and architectural propriety not often found on the stage. As the pit could not be given up to the choruses and bacchanals, the front of the stage is set apart as the orchestra, and the action of the piece takes place on an elevated platform behind, from the level of which rises the fixed scene. The scene is represented by the engraving at the head of this article (made from the original drawing), and shews the principal and two secondary doors mentioned in the previous description. Cleon and his son use the centre door, Antigone and her sister the right-side door, and the sages and guards the left-side door. The side-walls, not shewn in the engraving, contain the fourth and fifth doors before alluded to, from one of which the dead body is carried in as from the country. The strophe enter at the right side of their orchestra, and the antistrophe the left; the altar of Bacchus is in the centre of it.

The scene is decorated with statues of Melpomene, the muse of tragedy, Olio, the muse of comedy, Apollo, bas-reliefs, &c. Tripeds are painted on the doorposts, figures in the panels, and the whole of the architecture is

polychrome. Tripods are burning on the top of the scene, and in the centre, terminating the whole, is a car of triumph. The orchestra and stage present the effect of a pavement of black and white marble with a fret border. It may be objected, and with justice, that the decorations are Pompeian rather than Greek, and that a simpler and severer character should have been attained; but it must be remembered that no examples of the Greek scene remain, and that in Pompeii, so far as related to painted decorations and sculpture, the Greek style and manner prevailed.

The scene was painted by Mr. John Macfarren, who is entitled to special praise for the care with which the parts are made out; this was the more important, as the scene is brought closer to the eye than usual. It is not the province of THE BUILDER under ordinary circumstances to allude to actors, but we cannot avoid pointing attention to the fine series of attitudes introduced by Miss Vandenhoff in the part of Antigone, which might be usefully studied by sculptors.

BARBER-SURGEONS' HALL.

BARBER-SURGEONS' HALL is situated on the west side, and near to the middle of Monkwell-street, in Cripplegate ward, London; the foundation of the building being partly laid upon the ancient City wall. At what time the original structure was erected does not appear ; but it was enlarged at different periods down to the time of Charles the First. The Theatre of Anatomy was built by Inigo Jones in the years 1636 and 1637. Walpole calls it "one of his best works." This theatre, through being a detached building, escaped conflagration, but all the other parts suffered in the great fire of 1666; and the theatre itself, which had an elliptical cupola, and was decorated with figures of the seven liberal sciences, -the signs of the Zodiac, cedar benches and doors, &c. was pulled dewn about the year 1783, the company having no use for it; and three houses, were soon afterwards erected upon its site. b. The present buildings were erected by subscription within a few years after the fire, and are of brick ; the entrance and dwelling of the clerk fronting the street and dwelling of the clerk fronting the street are separated from the other parts by a small pared court. The hall is a good room, but not large; the west end is semicircular, and remarkable from having formed the interior of one of the towers (or bulwarks as they are called in the minutes) that defended the city wall. Here are two full-length paintings of human figures, shewing the disposition of the muscles, &c.

The court room, which has a small elliptical cupola in the centre, built in 1752, is an apartment affording much interest, from the various pictures with which it is decorated. The principal of these is the celebrated piece by Holbein of *Henry the Eighth delivering the Charter of the Barber-Surgeons to the Court of Assistants and Company.* This picture, which is painted on panel, and in a very excellent state of preservation, measures ten feet two inches in length, and six feet in width. The bluff sovereign is represented in his royal robes, and crowned, seated in a chair of state, and holding in his left hand a sword erect, resting upon his knee; on each side are the principal members of the company, kneeling, with others behind standing; and the king is in the act of presenting the charter with his right hand to Thomas Vicary, the then master. The names of thirteen of the chief members are above their heads. All are in gowns trimmed with fur; the three on the right of the king represent the Doctors Chamber, Butts, and Alsop, all of whom, at the time of the giving of the charter, were past masters of the company. Dr. John Chamber was Henry's principal physician, and Dean of St. Stephen's College, Westminster, where he built the curious cloister, a part of which remained in the

speaker's house until destroyed by fire a few years since; he has on a close cap, and his hands are wrapped in the large sleeves of his gown. Dr. William Butts, who was also king's physician, is also in a cap, and has a gold chain over one shoulder; his conduct on the presumed degradation of Archbishop Cranmer has been finely portrayed by Shakspere in his play of Henry the Eighth. Vicary, who has a gold chain like Butts,

Vicary, who has a gold chain like Butts, was serjeant-surgeon to the sovereigns, Henry VIII., Edward VI., Queen Mary, and Queen Elizabeth, and is reputed to have been the author of the first work on Anatomy that was ever written in the English language. Sir John Ailife was also an eminent surgeon, and had been Sheriff of London in 1548: according to the inscription on his monument in the Church of St. Michael Bassishaw, he was " called to court," by Henry VIII., "who loved him dearly well," and was afterwards knighted for his services by Edward VI. This picture is not only finely coloured, but is also finished with such carefulness and minuteness of pencilling that even the

This picture is not only finely coloured, but is also finished with such carefulness and minuteness of pencilling, that even the subordinate parts, as the rings on the king's fingers, the ermine of his robes, &c., will bear a very close examination, and still appear true to nature. It is remarkable likewise from furnishing an example of a beginning of an alteration in costume in respect to shirts, the wrists of Henry being encircled by small *ruffles*, and the necks of several of the members displaying a raised collar. An engraving from it was made in 1736, at the expense of the company (who have the plate still in their possession), by B. Barrow, whose reduced drawing in red chalk is also preserved in this apartment. The painting itself was borrowed by James I. (whose grandmother, Margaret, was Henry VIII.'s sister), and his letter on the occasion is yet preserved by the com-

pany; it asserts that "the portrait of Henry was both like him and well done."

On the same side of the room with this picture, are two excellently painted wholelengths, said to represent "A Spanish Gentleman and a Lady, his sister," but unknown, and a mezzotint head of John Paterson, Esq., formerly clerk to this company, and Member of Parliament for Ludgershall, in Wiltshire. This gentleman was deputy for the Ward of Farringdon-within; he projected various useful plans for the improvement of the City, and was the principal means of the streets being paved with Scotch granite, &c. in the regular way, which universally prevailed until the recent introduction of wooden blocks. He presented the company with a very beautiful painting of a Duchess of Richmond, said to be by Sir Peter Lely, but more probably by Vandyke. The Duchess is represented sitting, with a lamb and olive branch : the drapery is very finely coloured.

with a lamb and olive branch : the drapery is very finely coloured. The principal other pictures in this room are Charles II. sitting; Mr. Lisle, barbersurgeon to that monarch; Sir John Frederick, who was sheriff in 1655; Sir Charles Bernard, surgeon to Queen Anne; Inigo Jones, a fine head, by Vandyke; Mr. Ephraim Skinner; Edward Arris, Esq., an alderman of London; and the celebrated Sir Charles Scarborough, chief physician to three sovereigns, Charles II., James II., and William III., and one of the first mathematicians of his time. The two last portraits are in the same piece, and were ordered to be "set up (that is, painted) in the void table" in February 1654. Dr. Scarborough was chosen anatomical reader in this hall on the 12th of October, 1649, and shortly afterwards he commenced the delivery of his highly-famed anatomical lectures, and continued them with great approbation for many years; he has the reputation of being the

ENTRANCE TO BARBER-SURGEONS' HALL,

first person who in discourses on the muscles demonstrated their uses and power by geome-trical and mechanical illustrations. He is represented "dressed in the red gown, hood, and cap of a doctor of physic in the act of lecturing, with one hand on his breast, the other a little stretched out. On the left is another figure, Mr. Alderman Arris, dressed in the livery gown, holding up the arm of a dead subject, which is placed upon a table and

partly covered with a sheet, the sternum, or that part of the breast where the ribs meet, being naked and laid bare, so that the pectoral muscles are seen." Under the picture is an inscription in Latin which was composed by Dr. Thomas Arris, M.P. for St. Albans in 1661, and son to Mr. Alderman Arris, the latter of whom bequeathed the sum of 510%. for founding the muscular lecture in the hall.

[The engraving on the other side repre-sents the entrance in Monkwell-street to the court-yard in which the Barber - Surgeons' Hall stands. The arms of the company are protected by a semi-circular canopy supported on carved consoles, which serves likewise to protect from the rain those who may be wait-ing for admittance. Under the arms is the date 1671, with the words De Præscientia Dei. The foliage on the lintel, represented at large by the annexed engraving, is well carved. A gateway of similar character may be seen at the entrance to New-inn, Wychstreet, Strand, but there the canopy is concave inside, and is ornamented simply with foliage, and a shield on the face of it.

Monkwell-street and its immediate neighbourhood present a very different appearance from the more frequented parts of the city, although immediately adjacent, and serve to

induce in the contemplative mind many recollections of old London. The name street itself records the well belonging to a the site." Nearly street itself records the well belonging to a hermitage originally on the site.⁶ Nearly opposite to the hall are twelve almshouses founded in 1578 by Sir Ambrose Nicholas, and rebuilt shortly after the great fire. And at the north end of the street are "Lamb's Chapel" and Almshouses, originally the Her-mitage of St. James-on-the-Wall, above re-ferred to. Then you see written, "Alderman-bury Postern Chapel," and in another direc-tion the "Barbican." On coming suddenly on St. Gilee's Church, Cripplegate, you remember that immortal John Milton lies buried there, and wander on full of plessant thoughts and and wander on full of pleasant thoughts and associations, till you come to Grub-street, and so have your ideas diverted into another course.—ED.]

* Malcolm's " Londinium Redivioum," vol. ii.

SCAGLIOLA, OR THE ART OF IMITATING and afterwards polished with plaster by fric-MARBLE.

THE art of manufacturing scagliols, or imitation-marble, was well known to the ancients; although chiefly confined to the pure white or marmoratum opus, and albarum opus, men-tioned by Pliny, and of which the statues, busts, basso-relievos, and other ornaments of architecture were composed. The cements of the Egyptians employed in costing the walls of the tombs, and forming the ground-work of their paintings, also partake of the character of marble. In modern times the art of imiof marble. tating marbles has been carried to a far higher state of perfection, particularly in Italy, and some parts of France and Germany; and the imitations of many of the precious marbles, such as sienna, brocatello, jasper, porphyry, verde antique, &c. exhibit an astonishing degree of beauty of perfection and finish. In England this art is comparatively unknown, having almost sunk into disuse in consequence of the perish-able nature of the material, its insecurity when employed as pillars baving to bear a heavy super-incumbentweight, its liability to damage, ready absorption of damp, and its expense, which, although trifling when compared which, although triffing when compared to marble, is still much higher than is warranted by the nature of the material.

It is evident that this truly beautiful art is open to great improvement, and experience tells us there is something wanting beyond that of mere skilful imitation and beauty of finish, for after all it is simply lath and plaster with an exterior coating, rather harder, it is true, than the rest, but still incapable of resisting the influence of moisture or the slightest ex ternal violence. By the present imperfect process the plaster of scagliola work is pro-duced by applying a pap of finely-ground calcined gypsum, mixed with a weak solution of Flanders glue upon any figure formed of laths nailed together, or occasionally upon brickwork, and bestudding its surface while soft with splinters of spar, marble, granite, bits of concrete, coloured gypsum, or veins of clay in a semi-fluid state. The substances employed to colour the spots and patches are the several ochres, boles, *terra di sienna*, chrome yellow, &c. The surface of the column is yellow, &c. The surface of the column is turned smooth with a lathe, polished with stones of different fineness, and finished with some plaster pap to give it lustre. Pilasters and other flat surfaces are smoothed by a car-Pilasters penter's plane with the chisel finely serrated, By the above process the scagliola manufac-

tarer, with a vast deal of labour employed in the final polishing, is enabled to turn out pillars and pilasters of great magnitude and beauty of polish; but the glue which is the cause of the gloss, is also a cause of its subse-quent dulness and decay when it becomes ex-posed to moisture and damp air. Again, by employing plaster of Paris alone the manufac turer is subject to great loss by waste of material, in consequence of its setting too rapidly, or of the coagulating property of the burnt alabaster being very much impaired or lost by the powder being kept too long, espe-cially if in the open air, before it is made use of, for when it has once been suffered to grow hard, it is no longer serviceable, nor can it be made so, by any known process of burning.

The first and most important step towards improving the art, so as to ensure durability, is by employing more substantial materials in the body or ground-work than are at present used. The second consideration is to substitute a cement of mixed qualities instead of pure plaster of Paris or burnt alabaster, so as to ensure the requisite strength and density of the material, and to enable the artist to finish off the polishing without the use of glue or any other substance which has the property to absorb, and thereby cause the rapid decay of the work; greater hardness is also essentially requisite to avoid moisture, the chipping, indentations, an scratches to which it is now so very liable. and

For pillars of magnitude, pedestals and pilasters, a core of rough brickwork might be used to great advantage instead of the present lath and plaster, the bricks being cemented together, and roughly covered in by one of the cheap durable coments commonly in use, or by a mixture of lime, oxide of iron, and manganese, similar to Parker's cement, which has the effect of setting rapidly even under water. Mortar made with about five parts of flint powder, one of shell-lime and the newell triturated together, will make an exceed-ingly fine and durable base on which to dispose the colours, and if properly used and follo up with an outer coating composed of fine shell-lime, flint powder, milk, and eggs, will assume the hardness and capability of polish of marble. The room in which these works are carried on should be kept at a warm temperature, and great care should be taken under all processes of scagliola work to exclude the atmospheric air as much as possible, also that the stucco should be free from saline impurities, contain some cohering body, and ha capable of acquiring hardness gradually until it become of stone-like quality.

The art of making plasters of mixed quali-ties, to be employed in modelling statues, busts, and other works of architecture, instead of using pure plaster of Paris, is unknown to us. The Romans paid great attention to these matters, and the ancient plastering pre-served to this time, where it has not met with violent blows or injuries from accidents, is still as firm and solid, as free from cracks or crevices, and as smooth and polished on the surface as if made of marble; the bottoms and sides of their aqueducts were made of plaster, which has endured many ages without decay. Again, the roofs of houses and the floors of rooms at Venice are covered with a sort of plaster, made at later date, and yet strong enough to endure the sun and weather for several ages without spoiling or crack-ing, and without much injury from the feet. But the greatest attention perhaps is paid to this subject by the natives of the East Indies, who, for their finer cements, which are capable of receiving a most exquisite polish, use ghee (butter in its oily state), oils, jaggery, and other to us expensive ingredients. At Madras fifteen bushels of pit sand well sifted are added to fifteen bushels of stone lime; this is slaked in the common man-ner, and so laid two or three days together. Twenty pounds of coarse sugar or molasses is dissolved in water, and the mortar is sprin-kled with the liquor, which is then beat up together and well incorporated, and afterwards let to lie in a heap. A peck of gram (similar in nature to our coarse gray pea) is then boiled to a jelly, and the liquor strained and preserved. A peck of mirabolans is also boiled, and the liquor set aside; the three waters are then added together. The mortar beaten up, and, when too dry, sprinkled with this liquor, proves remarkably good for laying bricks or stone, keeping some of the liquor always at hand for the workman to wet his bricks with. For very strong work, tow is incorporated with Of this the natives make many archimortar. tectural ornaments, such as columns, arched work and imagery, besides using it for common building purposes. For finer works, to every half bushel the white of five or six eggs and four ounces of *ghee*, or ordinary salted butter, and a pint of butter-milk beaten all well together; mix a little of the mortar with this, till the ghee, butter-milk, and white of eggs be soaked up; then soften the rest well with plain fresh water, and so mix all together, and let it be ground, a trowel-full at a time, on a stone with a stone roller. When you use it, in case it be too dry, moisten it with some water, or the before-mentioned liquors. This is for the second coat of plastering.

When the first coat of plastering is laid on, let it be well rubbed with a hardening trowel, or with a smooth brick, and strewed with a gritty sand, moistened, as occasion requires, with water, or the before-mentioned liquor, and then well hardened again; when half and then well hardened again; when half dry, take the last-mentioned composition for the fine plastering; and, when it is almost dry, lay on the whitening varnish; but, if the work should be quite dry, then the chunama liquor must be washed over with a brush.

The best sort of whitening varnish is made thus :---take one gallon of toddy (the juice of a tree), a pint of butter-milk, and as much fine shell-lime as shall be proper to colour it ; add to it some of the chunam liquor, wash the plaster-ing gently over with this, and when it is quite dried in, do the same again. A plaster thus made is more durable than some soft stone, and stands the weather better in India than any of the bricks they make there. Butter-milk is always added to the outer coating. There are several varieties of cements of durable quality, and capable of receiving a fine polish.

I have been thus particular in describing one of the Indian methods because the cement so of the Indian methods because the cement so made is vastly preferable in every respect to the plaster of Paris used in the process of scagliola work, and also for making large capitals to imitate marble, which, however beautifully executed, soon lose their polish, and are liable to be injured past the power

of repair. It may be thought that the materials are much too expensive, but the small quantities of each actually required for scagliola or plastering of walls and floors will raise it but little ove the common price of cements. The boles and earths laid on for the imitative abov

art of the work ought to be mixed with the like material, so that it may incorporate as one with the interior costs, the pillars being care-fully fashioned on the lathe, as is at present practiced, or polished dry, or with the use of the liquor. Clay ought to be used as sparingly as possible, the requisite plastic quality being given to the mass by the mixture. The commen segliola of the day, as exhibited in some of the leading shops of the metropolis, deceives nobody; it is what it purports to be, a vile imita-tion of Natere; but nevertheless there are some fine specimens to be found in Buckingham Palace, the Pantheon in Oxford-street, in Everington's, and other buildings of the metropolis. No attempt is, however, made in the present day to extend and improve the art of imitating the precious marbles, or to ensure durability, consequently it falls into disesteem, and is rarely used.

I have mentioned in a preceding article that the Palace of Munich is built of artificial marble, the material being boiled, and the colouring added when the boiling mix-ture has acquired consistence. This practical application of the art might be employed to great advantage with us, chimney-pieces and vest variety of ornaments being by this means formed at so cheap a rate, and of so fine a fabric, as to supersede marble. I trust that this beautiful branch of architectural art will bolder will be without some specimen of it adorning his mansion, as pillars, pedestals, slabs, vases, baths, or other ornament. A little determination and enterprise on the part of the scagliola manufacturers, and the importa-tion of a few first-rate Italian artists, would tion of a few hrst-rate stations soon bring it into favourable notice. H. G. M.

PROJECTED ACADEMY OF PAINTING.

THE lovers of the fine arts will hear with no small pleasure that an Academy of Painting is about to be established in Bristol, under the most favourable anspices. Its object would be to foster and call forth native talent and genius in the various branches of art, and to gratify the public by periodical exhi-bitions of paintings. A School of Design, and prizes to reward superior merit, form also parts of the plan. The want of such an in-stitution has long been felt in Bristol, particularly by the artists, but the sum of money calarly by the artists, but the sum of money required to give efficiency to the plan is so considerable, that no hopes were entertained of raising it. In fact, a spacious picture gallery, and apartments for artists to study and copy casts, designs, and pictures, form es-sential parts of the projected scheme. The peruniary difficulty, the most formidable of all, is, bowever, removed in a considerable degree by the munificence of a lady, whose name we shall ere long have the pleasure to announce as a contributor of no less a sum than 2,000*l*. (under certain conditions) to the Academy. This splendid example will, we feel no doubt, attract numerous contributions from the public of Bristol and its neighbour-hood in furtherance of the design. When we mention that P. W. S. Miles, Esq., M.P., John S. Harford, Esq., and Robert Bright, Esq., are actively promoting this truly interesting object, in conjunction with the artists of this city and neighbourhood, we are per-sonded that these names will be deemed a sure guarantee of success.—Bristol Journal.

YORK AND RIPON TRAINING SCHOOLS. The subscriptions and donations towards the erection of these buildings already amount to 2,500L; but much more is needed to carry the original design into execution. It is remarked by the *Hull Packet*, that nearly half the subrection of these buildings already amount to scribers are clergymen.

HAMBURG IMPROVEMENTS. We learn from the Frankfort Journal that Mr. Munday, the builder of Abchurch-lane, is at present constructing a sewer at the cost of 80,000*l*. through Hamburg, and employs on the work 500 Englishmen.

VENTILATION. (From a Correspondent.)

IF an architect were to build a house without windows, he would be thought a very odd sort of person, but he may shut out what is far sort of person, but he may shut out what is far more important than light—fresh air, and nei-ther he nor any one else will discover any thing unusual. We are so much in the habit of looking on a building as a shelter and an ornament merely, that we do not require it to be any thing else. As to any provision being made for a due supply of fresh air, that never enters into the mind of an architect at all, or enters into the mind of an architect at all, or if it do, he regards it as an art and mystery which has as little to do with construction as law with physic. If fresh air should happen to be insisted on, he must needs call a professor of the science of ventilation to his aid, and he, he dist of fire a former on both contribute to by dint of fire or force, or both, contrives to accomplish his purpose, as many a legislator can vouch, to his cost.

Now, however, that the importance of ven-Now, nowever, that the importance of ven-tilation is beginning to be understood, the best means of effecting it are being studied, and several ingenious and scientific persons are taxing their invention to repair the omissions of former architects; some by providing efficient vents for the foul air, others by giving free and safe admission for pure air.

The plans in common use for accomplishing the same object are, the revolving ventilator, the hopper, and the glass louvres.

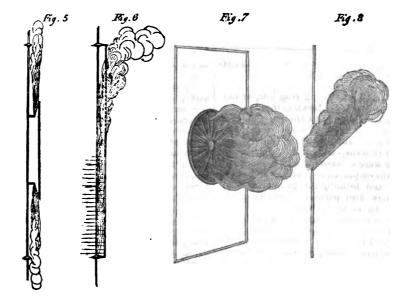

The first of these, the revolving ventilator, is open to every possible objection. It is noisy, dirty, ugly, and liable to get out of order; and it does not prevent a draught. When not in action it is useless, and when revolving it is a nuisance.

The hopper is somewhat better, but open to the serious objection, that it disfigures a build-ing by breaking the line of the window; and that, though it modifies a draught, it does not prevent it.

The glass louvres are elegant in appearance, and ingenious in arrangement, but very ex-pensive, and open to the same objection as the hopper, viz., that they only modify, but do not prevent draughts.

Indeed, it must be quite evident that no form of ventilation which causes the air to enter a of ventilation which causes the air to enter a room at an angle, however small, can prevent a draught; for the cold air, though its course may be altered, and it may be directed above the head, will descend again into the room before it has mixed with the warmer air of the apartment. There is but one way then in which a draught can be wrevented, and the is apartment. There is but one way then in which a draught can be prevented, and that is by a shield fixed, not obliquely, but parallel to the point of admission of the air. If, in addition to this shield, a perforated plate or plates be provided, by which the current of air is broken up into a number of small streams, we have the most complete invention for preventing a draught which it is possible to imagine imagine.

This is the principle of a mode recently in-vented by Dr. Guy. In place of the oblique shield, of the hopper, and louvre, he employs a shield, of the hopper, and louvre, he employs a parallel shield, by which means the air is distri-buted over the wall or window by which it gains admission, and all direct draught is effectually prevented. The aperture in the wall or window is filled by a perforated plate, which is flush with the surface of the wall or window itself, and the shield is connected with this plate through the medium of a second per-forated plate and flanges.

The first of the subjoined figures (marked fig. 5) represents a section of Dr. Guy's simplest and cheapest form of ventilation, with the course of the air traced by smoke. In this figure, the dotted line represents a plate of perforated zinc bearing upon it a narrow flange. The plate is let into the centre of a pane of glass; parallel with this perforated plate is a shield of glass, joined to a second flange, fitting within the first by means of a second perforated plate, inclined at an angle to the shield and flange. The air enters through the first-mentioned perforated plate, strikes on the glass shield, and is thrown back through the second perforated plate on to the glass, along the surface of which it runs to an extent proportioned to the force with which it enters the room.

Another form, which is open to the objection that the air is thrown into the apartment instead of being confined to the line of the wall or window, is shewn in fig. 6. The remaining figures shew the course of the air as it issues through the revolving ventilator and the common hopper. It is said that Dr. Guy's invention, besides

possessing the great advantage of preventing a draught, may be made to assume a great variety of ornamental forms, so as to adapt it to any style of architecture. The parallel position of the shields evidently gives it an advantage, in this respect, over all other forms of ventilator. When the apertures in the zinc are large (as they must be in large towns, or they will soon

become so clogged with dust and soot as not to allow any air to pass), and the shield is of glass, the ventilator obstructs very little light, and if kept clean, is open to no reasonable ob-jection. Messrs. Cottam and Hallen, in whose hands Dr. Guy has placed his patent, have suc-ceeded in introducing the ventilator securely into a pane of glass without using cross bars, so that the pane and the ventilator seem one

If on trial Dr. Guy's invention shall be found effectually to prevent a draught, we shall con-gratulate him and the public on the fulfilment of a great desideratum. The prevention of a draught lies at the root of all improvement in this respect; without it, the most elegant and costly inventions are mere waste of time

and money. [We shall take an opportunity to examine this invention.—ED.]

PROPOSED METHOD OF CLEANING STATUES EXPOSED TO THE AIR.-It has long been remarked that the stone staircase of the bronze marked that the stone staircase of the bronze obelisk to the memory of the Bavarians who fell in the campaign of Russia, was perfectly clear from green mould in the parts washed by the rain. M. Jobard, of Brussels, is of opinion that the oxide of the copper carried down with the rain destroys this vegetation; and recommends that a solution of copper should be tried in the cleaning of statues covered with vegetable matter.

$\mathbf{22}$

THE BUILDER.

ORIGIN OF THE APPELLATIONS DORIC, IONIC, AND CORINTHIAN, AB APPLIED TO THE OBJERS OF ABCRITECTURE.

RESEARCHES into the early history of nations, the rise and development of their lancharm for the inquirer, though little but con-jecture can result. Out of the mass of mythi and traditions handed down from the times when the Pelasgi ruled, or from those in which the first symptoms of Hellenic civilization appeared, how hard must it be from the false to select the true, to divest the tangible body of its beautiful but deceptive garb. Yet I venture to offer a few conjectures, arising out of certain well-authenticated features in the early age of Grecian history. During that period the Hellenes were divided into four great tribes, two of which subsequently merged into the others; and the country may from that time be considered as inhabited by the widely differing races of the Dorians and the Ionians. In examining the characteristics of the latter, we behold a yearning after intellectual cul-ture, a keen perception of the beautiful, and a desire to excel in the arts, which gave birth to the philosophic legislature of Solon, the breathing sculpture of Phidias, the impassioned poetry of Sophocles, and the command-ing eloquence of Demosthenes. Wheresoever the Ionian influence was shed, arose a people peculiarly alive to the refinements of life, peculiarly alive to the refinements of life, sowing seeds destined to expand and refructify till the globe itself should become extinct. Athens, "the violet queen," from her isolated position in the continent of Greece, retained in a peculiar manner the distinctive impress of an Ionian origin. Angelica Kaufmann somewhat fancifully ascribed her enthusiasm to the water of Rome: but it would appear as to the water of Rome; but it would appear as though the "earthborn" Athenians were gifted with a love of beauty, and a thirst for fame, by the consecrated soil from which they sprung, and by the szure sky on which they gazed. Historic recollections of their own city, for whose sovereighty deities contested, and where the genius of liberty was invoked by Solon, and defended by Harmodius and Miltiades, tended to enlarge and heighten the influence of their birth.

Opposed to the revivifying picture we contemplate in Athens, we are struck by the rapulsive character of the Dorian Spartans, whose name only remains to after-times. Fit subjects for the cold and mechanical legislature of Lycargus, they were ever desirous by crafti-ness and obstinacy to gain the supreme rule over the Grecian states. Selfish in their policy, over the Greecian states. Seins in their policy, they shared not in the glorious victory of Marathon, which even to themselves was a second birth, and by their apathy to the cause of Greece, they had nearly brought about the enslaving of the whole country. Their severity of memory was increased by Lyconrue, but was of manner was increased by Lycurgus, but was from the first a feature of the Dorian race.

The peculiar characteristics of the two nations being thus contrasted, may we not argue that the names "Doric" and "Ionic," as applied to each order of architecture, severally arose, not so much from its having originated in any particular country, as from its typifying those distinctive features?

It is scarcely requisite to contend against the exploded story of Vitruvius (lib. iv., c. i.), since the period to which he assigns the introduction of the orders is long antecedent to the time of Homer, who, so remarkable for the care he takes in describing minute points in the history of his own time, would hardly have omitted mention of the names. Columns, in-deed, he speaks of, but without leading us to suppose that they were any thing but posts; and we know from Pausanias and others, that and we know from Pausanias and others, that the earliest temples were constructed of the rudest materials. (Pausan. lib. x., c. v.) The opinion of Goguet (Origine des Lois, &c.), that the orders arose in the colonies of Asia Minor, may have foundation, without militating against the opinion expressed as to the origin of their names. But, if the Doric order was invented by the Dorings to which construct invented by the Dorians, to which country, bearing the name Doris, must it be ascribed? Names are not good marks for ascertaining the origin of things; in proof of which we need but cite the appellation Gothic. If the Ionian colonies preferred the Ionic order, we should hardly assume that circumstance as a proof that it was by them invented : we might with as much propriety ascribe the invention

of the Corinthian to the Romans. (Gwilt.) The fact is, there is no conclusive evidence for stating the origin of either order; but, it appears, that, whichever was invented first, that one received no distinct name, further than the name "Grecian order," until the invention of the second, when the names would be applied for the reasons stated. Holding these opinions as to the Doric and Ionic orders, I feel even more confidence in stating them as regards the Corinthian. The story of Vitru-vius can but be considered as a beautiful fable; for there are Egyptian capitals, bearing so striking a resemblance to those of the Tower of the Winds, which last were, probably, copied from the earliest examples, that we feel tified in looking to Egypt as the country from which the first idea of the order was brought to Greece. Heeren (Manual of Ancient History) says, that "what the Greeks borrowed tory) says, that "what the Greeks borrowed from foreigners, they previously stamped with their own peculiar character, so that it became as it were, the original property of the nation." Thus was it with the Corinthian; under their improving hand the decorations of its capital were varied and nationalized; and, in place of encircling its bell with plants nourished by the encircling its bell with plants nourished by the the waters of the sacred Nile, they substi-tuted leaves of the olive, sacred to the tute-lary deity of Athens. It became the richest of the orders, and, the city of Corinth being famed for richness and luxury, the order was denominated "Corinthian," a name probably applied to any thing of supressing luxury. applied to any thing of surpassing luxuriance, in the same manner that the term "Cyclopian" was given to works of great size or laborious execution, though, perhaps, not erected by the Cyclops. We need but mention the words "stentorian" and "herculean" as having had similar origin. EDWARD HALL.

SOCIETY OF ARTS.

JANUARY 8th .- Dr. Roget, Sec., R.S.V.P., in the chair.

The first illustration for the evening was "On the Arts and Manufactures of Mexico and Yucatan," by the Rev. James Thompson.

The second subject for illustration . was "Pilbrow's Atmospheric Railway, without a valve," a large working model of which was placed before the meeting, including a carisge, which was moved on the railway at considerable velocity by exhausting the tube by means of an air-pump. The object aimed at by the inventor is to

get rid of the slot or chase in the cylindrical main pipe or tube, and also the valve, with its appurtenances. If, in practice, this desidera-tum can be attained as efficiently as it is ac-complished on a small scale, an important advance will be made in railway locomotion.

The pipe or tube, instead of being fixed above the level of the rails, as in the case of Pinkus's and Samuda's plans, is sunk consi-derably below it, whereby facilities are afforded of effecting a junction between two or more railways, as also of allowing (when necessary) roads and railways to be crossed on a level. At intervals of about 30 feet are fixed two boxes cast on to the tube, one on each side, in each of which works a vertical spindle or axis, to which are fixed two small cog-wheels or pinions, the one being inside the box, and the other outside. A diaphram or piston works within the main ipe or tube, as in the ordinary atmospheric railway tube, to which, however, is attached a double rack, so that when the piston is moved forward by the exhaustion of the tube in front of the piston, the rack is moved with it, and which, working on two or more sets of the lower or under pinions, causes the upper or outside pinions to revolve at the same time and with the same which we have been as the same time and with the same velocity. A second rack, of the same length as that within the tube, is attached to the first carriage of a train, and as the upper pinions revolve, the rack, and conse-quently the carriage to which it is attached, moves with it. Thus the valve ordinarily used is entirely dispensed with.

THE LONDON BATHS AND WASH-HOUSES. The Committee have so far advanced their plans as to be ready to treat for the purchase of eligible sites for the erection of model esta-blishments. The space required is equal to 100 feet square at the least. The situation, in or very near to a crowded and poor neigh-bourhood, but with good access. Freeholds will be preferred.

Aew Books.

A series of ill Ecclesiantical Architecture. trations of the rise and progress of deco-rated window-tracery. Edited by E. SHABPE, M.A., Architect. Van Voorst, London, M.A., Architect. 1845. No. 1.

THE object of this work, according to the prospectus, is to supply the want of some publication expressly devoted to the illustration of the origin of tracery, its gradnal development, and the perfection which it attained in the middle of the 14th century. Our parish churches contain examples which for purity. churches contain examples which for purity and elegance of design are unsurpassed, and it is proposed to present in this publication a continuous series, exhibiting the gradual alteration which took place from the early geo-metrical form to the elaborate window-besds of rich flowing tracery. The present Number contains eight examples, and is nicely got up. The work would be more valuable if sections accompanied the elevations.

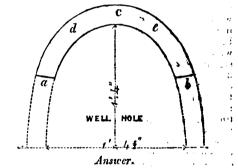

Correspondence.

HAND-RAILS.

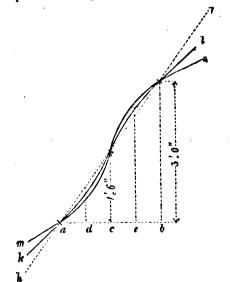

TO THE EDITOR OF THE BUILDER.

SIR. -By inserting the following question,

SiR,—By inseiting the following question, you will oblige me and instruct many :— What is the least thickness, and how much stuff will be used, in getting out a hand-rail $2\frac{1}{2} \times 2$ in., as the drawing, without a joint, the rise on the falling mould from a to b being 3 ft.? J. W. W., Jun.

If the mean inclination of the rail from a to point 3 feet in height above b be uniform, as shewn by the dotted line h i, in the disgram : below, the thickness of plank required for the formation of the wreathed rail (moulded in the ordinary manner) will be $4\frac{1}{2}$ inches; or, if the mean inclination be an undulating curved line, as shewn by the line kl, the thickness of plank required will be 31 inches.

Again, if the mean inclination be such as thickness of the plank required should not be less than $2\frac{1}{2}$ inches, so as to allow for the proper finishing which ought to be given to the work. G. R.

SHIP-BUILDING.

Digitized by Google

SIR,—From the name of your paper, I presume you enter into the controversy of ship-building, for nothing can be worse than those that have lately been built for the service of Government.

I have all along asserted we shall never improve the speed of our ships without we alter their form, which is decidedly against going a bead. If they would study to make the sails on the fore-mast to keep the ship to the wind, we should not want all that after-sail fur that parpese, which impedes going through the water. Our study should be that the prome divide the water, and as it comes aft, should form that resistance at the water-line

only, and not as it is at present. We are going to commission a number of ships, to try their good qualities, but as for sailing, they will never go faster than they have invariably dome, from the mal-formation have invariably dome, from the mai-formation adhered to. A sensible plan has been sug-gested, that would increase speed without interfering with masts, yards, or sails, but they in their wisdom will not give it a trial, because it will bring into notice a power that will supersede spending so much of the public money, and being a novel idea, it is not attended to.—I am, Sir, your obedient servant, NAUTIOUS. NAUTIOUS.

London, Dec. 31, 1844.

ESTIMATE FOR WORKS NOT TO BE EXECUTED. SIR,-The exposure of injustice is a laudble undertaking, but he who attempts to make the exposure should assure himself that his accusation is correct, otherwise he may be incusation is correct, otherwise ne may be in-flicting a real injustice upon the party accused, while he is endeavouring to expose a fancied injustice, which, nevertheless, has not been committed. This, Sir, is often exemplified among those numerous (?) mis-statements which so much depreciate the value of your useful so much depreciate the value of your useful paper, and, at page 11 of your last num-ber, there is one from a builder at Dartford, who, shielding himself behind an anonymous signature, asserts a series of falsehoods. He does not venture to name the parties accused, one of whom is my client, residing near Dartford, and the other is my client, resuling near Dart-ford, and the other is myself. The accusation is, that we have, by a particular method, "vic-timized the builders," and have put them to the expense of making estimates for work not intended to be excended. He states that, "as the sanctity of my office could not be invaded. copies of the drawings and specification were to be furnished, upon each competitor paying down five guineas, and a copy of the quantities for four guineas more.²⁴ The fact, however, is, that no copies nor any quantities were fur-nished by me, nor did 1 receive one shilling from either of the builders, but each competioffice for that purpose, and who were sens to my office for that purpose, and who, I assure you, invaded its sanctity much more than was agreeable. Your correspondent makes out, that I manimum for the sense out, that I received forty-seven guineas from the builders, whereas I received nothing. He fur-ther states, that the estimates of the builders exceeded mine, but that was impossible, as no estimate was made by me. The lowest tender was Mr. Kirk's, and was not above what I expected the house would cost, but, to my surprise and disappointment, my client stated, after the tenders had been opened, that it was not prudent for him to spend so much, and, after a few days' consideration, he determined not to build, but to pay Mr. Kirk and myself for the labour and expense which had been incurred, and he thus most honourably sacrificed a certain sum of money rather than run the risk of spending too much. I would now ask your correspondent to point out the injustice, if he can; and would suggest that, on a future occasion, he should sign his statements with his own name, or that he should previously ob-tain correct information, which, in this case, might have been easily had from the success. might have been easily had from the success-ful competitor, Mr. Kirk.-I am, Sir, your most obedient servant,

EDWIN NASH, Architect.

53, Moorgate-street, London. 7th January, 1845. [We readily give place to Mr. Nash's letter. The statement to which it refers did not men-tion the names of the parties, and was admitted into our pages as applying to a *class* of cases. Mr. N. will observe, by our note attached to it, that we had no confidence in its accuracy

ABCHITECT'S COMMISSION.

SIR.-Will you be kind enough to inform an old subscriber what are the usual professional charges of an architect. As for "general" drawings," "working ditto," and "specifica-tion," "superintendence," &c., I am aware that the charge, including every thing, is usu-ally 5 per cent. on the outlay, but I wish to know how that is generally divided under the heads given above. Honge you will oblige heads given above. Hoping you will oblige me, I am, Sir, am, Sir, Yours respectfully, H. G.

[There is no general rule for such a division. The charge for designing and superintending works is 5 per cent; but it does not follow that if the various matters included in that charge are done for different persons, or at charge are done for different persons, or at different times, that the separate charges should amount only to 5 per cent. 21 per cent is an ordinary charge for plans and specifications when the building is not executed. 5 per cent. for designing and superintending does not pay for the time occupied and the responsibility incurred when the amount expended is small, and many architects charge more than this commission when the amount is under $\pounds 500$. An auctioneer is much better paid: he walks through a house full of furniture, jots down what he thinks the value of each item, and charges 5 per cent. on the gross amount.-ED.]

BRIDGE OVER THE LEA AT HACKNEY.

SIR,—I beg to inclose a notice, just issued, for tenders for building a bridge across the Lea. I should think that the persons about to tender for the same will take care to ascertain that the parties have made up their minds to have the bridge built, or, as in the last case, they may have the pleasure of making out the specifications for the trouble. At all events, they will not have among their victims Your obedient servant,

A BUILDER.

"To Bridge Builders, Carpenters, and Others. -Notice is hereby given, that the Board of Surveyors of the Highways of the parish of Hackney have ordered to be built a new wooden foot bridge, over the River Lea, near Temple foot-bridge, over the River Lea, near Temple Mills, in the Hackney Marshes. A plan of which, and specification of the works to be done, may be seen at the committee room in the parish house, in Church-street, Hackney any day (Sunday excepted) from January the 6th to January the 16th, between the hours of nine and three; and any further information may he hed on employetion to Mr. Samuel For may be had on application to Mr. Samuel Fox, jun., of Morning-lane, Hackney, surveyor. Sealed tenders, endorsed "Tender for Bridge," to be sent into the clerk before Thursday the 16th inst., on which day, at seven o'clock in the evening, the board will meet, at the place aforesaid, to open such tenders, and to con-tract. The board do not bind themselves to accept the lowest tender. The persons who Tender must attend the board personally, to

"By order of the board, "By order of the board, "CHAS. HORTON PULLEY, Clerk. "28, Great Winchester-street, and Upper Hommerton. January 1st, 1845."

Ødituary.

MR. ALFRED BARTHOLOMEW, F.S.A., the late Editor of this Journal, expired, after a severe illness, on the 2nd instant, at his resi-dence in Gray's-Inn. We cannot now do more than express our sincere regret, but shall en-deavour next week to furnish our readers with some particulars of his life and works.

MR. THOMAS WEBSTER, Professor of Geology in the London University, who died on the 26th of last month, was educated as an architect, and built the theatre and laboratory of the Royal Institution; but ultimately aban-doned the profession for philosophical pursuits.

THE NEW FRENCH PROTESTANT CHUBCH. -Last Thursday week the ceremony of laying the first stone of this church, situate in Bloomsthe first stone of this church, situate in biooms-bury-street, late Charlotte-street, was per-formed by the Bishop of London. It is to be built in the Elizabethan style, the front facing Bloomsbury-street. The dimensions are rather confined, being 68 feet 6 inches by 38 feet 7 inches, affording room for about five hundred persons. A gallery is to be erected in the west end. The architect is Mr. Amb. Poynter.

Miscellanea.

GIBBONS' WOOD CARVINGS AT CHATS-WORTH.—A visitor, on viewing the suite of rooms of that magnificent mansion, Chatsworth, cannot fail in remarking the excellency of the cannot tail in remarking the excellency of the carvings in wood, which adorn, in many in-stances, the interior of this truly termed "Pa-lace of the Peak." They consist in represen-tations of dead game, fish, flowers, shells, and trophies, variously composed and distributed, being the efforts of that celebrated artist, G. Gibbone particularly in the chernel Viet Gibbons, particularly in the chapel. In the great antechamber are several dead fowl over the chimney, finely executed, and over a closet-door a pen, not distinguishable from a real fea-ther: the latter is considered his chef. d'œuvre, When Gibbons had finished his marks in the When Gibbons had finished his works in that palace, he presented the Duke of Devonshire with a point cravat, a woodcock, carved in wood, and likewise a model with his own head, all preserved in a glass case in the gal-lery. Horace Walpole says, that "There is no instance of a man before Gibbons who gave to wood the loose and airy lightness of flowers, and chained together the various productions of the elements, with a free disorder na-tural to each species." In the "Family Library" we also find the claims of that artist strongly enforced. All the wood carvings in England fade away before that of Gibbons, at Chats-Tade away before that of Gibbons, at Chats-worth ;--the birds seem to live, the foliage to shoot, the flowers to expand, before your eye. The most marvellous work of all is a net of game. You imagine, at the first glance, that the gamekeeper has hung up his day's sport on the wall, and that some of the birds are still in the death futtore. Gibbon: the wall, and that some of the birds are still in the death flutters. Gibbons' works chiefly are the carvings in St. Paul's choir, the wooden throne at Canterbury, the embellishments at Chatsworth, Petworth, Burleigh, Houghton, Southwick, in Hampshire, where the whole gallery is embroidered in pannels, by Gibbons' own hand, and the altar-piece of 'Trinity Col_r lege, Oxford. This artist was appointed master carver in wood to George the First, with a , salary of eighteenpence a day, which splendid allowance he enjoyed from 1714 to 1721, on the 3rd of August in which year he died,-Doncaster Gazette.

PROPOSED NEW CHURCH AT FREEIBY A meeting of ratepayers was lately held in the parish church of Ferriby, to consider the propriety of building another church. We usder-stand that Joseph Robinson Pease, Eeq., of Hessle Wood, who was present at the meeting, greatly to his bonour, generously stated, that his tenants should not be called on to pay one farthing towards it, as he himself would pay their portion.—Hull Packet.

MR. COCKERELL'S LECTURES .-- Mr. Cock erell commenced his course on architecture at the Royal Academy, on Thursday night. In the next and following Numbers we shall fur-

nish our readers with a report of them HORNSEY DISTBICT.— The death of Mr. Bartholomew has left this district vacant. Seven candidates have already declared them-Selves, namely, Mr. James Harrison, Mr. S. S. Teulon, Mr. Moon, Mr. Thomas Bird, Mr. Witherden Young, Mr. Herbert Williams, and Mr. John Dent. Some of these gentlemen have not yet passed the examiners, and will not be able to do so in time for this election, as will be seen, on comparing the two following notices :-

A notice has been issued by the Middle-sex magistrates, signed "C. H. Ellis, Clerk of the Peace," to the effect, that the court will proceed, on Thursday, the 30th instant, to the election of a surveyor for the district of Hornsey. All candidates must, on or before Friday, the 17th instant, forward to the clerk of the peace a statement, in writing, of his name, residence, age, and qualification, and must also personally appear before the Committee for General Purposes, at 12 precisely, on Saturday, the 18th instant, at the Sessions House, Clerkenwell.

A notice has been issued by the Registrar of Metropolitan Buildings, "that the exa-miners will hold their next examination of per sons desirous to obtain a certificate of qualification for the office of district surveyor, on Friday, the 24th instant. Persons desirous to be examined must apply on or before the 23rd instant, and their applications must be accompa-nied by a preliminary statement, according to the course of examination prescribed in the rules for that purpose."

INCRUSTATION IN BOILERS .-The incrustation formed by deposits from the water in steam-boilers is the cause of considerable inconvenience and loss. In some cases it is necessary to clear it away every three or four weeks, for which purpose the works must be stopped, unless there is a second boiler. In the operation too, the boiler is necessarily in-jured, and at all times it causes great waste of caloric. Any invention to prevent this is im-portant. Letters patent have recently been granted to Mr. Francis Watteeu, for a material by which this desideratum is said to be at-tained. It is inexpensive and innocuous; is applicable to all sorts of boilers, and acts by preventing crystallization and attraction.

RESTORATION AND RE-OPENING OF SKERNE CHURCH.-Skerne Church was reopened on the 22nd of December. This edifice has undergone a complete restoration; the roof is entirely new and a Gothic design; the root is entirely new and a Gothic design; the pews are designed to resemble open seats and stall ends; they are of a simple character, aud are also new; the pulpit, reading desk, altar rails, and table are exceedingly chaste speci-mens of ancient architecture. The stone-work of the windows & has been also work of the windows, &c., has been also restored to its original design, by Messrs. Simpson and Malone, of Hull. The church is heated by an ingenious hot-water apparatus, fixed by Atkinson, of Driffield. The roof and all other wood-work has been stained and all other wood-work has been stained and varnished in imitation of old oak; the Com-mandments, Creed, and Lord's Prayer are upon four tablets of slate, in the ancient illuminated style; and these, in addition to the national arms, which have also been em-blazoned, have all been executed by Messrs. Binks and Son, Hull. The whole of the marks compacted with the above restoration Diazoneo, nave an been executed by Messre. Binks and Son, Hull. The whole of the works connected with the above restoration have been executed under the judicious ma-nagement of Mr. C. Appleton of Anlaby, upon whom it reflects the highest possible credit as a builder. The whole of the restoration has been at the expense of Charles Arwright, Esq., of Dunstall, Burton-upon-Trent.—Hull Packet.

THE NEW BUILDING ACT.—On Thursday the district surveyor for the Strand district, accompanied by assistants, viewed the houses in the parishes of St. Mary-le-Strand, &c., in which persons resided in cellars or under-ground kitchens, in order to see whether they were fit for habitation. In New Church-court and other places the cellars were very confined, and in some places the landlords were called upon to give notice, under the New Building Act, for the occupiers to quit within a fortnight. In other cases, where the kitchens were dry and of sufficient size, the only other requisite being light and air, notice was given to the owners to increase the size of the windows, and to extend the gratings over the area in front.— Young England.

BATHS FOR THE WORKING CLASSES .--We are gratified to learn that the traders of this city continue steadily to subscribe to the erection fund of this institution, and are determined to do their utmost to carry out the scheme. As an instance of the spirit with which they subscribe, may be adduced that of the workmen at the Holyrood Glass-works, South Back of Canongate, who paid to the sub-treasurer the other day the sum of 20/. sterling, as their subscription. When the number of men employed at these works is taken into consideration, the average subscription of each will appear very large, and evinces how much self-denial the workmen are capable of to carry out a plan upon which they now set their hearts. —Edinburgh Witness.

IMPROVEMENTS AT WHITEHALL.—We are informed that Mr. Barry has been directed to examine the buildings now occupied by the Board of Trade, with a view to provide ad-ditional accommodation for the different deditional accommodation for the different de-partments now under the control of that board. Mr. Barry has determined upon a plan which will afford the required accommodation, and greatly improve the present appearance of the buildings, by raising the elevation, and thus afford an effectual screen to the ugly roofs and bimmary nots which are now widther bows the chimney-pots which are now visible above the present parapet. It is also in contemplation to pull down the old building at present occu-pied by the department of the Home Secretary of State, which has long disfigured that portion of Whitehall, and to erect a more sightly structure in conformity with the new front of the Board of Trade.—Observer.

HIGHGATE TUNNEL .--- It will probably be

in the recollection of many persons living, that

early in the present century, an attempt was made to construct a tunnel through the London

clay at Highgate Hill, for the purpose of making a more easy communication between Holloway and Finchley. The attempt, how-ever, failed, and the result was the construction

ever, failed, and the result was the construction of the open cutting which forms the present Highgate Archway-road. The failure appears to have arisen, in a great measure, from the want of experience on the part of the engineers who had charge of the work, more especially

as they had such very difficult and heavy ground to work in as the London clay. Those

ground to work in as the London cray. Those who have witnessed the trouble and difficulties that have been recently experienced in work-ing in that treacherous soil will be less sur-prised at a failure in such a work thirty years ago. In the year 1811, while the works this better programming the committee

at Highgate were progressing, the committee of management thought it necessary to obtain the opinion of the late John Rennie, Esq., as

the opinion of the late John Remne, Edd, as to the correctness of their mode of proceeding, as difficulties began to appear. The report of that truly eminent engineer threw some light on the probable cause of the failure of the work, and at the same time led to the erroneous

opinion that too generally prevails, namely,

that Mr. Rennie was the engineer to the said

The

-Practical Tun-

work; whereas the fact was otherwise. The author believes that Mr. Nash, the architect,

was the principal, and a Mr. Vazie the resident

engineer. It may, at the present day, be a matter of surprise that an architect should undertake the construction of a tunnel; but so late as August 17th, 1812, there appeared in the Star, a London newspaper, an advertise-ment from the Regent's Canal Company, addressed to "architects and engineers," offer-

ing a premium of fifty guineas for the best design for a tunnel that was to be made (and afterwards was made) under the town of Is-

lington; in which advertisement it was stated, that the company were "anxious to have the

best information which science and practice

. We direct our readers' attention to an effort now making to obtain a fund for the widow of the late George Maddox, an able man, to whom many members of the profession are indebted. LABOURERS' COTTAGES.—In the course of

an inquiry before the coroner for Oxfordshire, touching the death of a poor girl at Hampton Poyle, a village within six miles of Oxford, it came out that the cottage of the family contained only one sleeping room, and that of the most miserable description, being near the thatched roof, and being barely high enough to stand upright in the middle. There were three beds in this room, and eight persons (comprising the father, mother, a grown-up daughter and son, and four young children) occupying it as a dormitory. This is not at all an isolated case in the neighbourhood of Oxford, where, with the exception of a few villages, the labourers' cottages are wretched in the extreme.

THE COLLINGWOOD MONUMENT. edifice has risen to the height of 18 feet above the ground. It stands at the entrance of the Tyne, a little to the west of the Spanish Battery, and will form a conspicuous landmark for seamen, easily distinguishable from all others. In consideration of this circumstance, a subscription of 100 guineas has been made by the Trinity House of London. The height of the erection, including Mr. Lough's statue (21 feet high), will be 80, 90, or 100 feet, just as the countrymen of Collingwood, and more espe-cially his townsmen, may decide.-Durham Advertiser.

SATURDAY, JANUARY 18, 1845.

HE society for obtaining baths and wash-houses for the labouring classes advertised, some time ago, for plans and estimates for erecting and fitting up the

first establishment in London. Nearly a hundred architects, it is said, applied for the particulars; and the designs were sent in on Saturday last. It is unnecessary to say we shall look anxiously for the decision of the committee. We beseech them to reflect on the time and thought which have been expended on the production of these designs, and to decide fairly and honestly, with especial reference to the instructions that were given to the competitors. These instructions must be constantly before the committee during their examination. The plans in which they are complied with in the most perfect and satisfactory manner, should unquestionably be selected. We are so accustomed to find competitions managed badly and decided unjustly, that we can hardly bring ourselves to anticipate a better result in the present case. Feeling very strongly, however, on the subject, we call carnestly on each member of the committee to act as if the whole responsibility rested on himself. If they will do this-if they will decide as individuals open to question. and not with the feeling that they merge in the bedy, there will be little reason to cavil at their decision. As an incentive to such a course, they may be reminded that many eyes are upon them; and that by exciting an ill feeling against themselves in this respect, they would greatly injure the important object they have in view. Our readers may rest assured that we shall return to this subject when the plans are fairly before the public.

In the meantime we would make a few observations on the general question of baths and wash-houses, and urge the public to provide funds suitable to the greatness of the occasion.

The committee are anxious to carry out the plan on an extensive scale. They wish to begin with four model establishments in populous districts-three on the Middlesex side, and one on the Surrey side of the river, and they have advertised their desire to purchase land for sites. As yet, however, they have not received sufficient money to do all that is required, and we would gladly aid in obtaining it for them.

Assertions have been made that our poorer brethren will not avail themselves of the contemplated advantages when they are offered to them; that they prefer dirt to cleanliness; and various others equally unjust and libellous. The baths and wash-houses at Liverpool will of themselves afford sufficient answer to such statements. We can from them set facts against conjectures, and render unnecessary all querulous suppositions of what may take place by shewing positively what has occurred. We have recently visited the Liverpool establishment (in Frederick-street), in order to judge for ourselves, and were thoroughly satisfied with the result. It was there a mere experiment, and the establishment is very small. They have eighteen baths in three THE BUILDER.

classes, for which the charge is respectively 1s., including the use of two towels, 6d. and 3d. with use of one towel. For cold baths the charge is 6d., 3d., and 2d., formerly 1d. In the first year 11,661 baths were taken, and in the second, 16,323; the majority being warm. The keeper informed us, that the average number of bathers in summer was from 100 to 150 each day. In winter the number is small. There is a vapour bath .- for which, with the use of three towels, is, is charged, but no plonging bath. The revenue last year, including the wash-houses, equalled the expenditure within 1L, and this year will probably exceed it ! In consequence of which and of the advantages found to result, Mr. Franklin, the town surveyor, has prepared plans for a second and more extensive establishment (including two plunging baths), which will be carried out immediately.*

The baths are open till 9 o'clock every evening in the week but Sunday; and on Saturday till an hour later. They are also open on Sunday morning from 6 till 8 o'clock in the summer, and from 7 till 9 in the winter. In these two hours on a fine morning, 50 or 60 persons usually avail themselves of the baths. In the London establishments there should be a proper place for the applicants to wait their turn, and it would be desirable if arrangements were made so that those persons who wished it might be shaved cheaply. There are many additional comforts that working classes might enjoy by co-operation, and gladly would we see them in the way of obtaining them. The labourer pays more for his cup of bad tea (when he gets it) than his more wealthy brethren do for good. With this, however, it is hardly our province to deal. The waiting-place should be decently fitted up, and if it were adorned with good prints, now so cheaply obtainable, might aid in improving the character of the visitants more powerfully than at first sight seems likely. Let us take them away for a time from their "coals and potatoes," hold up virtuous actions and heroic deeds for admiration, give them something to think about and talk about, and increase their self-respect.

Turning for an instant to the wash-houses: we found that the desire to avail themselves of these is even greater than of the baths, and that, although the establishment is not so extensively known in Liverpool as it ought to be, there were often more applicants than could be accommodated. There is room in the whole for twenty-six tubs, and these are usually all occupied. Each tub is furnished by pipes with hot and cold water, and has a plug by which it can be speedily emptied. There are two coppers to boil the linen, and a room heated by steam and fitted up with iron slides, termed there "maidens," to dry the clothes. The charge for the use of one tub from six till twelve o'clock is a penny, and for the whole day two-pence.

To those who have visited the abodes of the poor, the courts and alleys of great towns,who have found a father, mother, and seven or eight children of different ages with only one small room for all purposes,-with, perhaps, a bed-ridden grandmother or sick child-it is unnecessary to point out the important boon which will be afforded to that class by the establishment of public wash-houses. In such a position cleanliness is out of the question; and moral degradation must follow its abandonment. To those who have not seen it we

* The site chosen is in Paul-street, a poor and crowded part of Liverpool.

would say, think on the fact that thousands of families are in this state, and worse, and you must recognize the value of the endeavours now being made, and will feel disposed to assist them. The establishment of public wash-houses will at once improve considerably the dwellings of a very numerous class,

In the arrangement of the plans about to be submitted much attention must be given to questions extra-architectural; such as the supply of water to the baths and mode of heat. ing it, construction of the drying-rooms, heating and ventilating the apartments, &c. To these we shall recur anon.

DOINGS UNDER THE METROPOLITAN BUILDINGS ACT.

THE official referees are active in their vocation. The subject of buildings commenced before the 1st of the present month, particularly alluded to in our leading article last week, is receiving special consideration. On the 19th of December last they issued a ciris receiving special consideration. On cular to the district surveyors, requesting them to make a return, as early as possible after the 1st inst., of all buildings commenced before that day and then unfinished, distinguishing the classes and rates and the respec-tive situations of such buildings. On the the 3rd inst. they sent out another circular with reference to the last, wishing to know to what height from the base of the footings such buildings had been carried on the 1st, and asking information of any circumstances respecting them which the surveyors might think necessary. It had been represented to them, the letter stated (and it is true enough), that, "in some cases, mere trenches have been excavated with nothing in them; in others, a skimming of concrete is laid in the trench; in some, a course of clinkers merely, and in others, a single course of bricks. In others, again, a foundation is put in to only part of the walls, without its being continued so as to be united at the back or ends;" and they wished to know, as early as possible, the number of buildings in such or similar cir-cumstances. How they will decide in such cases, should the question of exemption or otherwise come before them, remains to be seen, but is not very doubtful. One of the earliest, if not the first, applica-

tion to a magistrate under the new Act, was made at Lambeth, on the 10th inst., when Mr. Southby, firework-manufacturer, applied to the Hon. Mr. Norton, to solicit his interference to prevent the erection of a varnishmanufactory near his premises. Mr. Southby said if the building were permitted it would be highly dangerous, and a serious loss of life might ensue from the combustible materials. The building was within 50 feet of his pre-mises. There was also a great deal of timber in an adjoining yard, and should an explosion take place the consequences would be frightful. Mr. Norton said the person had clearly no right to erect such a building, and asked if

there was a public way?

Mr. Southby stated there was. Mr. Norton immediately sent an officer of the court, with the applicant, to inform the person that he must discontinue the building, and that, under the 54th clause of the new Building Act, he was liable to a penalty of 50%. per day, every day the business was carried on, and, in default of payment, was liable to be sent to the House of Correction for six calendar months, with hard labour.

The official referees have adopted a measure which is likely to be exceedingly useful, namely, lithographing the correspondence from and to certain surveyors on matters connected with the new Act, and transmitting a copy to each district surveyor, for his instruc-tion and guidance. The Act, from its com-plicated nature, is as yet but little understood by either surveyors or builders,* and, in order to spread information on the subject, we propose to give our readers the substance of each case as it occurs.

^{*} Many of the builders and zinc-workers have been asto-nished at the interference of the district surveyor when erecting a funnel or smoke-pipe on a chimney-shaft! Never-theless, he would seem to be justified; if it be 4ft. above the brickwork, notice must be given of such work, and the fee paid, or the penalty may be incurred. See Sect. 13, and Sched. F, Art. Chimney-pots, tubes, &c.

Mr. Browne, surveyor of the Greenwich district, made a complaint against Mr. James Williams for a certain alleged illegal "projection of a shop-front, and cellar-flap and way," but having omitted to state all the grounds and particulars of his objection, and the particular parts of the new Act to which the said works were not conformable, he was advised, by the official referees, to do this, " by means of a drawing, sketch, or outline, with explanatory observations." The following is then added, and as it is highly important to all classes to know that the referees never intend to make a survey, without charging for it, we reprint it at length :--

"You will at once perceive, that it is of importance that the parties who make a complaint, or refer a matter to the official referees for their determination, should state the complaint, or the matter referred, with a fair degree of certainty, in order that they may be enabled to judge of it without the expense of a personal survey, which may be avoided, and in order that the opposing party may be fairly informed of the subject-matter of the complaint or reference." The letter concludes with a little wholesome advice to Mr. Browne not to interfere in an irregular manner.

The same gentleman also made a complaint against Mr. John Hiscock, for an irregular projection before a line of houses, but it was referred back to him for the "grounds and particulars of his objection," as in the last case. Mr. Badger, of Lewisham, complained of Mr. John Godwin, for erecting some cottages contrary to the Act, but as the buildings in question were carried up to aconsiderable height before the lat inst., they were deemed by the official referees to be "already built," and not within the operation of the Act. Mr. Badger imagined that as they were being built by contract they came within the meaning of the 9th section, which directs such contracts to be so modified that all buildings may be erected according to the provisions of the Act, but this of course only applies to buildings commenced since the lat of January. Mr. Sibley, of Clerkenwell, having mixed

Mr. Sibley, of Clerkenwell, having mixed up with his return of buildings in progress on the lat inst., an allusion to the dangerous state of St. John's Gate, erected several hundred years ago, representing that the decaying stone fell on the public way, received a request that his communications might be made "formally in future," and directions that he would make a survey of the building, with a view to its repair, under the 40th section. Mr. Sibley, we believe, has not yet made his report, and until then the official referees cannot take any steps for the abatement of the danger.

Mr. Baker, of St. Pancras, likewise received authority from the official referees to survey the scene of the late calamitous fire in Guildford-street, they having received information from another party that the walls were in a dangerous state. The case being urgent, Mr. Baker lost no time in serving the notice required by the 24th section upon Mr. Farey, the lease-holder; he was accompanied in his survey by that gentleman's son, who so narrowly escaped from the fire, and the report and certificate were at once drawn up and transmitted to the registrar. The purport was, that a hoard would be useless, as the front of the house might be blown down right across the street, but that it was necessary, for the eafety of the public, immediately to pull down the front as low as the stone balcony, inclusive, and also the rear-front to the level of the ground-floor, shoring up the walls which would be left standing. The official referees have to send a copy of such certificate to the overseers of the poor, and the latter again have to write to the owner of the building to repair or pull down "within fourteen days."

The whole regulations respecting ruinous buildings seem rather complicated. The 40th section takes the matter in hand, but instead of giving some simple directions, refers to the 24th section, which is a mass of regulations about the survey and condemnation of partywalls, and contains a form of notice which is not strictly applicable in both cases. Time will, however, simplify these points.

In another part of the journal we present in a tabular form a list of all the district surveyors and their offices, the names and address of the official referees and registrar, and an abstract of those portions of the Act which relate to the notices required from builders.

INSTITUTION OF CIVIL ENGINEERS.

JANUARY 14, 1845 .- The President in the chair.

The first meeting of the session of 1845 took place on Tuesday evening, the 14th inst. We noticed that some further improvements had been effected in the comfort and decorations of the rooms of the society. The collection of portraits has been augmented by that of Mr. Walker (the president), which was painted by J. P. Knight, R.A., last year for the members of the institution. The model gallery has also received some interesting additions.

The first paper read was on the different modes of confining railway bars in their chairs, by Mr. W. H. Barlow, resident engineer on the Midland Counties Railway. Of the numerous methods which have been tried for keying the rails in the chairs, it would appear that the one now most generally practised is that of parallel compressed wooden keys, but even to these Mr. Barlow states several objections, which, in his opinion, counterbalance the advantage of their elasticity and tendency to assume their original dimensions when exposed in a damp atmosphere. Being of small dimensions and placed just at the surface of the ballast, they decay rapidly; they swell and shrink with every change of temperature, thus becoming loose in dry weather, and requiring constant driving up, which soon destroys them. On the Midland Counties Railway the duration of the wooden Counties Railway the duration of the wooden joint keys has not exceeded five years, and at the present price of compressed keys, which varies from 8*l*. to 12*l*. per thousand, the ex-pense of renewal of keys per mile per annum at the latter rate would be 10*l*. 25. 6d. for a line with 3 feet bearings, and 8*l*. 95. with 3 feet 9 inches bearings. This induced Mr. Bealow to the ballow wrought icon have made Barlow to try hollow wrought-iron keys made like the Russel gas-tube, but of such a form as to bear equally against the jaw of the chair, the middle web of the rail, and the top and bottom flanches. This form and substance it has been found gave great stability, held the rails firmly in their places, and yet possessed such elasticity as to neutralize the effect of the travelling of the wheels over the chairs, and rendered the motion of the carriages peculiarly smooth and agreeable. A number of experiments were given, wherein the great superiority of these keys, in their inherent qualities and their cost, over all other kinds was satisfactorily shewn. They have now been used for a considerable period on the Midland Counties, the South-Eastern, the Warwick and Leamington, and other railways; and in the discussion which ensued, several engineers expressed themselves so well pleased with them, that they intended to introduce them in all their new works. A paper, by Mr. John Storey, described an oblique bridge of freestone over the river

A paper, by Mr. John Storey, described an oblique bridge of freestone over the river Gaunless, on the Hagger Leases Branch Railway. This bridge is remarkable for the acute angle (27°) which it forms with the line of the river it spans; and from its having been built so long ago as the year 1830, when that kind of construction was but imperfectly understood and but little practised in England, the square section of the arch is 19 feet, while the length of the face of the arch, in consequence of its extreme obliquity, is 42 feet. The paper described the mode of setting out the work and of executing the masonry; they were not so theoretically correct as the methods now practised, but the practical effects were struck, the crown of the arch did not drop half an inch, and no subsidence has been since observed in any part of the work.

The meeting was adjourned until the 21st instant, when the annual general meeting will be held for the election of the council and officers for the ensuing session. A considerable change is contemplated.

PURE OIL FOR MACHINERY.—Owing to the impurities which oils contain in their natural state, such as mucus, or albumen, and which act like yeast in promoting chemical action, most of them, when kept, become rancid. To obviate the difficulty this causes to philosophical instrument-makers and engineers, Messrs, Lundholm and Co. have produced a new oil, called pure Elaine, which seems worthy of trial.

ROYAL INSTITUTE OF ARCHITECTS.

ON Monday evening, the 13th instant, the Institute met in their new rooms for the first time, George Smith, Esq., vice-president, in the chair. Thanks were voted to Messrs. Mair, Scoles, and Thompson, and to the honorary secretaries, for their services in effecting the removal. Mr. C. N. Cumberlege was elected a fellow, and Messrs. Henry Peet and Edward F. Hutchins associates. The foreign secretary read an extract from a letter stating that the King of Prussia had purchased all the drawings and papers left by Schinkel, in order to preserve them intact.

Mr. Donaldson then laid before the meeting a brief view of the history of architecture, from the building of Babel, assumed to be 2249 years B.C., to the revival of Italian architecture in the 16th century, illustrated by a beautiful series of drawings. The chief object of the lecture was to point out the connection which existed between the architecture of the various countries of antiquity. Egypt, Greece, Italy, and Byzantium were each alluded to, and the rise of Christian architecture pointed out. The lecturer considered that the pointed arch came to us from the Saracens, and read some extracts from M. Guizot's "History of Civilization in Europe," to shew the effect of the crusades on arts and manners in this quarter of the globe.

Some clever sketches of Athenian and other Greek monuments, recently made by Mr. George Knowles, were exhibited; and a coloured copy of Mr. Lewis Gruner's elaborate work on the freeco decorations and staccoes of buildings in Italy.

SOCIETY OF ANTIQUARIES.

At a meeting of this society, held on Thursday, the 9th instant, Mr. Henry Hallam, the historian, in the chair, Mr. Albert Way exhibited an ancient altar-cloth from Steeple Aston Church, Oxon. A letter from M. de Caumont, of Normandy, was read, solicity ing subscriptions for a statue of William the Conqueror, proposed to be erected at Falaise, the place of his birth. The letter also stated that the French antiquaries would hold their annual congress at Lille in July next, and expressed a hope that they might be favoured with the presence of some members of the society.

A communication from Mr. Edward Richardson was read, describing a number of coffins, stone and lead, found in the circular part of the Temple Church, London. The lead coffins were attributed to the time of Henry III., the stone coffins might be earlier. An account of Old Sarum, by Mr. Hatcher, illustrated by a model, was also read.

We have received several communications complaining of the apathy which prevails in this ancient and respected society, and the little good it effects as compared with its powerful means and influential position. The chief cause of the evil seems to be, that its management is allowed to rest exclusively with a few individuals (excellent though they may be), and has become a mere matter of routine.

THE "STATUE OF WILLIAM IV."—The commemoration of the erection and inauguration of the statue of the "Sailor King," which has just been completed by Mr. Samuel Nixon, and is now placed on a pedestal at the termination of King William-street, at the point which faces London-bridge, was celebrated a few evenings since at the Adelaide Tavern, at the foot of the bridge, where, at six o'clock, a numerous assembly of the influential gentlemen of the wards of Bridge and Candlewick sat down to an excellent dinner. The chair was filled by Sir Chapman Marshall, who was supported on the right hand by Sir George Carroll (these two gentlemen being the aldermen of the respective wards), and on his left by Mr. Nixon. We are sorry that we cannot coincide in the flattering opinions of the statue which have been expressed. It is, to us, coarse and clumey, and not likely to advance the reputation of the sculptor.

ROYAL ACADEMY. — Every academician was entitled to exhibit eight pictures each season, and for which, of course, the best places were retained. By a recent resolution they have now limited themselves to *siz*. This alteration cannot fail to be gratefully received by the profession generally.

TABLE OF METROPOLITAN DISTRICT SURVEYORS.

Official Referees, JAMES WHITE HIGGINS, Esq., and WILLIAM HOSKING, Esq.-Registrar, ARTHUR SYMONDS, Esq. Board of Examiners appointed to assist the Official Referes in the Examination of Candidates for the Office of District Surveyor, SIR ROBERT SMIRKE, JAMES PENNETHORNE, Esq., and THOMAS CUBITT, Esq.

All Communications are to be addressed under cover to the "Registrar of Metropolitan Buildings," 3, Trafalgar-square.

LIST OF SURVEYORS' DISTRICTS (OLD AND NEW) APPOINTED BY THE JUSTICES OF THE PRACE OF THE RESPECTIVE COUNTIES, PURSUANT TO THE ACT 7 & SVICT. C. SI. WITH THE NAMES OF THE SURVEYORS, THEIR RESIDENCES, AND OFFICES,

| DISTRICT, | SURVEYOR. | RESIDENCE. | OFFICE. |

LONDON AS IT WAS, AND IS.*

WE commence our present narrative at that period when London was threefold afflicted with the terrible calamities of famine, pestilence, and fire. In 1663, and for some years previous, there was a general dearth throughout England, wheat being sold at the enormous price of 3/. 14s. per quarter, and malt at 2/. 2s. This was succeeded by the plague in 1665, by whose direful ravages 68,596 persons were swept away, which, together with the number of those that died of other distempers, made the bill of mortality of this year amount to 97,306 souls. The recurrence of this dreadful calamity, after an interval of forty years, worked upon the superstition of the age, and many began to impute the fatality to that number, as if in that sense the land was to have rest only forty years. Many ingenious conjectures have been made concerning the origin of this scourge, and from all the facts that can be collected in modern times, there is every reason to believe that it originated with the hot, poisonous blasts of the deserts of Persia, Arabia, and Egypt, and travelling into Europe, it occasionally committed great ravages in the chief cities, and was never eradicated therefrom. During the calamitous period we are now speaking of, it was observed by Dr. Baynard, a very intelli-gent physician, that there was a general calm and serenity of weather, as though both wind and rain had been expelled the kingdom, and that for many weeks together he could not discover the least breath of wind, not even so much as to move a weathercock, and the fires in the streets were made to burn with great difficulty; the birds too, as in tropical regions, flew heavily on the wing, panting for breath.

In the history of nations we find very often a singular coincidence of events, surpassing human comprehension, and appearing almost miraculous: London furnishes a remarkable illustration of this; a few months only had elapsed, the houses untenanted by the plague had scarcely been opened to the new comers from the country, than they were turned out again by a disaster more sudden than the former. The great fire of London, which happened in the year 1666, broke out Sept. 2nd, at one o'clock in the morning, in Pudding-lane (near now Fish-street), in a quarter of the town closely built with wooden, pitched houses, and made such ranid headway under a strong easterly such rapid headway under a strong easterly wind then blowing, that before daylight it became too great for any hopes of mastering it by the engines, or even for approaching within any reasonable distance. Many attempts were made to prevent the spreading of it by pulling down houses and making great in-tervals; but the fire, seizing upon the timbers and rubbish, soon passed the spaces, and continued its devastating progress the whole of Monday and Tuesday. On Tuesday night the wind slackened a little, and the flames meeting with brick buildings at the Temple, began to lose their force gradually on that side, and on Wednesday a stop was put to it at the Temple Church, near Holborn-bridge, Pye-corner, Aldersgate, Cripplegate, near the end of Aldersgate, Cripplegate, near the end of Coleman-street, at the end of Basinghallstreet, by the postern at the upper end of Bishopsgate-street and Leadenhall-street, at the Standard in Cornhill, at the Church in Fenchurch-street, near Clothworkers' Hall in Mincing-lane, at the middle of Mark-lane, and at the Tower Dock.

Thus, after raging three days with the utmost violence, and in despite of the feeble efforts of the inhabitants to check its progress, it gradually ceased, after laying waste and consuming the buildings on 436 acres of ground, 400 streets, lanes, &c., 13,200 houses, the cathedral church of St. Paul, 86 parish churches, 6 chapels, the magnificent buildings of Guildhall, the Royal Exchange, Custom-house, and Blackwell Hall, several hospitals and libraries, 52 of the companies' halls, and a vast number of other noble edifices, 3 of the city gates, 4 stone bridges, and the prisons of Newgate, the Fleet, the Poultry and Wood-street Compters, the loss of which, together with that of merchandize and household furniture, by the best calculation amounting to ten millions seven hundred and thirty thousand pounds.

Without staying to inquire into the validity of the numerous reports handed down

* See vol. ii. page 528.

to us concerning the origin of the fire, which in these days are truly placed to the prejudices and bigotry of the age, we will proceed at once to notice the permanent benefits derived by the inhabitants of London from what was then considered by them an irreparable calamity. Instead of very narrow, crooked, and incommodious streets; dark, irregular, and ill-contrived wooden houses, with their several stories jutting out, or hanging over each other, whereby the circulation of the air was obstructed, noisome vapours produced, and destructive and obnoxious vermin harboured, the order of the King in Council declares that no man shall henceforth presume to erect any house or building, great or small, but of brick or stone, under penalty of having it brick or stone, under penalty of having it pulled down; the cellars to be well arched. That Fleet-street, Cheapside, Cornhill, and all other eminent and notorious streets shall be of sufficient breadth; that no lanes or alleys shall be erected but where absolutely necessary; that keys or wharfs be formed, and no house to be erected within so many feet of the river. Many superb edifices were erected; greater attention was paid to paving and lighting the streets, and had the plan of Sir Chris-topher Wren been carried out, many of our modern improvements would have followed.

The Building Act of 19 Car. II. determined that there be only four sorts of buildings, defined by the Act, the largest embracing noblemen's mansions, not to exceed four stories high; that all new buildings be built with stone or brick, with party-walls; and three years were allowed, from the time of the conflagration, to rebuild the houses destroyed. All bricklayers, masons, plasterers, and joiners were to enjoy the privileges of freemen for seven years, or so long as the building was completing, and any exaction by them for material or labour was punished by fine or imprisonment. Α spacious wharf 40 feet in breadth was also ordered to be erected from Tower-wharf to Temple-stairs, clear of all buildings other than cranes and sheds for the convenience of landing and preservation of merchandize; and for the more effectual preventing inundations, Thames-street and the ground between it and the river Thames to be raised 3 feet. And to enable the lord mayor and citizens to perform the stipulations of the Act, they were permitted to exact 1s. for every chaldron or ton of coals imported into the port of London. The exact width of many of the streets was defined by this Act.

Another order of council was shortly after issued to regulate the duty of surveyors, that special care be taken to preserve as far as possible uniformity in the lines of houses, the breast-summers ranging an equal height house with house; that encouragement be given to builders for ornament sake, the ornaments and projections of the front buildings to be of rubbed brick; that the signs be fixed against the balconies, instead of across the street as here-tofore, &c. A tax of 6s. 8d. for every foundation was also levied for the surveyor. Rules and regulations were also laid down for paving and levelling the streets. Many other local acts followed for improving and beautifying the city. Sir John Evelyn's plan, as given in Maitland's History of London, would have greatly added to the beauty of the city.

From this time nothing of interest to the "builder" can be said to have taken place until 1703, when the metropolis was visited by a terrible tempest, which, lasting for eight hours, committed great devastation, destroying many spires and turrets, overturning houses blowing down a vast number of trees and houses, and killing many people. The city was particularly afflicted by this visitation, scarcely a house escaping without damage, and the streets being literally filled with bricks, tiles, signs, bulks, and pent-houses, and many of the houses were wholly stripped of their roofs; some idea of the immense damage may be formed by the rise of tiles from one guinea to six pounds the thousand. The damage at sea exceeded that on land. Twelve men-of-war were lost, with above 800 men on board, and an immense number of merchant-ships, the Thames and sea-coasts being covered with wrecks. In 1709, in consequence of the vast increase of the city and suburbs, fifty new churches were ordered to be built, in or near the cities of London and Westminster, an

of London for the space of 137 days, and 3s. per ton for eight years afterwards. By the Act 2 Geo. 1, cap. 28, in consequence of many contentions having arisen among neighbours concerning rebuilding their houses within the city and liberties, it was ordained, that if any person refused or neglected to build his share of a party-wall after due notice was given him, his next neighbour may build it for him, and oblige the person so neglecting it to pay the charges of rebuilding it; and that the ater falling from the tops of houses, &c., should be conveyed into channels or kennels by pipes in the front or sides of the houses, on pain of twenty pounds penalty. In 1734, the city of London was lighted by 1,000 lamps only, the contractors paying the city the sum of 600%. annually for lighting the same. Every house-holder paying poor's rates being taxed 6s. per annum by the contractors, who were compelled to light only on dark nights till twelve o'clock from Michaelmas to Lady-day, excluding moonlight, or ten nights in every moon. In this year an alteration took place, a more equitable mode of lighting and taxing was imposed, and the number of lights were increased to 4,679. About this time the Fleetditch was covered in, and converted into a market. In 1738 the Mansion-house was built on the site of Stock's-markets, the first pile was driven at Westminster-bridge, and the foundations of the Foundling Hospital were laid. In 1747 a great fire happened in Corn-hill, by which 100 houses were burnt down, which had the usual effect of improving the appearance of the city. In 1750 the city was visited by an earthquake, but without any damage being done; it was sensibly felt in the cities of London and Westminster, Highgate, Hampstead, Greenwich, Richmond, &c. In 1739 London within the Bills of Mortality

consisted of 5,099 streets and 95,968 houses; of which 42,676 houses were insured in the Hand-in-Hand Fire-office. at 9.231.4004. and 7,852 in the Westminster Fire-office, at 2,059,1217. The rents of the houses at a medium within the city and suburbs were estimated at 26% 23. 11d. each, or 2,509,160%. 3s. 7d. for the whole.

Having thus noticed every matter of interest to the builder connected with the vicissitades and progressive improvements of London up to the present time, we shall conclude with a few remarks on its present condition. London now stands pre-eminent among nations; its progress in architectural improvements since 1814 is acknowledged even by foreigners to be marvellous; and the piles of buildings meeting the eye at every turn in the West-end, are unerring testimonials of the increasing wealth of its inhabitants, comparatively little affected by an enormous taxation, the result of . long-protracted war. Its proudest edifices are the results of individual enterprise, unaided by the government ; for though the latter affects rivalry, it cannot hope to surpass the numerous monuments of individual enterprise with which this great metropolis is adorned : its docks, bridges, canals, the colleges and hospitals, theatres, clubs, palaces, picture-gal-leries, breweries, distilleries, and other public works. The inhabitants walk with pleasure the carefully-paved and well-regulated streets by day, and the illuminated streets by night, secared from violence by a well-regulated police; and an endless stream of wealth flowing in from all quarters of the globe, however unequally distributed, is still in some degree shared by all. "When," says the Marquis de Vermont, "I reflect on the variegated scenes which hourly draw my notice; when I add to may own observation those of others, on whose judgment I can rely; when I gaze upon this nighty metropolis, so rapidly sugmenting in size and grandeur; when I recollect the high moral and military character which your avins attained in the last war; when, extending my views to literary and scientific subjects, I find that while the Duke of Wellington triumphed in the field, Dr. Jenner and Sir H. Davy were immortalizing both themselves and Great Britain by discoveries for which they will receive the blessings of ages yet unborn ; and that Crabb, Moore, Scott, and Byron, after raising the poetical fame of the country, still live, and still promise to carry higher (own and England's reputation; when I their Dut all these contemporary circumstances together, additional duty of 2s. per chaldron being laid upon all coals and culm brought into the port to acknowledge that you are rapidly approach. I am compelled, in spite of early prepossessions,

Digitized by GOOGLE

ing the goal of national greatness." Twenty years have passed since the above was written, and since then improvement has marched through the metropolis with giant strides, swelling her dimensions and multiplying her inhabi-tants, and still we appear as far as ever from the goal of our greatness. West, north, east, and south, we see London still stretching forth its thousand arms, swallowing up every villa in its environs, and compassing every obstacle which it cannot overcome; and railways, as so many main arteries, diverging on every side from the great seat of life, must and will give additional impetus to its trade and commerce, and contribute to swell out still further its extent and population. As the powers of the human mind become developed, as improvement keeps pace with invention, as wealth increases with the increase of our wants and and disease lose its force. Time and space analibilated, and apparent impossibilities ac-complianced, we find the means of national, intellectual, and physical enjoyment awaiting our disposal.

In the midst of increasing prosperity and the almost universal pursuit of wealth by the sbortest possible road, it is gratifying to find that in the rage for improvement, the poor are not quite forgotten; that the most considerate attention is being paid to the drainage and ventilation of this and other large cities, and the dwellings of the poor are not altogether overlooked: the new Buildings Act will go far to mitigate the sufferings of the labouring classes by disposing them in healthy and commodious dwellings, and ere long the exer-tions of philanthropy will go much further in removing these moral plague-spots wherein poverty and crime are necessarily associated, carsed with a tainted atmosphere and the society of each other. St. Giles's, once the impenetrable sanctuary for the Alsatian, the highwayman, and the street brawler, noted for its filth and squalid wretchedness, is gradually disoppearing; but, unless timely means are taken, the evil is only removed to another quarter of the metropolis, not eradicated; it is therefore the bounden duty of the legislature to apply more effectual measures for enforcing cleanliness, ventilation, and drainage in all crowded places. Private benevolence may mitigate, but it cannot eradicate the evil. Baths and wash-houses will do much towards purifying these abodes of vice and wretchedness, education will do much more, but nothing permanent can be expected until the means of an honest living are placed at every man's disposal. Many means to attain ends so truly desirable are devised in the present day, but political quackery is too apt to usurp the sent of Christian benevolence, and the millions mast still suffer on until property, under its various forms, awakens to a sense of its duties; then, indeed, London will have reached the goal of its greatness and prosperity.

xxxx.

IMPROVED DWELLINGS FOR THE WORK. ING CLASSES IN EDINBURGH.

THE public will be gratified to learn that The preliminary measures are in progress for calling a public meeting with the design of constituting a sanatory council, or association for the promotion of public health in our city. The state of the Old Town is now such that some vigorous effort is certainly necessary, in counce is correcting its more fitting residence for order t e render it a more fitting residence for inch of the middle and working classes as have their abode in it. There is a clamant need in particular for improved dwellings for the working classes, and, indeed, for an extension of the number of houses devoted to their accommodation, as it is found at present nearly impossible for a working man to obtain such a dwelling as he requires, and could well pay for. The first object now in view is to form a standing council of gentlemen competent to scertain and judge of measures desirable for the public health, which they shall endeavour the promote by all means within their power. Amongst their duties will be that of dealing with private parties, individually, or joint-escele companies, who may be disposed to build the they follow the proper rules as to the

ł

arrangement of their buildings, the local needful accommodations, drainage, sewerage, and other requisites. It is conceived that speculations of this kind may obtain favour amongst capitalists, as it can be shewn that the amongst capitalists, as it can be shewn that the required outlay may make a good return, even while tenants are better and more cheaply accommodated than at present, if only care be taken to keep up the character of the new buildings in moral and physical respects, which it is by no means beyond the power of prudent regulation to accomplish. The gentlemen, with whom this movement originates, con-template both the erection of buildings in open suburban situations, and the substitution of suburban situations, and the substitution of improved dwellings for masses of the older and more ruinous parts of the city. In every case there will be due care taken to provide open-air spaces for the recreation of children, apart from contaminating street influences; general accommodation for washing may also be furnished, if, upon due deliberation, thought advisable; ventilation, the supply of water, and arrangements for the removal of all kinds of refuse, will be special objects; in short, while no extravagant views of any kind are entertertained, it is believed, that, by good practical arrangements, and working upon a large instead of a narrow scale, the working classes may be supplied with domestic accommomay be supplied with domestic accommo-dations, comprehending a large amount of comfort, favourable to, instead of destructive of health; and lastly, but not least, promotive of their moral interests, seeing that a home which we can love and delight in is, by universal acknowledgment, the first requisite to the vietnes. Sectomen to the virtues .- Scotsman.

Obituary.

THE LATE ALFRED BARTHOLOMEW, ESQ., F.S.A.

IN accordance with the promise contained in our last number, we now proceed to lay before our readers some notice of the life and works of this gentleman, whose death took place on the 2nd day of the present month, in the midst of a career of usefulness, and at the very time that a life of untiring zeal, selfdenial, and study, had apparently placed within his grasp, at no distant period, complete success in this world; which, however, it has pleased the all-wise Arbiter of our fates he should never enjoy.

Mr. Bartholomew was born in London on the 28th of March, 1801, and although he had acquired at school only that moderate degree of education which usually falls to the lot of those amongst the middle ranks of society who are not destined for one of the learned professions, his early-developed devotion to geometry and science in general determined his father to bring him up to the profession of an architect, and he was therefore articled to Mr. J. H. Good, then of Hatton Garden (a former pupil of Sir John Soane), now the surveyor to some of her Majesty's palaces, and to the Commissioners for Building New Churches, &c. Mr. Bartholomew's destiny heing thus fixed

Mr. Bartholomew's destiny being thus fixed, he applied himself to the study of his profession, as well as to other congenial pursuits, with all the energy that was inseparable from his character: up early in the morning dur-ing his pupilage, he employed himself in carefully measuring and delineating, amongst other buildings, the most beautiful parts of the Bank of England, with a reverence for Soane, to whom, by his connection with Mr. Good, he seemed in some sort to claim kindred.

Perspective, whilst he was under articles, received, as it always should do, the careful study of the aspirant; and having in this respect acquired the requisite proficiency, he was called upon to communicate it to the younger branches of a noble family, where he received the first pecuniary gratification that resulted to him from the studies to which he had devoted himself.

Architecture, however, although apparently the all-absorbing subject, did not entirely en-gross him; amidst an attention to it which appeared to be undivided, he yet found time for the acquisition of several languages, and

This work, a labour of love, contains strains of the sweetest character, and occasionally the sublime pathos of the original appears through its English dress with a force and beauty but little diminished (and this is saying much) by the change into our own language; and although containing some inequalities, yet, on the whole, as far exceeds the general tameness of Nicholas Brady and Nahum Tate as their version stood above the antiquated dulness of Sternhold and Hopkins. Still, and though warmly praised by nearly the whole bench of bishops, in complimentary letters to the author,

bishops, in complimentary letters to the author, it has yet made no way in public use. After the publication of the Psalms, Mr. Bartholomew's literary labours appear to have been more peculiarly devoted to his profession, and particularly to recording from time to time the thoughts ultimately embodied by him in his "Specifications for Practical Architecture," which work displaying as it does some singuwhich work, displaying, as it does, some singu-larities and blemishes, perhaps the too common accompaniment of genius, may be studied with

accompaniment of genus, may be studied with advantage by every member of the profession, and is calculated to effect much good. It cannot fail to become a standard book. Besides the "Specifications," Mr. Bartho-lomew is the author of "Hints relative to the Construction of Fire-proof Buildings" (very favourably reviewed in the Gentleman's Maga-zine), and of various fugitive papers that have from time to time appeared before the public. from time to time appeared before the public, as well of a professional as of a non-professional character. He has left uncompleted nusional character. He has left uncompleted nu-merous sketches of a miscellaneous nature, full of ability, but not fitted for publication. His leading articles as editor of this journal during the past year are before the public, and have received favourable judgment, as evinced by the increased circulation of the periodical during his connection with it.

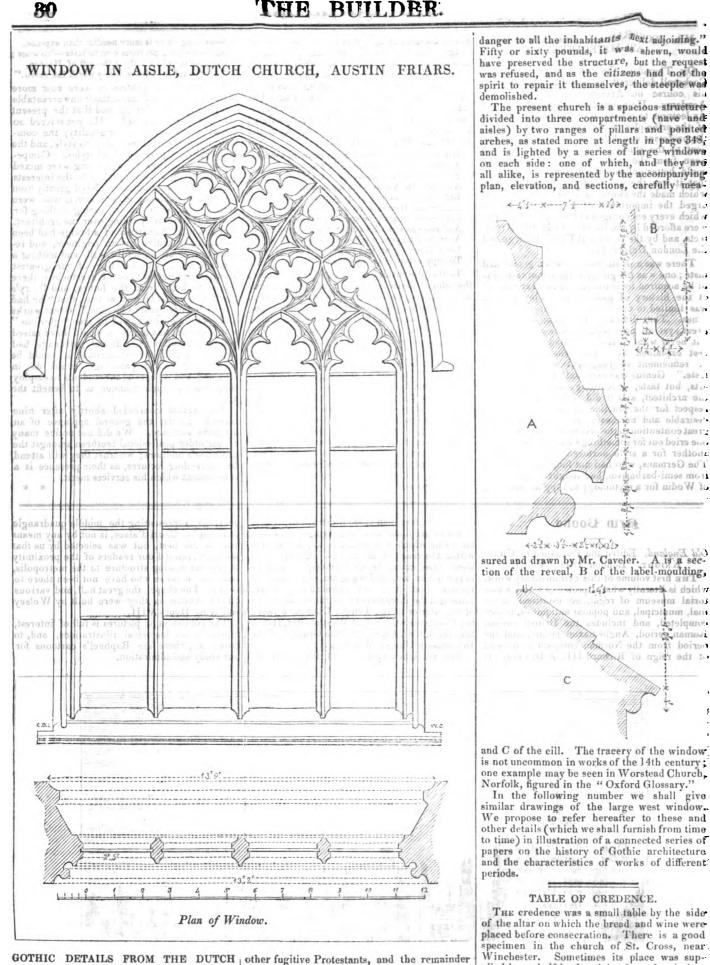

Amongst the most prominent objects of Mr. Bartholomew's thoughts was Gothic Architec-ture, in the study of which he was enthusiastic; and hence in a great measure (prompted by his veneration for those itinerant architects, to whose genius we owe the magnificence and beauty of our Gothic cathedrals) arose his zeal in favour of the society known as "Freemasons of the Church, for the re-covery, maintenance, and furtherance of the true principles and practice of architecture," which was commenced by him which was commenced by him.

Few men are better acquainted than he was with either the old or the new Building Act, and with regard to the latter, he had frequent correspondence with the Earl of Lincoln whilst it was being framed and carried through Parliament; his last work was to correct the proofs of his "Cyclopædia of the New Metropolitan Building Act," upon which he bestowed the utmost labour and attention. His canvass for the district surveyorship of Hornsey, to which he was elected by a very large majority only a few weeks ago, appears to have brought upon him an attack of rheumatic gout and fever, but through this his physicians fully expected him to struggle; taking cold, however, bronchitis resulted, which unhappily proved but too fatal.

His brother, Mr. Valentine Bartholomew, holds the appointment of Flower Painter to her Majesty, and is well known as a most able artist in his particular department.

NEW CHURCH AT SOUTH SHIELDS .--The foundation-stone of this church was laid by Robert Ingham, Esq., of Weston, on the 26th ult. It is arranged to receive a congregation ult. It is arranged to receive a congregation of 800, and the plans have been so skilfully designed by Mr. Salvin, the architect, and the execution of the work by Mr. Alderson is to be of so substantial a character, that accom-modation may be added for a larger number when required. The church is intended to be ready for diving service on the lat of lung ready for divine service on the 1st of June next.-Newcastle Journal.

KESWICK CHURCH .-- This church is about heswick Church.—Inis church is about to undergo a general alteration and repair at the estimated cost of upwards of 3,000/., which will be laid out for that purpose by a private gentleman, J. Stranger, Esq., of the Dovecot, Keswick. The same gentleman some time ago built a new school for the benefit of the town which cost upwards of 1,000%. In Keswick church yard lie the remains of the late Dr. Southey, poet-laureate. -Westmoreland Gazette.

CHURCH, AUSTIN FRIARS.

In the second volume of THE BUILDER, IN the second volume of THE DOLDER, at page 6 and page 348, there is a general account of the Dutch Church in Austin Friars, so far as relates to its history, with views of the west end and interior. It is a part of the ancient Priory of St. Augustine, the chief residence of the friars of that order in England, whence the name of the place. After the dissolution of the monastic orders. the Priory of St. Augustine fell into various hands: the west end of the conventual church was granted for the use of the Germans and

• Founded by Humfrey de Bohun, Earl of Hereford and Essex, 1252, and re-edified in the year 1351, by his descen-dant of the same name.

GOTHIC DETAILS FROM THE DUTCH | other fugitive Protestants, and the remainder was appropriated to meaner purposes. The steeple was standing in the year 1609, and seems to have been held in great esteem, if we may judge from the words of a memorial from the lord mayor and citizens, praying the Marquis of Winchester, the owner, to repair it.† The memorial said: "The fall of it, which without speedy prevention is near at hand, must needs bring with it not only a great deformitie to the whole city, it being for archi-tecture one of the beautifullest and rarest spectacles thereof, but also a fearful eminent

The previous Marquis of Winchester built a mansion the sits of the monastery called Winchester-place. In inchester-street there are still many of the overhanging uses with gables towards the road, which were at one time secal, but are now hardly to be found in London.

MR. COCKERELL'S LECTURES ON ARCHITECTURE.

Ox Thursday, the 9th instant, Professor Cockerell delivered the introductory lecture of his course on Architecture at the Royal Academy. He pointed out the insufficiency of six lectures to convey any adequate knowledge of the principles of architecture, and that all the professor could do was to give the proper bent to the studies of his hearers. Himself risen from the ranks of the profession, he could better enforce the dictum of Vitruvius, that it was the union of theory and practice which made the skilful architect. He strongly urged the importance of present studies, for which every encouragement and great facilities were afforded by the Institute of British Architects, and by the courses at King's College and the London University.

There was a distinction between genius and taste; one was the gift of Nature, but taste was to be acquired by learning and by examination of the history of past times. The lecturer was limited to uphold the authority of former times. The difficulty to define taste was great, yet all men would confess ignorance, but never want of taste. It had been perhaps best explained as "that sensitive rectitude or refinement of judgment which we call taste." Genius was essential to success in the arts, but taste, or learning, was demanded of the architect, and it did seem that a certain respect for the practice of former times was desirable and necessary in him. There was great contention in the present day about styles; one cried out for something suited to the climate, another for a style nurtured in the country. The Germans, who had not long ago emerged from semi-barbarism, had sought in the stories of Wodin for a mythology to supplant the old;

New Books.

Old England. Edited and Published by CHAS. KNIGHT. London, 1844. Vol. I. THE first volume of this extraordinary work,

1

The first volume of this extraordinary work, which is literally what it professes to be, a pictorial museum of regal, ecclesiastical, baronial, municipal, and popular antiquities, is now completed, and includes the British period, Roman period, Anglo-Saxon period, and the period from the Norman conquest to the end of the reign of Richard III., A.D. 1485. It but the respect of ages was not yet to be set at naught, and the love of classic art would again prevail, let present opinion say what it would. In architecture, learning was essential, and the only safe course was, not by acting counter to, but in the spirit of those rules which ages had registered. The art was built on the accumulated evidence of former times; that calculated to satisfy the future must be founded upon the preceding. Pope had well said;

When first young Maro, in his boundless mind, A work to outlast immortal Rome design'd, Perhaps he seem'd above the critic's law, And but from Nature's fountains seomed to draws But when to examine every part he came, Nature and Homer were, he found, the same. Convinced, amazed, he checks the bold design, And rules as strict his labour'd work confine, As if the Stagyrite o'erlooked each line. Learn hence for ancient rules a just esteem, To copy nature is to copy them."

In the present day all styles were in request; the scholar desired to be reminded in his residence of the people the first in learning and in art; the titled possessor of broad lands erected the donjon keep in the pride of feudal times; each class had its particular association. The absurd turns which style had taken in our own recollection, were almost beyond our own powers of belief. The accident that made Sir Wm. Chambers a supercargo, first gave us the Chinese style; the work of Denon flooded us with the Egyptian; had Algiers or Mogador presented the least thing available, our neighbours, more susceptible than we are, would have taken it up. Fashion would have its day; it warped our taste; and the architect's only proper course was to have his buildings constructed upon permanent principles, recurring to history, and regardless of the fashion of the day. Pope said :—

contains no less than 1,390 illustrations, twelve of which are illuminated engravings, folio size, for a sum which is so small, as to put the book within the reach of all classes. Unlike what were called cheap books formerly, it may be depended on too, and we again say, conscientiously, that it is an extraordinary work. Amongst the illuminated illustrations are views of the interior of the Temple Church, Edward the Confessor's Chapel, at Westminster, Henry the Beauchamp Chapel, Warwick.

The subjoined specimen of the wood en-

Something there is more needful than expense, And something previous e'en to taste—'tis sense; Good sense, which only is the gift of Heaven, And, though no science, fairly worth the seven."

The efforts of professors were now more than ever necessary, as, without unwarrantable complaining, it must be said that the present state of taste was bad. He considered so from the absence of all originality, the complete indifference of the public to style, and the indiscriminate practice of all styles. Competition, in which the old and young were mixed up together, was also injurious to the interests of art. The art likewise suffered greatly from the undue influence of engineers, who were entirely utilitarian in art, caring nothing for taste, and absolutely riding over the architect. The beautiful balustrade of a bridge had been swept away entire by an engineer, and replaced with an unsightly wall, and without a remonstrance. The buildings of our greatest architeet did not escape. Nevertheless, there was all to hope from the future, and Barry's prediction might be held as true, that "he had lived a hundred years too soon." Great works had been impossible, and in one "glorious." war was spent as much as would have raised 800 public buildings. Royal patronage had done every thing for art abroad; it would be seen what public patronage could do in England, and it behoved the students to employ their time in such manner as to benefit the art.

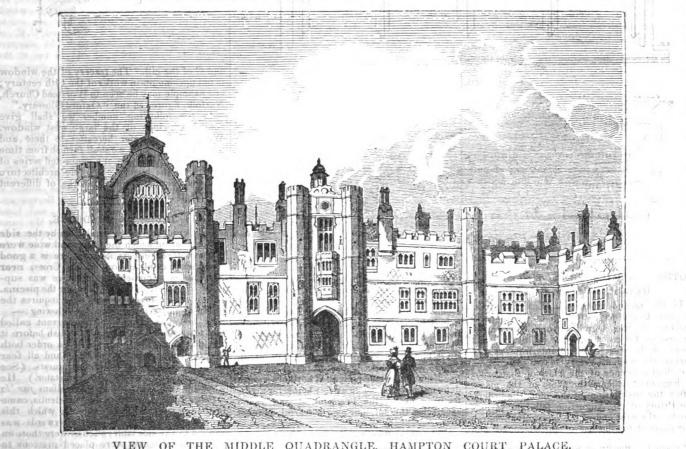

The lecture concluded shortly after nine o'clock, amidst the general applause of an attentive audience. We did not notice many of our older professional brethren amongst the professor's auditors; we trust they will attend his succeeding lectures, as their presence is a compliment which his services merit.

DRY ROT.

DAMP is not only a cause of decay, but essential to it; while, on the other hand, absolute wet, especially at a low temperature, prevents it. This latter must be understood to imply more than the partial immersion to which log rafts are usually subject; for that is a practice unquestionably injurious to the timber. Piling and planking under damp foundations, not-withstanding the incontrovertible instances which can be adduced of their long endurance, are practices decidedly bad; for the decay of the timber is little less than certain: the sinking of the superstructure must obviously keep pace with it, and the settlement being irregular, must produce fractures in the edifice. Again we say, if the wet is perfect, the result is otherwise. Old refuse-wood that has been is otherwise. lying about in timber yards, imbibing mois-ture from the earth, makes bad bearers for logs; for it is more or less decayed, and therefore infectious. To bed timbers in mortar, which is liable to continue long in a humid state, is bad ; under such circumstances decay may be expected: to prevent this chance, it was en-acted by the 19th Car. 2, cap. 3, that bond and plates, the ends of girders, &c., should be bedded in loam instead of mortar; it may be here remarked that sawn timbers are, in their sides, more subject to the influence of moisture than such as have been split; for, as the saw cuts through the fibres, the moisture is afforded more ready access; for this reason cleft pales are the most durable. Hasty finishing on damp walls delays drying, and must induce premature decay where timbers are confined : drying therefore should, in favourable weather, be accelerated by a free admission of air, and in the night by fires, but not too strong, for that would cause the wood-work to shrink and crack.

The confinement of timbers under most circumstances is attended with the worst consequences; yet a partial ventilation tends, as an able writer has expressed it, to "fan the flame" of decay, and hasten rather than prevent it: floors in general do not afford good facilities for ventilation, and are therefore very liable to decay : the joints of even well-ventilated framing frequently afford illustration of this; for when the timber has not been thoroughly seasoned, the moisture which there seeks escape, and (from the parts being neither perfectly close nor yet sufficiently open to allow dampness to evaporate) is confined, invariably induces decay. Timbering to basement floors, induces decay. Timbering to basement floors, and in close cellars, is destroyed in a very short time

Damp combined with warmth is, as a destroying agent, still more active than simple damp alone—the heat being understood as damp alone—the heat being understood as insufficient to carry off the moisture by eva-poration; and the higher the temperature, with a corresponding degree of moisture, the more rapid the decay. The kind of composi-tion produced in this way is called rot, and is of two kinds distinguished court and and is of two kinds, distinguished as wet rot and dry rot: these proceed from the same primary causes, the difference between them being constituted by the disparity in the evaporation; where that is free, and disperses the gaseous products of the putrefaction, we have wet rot; where there is not a free circulation of pure atmospheric air, to absorb all the moisture and carry off these products, they combine in the formation of a parasitical fungus called *boletus lachrymans*, belonging to the botanical class cryptogamia, and thus we have dry rot: of this serious evil it is important to be well aware :-

Dry rot, externally, first makes its appearance as a mildew, or rather a delicate white vegetation, that looks like such. This stage of the disease, if not one more advanced, is almost invariably found to be arrived at in the American timber brought over to this country in the confined and heated holds of ships; its next step is a collecting together of the fibres of the vegetation into a more decided form, somewhat like hoar frost; after which it speedily assumes the leathery, compact cha-racter of the fungue, forming into leaves, spreading rapidly in all directions and over all attain when once it takes root and is left un-arrested, we shall collect some scattered cases.

In the memoirs of Pepys, who was secretary to the Admiralty during the reigns of Charles II. and James II., reference is made to a commission which was appointed to inquire into the state of the navy, and from which it ap-pears that thirty ships, called new ships, "for want of proper care and attention, had toadstools growing in their holds as big as one's fists, and were in so complete a state of decay, that some of the planks had dropped from their sides." In the European Magazine for Dec., 1811, it is stated that, "about 1798, there was, at Woolwich, a ship in so had a state, that the deck sunk with a man's weight, and the orange and brown-coloured fungi were hanging, in the shape of inverted cones, from deck to deck." In the Transactions of the Society of deck." In the Transactions of the Society of Arts, vol. xxi. p. 294, we find that "an oak barn floor, which had been laid twelve years, began to shake upon the joists, and, on examination, was found to be quite rotten in va-rious parts; the planks, 21 inches in thick-ness, were nearly eaten through, except the ness, were nearly eaten inrough, except the outside, which was glossy, and apparently with-out blemish. The rotten wood was partly in the state of an impalpable powder, of a snuff-colour, other parts were black, and the rest clearly fungus. No earth was near the wood."

In timber which has been only superficially seasoned, and the heartward sap of which has never been discharged, this disease is produced internally, and has been known to convert the entire substance of a beam, excepting only the external inch or two of thickness to which the seasoning had penetrated, into a fine, white, and thread like vegetation, uniting in a thick fungous coat at the ends, the semblance being that of a perfectly sound beam, thus serving as a mask to mislead the inexperienced. In this internal rot, a spongy or fungous substance is formed between the fibres.

The first symptoms of rottenness in timber are swelling, discoloration, and mouldiness, accompanied with a musty smell; in its greater advance the fibres are found to shrink lengthways and break, presenting many deep fosures across the wood; the fibres crumble readily to a fine snuff-like powder, but retain, when un-

disturbed, much of their natural appearance. The prevention of dry rot, or growth of fungus, has engaged the attention of scientific men for a very long period ; and much floundering has there been in their meritorious endeavours towards accomplishing this desirable object. Some of the means tried, while calculated to prevent vegetation, were found to introduce evils as great as those they were intended to obviate; even now, although much has been achieved, it is to be feared it remains, in a great measure, a vexuta quæstio. The most favourite theory has been that of impreg-nating the pores of the wood with some such substance as should arrest putrefaction, and materials have sometimes been introduced for this purpose which produced an effect just the opposite of what was anticipated. About 1670 a Mr. Jackson, with a view to the prevention of decay, obtained permission to prepare some timber to be used in the national yards, by immersing it in a solution of salt water, lime, muriate of soda, potash, Epsom salts, &c., the result of which dose was, that the vessels built with it were rendered more perishable than if they had been constructed of unprepared timber. Between 1768 and 1773, a practice prevailed of saturating the timbers of ships v common salt, but this was found to cause a rapid corrosion of the iron fastenings, and to fill the vessels between decks with a continual damp vapour. Subsequently, mundic, found in the mines in Devonshire, was employed, in a state of fusion, to eradicate present, and prevent future growth; but whether its efficacy was proved by time, we have not been able to ascertain.

Quick-lime, with damp, has been found to accelerate putrefaction ; but when dry, and in such large quantity as to absorb all moisture from the wood, the latter is hardened and ren-dered durable; vessels long in the lime-trade have afforded proof of this fact. White-wash or lime-water has been strongly recommended for use between the decks of ships, as being unfavourable to vegetation. Smoke-drying, oven-drying, scorching, and charring, have the effect of hardening wood, contributing to its durability, and preventing and destroying in-fection; but they may only be adopted with timber which has previously undergone a thorough seasoning. Steaming is also un-

derstood to prevent dry-rot. The piles sup-posed to have been driven by order of Julius Casar, when he forded the Thames at Cowey Stakes, near Shepperton, were charred; and when taken up some five-and-thirty years ago, were found in a complete state, free from decay. The incorruptibility of charcoal is well known, whether it be buried in the earth, exposed to the atmospheric action, or to that of water; the beams of the theatre of Herculaneum, which were reduced to that state by lava, were, after a period of nearly eighteen centuries, found to be perfect; the charred feet of posts which are put into the ground afford proof of its efficacy; the flag-ship, Royal William, at Spithead, built in 1719, the inner charce of the planks of which only were charred, was an example of great durability. A mongst other advantages, rats will not touch charcoal, neither will the white ants and cockroaches, so common in the Indies, commit their depredations where charring has been employed.

But the methods which have most engrossed the public attention of late years are those re-spectively distinguished as Kyan's, Payne's, Burnett's, patents, &c. In the years 1833 to 1836, at the Arsenal, Woolwich, experiments were instituted, having for their object the es-tablishing or otherwise the claims of that first mentioned, and the results of which were of a very satisfactory nature: the Kyanised spe-cimens generally, which were submitted to the fungus-pit, when taken out at the end of three years, being sound, while duplicate pieces, unprepared, were found in various stages of decay. Certain questions, however, presented themselves:—lst, Whether the impregnation to which the timber had been subjected might to which the timber had been subjected might not be removable by some cause, and perhaps generate an atmosphere poxious and inju-rious to health. 2nd, Whether the strength of the timber were impaired or otherwise. The first was satisfactorily determined by Dr. Faraday, who proved by experiment that the combination was not simply mechanical but chemi-cal, and that a permanently compound material was formed; the second was solved by experi-ments made by Capt. Alderson, C.E., upon ash and Christiania deal, and which shewed that the rigidity of the timber was enhanced. but its strength in some measure impaired ; its specific gravity being also somewhat diminished. Another question yet remains open :--- how far, since the impregnation has not been traced to a depth greater than half an inch, does this process meet our requirements? and, after the atisfactory conclusion arrived at, as above related, and the evidence of the facts upon which it was so reasonably founded, how are we to meet the assertion of Mr. Pritchard, C. E., of Shoreham, made in 1842?--- "The sleepers Kyanised five years ago, and in use at the W. I. Dock warehouses, have been discovered to decay rapidly; and the wooden tanks at the Anti-Dry-Rot Company's principal yard are decayed:" but more from this gentleman here-after. Mr. Kyan's infusion is corrosive subliafter. Mr. Kyan's infusion is corrosive sublimate, and the process consists in submersing the timber in tanks for about a week, then taking it out and drying: Sir Humphey Davy had previously recommended a weak solution of the same thing, to be used as a wash where rot had made its appearance. Dr. Birkbeck made a favourable exposition of the process as pursued by Mr. Kyan; Sir John Barrow and the Duke of Portland impugn it; and Lord Manners and Dr. Moore follow on the same side. The Paynising process, besides profess-ing to preserve timber from dry-rot and the ravages of insects, is said to render it unin-flammable, or at least to deprive it in a great flammable, or at reset to a measure of combustibility. JAMES WYLSON.

ALTAR-PIECE, ST. JAMES'S CHURCH, BER-MONDSEY .- About seventy sketches, it is said, were submitted to the committee in reply to their advertisement. The successful competitor is Mr. John Wood, of Charlotte-street, Fitzroy-square. After the picture is painted, however, the premium will not be paid, unless referees, to be appointed, shall pronounce it worth the sum offered, 500%. STATUE OF PRINCE ALGERT.—A committee of the most influential merchants of the city is

in course of formation to erect by subscription a full-length marble statue of Prince Albert, in the Royal Exchange, in commemoration of his having laid the first stone.

THE BUILDER.

ON TIMBER SCAFFOLDING FOR BUILDINGS.

By THOMAS GRISSELL, Assoc. Inst., C.E.

From the Proceedings of the Institution of Civil

In adopting the principle of timber scaffold-fing for buildings, in preference to poles and ropes, Messrs. Grissell and Peto, the con-tractors, were influenced by considerations of saving both time and expense. They had long been impressed with the want of scientific principle exhibited in the ordinary scaffolding, and were more readily induced to turn their attention to that now referred to, which they believe to be an essential improvement, and calculated to be of considerable advantage to

contractors on large works. The author is well aware of the progress which has recently been made by the civil engineers and architects of this country, but he ventures to claim some share of merit for the practical builders, to whom is committed the execution of the works designed by the engineer and architect; and when a review is taken of the stupendous public works which have been executed within the last few years, it is evident, that without the exercise of great skill, and the introduction of new modes of reducing fabour, the amount of work could not have been executed within the time.

The necessity for this reduction of labour on large works had been long felt in the north, and methods had been adopted in consequence, to emulate which, this timber scaffolding was to emulate which, this timber scatfolding was introduced to London. The system had been employed, in rather a rude form, by Mr. Tomkinson of Liverpool, in his quarries and stone yards, for moving stones of large di-mensions. Scatfolding of a somewhat similar kind wiss used in the erection of the Arc de Triomphe, Barrière de l'Etoile, and at the Eglise de la Madeleine, at Paris.* The first time it was used by the author's

firm was for the erection of the Reform Club-house (Pall Mall), under Mr. Barry, in 1838; then at the large graving-dock at her Majesty's Dock yard, Woolwich, under Mr. Walker (Pres. Inst. C. E.), in 1839; and it is now employed very extensively at the New Houses employed very extensively at the New Houses of Parliament. In these constructions its general applicability was proved, and in the erection of the Nelson Column (commenced in 1840), where it was carried up to the height of 180 feet, its stability at a considerable elevation was fully tested. Its usefulness is manifested by the facilities which it affords to the work then on vertical action in buildings of chose the workmen, particularly in buildings of stone. By its aid, and with the travelling machine at its summit, one mason, or 'setter', can set as much work in one day, as was formerly done in three days; whilst at least six labourers are dispensed with, who, with the old mode of despensed with, who, with the old mode of scaffolding, were always required to be in attendance. It is also well known that scaffolding poles and cords are not only ex-pensive, but are subject to rapid decay, and after a few years' wear become useless; in fact, the scaffolding of a moderately extensive building costs a large arm who first are fact, the scanolaing of a moueratery extensive building costs a large sum when first pur-chased, but it is almost valueless after a comparatively short period of time. Such is not the case with the timber scaffolding, which may be said to be of no greater cost to the contractor than the expense of its erection, which will not exceed in any ordinary case three-pence per foot cube. It is not secured three-pence per toot cube. It is not secured together by either bolts or spikes, so that the waste is trifling; and after having performed its daty as a scaffold, it may be removed piecemeal into the building, at the level of each floor, and be used directly for constructing the most and the interval momentum of the the roof and the internal carpentry of the structure. The timber having become seasoned by its exposure to the weather, is consequently ter fitted for immediate use.

These advantages have been proved in the buildings which have been mentioned, and sfter an experience of more than five years, the author strongly recommends the adoption of the system. He also advises its use in

• The square timber scaffolding was employed by Domenic Festma, in 1566, for the erection of the Egyptian Obeliak in frast of Sc. Peter's at Rome. The means employed in that work are shown in detail, in engravings, dated 1586, in the procession of Mr. Allen, at the New Houses of Parliament, and they are described with many other methods of using square imber scaffolding for external and internal construc-tions in the "Contignationes, ac pontes Nicolai Zabaglia un cam quibusdam ingeniosis praxibus, ac descriptione transisis obelisti Vaticani, aliorunque, per Equitem Dominicum Fontana susceptes. Romse, 1743."

moving and working large stones, either for permanent erections, or in masons' yards. If used on a wharf the rent would soon be saved in labour, and by allowing the stage to project 8 feet or 10 feet over the river, the scaffolding would be found to answer the purpose of a erane.

crane. The scaffolding at the Nelson Column, designed by Mr. Allen, under whose direction the work was executed, was composed of sills, uprights, cross-heads, longitudinal timbers, braces, and struts, which were used whole, without sawing; the upright timbers were slightly tenoned into the horizontal timbers, and the junctions were secured by iron dogs driven into the timber diagonally across the joints. This mode was preferred to bolts or spikes, on account of the ease with which they could be withdrawn, and because the timber was not into the timber diagonal of the could be withdrawn. injured. The base of the scaffold was 96 feet square, exclusive of the raking-braces; the height of each stage varied from 48 feet to 21 feet, upwards; and the total height was about 180 feet. The total amount of timber in the scaffold was 154 loads, or 7,700 cubic feet, and the cost of its erection was 240%.

Its stability was secured, at the height to which it was carried, by using flying windbraces, supported upon cross transoms, running outwards about 6 feet beyond the perpendicular of the scaffold at each stage.

Mr. Nicholson remarked, that a scaffolding of a similar description was used in 1837 by Mesers. Cubitt (Gray's-inn-road), for erecting the entrance gateway of the London and Birmingham Railway (Euston-square).† It was composed of two arallel rows of whole timber uprights, 50 feet high and 17 feet apart, surrounding the building (Fig. 1); these were well stayed by diagonal braces, and a tramway was formed on the top of each was formed on the top of each row, by horizontal sill pieces, bolt-ed down and secured by plates. The building work was executed by the aid of travelling carriages upon the tranways, and when the masonry had reached the height of the first scaffold, a second series of uprights and sills was added, making the total height 90 feet, which enabled the work to be completed without an accident.

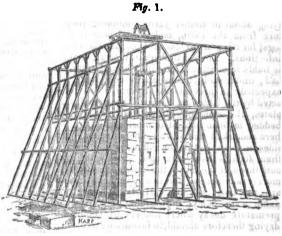

Mr. Harrison believed, that a scaffolding of a somewhat similar construction was used by Messrs. Rennie, at the Vic-tualling-yard at Plymouth, in 1826.

Mr. Rennie said, that the scaffolding employed for rais-ing the statue and other heavy parts of the work, at the Vicparts of the work, at the vic-tualling-yard, was on the der-rick principle, and was some-what similar to that used for erecting the Commemoration Column at Devonport (Fig. 2).

Mr. Grissell stated, that when writing the account of the scaffolding at the Nelson Column, that which had been used by Messrs. Cubitt, at the entrance of the London and Birmingham Railway, had en-tirely escaped his recollection; he now remembered it perfect-ly, and was happy to have the opportunity of acknowledging that fact. He could not speak too highly in praise of the system, and he thought its advantages had, as yet, been under-rated. The waste of timber was comparatively nothing; while serving as scaffolding it was becoming seasoned, and like that at the Nelson Column, could be immediately worked up, in situations demanding dry timber. The cost was one-half, and sometimes one-third, of the ordinary kind of scaffold, if the loss by the rotting and de-struction of poles and cords was taken into account. The saving of labour in raising the mate-rials was very great, particu-larly where weights of from 8 tons to 14 tons were required to be lifted. If steam power had been used at the Nelson Column, a still greater saving would have been effected.

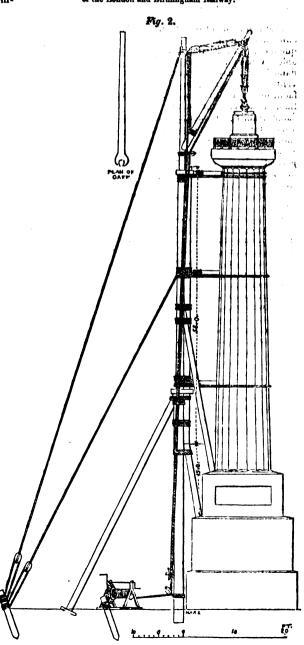

Another considerable advantage was the freedom from danger to the workmen; during five years, in all the works where he had used this kind of

† In the "Drawings of the London and Birmingham Railway, by J. C. Bourne" (Ackerman and Co.), two views are given of this scaffolding.

Scaffolding used for building the entrance of the Euston Square Station of the London and Birmingham Reilway.

Derrick used for building the Commemoration Column at Devonport.

scaffolding; only one man had been killed. That accident occurred at the Woolwich Graving Duck, when a men was thrown from the travelling carriage by the handle of the winch striking him, from his having omitted to put on the break.

to put on the break. He believed, that this description of scaf-folding might be safely carried still higher than at the Nelson Column, for although be-fore the statue was hoisted, he had felt some-what anxious, and had thought of attaching guide chains, and using other precautions, the fabric had stood so well, that he should not now

fabric had stood so well, that he should not now hesitate to go to a greater height, relying upon the scaffolding alone. Mr. O. H. Smith had adopted the system of the travelling winch on a framing, with great advantage in his earving room, for moving the heavy blocks of stone, from which the capitals of the columns for the Royal Ex-change were cut. Without such mechanical assistance, he could never have executed his task within the required time, nor could the capitals have been raised and placed on the carriages, to be conveyed away, without much capitals nave over raised and placed on the carriages, to be conveyed away, without much danger of isjury. Mr. Giles said, that Corby Bridge, over the Eden, on the line of the Newcastle and

Ourliele Railway, was built by Mr. Denton, the contractor, by means of whole timber scaffickling put together in three stages. The bridge consisted of five arches, of 80 feet span each; 100 feet in height, and contained 400,000 feat of stone-work which was executed with feet of stone-work, which was executed with the greatest facility, chiefly owing to the con-venience afforded by the scaffolding, and with-out any accident, excepting to the foreman, who fell twice from a considerable height, but mately was not killed.

Mr. Fowler said, that the scaffolding at the Cathedral at Cologne was of whole timber; there was little doubt, that the system was very similar to that which was employed when the building was commenced, in 1248. The erane which was used in raising the naterials still remained on the summit of one of the towers ; it was once removed, but was speedily restored to its situation, as the superstitious fears of the inhabitants of Colegne were excited by the occurrence of a storm immediately consequent upon the re-moval of the grane. It had subsequently been constantly repaired as it decayed, so that at present little of the original remained, but the present little of the original remained, but the form was still the same. He believed, that the susteriads for the York Column (Carlton-terrace) were raised by a kind of travelling carriage, on the top of the scaffolding. Mr. Hawkins observed, that the scaffolds

med at Vienna, for the erection of any building of importance, were always constructed of whole timbers, secured together by ' dogs.' In 1837 he superintended the erection of an ex-tensive sugar-house at Vienna, where such scaffolding was used.

Mr. Colthurst stated, that at Devonport there was a column built of granite from Hol-man's Hill Quarry, near the Tamar. The shaft was 11 feet in diameter; its height, from the bottom of the shaft to the top of the capital was 65 feet 4 inches. The total height of the column, with its inferior and crowning pe-destals, was 101 feet 4 inches. Its height above the street, including the rock on which it stood; was 124 feet. The abacus of the capital was composed of four stones, each weighing between 3 and 4 tons.*

The stones of the column were raised and set, entirely without the use of scaffolding, by set, entirely without the use of scaffolding, by means of a series of tall spars joined together (Fig. 2); the lowest, being fixed into the ground and braced by diagonal picces, was lashed and strutted to the lower part of the shaft. A gaff, with a jnw at the lower end, was then elung in the throat by a strong rope or chain, so as to work round the upright spar, in the jaw prepared for this movement; from the end of the gaff, blocks and a fall were suspended, in such a manner as to command every part of the work, by raising or depressing the point of the gaff, to increase or dimi-uish its range. Crab winches sufficed to ruise the stones ; and it was stated that the work was executed in a very short time.

Mr. Rendel had seen this column while in course of construction; the derrick appeared to act well, and it was certainly a cheap mode of raising the materials.

Vide "The Public Buildings erected in the West agland ;" by John Foulston. 4to. 1638, pp. 57 and 59.

Mr. Smith said, that in a recent visit to Liverpool, he had observed an ingenious mode adopted by Mr. Tomkinson for raising building materials, which almost superseded the use of external scaffolding. It consisted of a very high double "derick" placed upon wheels running on a tramway laid parallel with the walls of the building; the head of the derick curved over towards the wall, and steam power was employed for raising the materials, which appeared to be accomplished with rapidity. The president remarked, that the institution always viewed with pleasure papers descriptive of the webbel de latet the series of weaks desired her significant the significant the significant the significant the series of weaks descriptive of the series of the series of the significant the significant terms of the series of the series of the significant terms of the series of the significant terms of the series of the series of the series of the series of the significant terms of the series of the significant terms of the series of

of the methods adopted by contractors in the execution of works designed by civil engineers or architects. The profession was much indebted to the practical skill and intelligence of the contractors, and it would be extremely interesting to find recorded in the "Minutes of Proceedings" of the institution the names of the inventors, and the dates of the introduction of such ingenious modes of accomplishing works of magnitude as had been described by Messrs. Grissell and Peto. This could only be arrived at by either the engineers or con tractors sending the necessary information, or by their giving it during the discussions at the meetings.

General Pasley described the method adopted by Mr. T. Slacks (Langholm), for building the obelisk which was erected on the Whitaw, Eskdale, to the memory of the late Major-General Sir John Malcolm, a native of that district.*

The obelisk, which was of white sand-stone, was carried up to the height of 100 feet above the foundation; it was built hollow, with thorough courses at intervals; through the centre of each of these courses was left a circular hole. In the lower of these holes was placed the foot of a pole 40 feet long and 10 inches diameter; the next hole above holes was placed the foot of a pole 40 feet long and 10 inches diameter; the next hole above served as a stay, whilst the upper one supported the whole weight, as around the poles was firmly fixed a collar of hard wood. Beneath this collar 17 metal balls, 31 inches in diameter, were introduced, which, running in corresponding circular grooves in the collar and the thorough course, enabled the pole to revolve easily. Across the top of the pole was mortised a beam 12 feet long and 12 inches square, in the form of the letter T, and it was strengthened by diagonal iron braces and straps. By means of a crab winch with a rope passing over pulleys in each end of the transverse beam, the stones, were raised to the requisite height, and by a traversing carriage on the beam, a small crab, and the pulleys, the stone was enabled to run inwards to the spot for laying it. The crane was raised as each bond or thorough course was fixed, and the time consumed in the oversetion of moving it did not exceed two hours.

crane was raised as each bond or thorough course was fixed, and the time consumed in the operation of moving it did not exceed two hours. This crane had been found very efficient, and had greatly reduced the cost of building the obelisk, which was completed in less than twelve months. For the ingenuity displayed in this simple modification of the balance crane used by Mr. Stevenson, at the Bell Rock Lighthouse, and for a clever banging scaffolding used for completing the pyramidal top of the obelisk, the gold Isis medal was voted to Mr. Slack, by the Society of Arts, in 1836-7. A model was exhi-bited of a moveshe

bited of a moveable derrick crane (Fig. 3), which had been pre-sented by Mr. How-kins. It was used by kins. It was used by Mr. Wightman at the works of the Granton Pier, Edinburgh, and was stated by him to be very superior to any other kind of crane. It consisted of a vertical post, supported by two timber backstays, and a long moveable jib, or derrick, which was hinged against the post, below the gearing; this jib was held by a chain, passing from a barrel over a pulley at the top of the post, in such a manner that the extreme end of the jib could be raised almost vertically, or be low-ered nearly to a horizontal position.

The chief advantage it possessed over the old gibbet crane, was, that it commanded concentric circles of from 10 feet to 60 feet radius, which was of great use in large works, as it could extend its sweep over a circle of 120 feet diameter, without being moved from its position; whereas, the old gibbetcrane command-

Derrick crane used at Granton Pier (Edinburgh).

ed only one circle of comparatively limited extent, and in moving it, as the works proceeded, there was a considerable loss of time.

there was a considerable loss of time. Mr. Brenner stated, that he had seen the crane at Granton Pier; it was a very useful machine, and the only fault he could find with it, was, that in an exposed situation, there was a risk of the wheel-work being destroyed. He believed, that the contractors had found much advantume from it was much advantage from its use.

Much advantage from its use. Mr. Bremner had used, at the works of Lossiemouth Harbour, a crane of a somewhat similar description. The jib was composed of two spars, with the hoisting-chain working between them; the radius of its sweep was 60

Vide Trans. Soc. Arts, 1836-7, vol. li., page 78.

feet, so that any spot, within a circle of 120 feet in diameter, was fully commanded by it, and that extent of work could be completed without moving the crane.

Mr. Gale presented two drawings of im-proved moveable jib-cranes, the alterations in which had been suggested by the serious accidents which had occurred from the failure of the ordinary cranes. On investigating the circumstances con-

nected with these accidents, he found that in general they had arisen from the snapping of the jib-chain. After numerous experiments, it occurred to him that this defect might be occurred to him that this defect might be obviated by attaching the jib-chain to the top of the post, instead of fixing it to the end of the jib: this alteration was productive of great

advantage; the strain was found to be less than one-half that of the single jib-crane, and it consequently required fewer men to work it.

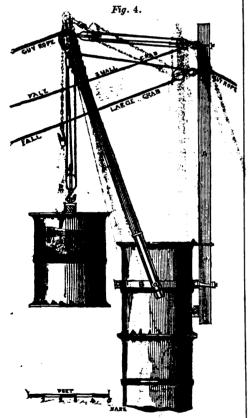

had also applied a rope instead of a He chain for working the jib, as it was preferred by some builders, and he had also made some minor improvements in the other parts of the cranes.

These kind of cranes were, he believed, in-troduced by Mr. W. York, at Glasgow, in the year 1833, and Mr. Gale had used the improved sort in 1842, at the erection of the New Court Houses, Glasgow. Since that time many builders had adopted them, and their adventages were becoming daily so evident, that he would send, early in the ensuing session, a paper descriptive of them.

Mr. Thomson believed, that cranes of this description were first used at Glasgow by builders. The contractor for the Grange-mouth Docks, under Sir John Macneil, em-ployed them in 1841 and 1842 with much advantage; he thought them the most useful kind of crange for general work kind of cranes for general work.

The President agreed in the opinion of the general utility of the cranes; he had been so pleased with them, that be requested Mr. Howkins to present to the Institution the model of that used at Granton Pier. With respect to the date of the introduction of the respect to the date of the introduction of the swinging-jib, or moveable derrick crane, it was used at Granton Pier by Mesars. Orrell, of Liverpool, in 1838, and he believed, that it had been commonly used by them for some time previously.

Wicksteed presented a drawing of kle used in elevating pipes of the Mr. the tackle used in elevating pipes of the "stand-pipe" of the East London Waterworks (Fig. 4). A piece of timber (A),

Tackle used in elevating the pipes of the "Stand-pipe" the East London Water-works.

9 inches square, was attached vertically to the upper flanch of the pipe, and held below by an iron girdle (B), which encircled the body an iron girdle (b), which each clear the body of the pipe; guy ropes were attached to the top of the upright, which served as the points of suspension for the snatch blocks, through which were passed the fall ropes from the large and the small crab winches. The iron girdle had at its opposite sides two pivots, which traversed the lower end of two timber jibs (C), connected at their upper ends by a cross piece (D), from the centre of which were suspended the blocks and tackle con-nected with the large crab, by which the pipes When each pipe had arrived at were raised. its height, the jib frame was drawn up verti-cally by the tackle from the small crab, and the pipe was lowered to its position ; the pins were put into the flanches, and the whole apparatus was raised and attached to it, in order to use it for raising the next pipe. This process was

repeated until the stand-pipe was finished at a height of upwards of 130 feet. It was stated to be a very simple and economical mode of proceeding.

Corresvondence.

TUBULAE CHIMNEY-FLUES. SIR,—Observing in THE BUILDER a con-troversy respecting tubular chimney-flues, I beg to acquaint you that tubular chimney-flues were introduced here at Abbotsford, by John and Thomas Smith, of Darnick, in the year 1822, and I never saw or heard of them before that time that time.

Their flues were in pieces of 12 inches high, and from 9 to 15 inches diameter in-They were made of a mixture of fine side. clay and common clay, about 14 inch thick. To form the inflections, they were made a little off the square on one end, so that when put together, they formed a curve.

Since that time these flues have been very much used in this neighbourhood .-- I am, Sir, your most obedient servant,

A CONSTANT READER. Melrose, 10th January, 1845.

THE WINDOW-TAX.

-I have just made a Venetian window of SIR, three lights, divided by two 14 inch mullions, for which the opening between the out-side brickwork of the whole window is 4 feet 9 inches. The boxings are placed in the usual way in the reveals, and the window frame is seen on the inside, and makes the window there, including the frame, more than 5 feet 6 inches wide. The height of the whole frame, including head and cill, is 7 feet 6 inches.

Is such a window liable to be charged as a double light under the Window tax Acts? And if so, why? — Your answer will oblige, A JOINER.

Oswestry, Jan. 13, 1845.

[Windows above 4 feet 9 inches in width between the reveals, are charged as double lights; except in shops, workshops, and ware-houses, or in the public room of any house licensed to sell liquors by retail or in farm-houses especially exempted from the duties on houses.—ED.]

BLISTERS IN LIME. SIR,-May I beg the favour of inserting the following in your excellent journal, BUILDER :-

servant. W. S. S.

[Is the lime in question properly prepared? Blisters usually result from the lime not being thoroughly slaked before it is used. Some limes crack in drying, when slaked with too much water. They cannot combine with the fluid, and when this is withdrawn by evaporation, shrinkage takes place .--- ED.]

MODEL (?) HOUSES, PENTONVILLE.

SIR,-The public is much indebted to you for your comments on the so-called model houses in the Bagnigge-wells-road. Pray do not relax in your efforts to effect an alteration in them. The present plan is perfectly preposterous.-Your obedient servant.

A MEMBER OF THE SOCIETY. We shall not fail to return to the subject shortly.-ED.]

ANOTHER FIRE FROM OVER-HEATED FLUE. -On Tuesday night, shortly after 10 o'clock, police constable Reeve, perceiving smoke issuing from the lower part of the extensive pre-mises in the occupation of W. Thomas and Brothers, 128 and 129, Cheapside, gave an immediate alarm to the engine station at Watling-street. Mr. Braidwood and two Watling-street. Mr. Braidwood and two engines from that establishment were soon upon the spot, and upon an entrance being effected, it was discovered that the flue of the apparatus for warming the premises had been over heated, and was communicating with the timbers of the flooring underneath the shop. The discovery was most opportune; as it is, however, considerable injury is done by smoke and water.

Miscellanea.

WAREHOUSING. --- There is now a warehouse in the course of erection in Manchester which seems deserving of especial notice on account of its extent, as well as its mode of construction. It is the property of Mesars. Philips, and Co., the oldest, wealthiest, and certainly the most respectable firm within the borough. Its site is in Church-street, and adjoining their present large establishment. Its basement story is equal to that of Measre, Watts, within a few superficial yards. The area of the various floors will be within a shade of a statute acre, whilst the entire concern would cover over two statute acres. The building is to be completely fire-proof; not building is to be completely fire-proof; not an inch of timber will, it is said, be used in its construction. It is built of the best stock dressed brick, and instead of plastering the inner walls, the inside brick-work will be faced with dressed stock-brick, similar to the outside, with this difference, however, that the inside facing will be laid in Roman consent, thus making the inner walls impervious to damp-a great desideratum in a *holmetherhork* damp-a great desideratum in a haberdaahory concern like this. It is somewhat singular It is somewhat singular that the Messrs. Philips should have been the first to introduce firs-proof cotton-mills-the first, too, to introduce gas into a cotton-mill; which was effected in 1801-2, to a large extent, -and also to be the first to build a fire-proof warehouse, for the first it will be in Man-chester, that has been erected for the sale of

goods only.—Doncaster Gazette. WILTON.—We understand that the internal decoration of the church building at Wilton, at the expense of the Hon. Sydney Herbert, M.P., is to be completed by Mr. Willement; in the style of the Temple church. We be-Register. MOVING BRIDK HOUSES. --- The Boatch

Daily Advertiser of the 20th alt says, # A very neat and successful operation was performed in Lincoln-street, in the removal of a block of two large three-story brick dwellings a distance of some 10 or 15 feet, for the widening of the street. The new foundation for the houses had street. The new foundation for the houses had been of course previously prepared, and the houses themselves were placed on a source of railway, preparatory to their removal. The movement was effected by measure of juck-screws, acting in a horizontal direction. The construction of the tracks or ways was novel and extremely simple. They consisted of double lines of cast-iron plates, inserted be-tween the foundations of each of the walls of tween the foundations of each of the walls of the building itself; and for wheels, or rollers, cannon balls of equal size were placed between the two lines of plates—the upper plates being inverted. As the foundations of these ways consisted of the original foundation of the building, there could of course be no hasard of yielding, as the whole building rested on walls of equal size: it was moved without any walls of equal size: it was moved without any dislocation or cracking of the walls in any part, or of the finishing. The operation of remov-ing the building was performed under the direction and superintendence of Mr. Preston, of the Board of Aldermen, and has been ad-complished with entire success. We under trad elec thet it has here done at a way stand, also, that it has been done at a very moderate expense, compared with the advantage gained of placing the whole edifice on its new foundation without the slightest injury, and without hazard of serious accident."

FIRE-PROOF CONSTRUCTION .--- At the con-clusion of the inquest on the bodies of the sufferers in the late fire in Guildford-street, and before the jury separated, Mr. Geary, the ar-chitect, exhibited the model of a house, which he said was so far fire-proof as to ensure the saving of life. Its chief merits consisted in brick partition-walls, instead of lath and plaster, and in having the panels of the doors of sheet-iron. This confined the fire in whatever room it occurred. He stated, that this mode of building was not more expensive than the lath and plaster one usually pursued in London.

IMPROVED SYSTEM OF DRAINAGE It is so currently reported and believed that Government, during the approaching session, intend to introduce a Bill for the improvement of the system of draining towns, that, in some in-stances, works, which otherwise would have been commenced, have been postponed,

ARCHITECTURE AT KING'S COLLEGE. Professor Hosking will resume his course on the arts of construction on Friday, the 24th, at 4 o'clock, and will continue it at the same time on every succeeding Tuesday and Friday throughout the term. We hope to find it well attended.

36

VACANT CHAIR AT UNIVERSITY COLLEGE. -The professorship of civil engineering at this college being vacant, candidates are requested to send in applications and testi-monials on or before Friday, the 14th of February.

PUBLIC PARKS .- The subscription in Manchester for public parks, &c., now amounts to nearly 30,000%.

THE IRON TRADE.—This important branch of our manufactures is in the most thriving condition which its best friends could wish. condition which its best friends could wish. We noticed an increase of 10s. per ton on manufactured iron in the early part of last month. On Friday, the usual preliminary meeting of iron masters was held at Dudley, in order to fix the prices of iron for the ensuing quarter-day, when a further increase of 10s. per ton was agreed upon. The Great North of England Railway Company's contract for 6,000 tons of rails has been taken by the Bishopwearmouth Iron Company, at Sunder-land, and Messrs. Blockow and Vaughan, of Middlesbro' Ironworks. at 7L 15s. per ton. Middlesbro' Ironworks, at 7L 15s. per ton, which is a considerable advance on the late quotations .- Bristol Journal, Jan. 4.

NOTICES OF CONTRACTS.

For the erection of a Wesleyan Chapel at Hythe. - Mr. T. Pilcher, Stationer, &c., Hythe. January 21.

For making a Sewar in the town of Cambridge. The sewer to be cylindrical, and 2 feet diameter in the clear, the length will be about 385 yards, and the average depth about 9 feet.—Frederick Randall, Town Hall, Cambridge. January 21.

Town Hall, Cambridge. January 21. For Warming and Ventilating the new Build-ings of the Suffolk Lunatic Asylum; and for fitting up the laundry with Drying Apparatus, upon the most approved plans.—John Henry Borton, Milton, Suffolk. January 21.

For the Erection of Stone Booking-offices at Ashton and Stalybridge Stations; and for the Erection of a Station at Sheffield for the Sheffield

and Manchester Railway Company. January 21. For supplying the East-India Company with Tin Plates. — J. D. Dickinson, Dep. Sec., East-India House. January 22.

For the erection of the Railway Works between Loeds and Bradford, including fencing, earthwork, masonry, roads, and permanent way.—William Clarke, Secretary, Hunslet-lane Station, Leeds. Japuary 27, 1845.

For the erection of a New Pauper Lunatic Asy-lum at Clifton, near York. — Messrs. Scott and Moffatt, Architects, 20, Spring Gardens, London; or Mr. J. Holtby, J.ow Ousegate, York. January 28.

For the execution of Works on the Chester and Holyhead Railway.—1st. A distance of eight miles, or thereabouts. 2nd. A distance of twenty-two miles, or thereabouts. 3rd. A Tunnel through the George King, Secretary, 62, Moorgate-street. January 29, 1845.

For the Execution of Works on that part of the Blackburn and Preston Railway extending from Blackburn to Pleasington, being about 34 miles in length.—Peter Sinclair, Secretary, Blackburn. January 29.

For the supply of Wrought Iron Rails and the requisite number of Chairs for about 15 miles of the Southport and Euxton Junction Railway. The weight of rails to be from 60lb. to 70lb. per lineal 2 yards and 15 feet lengths, equal to thom Job. per linear 1,800 tons of wrought iron, and about one-third of that quantity of cast iron.—Woodcock and Part, Solicitors, Wigan. January 31.

For erecting the Works of the third division of the Main Line of the Great Southern and Western Railway, being 11 miles, 6 furlongs, and 75 yards in length. Also for the first division of the Carlow branch, being 10 miles, 7 furlongs, and 160 yards; comprising excavation, embankments, bridges, cul-verts, &c.—William Taylor, Secretary, 3, College Green, Dublin. February 1.

For the formation of 4 Miles 561 Chains (single line) of the Ashton, Stalybridge, and Liverpool Junction Railway.—John Jellecorse, Secretary of the Manchester and Leeds Railway Company, Palatine Buildings, Hunt's Bank, Manchester. February 3.

For the erection of Alms' Houses in Foundationstreet, Ipswich. - Mr. J. M. Clark, Brook-street, Ipswich; or Mr. Notcutt, Solicitor, Ipswich. February 1.

For the erection of a Bridge, called White Bridge, at Grasmere, near Ambleside, Westmore-land. — Mr. George Robinson, Bridge Surveyor, Kendal; or Mr. Daniel Donaldson, Ambleside. February 4. For the construction of the several Stations and

Railway.-Mr. Andrews, Architect, York; or Mr. George Baker, Secretary, Railway Office, York.

February 5. For the erection of a Steam Boat Pier at the

For the erection of a Steam Boat Pier at the Quay on the north-east side of Blackfriars' Bridge, also for building a Decked Lighter or Dumby.— Town Clerk's Office, Guildhall. February 6. For erecting and completing the Lower Sluice and Sluice-Pit at the top of the Eau, Brink Cut, about 4 miles above Lynn.—Messrs. Walker and Burges, 23, Great George-street, Westminster; or Mr. George Game Day, Clerk to the Middle Level Drainage Commissioners. St. Ives. February 10.

Drainage Commissioners, St. Ives. February 10. For the erection of New Buildings in Pembroke College, Oxford. — Plans, &c., prepared by Mr. Haywood, Architect, may be seen at the Master's

House. February 11. For the supply of 11,000 feet of nine-inch cast-iron Pipes for a new line of Aqueduct to be laid in the Island of Malta.—Vin. Casolani, Collector of Land Revenue, Office of Land Revenue and Public Works, Valletta, Malta. March 31, 1845.

COMPETITIONS.

Plans and estimates are required for a Pauper Lunatic Asylum for the County of Somerset; the building to accommodate 300 patients, and to con-tain two Stories. The Committee of Visiting Magistrates wish it to be of a plain, cheerful character, but will not further fetter the architect by suggesting any particular arrangement as to the in-terior, its ventilation, warming, or otherwise. The ground selected contains 36 acres.—The Clerk of the Peace, Taunton. A Premium of 1001, will be adjudged for the best plan, and 501. for the next best. January 22 best. January 22.

The Committee for Building a Chapel at Hol-loway are desirous to receive Designs for their intended building. The style to be Gothic. The Committee pledge themselves to select for their Architect the gentleman whose design they shall prefer.—George Brooks, Esq., 1, Lansdowne-place, Holloway. January 31.

Plans and estimates are required for a Work-house, to contain about 1,180 persons. The whole to be done in a plain and substantial manner, with-out any expensive embellishments. The plans and architects' estimates to be sent to Robert Mercer, the Clerk of the Clifton Union, Pennywell Road, Bristol, on or before the 17th of February next, and the Board of Guardians will adjudicate on the 28th. The architect producing the best plan in the estimation of the Board will be employed at a sum not exceeding 5 per cent. on the outlay, and a gratuity of 25 guineas will be given to the architect producing the second best plan in the opinion of the Board.

APPROACHING SALES OF WOOD, &c.

BY AUCTION. January 22.—At Oakwood Farm, Radwinter, Essex; 175 Oak Trees, of good dimensions.—Mr. Martin Nockolds, Auctioneer, Saffron Walden, Essex.

January 24. — At the Methuen Arms Inn, Corsham, Wilts; 399 Oak, Ash, Elm, Beech, Walnut, and Apple Trees, most of them of unusual large dimensions, and clean, straight, and lofty growth. — Messrs. Giller and Son, auctioneers, Corsham.

February 25 .- At the King's Arms Inn, Hemel February 25.—At the King's Arms inn, Hemel Hempstead; a large Fall of capital Oak, Ash, Elm, and Beech Timber Trees, the greater portion of which are of very large dimensions and superior quality.—Mr. James Adams, auctioneer, Clarencestreet, Staines, Middlesex. *** The Sale at Elmer Farm, noticed in our

last number, is postponed for a short time. Due notice will be given of the day when it will take place.

TO CORRESPONDENTS.

"A Young Architect (Sheffield)."—The Wes-leyan Chapel at Battersea is hardly commenced. The architect is Mr. Andrew Trimen, the con-tractor Mr. John Sugden. "T. M. O." asks us which is the best office in which to effect an insurance against fire. There are so many good offices, it would be invidious to name one. The Alliance, the Phænix, the Sun, the arcs envalue respectable

Sc. are equally respectable. "C. P." is thanked for his drawing of the Doorway to Hedingham Castle. He will do better before long.

"W. C. P."—The height of the nave of the Church of SI. Vincent de Paul, as elated in our article headed "Church Architecture in Paris" (p. 3), is quite correct, great as it may seem, namely, 96 feet. The portico is lower than the body of the church. We have not the dimensions of it, but should estimate its extreme height at about 70 feet. The quotation alluded to is from a description of the church, published with the sanction of the architect, M. Hiltorff, "Au Bureau de l'Illus-tration," Rue Richelieu, Paris, 1844. "Mr. Rogers" is thanked; we were not able to

avail ourselves of the information.

"T. and W. Stirling."-Received. "Rusticus."-The Act cannot be obtained till

the opening of Parliament. "H.S." will appear. "Architectural Draughtsmon's Society."-The place of meeting is No. 33, Southampton-street Strand.

"F. C. M. S." asks which is the best "Builder's Price-book." We would recommend Laxton's.

ERRATUM.

St. Paul's Church, Herne Hill.—In our account of this church, p. 2, the sentence, "The building consists of a nave and side-aisles, or chancel," should be, "The building consists of a nave and side-aisles with chancel.

MEETINGS OF SCIENTIFIC BODIES During the ensuing week.

Medico-Botanical, 32, Sackville-street, 8 P.M.; Nunismatic, Somerset House, 7 P.M. FRIDAY, 24. — Royal Institution, Albemarke-street, 8 P.M.; Philological, 49, Pall Mall, 8 P.M. SATURDAY, 25.—Royal Botanic, Regent's-park, 4 P.M.; Westminster Medical, 32, Sackville-street, 8 P.M.; Inst. of Fine Arts (Society of Arts, Adelphi), 8 P.M.

ADVERTISEMENTS.

JOTICE. - INVENTORS desirous of NOTICE. — INVENTORS desirous of obtaining LOANS ON or of SELLING their IN-VENTIONS, or Patents, should apply to Mr. M. JOSCELIN COOKE, at the OFFICE for PATENTS, 20, Half Moon-street, London, where English and Foreign Patents are ob-tained, and Designs registered. An INDEX is kept for inspection of all Patents granted for the last century; also copies of every Patent of importance. Instructions to Inventors and a list of charges gratis on application.

EMBARRASSED CIRCUMSTANCES. EMBARRASSED CIRCUMSTANCES. —PERSONS IN DIFFICULTIES being desirous of availing themselves of the Beneth of LORD BROUGHAM'S HUMANE ACT, are requested to apply to MESSRS. GRAND & CO., of Moira Chambers, Ironmonger-lane, Cheapside, where every information may be obtained, FREE OF EXPENSE, or arrangements can be made with Creditors, by which means the painful necessity of resorting to BANKRUPTCY or INSOLVENCY may in many cases be avoided.—N.B. Partnership accounts adjusted.

OKER.-B. R. WRIGHT begs to inform DIALAN. D. R. WITCHIL Degs to IDIOTM Builders, Paperstainers, and the Trade in general, the prices for Native Oxford and Washed STONE OKERS, at his Oil and Colour-warehouse, 27, Castle-street East, Oxford-street:-Native Oxford Oker, 21s. per cwt, or 182, per ton; Washed Stone Oker, 14s. per ewt., or 127. per ton. A liberal discount to the trade. A Porter and Grinder wanted wanted.

MOREWOOD'S PATENT GALVAN-MOREWOOD'S PATENT GALVAN-IZED TINNED PLATES, PATRONIZED by the ADMIRALTY and the HONOURABLE BOARD OORNANCE, being extensively used in HER MA-JENTY'S DOCK-YARDS, at the TOWER, and etse-where, for every variety of ROOFING, and other pur-poses, where a strong, light, cheap, and durable material is required. It has been found by experience that this article is beyond all comparison superior to zinc, possessing, as it does, all the advantaces arising from the strength and if mmess of iron, combined with perfect immunity from rust; whilst it is free from the very scrious objection, which applies to zinc, viz. its contraction and expansion, consequent upon very change of temperature, and from which circumstance leakage must of course result. This material is not likely to be destroyed by fire, as is the case with zinc and lead, which and cassing it to burn more fierely. It is, therefore, ob-viously well adapted for all the purposes above named, and most importantly so, when there is the possibility of fire. It is also peculiarly suitable for chinmey-tops, gutters, spouting, and out-door work generally, possessing the strength of iron without its liability to corrosion. It is by far the most eco-of its strength, as it may be laid without boards, and upon the lightest rafters. This mode of preserving metal from rust does not only apply to sheet-iron but also to manu-factured iron in any form, as bolts, nuts, hinges, nails, &c. &c. S. HOLLAND, 34, GRACECHURCH-STREET.

POCKET EDITION OFTHE

NEW METROPOLITAN BUILDINGS ACT. Just ready, a nest Pocket Edition of

THE NEW METROPOLITAN BUILD-INGS ACT, together with a CYCLOPEDIA, in which all the details of the Statute are arranged alphabeti-cally, so as to be instantly found, and accompanied by extensive references and counter-references to the sections cally, so as to be instantly found, and extensive references and counter-reference of the Act itself and its minute provisions.

ex the Act itself and its minute provisions. By the late A. BARTHOLOMEW, Eq., F.S.A., Architect, Surveyor of the Hornsey District. To the above volume will be appended a Folio Table of the Metropolitan Districts (old and new), and a List of the Surveyors, with their Residences and Offices. Published at the Office of "The Builder," 2, York-street, Covent-garden.

CHARGE FOR ADVERTISEMENTS IN "THE BUILDER." 11 R (Q) Juilder.

No. CIII.

SATURDAY, JANUARY 25, 1845.

HE present moment is one of considerable importance to builders and owners of house-property within the limits of the Metropolitan Buildings Act, insomuch as

the amount of interference which may be expected on the part of district surveyors will probably be established by the first decisions of the official referees. The Act is unquestionably stringent; and, if acted on to the letter, and with a litigious spirit, will be deemed oppressive, and speedily become very unpopular. In the discharge of our duties, it will be incumbent on us to urge two things, to advocate, as it may seem, two opposing interests. While we shall have to say to builders and owners, comply strictly with the provisions of the Act, consider it, as it is, a measure for the general advantage which all are bound to assist in carrying out, we must urge on district surveyors the necessity for a lenient administration of it, and an attendance to the spirit of its provisions, rather than the word.

We are satisfied by decisions already given that the official referees desire this : it is to be hoped the surveyors will take the same wise view of the matter.

Section 13 provides that notice shall be given by the builder to the surveyor two days "before any party-wall, external-wall, chimney-stack, or flues, shall be begun to be built, pulled down, rebuilt, cut into, or altered,' with a view to his attendance, for which, of course, a fee is to be paid. Now this, strictly speaking, would seem to prevent a man from letting in an iron air brick, for example, to his front or back wall, or making a hole for a bellwire at the street door, without payment of a fee: but surely this is not the way in which the Act will be read, although we fear some of the surveyors think otherwise. The question of interference or not in matters of this sort will, however, be settled, as already remarked, by the first decisions of the official referees. Upon these, therefore, much will depend, and we shall endeavour as they occur to lay them before our readers for their guidance.

It becomes necessary for us to state, in

consequence of the numerous comments and inquiries which followed our last publication, that we shall carefully avoid exposing individuals to annovance by the mention of names in cases where no good can result from inserting them. Our main business is with the decisions themselves, and all must at once see that we are conferring a boon on our readers and the public by rendering them extensively known.

The referees have already made one important decision as regards what constitutes a commencement of a new building, so as to take it out of the Metropolitan Buildings Act. In answer to an application on this point made by Mr. Allen of the Rotherhithe district, they say, "We feel it necessary, having regard to the judicial capacity of the official referees who may be called upon to determine cases especially referred to them, not to signify our opinion as to the particular circumstances of any commencement without hearing the parties whose rights may be affected, but we may state briefly that we are of opinion that the commencement must be a boná fide one; and that our present impression is, that the erection of the footings with two or more courses of the walls themselves built in a workman-like manner. is such a commencement.

"As to the modes of erection which may be pursued with regard to buildings so commenced, we are of opinion that as to such buildings within the operation of the old Building Act (14 Geo. III. c. 78), they must be built according to the provisions of that Act, since these provisions, as to proceedings commenced or taken under that Act before the 1st of January, are not repealed; but we are of opinion that as to such buildings within the new districts, not within the operation of the old Act, the parties concerned are at liberty to pursue what course they please, so that the buildings are finished on the 1st of January, 1846."

Relative to streets, they have decided that " streets formed after the passing of the Act, must be built in conformity with the provisions of the Metropolitan Buildings Act-see sec. 52: and that the mere setting or laying out will not be sufficient to take them out of the Act.

" If parties are prejudiced by the enactment, they must seek relief under the 9th or 10th section."

Since the Act came into operation, the district surveyors have found much occupation for the referees and registrar, and will continue to do so for some time to come. It seems quite clear to us that the duties which devolve upon the official referees will be much more numerous and weighty than two gentlemen, however energetic and industrious they may be, will be able to discharge. If no notice be given by a builder, the referees are to be applied to; if any irregularity be committed, and is not remedied, the referees must interfere; all doubts, differences, and dissatisfaction must come before them; they are to settle all terms of qualification, and to say what is the meaning of good, sound, fire-proof, fit, proper, or sufficient. Buildings of a certain class they must themselves survey; they will be called on to settle the respective terms and interests of tenants and owners, to affix the rates and prices, according to which accounts for work and materials in party structures are to be made out; to survey in certain cases ruinous buildings, and do various other acts too numerous to mention now. They have issued a table of fees to be paid in respect of these services, which, at first sight, seem cal-

culated to increase rather than diminish the number of cases submitted to them. We have the pleasure to place a copy of this table before our readers, but reserve our remarks upon it for a future occasion. It involves a matter of considerable importance to the profession at large.

TABLE OF FEES

To be paid to the Registrar of Metropolitan Buildings, in respect of the services to be performed by the Official Referees and by the said Registrar, in order to defray the expenses of the office, incident to such services, and the salaries of clerks, &c.

| | Awards. | £. | 8. | đ. |
|----|---|----|-----|----|
| 1. | For every hearing- | | | |
| | By one Official Referee | 1 | 1 | 0 |
| | By one Official Referee and the Registrar | 1 | 11. | 6 |

By two Official Referees and the Registrar. 2 2 0 2. For every final award (according to the decision of the Official Referees in that behalf) from

£ i 0 to 21 0 0

Examinations or Taxing of Accounts of Charges referred.

- 3. For every account examined, 1 per cent. on the amount of the account.
- 4. For every measurement-
 - If the work amount to 100%. or less, 24 per And for all above 100/., 14 per cent.

Special Supervision of Buildings. For special supervision by the Official Referees of buildings subject to such supervision, and whether upon the original erection thereof, or upon any alteration involving structural arrangements, as follows :---

- If the building be of the extra first-rate 8 8 0 If the building be of the first-rate, of what-ever class, or of the second-rate 8 3 0 If the building be of the third or fourth-rate 2 2 0

[The foregoing fees to include travelling expenses in all cases of supervision.]

in all cases of supervision.] 6. For every licence to use a building before the certificate of satisfaction has been granted (according to the rate of the building from £0 5 0 to 1 1 0

Surveys.

- 1 1 0
- 8. For every survey by direction of the Official Referees.
 8. For every survey by direction of the Official Referees may authorise to be paid to the person employed to make the survey.

Plans or Drawings.

9. For preparing, making, verifying, tracing, or copying plane or drawings, such proper fee as may be charged by the person employed to make them, unless performed in the office, and then according to the schedule hereto annaxed.

Sanctions, Authorities, or Approvals as to Materials, &c., under the Rules of the Act.

MR. COCKERELL'S SECOND LECTURE ON ARCHITECTURE.

On Thursday, the 16th instant, Professor Cockerell delivered the Second Lecture of his course on Architecture, at the Royal Academy. He proposed, in the present lecture, to give which the greatest advantage was to be de-rived, in a careful consideration of its prin-ciples and details. These were to be regarded as applied to plan, section, elevation, and deco-ration. The subject of the succeeding lec-tures was one of the noblest which could occupy the mind of man. Political history was of comparatively small interest, and pic-tured, in the greater part, the evil passions of markind. The ordinary occupations and dis-appointments of life aroused melancholy emo-tions but in architecture ons, but in architecture, man found scope for his lofty aspirations and idealities, and for his physical energies. There he perceived that he had a soul: order, calculation, beauty, and immortality were opened to his contemplation, and he seemed to feel the power of extending his works beyond the bounds of nature, and of in reason! how infinite in faculties! in form and moving, how express and admirable! in action, how like an angel! in apprehension, how like a god!"—Architecture invoked the display of physical prowess, which was the natural desire of man. Anaxagoras had asserted that the supremacy of man was owing rather to the power's of his hand, than to his head, and Sir Charles Bell had made the hand the subject of one of the Bridgwater Trea-tises. In the infancy of man, he contended with the forces of nature; he carved the rock, and reared the obelisk; in accumulating the masses in the pyramid, he emulated the works of Nature herself,-and, exulting in his ac-quired skill, exclaimed with the Babylonians -"Go to, let us build a city and a tower, whose top may reach unto the heavens, and let us make us a name." And though we can afford to smile at such aimless labours, we must recollect that by them metallurgy, me-chanics, and all the skill necessary in nobler works were first brought into practice. It was the natural sequence that in the age of Alexander and the Romans, art should be exerted in substantial benefits, and superior to the masses of Egypt, or to the delusion of beauty alone in

Grecian architecture. Man at this period contended with the elements themselves. The ocean was curbed by his ports, and quays, and Pharos; marshes were drained; sewers, canals, aqueducts, and roads, displayed his mastery over Nature. Frontinus, whose work on aqueducts, written about the year 80, the professor had previously noticed, had a passage strongly illustrating the growth of this spirit. After giving an account of the nine aqueducts under his care, constructed at Rome at various periods, and amounting in length to about 142 miles, he said :--" With so many waters, and so many magnificent works necessary for their transport to this great city, will you compare the idle pyramids of Egypt, or even the inert works of the Greeks, however celebrated and glorious in history." In our day, architecture was contracted to absolute utilitarianism; all its powers being devoted to the perfection of the individual dwelling between party-walls, in which every citizen was in the enjoyment of luxuries and conveniences, unheard of in the days of the Pharoahs, the Medici, or the magniticent Louis the Fourteenth.

The professor now called the attention of the students to a number of plans of the most remarkable sacred edifices, constructed from the time of the Tabernacle in the Wilderness, to the Christian era. It might be considered that objects of daily practice should be illustrated, rather than what were of rare occurrence, and of such vast scale and costliness, but we should remember, that Vitruvius laid down, that the architect's studies should be pursued "maxime in ædibus Deorum, in quibus operum laudes et culpæ æternæ solent permanere."

In discussing the form and proportions of temples, we held in veneration those noblest motives of the heart, which we recognize alike in the Grecian, the Druid, the Hindoo, and the Christian temple, and so finely expressed in the Book of Psalms. In excavating the foundations of the temple at Ægina, the remains of hurnt woods and bones were discovered, mixed, doubtless, with tears and aspirations as warm as those of David ;—at Selinus, the steps of one of the temples were worn down almost to an inclined plane by the devout.

The temple of Jupiter Capitolians, which formerly stood upon the Capitoline Hill, was then noticed at length, and the fact pointed out, that during many successive ages, and reedifications, the original plan was strictly ad-

hered to; a remarkable instance of the forse of religious prejudice in an edifice baviag so many points of distinction from coeval works. It was remarked as a coincidence, that many of these large temples approach 180 feet in front, the building under notice being 200 feet by 185 feet.

by 185 feet. The plan was the most important con-sideration in a building; it gave evidence of the use and purpose of the structure atid was addressed to the understanding, while, the elevation addressed the eye. The atrangement of the plan, should in all cases have precedence, which was the reverse of the ordinary mode. The plan was made to fit an elevation previously designed, and much variety of effect, which the ever-changing considerations of purpose and convenience might have suggested, was lost. We were deficient in books on the ichnographic part of architecture, though we had many on the orthographic. Sacred architecture was not only an antiquarian study, but one of immediate application, as it was quite certain, that the architecture of the Greeks and Romans would be the architecture of the whole civilized world. From the time of the Tabernacle to that of the Temple of Venus and Rome, we were struck with the uniformity of the plan. The plan was in all cases determined by the ritual, as it must be in every age. Vitruvius, who had been in so much unmerited disgrace, had given us the plans of the ascient temples; his omission of the peribalus was, however, a very remarkable one. In examining the sections of ancient temples, we felt a difficulty as to the size of the opening in such as were hypethral: Mr. Cockerell'sown opinion was, that only a small portion was uncovered.

The Roman temples were covered by a large continuous vaukt. This a late traveller had considered to have been of wood p but whether it was of wood or pumice-stone, it would necessarily have to be extremely light. In the orthographic design, the use of large stones made an important feature. The mention of "great stones" in the Book of Kings, shews that the Hebrews employed them, and, in fact, their use embodied the fundamental principle of building down to the Christian era. Towards the decline of the ampire, when the vast resources of ancient Rome were no longer available, smaller stones were employed. itruvius had given us much information ОП the proportions of the orders, and bis obseure parts were being cleared up. There was no reason why we should not now make the axes of our columns incline towards the building in obedience to his rules : the effect of our baildings in pyramidal outline would be vastly improved. Steps were always considered Steps were always considered an integral part of the order by the Greeks; the podium or continous pedestal, was perhaps necessary in Rome, and in street achitecture generally. In the treatment of orders above orders, care should be taken that they should seem to grow one out of the other: in the portico of Buckingham-palace, a very bad effect resulted from the contrast between the rapid diminution of the Doric, and the more slender proportions of the Corinthian. The ornamental part of a building might be considered as general decoration, sculpture, and painting. We had heard much about the revival of polychromy, but he was of opinion; that although it might add great beauty to ancient buildings, which were seldom more than 60 or 80 feet in height, and which stood under a genial sky, the case was different in those which sometimes reached to several in those which sometimes reached to several hundreds. The ornaments of ancient temples were all within the scope of the eye, and the smaller temples must often be considered 28.8 cabinet-works; the sculptor being a more important person than the architect, who only furnished the framework for his brother artist. The lines of the sculpture contrasted with the right lines of the architecture, to the improved effect of each. In the pediments, the sculpture often projected beyond the mouldings, breaking their lines ; in the Parthenon, the horse's head hung over the cornice beneath. The effect of the figures in pediments was much improved by the smaller scale of those in the frieze. In concluding this section of his course, the professor paid a compliment to Mr. Pugin the successful manner in which he for had employed polychromy on the gate of Magdalen College, Oxford, which, he said, wanted only the effect of time to give it every thing to be desired. itized by Joogle

38

THE PLAGUE OF WHITEWASH.

In this age of grasping at the future rather than contemplation of the past, the tardy, though highly meritorious offorts of modernanthe stress have done comparatively little to sheek that course of spoliation, which bids fuir speedily to overwhelm all our national antiquities. Every county in England is arowded with village churches at distances of one to two miles apart, and all of them contain matter of interest, whilst a very large pro-partion are full of the richest beauties of Gothic architecture.* But, to antiquary and to artist, how melancholy is the present aspect of each. The reformers and the puritans have inflicted less injury upon those noble works, than do the curiosity hunters, and the improving churchwardens of modern times. The re-formation despoiled the altars, and plundered the vestments, the revolution defaced the carvings and the tombs : the fine open beaches were raised and converted into pews, and the colours and gilding of the road-screen ob-scured with an unmeaning white; the stove chimney was made to meander through the columnos and arches of the church, and disappear through the ruthlessly broken tracery of a decorated window; the timbers of the roof were covered over with a flat ceiling, and the roof itself lowered from the original pitch. The squire erected his glazed room in the church, and made himself counfortable at "his own fireside," marring the exterior with an unsightly excrescence for a chimney. The sector stole the brasses, and an "antiquary" parchased them. The antiquary stocked his purchased them. The antiquary stocked his collection with stained-glass; the country equire worked up the panels from a rood-screen in his sideboard. All these and many more were the acts of robbery and spoliation common and uncured for once, and not enough noticed powr. But warm than the plunder and havoc of mistukes zealots, worse than ruin and the alterations of ignorant churchwardens, is the grapped, Briarcus-like, on cathedral and arish church in every hale and corner of the parish church in every unit and the set in t paselling, and obscorring unual paintings, colour, and gilding. The infection is not de-stroyed; and men will never be convinced that P it is better to let the tooth of time cat its way into corbel and boss-rather adding new beauties than consuming old-than to mar the contour of a monisting, or to clog up the indents of a test. The very extent of effort in those to whom the country allows the guardianship of war national monuments is the making them look clean, f e, white. The greens and browns from Nature's palette, are hidden beauties to those who deem the bucket and mop the true more who deem the bucket and mop the true instruments of taste, and a whitewashed cottage the brightest ornament in a land-scape. The noble interiors of Beverley Minster, of York, and of our other cathedrals, when compared with the nave of Westminster Abbey, whose columns retain their natural fints, hock much of the beauty which the latter possesses, despite the eye-sores on its walls. Rochester Cathedral was rich in mural decoration, yet it has been all obscured. At Chester, which we visited very few years since, we had, at usual, occasion to notice the ill effects of whitewash, and we ventured to express our opinion to one of the dignitaries of the cathedraf, who concurred with us; yet we sub-sequently discovered, that he himself had not borg previous given directions for an additional coat. The fine Norman doorway of the Temple Church was no sooner rid of its accumulated whitewash than it received another application. At St. Albans, St. Cuthbert's screen, rich in flowers and foliage, has all its beauty obliterated or destroyed. The clerk of the church, un intelligent man, and probably remémbered by many of our readers, has taken some pains to clear a portion of this screen, and the delicacy of the carving is there apparent. At St. Mary's Church, Stafford, we were present during a portion of the late restorations, and saw the workmen remove the whitewash from some capitals, and found, that shapeless lumps concealed foliage of elegant design, having traces of pointing. St. Peter's, Northampton,

1

THE BUILDER.

till a few years ago, seemed destitute of ornament; the capitals of its columns were mere lumps, and the whole interior devoid of beauty; fortunately the state of the building attracted the attention of Miss Baker, the sister of the historian of Northamptonshire, who, at some expense, and, it is said, considerable personal labour, had the capitals freed from their covering, and they now form the most beautiful series in Anglo-Norman architecture. Haddon Hall, in Derbyshire, a perfect example of an old English residence, is preserved in its original state in all respects except the application of whitewash. The figures in relief, the ceilings, and ornaments formerly enriched with painting and gilding, periodically approach a step nearer to entire concealment. St. Paul's itself has not escaped, and the absence of the natural tints makes more than ever apparent the want of artificial colour, and revives our regret that so good an opportunity as was once available should have been lost. The colouring, in parts of Gothic churches, was a valuable in-strument in the hands of the artists of the middle ages; it was applied with judgment and effect, was mostly upon plain surface, and impaired the form of neither moulding nor ornament; but the first coat of whitewash shews, like the last of Banquo's line, a mirror in which we see a long succession following after. Individual buildings there may be that have suffered little, and others which, within the last few years, have been entirely freed from whitewash, and the beauty of these is great; but we are certain that were the whole of our churches divested of what shrouds them as completely as the lava of Vesuvius did Pompeii and Herculaneum, the splendour of Gothic architecture would at once strike upon the beholder with a witchery and a power hardly felt even in these days of restoration and research. Let us hope for the speedy establishment of a national commission for the preservation of works of art, and that one of its earliest endeavours will be in the direction pointed out. A tithe even of the small sum we devote to public works would serve to uphold what we now possess, valuable to an extent we have mever felt, and bourly crum-bling away beyond the hope of renewal.*

Е. Н.

COMPETITION OUTLINES FOR ART-UNION OF LONDON.

The nineteen sets of designs received by the committee in reply to their offered premium of 60%, were in illustration of the following subjects:--The life of Offa, king of the East Angles; Midsummer Night's Dream; Thalaba the Destroyer; Parables; Revelations of St. John; the Watchfulness of Providence; the Rape of the Lock; Keat's Hyperion; the Commandments; Harold the Dauntless; Anne of Gierstein; the History of Joseph; Raising of Jairus's Danghter; Scott's Betrothed; Judgment of God against Sin; John Gilpin; Byron's Mystery; Life of Brutus; and Cymbeline.

After long deliberation, the committee selected the set illustrative of the Revelations of St. John, afterwards found to be by Mr. George Elgar Hicks, Lymington, Hampshire, as most fully complying with the terms of their advertisement, and awarded the premium to the author of it. Considering that much talent was displayed by some of the competitors, and anxious to stimulate young artists to exertion, they awarded honorary premiums of 20% each to the authors of the three following sets: -Offa; the Watchfulness of Providence; and the Commandments; who werefound to be respectively Mr. G. E. Sintzenick, of 3, Princes-street, Fitzroy-square; Mr. William Cave Thomas,'of 39, London-street, Fitzroysquare; and Mr. G. Scharf, jun., of 14, Francisstreet, Bedford-square. Mr. Hicks obtained the Royal Academy medal at the last distribution of prizes; and Mr. Cave Thomas is one of the artists selected by the Fine Arts' Commissioners for the decoration of the new Houses of Parliament. Amongst the most meritorious of the other designs we may mention the series from the History of Joseph; Byron's Mystery; and Thalaba.

A CHAPTER ON MARBLE.

MARBLE, marbre French, marmor Latin, from the Greek μαρμαιρω, to shine or glitter, is a term used to define numerous varieties of compact and granular limestone, which are susceptible of a superior polish, and are denominated either from their colour, their age, their grain, their country or district, their degree of hardness, their weight or their defects. The general characters are,—large or small-grained, generally in distinct concretions, sometimes so fine-grained as to appear compact, and often only distinguishable by a glimmering lustre. Fracture, foliated ; fragments, amorphous, blunt; weight, granitose; lustre, from glimmering to shining, between pearly and vitreous, sometimes translucent, but the black only on the edges. It consists chiefly of 50 lime and 40 carbonic acid, whence it is called by chemists and mineralogists a carbonate of lime, to which class in all strictness it belongs.

Marbles are distinguished from gypsums by the application of diluted nitric or muriatic acid, which produces a strong effervescence, by expelling the carbonic acid; but otherwise, in external character, organic disposition, and capability of polish, there is a striking similitude between many varieties of each. They embrace every degree of hardness, and the specific gravity of marble varies with its density and crystalline structure. Some of them are of one simple colour, as white or black, othera streaked, or variegated with stains, clouds, veins, waves, &c., but almost all are opaque, excepting the white, which, when cut in thin slices, becomes transparent.

Of the endless varieties of marbles abounding in almost every region of the earth, vast formations, in like manner with the simple limestones, retain the evidences of organic character and composition, being crystalline masses of marine animals, and embracing, in some few instances, the bones of land animals and fresh-water shells; in almost all of them we see a certain advance towards decomposition; while in other and perhaps the more extensive beds, every trace of organization is extinguished. Geologists, on, this account, have classed them as primary and secondary rocks, presuming that the absence of organic delineation denotes the more advanced age; but most erroneously so, for the preservation or decay of organic masses of calcareous animals depends more upon climate and association than upon age, and very often the same formation presents the two characteristics of this class of rock. Again, geology infers that marble is formed

from masses cooling down under intense lateral pressure, but were this the case, every trace of animal organization must have been destroyed, and the crystalline appearance would have been uniform; but so far from there being any evidence of heat or fusion, or lateral pressure, much of the coralloide and shell-marble rests in its primary undisturbed state, the shells and corals exhibiting the uninjured outline, and so disposed as to exhibit an uninterrupted series of natural events, embracing in the one whole an epoch which has long since passed away. The existence of these organic masses in their pristine form, and disposed in spots where they formerly lived, propagated in their generations and died, and now their calcareous, concrete, and crystalline states, evidence the small amount of faith the student ought to place in modern classification and modern theories : a classification which pronounces all crystalline rocks volcanic; theories which assign various epochs to rocks and earths which are manifestly formed under the same existing causes, and at the same period of time. Among the most remarkable varieties of

Among the most remarkable varieties of marble may be mentioned the African, having a black ground diversified with moderately large spots, sometimes tinged a little reddish; Alabandum marmor, much used in building among the Romans, and distinguished by its remarkable glossy jet-black appearance; Auvergne marble, of a pale red mingled with violet, green, and yellow; Brocatello, of a fine bright yellow colour, thickly variegated with irregular veins and spots of purple, and spots or spaces of fine semi-pellucid crystalline spar —this is a truly beautiful marble, equal in polish to the finest agate; Carnangione marble, so called from its flesh colour, exhibiting shades of pale whitish and yellowish casts, and also of a rosy hue; Cippolino, the true Egyptian

[•] We intend to revert to the subject of village churches, and we shall be glad if our friends in the country will favour us with absorbes and measurements, or any information as to the present state of fabrics.-ED.

[•] We have long felt the need of a national commission for the preservation of monuments, and shall take every opportunity of advocating its establishment. We shall be kind to receive communications on the best mode of cleaning paintings in distempor.—ED,

marble, of a sea-green colour, mixed with large waves or clouds of white or pale green, the same with that which the ancients called Agustum and Tiberium marmor.

Coralloide marble; of this there are numerous varieties, and in great abundance in almost all countries; in this country we have principally two in use, one grayish black, the other jet black. The first is found in many parts of Derbyshire, and the corals it contains are of the porous kind, and of the most elegant species in the world ; they are lodged in it at all angles and in all directions, and are in general about one inch and a half long and three quarters of an inch broad; they are composed of longitudinal plates, very fine and thin, and of a snowwhite, ranged in distinct orders, and finely interspersed at small distances with their transverse plates, the whole internal part of the coral being thus divided into a sort of square cells. This net-like division runs through about three-fourths of the body, but the top has only the longitudinal plates without the transverse ones. It is a very beautiful substance, and abounds in Derbyshire and Wales. The other species is an equally beautiful com-

pact substance; fine, even texture, very hard, of a deep jet black, and capable of a very high polish. It is elegantly variegated with species similar to the above, but smaller, and of a less elegant texture; and among these has usually a great number of sea shells, both turburated and bivalve, the corals and shells being of a pure snow-white.

There is another marble common to Derbyshire, Dorsetshire, Sussex, and many other parts of England, of a green colour, and thick set with marine shells, and is what the pillars of many of our cathedrals are made of. We have in England vast quarries of marble abounding with marine shells.

The varieties of marble in England are numerous and exceedingly diversified, and many of them perfectly adapted for all the pur-poses of architecture. The green marble of Anglesea is much like the verde antico; its colours are greenish black, leek green, and sometimes dull purple, irregularly blended with white limestone, the green shades being owing to the presence of magnesia; it is an elegant marble, but apt to be internated by small cracks, and has a variable polish.

Derbyshire abounds with several fine varieties of marble, particularly such as is composed of concrete masses of marine shells and petrifactions; excellent black marble is found at Ashford, Matlock, and Monsaldah. In North Devon, marble is still more abundant and diver-sified; there are varietics of black and white from Bridestow, South Tawton, Drewsteignton. Some of the Chudley, Staverton, and Berry pomeroy marbles have a black ground, with large veins of calcareous spar traversing it in all directions. The variegated marbles are generally reddish, brownish, and grayish, variously veined with white and yellow, and the colours are often intimately blended; the Plymouth marble is principally of two sorts, one ash colour shaded with black veins, the other blackish gray and white, shaded in concen-

tric spots interspersed with irregular red spots. The cliffs near Marychurch, says Polwhele, exhibit marble not only of great extent, but of superior beauty to any other in Devonshire, superior beauty to any other in Devonshire, being for the most part either of a dove-coloured ground with reddish purple and yellow veins, or of a black ground mottled with purplish globules. In a valley below the cliff, about 400 yards wide, there are loose unconnected rocks of this marble, owing their situation probably to the falling down of the ground into the seat for there are very large ground into the sea; for there are very large rocks even on the beach. The huge fragments of rock scattered over the valley, by which we easily descend to the sea, give it a grotesque appearance, and have been whimsically called a petrified congregation; and the pleasantry of this fancy has been heightened by a rock, supposed to be about forty tons, in a very erect position, which has been ludicrously enough entitled "the Parson."

The Petworth marble was formerly most employed; it is a fossil concrete of marine and fresh-water shells, some of which are filled with spar, and add greatly to the beauty of the stone. The slender round pillars of the Abbey Church in Westminster, and of the Temple Church, are of this sort of marble: so likewise are those of the Cathedral Church at Salisbury.

France is very rich in marbles. The Romans availed themselves of this stone in their monuwere abandoned, and recourse was had to Spain, Italy, and the East. In the internal decorations of the Louvre and the Tuilleries, louis IV were had the dest. Louis XIV. availed himself of French marbles. They were little used after his time up to the present century; latterly, abundance of every variety and colour has been found, and suited to all purposes except statuary. The marble to all purposes except statuary. The marble of St. Beax, on the banks of the Garonne, is the best marble used in French sculpture, and this is a very indifferent one, being dirty white, and rapidly decaying on exposure atmosphere. to the

The variety called marbre de Languedoc, or de Sainte Baume, is of a fiery red, with white The and gray stones formed of madrepores. eight columns which adorn the triumphal arch in the Caronsel at Paris are of this marble, which was formerly only employed for the decoration of royal palaces. The neighbour-hood of Narbonne furnishes several valuable marbles, among others a shell marble of an intensely black colour, with white belemnites, and a purple marble with yellow spots, &c. One of the most esteemed varieties of French

marble is that called *griotte*; its colour is a deep brown, with blood-red oval spots, pro-duced by shells. Some of the ornaments of the triumphal arch of the Carousel are made of griotte, and it is extensively used in decorating public monuments and splendid furniture. Madraporic marble is common in the department of Jemappes. The beautiful bridge of Namours is constructed of an elegant marble termed *Chatean London*, of a very pale yellow, containing small, unconspicuous shells and white translucid veins.

The Rovigio marble, found at Padua, is used for architectural purposes. The occhio di pavone is formed of concrete masses of shells which form large orbicular spots, red, white, and blueish. According to Da Costa, the peacock's eye is of a bright cucumber colour, with spots and veins of milk-white spar; many of the spots, forming circles about the size of a sixpence, are filled with a red ground. Pietra stellaria, much employed in Italy, is entirely composed of star madrepores, converted into a grayish and white substance. Baron Bord in his "Sicilian Mineralogy," describes upwards of a hundred varieties; the most valuable of these is that denominated Sicilian jasper by English stone-catters; it is red with large stripes like ribbons, white, red, and sometimes green which here and there revolve, forming composed of star madrepores, converted into a green, which here and there revolve, forming etty acute angles.

Spain abounds with marbles of every variety. A mountain entirely composed of beautiful marbles exists at the distance of three leagues from San Felipe, and the l'agus takes its course through hills of marble, which also constitute The abundance of this material led its bed. to its extensive use even so far back as the time of the Romans; and the monuments of an-tiquity, those of the middle ages and of modern times, are profusely decorated with indigenous marbles. The vault of the beautiful theatre The mosque of Cordova, erected by Caliph Abdoulrahmin III., is ornamented with 1,200 columns, most of which are of Spanish marble. Among the ruins of ancient Merida, built 28 years B.c., fragments of the most beautiful marbles are still discovered. The beautiful marbles are still discovered.

beautiful marbles are still discovered. The beautiful marbles are still discovered. The The principal deposits of marble now wrought are those of High and Low Pyrenes, the High Garonne, the Arriége, the Ande, the Herault, the Vosges, and the Straits of Calais. M. Géruzet of Bagneres de Begore (High Pyrenecs) sent the most beautiful and varied marbles last year. The marbles of Aspan, the stalactite marbles, and the campana-rante marbles were those most admired. M. Géruzet has set up on the Adour a marble work which has 150 saws constantly at work, besides ten rough saws for cutting out the blocks, seven lathes, one circular saw, a straight moulding frame, four machines for making flat slabs, and one machine which makes twelve rosettes at one time : he has obtained all the prizes usually awarded and the Legion of Honour. A saw mill has been set up at Perpignan, by M. Fraisse. At Mayenne, Mr. Henry, of Laval, has a factory where 230 blades are at work on black and veined marbles. Messrs. Landeau, Noyers, and Co., of Sable (Sarthe), work black and vein marbles by machinery of their own construc-tion. The quantity of marble imported into France is 6,000 tons, valued at 20,000/, and coming principally from Tuscany, being white statuary marble, and from Belgium being amadreporic gray and whitemarble, known as St. Anne's marble, and used for furniture, slabs in coffee-houses, &c. The value of French marble 22,400,000/.; of this amount 1,600,000/. or 2,000,000/. is the regular produce of quarties in constant work. These quarries are 18,000 in number, employing 70,000 men. The value of slate quarried annually is estimated at 80,000/.

church of the Escurial, the principal churches in Madrid, the palace, &c., are all decorated with the most beautiful marbles.

The milk-white marble of Cordova is adapted for sculpture. One of the most celebrated marbles is the *broccatello*: its chief colour is claret red, variegated with numerous small spots and points of isabell-yellow, yellowish gray, and a translucent white. The marbles of Germany are very numerous.

Carinthia possesses the most beautiful of all shell-marbles, viz. that of Bleyberg, called fire marble, or opalescent lumachella. It abounds with the opalescent fragments of a species of nautilus, here and there disseminated in its mass, reflecting tints of red, green, and blue, of considerable intensity; it seldom exists in

layers. The statuary marble of the ancients w principally Parian marble, so called from its coming from the island of Paros in the Grecian Archipelago, although it is well ascertained that several other islands, as Neupos, Tenos, &c., in that sea, afford similar marble. Carrara marble was also used by the ancients, and is the choice material of modern sculptors. To the choice material of modern scalipors. To fit a marble for statuary, it should be highly crystalline, and yet with a fine grain; it should be perfectly white, entirely free from flaws and from foreign minerals, and should be very compact. The American Washington and New Milford marble answers very well to these qualities.

Statuary marble is exceedingly durable when favoured by climate or association, although far from being a hard stone. Hence, says Patrin, it is sought for, for the construction of the most sumptuous edifices, and of monuments which are intended to be at once magnificent and durable. Marble is one of the least destructible materials; of this we have a proof in those precious statues, which are the eternal monument of the genius of the artists of ancient Greece. They have supported the injuries of twenty centuries, while the scythe of Time has been made harmless by the brilliant polish of their surface.

H. G. MONTAGUE.

EPISCOPAL CHAPEL AT WRINGTON.

An Episcopal chapel has lately been erected at an expense of about 1,000%. at Redhill, in the parish of Wrington, Somerset; Mr.Wilson, of Bath, was the architect. It is built in the early English style, whose prominent features are simple, elegant, and light, and whose decorative members being comparatively few, admit of its more general adoption for small churches, where the funds necessary for their erection are limited. For the amount ex-pended, we have a quiet, unostentatious beauty in the arrangement of the interior of this building that could scarcely be expected. t receives light from graceful lancet windows, three of which, with stained glass, give a pleas-ing effect to the chancel. The roof is of wood, opened to the ridge-piece, and for its plain construction is particularly ornamental. At the entrance, on a platform of two steps, is an ably chiselled font of stone of appropriate character; and over the doorway is a tablet which records that "This chapel was erected in the year 1844. It contains 315 sittings, and in consequence of a grant of 80% from the In-corporated Society for Promoting the Enlargeand Chapels, and of a grant of 90% from the Bath and Wells Diocesan Church Building Bath and wens Diocesan Onuten Dentiting Association, 250 of that number are hereby declared to be free and unappropriated for ever." There is, with the exception of the corbel heads without the porch, so much good taste displayed in the uniformity and completeness of this unassuming structure, that we regretted to find what is called a "handsome" stove placed in the centre of the aisle, with a black flue rising vertically to some height, and then running horizontally to make its escape through one of the windows, which has been disfigured for that purpose. think, also,-but this is a subject which we must touch upon with the greatest diffidence that had the chancel, which is paved with imitative encaustic tiles, been elevated one step, in point of practical utility alone it would have been better, from imparting a greater distinctness and dignity to the clergyman; and as from the communion table he proclaims the holy Commandments of God, they would not

40

be lessened in their solemnity, nor lose the force of their impressiveness, from his being raised above his congregation. We should deprecate any attempt to produce a renewal of obsolete forms, utterly inconsistent with the pure religion which, as Protestants, we profess, but even as a spiritual religion, it is requisite to maintain the principle of doing all things decently and in order, so that, by avoid-ing Puritanism on the one hand, and Popery on the other, we may enter into the deep tranquillity of the House of God with a sincere, zealous, and unquestioning faith, awake only to those gracious and sublime emotions of the soul which conduct us with good thoughts, kind thoughts, ennobling thoughts, to the observance of our highest and most benignant duties .- Bristol Mirror.

SUFFOLK CHURCHES.

TUDDENHAM ST. MARTIN.

FEW villages in Suffolk can boast of a more ictaresque situation than Tuddenham. Seated in the hollow of a deep and narrow valley, it is not perceived from the high table-land on which it is approached from Ipswich, until the traveller has reached the point of descent, when a fresh landscape breaks upon his view, and below, the intermingled red-brick, and more ancient timber-built houses, with their gardens, constitute the village of Tuddenham. Westward, the valley presents no remarkable at-tractions, but in the opposite direction are to be found some of the most pleasing views of Suffolk scenery.

The parish church, the first object of interest The parsh church, the first object of interest in most places, occupies a commanding station on the brow of the hill immediately over-looking the village. The large Norman docuway, on the north side of the nave, refers the earliest date of the present bailding to the tenth centary; and though no other fea-tures of that style of architecture are now visible, it is most probable that the walls of the nave are of the same era. Occasional repairs nave are of the same era. Occasional repairs have probably effaced some of the characteristics of the original design, which the introduction of larger windows more directly superseded. There are now four windows opening into this part of the eburch, but the tracery is of that meagre description which is commonly found to have been supplied to village churches in the fifteeoth century. The accustomed entrance is now on the south side, where the doorway is of the same date as the windows we have just mentioned. In the interior, the visitor cannot fail to be struck with the simple yet graceful appearance of the ancient open timber roof, which, with the exception of the mutilated forms of saints and angels, bereft of their heads by fanatic zeal, remain uninjured and in good preservation. The entrance to the chancel is through a rude arch, without shaft or impost. This part of the building is probably of later date, as succeeding builders generally lengthened the chancels of their Norman predecessors. The door and side windows appear to have been substitutions for former work, and are of poor design; the east window, which is of three lights, the tracery formed by crossing the mullions and without foliations, was, till lately, the only indication from which it could be inferred the present chancel might have existed in the 14th century. But the present incumbent, upon examining the walls of this part of the church, discovered, near the surface of the ground, the ancient piscina. Upon clearing away the rubbish with which it had been filled, it was found to consist of two arches, one on the face of the wall, the other occupying part of the racess of the side window. The design of the recess of the side window. The design is bold and striking, the central shaft appearing to support the weight of the whole superin-cumbent wall. The position of these arches so near the ground, as well as the form of the east window, suggest the notion that the floor of the was originally lower than that of the chancel nave, a circumstance extremely rare, but which is here to be accounted for from the slope of the hill upon which the church is built. tower is square, consisting of three stages, with-out buttresses. All the windows have the tracery defaced, and this destruction in the belfry story, which is so common a feature in our churches, we can refer to no other cause than the mischievous carelessness of those workmen who have inserted the timber frames

for the bells. It is really much to be regretted that such a negligence has ever been suffered, which so often gives a fine tower a very unsightly appearance. The bells are five in number, and, from the inscriptions, were cast in 1655 by John Darby, whose name is similarly preserved in a very large number of the Suffolk churches.

The history of the ersction of our parish churches is generally involved in obscurity; seldom have documents been preserved to shew through whose munificence they were erected, or enlarged, or ornamented. Armorial bearings are frequently the only traces which are left wherewith to identify the families whose names may be associated with the parochial history of former days. Such is probably the case with respect to Tuddenham. But on examining the western entrance, we trace the arms of the family of D'Avilliers, a shield charged with three escutcheons, a name well known to those who have interested themselves in Suffolk genealogy. These appear in the right hand spandril of the western doorway; on the left is a shield, bearing a plain cross, charged with five escha-lops, but we know not to whom it may be referred

The monumental inscriptions in the church Keeble in 1653, and several members of his family. This Mr. Keeble was a lawyer of some eminence, and his 'Reports' are at this day considered as a valuable contribution to the legal records of the country. Another is dedicated to the memory of John Sicklemore, Gent., Lord of the Manor of this parish, who died 1644, and was here buried with several of his family. The only other is an affectionate tribute to the memory of Isabella Wrattislaw, who died at the early age of 20. No date is given.

We are unwilling to refer to the state in which the interior of the building lately ap-peared, but we notice with great pleasure the improvement which has taken place. The north doorway, which had been contracted from its original dimensione by a poor insertion of a later date, has been restored, and a new and substantial door provided; the win-dows of the nave have been put in order, and their tracery repaired; and the fine open roof thoroughly cleaned. The unsightly and en-croaching pews have been removed, and the

ancient seats (of which a considerable portion remained in the church) have been rein-stated. As more seats were required, the carving of new ones was entrusted to Mr. Ringham, of this town, who has executed them in admirable style, and in exact confor-mity with the rest. The rails for the communion-table have been executed by the same hand, with the same excellence of workmanship. Across the chancel arch stand the basement panels of the old rood-loft screen, the access the access to which was by a doorway now remaining in the south wall. The pulpit stands at the north-east corner of the nave, and is a very remarkable specimen. It exhibits a pattern of the decorative art of the middle ages, immediately before its extinction, when fantastic forms superseded the designs of a more chastened and correct taste. Indeed, there are indications of the approaching change in the workmanship of this pulpit, which, while in the workmanship of this pulpit, which, while they interest the curious, do not appear to offend the eye. This pulpit has also been restored by Mr. Ringham. A small gallery has been placed in the tower, in the room of those unsightly projections which are very often found in our churches, but neither com-pensate for their ugliness by any additional accommodation. The font stands on the right hand side of the south entrance, and is elabo-rately carved, and notwithstanding the defacements by the puritanical hatchet, is one of the best specimens of mediæval art in this neighbourhood. From the fragment of an inscrip-tion in the horizontal surface of the basement, it appears to have been the gift of Richard Sil-

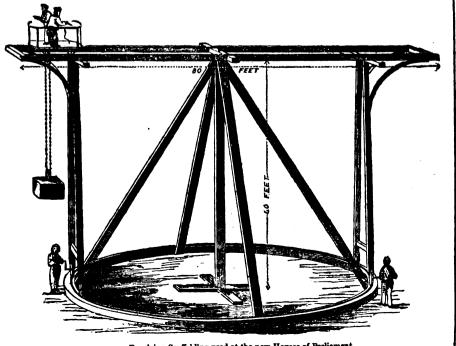

styr and his wife Agnes, about the year 1480. The recent alterations in the interior have excited much interest amongst the parishioners, who have cordially seconded the views of their worthy pastor, by voluntary contributions towards the reparation of the church; and though some seceders from the Church of England have refused their aid, a better spirit has influenced others, and one, a landed pro-prietor, has been a very liberal contributor. Something yet remains to be done towards the renewal of the chancel, which, we hope, will not be neglected by the impropriator, and the church, thus completed, will unite the requisites of comfort, convenience, and neatness, with strict architectural propriety.-...Ipswich Chroniole.

REVOLVING SCAFFOLDING USED AT THE NEW HOUSES OF PARLIAMENT.

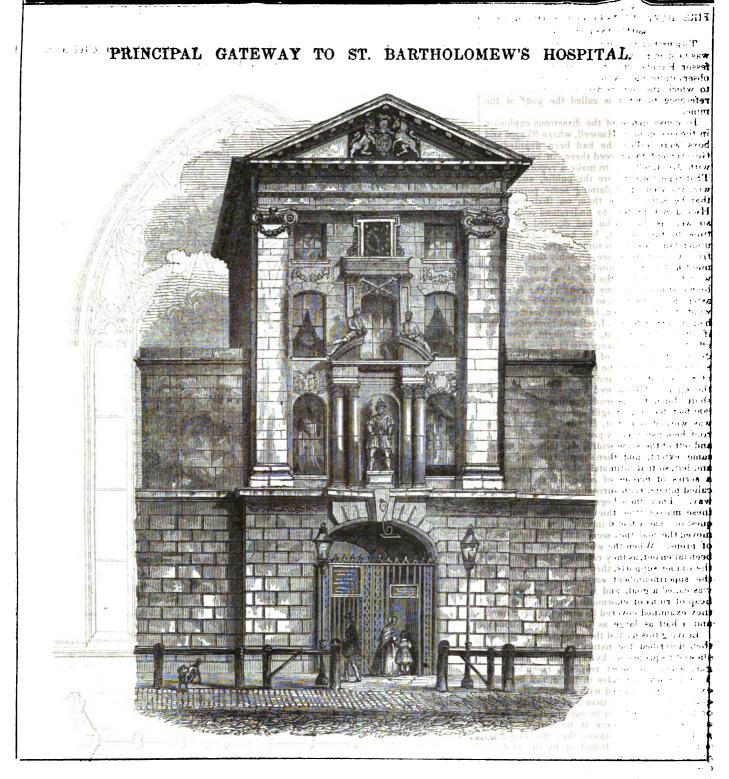

In continuation of the article on timber scaffolding which appeared in our last Number, we are enabled, by the kindness of Mr. Grissell, to give our readers an engraving of the circular travelling crane, now in use for erecting the central, or ventilating tower, at the new Houses of Parliament.

It consists of a circular base curb, at the top of which is fixed a toothed rack. In the

contro is fixed a vertical post, with diagonal control is intered a vertical post, with diagonal braces, carrying a centre point, around which the travelling crane works, with its hoisting crab on the top. At the foot of each leg is inserted a toothed wheel, working into the rack, so that by means of winch handles the whole can be made to revolve. It is stated, that the saving in labour is very considerable, but that the saving as compared with the cost of constructing scaffolding is very much greater.

Revolving Scaffolding used at the new Houses of Parliament.

ST. BARTHOLOMEW'S HOSPITAL.

ST. BARTHOLOMEW'S Hospital is one of the most ancient, as well as the most important, of the numerous charities which distinguish England from all other countries in the world. Rahere, by whom it was founded, lived in the reign of Henry I. A curious document among the Cottonian MSS. (quoted at length by Malcolm in his Londinium Redivivum) describes the life of Rahere, and the circumstances which led him to build the priory of St. Bartholomew and the hospital near it. In his youth he is described as haunting "the howsholdys of noblemen and the palices of prynces; where under everye elbowe of them, he spread ther coshyngs with iapys and flatteryngs delectably anoynting the eevyes, by this mean to drawe to hym ther frendschippis," and took the lead at all plays "and other courtly mokk'ys." Becoming impressed with a feeling of the wickedness of his life, he journeyed to Rome as a penance. Here he was overtaken by sickness, and being at the point of death, made a vow, that if he recovered, he would build

"an hospitale in receation of poure men, and to them so ther gadered necessaries mynyster after his power." He was afterwards commanded by St. Bartholomew, in a dream, according to the legend, to build a church in his name in Smithfield; and recovering, returned to England to fulfil his vow, and comply with the command. Having obtained the king's favour, he first built the church, and then "an hospital house a litell lenger of from the chirche by hymself he began to edifie."

The hospital remained attached to the priory till after the dissolution; when Henry VIII., in the last year of his reign, granted it a new charter of incorporation, and endowed it with a certain sum on condition that the citizens of London should contribute an equal amount. At the present time its revenue is very large, the good it effects incalculable.

The buildings escaped the Fire of London; but becoming ruinous, were for the most part taken down in 1729. Subscriptions were

* Rahere's tomb is in the church of St. Bartheloanew the Great close by; an interesting building, once part of the of priory. raised to rebuild it, and in 1730, the present structure was commenced from the design of James Gibbs, but was not completed before 1770.

The principal gateway, very accurately represented by the accompanying engraving, is of earlier date than the hospital, having been rebuilt in 1702, when Sir W. Prichard, Kt., was president, and John Nicoll, Esq., treasurer-The whole is of stone, and is in a good state of repair,-much better than the hospital itself. The figure in the niche is intended for Henry VIII., those on the broken pediment above it. are designed to represent Lameness and Disease. Originally this gateway was connected with buildings on either side, and did not profess to have any thing more than a street front. Lately its character has been altered by removing these buildings, and the result is not advantageous to the design.

In the ensuing number we shall give views of the quadrangle and the Giltspur-strees gateway, and shall then be able to speak more at length of the architectural peculiarities of the hospital.

.42

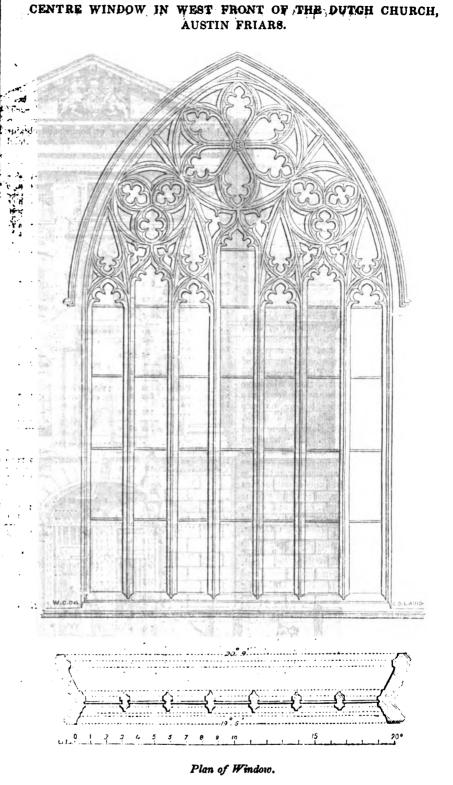

FIRE DAMP-VENTILATION OF MINES.

Two first evening meeting in the present year was held on Friday, the Untristant, when Professor Faraday laid before the members some observations on coal mines, and the accidents to which the miners are liable, with especial reference to what is called the goaf of the mine.

. In consequence of the disastrous explosion in the coal mine at Haswell, where 95 men and boys were killed, he had been deputed by Government to proceed there, in conjunction with Mr. Lyell, and to make a report upon it. That report was before the public, and it was with the view of explaining some points in it That report was before the public, and it was with the view of explaining some points in it that he came before them on that occasion. He did not profess to understand coal mines so well as those who had devoted all their time to the subject, but he did profess to understand Nature in some degree, and it was from this circumstance probably that Gowern-ment had selected him for the inquiry. He would premise that the inquest shewed that no blame attached to any person in the late disblame attached to any person in the late dis-mater; all precaution, so far as their knowledge went, had been taken, but certain observations had occurred to Mr. Lyell and himself which, nster ; all precaution, so far as their knowledge went, had been taken, but certain observations had occurred to Mr. Lyell and himself which, if attended to, might, he thought, have the effect of lessening danger in future. He then described, by means of their, cloth stretched against the wall of the their were appearance of a seam of coal, and the noise of working the mine. He shewed were the present case 900 feet deep), a straight means of their present case 900 feet deep), a straight means of their present case 900 feet deep), a straight means of their present case 900 feet deep), a straight means of their present case 900 feet deep, a straight means of their present of and left, so that ultimates the mine presented a series of masses of coal 24 yards square, called pillars, each surremined by a passage or way. They then began means that four one in question was 4 feet 6 in the root by means of props. When the world of one pillar had been taken out, as they command the root by means of props. When the world of one pillar had been taken out, as they command the root by means of props. When the world of one pillar had been taken out, as they command the root by means of props. When the world of one pillar had been taken out, as they command the root and the superincumbent earth, the presented a heap of ruins of enormous extent. The goaf they examined covered light the professor men described the nature of time damps and shewed its properties by experiments with coal-gas, which, in most respect, resembled it. The gas which exudes in the mines becomes explosive when mixed with atmospheric air in quantities of not less than 5 of air to for gas; or more than 14 of air to one of gas; with less air or more air there is no denger. The professor was of opinion that the coal-dust active about was licked up by the rush of air produced, in which case the combustion (as he shewed by experiment) was very dif-ferent. Fire-damp is exceedingly light, and necessarily ascends to the highest parts. This be wished to enforce—na be exemplified by various experiments, as upon this property was based the proposition he wished to enforce—namely, that the goaf is a receptacle for fire-damp, and by a variety of circumstances may be made to discharge part of its contents into the mine—for example, by

ef its contents into the mine-for example, by change in the density of the atmosphere. The ventilation of mines was effected by two shafts, in one of which was a furnace; through the rarefaction produced, currents were established which drew off the gas. To shew the size of the furnace at the mine where the accident occurred, he mentioned that a ton of coals was always in combustion. The professor then shewed by experiments with pipes communicating with a fire, how rapidly smoke was carried off in this manner, and urged, as the main object of his lecture, that all goafs should be ventilated as high as was practicable by means of pipes communicating with the furnace. This might

be done in most cases at an expense of 50. There is no lecturer who can invest a simple subject with an much interest as Mr. Faraday, or more completely simplify an abtruse one. His illustrations too, never fail, and are always ready. His audience are not kept waiting while this bottle is filled, or that jar exhausted; preparation and explanation go on together, and the result is perfect.

GOTHIC DETAILS FROM THE DUTCH CHURCH, AUSTIN FRIARS.*

THE centre window in the west front, represented by the accompanying engraving, is a very good example of a window in what is termed the decorated style, which, as a general rule, may be called the architecture of the 14th century. The arch of windows of this style is usually equilateral (not always), and the tracery consists in the earlier specimens, of geometrical forms, circles, trefoils, &c.; and in the later examples is formed by wavy, flowing lines. In the Perpendicular style, which succeeded it, the multions ran through the head in perpendicular lines, and the tracery took the same character; the arch became flatter, and altimately lost the pointed form altogether. The perpendicular style in the same general way, as above stated, may be considered to belong to the fifteenth century. In windows of the early English style, which preceded the decorated, the arch, especially in

* See p. 30

the earliest specimens, is acute, and the opening long and narrow. This style belongs to the thirteenth cen-

tury. Tbe window that forms the subject of our illustration is considerably larger than the siele window figured in the last number of our journal, (as is shewn by the dimensions annexed), but is drawn to a smaller scale. The moulding of the eill is the same is this as in the aisle window; the section of the reveal, with its dimensione, is shewn by the annexed cut.

43

SOCIETY OF ARTS.

44

WEDNESDAY EVENING, JAN. 22-W. H. Bodkin, Esq., M.P., V.P., &c. in the chair. Bennett Woodcroft and J. Havers, Esqs., were elected members.

The secretary read a paper by M. Claudet, "On the progress of the various branches of

"On the progress of the various branches of Photography." The author treated of the improvements which the art of Talbotype and Daguerreotype have undergone during the past year. Also, mentioning many new processes, and describ-ing a discovery of his own connected with the optical part of the subject, by means of which great and hitherto unattainable facility is given great and nitherto unattained of the second for obtaining a sharp and defined picture. The most interesting part of the paper, however, was that which treated of the new process of engraving the Daguerreotype image, so that it may produce a great number of copies, in the same manner as a plate engraved by the usual method. The process consists in biting away (by certain means described by the author) the dark parts of the picture, so that they may retain ink, and admit of being printed by the ordinary process of copper-plate printing.

FLOOR-TILES.

WE have been favoured with a specimen of glazed flooring tiles from Scinde, of such superior quality and beauty to any procurable in Bombay, that the subject of their importation seems well worthy of the consideration of the mercantile community. The aspect of the tiles must be familiar to most of those who have tiles must be familiar to most of those who have been on the Indus—specimens, indeed, are plentiful in Bombay. Those before us are 6½ inches square, and 3 of an inch thick, admirably well-baked, and glazed blue and white, like old Dutch ware. One hundred will furnish 3½ yards of pavement for 2½ Rs. of price. The glaze is a true vitreous one, as perfectlymade and applied apparently, as that on European earthenware. Thefloors of our lobbies and verandahs are here at present generally comand verandahs are here at present generally composed of blocks of trap, rough, cold, and com-fortless looking, though sufficiently strong and substantial, or of tiles imported from China. The stone is at once unseemly and expensive, and would rarely be employed could a more elegant and economical substitute be found. The Chinese tiles are 14 inches square, and cost from 15 Rs. to 25 Rs. per 100. Or taking 20 Rs. as the average price, and assuming that something less are required to the square yard than seven tiles, at a cost of about Rs. 1: 12 than seven tiles, at a cost of about Rs. 1: 12 annas a yard—more than double the price of the Scindian tiles, which can, it is said, be imported here for betwixt 2 and 3 Rs. a hundred—equivalent to 3½ yards of flooring, which will, on an average, cost less than 13 annas a yard. A verandah, or lobby, 15 feet by 30, could be paved with them for about 70 Rs., chunam, pavior work, and all. They would exceed the Chinese tiles as well in strength as in cleanliness and heauty.— Bombau strength as in cleanliness and beauty .- Bombay Times, Nov. 23.

BUILDING SOCIETIES, LOAN COMPANIES, AND SAVINGS' BANKS.

BY WILLOUGHBY WILTON.

(Concluding Letter.)

Smag. "You never can bring in a wall. What say you, Bottom ?" Bottom. "Some one must present wall." MIDBUMMER NIGHT'S DREAM.

THE Editor of THE BUILDER has received a letter from "H. S." on the subject of our remarks in previous letters respecting build-ing societies. As our object is truth, not victory, we most willingly receive any light which can be thrown on this abstruse subject. Acting on this principle, we will con-sider it our duty calmly and independently to admit and criticise such attacks as may be made upon our position, until we shall be shifted from it by numbers—not of assailants, but of truth-telling figures. But to cut this preamble short, the letter of "H.S." reads thus:—

TO THE EDITOR OF THE BUILDER. SIR,—I have read the letters of Mr. Wilton in your periodical on building societies, and although he has stated sufficient to act as a caution to the he has stated sufficient to act as a caution to the public, yet, as it appears to me, he has fallen into public, yet, as it appears to me, he has taken into some errors, which needlessly make those societies appear worse than they would really seem to be, and consequently of greater disadvantage to the borrowers. Having no connection with any of

these societies, I know nothing of their plan of unese societies, I know nothing of their plan of operation, beyond what one may glean from their rather ambiguous prospectus; far from thinking, however, with your correspondent that a period of seventeen years is required, I am inclined to believe that a society may finally terminate in ten years, and also yield a large return of profit to those members who become in fact lender of money members, who become, in fact, lenders of money.

members, who become, in fact, lenders of money. Let us suppose a society holding 100 shares. The terms are that 10s. per month per share shall be paid, and in addition 4s. per month for interest on those shares upon which money has been advanced. The shares being nominally 120*l*. each, we will further suppose that the borrower agrees to a deduction of 63*l*. by way of bonus, and obtains 57*l*. for his share. The account will then stand thus :--*

* The calculation here instituted has not the merit of novely, though it may be original to its author. The same species of Dr. and Cr. account will be found in some of the pamphlets which have been published on building societies ; and particularly in the "Proceedings of the Court of Common Sense," but with this difference 'that the author of that brochure gives it the title—"Calculation to show what would be the duration of a society, if the shares were fixed at 1501, each, the monthly payments twenty shillings per share; the borrowers to pay five per cent, interest, or 122. 6d. per share, and to receive the full value of their shares without any deduction for premiums or discount;" and proceeds as follows:— DE. FIRST YEAR. Cr.

as tollows :--DR. FIRST YEAR. Cr. To Subscription, 500 0 shares at 12/.... 6000 0 To Interest, 41 shares average 75s. ... 153 15

266153 15 The writer "H. S.'' suppose in all this that the bor-rower is liable only for 571.; but from all we can learn—and we have asked the question besides in our letters, and it has not been answered in the negative—the borrowers are bound to pay, in full of all demands, 1201. per share; and it is this which constitutes the difference between the apparent and real duration of these societies, between 10 and 17 years. ‡ We would recommend "H. S.," who is quite compe-tent to the task, to work out the several cases with these data:—

 $160 \times 120 = : \pounds 12,000 \mid 100 \times 63$

E12,000 These 6,300% of bonus are, what? Are they the premium which has become a shadow of James Blackman, chairman of directors of the Lambeth Building Society? We again pause for a reply. And then let "H. S." say whether we have needlessly made these societies appear worse than he himself does.

22 shares, pay each sub. 60 0 0 and double their capital in 10 years.9

In their prospectus they say that the member only pays an interest of 4 per cent. on the loan. Were the member to receive 60%. upon his share, Were the member to receive 60% upon his share, doubtless the interest at 4 per cent. would be exactly what the society charge him, viz. 4s. per month, or 2%. 8s. per annum; but this is a one-sided account, and without reckoning the value of his annual subscription of 6% for 10 years, which at 4 per cent. amounts to 72%, leaving him 12%, after paying his debt of 60% and interest at 4 per cent. I Let us take, for example, the first and last cases in our calculation. In the first case, a member joing the society, and pays an annual sublast cases in our calculation. In the lifet case, a member joins the society, and pays an annual sub-scription of 6l; he has appropriated to him at the end of the first year 571, for which he has to pay annually 22. 8s. in addition to his subscription. At annually 21. 8s. in addition to his subscription. the expiration of

10 years, he will have paid £81 12 0 And have received from the society 57 0 0

Paid for loan of 571. for 9 years #24 12 0 If he had borrowed 571. for 9 years at 4 per cent,

in in

interest as the lenders are receiving, and this we find by calculation to be about 15 per cent., and doubling their capital in 10 years by monthly instalments. -I am, Sir, your obedient servant.

H. S.

The monthly subscriptions, fines, and forfeiture of shares, tend to increase the profits above

15 per cent. We have deemed it our duty not to disturk the calculations of "H. S." in any manner, but to leave them as he has conducted them, believing that without being checked, on his own premises, the computations of the in-terest are perfectly correct. "H. S." and all men capable of conducting a calculation of

9 The whole of this claborate but ingenious process is detailed with great fidelity by "H. S.," but what end does it serve? It does not come near the amount we have shown to be contributed by the unfortunate borrower. I There is much of truth in this remark, but the whole calculation, which disregards the operation of the bonus or premium, and its terrific re-action on the borrower at the inclusion, which disregards the operation of the bonus or premium, and its terrific re-action on the borrower at the one of 10 years, or for a duration of 17 years, must be erroneous in the extreme. We have already so fully expounded the operation of these monthly instalments in our previous letters, that see pointles, and lave the question as therein stated. We are not in any way interested in these societies, and have enterprised to set the matter right, " that the public may be able to place confidence in them," and shat the borrowers may be equitably dealt with.

magnitude similar to that we have presented from his pen must know that if we had in our previous letters followed the same course, our readers would have been confounded by the very appearance of the figures marshalled to bring out our results. But in all these cases the figures resemble the ingeniously con-structed scaffolding which surrounded the Nelson Column, the Royal Exchange, or that which now surrounds the New Houses of Par-liament. We removed the whole of our apparatus, and left the object single and entire to view. This, to drop the simile, is to take up the whole question in one proposition, which we word thus :-

To what sum would an annuity of 81.8s.a year for ten years amount, when paid or re-ceived, and laid up at interest in monthly por-tions of 14s. 8d. each, the interest at the rate of 51. per cent. being con treelve times in the year? cent. being converted into principal

THE ANSWER IN BOUND NUMBERS IS ONE HUNDRED AND SIX POUNDS TEN SHILLINGS.+ Thus the whole of the calculation of "H.S." falls to the ground, if one share pays ansually 64 of contribution and 24. 8s. of interest; or 8 guincas a year by twelve payments of 14s. 8d. each; and with this stringent con-dition in our calculation on the lenders, that the borrower has had 60*l*., which he repays in ten years, with interest at the rate of 4 per cent

If therefore this contribution will not make 1201. in ten years, what annual, or from thence, monthly sum will make 1201.?

We answer : Nine pounds nine shillings and we answer: I time points nine similaritys and seven pence a year; or fifteenn shillings and ten pence a month; improving the contribu-tions at 5 per cent. compound interest; in all of which the borrower has no participation, as we have shewn already from the rules of these constitue. Therefore, we conclude the her societies. Therefore, we conclude the bor-rower must make good the bonus, and become free some years after his financial bondage of

we had promised in a previous letter to notice also in our inquiries the operations of the small loan societies. But we desire not to be misunderstood here. We do not asso-ciate building societies with the nefarious schemes we are now about to handle.

The small loan societies differ essentially from all other modes of advancing money upon interest in Britain: they are sui generis - they make the food they feed on-they are esta-blished professedly to lend sums of 5l., 10l., &c., at 5 per cent. interest, to be repaid by weekly instalments proportioned to the sum borrowed.

Suppose some five idle men choose to get up one of these societies, one is manager, another treasurer, three are trustees, who become divi-sible also into clerk, messenger, and "Newman Noggs,"-the man who makes inquisition into and reports on the character cum woridus bonis of the borrowers' sureties. But these "five senses" have no money, nor do they require any; they are started by a "Ralph Nickleby," and his man "Noggs" is put in to look after the other fellows. Ϋ́οτ cannot now-a-days contemplate any one of these wretched concerns without finding at kast one spy, one eaves dropper — and in the third corner a sourd et muet placed there by the chief :---

" Of spirits, likest to himself in guile

To be at hand, and at his beck appear If cause were to unfold some active scene

Of various persons, each to know his part."

Well, then, the directors-oh! the prostitation of language !-- meet at eight o'clock at night, in a decently-furnished house, or it be otherwise, as we shall presently see, Dav and in an innermost snuggery sits the chief, the counterpart of your *Ralph Nickleby*. All persons wishing to become members pay the hist week's contribution, and tender the names and residences of the parties they propose as surveises, and sho the fees for Mr. Nogga making inquisition into their respectability, which fees go by the mileage scale of one mile, is.; not exceeding two miles, ls. 6d.; and for every additional mile, the further charge of 6d. And then the chairman informs the applicant that notice will, in due course

of time, be sent to him whether the sureties are approved of.

First applicant wants 51. on loan, and pays for being allowed to ask for it 2s., or the first week's contribution; and for the journey of Mr. Noggs from Paddington to Stepney, 3s., ls. for the book of rules, ls. towards a de-ficiency found, and 2d. for office-rent, making in all 7s. 2d.

This is a tolerable entrance-fee before the man knows whether his respectable friends will be accepted as sureties, and the loan obtained.

Pray, gentle reader, is this according to law, and conformable with the Act of Parliament? However these may be, the man buttons on his great-coat, makes his bow, retires, and walks home, the Devil whispering in his ear all the way :-

" Therefore, if at great things thou wouldst arrive, Get riches first, get wealth, and treasure heap, Not difficult "----

and the visions of "wealth amain" piled on the board-table, flickering brighter than the gas-lights to his eyes, and his ears listening as to the chairman's voice, as in broken accents it says of the society :-

"Riches are mine, fortune is in my hand."

Enter No. 2 for a loan of 10/ .-. "Four shillings, Sir, first week's contribution (says the chairman); 9s. for the inquiries into your survives, one being at Hoxton, another in Kennington, a third all the way to Notting-hill—in all 15s. 2d." The man pays: "small consolation" to be now told, as the former, that he will hear in due course from the secretary.

The third party for a loan of 151. now appears, and the same forms are gone through, and he feels

" That fellowship in pain divides not smart,

Nor lightens aught each man's peculiar load ;" for he pays 6s. as the first week's subscription, and all the et cæteras of No. 2. Or at the option of the member, to which option he receives a gentle hint from a touter in the person of Mr. Noggs, No. 1 for 5*l*. puts down his 4s.; No. 2 for 10*l*. takes 10s. out of his purse, and hands it to the secretary; and No. 3—"envy they say excites"—whisks 12s. on the table.

Next evening the cases are discussed; and some accepted, some postponed, and some rejected. In due course the parties and their "promissory notes" are drawn, signed, ac-cepted, and endorsed; and each gets a book, in which is entered, or to be entered, all the transactions of the loan, and the results of his wandering promissory notes. Suffice it to say, the parties are charged interest at the rate of 5 per cent. per annum, from and for the time the money is advanced; charged too in the amount, and deducted from the money when advanced.

Now, though "Ralph Nickleby" appears the lender to the hundred borrowers, his coadjutors could manage the matter very well without him, for 50 subscribers would enable a society in four weeks to lend 10/., since the society is not the lender, but merely the manager of the fund lent. This is the great secret, the moving spring in the operations of these widely-spread and ruinous societies, for the managers are paid so much for doing improperly what the contributors themselves could do economically and equitably.

Upon the principle of receiving, as from 50 members, their weekly quotas, these societies, if they have no backer as "Ralph Nickleby," are enabled to make loans of 101. ad infinitum, the difference between what the borrower receives and what he pays being quite enough to pay expenses of management, and allow the "direc-tors," as the needy scheemers style themselves to pocket a handsome sum annually. We speak advisedly when we affirm, that for managing every loan of 10%, which the borrowers contribute one to another, the directors pocket far more than people generally imagine; but we shall see. Besides, the interest is here illegally charged—we mean that the lenders charge the borrowers interest in place of dis-count, which makes an immense difference in these transactions. For example, if a poor man contracts for a loan of 10% by weekly instalments of 4s. a week for 50 weeks, the loan is at first simply equivalent to the sum of five pounds two shillings for that time, or to two hundred and fifty five pounds for one week;

and the true charge for interest would be about four shillings and eleven pence, whereas the lenders exact about seventeen shillings and sixpence by their process more than ought to be taken.

But we must now have done with both Building and Loan Societies.

Yet one word in defence of the savings banks before we lay down our pen. In recommending building societies to the public, the secretary to the Tring Benefit Building Association, ventures a bold remark, to the effect, that "Persons desirous of joining a building society, have nothing to fear in regard to the safety of their money. These societies," he affirms, " offer a better security than savings' banks, or any investment of the sort. The security of savings' banks is only visionary at best; but building societies have real security for money advanced." That is to say, a rity for money auvanceu. I have to comp, -small joint stock club at Tring, in Hereford-shire, is broader-backed, stronger, and more shire, is broader-backed, stronger, and more secure than a savinge' bank over which the most independent, wealthy, and influential men of a county, parish, or district preside whose funds are periodically invested with the Commissioners for the reduction of the Na-tional Debt. The ravings of this Bedlamite would deserve no consideration, did he not labour under the mesmeric influences which impresees members of building sociaties with impresses members of building societies with the belief that, as to their freeholds-

" Underneath are diamond-rocks,

Topaz-boulders, ruby-blocks,"

and past their doors run onward still

" Golden rivers, silver streams, Richer sights than visit dreams."

We beg leave to recommend savings' banks,

as banks of safety. The miserable victims of the small loan societics, so hurtful and pernicious to the morals of the industrious classes, not only find no relief in the calamities to which they expose them, but by association with them prepare themselves for future unknown vicissitudes; while the humble man, who goes weekly to the which had enabled him in the beginning to call himself a "saving-man."

Correspondence.

METROPOLITAN BUILDINGS ACT.

SIR,-It is much to be regretted that complexity or ambiguity should exist in such an important Act of Parliament as the above; but that it does exist, and in several of its regulations, cannot be denied. This was regulations, cannot be denied. This was repeatedly pointed out during its progress through its several stages; and to improve the Bill, a postponement was suggested until the ensuing session; * but having lingered so long, and having undergone so many altera-tions, it was supposed by those having its management to be perfect in all its parts, and it was determined at once (late in the session) to pass it into a law.

In your last publication, in a note to your notice of some of the proceedings under its provisions, you state that " many of the builders and zinc-workers have been astonished at the interference of the district surveyor when erecting a funnel or smoke-pipe on a chimney-shaft! nevertheless, he (the surveyor) would seem to be justified. If it be 4 feet above the brickwork, notice must be given of such work, and the FRE paid, or the penalty may be incurred. See s. 13, and schedule F, art. chimney-pots, tubes, &c.

I must confess I was as much astonished at reading this note as the builders and zincworkers must have been at a visit by the district surveyor, especially with the demand for a FER.

Having carefully read over sect. 13, I find. no mention whatever of chimney-pots, smokepipes, or funnels, but the section clearly enough particularizes chimney-shafts and flues; by referring to schedule F, you will find that chimney-shafts and flues are to be of brick or stone-work, and at least four inches thick ; this, therefore, cannot mean, even by implication, a metal or any other chimney-pot or smoke

• In the reports made upon the Bill by the committee of master carpenters, published from time to time in THE BUILDER.

[•] The borrowers are charged 4 per cent.; we assume that the lenders can improve their contributions at 5 per cent. • If we had computed the improvement of the money at • per cent. the amount would have been somewhat different.

tube, bet a little further in advance in the enne schedule you will find the following regulations for "Chimney-pots, tubes, &c." "A As to earthen or metal chimney-pots, tubes, funnels, or cowls, of any description whiststever, if such pot, tube, funnel, or cowl be higher than 4 feet above the brick or those work of the flue on which the same is placed, then it must be fixed 2 feet at the least built the brick of a stonework of the flue. on preced, then it must be index a you in the internation of the first or stone-work of the flue, on which it shall be placed."

which is shan or placed." There can be no doubt but this is a very proper regulation in the affixing these tubes, had match to be preferred to the old and blamsy method usually adopted in piling brick-work upon a flange, and round the pot or tube; work apon a flange, and round the pot or tube; but that the Act requires any notice to the district surveyor for such a trifling work can-not be admitted; and less so that any FEE is payable therein. It is true that if a "at chimney pol, &c. higher than 4 feet, is not fixed," "at least 2 feet into the chimney-shaft and fixe," that then (but not if properly constructed) the Hat and 18th secs. may be put into operation 'Isth and 15th sees. may be put into operation against the party committing the irregularity; "both these sects, provide for the payment of "all costs and charges to which the district "surveyor may be put in rectifying irregu-larity; but he is certainly not to be paid 'regular or irregular by a FEE. I am borne out in this opinion upon reference to the "mended Bill in the committee of the House of Commons, previous to the "amendments and alterations" proposed to the Committee of and alterations, proposed to the Committee of "the House, and assented to by them. In that "the frome, and assented to by them. In that "Bill, among a great many other objectionable frees, was a fee specially set forth of 10s. for "fupecting chimney-pois, shafts, funnels, &c. "above a certain height. "This and several other fees for trivial f matters were opposed by the society I had the

matters were opposed by the society I had the binour to represent, and I may venture to "sissert," that "the result was an alteration and "expunding of these unnecessary and objection-"bine inflictions." It is therefore to be exceed-"bine inflictions." It is the effort to be exceed-"bine inflictions." It is the effort of the exceed-the exceed-the exceed-"bine inflictions." It is the exceed-the exceed-the exceed-"bine inflictions." It is the exceed-"bine inflictions." It is the exceed-the exceed-"bine inflictions." It is the exceed-"bine inflictions." It is the exceed-the exceed-"bine inflictions." It is the exceed-"bine inflictions." It is "making in many instances to inflict upon the "minimity a fee not justified by any part of the "Act; and further, there is no question that "the surveyor or surveyors exacting a fee for "the inner, pots, smoke pipes, tubes, &c., will "minimity bring himself or themselves under "the operation of the 79th sec, of the Bill. In .a word, the legitimate fees demandable will be "found to be quite remunerative for any of the ordinary duties to be performed; for any or the ordinary duties to be performed; for any spe-cial services provision is made to meet all such services by special fees. This being the case, and any costs or charges, expenses or loss of ¹¹ time," in compelling or putting in force its re-¹² gulations and enactments, being also folly and ¹³ amply provided for, and which charges are set ¹⁴ forth in schedule L, in the Bill, it is to be hoped ¹⁵ that charges will not be made upon the public ¹⁶ hot authorized by the legislature. ¹⁷ Dorset Place. H. BIERS.

The above letter did not arrive in time for . •/. ús is to offer any observations upon it in the present number. We shall do so hereafter; the subject of it, as will be seen by our leading article, has already occupied our thoughts.— ED.]

MISTAKES IN ESTIMATES.

Sin, — The steady course you have always pursued with respect to professional disputes and grievances, and the decided stand you have always made sgainst crooked dealings connected therewith, induce me to make known to you the particulars of a transaction in which I have been recently engaged, and regarding which I conceive that I have a just cause of complaint. In so doing, I trust that others may benefit by my want of caution, and by my loss. In the remarks upon St. Paul's Church, Herne Hill, which appeared in your publication of the 4th instant, it is stated that the amount of the estimate for the building was 4,500L, and details are given to prove that the actual outlay did not exceed that sum. This agreement between the estimate and expenditure is generally a theme for well-merited praise, and deservedly so when the conditions of the cona rtract are fairly carried out; but cases may trise; and in the one I am about to trouble you with, has arisen, when very different deserts to those of praise should be awarded. ft was my lot to be the unfortunate sub-contractor for the musons' work of the church

τ.

71

ŧ.

in question: Wy calculations were that from quantities supplied by Mr. Brobmfield; after which an agreement was handed to me by the chief contractors, Messes. Howard and Son, which, in an unguarded moment, supposing all was right, I signed. By this I undertook to be thereast correspondence and specificado the work agreeably to plans and specifica-tions furnished by the architect, and which I distinctly anderstood were the same or similar to those made use of by Mr. Broomfield. As to those made use of by Mr. Broomheid. As I progressed with the work, I soon discovered that the quantities supplied by Mr. Broomfield were very deficient when compared with the plans and specifications supplied by the ar-chitect. I remonstrated with each party, but to no effect; Ms. Broomfield said that he did not take out the currentiles himself, but conied not take out the quantities himself, but copied them from the architect's book of dimensions. The architect said that he had nothing to do with it, and referred me to Mr. Bruomfield. Messrs. Howard and Son said that I had the same quantities that were supplied to them, and that I must abide by my written agree ment. Without troubling you with the full particulars of the loss which I contend has been most unjustly forced upon me, I will mention that one item in the quantities supplied by Mr. Broomfield was 322 feet of stone in quoins to buttresses taken at 7 inches by 5 inches, while in the plans and specifications supplied by Mr. Alexander, all the quoins were to be 9 inches by 54 inches. I can prove that upwards of 1,000 cubic feet of stone have been used more than my calculations were made for, and this, together with the labour upon it, I shall amounts to a very considerable sum. I shall feel obliged by your giving insertion to this communication in your columns; it is a trans-action that ought to be generally known in the I am, Sir, your obedient servant, WHLIAM SUGDEN.

Gravel-lane, January 18, 1845.

[The circumstances stated do not seem to reflect in any degree on the architect. Mr. Sugden's remedy is against the party who took out the quantities.—ED.]

REPAIRS COMMENCED BEFORE JANUARY IST. SIR, -I commenced some rather extensive alterations in a house in one of the metropolitan suburbs (removing old pots, rebuilding part of chimney, stuccoing the front, &c.) about the 15th of December last, and had finished the chimney before the scaffolding for the front was erected, which was this week.

I am applied to by the district surveyor for "a notice," which, as we commenced opera-tions before the new Act came into force, I do

Not think proper to send. You will oblige me by giving your opinion on this subject to your numerous readers, among whom is yours, &c., January 17, 1845. ALPHA.

[This is an important question, and one which, as we desire our opinions to be re-garded, we cannot definitely answer without the fullest information. One alteration or addition commenced before the 1st of January, and therefore not within the control of the Act, would not exempt from its provisions another alteration or addition commenced after the 1st, although in the same building. If the whole were included in one specification, and contracted for before the 1st of January, the matter would perhaps be open to question.—ED.]

SIR,-I am a journeyman carpenter, and want to make myself acquainsted with archi-tecture, drawing, &c.; but from the numerous works published, I do not know which to buy that would be most useful to me; and after reading your leader of THE BUILDER, January 4th, I resolved to seek your advice. Your opinion would oblige and serve

ONA OF YOUR SUBSCRIBERS.

32, Shaftsbury-street, City-road, January 20, 1845.

fOur correspondent's inquiry is a more difficult question to answer fully in a few words than it may appear to be; but we recommend him to read Mr. Hosking's two treatises on Architecture and Building, pub-lished by Longman. He can perhaps borrow them, rather than boy. As to drawing, he would find facilities for learning the rudiments cheaply at one of the literary institutions-the Mechanics', for example, in Southampton buildings.-ED.]

SLABS AND HRARTHS UNDER THE NEW ACT.

SIR,-In the new Building Act, schedule F, it is required, that the hearth of every chimney must be laid and bedded wholly on brick or stone, or other incombustible substance, which must be solid for a thickness of 9 inches at least beneath the surface of any such hearth.

Our correspondent mistakes hearth for slab. The Act directs, as he correctly states, that the hearth (on which the stone stands, within the opening) shall be bedded on incombus-tible substance at least 9 inches thick : but regarding the slab, in *front* of the opening, it simply provides that it shall be laid on stone or iron bearsrs, or brick trimmers, without mentioning any thickness.....ED.]

Atiscellanea.

CLERKENWELL IMPROVEMENTS. — At a meeting of the Middlesex magistrates held last week at the Sessions House, Clerkenwell, the report of "the committee appointed to ascertais if any and what alterations and repairs are necessary to be made in the Sessions House," was read. It set forth that the present building was entirely inadequate for the purposes of the county, especially for the business of the sessions, whether in regard to the secommodation of the prisoners, to the offices for the clerk of the peace, to the comfort of the judges, the jury, the bar, the press, or the public. Mr. Wilson, in moving that the report be printed and eiroulwes amongst the magistrates, begged that they would all come and examine the present build-ing, and, if they were to do so, be, was IMPROVEMENTS. - At a CLERKENWELL ing, and, if they were to do so, he was satisfied they would instantly approve of the suggestions which the committee had made in the report as to a remedy for the evil. Mr. Botch said the county would be much benefited by the adoption of one of the suggestions, which was that the present building should be pulled down and the site let upon building leases for the new street in continuation of Farringdon-street; and that a new Sessions House should be built on some waste ground belonging to the county, nearly opposite to the House of Correction. The motion was agreed

GROWTH OF TOWNS NHAB RAILWAY STATIONS.--A village of 200 houses and a population of 1,000 souls, has sprung up at the Wolverton station on the London Wolverton station on the London and Bir-mingham Railway. A church and parsonage house have been built at an expense of 4,000/. We learn from the Railway Record that the railway company have given a room for the use of the Wesleyan methodists, and have established day and sunday schools, where 250 children are educated under the charge of the clergyman. A reading room and library, savings' bank, and musical club, have been established and are working satisfactorily.

PROPOSED RAILWAYS. — The Board of Trade are throwing overboard the new schemes by wholesale, but it remains to be seen whether or not their decisions will be allowed to pass unquestioned. It seems dangerous to entrust such powers as this Board seems to wield to a small number of individuals.

THE CATHEDBAL OF ST. CANICE .- This, THE CATHEDBAL OF ST. CANICE.—This, perhaps the most perfect and beautiful of the ancient cathedrals in Ireland, was lately threatened with destruction by fire, caused by the overheating of one of the flues. Mrs. O'Brien, the bishop's lady, first observed that flames were bursting from the roof of the cathedral and grave the alarm. A four observed an hour's active exertion on the part of the military and the inhabitants, it was completely extinguished, without further injury having been sustained than the partial burning of a few rafters and the stripping off of some of the slates and lead.

SOURCES TO FELLOWS OF ROYAL SOCIET Y. -Lord Northampton has issued his invitations for Saturday, February 22nd; March 8th and 15th; and April 5th.

GREENWICH HOSPITAL. The buildings composing Greenwich Hospital. — Ine buildings composing Greenwich Hospital, which have hitherto been unprotected from the ravages of the electric fluid, are about to be supplied with Harris's lightning conductors.

THE BUILDER.

The House or Commons -A great many workmen are employed in constructing the temporary buildings intended as committee temporary buildings intensed as committee rooms for the approaching session of parlis-ment. They are being built in what is termed the Speaker's Court of the eld houses, and are about ten in number. These rooms have become necessary from the alterations made in the lobby of the House of Commons, which has been contained at least one half, and which has been curtailed at least one-half, and the preparations now being made in the Speaker's drawing-room and adjoining rooms, which were used as committee rooms int year, those apartments, as well as the fine old diwing-room, having to be prepared for the extension of the building of the new Houses of Perliament. The new committee rooms are so placed as to afford every facility of communication, especially to members at the house, by a passage through Westminster Hall and the Cloisters, feading from the lobby. Some months back it was stated that Bellamy's refreshment rooms were required to be removed to make the necessary alterations. They now occupy nearly the same site as before the fire which destroyed the Houses of Parliament. In the Cloisters presses are being formed for the papers of the Journal Office, as a temporary depository. The two large rooms in New Palace-yard are intended as coarts for the Vice-Chancellors Knight and Brace. The ancient spartment known as the Speaker's dining-room, is to be restored to its original which the econocting buildings are being cleared sway for the building of St. Stephen's Hall. The beautiful "Gothio Cloisters are also to be renovated, and are to form a portion of the new houses .--Morning Paper

"NXwonth Castric.—We are glad to learn that Naworth Castric.—We are glad to learn that Naworth Castle is to be restored forthwith, in the style of the olden time, and that to Mr. Salvin, F.S.A., is confided the task. During the past week a quantity of magnificent oak timber, from Lowther-park, has been laid down for the purpose of being used in the work of restoration, and already are workmen busily engaged in preparing materials, and in repairing and strengthening various parts of the external walls. The great hall, which formed perhaps the most imposing feature of the old castle—in which, of yore, had feasted the retainers of "the noble Lords Dacre, who dwelt on the Border," and where, in later and more peaceful times, the tenantry of the barony were entertained—is to be furnished by a highly decorated ceiling of carted oak, somewhat after the fashion of that of Eltham Hall, in place of the "grim and antique portraitures" with which it was formerly crowned. A strong arch of freestone has been built for support, under the hanging eastern tower, the apartment in which, comprising the tapestries, bed-chamber, oratory, and library of " Belted Will," have suffered but little injury, and will still serve to afford future visitors an idea of what Naworth Castle was previous to the late lamentable fire.—*Carlisle Patriot*.

COMPETITION FOR BATHS AND WASH-HOUSES.—The committee have passed a resolution to the effect that no person is to be admitted to see the plans, or even to be informed of the number sent in, until the decision be made. They find difficulty in obtaining proper sites at a fair price; landowners have manifested their desire to follow precept and "take in the stranger." At a meeting of the committee, held lust Wednesday at the London Tavern, among several plans submitted was one which met with approval, having for its object the making various divisions in the washing department, so as to preclude any party from being overlooked by a neighbour, and thereby prevent unpleasant observations or feelings with respect to the nature, quality, or quantity of the articles brought to be washed.

FINE ARTS IN BATH. — The second exhibition of the Society for the encouragement of the Fine Arts in Bath, will be opened early next month. It is the intention of the committee to award a premium of 201. for the best picture exhibited.

STRASBURG CATHEDRAL.—The Courter du Bas Rhin contradicts the report of a deviation from its perpendicular in the Tower of Strasburg Cathedral, and affirms that it rests as securely on its foundations as it did two centuries ago.

TESTIMOWIAL TO MR. BRUNEL, C.E. An elegant service of plats, said to be worth 2,000k, was presented vesterday work to Mr. Branel by 257 subscribers connected with various railways, to commemorate their successful completion. The entertainment took place at the Albion in Aldersgate-strest. Mr. C. Russell, M.P., chairman of the Great Western railway; presided, and was supported by upwards of one hundred of the subscribers. Mr. Saunders, the secretary, in the course of the evening supported that the differences between the Great Western railways had been amicably adjusted.

CORRUCATED INON ROOTS AT PRESERVE DOOKNARD. — Messis, Fox, Henderson, and Co., are now creating nine iran roofs over as many slips in Pembreke Dockyard. They are remarkably light in appearance. The iron principals are of the same shape as the carpentry introduced by the late Sir Robert Seppings, in the construction of his wood roofs. The covering will be corrugated iron. If these roofs answer, of which there is little doubt, it is reported that other slips of larger dimensions will be similarly covered. Within the last year the dock-yard has been increased about 14 acres, making an area of nearly 80 acres. In the new part, two large building slips have been formed. There is also an extensive pond for the immersion of elm timber, and it is generally thought that much durability would be given to English oak by a similar process, before it is put into a ship, a system adopted by the late Sir R. Seppings. The foregoing works have been executed by Henderson and Co. Large additions are making to the smithery. A building for Nasmyta's steam-lift heamer, &c. These buildings are in the hands of the contractors for the iron roofs. A great many sheds, for the preservation of timber, plank, deals, &c., have been built.

THE NATURAL SYSTEM OF ARCHITEC-TURE. AS OPPOSED TO THE ARTIFICIAL SYSTEM OF THE PRESENT DAY.—Mr. W. P. Griffith, F.S.A., has issued a prospectus of a work under this title, the object of which is to set forth the principles which guided the formation of the Grecian Temples (the circumstances which regulated their proportions), and to shew the connection between ancient architecture and music.

New CHURCHES.—At a meeting of the society for promoting the enlargement, building, and repairing of churches, held last Monday, grants were voted in aid of the erection of new churches for the districts of Wyke, in the parish of Birstal, near Halifax, North Rode, near Congleton; Salford, near Manchester; East-end Finchley, Middlesex; Byley, near Middleton, Cheshire; St. James, Congleton, and Neut Head, near Penrith.

IMPROVED DWELLINGS FOR AGRICULTURAL LABOURERS.—Forty-two acres of excellent freehold land, most conveniently situated between the Wilford and London roads, have been bought by the members of the Ruddington Land Allotnent and Provident Fund Society, the purchase to be completed and the land entered upon at Lady-day next. It is intended to erect 160 five-room cottages for the members, two and two, upon each half-acre. The moneys from the sick clubs, and those small sums belonging to private individuals will be withdrawn from the savings' banks, to be invested in the purchase, bearing an interest of 41. per cent. per annum. Any person is allowed to subscribe, in shares of 51. each, but none permitted to have more than 20 shares. In this way, the working men will have the use and profit of their own money, in addition to the interest. Each cottage will have a back door, garden, office, pigstye, and covered cesspool, for the reception of all drainage and refuse of the family, so that nothing unseemly, offensive to the senses, or injurious to health will be met with here.—Derby Mercury.

FIRE BRICKS IN STORES.—The stores in Lloyd's rooms at the New Royal Exchange are said to give great heat with much economy. The economy arises from the use of firelumps, which are placed at the back of the grate. These fire-lumps are slow conductors of heat, which is very powerfully radiated over the apartment by them, and they retain the heat much longer than metallic bodies, and to such a degree, that they impart a considerable warmth to the rooms many hours after the fires have been extinguished.

THE FATAL AGOIDENT AT THE PHONEX-PARK-The fatal accident which layely, ogg curved in the park caused the greatest sengsation in the neighbourhood. It is, a matter of surprise that more damage was not done both to life and property, considering the position the houses are in, and the apdden burst of the accumulated waters on them. The following is the finding of the coroner's inquestand J. Coyne were accidentally drowned, by means of an evabankment at the pond in, the Furry-hill, Phoenix-park, giving way, when the water rushed into the room where they wars, and did then and there drown them. And the jury further say that said embalkment, built or caused to be built by the Commissionera of Woods and Forests, was built in an insecure and insufficient manner, and wholly incapable, of supporting the body of water therein confined; and that such insecurity and insufficiency was the cause of the accident; and the jurors beg to call the attention of the Commissioners of woods and Forests to the great injury and loss of property sustained by Woods and Forests, "-Globe. New Pier AND BASIN AT DRYORFORTS"

47 -

NEW PIER AND BASIN AT DEVORTORY. The foundation-stone of this immense work was laid on the 14th of May, 1844, since which time 52,000 cubic feet of stone have been set, and a great extension of dam has been effected for the purpose of building the invert for the caisson at the basin entrance. The foundation of these works over a considerable space is at a greater depth from the coping than was ever known in a work of a similar nature, it being no less than 68 feet, 6 inches, which is 8 feet deeper than the lowest foundation of London-bridge, consequently the greater is the risk of the security of the collige-The strate of the foundation is hard star pock. On the east side of the basin, and leading into it, two large docks will be found, capable of receiving the largest class ahip. These will be made partly from the docks. Nos., I and 3, intended to be brokes up. The, dock. No., I, which will be thus converted, is the olderation the dockyard. From a copy of an old drawing, it appears that it was made about the com-

It appears that it was made about the gommencement of the 18th century; the rise show THE SMOKE NULSANCE IN MARCHESTER. —It is yet too early to speak with any accuracy of the amelioration of this long-enduged nuisance; but so far as we have been about the streets of Manchester and Salford, in both of which boroughs the statutory provisions against smoky chimneys came into pperation on Wednesday week, we are inclined to thick that there is a considerable improvement. Indeed, we know that various apparatus for consuming smoke have recently been fitted to the furnaces of a number of manufactoring establishments in both towns, and it would be a libel on these to suppose that no good effect had resulted from them, or from the increased watchfulness and care rendered obligatory by the local acts. The nuisance committee of the Manchester Council have given three months' grace to parties offending, and will begin to enfore the penal provisions of the Police Act "from and after the lat of March next,"— Manchester Guardian.

HESSLE CHURCH.—Some further improvements in this church have just been completed. The noble arch connecting the tower with the nave was some time since opened, thereby extending the church to the extreme west, and affording better and increased accommodation in free seats to the parishioners. And during the last week a very handsome window of stained glass has been put into the west side of the tower. The window, which is partly after the design of some in the Temple Church, London, has been very ably and satisfactorily executed by Mr. Barnett, of College-street, York. Few parishes can now boast of having a neater or more comfortable church than Hessle, nor bave any, during the last few years, undergone more alterations that have tended so much both to improve the sacred edifice, and also to accommodate those worshiping therein.—Hull Packet.

INSTITUTION OF CIVIL ENGINEREST-At the anniversary meeting, held last. Tuesday evening, Mr. Walker was re-elected president for the ensuing year. A change had been contemplated.

REMOVAL OF ST. MARGARET'S CHURCH, WESTMINSTER .- Towards the close of the last session of Parliament a report was ordered to be printed, made by the select committee to whom the petition of the rector, church-wardens, and vestrymen of St. Margaret's, Westminster, for aid towards repairing the church, was referred. The report is an inter-esting document, and contains a recommendation for the removal of St. Margaret's Church from its present site. The incongruity of the church (the committee declare) in its style of caurch (the committee declare) in its style of architecture and its proximity to Westminster Abbey, have been frequently noticed and la-mented. They express their unanimous re-commendation "that the church of St. Mar-garet's should be removed from its present site, and they have reason to think that a new churchurch or committee in some last new eburchyard or cemetery in some less populous situation might be purchased at a very mo-derate expense; and that it might be possible to obtain a portion of land not far distant from the present site, where the church could be rebuilt in a great measure from the present materials.-[Churches should not be pulled down without the gravest consideration, and for most cogent reasons.-ED.]

IMMENSE STONE .--- The Peckforton Quarries have for some time been in full work, and we understand that the stone for all purposes we understand that the stone for all purposes is of the very best quality. Some little time ago an immense stone was raised in the quarry belonging to Mr. Tollemache; it was 54 feet long, 18 feet 6 inches wide, and 5 feet dcep. It was cut up in blocks for the baronial castle now in course of erection by Mr. Tollemache, at Beeston. We are informed that the stone was fairly lifted out of its bed. — Chester Chronicle.

TYPHUS FRVER .- We have said that this pestilence has many favourite lurking places as well known to our learned physicians of the Fever Hospital as their own names. Where are they? In the aristocratic vicinity of Bel-grave or Grosvenor Squares? Alas! no. grave or Grosvenor Squares? Alas! no. Would to heaven the fever would follow the fashion and migrate westward, if only for a single season.—Imagine but one fashionable street or square in the predicament of a fever district in Whitechapel, with not a house, nor a single room in a single house without its fever patient. What a sensation it would profever patient. What a sensation it would pro-duce ! What learned consultations as to the cause, what paragraphs in the newspapers, what searching inquiries into the state of the drain-age, what indignant denunciations of the Commissioners of Sewers, what abuse of the land-lords! The patriots of both houses would lose no time in bringing the matter forward, and we should have a second edition of the qui tam actions. The witty divine who wished to im-molute a member of the Episcopal bench to stop a railroad abuse, would be delighted with such a practical application of his principle. But, unfortunately for the cause of social improvement, the fever has vulgar tastes and loves obscure localities, such as Rosemary Lane, and other low parts of Bethnal Green and White-chapel. "The streets, courts, alleys, and houses, in which fever first breaks out, and in which it becomes most prevalent and fatal, are invariably those in the immediate neighbour-hood of uncovered sewers, stagnant ditches, and ponds, gutters always full of putrefying matter, nightmen's yards, and privies, the soil of which lies exposed, and is seldom or never removed. It is not possible for any language to convey an adequate conception of the poison-ous condition in which large portions of both these districts always remain, winter and summer, in dry and rainy seasons, from the masses of putrefying matter which are allowed to ac-cumulate." This description, though written some few years since, still remains true to the letter. Again: "In every district in which fever returns frequently, and prevails exten-sively, there is uniformly bad sewerage, a bad supply of water, a bad supply of scavengers, and a consequent accumulation of filth; and I have observed this to be so uniformly and generally the case, that I have been accustomed to express the fact in this way. If you trace down the fever districts on a map, and then compare that map with the map of the Com-missioners of Sewers, you will find that, whereever the Commissioners of Sewers have not been, there fever is prevalent; and, on the contrary, wherever they have been, there fever mparatively absents"—Medical Times.

- The immense ANCIENT RESERVOIRS. orks which were made by the ancient kings of Egypt, for receiving the waters of the Nile when it overflowed, are well known. But there never was a more stupendous work of this kind than the reservoir of Saba, or Merab, in Arabia Felix. It was a vast lake formed by the collection of the waters of a torrent in a valley, where, at a narrow pass between the mountains, a very high mole or dam was built. The water of the lake so formed had near 20 fathoms depth; and there were three sluices at different heights by which the plains below might be watered. The city of Saba, or Merab, was situated immediately below the ceat dam: a great flood came and raised the ake above its usual height; the dam gave way in the middle of the night; the waters burst forth and overwhelmed the whole city, with the neighbouring towns and people. The remains of the eight tribes were forced to valley became a morass and desert. This fatal accident happened before the time of See Mahomet, who mentions it in the Koran. also "Sale, Prelim. sect. 1, and Niehbuhr, Descript. d l'Arabic, p. 240."-From Lowth's Notes on Isaiah, ch. 1. HAWKSHEAD CHURCH.—This fine ancient

edifice is about to be greatly beautified in the forthcoming spring. An altar-window is to be put in at the cost of nearly 100%, and a new and powerful organ to be erected. A covering for powerful organ to be erected. A covering for the altar was lately received by the rev. vicar as a present from some ladies who visited the church last summer. It is a very splendid and costly affair, richly embroidered with gold .---Westmoreland Gazette.

Cenders.

NOTICES OF CONTRACTS.

For the erection of the Railway Works between Leeds and Bradford, including fencing, earthwork, masonry, roads, and permanent way.—William Clarke, Secretary, Hunslet-lane Station, Leeds. January 27.

For the erection of a New Pauper Lunatic Asy-lum at Clifton, near York. — Messrs. Scott and Moffatt, Architects, 20, Spring Gardens, London; or Mr. J. Holtby, Low Ousegate, York. January 28.

For the execution of Works on the Chester and Holyhead Railway.—1st. A distance of eight miles, or thereabouts. 2nd. A distance of twenty-two miles, or thereabouts. 3rd. A Tunnel through the promontory of Penmaen Back, near Conway.---George King, Secretary, 62, Moorgate-street. January 29.

For the Execution of Works on that part of the For the Execution of Works on that part of the Blackburn and Preston Railway extending from Blackburn to Pleasington, being about 3½ miles in length.—Peter Sinclair, Secretary, Blackburn. January 29. For the Compo and Plasterers' Works, both external and internal, of four houses now erecting in Brandon-terrace, Yarmouth. — Mr. Farrant, Victoria Hotel Varmouth. — Ianuary 29.

Victoria Hotel, Yarmouth. January 29.

Victoria Hotel, Yarmouth. January 29. For the supply of Wrought Iron Rails and the requisite number of Chairs for about 15 miles of the Southport and Euxton Junction Railway. The weight of rails to be from 60lb. to 70lb. per lincal 2 yards and 15 feet lengths, equal to 11 om 1,500 to 1,800 tons of wrought iron, and about one-third of that quantity of cast iron.—Woodcock and Part, Solicitors, Wigan. January 31. For erecting the Works of the third division of the Main Line of the Great Southern and Western

Railway, being 11 miles, 6 furlongs, and 75 yards in length. Also for the first division of the Carlow branch, being 10 miles, 7 furlongs, and 160 yards; comprising excavation, embankments, bridges, cul-verts, &c.—William Taylor, Secretary, 3, College

comprising countername Taylor, Secretary, 3, Conego Green, Dublin. February 1. For the erection of Alms' Houses in Foundation-street, Ipswich.—Mr. J. M. Clark, Brook-street, Ipswich; or Mr. Notcutt, Solicitor, Ipswich. Feb-

For the formation of 4 Miles 561 Chains (single line) of the Ashton, Stalybridge, and Liverpool

Junction Railway.—John Jellecorse, Secretary of the Manchester and Leeds Railway Company, Palatine Buildings, Hunt's Bank, Manchester.

Palatine Buildings, Hunt's Bank, Manchester. February 3. For the works required in erecting certain Farm Buildings at Badley Hall, Esser, and for alterations and additions to the dwelling-house.—Mr. George Sergeant, 27, Queen-street, Colchester; or Mr. John Eagle, Badley Hall. February 3. For the erection of a Bridge, called White Bridge, at Grasmere, near Ambleside, Westmore-land. — Mr. George Robinson, Bridge Surveyor, Kendal; or Mr. Daniel Donaldson, Ambleside. February 4. For the construction of the several Stations and

other Buildings on the York and Scarborough Railway.—Mr. Andrews, Architect, York; or Mr. George Baker, Secretary, Railway Office, York. February 5.

For the erection of a Steam Boat Pier at the Quay on the north-east side of Blackfriars' Bridge,

Quay on the north-east side of Diackfriars Diage, also for building a Decked Lighter or Dumby.— Town Clerk's Office, Guildhall. February 6. For one Pleasure Carriage, four Milk Tracks, and fifty Box Waggons, with drawing and buffer springs, for the Manchester and Birmingham Rail-way.—Mr. John Latham, Secretary, London-road, Manchester Reburger 6. Manchester. February 6.

Manchester. February 6. For erecting and completing the Lower Sluice and Sluice-Pit at the top of the Eau, Brink Cut, about 4 miles above Lynn.—Messrs. Walker and Burges, 23, Great George-street, Westminster; or Mr. George Game Day, Clerk to the Middle Level Drainage Commissioners, St. Ives. February 10. For the erection of New Buildings in Pembroke Collage Oxford — Plane & & menared by Mr.

College, Oxford. --- Plans, &c., prepared by Mr. Haywood, Architect, may be seen at the Master's February 11. House.

For the erection of two Fever Wards in the workhouse at Slough.—C. P. Barrett, Clerk of the

Union, Eton. February 11. For a supply of Railway Fastenings for the Great Southern and Western Railway, Ireland.--Mr. William Taylor, Secretary, 3, College-green,

Mr. William Taylor, Secretary, 5, Conege-green, Dublin. February 17. For the supply of 11,000 feet of nine-inch cast-iron Pipes for a new line of Aqueduct to be laid in the Island of Malta.—Vin. Casolani, Collector of Land Revenue, Office of Land Revenue and Public Works, Valletta, Malta. March 31.

COMPETITIONS.

The Committee for Building a Chapel at Holloway are desirous to receive Designs for their in-tended building. The style to be Gothic. The Committee pledge themselves to select for their Architect the gentleman whose design they shall

Architect the gentleman whose design they and prefer.—George Brooks, Esq., 1, Lansdowne-place, Holloway. January 31. Plans and estimates are required for a Work-house, to contain about 1,180 persons. The whole to be done in a plain and substantial manner, with-The plans and out any expensive embellishments. architects' estimates to be sent to Robert Mercer, the Clerk of the Clifton Union, Pennywell Road, Bristol, on or before the 17th of February next, and the Board of Guardians will adjudicate on the 28th. the Board of Guardians will adjuncate on the 25th. The architect producing the best plan in the estima-tion of the Board will be employed at a sum not exceeding 5 per cent. on the outlay, and a gratuity of 25 guineas will be given to the architect produc-25 guineas will be given to the architect producing the second best plan in the opinion of the Board.

NOTE.

We shall be glad to receive information from Publishers of all New Books on the subjects whereof we treat.

TO CORRESPONDENTS.

"James Pulham," and " One of your Readers," receired.

An Architect and Subscriber's " letter about Chimney-pieces in Keene's Cement, is too palpable

an advertisement for insertion. "R.K." objects, in a sensible letter, to our brief remarks on Mr. Nixon's statue of William IV. He may rest satisfied that we give no opinion without due consideration. We shall probably accede to his wish, and "eramine the work in about a fortnight hence, when it will be com-plete."

"Charles Newnham" is thanked for his good opinion. The advantages of railway travelling not "to the select few," but the community at large, are now so fully understood, that no such

targe, are now so fully understood, that no such obstacles as he would impose would be permitted. "W. J. D." and "Mr. Gliddon."—Any irre-gularity in the return of communications which has occurred must be altributed to the death of the late editor. Inquiry shall be made.

"Scrutator." - Next week. "Bernan's History and Art of Warming and Ventilating" received.

SATURDAY, FEBRUARY 1, 1845.

URING the past week we have attended a series of experiments on the strength of iron girders made by Mr. Thomas Cubitt, at his place of business at Thames Bank.

The object was to try the absolute and comparative strength of different forms of section, partly to assist Mr. Cubitt and Sir Henry Delabeche in their inquiry into the cause of the accident at Oldham (on which their report is anxiously looked for), and partly beuse it is the custom at that establishment to leave no means untried to prove every thing that they are about to use, and arrive at the most certain information on all that relates to construction. The greatest care was exercised to obtain an exact result. Force was applied by means of the hydrostatic press to the centre of girders with 15 ft. bearing. The deflection caused by each successive ton weight (or that which represented weight) was measured, as was also the ast permanently acquired by the girder at each stage of the proceeding, and the exact weight by which at last they were severally broken was recorded. These details, with the form of section, we propose to lay before our readers in an early number of the journal. In making these experiments the difficulty of obtaining a perfectly sound casting, and the consequent danger of using cast-iron girders without proving them, was strikingly apparent.

Wrought-iron girders at reasonable cost are a desideratam; and there is no difficulty in the way which could not be overcome. Mr. Cubitt suggested that a few premiums offered by Government for the best wrought iron beams above a certain size would probably lead to such an improvement in the machinery used, that they might be drawn of large dimensions at little more cost than cast beams. It is to be hoped that he will urge this on the Government in the forthcoming report, and that it may be acted on. A series of experiments on cast and wrought beams should likewise be undertaken by Government forthwith, as, from the expense attending them, individuals cannot be expected to work out the question fully. When the amazing difference in strength produced simply by a different disposition of the as quantity of metal is seen, the importance of a full and minute inquiry to ascertain the hest disposition of the metal-the best form of section in other words-must at once be evident

Mr. Cubitt's establishment offers many subjects of great interest for consideration, and it is of these we propose to speak briefly in the present article. A minute description of it, shewing its extent, comprehensiveness, and completeness—the modes of economising labour, and the new processes employed, would be equally instructive and interesting. As, however, this would excite curiosity, and lead to applications, which the proprietor would be compelled to refuse on account of the interruption they would cause, we will speak rather of the results, and the motives which are seen to prevail, than of the works themselves.

Amongst the most important of the latter, apparent at every step, is a desire to raise the THE BUILDER.

condition of his workmen; a desire so wise and so good, that we cannot praise it loudly enough, or set it forth for imitation too forcibly. The men literally work in drawing-rooms, large and lofty (the carpenters' shop is above 200 feet long), equably heated and well ventilated. Attached to each shop is an apartment for cooking, with oven, boiler, and hotplate, where they may dress their dinner, or prepare their tea. And here, high up under the roof, are rails, where they may dry their coats after a wet walk to their work. In order to prevent the men, as far as possible, from acquiring the habit of drinking spirits in the morning, facilities are given, so that, on their arrival at six o'clock, they may have a cup of hot coffee, or cocoa, by arrangement amongst themselves, on payment of one halfpenny ! The consumption being large and certain, one halfpenny pays the expense of a cup of coffee, a fact that speaks volumes, and points the way for an amazing increase of the personal comforts of the operative classes. Hot water is used to heat the shops, and the range of water-closets belonging to each department is ventilated by superfluous warm air.

In the smith's-shop, in the mason's-shop, one usually so smoky, the other so wet,—all is clean, dry, and warm, and here, as the shops themselves are hardly suited for eating in, there is a dining-room, with tables and benches, connected with the cooking apparatus. When to all this we add that there is a lending library comprising some of the best scientific and elementary books, and a room supplied with the daily papers to which the foremen have access at particular hours, it will be seen how much the comfort of the men is studied.

The result, it is gratifying to know, is exactly what might be expected. The best workmen are anxious to be employed there: a drunken man is unknown in the establishment,—a man who cannot trust himself hardly ventures to ask to be employed.

The arrangements to prevent accidents by fire, so important and often so little regarded, are very complete. The most important parts of the building are fire-proof, and in other places where this was not so practicable, portions are made fire-proof, in order to cut off the connection, and stop the spread of the flames. Along the side of the carpenters' shop are cisterns supplied with water to extinguish *instanter* any outbreak, and around the building are mains constantly charged, and hose ready for emergency. The stables are wholly fireproof and complete in all respects.*

The plasterers and modellers' shops will afford many lessons in design, and here may be observed one of the numerous arrangements for economising labour and obtaining a satisfactory result, which occur throughout the establishment. High up, above where the modellers sit, is a large looking-glass framed and so regulated by pullies and cords, that the modeller has but to turn his head to see the appearance which would be presented by the work on which he is engaged if raised to any particular height.

Steam plays a very important part in the establishment; it is sawing timber, polishing marble, pumping water, preparing food for the horses, and clipping bars of iron irresistibly. As we have already said, however, we may not go into details, and with the remark that there are excellent arrangements for preparing the timber and deals for use, we will close our present notice of this extraordinary result of one man's energy and power.

The chimney-shaft attached to this establishment presents several peculiarities, to which we shall refer in a separate article.

MR. COCKERELL'S THIRD LECTURE ON ARCHITECTURE.

PROFESSOR COOKERELL gave the third lecture of his course at the Royal Academy, on Thursday, the 24th ultimo, and was listened to throughout with great attention. He proposed on that occasion to direct their notice to the give a production of the

He proposed on that occasion to direct their notice to the civil architecture of the ancients, to the gymnasium, the forum, and the baths. The form of the temple, a parallelogram, admitted very little variety except as to the order used, and its size : nothing was left to the architect. The refinements which were gradually introduced in templar architecture had been recorded, fortunately for us, by the faithful Vitruvius, whose accuracy was confirmed by recent investigations. He mentioned particularly Vitruvius's description of the pyramidal tendency of the temples, obtained by inclining the axes of the columns until the inner line of the columns was perpendicular, and of the elevation given to the centre of long horizontal lines such as the entablature and ridge, in order to overcome an optical illusion by which a long level line was made to appear inflected. The precise rule for this elevation had been deduced from the Parthenon. The professor illustrated the present state of Athenian antiquities by Mr. Knowles's drawings, already mentioned in our journal. Civil architecture, he went on to say, afforded much more acope to the architect. It

flourished during 500 years, namely from the reign of Alexander to that of Constantine, and its principles became as fixed as those which guided the erection of temples. In the time of Alexander canons were laid down which guided the erection of temples. which are as applicable now as they were thenthey have endured through all the changes of fashion and caprice, and are clear to all who have respect for them in their hearts, and will study them with a proper feeling. The study study them with a proper feeling. The study of Vitruvius had been recommended by the greatest masters: the execution of his book had been forced on Vitruvius by Augustus. Palladio said, from his youth upwards Vitruvius had been his study: Vignola, Serlio, and others said the same thing. All modern archiothers said the same thing. All modern archi-tecture had sprung from ancient art. Ancient buildings had been fully explained to us in modern times, especially by Canina, whose work was worthy of the glorious country of which it treated. British architects had an opportunity to reproduce every style in its proper climate: the sun never went down on the British dominions, and our colonizing the British dominions, and our colonizing architects should study the works of all countries. Cast-iron would lend itself usefully to a columnar system, and many modern appliances might be used, but for design we must still go to the ancients. The arch afforded us facilities : it was doubtless used in Greece, but the Romans had first united it to a columnar system and employed it every where. We had no excuse for neglecting the study of ancient works; modern travellers and writers had afforded us increased facilities. The merits of Vitruvius he had long maintained against fashionable detractors, and would continue to

do so. The professor then alluded to ancient cities, and described their arrangement. The great streets crossed each other at right angles with colonnades through the heart of the city; these were sometimes deflected slightly, so that their extent was never seen. There was an example of this at Palmyra. Chester might be restored to afford a very fair approximation to a Roman town. He recommended for study the article "*Cité*" in Quatremère de Quincy's important for those who went to the colonies; mistakes made in a new settlement, in the first instance, were usually perpetuated and injured all that was done after. He then described with the aid of drawings, the principal buildings in an ancient city. The agora of the Greeks, and the forum of the Romans, had been well illuatrated by Vitruvius. The former was used for gladiatorial shows before amphitheatres were

[•] Each horse is supplied with a lump of rock salt placed in a compartment of the manger. The paxement of the stable (granite pitching laid in asphalte on concrete foundation with alayer of broken glass in centre of concrete to keep back the rats), is aprinkled periodically with plaster of Paris asturated with sulphuric acid, to absorb deleterious masters.

50

THE BUILDER.

built. The confined streets of Rome made such a meeting place as the forum necessary. Relative to these streets, he could not tell how a population of four millions could have moved in them. Adorned by such buildings, Rome became the graudest city in the world; it required a strong imagination to recal the appearance she must have presented in her per-fect state. The forum of Trajan was the most magnificent; it covered twelve acres of ground. The basilica was 540 feet by 168 feet. The forum itself, was a quarter larger than the court of Somerset House and was surrounded by a portico 32 feet deep with two ranges of by a portico 32 feet deep with two ranges of columns. The plan of the new Exchange placed by the side of a plan of this forum drawn to same scale, shewed strikingly the great size of the latter. Much could be learnt by studying the plan of this forum. The professor then went on to speak of the best position for a monu-ment, to produce an effect on the beholder. He was satisfied, that by placing it in a con-fined space, its appearance was increased. An insulated column placed in the centre of a large area, lost much of its effect. If the insulated column placed in the centre of a large area, lost much of its effect. If the buildings were removed from around St. Paul's Cathedral, the effect of the building would be lessened. Vanburgh excelled in placing his buildings are as to produce good effect. The buildings so as to produce good effect. The gymnasium, the schools, and baths, formed a compact building of great size. In the side of compact building of great size. In the side of the school there was an apse or semi-circular recess—this had not been forgotten by Wren when he rebuilt the Westminster School. Buildings in our country were deficient in character. In ancient models each had a dis-tinct character. To describe these buildings required a volume; he simply alluded to them to induce students to give their attention to to induce students to give their attention to the study of them. He was aware that their everyday business, the duties of the various others in which they were engaged, must oc-cupy the greater part of their time, but he nevertheless trusted they would make opportu-nities and become well acquainted with these glorious works of a glorious country.

THE BUINED CITIES OF AMERICA.

ATTEACTED by the subject, we attended a lecture under this title, delivered in Miss Kelly's theatre, Dean-street, Soho, on Saturday last, boping to be able to place before our readers some new information on these extraordinary and mysterious ruins. It seems that a society has been established, or is in progress, chiefly through the exertions of Mr. W. H. Shippard, of Turnham-green, under the designation of "The Museum of History," or, as it originally stood, "My Museum." The object of which, as set forth in a prospectus, is—" to illustrate the history of man by means of popular lectures, aided and enforced by scenery, maps, and costumes, adding every scenic attraction to the higher views of instruction, and combining art, history, travels, aud geography. "The classic lecturer shall thus convey his

"The classic lecturer shall thus convey his observations in the Roman forum restored, or awaken the spectator's reflections smidst its very ruins."

very ruins." The lecture on the present occasion was given by Mr. Shippard, and had all the aids proposed in the prospectus—transparent maps, as large as the stage would admit, and some views of the ruins equally extensive, by Mr. C. Marshall so beautifully executed, as really to carry the spectator to the place itself.

Unfortunately, however, Mr. Shippard mistook bis vocation when he turned lecturer. He seems enthusiastic in his endeavours to carry out what is really a fine idea, and, therefore, we would not willingly say any thing discourteous; hut wasting, as he does, the power of condensation, and the facility for connecting subjects, necessary for a lecturer, we are satisfied he will fail in rendering the institution popular, unless he yield the lecturer's wand to more practised hands. If properly carried out, the "Museum of History" may become a very important educational institution.

The ruined cities of America afford much interesting matter for consideration; fortifications, mounds, pyramids, town-wulls, and temples, are scattered over a large extent of country, overgrown by enormous trees, and covered, in some instances, by 9 feet of mould. Mr. Stephens, in his interesting account of these remnants of past time, speaks of no less than forty-four cities in one district alone, long buried and unknown. Some of these were described by the Spaniards 300 years ago, and their accounts shew that the ruins were in the same state then as now. These statements were at that time considered fabulous, but are now verified. The date of their erection, and the people by whom they were executed, are still disputed points. The pyramids agree in many particulars with those of Egypt (they face the cardinal points for example), but it does not seem certain that there was any connection between the two countries.

ARCHITECTURAL THEOLOGY.

THE reporter for The Times at Exeter described in a recent communication St. Paul's Church, in Penzance, which was built in 1842 by private subscription. He says that it is in "the Norman Gothic style" and is fitted up in the interior almost precisely as a Roman Catholic Chapel. "This church is divided entirely by a distinct chancel, with sedilia for the priests. They

are thus separated during the whole service from the people. The access to the pulpit, which is of stone, is within this chancel. The lecturnum is placed on the base of the chancel; so that, except when the priest descends to the faldstool, where he kneels with his face to the communion-table and his back to the people, he is separated from the congregation. That which in other churches is a railing round the communion-table, is here a stone screen built across the church, and separating this portion of it entirely for the use of the priests, and constituting it a kind of holy of holies. The faldstool is placed on the steps fronting and erected up to this screen. Within this chancel are two enormous candlesticks on each side the communion-table ; and on the table two other of smaller dimensions. Erected over the table is a large gilt cross; and the mode of conducting the service, together with the ceremonics which have been introduced, render it a close copy of the Roman Catholic mode of worship. As may be supposed, this new church has excited much comment, and its mode of service has been much objected to. The Rev. C. V. Le Grice, for a great number of years minister of Penzance, in several very able letters, signed 'Civis,' eloquently and strongly denounced these innovations as dangerous to the church, as an introduction of —

church, as an introduction of — "Every thing ceremonial and nothing spiritual—every thing to make the priest proud, but not to make the people pious—in short, to strengthen Puseyism, which is an attempt to bring every thing connected with religion within the material walls of the church, within the exclusively distributive power of the Sacraments, and within the sole, mystic, arbitrary, dispensing meditation of the priesthood."

ON THE MANUFACTURE OF SCAGLIOLA, OR ARTIFICIAL MARBLE AND GRANITE.

Sin,—In your useful journal, of the 21st of December last, a paragraph appeared concerning a factory about to be established at Berlin, for the manufacture of artificial marble (commonly called scegliola) from plaster of Paris and solutions of alum, said to be equal to the finest marble, from which it might appear to those who are unacquainted with it that scagliola was not made in England. And I see in your journal of January 11th there is another paragraph entilled "Scagliola, or the Art of Imitating Marble," which only tells us a few of the materials used, and is not altogether correct. I think the writer, ("H. G. M.") cannot understand it, for the art of making scagliola would fill a volume, and is kept secret by the trade. I do not know that it was ever published in a correct form, although attempts have been made. He says, "in England it is comparatively unknown, having sunk into disuse, in consequence of the perishable nature of the material." Now there are several establishments in London, and one at Hoddesdon, Herts: and it is very much in uee by English artists, and has been for many years in our public buildings and noblemen's mansions. Indeed, there is scarcely a building of note of the present day but is more or less embellished with this most beautiful material. That done at Buckingham Palace, Pantheon Oxford-street, and Everington's, of which "H. G. M." speaks well, was executed by English artists; indeed, I know only one or two places where it has been done by Italians or foreigners—namely, the chapel at Greenwich, and at Stoke Park, under Mir. Wyatt, the architect, many years ago. An English carpenter, named Alcott, who was employed to make the skeletons, and plane the work to its proper shape after the vener, or outer cost, was laid on (as is the method in general), was sent to Stoke Park, having an insight of the process, to work at it; and he obtained a piece of real marble, and, contrary to directions, imitated it so well, as to please the architect more than what had been done by the Italians. I may mention that an offer was made to my foreman, a few years ago, who has been in the trade upwards of twenty-six years, to go to Fvance, to do some work, as his specimens were superior to those of the French artists. It has attained such perfection in England, that, to make use of the words of Stuart, in his Dictionary of Architecture, "it proves so complete a deception, that nothing but a fracture of its substance can discover the difference." I will mention a few places where I know it has been done, and the date, where I am acquainted with it, viz.:—

At all these places it is in excellent condition, except where it has been injured by accident; even bases, which are very subject to blows, where fixed on flows, remain unipured.

There are several works pow in hand, which, if compared with old work, will shew that improvement has been made. I have now in hand a first-rate staincase and a hall, the scagliola work of which consists of a great number of columns, pilasters, and pedestals in imitation of various marbles, with white mouldings, and imitations of statuary caps, bases, cornices, &c.; most of which are being done at Hoddesdon, and will be conveyed to Kilnwich Percy, in Yorkshire. Scagliolais of the same material throughout its thickness, except that the vencer or outer coat has the colour mixed with it, and is of rather less density of the two, and less brittle than some of the marbles. I think I have said enough to establish the fact of its durability, and that English artists are superior to the Italians; in fact, I will produce specimens of scagliola, which will prove it. The vile imitations, which are made by persons with very slight knowledge of the process, tend to bring it into disuee. With respect to its insecurity when employed as columns having to bear a superincumbent weight, it is seldom used to support a heavy weight, except in appearance, and where strength is required to support girders, entablatures, &c., an iron column or core is fixed to take the weight; and the skeleton or cradle is made on it. This skeleton I will describe; it has a large

This skeleton I will describe: it has a large piece of timber of 3 to 6 inches square, according to the size of column required, and circular pieces of wood are fixed to it; then strips of to wood cut from a half-inch board are nailed round, which form a very strong skeleton, and it is made 2 or 3 inches less than the finished work, to allow for thickness of composition. Some of the inferior work has been done on very bad skeletons, formed of common laths, and the first coatcomposed of lime and hair. "H.G.M." says the manufacturer is subject to great loss by the plaster setting too quickly; this is an error, for the solutions prevent that for five or six hours when necessary, and no manufacturer will keep it so long as to become useless, nor expose it to the damp atmosphere, which will spoil it. There is no material so easily mended without being seen, and as to expense, it is veri triffing in a building of magnitude, and scagliol gives an air of beauty, richness, and grandeun which could not be attained without, as th expense of marble is so great. It has been used for a floor in the Hall of the Duke d Northumbland's for many years, and it stands well, and is new used in the shape of columns for tamps, of which I have sent 300 and upwards, and coatinue making them, and it is also used for slabs, chimney-pieces, tables, vases, and many other purposes. "H. G. M.'s "statement, if not corrected, will tend to injure the trade, seeing it in a first-rate practical work, and also to discourage mative industry. Foreign artists are toe often encouraged without merit, and I think, Mr. Editor, your journal will cultivate native talent, especially as the art of scagliola is brought to such perfection by Eaglish artists. I will, if you think proper, lodge some specimens of acagliols at the Office of The BUIDERS, and I, as well as the trade in general, will feel glad to see this inserted in your valuable journal. Hoddesdon. JANES PULHAM.

I shall return to the subject of plastic compositions, cements, artificial stone, &c., in a future number.

ROYAL INSTITUTE OF ARCHITECTS.

As ordinary meeting of the Institute was held on Monday, January 27th, Mr. H. E. Kendall, vice president, in the chair, when Herr Ludwig Gruner, of Rome, and Il Conte Cavaliere Orti di Manara, Podestà di Verona, were elected corresponding members; Mr. John Tarring, fellow; and Messrs. F. Clark, Nevins Compton, Frederick Lett, Samuel Peyton, Robert C. Saunders, and Thomas Fuller, associates. Among the donations annoanced was "Views of Ancient Monuments in Central America, Chiapas, and Yacatam," by F. Catherwood, presented by the author, for which Mr. Godwin moved a special vote of thanks, and took occasion to speak of the interesting hatere of the work.

A paper was then read "On the Domestic Architecture of France during the Middle Ages," by Mr. Ambrose Poynter, wherein the gradual changes which occurred between the gradual changes which occurred between the 13th and 17th centuries, were traced. The data were chiefly taken from Ronen, where at were oneny taken from fromen, where he did not find any specimen earlier than the first-named date. Beauvais contains some stone houses of the same date. The roofs at this time were equilateral, but had afterwards much greater elevation: The dormer windows became an important feature, and were in some ex-amples highly decorated. In the 14th century he found few stone houses in France, and in the 15th they were chiefly of timber with derbanging fronts, one story projecting over the other. Bricks then became used in constory. In the 15th century the stairs were often formed in a towrelle projecting from the angle of the house, especially when at the corner of a street. At Dijon there was an interesting ex-ample of this, where the top of the newell was soulptured to represent a man with flowers on his head, which branched out and formed the roof. At Paris these tourelles are numerous : they are to be found also in Scotch architec they are to be found also in Scotch architec-ture. Passing on to the time of the Re-naissance, he showed the change in style which took place, and alluded to some fine specimens now at the Palace of the Beaux Are, in Paris. The paper then gave a view of the improvements made in the internal arrangement of houses in France, and some patience of the situ of the situ means notices of the state of the city in early times. Philip Augustus paved for the first time four of the principal streets. In the 14th century the state of the streets was dreadful, nor did they become much better for a hundred years after. Mr. Poynter took an opportunity to mention that the French government had presented, through M. Guisot, to our School of Design, casts from the celebrated bronze does of the Baptistry at Florence, executed by Ghiberti, after the designs of Arnolfo; Mr. Wilson, the director of the school of design, who was present, invited all members of the Institute to examine them.

Mr. I'anson, relative to Mr. Poynter's paper, considered that the roofs of high pitch were earlier than agricultural roofs. He mentioned that the works of the transition period in France, weremuch better than the Elizabethan werks of this country, and attributed it to the circumstance that France had a more intimate connection with Italy than we had.

The council have not yet reported on the prize essays.

A FEW WORDS ON COMPETITIONS.

MUCH as the subject of architectural competitions has been discussed, we still seem to stand a long way distant from improvement. The general ignorance of the public in any thing beyond the mere book illustration part of architecture, the apathy of the influential members of the profession towards the imme-diate interests of their younger bretbren, and the want of energetic remonstrance vigorous co-operation amongst architects in general, are obstacles in the way of change which need to be at once stoutly assailed and demolished. We assume that, were competi-tion only a little better managed, it might powerfully aid the progress of art, that it might call out the latent energies of the young, and infuse something of the ardour of youth into the exertions of the more advanced, keep the public mind alive to the use and value of architecture, and open to all a legitimate road to success in an art in which the avenues to fame and recompense are confessedly few, and difficult of discernment. We deem that the attempt to prove that all competition is adverse to progress in art fails, and is entirely inconsistent with experience in buildings erected or in progress; the errors that have resulted were clear and remediable, and could not recur with the changes about which there is no difference of opinion amongst us. Such are, for example, explicit instructions, public exhibition before the decision, and competent judgment. The barrier drawn between architects and the notice of the *public* needs every examination, and speedy removal; but under the influence of a better removal; of a better system in competitions we are confident that the profession would rise in the estimation of the world, which is at present positively ignorant of its distinctive existence; that the appliances of the art would be ex-tended to buildings to which it has been sup-posed inimical rather than subservient; that the accredited professor would supply the place of the empiric; and finally, that architects, in-stead of consuming those days when hope and exertion are at the highest in working out the ideas of others on an inadequate stipend, or in filling the duties of some appointment in which art has no place, would find the pleasing and healthful reward for years of toil and outlay, in the practice of an art which speaks the history of mankind, and yields to all its votaries the "purest well" of intellectual delight. We can hardly call to mind an instance

We can hardly call to mind an instance in which competition has been conducted with fairness towards the several competitors, or for the benefit of the public. Indeed, it can hardly fail to be otherwise in the present state of matters. The interest which architecture excites is so small compared with its importance, that its finest works are allowed to be destroyed without the slightest notice. So that the usual education and habits of men are calculated to fit them even less for judges of architecture than for architects, and other considerations are allowed to operate with undue influence.

It seems strange that in a free country, we should permit ourselves to be ruled in matters of taste, possessing an importance in the highest degree national, by those who have never de-voted a single day of their lives to the study of the subjects on which they sit in judgment. Were our own character as a nation not involved in the question, it would still be unjust to suffer the dishonest proceedings complained of by architects; and were they the only par-ties interested, which they are not, their claims should be considered in a country where jus-tion have been elimine country where justice has been always considered the brightest jewel in the sceptre of a government. We hesitate not to say, that were an individual to act as, with few exceptions, committees have acted, his society would be shunned by all who rank themselves as men of honour and integrity. We need not deny that in some cases committees have desired to act with perfect good faith, but in general their ignorance of every thing that to form competent critics they should know, presents an insuperable barrier to a correct decision. Composed, for the most part, of men who consider the education of an architect limited to the knowledge of the five orders, they decide upon matters affecting the prosperity of twenty, fifty, or a hundred rising artists, and the progress or decline of art. One who applied in a case of typhus fever to a baker, or in an abstruse point of law to a winemerchant, would be considered as a fit subject for a commission of lunacy; yet we could mention cases in which the pursuits of adjudicators have been as little akin to the subjects on which they have sat to decide,

On one occasion a committee, for the erection of a pump-room at Harrowgate, was composed of seventeen individuals, among whom were five innkecpers, two wine-merchants, a porter-dealer, a baker, a coach-builder, a druggist, a plumber, a milkman, and a grocer. Now we wish to set no limits to the investigations of man in architecture, or in any other study, but are taese the individuals in whose custody we should choose, from their previous study and research, to leave the arts of a country? Doubless they were all honourable men, but some of them, if not all, were deceived by the trickeries so commonly employed, and which could not one moment escape the notice of an architect. Probably few of them were accustomed to the examination of geometrical drawings, the understanding of which requires long previous study and attention. Each one, we think, on being shewn the elevation of a building, would at once form an opinion as to its effect, instead of placing the plan and elevation side by side, and judging from the two, the only way in which architectural draw-ings are intended to be examined, as through the medium of several the same effect is conveyed which otherwise would be expressed conveyed which otherwise would be expressed by one perspective view. An inspection of the plan might shew that certain parts receded or advauced from the front; these in the elevation would appear upon the same plane, so that a tower shewn above the roof, and as if it were upon the plane of the front, might, in reality, stand in the centre of the block, and not appear when erected except from a point far removed from the building. If it requires great experience in the architect If it requires great experience in the architect If it requires great experience in the architect to unravel the mysteries of plan and section— and if, in addition, he must possess a knowledge of the strength of timber, of requisite supports and counterforts, of sizes of openings necessary to admit a proper quantity of light—if, to the experience of the practical man, he must add the acquirements of the man-of science, and the taste and fancy of the artist, he has surely a right to expert corresponding qualifications a right to expect corresponding qualifications and careful attention from those who adjudicate. and careful attention from those who adjudicate. Ordinarily, the committee are compelled to throw aside the instructions which were ri-gidly to be observed, so that the competitor who has acted with most good faith, in en-deavouring to make his design correspond in all particulars, is the first to feel the effects of his mistaken confidence. The committee will his mistaken confidence. The committee will often state that the building must be of a style to which they attach an unintelligible name; that it shall be built of certain materials; and shall afford accommodation sufficient to double the sum the architect has to work upon; and that the drawings shall be delivered on a day so near at hand, that he has barely time to execute the actual drawing, much less to mature the design. How many instances have there been in which the whole of the competition draw-ings have been laid aside, the work being given to some more fortunate architect who given to some more fortunate architect, who has had a larger sum for expenditure, and the whole of the competition drawings at whatever being granted to the competitors. How often after the drawings have been submitted, has one of the competitors received instructions to prepare another design, more in accordance with the altered views of the committee, to which the premium has been awarded. The architects who at present compete are, for the most part, those to whom competition presents the only chance of success they are compelled to embark in it with all evils, and though, through trickery and its ignorance, their chance is small, it is their only one. But we cannot notice all the disantages of the present system, and the adv dishonesty and want of principle which it en-genders-one of its effects we witness in some of our national edifices; and it is not too much to say, that were a change effected, compe-tition might oftener be appeuled to, and we might hope to feel the result in a higher chaacter in all our structures. The only course which, in the opinion of the writer, committees can pursue to induce men of established reputation to compete, with perfect fairness to the competitors, and to prevent the annoying attacks to which they are now exposed, will

be, in all cases, to call in the aid of architects themselves, and to exhibit the designs publicly *before* the decision.

The instructions, in the first instance, should be carefully framed, with complete practical particulars as to the objects and destination of the intended building, leaving to the architect the consideration of the mode in which those objects may be obtained. Full information should be afforded as to foundations, levels, and drainage; a plan of the land should be given, and some account of the site. The amount at the disposal of the committee should be stated, with the description and cost of building materials in the neighbourhood of the intended edifice. In deciding upon the merits of the designs, the committee should either refer them to architects of eminence, unconnected with the competition, or to the competitors themselves, who should record their votes openly, no one voting for his own design. The former course was pursued in the competition for the Royal Exchange, and, first by the report of the appointed architects, it appeared that many of the designs possessed errors of construction which would certainly have escaped the attention of any but pro-fessional men. We urge upon the atten-tion of building committees the considera-tion of the important subject we have noticed. The plan is by no means new, and in some minor details; might need considera-tion, but we are assured that no system could be worse than the present want of it, fraught, as it is, with injustice to the architect, discredit to the promoters, and with irreparable injury to the arts, and consequent standing of the country in the scale of pations. E. H. the

country in the scale of nations. E. H. [If the history of competitions were written, its details would shew an extent of rascality astounding to architects themselves. We shall not fail to publish particulars of such mal-practices as come to our knowledge. The remedy unfortunately is not evident or easy.—ED.]

ON BATH STONE. BY C. H. SMITH.

BY C. H. SMITH. BATH stone has been used almost universally, BATH stone has been used almost during in the city as a mineral substance for building, in the city Dath during a long period. The Abbey of Bath, during a long period. The Abbey Church, which was not finished till after the Reformation, has been in great part restored within the last thirty or forty years. The west front has been richly ornamented, especially with a representation of Jacob's ladder on each tower, reaching from top to bottom, on which many angels were carved in bold on which many angels were carved in bold relief; these have now mouldered away, till only a few faint traces remain, just sufficient to indicate where they originally were. This building I am inclined to believe is the oldest in existence of Bath stone, and beyond doubt not a very favourable specimen of its durability. The oldest of the modern buildings of similar material in that city is, I imagine, Queen-square, erected in the beginning of the last century; the houses are ornamented with projecting mouldings, Corinthian capitals, &c.; and certainly they are not much decomposed, considering the time since they were erected.

It has been remarked that Bath stone ap pears to stand the weather better in the neighbourhood of the quarries than it does if removed to a distance, or in London; and, judging from the present condition of the oldest houses at Bath in comparison with Bath stone buildings of more modern date erected in London, a casual observer might indulge his imagina-tion with the idea of something being more congenial to the stone in its native atmosphere than if removed to waste and perish in what may be termed a foreign climate. I am ready and willing to admit that there may be a very material difference between the air of Lombard-street or the Royal Exchange, and that of the land of the cuckoo and the nightingale, or any other spot far from the busy world's unceasing sound. But I cannot conceive it probable, that a stone which would last for a century or more in the city of Bath or its environs, would decompose in a quarter of that time were it placed in the Regent's-park. The plain matter of fact is, that the stone used in the construction of the oldest buildings at Bath was procured from the Box quarries, which is in the more important qualities very superior to, and far more durable than, such as is now generally used. The Box quarry stone is still used occasionally in and about Bath, but the stone merchants in London have long since

discovered that the masons will not buy it on account of its being a little coarser and harder, and thereby more expensive to work. Coombe Down Bath stone was next intro-

Coombe Down Bath stone was next introduced; it is finer grained, softer, and less durable than the Box stone; but both these have been almost entirely superseded by the grand favourite from Monckton Farleigh, or by what is usually called "Farleigh Down Bath stone." This material possesses all the qualities required by a hasty mason or contractor; it may be sawed dry, like wood, with a common pegtoothed saw, more expeditiously than any other stone; an industrious workman may do almost as much work as he pleases in it, consequently a building may be executed in this stone in a shorter space of time than in any other; and, lastly, it decomposes in a shorter space of time than any other stone, hence some people are inclined to think it "makes good for trade."

The restorations of Henry the Seventh's Chapel, at Westminster, were executed in Coombe Down Bath stone, between the years 1808 and 1821, at an expense to the nation of about forty thousand pounds. A large pro-portion of this amount was for the Bath stone, which has always been about as expensive in London as those of a more durable nature. If an additional ten thousand pounds had been bestowed on labour, in all probability a mate-rial might have been selected which would have lasted several centuries longer without being in so decomposing a condition. But whilst the lover of elegant architecture is admiring the extreme attention that has been bestowed in preserving the true spirit of the original design, he will be annoyed at discovering abundant evidences of premature decay. Many projecting parts of that beautiful fabric are conspicuously mouldering away, in less than thirty years since they were restored. casual observer may, by one glance at the southeastern towers, convince himself of the truth of these statements; but on more attentive examination, a considerable portion of the masonry throughout the entire structure, especially the more exposed parts, will present multitudes of slight undulations or swellings, somewhat resembling in their progress gather ings or tumours under the skin; these increase in size and number until they meet each other, when they burst, and the surface falls off. This cankering process will be repeated as often as a fresh surface is exposed, until all architectural features are obliterated. Such is the lamentable condition and prospective state of Henry the Seventh's Chapel at this time, that there is every probability of its being in the same dilapidated condition within thirty or forty years that it was in before the repairs were commenced in the year 1808.*

That there are many stones in the building which at present shew no symptons of decomposition is readily admitted; and those persons who advocate the use of Bath stone for such highly decorative purposes frequently imagine that sufficient care has not been taken to place the stones on their natural bed. The importance of such precaution is generally very considerably overrated; I do not consider it signifies which way a stone is fixed, unless it presents a laminated structure, which scarcely ever occurs amongst the oolites. A stone of an open, powdery, and slightly cemented texture, will, if exposed to the weather, decompose in a comparatively short space of time, in whatever direction it may be fixed, or whichever surface may be parallel to the horizon.

Another generally received fallacy is the opinion that soft stone will become hard and durable by exposure. Although this notion is true to a certain extent, it is not of sufficient importance to warrant its appreciation in architectural works. All kinds of stone while in the rock, or when recently quarried, are somewhat softer and more easily worked than after they have been exposed to the atmosphere a few months, owing to the stone in its original situation being more thoroughly saturated with moisture than can ever be accomplished after

* The north front of Westminster Hall was restored with imilar material immediately after Henry the Seventh's Chapel was completed; it is now progressing in the same state towards decay. During the spring of the year 1840, the stonework about the principal entrance was washed by means of an engine; this operation mutilated the projections in a slight degree, the force of the jet of water separating many small portions of stone from the prominent parts that were already in a decomposing state. The restorations of Westminster Abbey, north side, are proceeding slowly with Bath stone, apparently from Farleigh Down quarries; it is to be regretted that a more durable stone is not used, since there is unequivocal proof of its perishable quality in the adjoining edifice.

it has been once allowed to get dry. This is principle well known to masons, for it is a general practice amongst workmen to fraquently wet a stone, especially if it be rather of a hard quality, during their operation of working it into mouldings or ornaments, to make it work, as they term it, "more kindly." If the stone be remarkably soft, it is advisable not to let it dry too fast after it has been taken from the quarry, for fear of its cracking, in consequence of the moisture being removed from the outside before the interior of the block can have had time to evaporate; hence, while the central part remains of its original size and extremely damp, the surface will dry, shrink, and thereby cause many invisible cracks, the effect of which will be conspicuous after is sharp frost.

All free-working limestones and oolites become in some degree harder on their surface by exposure to weather. This arises from a very slight decomposition taking place, which will remove most of the softer particles, and leave the hardest and most durable to act as a protection to the remainder. In addition to which, the pores and interstices of the surface get filled with dust and dirt, washed in by rain assisted by powerful winds; all which eircomastances help to secure the least protected grains from external violence. If the stone be naturally compact and durable, a surface of this description will materially assist its duration; but, on the other hand, such material as the Heddington stone, near Oxford, or the most perishable Bath stone, will in due time similarly attain a Bath stone, will in due time similarly sature u hard crust, which, from the general body of the stone being loose and powdery, is not suffi-ciently compact to hold on; water will sork in behind the crust, cause a swelling and disruption on the surface, which ultimately breaks. The crust thus opened gradually bends for-ward more and more, until finally the weight of the disintegrated portion causes it to fall off. In some instances, as in Bath stone, these defective places rarely exceed an inch or two of surface before the decomposed part falls off; whereas the crust of the buildings at Oxford is so remarkably tenacious that it peels off and hangs like rags, often as much as a foot super-ficial, before it entirely separates. Upon the whole, I do not consider it a recommendation to a soft stone to say that it gradually becomes harder on the surface.

As Bath stone is decidedly one of the most fragile mineral substances ever used for building, a few observations on its cohesive strength may be offered, less on account of their utility, than because most persons who have investigated the subject of stone for building have expatiated considerably on this head. In all cases which have come within head. In all cases which have come within my notice, the stone possessing the least cohe-sive strength, or that which will crush with less pressure than any other, is nevertheless strong enough, when once fixed, for almost all practical purposes. No architectural members have to sustain greater pressure in proportion to their size than mullions of large Gothic windows. The tracery in the great north window of Westminster Hall is now executed in Bath stone, which is remarkable for having the least cohesive strength of all the specimens experimented upon and described in the Report on the Stone for the new Houses of Parliament. Some of the mullions of that window are less than 9 inches wide, and more than feet high, sustaining not only their own weight, but also the whole of the tracery beneath the arch. The eastern window of Carlisle Cathedral, built of a friable, red sandstone, is 50 feet high; the mullions are smaller and the tracery much heavier than in that at Westminster; yet in neither of these examples are there any symptoms of crushing. The cohesive strength of stones is never more severely tested than during their conversion by workmen from the rough state to being fixed in their final situation in a building. During these operations iron levers, jacks, lewises, and various other implements are applied, quently without judgment, and with but little regard to the mechanical violence which a stone will bear; therefore, it may be considered a useful practical rule, that however soft a stone may be, if it resist the liability of damage 6e until out of the mason's hands, there can little doubt of its possessing sufficient cohesive strength for any kind of architectural work .-Lithology, or Observations on Stone used for Building.—Trans. British Architects.

THE IRON TRADE OF SCOTLAND.

Seeing that the iron trade of this country now employs a large amount of wealth and enterprise, and that, in many districts, the mineral resources are yet only beginning to attract attention, it may not be uninteresting to take a brief glance at the history of this im portant branch of national industry. We have not sufficient data to trace its earliest commencement in this northern part of the kingdom, but it is believed that attempts were made at a remote period to extract iron from ore in spen fires, of which evidences are supposed to exist in some of the higher mineral districts. About a century ago, the first application of pit coal for smelting iron was made in the south, previous to which we find that there were fifty-nine furnaces in England and Wales, producing at a very great cost, by means of wood fuel, about 17,000 tons of iron per ansum, or about 290 tons from each furnace. Sabsequently to the introduction of pit coal for trei, furnaces were crected at Carron and Wilsontown, in Scotland, and, towards the close of hast century, at Clyde, Muirkirk, Devon, and Omoa. It has only been, however, during the hast twenty-five years that the trade assumed any importance in this quarter, and we shall confine our remarks to the progress which it

the following list of the selling prices of the best quality of foundry pig-iron per ton in the Glasgow market for the month of January in each year:---

| 1821-27 1826-2101 1829-0 1827-7 | 1831- £ 5 | 1836-£5 | 1841-£32 |
|------------------------------------|------------------|----------|----------------------------------|
| 1823- 0 1827- 7 | 1889- 41 | 1837- 5 | 1842- 3 |
| 1828- 51 1828- 6 | 1833- 43 | 1838- 5 | 1843- 24 |
| 1824- 6 1829- 63 | 1834- 49 | 1839- 41 | 1844- 21 |
| 1815-12 1830- 5 | 1895- 44 | 1840- 3 | 1843— 24 1844— 24 1845— 34 |
| | - | | |

At the commencement of the above period, the number of furnaces in operation in Scotland was fifteen, and the average make of iron about 575 tons per week, or 25,650 tons per annum. In 1826, when an impulse had been given to the trade by the higher prices of the two preceding years, the number of furnaces increased to twenty-two, the weekly make to 780 tons, and the annual average to 36,900 tons. About this period an effectual struggle was made to obtain a reduction of duty on cust and wrought-iron imported from foreign countries, and we find Mr. Crawshay, one of the largest ironmasters in Wales, in his evidence before a committee of the House of Commens, in 1825, stating that the annual make of iron in Great Britain was 600,000 tons, of which one-third was exported to foreign countries. The above produce may be apportioned as follows :--

| South Wales | 83 | fornaces | | 231,000 | tons. |
|---------------|-------------|----------|------|-----------------|-------|
| North Wales | - 8 | •• | | 14,000 | ,, |
| Staffordshire | 81 | | •••• | 178,000 | |
| Shropshire | 36 | | | 90,000 | ,,, |
| Yorkshire | 32 | | | \$7,000 | |
| Derbyshire | 14 | | | 20,000 | |
| Scotland | 17 | | •••• | 29,000 | |
| Total | 96 3 | - n | | 000,00 0 | " |

In 1826 the imports of Welsh pig-iron into the Clyde were 1,600 tons, and the general exports of Scotch about 8,500 tons, being, in both cases, a slight increase on the preceding year. The trade remained somewhat stationary, with gradually declining prices, until the effects of Mr. J. B. Neilson's hot-blast came into operation. The patent was obtained in 1829, but several years elapsed before its practical application with raw coal was accomplished. This opened an entirely new era in the iron trade of Scotland; the quantity produced from the same furnaces became at once more than doubled, while the consumption of coal, to each ton of pig iron, was reduced to about one-fourth-hence an immense stimulus was given to the trade. Existing works were greatly extended, and new works were esta-blished in districts where, a few years before, the minerals were considered next to valueless Thus it is, that, during the last fifteen years, the number of furnaces have become nearly quadrupled; and with recent improvements in the construction, the yield from each, on an average, may now be reckoned about troble the quantity which was formerly made with cold sir and charred coal. At first there were complaints of the inferiority of the iron made by the new system, arising chiefly from the problem generation of the market of the system of the system has been satisfactorily ascertained, from nu-merous experiments by practical men, that, with proper care in the selection, castings

produced from hot-blast iron are equally strong, and of as sound texture, as those made from cold-blast. It must, therefore, be evident that the application of heated air in smelting iron has been an incalculable benefit to the country, to the iron trade generally, and to the landed interest. It has cheapened the cost and increased the variety and usefulness of articles manufactured from iron; it has vastly augmented the consumption; aud, but for this improvement, large tracts of land in the west of Scotland, now yielding a handsome return, would have remained at the former low value of surface rent. The extension of railway communication will open up other rich and extensive mineral fields, so that we may expect to see the iron trade of Scotland progressively increasing for many years to come. The average number of furnaces in operation last year was 65, and the weekly produce 6,600 tons, giving an annual make of 330,000 tons, or cousiderably above one-half of the entire make for Great Britain in 1825.

The following are the exports of Scotch pig-iron (in tons), as derived from anthentic sources, for the last two years, exclusively of what was shipped by way of Liverpool, which, to America alone, must have amounted to a very considerable quantity :---

| | Continent | | America. | | Indies, &c. |
|------|-----------|-------|----------|---------------|-------------|
| 1843 | \$7,970 | ••••• | 7,851 | • • • • • • • | 863 |
| 1844 | 30,715 | ••••• | 11,719 | • • • • • • | 613 |

In the former of these years the lowness of the price, and the prospect of increased duty in Germany, induced an extensive trade in pigiron, a material portion of which was for conversion into malleable iron. In the event of any modification of the American tariff there will be a large demand for Scotch pig-iron for that quarter.

But there is another feature which speaks well for the future prosperity of the iron trade in Scotland. The peculiar character, the ahundance, and the richness of the minerals, admit of iron being produced at less cost than in any district of either England or Wales; consequently, instead of importing from thence, as formerly, large quantities of Scotch iron are nowsent to these districts—this, no doubt, arises chiefly from the cheaper cost, but another cause may be assigned. Scotch pig-iron is particularly adapted for making malleable iron, and as the present unparalleled demand for railways, ship-building, and other puposes, has outstripped the produce of pig-iron in some of the southern localities, it may be expected that recourse will be had to Scotland for increased supplies to meet the growing deficiency.

supplies to meet the growing deficiency. We may remark, that the manufacture of malleable iron is yet but in its infancy in Scotland, although making rapid strides towards an important position : there are five establishments, and the present make may be computed about 900 tons per week, or 45,000 tons per annum. For superior finish, toughness, and uniformity, it will stand comparison with either English or Welsh iroe. — Scottish Guardian.

BRISTOL ACADEMY FOR THE PROMOTION OF THE FINE ARTS .- We recently alluded to the intention which existed of founding a Fine Arts' Academy in Bristol, and are rejoiced to find that it has now assumed a tangible shape, and has come before the public with a list of donors and subscribers whose munificent contributions shew them to be not only earnest in carrying out the scheme, but determined to evince their zeal in the most effective and palpable form. The lady, whose princely donation, 2,000/, houds the list descent of the lady. .000%, heads the list, deserves the highest praise for her public spirit and liberality. All honou is likewise due to Mr. P. W. S. Miles, M.P. All honour who originated this important movement, and to the gentleman associated with him, for comto remove the stigma which rests upon bining Bristol in regard to the arts. The objects of the society are the advancement of the arts of painting in oil, fresco, and water-colours; of drawing in chalk ; of the study of sculpture and to architecture : and of the other branches of the The academy will be free to all fine arts. artists residing within ten miles of Bristol for the previous twelve months, on their subscribing to its rules, and on certain condi-tions; and its arrangements will comprehend a school of painting and sculpture; pecuniary and honorary rewards to artists and students; exhibitions of pictures, &c., &c.; and an art union.

PROBABLE QUANTITY OF IRON REQUIRED FOR THE NEW RAILWAYS.

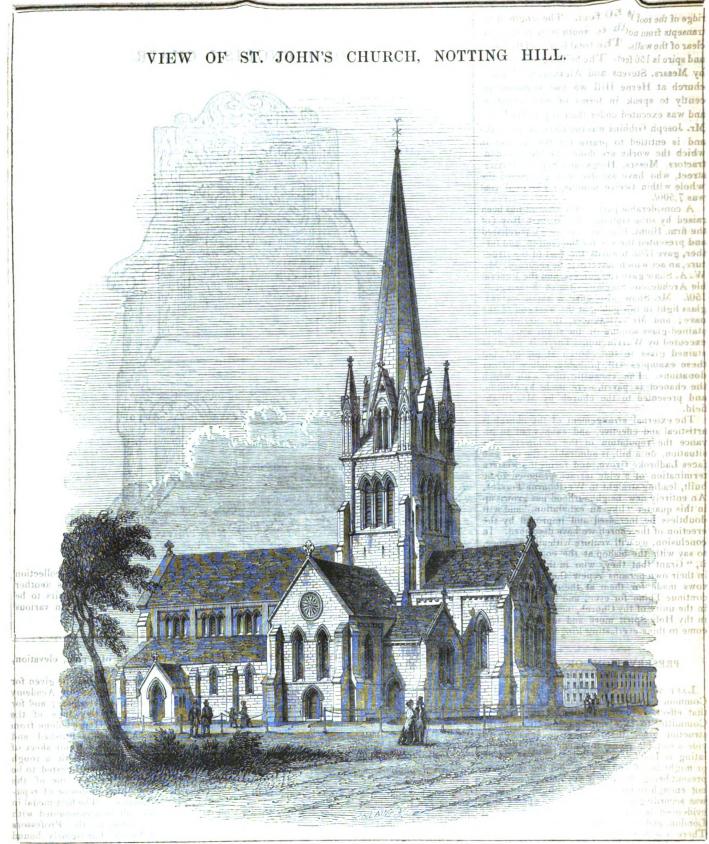

IT has been estimated, that out of the numerous railway bills coming before Parliament next month, there will be forty-five carried, or about one-fifth of the present applica-tions. Taking these lines at an average length of forty miles each, there will be 1800 miles of railway to be formed, commencing from the autumn of this year, and extending over 1846; for, though these will not be all completed at that period, the deficiency may be more than made up by the lines which were passed during last session, and which are now being formed. A yard of railway requires 280 lbs. of rails, 98 lbs. of cast-iron chairs, and about 70 lbs. of iron girders—making 4 cwts. per yard, or 352 tons per mile. In addition to this, it is pretty clearly ascertained, that an equal amount of iron is required for each mile, in waggons, carriages, stations, engines, and locomotive es-tablishments, &c.—making 700 tons of iron for each mile, or 1,260,000 tons for 1800 miles of railways about to be constructed in this country, or, as nearly as possible, the whole make of iron in Great Britain for one year. This is independent of the contractors' rails, which are immense; and, if to this tremendous consumption be added what will be required for the new water and gas companies, the docks and other great public works, as well as the extra demand arising out of the prosperous trade of the country, it can hardly be con-ceived that our capabilities for the production of iron, great as they are, will be sufficient to supply what will be required. This is also entirely independent of our foreign trade, and as railways are likely to be constructed in almost every country, the exports of iron must also be greatly increased. Under these ciralso be greatly increased. cumstances, there can hardly be a question that iron must shortly be much enhanced in value. -Mining Journal.

COMPETITION PLANS FOR BATHS AND WASH-HOUSES.

NOTWITHSTANDING the large number of applications for particulars, only twenty-two competitors have sent in plans, and it is said that as many as four-fifths of these have not complied with the published conditions. It is to be regretted that, with the exception of two or three sets, no attention whatever has been paid to ventilation in any of the designs. The number of drawings in the whole is 147.

A correspondent of *The Times* says, "There are many places in London well adapted for the position of such establishments, a poor or thickly-populated neighbourhood of course being likely to prove the most advantageous and convenient to the class of people for whose use they are intended. London, from its local position, is fortunate in having wells, which produce most excellent water, and some of them are known to be more or less medicinal. Would it not be an advantage, therefore, for bathing purposes, to select a site where such a well is known to exist, so as to combine a common bath with a medicinal one, for such as may require it, on account of health, or for other reasons?" He suggests that a spring at No. 3, Old Belton-street, in the line of the intended new street between Holborn and the Strand, said to have been the resort of Queen Anne, might be made available.

ROOFING HOUSES WITH TIN. — John Woolley, Springfield, of Massachusetts, gives the following description of his plan for rooting houses with tin :—"What I claim as my invention is, constructing metallic roofs without boarding, by means of strips fastened to the rafters by cleats, to which the sheets of tin forming the roof are attached. I also claim the shield-plate under the eaves, constructed and arranged in the manner and for the purpose described."—The strips of tin are fastened on the top of each rafter, and extend from end to end, with the two edges turned up, and to these edges the sheets of tin forming the roof are connected, by lapping over these edges, and then turning down; and the shield-plate, referred to in the second section of the claim, is for catching and conducting into the gutter all the moisture that condenses under the roof. For this purpose, a plate extends from the gutter under the roof, there being sufficient space between this plate and the lower edge of the roof, for the water thus collected to pass out.

ST. JOHN'S CHURCH, NOTTING-HILL.

On Wednesday last the new church of St. John, in Kensington-park, was consecrated by the Lord Bishop of London. The above engraving represents the structure as it appears when viewed from the south-east, and shews it to be cruciform in plan, and to have a tower and spire at the intersection of the cross. There is an entrance porch at the west end of each side of the building and other entrances in the transepts. The exterior is wholly of stone : the plain faces are of Kentish rag hammer-dressed, the quoins, dressings of doors and windows, ornamental parts, and the spire, are of Bath stone. The style throughout is early English, the style of the thirteenth century, but presents variations which are to of found rather in works in Normandy of that

I than in this country.

The interior of the church consists of a nave and two aisles, one on either side, transepts, and chancel. On each side of the latter, but extending only part of its length, as shewn in the engraving, an aisle is formed; that on the north side is used as the robingroom, and contains the organ in the upper part, that on the south side contaius pews, and is separated by a high open screen from the chancel. The nave is separated from the aisles by plain cylindrical columns bearing pointed arches, and has a clerestory. The tower is supported on four clustered columns and arches at the junction of the nave and transepts. The coilings are wholly of wood stained and varnished, and the timbers of the roof are exposed, and are slightly adorned with painted symbols of the evangelists, and scripture sentences rubricated. In an ensuing number we shall present to our

readers a general view of the interior of the building, as seen from the west end, which will convey a clearer idea of its appearance than description alone can do.

There is a gallery at the west end, and one in each transept, but none in the body of the church. The pews are low, formed of deal, simply varnished, and afford sittings for 1,500 persons, of which 400 are free. It was originally intended to separate the chancel from the nave by an un-protestant rood-screen, but this was wisely abandoned at the request, we believe, of the Bishop of London.

The whole length of the building, in the clear of the walls, is 125 feet 9 inches; the width of the nave between the columns is 19 feet 10 inches, and of each aisle 13 feet 6 inches, making in the clear of the walls, with the thickness of the columns, 51 feet. The height of the church from the floor line to the $\mathbf{\mathfrak{S}}$

ridge of the roof is 50 feet. The length of the transepts from north to south is 91 feet, in the clear of the walls. The total height of the tower and spire is 156 feet. The building was designed by Messrs. Stevens and Alexander, of whose church at Herne Hill we had occasion recently to speak in terms of commendation, and was executed under their superintendence. Mr. Joseph Gibbins was the clerk of the works and is entitled to praise for the manner in which the works are done: as are the contractors, Messrs. Higgs and Son, of Daviesstreet, who have satisfactorily completed the whole within twelve months. The total cost was 7,500/.

A considerable part of this amount has been raised by subscription. Mr. Robert Roy (of the firm Blunt, Roy, and Johnson), purchased and presented the site for the church, and further, gave 150. towards the cost of the structure, an act which deserves to be recorded. Mr. W. A. Shaw gave 150 guineas, and the Venerable Archdeacon Sinclair, vicar of Kensington, 150. Mr. Shaw also gave a small stainedgluss light in the gable, at the west end of the nave; and Mr. Alexander, the architect, a stained-glass window in the south aisle, both executed by Warrington. There is no other stained glass in the church at present, but these examples will, probably, induce further donations. The encaustic tiles with which the chancel is paved, were made by Minton, and presented to the church by Mr. Blashfield.

The external arrangement of the church is artistical and effective, and cannot fail to advance the reputation of the architects. Its situation, on a hill, is admirable; the east end faces Ladbroke Grove, and forms the western termination of a wide terrace proposed to be built, leading straight to Westbourne Terrace. An entirely new neighbourhood has grown up in this quarter "like an exhalation," and will doubtless be increased and improved by the erection of the church we have described. In conclusion, we will venture with all reverence, to say with the bishop at the consecration of it, "Grant that they, who in this place shall in their own persons renew the promises and vows made for them at their baptism, may continue Thine for ever; and being preserved in the unity of thy Church, may daily increase in thy Holy Spirit more and more, until they come to thine everlasting kingdom."

PRESERVATION OF LONDON ANTIQUITIES.

LAST week Mr. Lott, F.S.A., moved at a Common Council, in pursuance of a notice to that effect, a recommendation to the Library Committee to take into consideration an in struction given them some time ago, to provide a suitable place for such antiquities relating to London as were in their possession or might be offered to them, but the members present being counted, it was found there were not enough to form a court, and the meeting was accordingly adjourned! The apathy thus evidenced is really disgraceful to the city of London, and cannot be sufficiently reprobated. There are few towns in England in which some public repository of local antiquities can-not be found: yet in London, a city built on a city,-where curious remnants of the past are furned up every day, there is nobody appointed for their preservation, there is not even a place which they may be gathered together: they are at once sold to individuals and so dispersed east, west, north, and south, or worse still, and in too many instances, are unnoticed and destroyed. A museum of national antiquities is greatly to be desired, and might be made par-tially complete in very little time, and with very little trouble. If we remember rightly the Society of Antiquaries have in their cellars a large collection of architectural antiquities, for which they have no proper place. Many individuals too, possess relics of little value by Many themselves but very important in a series, and would gladly place them in some general collection, where they would form links in a chain, and be accessible to all. It is surely the duty of the corporation of London to bestir themselves in this matter : at the least let them provide a proper receptacle for the relics they possess, and take means to prevent the dispersion of such as may hereafter be discovered.

PREMIUMS OFFERED BY THE ROYAL ACADEMY OF ARTS.

THE council of the Royal Academy have issued the following announcement relative to the prizes for the present year :---

Royal Academy, Trafalgar-square, Jan. 20. The president and council give notice to the students in the Royal Academy, thut the following premiums will be distributed on the 10th day of December next, viz :--

A gold mcdal, and the Discourses of the Presidents Reynolds and West, for the best historical picture in oil colours; the subject to be—" Finding the Body of Harold." To consist of at least three figures; the size of the cloth to be a common half-length, viz. 4 feet 2 inches, by 3 feet 4 inches; the principal figure to measure not less than 2 fect in height.

A gold medal, and the Discourses of the Presidents Reynolds and West, for the best composition in sculpture; the subject to be— "The Hours leading out the Horses of the Sun." Basso-relievo—imbost not to exceed 2 inches; the figures not to be less than 2 feet, nor more than 3 feet high; the principal figure to measure not less than 2 feet in height.

N.B. The candidates to present their models either baked or cast in plaster.

A gold medal, and the Discourses of the Presidents Reynolds and West, for the bestfinished designs in architecture; the subject to be—"A Design for a National Record Office, including a Cosneil-room and Offices; a Keeper's-house, with Courts and appropriate Entrances; the whole to cover three acres." The whole comprised in one general and regular composition; the designs to be as large as an entire sheet of double elephant

will admit, and to consist of a plan, elevation, section, and perspective view.

A number of silver medals will be given for the best Drawings and Models of Academy Figures, done in the Royal Academy; and for the best accurate-figured Drawings of the Strand Front of Somerset House; done from actual measurements, carefully finished and washed; to be as large as a whole sheet of double elephant will admit; with a rough outline, giving the dimensions, attested to be their own performance by any one of the academicians, or any other professor of reputation resident in London. The first medal in each of the classes will be accompanied with a copy of the Lectures of the Professors Barry, Opie, and Fuseli, handsomely bound and inscribed.

Three silver medals will also be given for the best drawings, and three silver medals for the best models, of a statue or group in the Antique Academy, to be selected and set out by the keeper for that purpose on the 1st day of October next, for one month. The first medal in each of these classes will be accompanied with a copy of Fuseli's and Opie's Lectures, handsomely bound and inscribed.

Two silver medals, for the best copies made in the School of Painting, between the time of its opening after the exhibition and the lst of November. The first medal to be accompanied by the Lectures of the Professors Barry, Opie, and Fuseli; unless the student to whom the premium may be adjudged shall have previously acquired them in the Academy.

Academy. A silver medal will also be given for the best medal die, to be cut in steel, from the head of the Belvedere Apollo, in the Royal Academy. The size to be not less thun one inch and a quarter in diameter, to be accomnanied with an impression in way.

panied with an impression in wax. Digitized by

ACADEMY OF ARTS.

IN Vol. II. of THE BUILDER, page 630, | Mr. C. J. Richardson, is from the collection

we gave representations of two chairs belonging to Thomas Charles, Esq., of Chillington example of a numerous class of chairs to be House, Maidstone, Kent. The above glyphograph by Palmer, from a drawing by parts of England.

OLD ENGLISH CHAIR.

55

RIGHT OF TAKING UP PAVEMENTS.

A FEW day since Mr. Bingham was occupied for several hours at Worship-street in hearing an information on the part of Commissioners of Pavements of the Whitechapel district, against a man named George Bird, for having, as the admitted agent of the Commissioners of Excise, broken up a certain pavement within their jurisdiction to the extent of 1,820 feet, whereby he had incurred penalties to an enormous aggregate amount. Mr. Ballantine attended for the com-

penalties to an enormous aggregate amount. Mr. Ballantine attended for the complainants, and Mr. Carr, the solicitor to the Board of Excise, conducted the defence.

The substance of the case will be best un-derstood from Mr. Ballantine's statement of it, which was to the effect, that the present proceedings had been instituted by the Paving Commissioners, under the act 57 George, III., c. 29, s. 53, which enacted that any person who shall take or break up any pavement in any street or place within the jurisdiction of the commissioners, without their authority, or the commissioners, without their surveyor, shall forfeit and pay any that of their surveyor, shall forfeit and pay any 10%. nor less than 5%, for each and every square foot so broken up. After briefly referring to the several acts under which the commissioners were appointed, and by which they themselves were liable to in-dictment for the non-fulfilment of the trust reposed in them, the learned council went on to state the peculiar circumstances which led to the present proceedings. In the month of October last certain persons, employed by the Board of Excise, thought fit to break up the pavement immediately contiguous to the ex-tensive distillery of Messrs. Smith, White-chapel, for the purpose of discovering certain secret pipes which were supposed to be concealed under the ground, and to communicate with Messrs. Smith's distillery and rectifying-house; and, although the Paving Commis-sioners felt greatly annoyed at such vexations proceedings, no intimation whereof had been previously made to them, and the ground had been left in a state which was highly annoying and dangerous to the public, they did not at that time feel it necessary to interfere, as they were being aware of the authority possessed by the Excise Board under their laws to remove pavements contiguous to any distillery with regard to which they entertained reasonable grounds of suspicion that illegal proceedings were carried on there. Not satisfied, how-ever, with the steps they had already adopted, and in which perhaps they might have been then justified, the present defendant, acting under the express orders of the Excise authorities, had again commenced on the lst of January breaking up the pavement on the opposite side of a square, nearly 150 yards distant from Messrs. Smith's distillery, where there could not be the slightest pretence for supposing that any secret communication for supposing that any secret communication with the premises in question had been esta-blished. They, the Excise Board, had received timely notice of the illegality of their con-duct, but, notwithstanding that, they continued on the two succeeding days to break up the ground over an extensive surface, although they must have been well save they could have no must have been well aware they could have no justification for such a proceeding. He should proceed to establish his case by evidence, and felt the fullest confidence that the magistrate would consider the defendant had brought himself within the terms of the Act, and rendered himself liable to the heavy penalties incurred under its provisions.

Richard Burgess, surveyor of pavements for the district, proved that on the 1st 2nd and 3rd of January, a gang of men, acting under the orders of the defendant, were engaged intaking up the pavement along the line in question, which embraced three streets, named respectively Little North-street, Court-street, and Buck's-row, and that neither the witness nor any person acting under the authority of the Paving Commissioners had given his sanction to such a proceeding. The place where they on this occasion commenced breaking up the ground was situate about 200 feet from the gates of Messrs. Smith's distillery. In his cross-examination by the solicitor of the Excise, the witness stated that the defendant Bird, on being remonstrated with, at once acknowledged that he was acting under the express directions of the Excise authorities.

Joseph Little, another surveyor, deposed to having been ordered to measure the ground in question which had been taken up, and that in the whole it amounted to 1,829 square feet.

Mr. Jennings, clerk to the Paving Commissioners, stated that on his attention being directed to the subject he immediately waited upon Mr. Carr, the Excise solicitor, and cautioned him that they were acting illegally in removing the pavement without first applying for the consent of the Paving Board, which had not been done; and that though Mr. Carr assented to every thing he said with the utmost politeness, no arrangement or explanation had been come to.

been come to. Mr. Carr then, in defence, contended that the proceedings the Board of Excise had felt themselves called upon to adopt in this instance were perfectly justified by the terms of the sta-tute under which they had acted, namely, the 6th of Geo. IV., cap. 80, sec. 43, which en-acted that it should be lawful for any officers of excise, or persons acting in their aid and assistance, either by night or by day, to break up any ground in any distillery or enter pre-mises of a distiller or rectifier, or any ground near or adjoining such distillery, in search of any pipe or private conveyance or utensil, and on finding such pipe or conveyance, to break up any ground through which it shall lead; and be should clearly prove that they had reasonable grounds of expectation that an examination of this ground would result in the dis-covery of some pipes of this description. Before adopting this course, however, they had obtained the sanction of the East London Water-works Company, who supplied Messrs. Smith's distillery; and it was his strong im-pression that in the interview which he subse-cuently had with the complement? own elect quently had with the complainants' own clerk the complainants had given a qualified assent to the steps afterwards taken, on the understanding that their own servants should relav the pavement which it might be found necessary to remove. He had an ample justification for the proceedings the Excise had taken. but he was precluded from entering on as satisfactory an explanation as he should wish, or he must thereby anticipate the action now pend-ing against Messrs. Smith in the Exchequer, which would shortly come on for trial.

Thomas Frankish, an Excise officer, was then called, and proved being directed by the Board of Excise to trace the course of certain mentioned pipes suspected to communicate between Messrs. Smith's distillery and their rectifying house, that he discovered pipes of which he had reason to complain, and that the object of his finding them formed part of the grounds of action against the Messrs. Smith in the Court of Exchequer. Witness stated that every foot of pipe he uncovered led directly from the pipe at the entrance gates of Messrs. Smith's premises in the direction of the brokenup ground in question, and that the examination of a pipe leading into North-street was brought to conclusion by the discovery that it terminated in a dead end with a flange on it.

Mr. Ballantine then pressed for a conviction and the enforcement of a heavy penalty against the defendant, as the expense of carrying on the proceedings and re-establishing the roads in their former condition would amount to a considerable sum, and he considered it would be extremely unjust to impose the burden of its liquidation upon the rate-paying inhabitants of the district, when the cost had been solely incurred by the conduct of the Excise authorities.

Mr. Carr expressed his readiness to enter into any reasonable arrangement for defraying these expenses that might be suggested, but strongly deprecated the infliction of any of the penalties sought to be recovered. Mr. Bingham said the case was one of great

Mr. Bingham said the case was one of great difficulty and nicety, but, whatever decision he might come to, he certainly did not consider it one for the imposition of more than a merely nominal penalty; and with regard to costs in the way of compensation for expenses, he possessed no power to award their payment. He would, therefore, suggest that the whole amount of actual expenses should be ascertained and laid before the Excise Commissioners, and he felt assured that no obstacle would be thrown in the way of an amicable ajustment.

Both parties assenting to this arrangement, the case was adjourned for three weeks, to allow opportunity for its being carried into effect.—*Times*.

THE RUINS OF NINEVEH.

LETTERS from Constantinople announce that M. Botta has nearly completed his disco-veries in the subterranean palace of the ancient; Nineveh. He was then on the point of clearing, the grand southern façade. The vast entrance. the grand southern façade. The vast entrance of this front is entirely cleared: six colossal bulls, with the heads of men, and two human statues, also colossal, strangling lions in their arms, form its principal ornaments. These sculptures are said to be of great beauty, and as fresh as if executed yesterday. The two. bulls in the centre, as seen from the front, form the entrance pillars. The animals have inscriptions between their feet, some of which have, however, been cut away by the chisel, so as to leave only their traces, a circumstance which would seem to indicate that a new dynasty, or a new monarch, taking possession of the palace, had removed the inscriptions of his predecessors. M. Botta is anxious to transport these figures to Paris; but the physical difficul-ties are very great. Still, he hopes to remove them, on wooden rollers, to the Tigris, which is five leagues from Khorsabad,-whence they might go, by the first flood, to Bassora, and there be received on board a ship of war for France. This discovery of M. Botta's is one of the most valuable which has been made for many years in the field of archæology,---sapplying an important link, hitherto wanting, and believed to be irrecoverable, in the history of the arts amongst the earliest civilizations of the world. It deserves, therefore, some worls of further notice, which we collect from the French papers in general, and the *Revue de Paris* in particular. The Greek historians and Paris in particular. The Greek historians and the books of the Old Testament, furnish the very vaguest hints as to the condition of art amongst the Medes, Assyrians, and Baby-lonians; and hitberto no monuments were known to exist by which they were more fully represented. Unlike the cities of anoient Egypt, which have transmitted to our times, almost in their integrity, the arts of their Susa, Ecbatana, Babylon, Nineven - have perished from the face of the earth, leaving, in the language of ancient prophecy, scarcely one stone upon another. Dreary mounds of rubbish, traversed by deep and narrow ravines that indicate the lines of the streets, alone mark the sites of these mighty cities. Nineveh, the city of fifteen hundred towers, whose walls were a hundred feet in height, and hud space on their summit for three chariots abreast, seemed more utterly ruined than even Babylon; yet from beneath its dust has the long-buried art of the Assyrians been recovered, and an impulse been communicated which may end in bringing, through future excavations, our knowledge of the former to something of a knowledge of the former to someting of a level with our understanding of Egyptian art. M. Botta, as our readers know, is a distin-guished archeologist, who was consul for the French at Mosul; and there, his neighbour-hood to the ancient Nineveh inspired him with an earnest desire to try some excavations in the soil of the lost city. His first attempt was on the most conspicuous mass (for the ruins of the various gigantic edifices of old present now the appearance of separate barren hills), near the village of Nininoah, supposed by tradition to be the tomb of Ninus. Here, how-ever, finding only broken bricks and insigni-ficant fragments, he opened his trenches in the sides of another hillock, on whose summit is built the village of Khorsabad,—where bricks had been frequently found covered with inscriptions in the cuneiform or arrow-headed letter. It was principally the hope of finding other inscriptions, which might help, by comparison, to decipher the cuneiform writings, hitherto unreadable, that had tempted M. Botta to these explorations. Something of the success our readers know. An Assyrian edifice has been readers know. An Assyrian compreservation. On this discovery the French Government supplied M. Botta with the means of continuing his researches, and sent out M. Flandin to make drawings of whataver could not be removed. A tolerable whatever could not be removed. A tolerable judgment may now, from what is laid open, be formed of the extent and importance of these ancient constructions. Fifteen halls of this vast palace, with their corresponding espla-nades, have been cleared. The rest of the monument, it is made quite certain, has been destroyed,—intentionally, however, the stones

THE BUILDER.

having been carried off to serve for other buildings. A fortunate accident-that would seem an evil one at the time-has preserved for us what remains. This portion of the parace has been ravaged by fire, which has estirely destroyed only the timbers of the reafs:---bat as the other calcined materials were rendered useless for new constructions, they have been left where they were: and thus, one-third of the edifice remains, to testify of the rest. We have, from time to described the sculptures and inscriptions time, found within its walls; and we announced to our readers the work, which embodying M. Flandin's drawings, will furnish the details of this curious discovery. We may add that the fragments thought worthy of being collected and transmitted to France, are umerous and important enough to load a ship. - Aihenaum.

Dem Books.

An Act for regulating the construction and the we of Buildings in the Metropolis and its neighbourhood, with a CYCLOPEDIA arranged Alphabetically, and accompanied by estimative references and counter-references to the sections of the Act itself. By A. BAR-THOLOMEW, Eeq., F.S.A., Architect. Pub-lished at 2, York Street, Covent Garden.

THE Cyclopædia which accompanies this edition of the New Metropolitan Buildings Act was first published in "THE BUILDER." Its value was at once recognised so fully by the public and the profession, that the author was induced to revise the whole, enlarge it was noused to revise the whole, childrge it considerably, and arrange it in the pocket form, in which it is now issued. Together with the Act in full, it is no larger than an ordinary pocket-book, and cannot fail to be acceptable to all the numerous classes connected with heuse property. By a reference to it, all the parts of the Act which bear on a particular question are at once seen, accuracy is secured, and much time saved. Appended to it is a fall list of the district surveyors and their offices.

The History and Art of Warming and Venhe History and Art of Warming and Ven-tilating Rooms and Buildings; with Notices of the Progress of personal and fire-side Com-forts, and of the Management of Fuel. By WALTER BERNAN, Civil Engineer. 2 vols. London: 1845. George Bell.

In seventeen essays, illustrated by 240 diagrams; these two volumes present a very interesting history of the contrivances adopted for warming and ventilating rooms and buildings, such as open fires, hypocausts, German, Dutch, Russian, and Swedish stoves, steam, hot-water, heated air, and others, arranged, in most cases, in the order in which they ap-peared. It is very clearly written, and dis-plays considerable research. The subject is of paramount importance, and demands one consideration.

As the author observes in his preface, "Though much has been done by ingenious men in the art of distributing heat for household uses, it must be confessed, that in one or two instances only have they been able to make a permanent impression or bring their contrivances into that general use as to constitute them 'machines of society;' while in the eco-nomy of fuel for manufacturing purposes invention has already produced marked benefits; yet however great the saving that may ul-timately be effected in furnaces, still, from the nature of things, it must ever be of small importance when compared with that which woold arise were better methods of heating and ventilating dwelling houses generally fol-lowed ;-of the fifteen-and-a-hulf millions of tons of coals raised yearly from the mines, not more than three-and-a-half millions are consumed by steam-engines and in manufacturing operations,—leaving cleven or twelve millions of tons of fuel to be mismanaged in kitchens and sitting-rooms throughout the country. The register plate was described at the close of the fifteenth century by Alberti, the ancient Florentine architect, and by others who wrote afterwards. Were this simple and cheap smoke value introduced into every cottage chimney, it would save the heat of five or six millions of tons of coals that is now annually wasted and thrown away."

From the essay on heating by means of

steam, we extract the following table collected from cases given by various parties, which "exhibits the practical effect of a given surface of steam-pipe in keeping a certain cubic area of building at a certain temperature, when the external air was under the freezing point of water :---

| | Cubic feet | |
|---|-------------------------|----------------------------|
| Description | of space | Tempera- |

| | | |

"The quantity of steam-heated surface required to produce a certain average tempe-rature may be readily approximated by dividing the cubic contents in feet of the building to be heated by the number placed in the first column opposite the description of a similar building. Thus, for a factory containing 100,000 feet of space, this number divided by 175 in the table will give 574.2, which is the number of square feet of pipe surface that will keep it at a temperature of 80° in the coldest weather. If the cubic area of a dining-room be 5,000 feet, this divided by 140, one of the numbers in the table, will give about 35.7 square feet of steam-pipe surface required to warm it to a summer heat, with the air outside at the freezing point. These, it is obvious, although rough, are safe practical estimates that may be applied and depended on in numerous analogous cases.

"The required quantity of steam-pipe is sometimes estimated in another way. If, for example, 200 cubic feet of air are to be supplied in a minute to a room which is to be kept at a the arms of 60° , when the external air is at the freezing point, and the average heat of the surface of the steam-pipe is to be 200° , then, if the difference between the temperature the room is to have and the external air be multiplied by the number of cubic feet of air required per minute, and the product divided by 2.1 times the difference between 200 and the temperature of the room, the quotient will give the number of square feet of heating surface required, thus :-

$(60-32) \times 200 = 5600 + 2.1 (200 - 60^{\circ}) = 10$

which is the square feet of heating surface to be used.

"An estimate formed from the table omits the consideration of any definite amount of ventilation; and formed from the rule above, omits any reference to the cubic space to be heated. For instance, a room containing the same number of persons and windows, but of twice the cubic capacity, or one with double the superficial area of radiating wall, ceiling, and floor, would be supplied with the same quantity of pipe! The rough approximation to be had from the table will therefore be found a useful check on the still rougher guesses made by means of the rule.

" In Dr. Arnott's method of finding the amount of heating surface, one of the omissions in Mr. Tredgold's rule is supplied, 'to main-tain,' says the doctor, 'in an ordinary apartment the agreeable and healthful temperature of 60°, there must be of surface of steam-pipe, or other steam-vessel heated to 200° (which is the average surface temperature of vessels

filled with steam at 212°), about one foot square for every six feet of single glass window of usual thickness; as much for every 120 feet of wall, roof, and ceiling of ordinary material and thickness; and as much for every six cubic feet of hot air escaping per minute as ventilation, and replaced by cold air. A window with the usual accuracy of fitting is held to allow about eight feet of air to pass by it in a minute; and there should be for ventilation at least three feet of air a minute for each person in the room. According to this approximation, a room 16 feet square by 12 feet high, with two windows each 7 feet by 3, and with ventilation by them or otherwise, at the rate of 16 cubic feet a minute, would require 20 feet of pipe 4 inches diameter, or any other iron vessel having the same extent of surface.'

"If pipes 3 inches diameter externally are "If pipes 3 inches diameter externally are to be used, then the amount in square feet of heating surface multiplied by 1.09 will give the number of feet in length of 3-inch pipes re-quired; or of 4-inch pipes, if multiplied by 82; of 5-inch pipes, by .66; and 6-inch pipes, by .55. Thus in the above example, 23.7 \times 0.82 = 19.4, which will represent the number of fost of 4-inch pipe required to heat 200 unbig feet of 4-inch pipe required to heat 200 cubic feet of air in a minute from the temperature of 30° to 60°.

"The allowance made for the expansion of cast-iron pipes is in practice $\frac{1}{2}$ inch in 10 feet, or $\frac{1}{2}$ of their length. When heated from 32° to 212° , cast-iron expands $\frac{1}{2}$ of its length, bar-iron $\frac{1}{2}$, copper $\frac{1}{2}$, brass $\frac{1}{2}$, tin $\frac{1}{2}$, $\frac{1}{2}$ lead _{sit}, sinc _{vir}. "The size of the boiler is regulated by the

capacity of the heating pipes. As much space is left for the ateam in the boiler as is equal to all the steam in the pipes; and the space for the water may be about one-eighth less. The water-line should always be kept above the highest part of the flue." We shall probably return to this work, and in the meantime recommend it to our reuders

in the meantime recommend it to our readers.

CORRESPONDENCE ON METROPOLITAN BUILDINGS ACT.

WHO HAS POWER TO DECIDE WHAT IS A COMMENCEMENT?

SIB,-Finding it necessary to obtain for my own guidance counsel's opinion upon two points of the Metropolitan Buildings Act, I inclose you a copy thereof, thinking it may be of service to your readers, should you think proper to give it insertion in your valuable publication

Your obedient servant, A CONSTANT READER. Clapham, Jan. 29, 1845.

(Copy.) Having carefully perused and considered the Metropolitan Buildings Act with reference to the two points submitted to me-namely, "What is a commencement of a building within the meaning of the Act?" and, "Who has the power to decide what is a sufficient commencement?"

1 am of opinion that any acts which amount to a bond fide beginning, upon which it is in-tended to raise a superstructure, are sufficient to meet the object of the legislature; otherwise it would of course be very difficult to determine where the line is to be drawn, and say what acts just amount to a commencement and what are below the mark; I therefore have no hesi-tation in concluding that if foundations are commenced and a few courses of bricks laid (so as to denote absolutely an intention to build), it is "commenced" in terms of the Act.

On the second point, -The 82nd section gives power to the official referees to determine disputes as to the effect of the provisions of the Act in any case. This power must pertain solely to cases which are admitted to be within the operation of the Act, therefore they have no the operation of the Act, therefore they have no jurisdiction over such as are "commenced be-fore Jan. 1, 1845," provided they are "covered in and rendered fit for use within twelve months thereafter;" but should they assume such ju-risdiction, the remedy would be by action, or an application to the Court according to the act of interference.

Temple, Jan. 27, 1845.

[We have not the name of the party who gave this opinion, and can hardly believe that it proceeds from one "learned in the law." The 80th section, which provides for the ap-Digitized by GOOSIC

pointment of the referees, shews that they are to superintend the execution of the Act, " and also to determine sundry matters in question incident thereto:" and the 81st section enacts, incident thereto:" and the Slat section enacts, that they are "to perform the several matters to them respectively assigned by the provisions of this Act, and to determine all questions re-ferred to them, whether expressly by this Act or at the instance of any one or more of the parties concerned."—Eo.] . . .

METROPOLITAN BUILDINGS ACT-DEFINITION OF TERMS.

-Parties concerned in the operation SIR,-Sin,---.Fariles.concerned in the operation of the Metropolitan Buildings Act having applied to me for my opinion of the construc-tion of the words "commenced before" and "commenced after" in the sense applied to them by the seid Act, I beg to hand, through your medium, my consideration of the words in the sense they are evidently intended to bear in reference to this question.

It is necessary to keep in mind that the eneral tenour and spirit of the Act is, amongst other objects, "to prevent the great diversity of practice exercised by the various officers ap-pointed under the 14th Geo. 3, c. 78, whereby pointed under the 14th Geo. 3, c. 78, whereby the operations of persons engaged in building is retarded, and expenses are increased "(*Vide* Preamble); and "that the following terms and expressions are intended to have the meanings assigned to them respectively." (*Vide*

Construction of Terms.) Now the terms of the Act are "already built," and "hereafter to be built," and the words "commenced before," or "commenced after," are merely constructive words to shew the intended force of the terms used.

The term " alroady built " being in the past tense, would, in its ordinary signification, imply a building completed and finished; but the term " already built," in the sense applied to it by this Act, is evidently intended to include all buildings or demonstrations of buildings which are "commenced" by any operative which are "commenced" by any operative building demonstration being performed prior to the 1st January, 1845; and vice verse "here-spher to be built," is intended to apply to such as have no operative demonstration whatever prior to that date, and such as having an ope-rative demonstration of a huilding being about to be raised prior to the 1st of January, 1845, rendered fit for use within twelve months there-after."

Had the Act intended to renounce some commencements, and to have acknowledged certain other commencements, it would have been reasonable that in "the construction of terms used," such distinction of commencements would have been expressed; instead of which, the most open and unequivocal term is adopted, thereby acknowledging every demonstration of what kind soever, whereby a building is in visible progress of erection, shall be deemed to be "*already built*" within the meaning of this Act, provided it is "covered in and rendered fit for use within twelve months thereafter.'

Had we heretofore been without any Act to regulate our metropolitan buildings, probably the limits and operations of the 7th & 8th Vict., now under consideration, might have been of a more stringent and arbitrary nature; but hav-ing been regulated chiefly by the 14th Geo. 3, c. 78, ever since the year 1774, which has been considered efficient hitherto, it is evidently the object of the legislature, in producing the pre-sent Act, to do so with as little inconvenience to building operations as consists with the nature of the subject-matter itself.

Trusting to your devoting space for these remarks in your next publication, with the hope they may be useful to parties concerned, ~I am, Sir, your obedient servant,

CONSILIARIUS. London, 22nd January, 1845.

RAISING OLD BUILDINGS.

SIR, -I have a five roomed house and shop, cocupied (the walls of which are less than 18 in. thick), which I wish to raise another story, as also a kitchen adjoining at the back. Wílí any of your building friends inform me whe-ther such can be done irrespective of the new Buildings Act. But should the new Act prohibit such addition being made, permit me to inquire further, whether I can raise the front

by a parapet, without the interference of any surveyor appointed under the said Act. Α.

I am, &c. The new Act provides that buildings already built may be raised to an additional beight, not exceeding 10 feet, although the walls of such buildings be not of the thicknesses prescribed by the Act, if, in the opinion of the district sur-veyor, such walls be sufficiently secure to allow of the raising thereof.-ED.]

WHAT CONSTITUTES A SHOP-FRONT?

Sir,-Can you define the difference between a window in the front wall of a shop and a shop-front? as the frames of doors and windows must be fixed at a distance of 4 inches at least from the face of the external wall, and shopfronts come under a special clause of the New Buildings Act. By giving the definition, you will oblige ONE OF YOUR READERS. January 21st, 1845.

Such a definition in general terms cannot safely be given. Each case must be judged by itself.-ED.]

Correspondence.

ARCHITECTURAL COMPETITION. " My cars will not be charmed with sounding words, Or pompous phrase, the pageantry of sounds."

SIR,—It may be necessary to inform your correspondent "T" that the length of time which has elapsed since the date of his letter to that of the present reply, is owing to a cir-cumstance over which I had no control, and which is not yet satisfactorily accounted for; I shall, however, make no further apology for again alluding to the subject of competition, considering its paramount importance will prove a sufficiently ample one for making a few remarks on the letter of "T," at p. 622, vol. ii. of THE BUILDER.

I certainly think it savours of partiality in him to misrepresent that part of my former letter relating to Sir R. Smirke. If he possesses much candour, he must allow it to be extremely unfair of him to bring forward that gentleman as an *individual* illustration, when I distinctly mention him as a general one only: that is, that the same argument will hold good in the case of any other architect in a similar position. Nor has he by this quibble--for an I must consider it—answered any of my objec-tions, but has, on the contrary, evaded a direct reply to them. The enigma he should have solved is, how in all cases an *impartial* architect can be procured, one whose unbiassed opinion will alike be satisfactory and just, whether the competition be for a poor-house or a palace? Does it not seem very absurd for a writer to bring forward as an argument for the superiority of a certain system, a competition for the chapels connected with a cemetery? Of what flimsy texture must the reputation of such an architect be who would fear such insignificant buildings-even if treated with the most artistic skill-interfering with that reputation, when he has designed and raised much larger and more important edifices. Is he so inexperienced as to suppose, that if in a competition for a town-hall, a club house, or other large building, in which that architect was appointed umpire, he was to observe the name of a talented rival on a design the merit of which might seem calculated to dim the lustre of his own reputation elsewhere, that envy would not suggest a certain line of conduct? which I consider the principal ob-jection to this system: or does "T" really suppose that a paltry fee would reconcile him to its loss? Common sense and past experience unfortunately prove the contrary.

We will, to prove the inferiority of "T's" system to others, notice a few of the objections to which it is liable, and then compare it with the proposed one, in which the competing architects constitute the judges, and one which, I contend, is the most fair, satisfactory, and just.

In certain designs a professional umpire is very apt to form previous ideas in his own mind as to what particular style, plan, or arrangement he would adopt; this certainly gives an unfair advantage to certain compe-titors. Also it is a very difficult and wearying task to inspace minutely a number of designs task to inspect minutely a number of designs for a complex building; so much so, that it is very questionable whether the architect takes

that trouble, generally fixing in a very super-ficial manner on a few which most accord with his own ideas on the subject, and totally neglecting the others. This appears to be the instances in which the designs were sent in on Saturday and the result known on the Tuesday following! a length of time in which the designs could not all have received minute attention. Again, it is impossible for an umpire, however experienced, fully to comprehend the peculiar difficulties the site or plan may suggest; and, lastly, the opportunity for that hydra headed monster-jobbing-still remains. The before-mentioned objections, it will at

once be seen, would not exist under the pro-posed system. The competitors being of all all persons most intimately acquainted with the suggest, would ensure a correct decision ; their number would neutralize any peculiar prejudices, and would most effectually preclude

"T" cannot see why I can object to writing the name and address on the plans, and is further strengthened in his opinion by your own approval of the practice. Leaving the suspi-cion in the case I instanced, entirely out of the question, to be brief, I object to it for two reasons: the first of which is, that a person observing the name of any talented or popular architect written on a design would naturally regard those plans with more than ordinary attention, which would frequently operate fatally against the claims of one perhaps equally great, minus the reputation; and the second, that by having the names of the com-petitors publicly before him, an unpire could with the mantet are called with the greatest ease satisfy his revenge on any particular one,—and thus, by a wrong use of power, more effectually suppress talent than or power, more effectually suppress talent than even the—often unwitting—blunders of an un-professional committee. I admit that in many cases (where the architect is privately chosen beforehand) it is perfectly immaterial whether the names are written on the plans or not; yet at the same time it must be allowed that these objections do not exist when a private mark is used. I therefore decidedly object to the practice; in no instance will it prevent jobbing, while it frequently opens the door for the admission of evils far more flagrant and dishonest.

I have only to express a wish that architects generally will follow the example of your correspondent "R," inserted a few weeks back respondent "I," inserted a few weeks back, and expose every competition the result of which is not perfectly just and satisfactory; and not only object by their pens to the whole system, but practically prove their appreciation of the insult offered by the paltry one premium of ten guineas! of ten guineas !

It has been objected by some to this, that if an architect refuses to send in designs to ordinary competitions, the only means for pro-motion in the profession at once vanishes. To those who argue thus, I would merely hint at those who argue thus, I would merely hint at the inconsistence of crying down "the present system" at every opportunity that offers, at the same time they form the principal practical supporters of it, recommending them to study a treatise on "Probabilities," and carefully to note down the number of competitions they have here anormal in as well as the momentum have been engaged in, as well as the necessary expenses (exclusive of their time) incurred; and if the amount of current coin of the realm paid in hard cash does not twenty-fold exceed the amount of premiums received or comunission arising from that source, I shall have the only alternative of considering that mr-chitect a far greater rogue than an artist. To conclude this portion of my letter, I would mention, that the only ill-wish I wish towards "T" is that he may near find himself at for-"T" is, that he may never find himself at fault when he places so much reliance on the im-partiality of an architect.

In your note to my last letter, you very plainly charge me with ignorance of the laws of architectural optics: now, to use a very expressive, but withal, perhaps rather vulgar proverb, "You have hold of the bull by the horns, and I by the tail." I contend only that flutes to columns give them a richer and more delicate appearance than when otherwise, thus removing the bare appearance an un-fluted column in certain positions has. The question is not whether a fluted column appears thicker than when unfluted? What is heaviness and bareness, but mis-placed solidity and simplicity? That I do not

stand quite alone in my opinion is evident; for if you turn to page 385, vol. ii. of THE BUILDER, you will perceive that your corre-spondent, "G.R.F.," quotes Mr. Hosking and another authority in support of the views I hold on the subject hold on the subject.

To these of your readers who are in the habit of perusing the pages of a certain journal, it will be remembered that some remarks have been made by a writer on the propriety or correctness of a comparison made by me in a former letter, between the windows of the Royal Exchange and picture-frames, and who is pleased to attribute the "questionable" comparison, to the " lively sallies of a funny imagination which some endeavour to palm upon us for knock down argument." What precise meaning the writer attaches to the term "kmock down argument" I am ather at a loss to imagine; I would intimate, however, that I neither had the intention of knocking down the windows of the Exchange, nor to commit a breach of the peace on the persons of those who might differ from me. Is the writer serious, when he tells us, that if dressings similar to those of the windows of the E change were to surround a picture, they would still be termed window-dressings? Or supposing the same kind were to surround or ornament a niche, will be contend that they would still be called window dressings? The writer still be called *winkow* dressings r is be writer very evidently, in attempting to prove too much, has over-abot the mark; and I have no doubt that the generality of your readers rightly judged, that the comparison was never intended to be translated literally---to the very letter-but, for the especial benefit of the writer, and I am sorry his dulness of comprehension should require it. I would state, that the beaviness and grossness in detail—the overcharged ornsment-fully merit the comparison I made, if only for exaggeration and triviality. Though I cannot return the compliment to the writer that he has paid me, that of using the writer that he has paid me, that of using knock down argument, he despatches the windows of the Exchange in such a strain as the following:....",Compared with the frigid things just alluded to," meaning the ordinary samples of window-dressings, "the windows of the Exchange are what the luxuriant vegetation of the tropical climes is to the eternal tation of the polar regions. They bespeak ful-ness and spontaneity of ideas, gusto and con amore relish with pains taking - no, there we are wrong, not pains taking, but pleasure-taking excretates in the task." I am in doubt whether the luxuriance of imagination ought to be attributed most to the architect or writer. It is a great pity that the fulness of the architect's ideas were spent solely on the upstairs' win-dows; it is thought by persons possessed of very little luxuriance of imagination, that the shopo-cracy would have been benefited by a share, and if a little more "pleasure-taking earnest-ness" had been expended on them, the building would have been improved ; at the present time they look any thing but pleasing when compared with the vegetation above.

I would merely add, that the Exchange as a whole presents not a single trace of genuine artistic feeling. If the purpose of architecture is to produce emotions of the sublime, the distribution of the mass is the aim of the mastermind. Detail alone can never produce grandeur; and it speaks not a little for the in-trinsic merit of the Exchange that critics have generally been silent on the main point-con-faing their attention chiefly to the windows

and sculpture. It is this harmonious and effective distribution of masses, that has raised Barry to the proud emineace he deservedly occupies; at the same time it must be allowed be studies elegance of detail. What an opportunity was lost for *effect* in the view, from the quadrangle of the Exchange, of the tower, and what a positive blemish it is under the present aspect. Critics have now got into the babit of each

Critics have now got into a habit of continually harping upon originality; in my opinion, it would be better were they first to point out the distinction between originality and caprice, and to fix the line of demarca-tion between them. Originality has taken the place of simplicity. A few years back the cry was simplicity; now the public want some-thing new, and this has been changed for originality. I admit, however, that architects have been far more inclined to copy than to stady. study

I fear these remarks will not possess much

interest to some of your readers; there are many, however, who will no doubt expect some kind of explanation. Not daring at the present time to trespass further on your valuable space, I beg leave still to sign myself, though many may be inclined to argue my right to the name of,

London, Jan. 14, 1845. SCRUTATOR.

[Relative to the first part of "Scrutator's" letter we are glad to say that our experience of mankind in general, and of architects in particular, leads us to entertain a very different opinion from his. In recent cases where ar-chitects have been called in to make the selection, the result has been entirely satisfactory.-BD.]

VERBAL CONTRACTS.

Sin,-A country builder has made his own plans and specifications for some baildings he has erected, with which his employer, now they are finished, is not satisfied, although the plans were deviated from to suit his wishes, and additions made. There was a vorbal agreement that they were to be erected for a certain sum, which his employer now says is too much money, yet he will not agree to let a surveyor value the same, but says he will keep half the sum so agreed for, for twelve months, as also the amount of the extra work. I wish you would inform me in your next which is the best and most expeditious way of settling such an unpleasant affair, and you will oblige yours, Jan. 28, 1845. X. Y. Z.

[Place the matter in the hands of a respectable solicitor .- ED.]

COMPETITION

Sir,—In October last, I advertised for de-signs for laying out a plot of ground adspted for building in this borough, and in consequence of such advertisement an anonymous correspondent copied and sent me a letter, signed "Scrutator," which had appeared in your journal of the 31st of August last, recommending the adoption of a new mode of decision on the merits of the designs, by making the competing architects the judges.

There appeared to me to be so much of good sense as well as justice to those who were wil-ling to compete and have their merit tested by so many competent judges, by the adoption of this mode, that I at once determined to try the experiment, and I have the pleasure to tell you that I am well satisfied with the result.

I had upwards of forty designs sent to me,

-We understand that the di-MB. TITE .rectors of the Havre and Rouen Railway have appointed Mr. Tite (the architect of the Royal Exchange) to superintend the erection of the Havre station, and that many of the other stations on the same line have been built under his direction.

THE ELUCTRIC TELEGRAPH from London to Portsmouth, by the South-Western Reilway, is just completed. On Saturday last it heped its first sentence. A shareholder at Nine Elms asked the keeper at Portsmouth — "Hew's the wind ?" He was answered on the instant,—"South by west!"

MISTAKES IN ESTIMATES.

SIR.-As I am referred to in Mr. Sugden's letter of last week respecting the quantities of Herne Hill Church, I shall feel obliged if you will insert the following statement relative thereto. At the time the drawings and specifications were open for the inspection of the builders, Mr. Alexander, the architect, was out of town, and I went to his office for the purpose of taking the quantities for some clients of mine. I commenced doing so, and took off the bricklayer's and slater's works only. On my return, the following day, Mr. A. had arrived, when I told him it was impossible to have the when I told him it was impossible to nave me estimates delivered at the time stated in the advertisement, and wished him to postpone it for a week; with this request he said he could not comply, but stated, he had himself taken out the quantities, and they were correct. Of course I communicated this to my employers, and they agreed to accept the quantities taken out by Mr. A. I then made copies of them for the several parties, but I never took a single dimension except for the bricklayer's and slater's works. I am not able to state whether Mr. Sugden is correct as to the deficiency of stone, but he is as to the scantling of the buttresses. There were other builders who tendered for the church beside those for whom I was concerned, and they adopted the same course, viz., copied Mr. A.'s quantities. I have only to add, that I was not paid for taking the quantities, but i was not paid to: the copies. I am, &c. W. M. BROONFIELD.

118, Waterloo Road, Lambeth, Jan. 27, 1845.

and many of them displayed very considerable talent, and I confess, that on opening them, it appeared to me that so many were nearly equally balanced in point of merit, that it must be indeed difficult for one or two judges to arrive at a correct decision ; and the result of the votes has fully confirmed me in this opinion.

With a view of shewing this, and also of satisfying the competitors who attended to give their votes, that such votes have been correctly recorded. I beg to send you the motios to those designs which obtained votes, with the names of the competitors who voted for each, that you may, if you think proper, publish this in your next journal.— I am, Sir, your most obedient servant,

J. J. BLENDY.

Miscellanea.

A PRIMITIVE DWRLLING PLACE .--- In the A PRIMITIVE DWRLLING PLACE.—In the township of Westhope, about eight miles from Ludlow, there is a man named Edward Howells, supposed to be about fifty years of age, who, for the last sixteen years, has had no other dwelling place than a hole or small cave scooped out of the rock; there is neither door por any other coverning attached to it has nor any other convenience attached to it; he has not even a stool to sit upon; in fact, all this cave contains is a little moss and straw. Perhaps the most remarkable circumstance attending this eccentric being is, that every night, when he retires to his lair, he regularly undresses himself, as though about to enter ever so comfortable a bed. Howells is con-sidered perfectly honest and inoffensive-be never begs, but stands daily a short distance from some farm-house gate, and thankfully receives whatever broken victuals. &c., may be compassionately given him. No one can ascer-tain his parish, or from whence he originally came.— Ten Towns Messenger.

NEW CHUBCH IN CAMDEN TOWN .--- The newspapers state that it is intended to erect a new church in the Camden Town district of St. Pancras, the population of which is 16,000, with church accommodation for only 1,600. For this purpose a plot of ground has been given, free of all costs, by the Marquis of Camden and the Rev. Thomas Randolph. In addition to this gift, the Marquis has subscribed 500% towards the erection of the church, and the Rev. Thomas Randolph a like sum. Amongst the other contributors are the Rev. Dr. Moore, vicar of St. Pancras; Lord Calthorpe, Captain Theaker, the Rev. Mr. Lang-dale, Colonel Moore, &c. The Bishop of London has signified his approval of the place, and the works will be commenced as soon as the necessary arrangements can be made.

STATISTICS OF THE TIMBER TRADE OF CANADA FOR 1844. — We learn from the Annual Circular of Messrs. Forsyth and Bell that there has been a great increase in our consumption of Canadian timber during the last year. By the supervisor's return, the quantity re-ceived at Liverpool, is as follows :--White ceived at Liverpool, is as follows:--White pine, 12,150,964 feet; red pine, 4,164,317 feet; oak, 709,540 feet; elm, 660,964 feet; ash, 128,458 feet; birch, 73,142 feet; maple, 821 feet; butternut, 3,040 feet; basswood, 7,919 feet; tamarack, 19,925 feet; round maple, 255 feet; hemlock, 1,001 feet; poplar, 45 feet; walnut, 3,489 feet. Taking into con-sideration a small quantity of timber, wintering over last year without being measured and over last year without being measured, and which of course is not included in the above return, our exports of square timber and that used in our shipyards will not vary much from the following :- White pine, 11,950,438 feet; red pine, 4,669,149 feet; oak, 1,213,110 feet; elm, 1,208,988 feet; ash, 122,346 feet; birch, 61,309 feet. The returns of deals and staves are not yet made up in the supervisor's office, but will be hereafter reported. The number of arrivals for the last four seasons have been as follows: --1844, 1,214 vessels, 458,971 tons; 1843, 1,185 vessels, 429,741 tons; 1842, 863 vessels, 307,448 tons.

STOCK OF LUMBER IN THE PORT OF QUEBEC, DECEMBER 1, 1844, WITH A COMPARATIVE STATEMENT FOR THE LAST FIVE YEARS.

| | Oak Timber. | Elm Timber. | Ash Timber. | Birch Tim- ber. | | Bed Pine Timber. |
|--------------|----------------|----------------|----------------|-----------------------|-----------|------------------------|
| 1844 | 857,721 | 559,840 | | | | 2,969,668 |

Note.-The above includes shippable and unshippable lumber.

THE KING OF THE FRENCH .- The King of the French has given the sum of 201. towards the funds of the new Roman Catholic Church now erecting in Lambeth.

FRESCO PAINTING .- We are sorry to hear that the experiments in fresco-painting recently made in the summer-house at Buckingham Palace have, with one exception, proved failures, owing to the artist's want of ex-perience in the manipulative treatment of this style of painting. We have much yet to learn and to do before we can decorate our Houses of Parliament on the scale proposed.—Poly-technic Review.—[We must inquire into this. —ED.]

NEW EXPLANATION OF A BOILER EX-PLOSION .- Dr. Lardner having been appointed to investigate the cause of the explosion of a locomotive-engine on a railway in Pennsyl-vania, by which several lives were lost, has re-ferred its cause to lightning, which, "passing on the boiler, raised some part of it to a high temperature; that the water taking up the heat was rapidly evaporated, as it would have been by contact with highly-heated or incandescent metal; that steam of great volume and very extreme pressure being thus suddenly produced, the boiler yielded to the force, and the catas-trophe took place."-Mining Journal.

INSTITUTION OF CIVIL ENGINEERS.-We announced last week the re-election of Mr, -We Walker to the presidency of this institution, and at the same time stated that a change had been contemplated. It appears that, in accord-ance with a feeling very generally entertained in the council, that the office of president should not be held in perpetuity by any one gentleman, Mr. Walker declined to act, and Sir John Rennie has been unanimously elected in his stead.

CONVERSAZIONE AT SOCIETY OF ARTS .-The vice-presidents of this institution issued 800 or 1,000 cards for Tuesday evening last, and, in consequence, received a very numerous party. Drawings, bronzes, models, music, and conversation, formed the staple of a very pleasant evening, and kept many there till midnight. We are glad to find that this old and most valuable society is now again firmly established, and will continue its course of usefulness. Much praise is due to Mr. Wishaw, the secretary, for the zeal and energy he displays in his office

NOTICES OF CONTRACTS.

For the formation of 4 Miles 564 Chains (single For the formation of 4 Miles 305 Chains (single line) of the Ashton, Stalybridge, and Liverpool Junction Bailway,—John Jellecorse, Secretary of the Manchester and Leeds Railway Company, Palatine Buildings, Hunt's Bank, Manchester. February S.

For the works required in erecting certain Farm

For the works required in erecting certain rarm Buildings at Badley Hall, Essex, and for alterations and additions to the dwelling-house.—Mr. George Sergeant, 27, Queen-street, Colchester; or Mr. John Eagle, Badley Hall. February 3. For the erection of a Bridge, called White Bridge, at Grasmere, near Ambleside, Westmore-land. — Mr. George Bobinson, Bridge Surveyor, Kendal; or Mr. Daniel Donaldson, Ambleside. February 4. February 4.

For the construction of the several Stations and other Buildings on the York and Scarborough Railway.--Mr. Andrews, Architect, York; or Mr. George Baker, Secretary, Railway Office, York. February 5.

For the erection of a Steam Boat Pier at the Quay on the north-east side of Blackfriars' Bridge,

also for building a Decked Lighter or Dumby.-Town Clerk's Office, Guildhall. February 6. For one Pleasure Carriage, four Milk Trucks, and fifty Box Waggons, with drawing and buffer springs, for the Manchester and Birmingham Rail-Way.- Mr. John Latham, Secretary, London-road, Manchester. February 6.

For erecting and completing the Lower Sluice and Sluice-Pit at the top of the Eau, Brink Cut, about 4 miles above Lynn. — Measrs. Walker and Barges, 23, Great George-street, Westminster; or Mr. George Game Day, Clerk to the Middle Level Drainage Commissioners, St. Ives. February 10. For the erection of New Buildings in Pembroke

College, Oxford. — Plans, &c., prepared by Mr. Haywood, Architect, may be seen at the Master's House. February 11.

House. February 11.
 For the erection of two Fever Wards in the workhouse at Slough.—C. P. Barrett, Clerk of the Union, Eton. February 11.
 For the erection of a Cast-iron Tank, 52 feet dia-

For the erection of a Cast-iron Tank, 52 feet dia-meter and 16 feet deep; and for a double or Teles-copic Gasholder, to work in the same. Also for a double or Telescopic Gasholder, 70 feet diameter, to work in a tank 18 fest deep.—Mr. John Rofe, Engineer, Gas Works, Preston. February 12. For a supply of Railway Fastenings for the Great Southern and Western Railway, Ireland.— Mr. William Taylor, Secretary, 3, College-green, Dublin. February 17. For the Mason's and Pavior's Works, supply of Guerneey Granit Chinnings and Yorkshire Paving.

For the Mason's and Pavior's Works, supply of Guernsey Granite Chippings and Yorkshire Paving, for one Year, from the 25th of March next, for the parish of St. George, Hanover-square. Mr. R. Lees, Clerk to the Paving Committee. March 4. For the supply of 11,000 feet of nine-inch cast-iron Pipes for a new line of Aqueduct to be laid in the Island of Malta.—Vin. Casolani, Collector of

Land Revenue, Office of Land Revenue and Public Works, Valletta, Malta. March 31.

COMPETITION.

Plans and estimates are required for a Workhouse, to contain about 1,180 persons. The whole to be done in a plain and substantial manner, without any expensive embellishments. The plans and out any expensive embellishments. The plans and architects' estimates to be sent to Robert Mercer, the Clerk of the Clifton Union, Pennywell Road, Bristol, on or before the 17th of February next, and the Board of Guardians will adjudicate on the 28th. The architect producing the best plan in the estima-tion of the Board will be employed at a sum not exceeding 5 per cent. on the outlay, and a gratuity of 25 guineas will be given to the architect produc-ing the second best plan in the opinion of the Board.

APPROACHING SALE OF WOOD, &c.

BY AUCTION. February 25.—At the King's Arms Inn, Hemel February 25.—At the King's Arms Inn, Hemel Hempstead; a large Fall of capital Oak, Ash, Elm, and Beech Timber Trees, the greater portion of which are of very large dimensions and superior quality.—Mr. James Adams, auctioneer, Clarence-street, Staines, Middlesex.

ADVERTISEMENTS.

A NASTATIC PRINTING.—THE ART UNION, Part 77, published this day. contains Speci-mens of Letterpress, Woodcuts, and Drawings printed by this process—a process which threatens to completely revo-lutionize Literature and Art. The letter-press consists of a minute description of the manner in which the process is effected; the woodcuts are of various dates; and the drawings have been executed on purpose for publication in these pages. The examples supply indubitable evidence that a new power has been obtained which must inevitably lead to wonderful results. results. Published by Chapman and Hall, 186, Strand.

DR. GUYS TRANSPARENT DISPERSING VENTILATOR. THIS invention combines cheapness, trans-parency, and ornament, with the complete presention of DRAUGHT, and may be used in the Bed-rooms of the most delicate invalid at all times and in all seasons with perfect safety. Sole Manufacturers, COTTAM and HAL-LEN, 2, Winsley-street, London-Estimates furnished for the Ventilage and Warming of Hospitals, Schools, Churches, and all Public Buildings.

SATURDAY, FEBRUARY 8, 1845.

R O M the large number of letters that we continue to receive on the subject of the Metropolitan Buildings Act, and the eagerness with which all we say on

it is canvassed, we find it necessary to return to that subject. As might have been expected, opinions differ as to the precise meaning to be attached to certain parts of the Act, and there seems to be this difficulty, that doubts cannot be resolved without expense. The point most discussed at the present moment, is the meaning of the word "commenced." We inserted two letters upon it in the last number of the journal, and have received many more since, the writers of which insist, that if an intention to build has been operatively demonstrated before the time specified in the Act, the building is commenced, and does not come under the control of the district surveyor. The following, which is signed "An Old Surveyor," may serve as an exponent of those who, regarding the word in its widest sense, hold this opinion :-

"Sin,-Above all controversies of the present day, disturbing the metropolitan building community, the most vexatious and absurd is the present unnecessary discussion upon the construction of a word which of all others is perhaps the least susceptible of quibble or evasion. Can any ambiguity attach to the term 'commenced before,' in contradiction to the term 'commenced after,' a certain date? Are they not the most comprehensive and definitive terms that can be employed to describe two opposite conditions? And these words, be it remembered, are employed in 'the con-struction of terms used' in the above Act to define these two opposite conditions. Nevertheless, upon these words a very absurd dis-putation has been raised by parties desirous of opposing the operations of builders; and some of the district surveyors have been called upon to assume the power of giving these words weight and force, or of divesting them thereof, according to the locality in which such build-ings are 'commenced before 1st January, ings are 1845;' th thus requiring a construction to suit the interest or inclination of persons who call for the interference of those gentlemen. But what is more strange and unaccountable is that this extra-official duty has been regarded by some of the old-fashioned district surveyors a proper point for dispute, and consequently 24 for heaping additional labours unnecessarily on the official referces appointed by the new Act. "In order to avoid the delays and uncer-

taioties attendant on all new systems before they are thoroughly understood, many persons desirous of proceeding with their building, had commenced before the 1st January, 1845,' secording to the provisions of the Act under such circumstances; but, in some cases, im-pediments having arisen to prevent the entire footings of *some part* of their building being laid down before the lst January (though perhaps ten times more brick-work had, in realize been built then would have been done reality, been built than would have been done the whole of the footings inclosing area of the proposed building been had the completed), yet, notwithstanding such a sub-stantial demonstration of a building being in progress, so that he who runs may see that a building is 'commenced,' some of the surveyors have been pleased to cause the suspension of such buildings, and thus to set at nought the intention of the Act of Parliament, the terms whereof are so definitively settled by 'the construction of terms and expressions used in which construction is evidently the Act:' intended to reacue from all interested feelings whatever both the time and property of builders,

i.

who might otherwise have been exposed to the mercy or caprice of any party."

Another correspondent writes, "It is a settled axiom that words employed in the construction of terms used in any Act to define the intention and meaning of such terms, are always to be read in the most comprehensive and general signification, as all Acts of Parliament are intended to be understood by those whom they purport to regulate, and not to become clap-traps for any body. This is more particlap-traps for any body. cularly the case in all penal statutes, which the Buildings Act, sec. 18, most unquestionably is, and no person has power to put any other construction on the terms of any Act contrary to or differing from the construction of terms forming part of such Act, and in no case are the words used to construe the terms of any Act, to be subject to any variation of reading or to any construction whatever, other than the general and universal sense and bearing of the words employed to construe the terms of such Act.

"In proof of the position here taken, you will observe that the terms used to describe the reverse of 'already built,' namely, 'hereafter to be built' are to apply to all Buildings to be built or commenced after,' &c.; consequently, whatever is 'commenced' in any way 'before,' cannot be left to share the fate with those Buildings which are 'to be commenced after,' &c.; there really is no ambiguity about it.

"The more these words are looked at, the more comprehensive and absolute they become in the eyes of, Sir, your obedient servant, "SENEX."

Now, the referees have given as their general opinion that "the erection of the footings, with two or more courses of the walls themselves, built in a workmanlike manner," is a *bond fide* commencement.* Having regard to their judicial capacity, however, they consider it necessary that each case should be judged of under its particular circumstances; and it is much to be desired that a certain number of cases should at once be submitted to them and decided, by the result of which district surveyors and the public might be guided.

Shooting a load of bats on the proposed site of a building, or digging a few trenches, or even laying a few bricks, cannot surely constitute the commencement required by the Act; yet either of these is an "operative building demonstration," said by our correspondent, "Consiliarius," last week, to be all that is necessary to avoid the control of the surveyor. A hod of mortar made up, and a couple of bricks laid, might be termed so with equal truth, and called the commencement of a church, a theatre, a villa, or a union workhouse, yet no one would venture to assert that this was sufficient.

Something more is required, then, than an "operative building demonstration" to constitute the commencement required by the Act, and the question is, how much? The answer really seems obvious; THE FIRST COMPLETE STEP MUST BE TAKEN; we must be able to see that a *house* is commenced, not merely that a wall is built: and this is the view we have little doubt that the official referees take of the matter.

In many cases where builders have exemption, we do not hesitate to say, they would do wisely were they to throw it up, and proceed under the Act, rather than complete structures badly begun. Buyers will be found more easily for houses constructed under its provisions, than for those which have been built in evasion of them. Knowing human nature, however, we hardly hope to persuade many to adopt this course.

We mentioned at the commencement that the construction to be put on doubtful points in the Act could not be decided without expense.

* See letter on this point from Mr. Greenway Robins.

This is unquestionably an evil, and will tend to prevent the due administration of the law. In the first instance the official referees were willing to answer generally such questions as were put to them by the surveyors, but having regard to their judicial capacity, before alluded to, and knowing that these general replies might act injuriously, they asserted the necessity of hearing in each case the parties whose rights might be affected, before deciding; so that, if we are correct, in order to obtain a decision on any point, the surveyor must run the risk of having the costs of the inquiry to pay out of his own pocket. This, when the Act is understood, and the exact meaning of its various clauses has become established, may work satisfactorily; but it does not seem to do so at the present moment. An intermediate party appears to be required, and perhaps the best step the district surveyors could take under the circumstances would be the appointment of some person to act in all cases on their behalf, who might acquire the views of the official referees, and so save much trouble and expense.

Before leaving the subject, we would contradict a statement which has appeared in some of the newspapers to the effect that numerous families have been already ejected, under the provisions of the Buildings Act, from cellars and under-ground rooms not constructed in accordance with its provisions. The Act does not operate in this respect till the lst of July, 1846.

ARCHITECTURE FOR THE POOR. BY GEORGE GODWIN, F.R.S.

PUBLIC attention is at last aroused to the necessity of inquiring into and alleviating the condition of the poor, and men of all classes and in all counties are *talking* of improving the dwellings of the labouring classes and in-creasing their enjoyments. Whether or not they will do more than talk remains to be seen, for at present there is little of the "positive" to be appealed to as the result of the movement. Certain, however, it is that so much on the subject has never been said continuously before, nor so extensive a machinery organized to effect it. There is a society for improving the condition of the labouring classes, there is a metropolitan association for improving the dwellings of the industrious classes, a proposal to open public nurseries for their children, an association for promoting the health of towns, country labourers' improve-ment societies, and committees for obtaining baths and wash-houses, parks and public gardens. Her Majesty the Queen calls on Parliament to promote the comfort of the poorer classes : all the newspapers are advocating the same noble cause; every landowner who expresses sentiments in favour of such improvements may rely on having his speech quoted, and every chairman of a committee whose report contains allusions to the dreadful state of the hovels occupied by the agricultural labourers, or the cellars and garrets crowded with the families of operatives in great towns, is certain of public sympathy and public applause. Let us look at the cottages about us, and see how we can repair them, and make them comfortable at little expense," said his Grace of Norfolk at the late Arundel Christmas Show. " Let us make their cold cottages warmer than they are; let us look to their windows and their doors, and see if they keep out this des-perate cold wind that is blowing, and even if we do no more, we shall add to their comforts. Put the poor man's cottage in order, and as quickly as you can, and he will bless you, and we shall all be united together; and the more we are united, the stronger we shall be, and the more able to meet our difficulties." And

* "The health of the inhabitants of large towns and populous districts in this part of the United Kinedom has been the subject of recent inquiry before a Commission, the Report of which shall be immediately laid before you. "It will be highly gratifying to me if the information and suggestions contained in that Report shall enable you to devise the means of promoting the health and confort of the poorer classes of my subjects."—Queen's Speech, Feb. 4th.

^approving crowds repeated, and still repeat, ' put the poor man's cottage in order.' That it needs to be put in order all admit. What Sir Henry Bunbury said in his recent report to the Labourers' Improvement Society of one county will apply to the others :-- " Under the head of cottages the reports are in general painful. In a few parishes, where opulent landowners are resident, the cottages are re-presented to be good. But, speaking of the great majority, it appears that there are few parishes in which the cottages are even sufficient in number; and generally they are stated to be small, crowded, in bad repair, ill drained, and unfit for the decent accommodation of the families which inhabit them. Those which are the property of landowners appear to be the best; but almost everywhere, speculators have acquired small patches of land on which they have built what our ancestors called solly cottages,' with little or nothing in the thev shape of a garden attached to them; and these they let at rents which are ruinous to the labourers."

And then again,—" the reports on cottages exhibit generally the melancholy picture of a population ill-lodged, exposed to influences which engender diseases, and crowded to a degree which is not only likely to produce filthy habits, but gross indecency and vice. But this unhappily is a branch of our inquiries on which we are nearly powerless. All that we can do is to endeavour to open the eyes of landowners as to the insufficiency of the dwellings intended for the labourers on their estates, and the evil effects, both physical and moral, which result from the want of decent and wholesome accommodation. At the same time we may draw attention to the injurious consequences which spring from speculation in cottage building. The heavy rents exacted by these griping speculators contribute largely to depress the condition of the labourers, who are left without an option, if the owners of estates neglect to provide sufficient dwellings for the families of those by whom their estates are to be cultivated."

All that he said has been known long and long ago, through sanatary reports, which present an account of distress, disease, and demoralization, resulting from inattention to the dwellings of the poor, that cannot be contemplated without horror; but the wealthier part of society were not then so alive to its importance as they are now, and therefore it excited less attention. A kindlier feeling than was formerly exhibited towards the poor is springing up in the hearts of their superiors, and all classes will unquestionably benefit by the exercise of it.

Feeling and saving, however, are not enough, there must be *doing*, efficient doing; and it is to be hoped that the willingness which exists, and the large sums of money that in various shapes have been subscribed, will be applied in the best manner.

The importance of providing healthful and well-arranged dwellings can hardly be over-estimated. As the writer observed some years estimated. ago, when urging the same point :--- " Order will not engender disorder, nor disorder, order: but its like; and the man who passes his time amidst inconvenient and tasteless arrangements, exposed to continual discom-forts, and utterly unable to maintain an appearance of respectability, will gradually lose any desire to do so which he formerly felt, and find the external disorder result in a moral disorganization, lamentable in its conse-quences, if not fatal. 'Slaves, through alavery, lose even the desire to be free :' so men, be coming accustomed to badly-constructed, inconvenient, and ill-arranged habitations, lose their perception of excellence and goodness; and are lowered, not morely in their physical state, but mentally. Watch the progress of many a respectable and industrious young couple, placed in one of the miserable hovels dignified with the title of a labourer's still residence in some parts of the kingdom — damp, ill-drained, ill-ventilated, pervious to the rain, and void of every thing which could make and void of every thing which could make home happy. For a time, strenuous efforts are used to remedy the evils; but, as they are gradually found to be unconquerable, the wife, abandoning the task, becomes inevitably a slattern herself; habits even of decency are diregarded by the children ; and the husband, finding no enjoyment in his own house, seeks it in the beershop, and becomes a drunkard

and a desperado. On the other hand—a tidy, well-arranged dwelling leads to observances of better manners and feelings of self-respect, induces neatness and industry, and elevates in tone the character of all its occupants."

BUILDER.

THE

In all cases perfect ventilation is of the first importance. The deadly effects of breathing an impure medium would seem to be too generally admitted to require observation, and one would expect to find in all new dwellings the best arrangements for obtaining a free current of pure air. Unfortunately, ignorance and cupidity still operate to prevent this. At Liverpool lately, the writer observed with regret in one district more than a dozen narrow courts in progress, *closed at one end*, and lined with ill-ventilated houses; and took occasion publicly to point out the evils of such an arrangement in the strongest language he could command. The policy which prompts it is as short-sighted as it is unchristianlike. A fever, when generated, is no respecter of persons; and the landowner far removed from the immediate seat of contagion, might none the less surely fall one of its victims. The injurious effects of closed courts have been proved by numerous competent parties, and the new Buildings Act very properly forbids the erection of such within its limits. How distressing it is, then, to find that the first houses built by the "Society for Improving the Condition of the Labouring Classes," model-houses to be recommended for adoption, are actually made to form a court closed at one end, and less than 23 feet wide !* It is dif-ficult to guess what could have led the committee into this unfortunate mistake, which is a practical contradiction of what many of its members have often urged, and will probably prevent for several years to come, the abandon-ment of this most defective and injurious mode of laying out ground in localities not within the control of the Act. It is seriously to be desired that the committee may be induced to modify their present plan, and so avoid the reproach which the consummation of it would unquestionably bring to them.

At the present moment houses for the lower classes are especially needed in the metropolis. The recent formation of new streets has driven out hundreds of poor families without furnishing another place of retreat; and, by the operation of the Buildings Act, still greater numbers of persons will be ejected next year from kitchens and cellars (damp, unwholesome holes) not constructed in accordance with its provisions. Now is the time, therefore, to provide them with well ventilated, substantial, and healthful dwellings, and to teach them the importance of cleanliness, and the value of order.

ELECTION OF SURVEYOR TO THE HORN-SEY DISTRICT IN THE ROOM OF THE LATE ALFRED BARTHOLOMEW, ESQ. (January 30th, 1845.) No. of Votes.

PURCHASE OF THE FLEET PRISON .- A report from the City Lands Committee on the subject of the reference made to them to open a communication with the Commissioners of Woods and Forests to ascertain upon what terms the Fleet Prison could be purchased, has recently been presented to the Court of Com-mon Council. The report states that the committee had offered 23,000%, but that the Committee had onered 25,0007., but that the con-missioners of Woods and Forests had declined to accept less than 25,0007., the sum at which the property had been valued by three eminent surveyors. The commissioners had given the corporation an option of making the purchase at that sum until the 28th ultimo, and the committee, by their report, unanimously recommended that the purchase should be effected. Mr. Dixon, in moving the Court to agree with the committee in their report, bore testimony to the courteous manner in which the deputation had been received by the Earl of Lincoln, who came to town expressly to meet them. The motion was agreed to.

• In the Bagnigge Wells-road, as already pointed out in this journal. See p. 1 of present volume.

EVERY school-boy knows that heat expands bodies. A rod of metal made to fit an opening when cold, will not enter the opening if it be heated; and a glass vessel cracks if hot water be poured into it, because, as all are aware, the portion in contact with the heated fluid is expanded, while the other parts remain at rest. This property of heat was made available years ago in forcing upright the walls of a gallery which leaned outwards at the top. Bars of metal were passed across the gallery through the two walls, and were secured outside by a plate screwed on to each end of the bar tightly against the wall. The bars were then heated, and, being expanded by the operation, protruded slightly through the walls, and allowed of the plates being screwed farther on, the effect of which of course was that when the bars, being cooled, collapsed, the walls were drawn together, and by repetitions of the operation were ultimately made perfectly upright. The force exerted is immense.

All this we say is well known, and opportunities occur every day to observe the effect of heat on such substances as are here alluded to. Some bodies, however, expand much less than others, and the effect can seldom be observed, and *alumina*, or argillaceous earth, is an exception to the general rule, and *contracts* when heated. Brickwork it would seem is nevertheless expanded by heat, and it is to an instance where the expansion is to be seen and can be measured, that we direct the attention of our readers.

At Mr. Thomas Cubitt's fine establishment at Thames Bank, mentioned in the last number of our journal, the chimney-shaft for the steamengine is constructed in a peculiar manner. The chimney, which is circular, 5 feet in clear diameter all the way up, and 105 feet high, is built of very thin brickwork; that is to say, it is 14 inches thick at the bottom, and 6 inches at the top, the bricks having been moulded for the purpose; and it stands in the centre of a tower, 17 feet square on the outside, formed of 14 inch walls all the way up with hoopiron bond in the centre of this bond is 15 feet from the ground; the other tiers are put closer together as they approach the top. Around the shaft, but in no case touching it, are stone steps leading to the top with landings at certain intervals.

The chief reason for adopting this mode of construction was, to obtain a more striking object for appearance' sake than a chimneyshaft, and Mr. Cubitt is of opinion that its ultimate cost will be less than that of the latter: it economises the fuel to a considerable extent, and, moreover, the shaft must have been formed much more expensively if there had been no tower around it.

Now this shaft, standing independent of the surrounding building with themeans of access to it at any part, afforded the most perfect facilities for ascertaining the effect of heat upon this height of brickwork, and an index having been set up on the topmost landing under cover, which is 80 feet from the ground, it is found that this length of shaft becomes $\frac{1}{2}$ the of an inch longer when the fire is lighted than it is when cold. The construction of this shaft offers facilities for several other interesting and important inquiries, which will doubtless be pursued by the excellent and able owner of it.

FALL OF A HOUSE IN WESTMINSTER.— On the 16th of last month, a house at the corner of Old Pye-street, Westminster, fell down, but fortunately without injuring any person. The occurrence having excited much comment, we thought it our duty to inquire into the occurrence. It seems that Mr. Howell, the district surveyor, having received intimation that the building was in a dangerous state, repaired to the spot, and finding that it was so, gave orders that it should be shored up, and then dispatched information to the official referees. Before any thing could be done, however, the house fell. It seems that Mr. Howell had overstepped his duty in ordering it to be shored up, but if he had not done so, lives might have been sacriticed.

MR. COCKERELL'S FOURTH LECTURE ON ARCHITECTURE.

THE professor commenced his lecture on Thursday, the 30th ult., by stating that he proposed on that occasion to make some proposed further observations on the subject of the last lecture, namely, the civil architecture of the ancients. He should treat of plans; concealment and intricacy, adopted with the view of increasing the effect of a structure; palaces; curvilinear fronts; architectural character; and the angle of vision; and terminate by exhi-biting, for the first time in this country, drawings of a temple at Xanthus discovered by the late expedition. To penetrate the merit of ancient works, and understand the principles on which they were formed, was the great business of the student: to establish these principles was the great business of the master. This was a difficult task, and could hardly be achieved: it was best done by discussion, examination, and comparison of opinions. A consciousness of delight from the examination of fine works was necessary before taste could be acquired: those persons who had not this consciousness never would acquire taste. Being delighted, we should at last be able to discover the cause of delight. One course was, to accept the dogma of the master blindly : advantage always resulted. A builder with whom he was acquainted once produced an exceedingly fine portico, so much so that the professor inquired of him how he had designed it. "Why," said the man, "I opened Sir William Chambers' book, and copied it exactly." If the job had been his, the professor's, he would have been led probably to do something of his own, or to have altered parts, and so have injured it. The builder, he felt, was the wiser. He once, when designing a portico of a church, had doubts as to two things taught him by Vitruvius, to place the main door to the building in the centre of it, and to use the attic base. He hesitated, but a friend shewing him a number of drawings from actual examples corroborating the doctrine, he followed Vitruvius, and never regretted. He again urged the necessity of implicit faith in the ster on the part of the student. To establish principles, numerous examples must be compared: this was the course also pursued by the lawyer and the historian. He then erew particular attention to Canina's work mentioned in the last lecture. It contained 500 plates, and presented the whole body of architecture recovered, and in many cases re-stored with wonderful erudition. We were able, by means of that work, to penetrate the principles which the ancients followed, and discover the secret of their success.

Relative to concealment; he said we found temples surrounded by a peribolus, the temple partly seen, and were struck by the effect only obtained. The Parthenon was partially concealed by the Propyleum and the walls. The best distance from which to view a building was one equal to about three times the height of the When we get within the inclosure, elevation. we find this best position. The imagination is excited by partial concealment. If, according to the modern practice, the building be stuck ostentatiously before us, we see at once the whole of it, and are tired before we approach. There is nothing to be imagined or discovered. This partial concealment, then, he considered of high importance. It prevailed in Gothic architecture equally. The introduction of the organ at the east end of the nave, sometimes complained of in our cathedrals was, he thought, advantageous to the effect.

Architecture regarded with these considerations is the fine art. The successful architect must be a painter. The most efficient masters of effect were scene-painters, for example, Vanburgh and Servandoni, who designed St. Sulpice, the most effective modern building in Paris. Perspective was much studied at the time of these masters, until indeed it became almost a vice. We must study it if we would produce effective buildings, or even if we wish to comprehend drawings of ancient buildings. No one could form an idea of the baths of Diocletian, for example, stretching out equal to the whole length of Pall Mall, or comprehend the effect of the magnificent *Exhedra*, which occur in the plan, 60 feet high, with a semi-dome, 84 feet in span, without this knowledge. Some idea of the effect produced by the vistas in this extraordinary pile may be

obtained at Greenwich Hospital, Chelsea Hospital, and Blenheim. An architect should endeavour to excite a succession of new ideas. It was expensive—a painter might do it more cheaply, but less permanently. Extraordinary merit was displayed at Blenheim in this respect.

It was condemnatory of a building to say, as you were obliged to say of St. Peter's in Rome, that it appeared smaller than it was; yet some had considered this a merit. He would as soon think of applauding a general for gaining a small victory with a large army, as of praising a building for such a reason. It was a great reproach to the architect.

The professor suid he always dwelt with pleasure on the plan of the baths then before them as one of the finest buildings ever erected for the public advantage. Our country was remarkable for its hospitals and places of refuge, but had neglected means of affording elevating gratification to the masses. A better spirit was manifesting itself, and he was delighted to hear of public gardens at Manchester, and elsewhere. By denying the poorer classes such luxuries, they had been led to throw themselves into grossness. We might hope to see gardens, statues, and fine works of art provided for the general gratification. Considering these signs of the times, we should devise plans for arranging such.

The professor then spoke at some length on the necessity for calculating the point of view in which buildings were seen. Vignola always repaired to the spot, and drew imaginary lines to arrive at the best position. He proceeded to speak of palaces, and described that of Augustus. The disposition of the plan was source of all character. Character for a the building was the most difficult thing to be obtained, and the most essential. Palladio studied it especially; no one could mistake the purpose of his buildings. George Dance had great merit in this respect. No one could mistake the purpose of the front of Newgate; and Guildhall, although any thing hut Gothic, was, nevertheless, evidently municipal. In Canina's work palaces were largely discussed. In decoration and magnificence they should stand next to temples; and it would be well if they were accessible to the people. Our French and German neighbours set us a good example. The palace of Augustus had a curvilinear front, a form which gives many varieties of light and shade. Bramante, Vignola, and Palladio employed it. In modern times it had been used with good effect at Bath. Speaking of the Adams', the professor said they were deservedly the first architects of their day; they drew their examples chiefly from Dioclesian's baths and Dioclesian's palace. Sion House and Lord Bute's were the best specimens of their skill.

He would now have the pleasure of exhibiting for the first time a restoration of a tomb at Xanthus, drawn by Mr. Hawkins. Whether Xanthus, drawn by Mr. Hawkins. considered historically or artistically, it must be regarded as a most interesting structure. It was a monument of the Lycians, of whose country Xanthus was the capital, and shewed a high state of civilization at a very early time. There was every reason to believe that it was erected in the year 546 before our æra, a century earlier than the Parthenon. The temple was not large, 52 feet by 30 feet, and consisted of an Ionic peristyle inclosing a cella, on a lofty basement. The frieze of the order occupied the place of frieze and architrave, and sculptured with four separate groups. The first represented a fight; the second, Greeks bearing offerings; the third, Persians bearing fruits; and the fourth, a wild-boar hunt. There was another frieze under the base of the columns sculptured to represent the capture of Between each of the columns at Xanthus. the sides of the temple was a female statue standing on emblems. The pediments were adorned with sculpture, and the roof covered with Parian tiles. It was interesting to find in this ancient building, 2,390 years old, the progenitor of the Erectheum, all the refinements of art. The intercolumniation, however, it was worth while noting was aræostyle ;• the more beautiful system of incolumniation, the euslyle, was not used till later, probably just before the time of Vitruvius. In the next lecture Mr. Cockerell will treat of interior arrangements.

* That is, the columns were placed widely asunder.

STONE ALTARS AND CREDENCE TABLES.

THE long pending case between the incumbent of the parish of the Holy Sepulchre, at Cambridge, and the Cambridge Camden Society, relative to the right of the latter, in the name of the churchwardens, to erect a stone altar and credence table] in the wellknown round church of that parish, was de-cided against the latter in the Arches' Court, by Sir Herbert Jenner Fust, on Friday, 31st of January. Under a faculty obtained in the names of the churchwardens "to repair the church, and, as to such parts thereof as had been rendered unsightly by injudicious repairs, to restore the same as near as may be according to the original design, and according to a design and plan deposited in the registry of the court," the stone altar and credence table were erected without the knowledge of the incum-bent. When aware of what had been done, he objected to allowing them to remain, and when a second faculty was applied for in the Consistorial Court to ratify the proceedings, he opposed it. The chancellor of that diocese, however, issued the faculty, and it was on an appeal against this that Sir Herbert J. Fust

delivered his sentence, and has reversed it. Relative to the altar he said, "It appears that this stone structure consists of a slab, supported by three upright slabs, all of stone, resting upon a lower slab, also of stone, and that the weight is about two tons; that the lower part is imbedded in mortar or concrete, about an inch below the floor of the chancel which is built up to the table, and covered with encaustic tiles; and that the table was also made to adhere to the east wall of the chancel. This structure, Mr. Faulkner contends, is a stone altar, or altar table, such as is erected and used with the credence table for idolatrons and heretical purposes in Popish countries; that the rubrics and canons require that the communion-table should be of wood and moveable. On the other hand, the church-wardens deny that it is an altar, or such as is used in Popish countries for idolatrous and heretical purposes; and that it is essential to the preservation of uniformity in the internal arrangements of the church."

In order to arrive at the true meaning of the expression "table," he referred to the alterations made in the rubrics at the time of the Reformation, and from that time down to the passing of the present Actof Uniformity in 1662, and found that the word "altar" has been changed to "table." We all know, said the induce, that We all know, said the judge, that after the Reformation one of the doctrines of the church of Rome which was renounced by the church of England was the doctrine of transubstantiation; and it will be found that the material and the form of the altar in the Romish church are connected with this doc-trine of transubstantiation, and with the eucharist as a sacrifice. It was contended that by the rubrics of the Roman Catholic, church altars must be built of stone, and must be immoveable, and various canons from the body of the canon-law were cited to shew that the altar must be of stone, and fixed; and, if not, it must be re-consecrated. The Court does not think it necessary to go through all these authorities on this part of the case, because it is not incumbent upon the Court to pronounce whether this is or is not an altar At the same time, it may not be inexpedient to consider what was the origin of the altars as used in the Roman Catholic churches, of what material they were constructed, and of what form, in order to arrive more readily at the meaning and intention of those who directed the removal of stone altars and the substitution of tables. From the authorities cited by Cardinal Bona, in his work De Rebus Liturgicis, we learn that the altars used in the early ages of Christianity were made of wood, and in the form of a table; that about the year 509 they began to be of stone, although the wooden tables were not altogether abolished. The form altered with the material. Sometimes the altar or table was supported by one pillar, sometimes by four or two, and latterly they assumed the form of a tomb, as of the Sepulchre of the Martyrs, whence they derive their name; and there is no doubt that at the time of the Reformation the altars in the English churches were of stone, fixed and immoveable.

At the time of the separation of the church of England from that of Rome, amongst the Digitized by

many points of difference between them, one of the most important was that respecting the doctrine of transubstantiation in the supper of the Lord, which, as is declared by the 28th article of our church, "cannot be proved by holy writ, but is repugnant to the plain words of Scripture." In the reign of Henry VIII. the feeling against this doctrine was not so decided as it afterwards became ; nor did any material change take place in the early part of the reign of Edward VI., for we find in his first Prayerbook, 1549, that the mass was still to be celebrated book, 1549, that the mass was still to be celebrated in the order for the Supper of the Lord, "com-monly called the Mass;" and the word "altar" was used in different parts of the service as set forth in that book. But in his second Prayer-book, 1552, the terms "mass" and "altar" were altogether omitted. The order was for the administration of "the Lord's Supper or Holy Communion." The table was to stand in the body of the church, or in the chancel, where morning and evening or in the chancel, where morning and evening service were appointed to be read; and the priest, instead of standing in the midst of the altar, was to stand at the north side of the "table," and so on through the service. But in the interval between the publication of the first Prayer-book in 1549 and the publication of the second in 1552, certain events had taken place, and certain orders and injunctions had been issued, to which it is necessary to refer. In 1547 an order had been issued to take away and destroy all tables, images, and other monuments of feigned miracles, pilgrimages, idolatries, and superstitions; and in 1550, Ridley, Bishop of London, issued an injunc-tion to the same effect. These injunctions were of course confined in the first instance to the diocese of London and to the form of an exhortation. But there was an Order in Council issued to Bishop Ridley strictly charging and commanding him, for avoiding strife and contention, to take down altars and place communion tables in their stead. And it appears from Burnet's History of the Re-formation that is the low of the Reformation, that on the 19th of November, 1550, letters were sent to every bishop throughout England to "pluck down altars" for the avowed purpose of "moving and turning the simple from the old superstitions of the Popish mass." The change intended, therefore, must have been something more than nominal; it must have been substantial. In the short reign of Mary, which followed, one of her first acts was the repeal of all the statutes passed in that of Edward VI. respecting religion, and things reverted to the same state as they were at the end of Henry VIII.'s reign; altars were to be re-erected in the churches, and penalties were imposed upon those who, of their own accord, pulled down or destroyed them, and mass was again celebrated. But in the year 1558, Queen Elizabeth ascended the throne, and when she repealed the statutes of Queen Mary the statutes of Edward VI. were revived. In 1559 orders were issued by Queen Elizabeth for substituting the communion of the sacra-ment for the high mass, and for placing tables in the churches, to the same effect as those issued by Edward VI. From this order it is manifest that the tables here meant were something very different from the altars, and that were moveable; for the direction, that it they was to be placed where it stood before could not apply to an immoevable stone altar. In 1564 it appears that Queen Elizabeth issued advertisements directing, amongst other things, that parishes should provide "a decent table that parishes should provide "a decent table standing on a frame" for the communion; an expression applicable rather to a wooden table, than one made of stone. In 1569 Archbishop Parker's visitation inquiries go to the same fact as to the communion-tables and taking down of altars. In 1571 Archbishop Grin-dall's injunctions are remarkable for their expressions :--- "All altars to be pulled down to the ground and the altar stones defaced, and bestowed to some common use; the prayers and other service appointed for the mini tration of the holy communion to be said and done at the communion-table." Nothing can more clearly demonstrate the determined manner in which the measures for the utter subversion of the superstitions connected with the Popish mass were carried on than these orders and injunctions, the great object being the annihilation of the fixed, immoveable stone altars, and the substitution of wood moveable tables in

their place. We now approach a most important period,

when the contest raged between high and low church in the reign of Charles I. Its origin may be found in Lord Clarendon's History of the Rebellion. It has been shewn that the stone altars were removed, and tables of wood set up ; the questions then agitated were as to the place in which the table should stand, and its position. The Puritans contended that the proper place for the table when the communion was administered was in the body of the church before the chancel-door; and afterwards in the chancel, but placed tablewise, and not alter-wise, that is, that one of the ends of the table was to be placed towards the east. so that one of the larger sides might be to the north, the priest being directed to stand at the north side, and not at the north end of the table. The high churchmen, on the contrary, contended that as the injunctions ordered that the tables when not in use should stand where the altar used to stand, it should consequently be placed as the altar was. These apparently unimportant matters were the source of violent contentions. (The learned judge then proceeded to consider the case of Archbishop Laud, who became involved in these unfortunate disputes, by introducing many of what were at that time called "innovations," an unfortunate term, as Lord Clarendon called it, and which formed part of the articles of impeachment against him.) We now come to the time of the Resrubric were framed, when the term "table" was introduced, and the communion-table remained in the same situation as from the time of Elizabeth; that is, that it was of wood, not stone; and moveable, not fixed. The next question is, has any alteration been since made? In the rubrics of the present Book of Common Prayer the term "table" is repeatedly introduced, and in several places consistent only with the idea of an ordinary table of wood, which is moveable.

He was of opinion that the article set up in the present case, was not a communion-table within the intent and meaning of the rubric, and therefore reversed the sentence pronounced by the Chancellor of Ely.

As to the credence table, the Judge said, "I do not find any sufficient information to enable me to judge when this article was first introduced into the Romish church or into our English churches. It is clear that they were in use at the time of Archbishop Laud and before his time. It is admitted by the learned counsel on both sides that the term is derived from the Italian language; but in Adelung's German Dictionary we have the following de-finition of the word :-- '*Oredenzen*, verb. reg. act., from the Italian '*credenzare*,' to taste beforehand the meats and drink before they were offered to be enjoyed by another : an ancient court practice, which was performed by the cupbearers and carvers, who for this reason were also called 'credenzer.' Hence, also, the credenz teller -- credence plate-- on which the cup-bearers credenced the wine; and, in general, a plate on which a person offers any thing to another: credenz tische, credence table, a sideboard, an artificial cupboard with a table for the purpose of arranging in order and keeping the drinking apparatus therein.[•] In the Greek and Latin churches, something of the same kind was in use under another name, as I find from two of the tracts to which I before alluded. The word used to describe it is προθεσις,' that is, table, or preparation, or proposition, as on it were placed the elements before they were placed on the high altar for consecration. I am of opinion, therefore, that the credence table must fall under the same principle as the other, as it is immediately connected with the other structure, and does not appear to be required or sanctioned by any law, canon, or constitution. I shall, therefore, not include that in the faculty."

The delivery of this judgment, which gives evidence of most patient deliberation and careful research, occupied five hours: the question is one of extreme importance.

VICTORIA PARK.—Park palings, to upwards of a mile in length, have been laid down as the boundary of the park, in Wick-lane and Grovestreet, Hackney and Old Ford. Workmen are busily engaged in the formation of new roads, and making preparations for planting.

* See THE BUILDES, p. 30.

DECORATIVE ART SOCIETY.

At a meeting held on Wednesday, the 29th ult., at 11, Davise-street, Berkeley-square, a paper was read by Mr. Crabb, containing a general notice of colour and its application to decorative purposes. After a concise exposition of the laws of colour, he ex-plained the principles which regulated Persian art, restricting it to the use of the three primary colours, gilding supplying the place of secondaries, and that the Persian temples might be considered fine specimens of decorative colouring. The character of Grecian art was remarked upon, and the excess of colour adopted by the Romans leading to the abuse and decadence of art. The new era under Constantine was next noticed, and the grand specimens remaining to us of fine Italian art in the works of Raffaelle in the Vatican, where the use of rich dark blues round the windows presented, he thought, evidence of his consummate skill in decorative effects. In the Casina of the Ducal Palace at Mantua, by Giulio Romano, the utmost perfection of classic beauty was exhibited, the exquisite execution of which rendered his fame pre-eminent. A recommendation of a study of the old masters followed; the Caracci for graver purposes, and Titian and the Venetian school for beautiful examples of sumptuous and harmonious co-louring. These remarks were illustrated by coloured copies of the works of Gruner, Owen Jones, Pugin, &c.

A discussion took place on the suitableness of our extended use of rich colouring in this country.

country. In May next, Mr. Crabb, in continuation of the subject, will read a paper "On the application of colour to manufactures."

And on Wednesday, 12th February, a paper will be read, "On the Physiology of Timber Trees considered with reference to manufacturing purposes." L.

[The object of the Decorative Art Society is to diffuse among those engaged in the design, superintendence, or execution of interior decoration, a knowledge of the true principles of taste, and to lead them to investigate the nature of the various arts and manufactures connected with the subject.—ED.]

CHURCH NEWS.

THE parish church of Woodford, near Salisbury, is about to be almost wholly taken down and rebuilt on an extended scale, the present edifice being in a dilapidated state, and not sufficiently commodious for the parishioners. ——At New-passage, Devonport, it is proposed to erect a new church. An application is to be made to the Admiralty for assistance. —A new chapel for the use of the Unita-rians in *Leeds*, is about being erected on the site of the present one, properly known as "Mill Hill Chapel." We understand that the proposed new chapel is to be built on a considerably enlarged scale, and to have extensive school-rooms attached, in a modern style of architecture. The subscriptions for this purpose already received, amount to several thousand pounds. — The restoration of the thousand pounds. — The restoration of the interior of Chesterfield Church has been completed by two very important alterations. The old reading desk, which formed so unsightly a contrast with every other part, has been removed, and a new one substituted, the sides of which are open, and correspond with the fronts of the galleries. The other alterathe fronts of the galleries. The other altera-tion is in the chancel, where a railing of added.—Extensive reparations are now in progress in the parish church of Stratton St. Margaret, near Swindon, Wilts; the edifice having been found, upon the survey of an ex-perienced architect, in an insecure state. A church is in progress at Little Dawley, in Salop. The Queen Dowager has contributed Mademoiselle D'Este has given a 201. piece of ground adjoining some premises for-merly occupied by her at Ramsgate, as a site for a new church, which will be completed in a short time. The funds necessary for the erection have been derived from voluntary subscriptions, and include the sum of 100%. from the donor of the ground. — Prince Albert, in his capacity of a Knight of St. Patrick, has given 100% in addition to the gift of 200% by her Majesty, towards the reairs and restoration of St. Patrick's Cathedral,

Dublin. Digitized by Google

ARCHITECTURAL PROCEEDINGS

ABROAD. IN BELGIUM, during the last two or three years, great efforts have been made to restore ancient buildings. The west front of the church of St. Gudule, at Brussels, which has been in the mason's hands for some time, is now completed. The niches have been re-filled with statues, and all the decayed parts of the stone-work renewed. The spire of the Town-hall at Brussels has likewise been repaired, as also have the town-halls of Ghent, Bruges, and Louvain, and several churches in various parts of the country. The cathedral of TOURNAY, at the western ex-

tremity of Belgium, has been restored through-out, under the direction of M. Renard, and is approaching completion. This is one of the most interesting buildings in Belgium, and is well worth a journey to view it. In form it is a Latin cross, with five towers; namely, two at the end of each transept, and one at the centre of the cross. The transept is terminated at each end by a semi-circular absis. A very remote date has been claimed for Tournay Cathedral by local bistorians, but it seems to us that the earliest remaining parts belong to the lith century. At COLOGNE, the works at the cathedral are

proceeding steadily, but not so much so as to enable us to prophesy an early completion. We are told that the model of the pulpit intended for this cathedral is exhibiting at Berlin, and astonishing the public by its magni-ficence. The pedestal is a bundle of columns, about two feet in height, imitating in their clustering the pillars which sustain the building. These are terminated by a capital of acanthus leaves and scrolls artistically dis-posed, out of which spring a system of ribs that embrace the pulpit, developing themselves in exact resemblance to those which climb towards the key-stones of the vault. Basreliefs, and niches containing the figures of the benefactors of the cathedral, or saints, con-stitute the principal decoration of the monu-At its base is Conrad of Hochstaden, ment. and higher up, surrounding the pulpit, the twelve Apostles, and our Saviour bearing the banner of the redemption, and blessing his disciples. The canopics, beneath which these figures stand, form so many little steeples of florid workmanship, in whose upper portions are sculptured the arms of the principal German cities. The pulpit is covered by a sound-ing-board, on which sit the four Evangelists, with their recognized attributes. Over them, in a carved niche, is the Holy Virgin: and the cupola is closed in by a crown of flowers, on which sculpture has lavished its resources. The pulpit is ascended by a spiral staircase, winding round the pillar before mentioned. We cannot say that we have formed a high opinion of its fitness from this description.

At TREVES, we learn from the Art-Union for the present month (an admirable number, full of information), a grand work is in con-templation, which will be one of the most magnificent architectural monuments of modern times; we mean the Roman structure of the so-called Constantine Palace, which, according to the unanimous opinion of the connoisseurs, is the remainder of an ancient colossal basilica. One side-front and a grand round structure of the tribunal of the whole, which, till now, has been made use of for various purposes present a barracks-are still existing. Of no ancient basilica are there extant so important and considerable portions, so easily to be restored. From an authentic report it appears that these remains, by an order of the King of Prussia, will be restored in their original condition, and are intended for a church of the united Protestant civil and military commune. This church will vie with the grandest and most beautiful of those which bave once been possessed by the primitive Christians, to whom, as we know, basilicas, originally forming courts of justice, were assigned as churches, and which have ever been used as models. The fabric will, after its completion, form a single colossal nave, 180 for them been used for the second of for 180 feet long by 88 broad, and about 100 feet high, with a semi-circular tribunal of 62 feet diameter, separated from the nave by an arch of 59 feet span, with walls 9 feet in thickness, of which the still remaining ones are built of the best Roman bricks; and with a double row of windows, each 12 feet broad. Likewise, by order of the king, the ancient church of

Maximinius, at present forming a barracks, will be restored, and is intended for the temporary use of the Catholic military congregation.

At BEBLIN, the inauguration of the new Opera-house, on the 7th of December, has been an event of great moment in the annals of our city. Meyerbeer's inauguration opera-an excellent composition-was received in the splendidly decorated house with much applause and interest by the royal family and an The whole immenselv crowded audience. structure is said to have cost 600,000 dollars (87,500). The architect was M. Langhans, counsellor of the Board of Architects, a son of the architect who built the celebrated Brandenburger Thor (Brandenburg Gate). Breslaw theatre is one of his buildings, which is little inferior to that of Dresden. The Berlin Opera-house, however, is superior to both, and one of the most magnificent buildings of that description in the world. The lobbies are less splendid; but halls of that kind are generally little made use of in Germany, and deprive the indispensable loca-lities of a theatre of the necessary extent.

At GOTTINGEN a new art-museum has been established and inaugurated, in commemoration of the celebrated Winklemann. The localities of this museum are on the ground-floor of the university, containing a grand collection of gypsum models, which the late Professor gypsum Muller used to employ for the illustration of his lectures on the classical antiquities, together with those which formerly were placed The in the rooms of the university library. university owes most of these treasures to British munificence. Besides these are to be mentioned the Vienna sarcophagus and several relievos, of which the famous "Sacrifice of the Citharoedes" is the most eminent.

At HAMBURGH an exhibition of the plans for the re-erection of St. Nicholas' Church has taken place. Thirty-nine architects, German and foreign, have sent for this purpose their works, several of which are re-ported to be first-rate plans. Nos. 7, 32, 39— the first with the motto, "The success of the work, not its estimation, is its real value;" the second with the motto, "The work, not the architect or master;" the third with the the architect or master, the third architect or master, the the most eminent. The most valuable is as the most eminent. The said to be by an Englishman.

The ravages which were committed by the terrible conflagration in May, 1842, are now fast disappearing; and the great improvements which are taking place in consequence of that calamity will, in a few years, obtain for Hamburgh a degree of architectural celebrity it would else have hardly aspired to, as it now does, all at once. Many splendid hotels and shops, fitted up in a style of elegance, bespeak a degree of luxury hitherto unthought of at Hamburgh. The same may also be said with regard to newly erected private houses, a considerable proportion of which are upon such a scale and of such character as to be suitable only for wealthy families, who can afford to maintain an establishment in ac-cordance with them. Dr. Abendroth's mansion, erected by M. de Chateauneuf, who has given the designs for it in his "Architectura Domestica" (published a year or two ago in this country), fortunately escaped destruction, although so near the scene of devastation.

STATUE TO MR. GEORGE STEPHENSON. The directors of the Liverpool and Manchester Railway, acting in concert with the Grand Junction Board, have determined upon erect-ing a marble statue in honour of the above gentleman. It is proposed, that the statue shall be erected in St. George's Hall, Liverpool, now building in front of the Railway Station. The eminent sculptor, Gibson, has been engaged to execute the work, and the price, delivered

and set up, is not to exceed 1,800. THE FOUNTAINS IN TRAFALGAR-SQUARE. —These long-expected ornaments will soon be put into operation. The boring is complete, and a very good supply of water has been obtained. For several days past the two engines have been employed in raising water, which has been found quite equal to the supply required, and a jet of water has been forced to a height of about 30 feet in one of the basins. During the past week, workmen have been erecting poles, &c., to raise the stones composing the eastern fountain.

DISASTROUS EFFECTS OF THE LATE

STORM. Тик papers during the past week have been teeming with accidents which occurred during the storm of the 25th ultimo.

At Blackburn an entirely new and unfinished mill was blown completely down, the crash of which is stated to have been heard throughout the town as of the sudden discharge of distant artillery. The mill was what is called an artillery. "eight bay" mill, the area of the spinning part of the premises being 60 feet by 80 feet tached to the spinning-mill was an engine house, next to that a large boiler room, and more an extensive foundry shed. The first floor of the mill was completed, the boards of the other floors were not down, all the windows were in, and the mill roofed over. The engine house was arched over, and the boiler room covered in. In these two latter places the buildings were partly iron; great iron beams from 15 to 18 inches across, were erected in the engine-house ; the roof, &c., of the boiler room was supported by iron pillars, stout iron bars, &c.

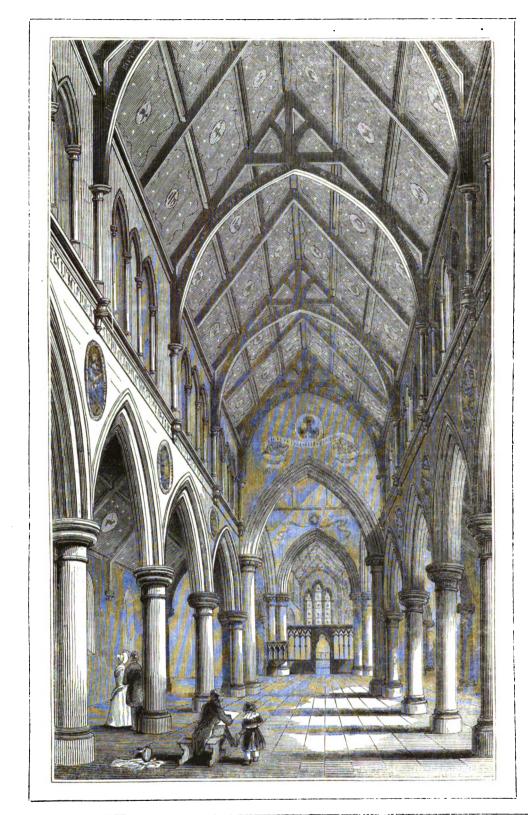

It appears that at about a quarter-past nine o'clock, some men employed upon the pre-mises, and living close by, observed one of the walls of the mill to bulge out; and they were discussing the readiest means of propping it up, when the gable end wall of the mill, against which the full force of the wind bore, was seen to bend inwards, and becoming thus loosened from the roof, the latter was lifted up by the wind, and falling back again with great violence, went to pieces, and carried down to only of some of the walls remaining. roof, first floor, beams, supporters, and the walls that fell with the roof were all smashed to pieces. The roofs of the engine-house and boiler room were destroyed, the thick iron beam ends being broken like glass. Part of the roof of the foundry shed was destroyed, as the root of the foundry sneu was desiroyed, as also part of some premises adjoining another side of the mill. The damage done cannot be calculated at less than 2,000*l*. Upwards of 3001. worth of glass was destroyed. It is said that the whole building was not to be surpassed for strength and compactness in Blackburn. In a short time the three upper floors would have been put in, and then this disastrous ac-

cident could hardly have happened. At Derby various buildings sustained con-siderable injury, the Messrs. Holmes, coachmakers, had just completed the erection of a makers, had just completed the erection of a large chimney on their premises, for the pur-pose of having steam applied to a part of their extensive establishment, the building of which had been intrusted to Mr. Edwin Thompson. This chimney was 60 feet high, and was only waiting for the iron capping. It was sur-rounded by a very heavy and substantial scaffolding, a circumstance which there is every reason to believe to a considerable extent conreason to believe to a considerable extent contributed to produce the accident which we have to record. On the night mentioned above, fears were entertained that the chimney so largely encompassed with scaffolding (and which had been round it for some time past, awaiting the finishing of the chimney from the cause al-luded to, that of the cast-iron capping), was in danger of falling from the severity of the gale, and as early as between 5 and 6 o'clock on Sunday morning, Mr. E. Thompson went to ascetain how far this really was the case. When there the tremendous squalls of wind waved the ponderous mass of woodwork to and fro in a very alarming manner; so much so as to induce those persons who resided in the house immediately connected with Messrs. Holmes's premises, to leave them immediately, though the chimney itself appeared entirely unmoved. Fortunate, indeed, was it the residents did quit them, for at a quarter-past 8 o'clock 40 feet of the 60 feet chimney fell with a terrific crash on one side of the roofs of the five houses, literally cutting them in two, and demolishing them to the very foundations, and destroying every piece of furniture they contained.

At Chesterfield three or four pinnacles were blown down from the tower of St. Thomas's Church, and burst through the roof, destroying the gallery, and doing considerable injury to the church. Fortunately, divine service had not commenced, otherwise a fearful loss of life must have ensued, as the children of the Sunday school occupy that part of the edifice

INTERIOR VIEW OF ST. JOHN'S CHURCH, NOTTING HILL.

ST. JOHN'S CHURCH, NOTTING-HILL.

In the last number of our journal we entered into a description of this church, and gave an engraving of the exterior as seen from the south-east. In compliance with our promise, we now present a view of the interior from a drawing made by the architects. By thus giving a perfect notion of the appearance of the building and the extent of decoration, the size, materials of which it is constructed, and ultimate cost, we consider we are supplying very important data for all who are concerned in church-building operations.

The engraving represents the church as viewed from the west end, and shews the rood screen at first proposed to be creeted, but which was very properly abandoned, as were also the coloured decorations in the spandrils of the arches which appear in the engraving. The pewing is omitted in the view for the sake of clearness.

BRONZE GATES FROM THE BAPTISTRY AT FLORENCE.

WE mentioned last week, that through the kind offices of M. Guizot, casts from the celebrated bronze gates of the Baptistry of St. John at Florence, had been presented to the School of Design at Somerset House. Some of the newspapers said there was no room there large enough to receive them, but this was an error. They are about 17 feet high and nearly 10 feet wide, and are fixed upright in the figure room, where we recommend such of our readers as delight in fine works of art to repair some Monday morning, when the school is open to the public, and examine them for themselves.

They are the work of Lorenzo Ghiberti, who competed for the commission with six other artists, including Donatello and Brunelleschi, and consist of ten panels filled with compositions from the Old Testament, and surrounded by a framework of great beauty,

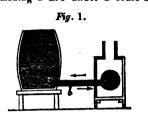

adorned with figures under niches, flowers, and fruit. The Creation, Noah leaving the Ark, Joseph and his brethren, and David's victory over Goliah, form some of the subjects. Those who have seen the originals say that these casts do not give a full notion of their great beauty, and it is evident to the least practised eye that the mould from which they were taken was either badly made or worn out. Michael Angelo, it is asserted, said they were worthy to inclose Paradise; if the author of them had been alive at the jime, he would probably have been less eulogistic. Ghiberti died about 1455. He first studied as a painter, and seems to have had some skill as an architect, for he was associated with Brunelleschi in the construction of the cupola of a church at Florence.

Relative to works in bronze, it is to be hoped that opportunities will be afforded for the use of this material in the new Houses of Parliament and elsewhere. The art of working it has been sadly neglected in England.

THE HISTORY OF HEATING BY HOT WATER.

SIR HUGH PLATT, who was the first to point out steam as a medium for heating the sir of a room, suggested that hot water might be used to avoid the danger then run, in one of the processes of the manufacture of gunpowder. "To drie this substance without ganpowder. "To drie this substance without all danger of fire, you may cause," says Sir Hugh, "a vessel of lead, pewter, latten, or copper, to be made, having a double bottome, between which bottomes you may convey scalding water at a pipe, which water may be also heated at another roome, and then you may lay your powder upon the uppermost bottome till it be drie, and when the water beginneth to cool, you may let it out at a cock beginneth to cool, you may let it out at a cock in the bottome of the vessel, and soe give passage for more scalding water by another cock." And in another part he says, "a vessel may be made to brew or boil in, by making a fire under a brass boiler, a, fig. 1,

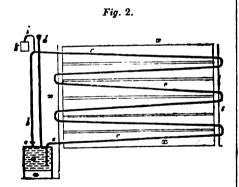

and conveying the steam water into or a wooden tub or recepta-cle, b." Rudolph Glauber, also, pro-posed heating a brewer's vat by a brass ball

filled with water and placed in a fire, a pipe from which was carried into the vat. "A from which was carried into the vat. "A contrivance," says Hooke, "which if prose-cuted, might be very beneficial to those who require great quantities of hot water, by enabl-ing them to use wooden casks instead of copper boilers.

Sir Martin Triewald, a Swede, who lived for many years at Newcastle-on-Tyne, before he finally settled in his native country, about 1716, described a scheme for warming a greenhouse by het water, instead of hy fermenting regetable substances. The water was boiled outside of the building, and then conducted by a pipe into chambers formed under the plants

Prior to the French Revolution, an ingeni-Prior to the French Revolution, an ingeni-ous application of the same medium for diffus-ing heat was made by M. Bonnemain, in an apparatus to hatch chickens, to supply the Paris market. In this water-stove, a transverse section of which is shewn in fig. 2, ; *a*, boiler,

a on its furnace, furnished with an expansion a on its turnace, turnshed with an *expansion*-rod to regulate the opening and shutting of the ash-pit door; *d*, a pipe for supplying water to the boiler, and keeping the pipes always filled with water; *o*, stop-cock, for regulating the quantity of the ascending hot water; *b*, pipe of communication between the boiler and beating-pipes, c, which traverses the boiler and beating-pipes, c, which traverses the hatching-chamber, x, with a slope towards the boiler, into which it is inserted, and its lower end carried nearly to the bottom of the vessel. The air disengaged from the water by boiling, and which would accumulate in the tubes and ob-struct the circulation of the hot water, escapes

struct the circulation of the hot water, escapes by the pipe, i, and the water that rises along with it from the tube falls in the receiver, k. As the water in the boiler gets warm, and becomes specifically lighter, it rises upwards in the pipe b, and its place is occupied by the colder and heavier water, which flows from the pipe, c, and enters the boiler at its lower currentiate the output of from the pipe b. ac pipe, c, and enters the other at its lower extremity, c. A current is thus established from the boiler upwards, through the pipe, b, and then downwards, through the range of pipes, cc, into the boiler, with a velocity depending on the difference between the temperature of the water in the boiler, and that in the descending or heating-pipe at its insertion into the boiler. By this means a very equable tem-perature was kept up in the series of compartments in which the eggs were placed to be hatched.

For many years after this period, M. Bonne-main was in the habit of describing his apparatus to others, and a few years later a good account of it, explained by figures, was given

in a French publication. About 1812, hot water was used at St. Petersburg in the manner practised by Triewald; and shortly afterwards, in the same capital, by Count Zubow, in a similar but more roundabout method. The water made to occupy the space commonly filled by the ferraised in a boiler place on the outside of the conservatory. It is not clear whether this was before or after Mr. Braithwaite, at Kendal, warmed his counting-house by a small rectangular boiler, having its furnace included in a rectangular cast-iron case, which had the ap-pearance of a chest placed against the wall. From the boiler a small pipe proceeded to the condenser, which was a copper vessel, 18 inches in diameter, placed under a double writing-desk. The condenser was formed on writing-desk. The condenser was formed on the plan of the improved cylindrical refrigeallowed to escape at the top, which was how-ever condensed against the lid, so that none of it escaped into the room. The steam gave out its heat to the water in the condenser; which was found, when once warmed, to retain the heat for many hours.

The Marquis de Chabannes, in 1816, introduced M. Bonnemain's method into this country; and in drawing the public attention to the hot-water system he claimed the merit of being its inventor. "The most perfect de-finition I can give of it," says the Marquis, " is by comparing a boiler to the human heart, and the effect of caloric on liquids to the circula-tion of blood in our veins. The fire is the power which gives motion to the water, as the admission of oxygen into our lungs causes the circulation of our blood. A pipe is placed at the top which may have any length or winding, but must finally return to the bottom of the The caloric which rises into the boiler. upper pipe, and communicates itself to the liquid in it, which loses that heat as it flows through the pores of the metal, or any reservoirs which may be placed in its passage for the purpose of extracting it, becomes gradually colder, and in that state pressing on the rare-fied pipe which issues from the top of the boiler, re-enters at the bottom in proportion to what goes out above-thus causing a continual circulation; and the liquid coming in contact with the fire at a colder temperature, and besides with friction extracts a still greater portion of caloric." In reducing his speculation to practice, he proposed to fix a small boiler behind the

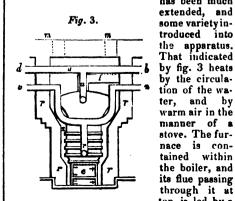

kitchen fire, and connect it by two pipes with a cylinder, containing twenty or thirty or more small pipes, open at both ends, and surrounded with hot water. This cylinder he placed under the stairs. The rarefaction in the small open pipes produced a current of warm air iu staircase, and the water which was cooled in the cylinder falling into the boiler, forced the warmer water upwards into the cylinder with continuous circulation.

and

bv

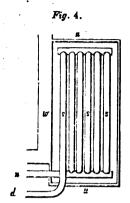

it at

Since his time, warming by hot water has been much

top, is led by a 9-inch pipe, *i*, into the smoke flue in the wall. The cylindrical boiler, c, is surrounded by a brick wall, r, leaving a space of four inches round it, which is covered in at top, and forms a small air-chamber. Into this inclosed space the air is admitted from a culvert, v, which communicates with the atmosphere under the porch in front of the building, and rising in the circular cavity, is heated by contact with the external faces of the boiler, and finally flows through the valved openings, or regusters, m, into the hall.

The hot water for warming the passages and staircases is conveyed from the boiler by the pipe, a, fixed under the ceiling of the

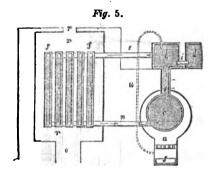

basement-floor, with branches, b d, carried to each end of the building, which terminate in a series of beating-pipes, ss, or neating-pipes, ss, arranged as shewn in fig. 4. These pipes are inclined from their point of junction, with the branch pipes to the exit by the descend-ing nine and the ing pipe, and the whole are inclosed in a case, *u*, that has the bottom per-forated with holes, to allow the cold air

67

to rise and come in contact with the hot pipes, and then to percolate, when heated, through the holes made in the top of the case into the passages in the floor above, on, the descending pipe from each heating-case connected with the return-pipe, and inserted in the bottom of the boiler. Small cocks, u, placed at the highest points, to emit the air that is extricated from the water. the water. The mean temperature of the enclosed pipes Mr. Bramah stated to be 185°, when the temperature of the water in the boiler was 270°.

Mr. Manby's apparatus is a good example of flat parallel, heating surfaces, arranged as a hot air-stove. It is shewn in fig. 5, c, a cylin-

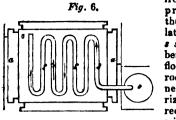

dric boiler placed over a furnace, a, a pipe rises from the upper part, and terminates in a square inclosed vessel, from which a pipe, e, anches to the upper end of a series of flat bollow vessels, ff, that communicate with each other; another pipe, n, on their lower end, forms a communication with the bottom of the boiler. The flat hollow vessels are inclosed in a chamber, x, into which the cold air is admitted through an opening in its floor, and the heated air is conveyed through an opening, r, in its roof into channels, which distribute it at the points where it is wanted. The water is upplied to the boiler from a recursion d and supplied to the boiler from a reservoir, d, and the water, which may be expelled by the expansion from heat, is conveyed by the small pipe, *u*, into a vessel, *s*, which forms the bottom of the ash-pit, to assist by its evaporation, as Mr. Manby thought it would, the combustion

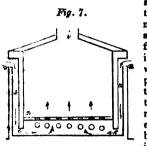

of the fuel placed on the grate over it. The operation of this apparatus is very simple. The water heated in c, flows through simple. The water heated in c, flows through e, into the air-heaters, f, where it is cooled by the current of cold air rising through the opening, u, and fails to the lower part of the heaters into a pipe, n, which conducts it to the lower part of the boiler, and by this means a continued stream of hot water flows from the boiler into the heating yessels, and preserves their surfaces at a certain temperature.

There is no practical objection to this neat and compact apparatus, except the greater difficulty of keeping the joints in order, when compared to a similar arrangement, where pipes are substituted for the flat vessels. The preceding methods shew the ventilating and warming processes to be kept separate,

which are combined in the apparatus indicated in the diagrams, fig. 6 and fig. 7, c, a boiler, from which

neral inclination from the highest point towards

proceeds ibe circulating pipe, s s, placed beneath the floor of the room in a nearly ho-rizontal direction.but with a ge-

The fresh air is admitted at n, and descends in the boiler, c.

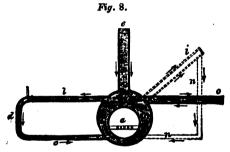

the vertical channel, a, into the space beneath the floor, and com-ing in contact with the heated pipes, is emitted through holes in the floor into the room, and the effete air escapes by the opening, i,

This is a very favourable disposition of the heating surface, and one that is often adopted in drying-houses: one of which is shewn in the figure. It is apparent that a similar series of pipes

may be placed in a basement chamber, from which channels may branch to the rooms which are to be heated in the floors above.

In all the apparatus which have been de-scribed, the circulation of the water is promoted by what is technically called a return or de-scending pipe. But in many cases, in which the difference of level is small, the effect does be compared to have been impressed by this not appear to have been improved by this arrangement.

In the diagram, fig. 8, a, is a furnace in the inside of the boiler, s, with various pipes pro-ceeding from it. If we suppose the pipe, e,

only to be attached to it, and filled with water as that in the boiler was heated, a circulation would commence and continue by the hottest water rising to the upper part of the pipe, and the water rooled by contact with its surface falling into the boiler. It is clear the same effect will be produced if the pipe *i* were substituted for the pipe *e*; and it is also clear that the circulation would be less impeded than if the hottest water rose to i, and descended when cooled through the pipe, n n, to the bottom of the boiler, s, supposing in both cases an equal quantity of heat to be dissipated. If the heating pipe, o, was nearly horizontal, the same effect would take place from the molecular action, the water in the pipe would be somewhat warmer than if it flowed along b, descended by d, and returned by c into the boiler, as less of the velocity due to the temperature would be lost from friction in the straight pipe than in the return-pipe. In most cases, the return-pipe might be altogether omitted, with manifest advantage to the simplification and consequent certainty of the circulating process, the lightest water will always find the highest level, and the less it is impeded the circulation will be the more perfect, and the heating effect will be greater. The arrangement, for instance, would have been as effective had there been no returnpipe; each floor or room might have been heated by a separate pipe proceeding from the boiler, and the expense been considerably less

by the simpler method. There are two ingenious devices for continuing a circulation in cases where there is a small difference of level-the rotary float of Mr. Eckstein, and the syphon apparatus of Mr. Kewley. In some instances they are

effective; but perhaps the cases where their use is necessary are not those in which hot-water heating is the most proper; they require more attention than can at all times be had from domestic servants, and are easily deranged. The high-pressure method, contrived by

Mr. Perkins, is shewn in the diagram, fig. 9. A coil of wrought-iron pipe of small diameter Fia. 9. placed in a furnace, a, is continued and conđ ducted through the building, and the ne-cessary quantity of sur-face is given by form-ing coils, n, of the pipe which are placed in the process to be ated

the rooms to be heated, and the pipe is finally returned, as at s, into the furnace, where it is joined to the coiled

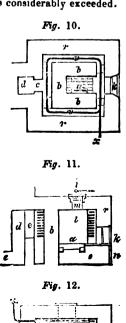

pipe, a, and thus forms an endless pipe. At the highest point of the heating pipe, f, in another pipe, d, of a larger diameter, placed either in a vertical or horizontal position, and which has a capacity from $\frac{1}{10}$ to $\frac{1}{10}$ of all the water in the eucless pipe. This is called the expansion-pipe, and into which the water rises asit expands in heating to prevent the apparatus bursting. The filling pipe, o, rises to the level, and no higher, of the lower part of the ex-

pansion or safety-pipe. The tubes being thus arranged, the whole series, except the expansion-pipe, is filled with water by means of a force-pump applied to the filling-pipe, o; and as it is of importance to niling-pipe, o; and as it is of importance to free the endless-pipe thoroughly from air, the water is pumped several times through the tube until it is accomplished. The endless-pipe being thus filled with water, and the ex-pansion-pipe empty, every part of the apparatus pansion-pipe empty, every part of the apparatus is then strongly and hermetically closed. The endless-pipe, having a bore of about $\frac{1}{2}$ an inch, and being $\frac{1}{2}$ of an inch thick, the apparatus is capable of sustaining a very great pressure.

Its action is the same as that of the chicken-stove of M. Bonnemain. The water heated in the furnace-coil rises into the upright pipe, In the furnace-con rises into the upright pipe, and then flows on a declination towards the coils placed in the apartments, and gradually giving out its wurmth to the air of the spaces it flows through, returns, greatly reduced in temperature, through the pipe, s, into the lower part of the furnace-coil, to be heated and rise upward again continually; the difference in temperature between the ascending and de-scending columns producing a continuous circulation throughout the apparatus.

From the manner in which the pipes are closed from the air and placed in the furnace, the water they contain may be reased to a very high temperature. Mr. Perkins states the average at about 350°, but in practice it has been observed this is considerably exceeded.

The three following diagrams will give some idea of the way in which the furnace was constructed to heat a portion of the British Mu-seum: fig. 10 is a plan of the furnace taken above the grate; fig. 11 a longitudinal section taken through the centre of the furnace; and fig. 12 a section, suppos-ing the front wall of the furnace to be removed; r r, a wall of common bricks, 9 inches thick, which in-closes the furnace on its four sides; b b, a wall 9 inches thick, formed of Welch fire-lumps, that inclose the fire - chamber on three sides. From the face and ends of this wall firebricks project, to

support the coiled pipe, O, placed in the flue. The intention of this wall is to prevent the too rapid abstraction, by the coil, of the heat from the fire which thus comes in contact with it at the opening in front only, where the hot gases turn into the back and side flues in which three-fourths of the furnace or boilerin which three-fourths of the furnace or boiler-coil is placed. The roof of the furnace is formed of Welshlumps, in which is an opening, m, fitted with a moveable cover, for supplying the furnace with fuel (coke or anthracite coal being preferred). Theash-pit, o, is inclosed with a door, n, in which there is a register, k, double fire-door to an opening in the wall, for clearing the fire-place and furnace-bars from dust and scoria. This has a dead plate to separate the ash-pit from the heating flues; x, heating-pipe, rising from the boiler-coil, which passes round the internal wall in the flue, v, and is thus defended from the radiant heat of the fuel on all sides but one. This heating-pipe is continued from but one. This heating-pipe is continued from the upper part of the fire-chamber into the building; z, the return-pipe which enters the lower part of the furnace, and passes through the bearing bars of the fire-grating, to prevent their overheating. The dust and soot fall to their overheating. The dust and soot fall to the bottom of the heating flue, and prevent the coil being clogged.

The furnace is placed in a vault in the base-The furnace is placed in a vault in the base-ment-story, and the pipes, x z, are carried up to a height of 40 feet in a flue to two coils of pipe; one containing about 300 feet of pipe, and the other 400; about 140 feet being used for the ascending and descending pipe in the flue, and 150 in the furnace for the coil-boiler. The room containing 360 feet of pipe is 43 feet long and 30 wide, and lighted by large sky-lights in the ceiling, is raised in winter to 65°. lights in the ceiling, is raised in winter to 65° which is a high temperature to be maintained in a room on this construction, even with this liberal allowance of heating surface.

Mr. Perkins made several skilful arrangements of his pipes in adapting his apparatus to different situations. In one example he sub-stituted a series of pipes for a cockle, with excellent effect. The pipes were arranged in an inclosed chamber, from the roof of which channels branched to the several points that required heating, and cold air-was admitted into this chamber through perforations in its floor (similar to that shewn in fig. 6), which was thus brought in contact with the hot pipes, and rose in a warm stream into the building; a disposition perhaps the most favourable that could be practised with such highly-heated surfaces, as the hot air could be properly attempered by the cold air drawn from an underground culvert about 300 yards long, before its admission into the building.— Bernan's History and Art of Warming and Ventilating Rooms and Buildings.

SAILSBURY AND WINCHESTER CATHE-DRALS .-- The points which rivet our attention when surveying the cathedrals of Salisbury and Winchester are so essentially different, that we are induced to place them in juxta-position. At the first glance at the exterior of the former, we are delighted with its elegant lightness, the appropriateness of its ornaments, and its perfect uniformity of design, whilst we gaze with mixed feelings of awe and adoration on its " heaven-directed spire ;" hut when we view-steadily view- the exterior of the latter, though it command not all those plea-surable emotions, we are struck by its solemn grandeur, its vastness of extent, and its im-movable solidity. When we enter the nave of Salisbury, we are still pleased with its elegance and grace, and wonder how the slender shafts of its columns sustain its massive roof; but of its columns sustain its massive root; but the flood of light poured in destroys those sen-sations of sublimity which the darker nave of Winchester, with its ponderous pillars, ad-mirably sustain. Salisbury Cathedral must be taken as a whole: Winchester Cathedral must be available its available of the off be examined in its several parts. If the exterior of the one delights and charms us, the interior of the other commands our admiration and reverence. Salisbury appears as if it had sprung into existence at the touch of the wand of some mighty magician, as perfect and as beautiful as it now appears to an enraptured eye; Winchester, on the contrary, bears on its brow the marks of age, and presents to the Its orow the marks of age, and presents to the antiquarian the most perfect specimens of the growth of the pointed style, from the period of unadorned simplicity, till at last it became en-cumbered, nay buried, beneath heaps of orna-ments.—Willshire Independent.

INSTITUTION OF CIVIL ENGINEERS.

On Tuesday last, Sir John Rennie, the new president, on taking the chair for the first time since his election, addressed the meeting at some length. After thanking the members for the honour conferred upon him, and regretting that their choice had not rather fallen upon one of the numerous able men by whom he was surrounded, he alluded briefly to the causes of the recent changes, and the progress of assimilation towards the constitu-tion of other flourishing societies. A wellmerited compliment was then paid to the able manner in which Mr. Walker had filled the chair, and by which he had rendered himself so popular. This rendered the task of imso popular. This rendered the task of im-mediately succeeding him very arduous; but Sir John hoped, that with the support of the council, the countenance of the members, and an ardent devotion to the welfare of the profession, he should be enabled to advance the objects of the institution, and to promote its prosperity. He then proceeded, "when we look around us, and see the vast strides which our profession is making on every side, and the deservedly high place it holds in public estimation, we cannot but feel justly proud, for without the slighest disparegement to the pursuits of duties of other prosions, I may confidently ask where can we find nobler or more elevated pursuits than our own; whether it be to interpose a barrier against the raging ocean, and provide an asylum for our fleets; or to form a railway, and by means of that wonderful machine. the locomotive engine, to bring nations to-gether, annihilating, as it were, both space and time, or to construct the mighty steam vessel, which, alike regardless of winds or waves, urges onward its resistless course; or to curb and bring within proper bounds the impetuous torrents, converting its other-wise destructive waves to our use and benefit, whether for navigation, trade, or domeetic comfort. Again, the drainage of the un-wholesome marsh, and converting it into fields of waving corn; or, illuminating our cities with gas, changing, as it were, night into day; or the fabrication of machinery of endless form and ingenuity, by means of which every article which can tend to man's comfort can be produced in the greatest perfection at the smallest cost; or to recover from the bowels of the earth, nature's exhaustless treasures, and convert them to our use. In fact, we may almost say that there is nothing in the whole range of the material world which does not come under our observation, or where the skill and science of the engineer is not required in a greater or less degree to render the bounties of Providence subservient to the good of mankind. With such splendid prospects before us we have every inducement to stimulate our zeal, and to press forward in the career of improvement. He then impressed upon the members the necessity of not only communicating good papers themselves, but of engaging the junior members of the profession in their employment to keep journals of the proceedings, and to use the materials so obtained as the basis for papers which would be of a most interesting character. The members of all classes were earnestly urged to banish all other feelings except those of unanimity, harmony, and kindness; and to make the institution a rallying point, where individuals, as well as the pro-fession generally, should meet with sympathy and support on all occasions."

Ó

REPEAL OF THE WINDOW-TAX.

Some of the largest and most influential of Some of the largest and most influential of the metropolitan parishes have determined upon petitioning Parliament to abolish this most pernicious impost. At St. James's, Westminster (the royal parish), resolutions were passed strongly condemning the tax, principally on the ground of its inter-fering with light and ventilation, and consequently with the health and happiness of the great mass of the population. At the Mary-lebone vestry last Saturday, the subject was brought under discussion; the Rev. Dr. Spry presided. Sir C. Napier said, that although the Government had a surplus revenue, and although he would support a total and immediate repeal of the window-duties, still he despaired of success—at least, he despaired that they should get a removal of the impost further than so far as it affected the poorer classes. The claims upon the Government, now that there was a surplus revenue, were pressing in the extreme, and there was one to his attention had been called which rhich affected the poorer classes, namely, a repeal of the duty on soap. The reason he was afraid that the Government would refuse to grant a total repeal of the window-duties was the vast amount they brought to the revenue-he believed no less than 1,200,000%.

On Tuesday last, a very numerous and respectably-attended vestry-meeting was held in St. Anne's parish, Westminster, Mr. W. B. Bird, churchwarden, in the chair. Resolutions in favour of a total repeal of the tax were adopted, and a petition to Parliament, founded on the resolutions, was also agreed to.

Mr. Matthew Humberton, of Clifton, near Bristol, has lately drawn up a memorial to the Premier, in which the objectionable nature of the tax is forcibly pointed out. He says, "Many and various are the claims for relief which are now being pressed upon the attention of the legislature, but of none of them, except-ing the window-tax, can it be said that ' this is an absurdity in principle,'---this is an anomaly in taxation which defies the power of human ingenuity to reduce to reason-it is like some unreal thing which we cannot understand, for although it is a tax upon windows, it is not primarily a window-tax, neither is it a house-tax, nor a property-tax, nor a landlord's-tax, a tenant's-tax, nor a tax upon wealth, nor not a tax upon poverty; but it is a compound of all these, and something more—it is essentially a tax upon LIGHT, and that not an artificial one, but the LIGHT OF NATURE, the enlivening, the pure, the holy light—an article beyond the reach of human commerce-an article beyond all price—an article as essential to our ex-istence as the air we breathe, and, by consequence, it is also a tax upon AIR, upon VENTILATION, and upon HEALTH."

-Recently, IMPORTANT TO ARBITRATORS. in the Court of Queen's Bench, Mr. Pashley shewed cause against a rule which had been obtained by Mr. Godson to set aside an award that had been made in the case Plews against Middleton. The objection to the award was that the two arbitrators, who were lay gentlemen (a builder and an architect), had received some evidence not taken in the presence of the two contending parties. They had gone to certain persons whom they knew to be in-formed on the subject of the arbitration, and had received their statements without giving the contending parties any information of their intention to examine those persons. The learned counsel contended at some length that the arbitrators here had merely been guilty of an irregularity in their procedure; that there was no pretence for charging them with fraud and corruption; and that their error in proceeding was not a good ground on which to set aside their award. The Court, without calling on Mr. Godson to support the rule, said that it must be absolute. This was not a said that it must be absolute. This was not a mere irregularity in procedure; it was some-thing against the first principles of justice. Nothing could be clearer than that a man was always entitled to hear all the evidence on which his rights and liabilities were to be decided. and where they were decided without his having that opportunity, the decision must be treated as invalid. The award must be set aside.

FIRES FROM THE OVER-HEATING OF FLUES.

THE inhabitants of Edinburgh were thrown into great consternation last Sunday week by its being discovered that the Old Gray Friars Church was in flames. The whole of the interior was destroyed, and the flames communicated with the New Gray Friars Church, adjoining, which shared the same fate, nothing but the walls of the two edifices remain. The fire was caused by the over-beating the flues of the old church. Among the property destroyed was a table once in the possession of the Reformer John Knox.

An extensive fire broke out last Saturday week in a steam flour-mill, situate in Gallowgate, Newcastle-upon-Tyne. The premises were nearly new, and had been fitted up at great expense with all the recent improvements, the model being supplied by one recently erected in the United States. The fire originated in the upper part of the building, it is supposed from the heating of the flues, whence it had communicated with some of the beams in the vicinity. The damage done is estimated at 2,000*l*.

Last Sunday morning before the commencement of service an alarm was created at Chiswick, by the outbreak of a fire in the parish church. The beadle, while repairing one of the bell-ropes, had his attention arrested by a piece of burning wood falling upon his head from the spire of the church. Upon making his way into the belfry he found the spire, which was composed principally of wood and lead, in a blaze. Having procured assistance, the parish engine was drawn out and set to work, and the fire was confined to that portion of the steeple where it originated; but it was not entirely extinguished until considerable damage had been effected, the spire being much burnt and injured by the molten lead flowing down. The ceilings are also damaged. The cause of the fire is supposed to be the over-heating of one of the flues.

From a similar cause, St. Paul's Church, Covent-garden, was in great danger of being destroyed last Thurday morning. The beadle was fortunately on the spot, and by prompt exertion the fire was soon extinguished.

THE BURIAL GROUND NUISANOE .-- Mr. Geo. Alfred Walker, in pursuance of his long-continued and praiseworthy endeavours to abate the injurious practice of burying in towns, has recently drawn attention to some disgrace-ful proceedings at Spa Fields Burial Ground. He says: - "This ground is surrounded by houses, many of them tenanted by respectable individuals. On the right is a one-story erection, called a bone-house. For some months past the neighbouring inhabitants having observed flame and sparks issuing from the chimney, entertained apprehensions that improper practices were in progress, and on a recent occasion, called upon the engine-keeper of the parish for his assistance in extinguishing what they believed to be a fire. He demanded admission, but was refused and resisted by the grave-digger. Being determined, however, to execute his duty, he seized a crow-bar, and having threatened to bleak in the door, it was opened. He observed a great quantity of coffin wood piled round the room drying, a fire made entirely of comms in the grave, and tions of human bones also. The engine keeper made entirely of coffins in the grate, and porparticularly noticed the appearance of chimney, and charged the grave-digger with having used water to extinguish the flame, which was denied; and he was told that what he "thought was water—was pitch;" and this was the fact. Thick flakes of pitch were adhering to the inside of the chimney, thus giving palpable evidence of the material consumed, -viz., coffin wood, about two pounds of pitch being used in 'pitching' round the inner joints of an ordinary coffin. The inhabitants of Ex. of an ordinary coffin. The inhabitants of Ex-mouth-street, Fletcher-row, Vineyard-gardens, and Northampton-row, in the immediate neighbourhood, have frequently complained of 'a tremendous stench' of a peculiar kind, which they say proceeds from the burning of human remains and coffins."

NEW STREET TO LONG-ACRE.-We receive great complaints against the bad and inconvenient form of many of the houses lately erected between Leicester-square and Long-Acre. We must look at them.

THE NEW MKCHANICS' HALL AT NOTTING-HAM....The foundation-stone of this building (be completion of which was celebrated last Tue-day week) was laid on the 12th of June, 1843. The erection is of brick, and stuccoed, and the front and side elevations are Grecian. The capitals of the columns are Corinthian. The external dimensions of the edifice are 124 feet long, 62 feet extreme width, and 46 feet high. The one pair is almost entirely occupied by a noble hall, 80 feet, by 45 feet, and 30 feet bigh. Under the orchestra is an upper rallerv for natural history, 50 feet long, 8 feet 6 inches wide, and 12 feet high; also a committee room, apparatus room, music library, &c. The ground, was presented to the members by John Smith Wright, Esq., of Rempstone, president of the institution.

Corresvondence.

BUILDERS' TENDERS.

SIR,—During the last year, I have been a constant reader of your valuable miscellany, and it is with considerable pain I have from time to time observed inserted under the head "Tenders" much to detract from that high tone of moral feeling and action which it otherwise inculcates? In what respect, I would ask, can your readers be edified, or that system of fair and honourable dealing which you so pro-perly advocate be promoted, by such announce-ments as are frequently to be found there? Talk about competition amongst architects, why it sinks into nothing when compared with an announcement of last week as to estimates; for we are informed that some half-dozen (I hope not builders) had met together near Wisbeach in most unworthy "Leverington Church;" and what is the result? why THE BUILDER is made the channel through which to inform the public that these worthies are ready to undertake work, I suppose from the same plans and specification (as nothing is said to the contrary), at sums varying from 25 to 60, aye 80 per cent. over or under each other; and thus builders as a body are held up to the world as men destitute of those common principles of action by which honest men are guided, and that dewhich honest men are guided, and that de-grading, demoralizing system of competition, so much practised in the present day, although condemned by all good men, is perpetuated. Now, Sir, THE BUILDER during the past year has been made the medium through which this sort of advertisement has been announced to the world, and I really feel a degree of disgust when I see the names of architects parading these puffing announcements which frequently, from the humble amounts, tell a sad, humiliating tale, but nevertheless are calculated to feed the cupidity of exacting employers, and damage the reputation of honest men; for the man whose estimate so far exceeds that of a speculator or needy adventurer is sure to be set down as disbonest, when nine times out of ten it is the only real honest offer amongst them, and the principle upon which it is founded the most fair. How do you account for these discrepancies (to call them nothing worse), in estimates for the same work, frequently pub-lished in your paper? It is true, Mr. Sugden has thrown some light on the subject in his letter of last week, wherein he states the quan-tities for the work were handed to him by some irresponsible party; on inquiry, he is informed they are correct; they contain 1,000 feet less of stone than he was called upon to use; the amount of the building is to that extent kept amount of the building is to that extent kept down, he signs the agreement and now (perhaps properly), complains of the consequence. I do think, Sir, your readers have some claim on you to exhibit in their proper colours such transactions when forced upon your attention, and not to allow those specious announce-ments "Tenders" to be published to the world with a sort of advertising impunity.—I am, Sir, yours, &c. TBUTINA. Sir, yours, &c. January 30th, 1845. TRUTINA.

[If the publication of tenders, often shewing ruinous differences between the highest and the lowest, have the effect of drawing attention, as it has drawn the attention of our present correspondent and many others, to the evils of the system, it may lead to some change, and so effect good .- ED.]

MODE OF HEATING CELLS .--- PENTONVILLE PRISON.

SIR,-In reply to "A.B.," Northampton, I beg to state that the cells at Pentonville Prison are warmed by the fresh air passing over an iron case filled with hot water, pre-vious to its being conveyed through the vertical flues leading to each cell. The apparatus was fixed by Messrs. Haden, of Trowbridge. The same system is now being adopted at the new prison at Northampton. The ventilation of Pentonville prison has been noticed more than once in THE BUILDER, but not favourably. We have, however, excellent health here, there. being very little sickness amongst the prisoners, which would not be the case under a bad system of ventilation. — I am, Sir, your obedient servant,

THOMAS LAURIE, Clerk of the Works.

CORRESPONDENCE ON NEW METRO-POLITAN BUILDINGS ACT.

WIDENING STREETS UNDER THE BUILDINGS ACT.

SIR,—There is a very narrow part of High-street in consequence of the houses having been originally built thus opposite a straight line. The freeholder and the coma straight time. In a freeholder and the com-missioners of pavement are willing to join in the expense of pulling down the fronts and setting them back, so as to make them parallel. Now the new Act, under the head "Front," says, if one front be taken down the height of one story, party timber partitions and walls under and over the same are to be taken down, and party walls substituted.

If I read this right, this great improvement cannot be made; your view of this case is respectfully requested. — Yours,

Shadwell. J. T. L.

["For the purpose of preventing the ex-press provisions of this Act from hindering the adoption of improvements," &c., the official referees are required by the 11th section to set forth to the Commissioners of Woods any grounds for a modification of its rules that may be submitted to them, and the commissioners are empowered to direct the official referees to make such an order in the matter as may appear to them to be requisite. application would not be expensive, and might readily be made : it does not seem likely, however, that it would be successful in the present case.—Ed.]

TEMPORARY BUILDINGS.

SIR,--Can you inform me, through the medium of your valuable journal, whether 1 medium of your valuable journal, whether I am at liberty to build in my garden a shed, to be used as a temporary joiner's shop for ten or twelve months, with just room for one bench, without being obliged to build accord-ing to the new Building Act? It would be clear of any other building by about 10 feet, and could not interfere with the landlord's in-surance.—I am, Sir, yours, AN OLD SUBSCRIBER.

Dover-road, February 5th, 1844. [It must be built in accordance with the provisions of the Act.—ED.]

JURISDICTION OF OFFICIAL REPEREES.

Sir,-In your paper, 25th January, you give an extract from a decision, or rather an opinion of the official referees, as to the construction of the term "already built," with reference to buildings commenced before 1st January last, in which it is stated, "the commence-ment must be a *bond fide* one; and that our present impression is, that the erection of the footings with two or more courses of the walls themselves built in a workmanlike manner, is such a commencement." From the vast number of houses so commenced, the question becomes a most important one. With every respect and deference to the legitimate antho-rity of the referees, I cannot understand how they at present assume to act in the matter they are an Appellant Court from the district surveyors, called into action only upon ground of complaint by or of such surveyors. Who has the power, or what would be the course taken to insist upon parties proving the bona fides with which such operations were com-menced? And still less do I imagine they could insist that such commencement should be done "in a workmanlike manner." The Act from the 1st January last, evidently controls workmanship and construction; but the exceptive clause distinctly implies that parties up to that period may adopt the course they have heretofore pursued. It would, from the opinion of the referees, appear that what they term a bona fide commencement would not be controlled as to any extent of work. They then define what would be sufficient under any circumstances. And, I presume, the inference to be drawn is, that where bona fides cannot be proved, a less quantity of work than they have defined would be considered an evasion of the Act, which is a term I cannot admit. It would seem, the only course that can be taken to raise the question would be by complaint of the district surveyor (treating the alleged com-mencement as nugatory), that he had received no notice of the commencement of the building. If resisted, by an appeal to a court of law upon the construction of the clause, I take it, the onus probandi would be on the district sur-

veyor- I cannot imagine the equitable jurisdiction, given to the referees for all matters arising after the 1st January, would be permitted to operate upon questions in difference Another important point is involved by the quoted opinion of the referees as to the progress of works so commenced, in which they say, "the parties concerned are at liberty to say, "the parties concerned are at liberty to pursue what course they please, so that the buildings are finished on the 1st January, 1846." To this opinion I would demur, as it appears to me, the finishing of the building is not in any way controlled. The clause treat-ing of what is to be deemed "already built," states, houses so commenced are to be "covered in and rendered fit for use within twelve months thereafter." But this is merely a permissive clause, not made liable to any penalties under the Act, which only accrue for acts of omission commission in respect of works began er the 1st January. The following clause, or after the lst January. The following clause, which is inactive as to the term "hereafter to be built," distinctly states that it is "to apply be built," distinctly states that it is to apply to all buildings to be built or commenced after the 1st day of January, 1845, or which being commenced shall not be covered in within twelve months thereafter." I would therefore inquire with whom is the power of complaint, or what penalty attaches for their not being "rendered fit for use within twelve months thereafter?" I will not further trespass on I will not further trespass on your columns, although I consider the opinion of the referees as to streets "formed after the passing of the Act" would admit of question. Yours, &c. GREENWAY ROBINS, Architect.

Hill-street, Peckham, Feb. 4th, 1845.

JURISDICTION OF OFFICIAL REFEREES.

SIR,-Referring to your note appended to the letter of "A Constant Reader" in your last No., in which you doubt the doctrine therein laid down, in respect to jurisdiction of official referees, there cannot arise a doubt that the official referees have jurisdiction in all matters upon which a difference may arise upon any point in "all buildings commenced after the 1st of January, 1845;" the question at issue is as to buildings commenced before that day. The officials have themselves admitted that they omicials have themselves admitted that they have no jurisdiction in a new district, vide their reply and directions in answer to Mr. Allen, and published in your No. 103. As to old districts, the Act 14 Geo. 3, c. 73, is still in operation in all cases of beginning before the 1st of January, 1845, and will so continue to January 1845.

continue to January, 1846.

Now, as there is very great doubt upon this point, it would be very satisfactory to me and many others to be enlightened, and the question settled, before we recommence our build-ing operations, having "already commenced" so as to come within the terms and conditions of "already built," as laid down in the con-struction of words, 7 & 8 Vict. Trusting that yourself or some of your readers will give attention to the question at issue, and enlighten your readers thereupon,--I am, Sir, &c., An OLD SUBSCRIBER.

5th February, 1845.

FALLING OF THREE NEW HOUSES IN LIVERPOOL.—Last Thursday week three new and unfinished houses in Upper Canningstreet, fell with a tremendous crash, the walls carrying nearly the whole of the joists, floors, &c., into the cellar, and smashing the timber into comparatively small pieces. The build-ings were of four stories in height, of brick, and formed the eastern end of a new row of houses on the south side of the street. Luckily no one was by at the time of the accident. We find that the lower or cellar portion of the walls to the datum level was roughly built of broken pieces of soft freestone called "nobling," and so imperfectly put together as to be inadequate to support the superincumto be inadequate to support the superincum-bent weight rising to an elevation of 46 feet. The walls were but 9 inches in thickness, which were quite inadequate for buildings of that size. The houses are upon what was formerly Mosslake-field, in which the unbroken ground is yet a black moss to the depth of 2 or 3 feet. The foundations, however, were sunk below this to apparently a stratum of soft sandstone, and the probability is that the house gave way from the cause assigned.—Liverpool Courier. Courier.

Miscellanea.

SPONTANEOUS COMBUSTION OF GUANO.— In our impression of the 28th of last September, we stated on the authority of Professor Buckland, that two churches in Italy had been destroyed by fire, in consequence of an accumulation of guano in their towers. This statement was at the time considered by many well-informed persons to be extremely doubtful. The following account of the destruction of a ship, which we extract from the Hull Packet of last week, will go far towards proving at least the possibility of such a catastrophe.— "The steam-packet Waterwitch, arriving at Hull from London, on the 15th inst, brought into port the master and crew of the barque Ann, Storey, of Sunderland, who had been picked up by the packet in an open boat, to which they had taken on the destruction of their vessel near Hasborough Sand, on Tuesday erening. It appears by the statement of the shipwrecked men that the Ann, a new barque, on the first voyage, was returning from Ichaboe with a cargo of guano, and unfortunately struck on the sand, and, while beating over, shipped a quantity of salt water, which, penetrating the cargo, caused almost instantaneous combustion. A volume of smoke rising through the fore hatchway warned the crew of this new danger, and induced their taking immediately to the boat, without saving any thing but themselves; and scarcely had they done so, when a tremendous explosion of the gas, engendered by the partially-fired guano, blew the stern out of the vessel, which then filled, and sank in deep water."

Blied, and sank in usep water. FALL OF A HOUSE AT LIMERICK.—A most appaling and fatal accident occurred in Limerick last Sunday night. A woman named Shaunessy, resident in Sheep-street, off Shaunessy, resident in Sheep-street, off Athlunkard-street, had died in the morning, and her husband, conceiving he had not sufficient room to wake the corpse in his own house, applied to a man named Mason, who lived opposite, for the use of the upper part of his house for the purpose. Masson, know-ing the rottenness of the timbers, and fearing the consequences, strongly objected. Even the deceased, offered her house, which mother of had no lofts, and where no accident could have occurred. But all was of no avail, Shaunessy persisted in having the wake at Mason's. The bouse consisted of three stories, and the upper or attic one being unoccupied, the wake was held there. A large number of women and two men were collected in the evening, when, about 8 o'clock, the floor gave way in the centre, and the entire were precipitated to the foor beneath, which also gave way, and all came to the under floor or kitchen with a tremendous crash and wild shriek, which was heard at the distance of several streets. By this melancholy accident eleven persons were killed and from sixteen to twenty grievously maimed some with legs and arms broken, skulls fractured, and one man had his back broken.

PUBLIC NUBSERIES FOR CHILDREN.—An Institution has been opened in Glasgow for the reception of children, from one to four years of age, belonging to the working classes, and is calculated to be of great service. A large building has been taken in an open part of the city, furnished with an extensive green and play-ground for the recreation of the children. The *Glasgow Examiner* says, "the ground floor contains a large kitchen, and a hall in which the juvenile community are assembled at meal hours. On the next floor there is a range of sleeping apartments, furnished in a plain, but neat and comfortable manner, and a room in which the children are tended by nurses, and, if competent, taught some useful lesson by means of drawings or pictures similar to those used in infant schools. The inmates are from one to four years of age. Some of them, whose mothers are employed during the day, remain in the institution from seven in the morning till the same hour in the evenine. During that time they are carefully attended and supplied with nutritious food for the trifting sum of twopence. Others, such as orphans, receive, in addition, comfortable lodging at night, for the same insignificant sum. Every thing, in short, is done, and done faithfully, ' to supply, us far as possible, the place of the absent parent;' and this is abundantly manifested by the appearance of the children, who seem contented, happy, and comfortable."

HEATING GREEN-HOUSES.—At the Hope Nursery, Leeming-lane, Bedale, is a small propagating-house, which is heated in an ingenious manner. The top of the furnace of the stove having been removed, it was replaced by a small boiler, from which two iron pipes, of 14 inch in the bore, proceed in the usual way, pass to the propagating-house, and enter what may be called the propagating-box, the one at the top near the front corner, the other near the bottom of the back corner; the box occupies a pit having a path before and behind; it is three inches in depth in the inside, and is formed of 14 inch deal, having a division up the centre for the circulation of water; the top is covered about three inches in depth with sand, there being an edging of wood that height all round, and in this the pots are plunged. The temperature of the house is kept up by zinc pipes, which issue from the front of the box at the corner near where the flow iron pipe enters. The whole is found to answer very well, especially in autumn and spring, when heat is most required; it is all gained heat. A span-roofed house here is glazed in a peculiar manner; the glass, after being placed on a bedding of putty in the usual way, is not puttied down, but painted with white lead of the consistence of rather thick paint; two or three coats of this are said to answer admirably; the white lead does not give way and peel off as putty often does.—*Correspondent of Gardener's Chronicle*.

FIRE ANNIHILATOR.—Dr. Ryan, of the Polytechnic Institution, has recently deli-vered a lecture "On Fire," for the purpose of explaining an apparatus lately invented by Mr. Phillips, of Bloomsbury-square, called the "Fire Annihilator." After explaining the *phlogiston* theory of the earlier chemists, and the more modern views of Lavosier and others, the lecturer proceeded to prove, that combustion under all circumstances is the result of chemical action. A considerable portion of his lecture was afterwards devoted to the consideration of supporters and non-supporters of combustion, or to those conditions which are necessary either to maintain fire or to prevent its action; he more especially pointed out the effect of volumes of free nitrogen or free car-bonic acid upon the flame of coal gas; and, after shewing that combustion instantly ceased in an atmosphere containing but a small per centage of these gases, he proceeded to explain that Mr. Phillips used a mixture of coke, nitre, and sulphate of lime, with a little water - the products of its ignition were principally free nitrogen, carbonic acid, and water vapour. To illustrate the office of the apparatus, which for a large house is only the size of a small stove, Dr. Ryan kindled a fire of patent wood, to which he added about half a pint of spirits of turpentine, in an iron house when the flame was at its height, he introduced a small apparatus, holding not more than two ounces of his material, and in half a minute the fire was completely extinguished. As the apparatus is small, and may be kept charged, requiring only the action of a trigger, on the requiring only the action of a trigger, on the alarm of fire it may be carried to any part, and immediately used. It will prove of vast utility in ships, as it may be placed in the hold, and on an alarm of fire, the trigger may be pulled, and the gas will escape, thus putting a stop to the ravages of the devouring element.

The new bridge at Besons, over the Seine, composed of seven arches of 80 fect span each, has been opened to the public. It is said to be a remarkably light and elegant construction in iron, built according to Mr. Neville's system of horizontal trussed girders, and was completed in six months.

ARTESIAN WELLS IN AFRICA.—M. Fournel has suggested to the Paris Academy of sciences, that by sinking artesian wells it would be practicable to have a constant and abundant supply of water throughout the whole extent of the desert.

STATUE TO SIR H. FLEETWOOD.—The inhabitants of Fleetwood are about to erect a statue to Sir H. Fleetwood, the founder of the town, and originator of the Preston and Wyre railway.

NEW PLASTER.—A new plaster has been invented by a lady named Marshall. It is said to dry with great rapidity, to present a good surface for painting, and to be cheap.

THE ROYAL EXCHANGE.-The merchants of London have felt themselves so seriously undersigned merchants of the city of London are of opinion that, in the construction of the new Royal Exchange, sufficient attention has not been paid to the comfort of those who attend the same, and beg most respectfully to submit to the Gresham Committee the followsubmit to the Gresham Committee the follow-ing alterations, which are necessary before they can assemble there without danger to their health and personal comfort. The altera-tions suggested are—1. That the area be covered in. 2. That some remedy be pro-vided to remove the cold damp from the pave-ment. 3. That a remedy be also provided to protect them from the current of air." Tha protect them from the currents of air." above petition ,has been signed by Messrs. Barings, Rothschilds, Heath, Morris Prevost, Barings, Roinschlus, Heath, Moris Lices, Doxat and Co., Lemme and Co., and some bundreds of the first firms in the city. After much discussion in Committee, the clerk was directed to communicate to the memorialists, "That in the month of September, in the year 1838, before the Gresham Committee took any steps whatever as to the erection of a new building, they applied by circular to most of the leading merchants and brokers, requesting their opinion as to whether the new Exchange should be a covered hall or partially open, as in the original Exchange of Mr. T. Gresham, and in the one recently destroyed; that besides, the committee took every opportunity, by personal inquiry, of ascertaining the wishes of their fellow-citizens on the subject; that the result of the circular and of these inquiries was, that a large majority wished the Exchange to be partially open, as heretofore, alleging the great noise in the Bourse at Paris, and the necessity for ventilation of the most free kind, as their reasons for the decision; that in consequence of this determination they directed a part of the merchants' area to be left uncovered as before, but that, for greater shelter, they fur-ther directed that the covered space should be increased from one-half (the proportion of the space covered in the late building) to twothirds, and that the architect of the present edifice had strictly followed out these instructions: and for these reasons the committee could not comply with the wishes of the mer-chants; that with regard to currents of air, the committee had directed such inner doors to be put up at the north and south entrances as might check the draughts, at the same time providing that such doors should not interfere with the extensive uses of the area of the Exchange as a thoroughfare to all the neighbouring streets, the Bank, the Stock Exchange, and the other important public and private buildings of the neighbourhood.

THE QUIORSAND UNDER THE NEW HOUSES OF PARLIAMENT. — Our readers may not be generally aware that the foundations of the new Westminster Palace actually float on a quicksand. Westminster Hall and the old palace for many centuries (upwards of eight) have done the same, so there would seem to be no reason for apprehension. This quicksand unless confined, has a tendency to rise, spread, and shift itself. It is thoroughly surrounded by walls of solid concrete, and above it, keeping it down like the cork of a bottle, is a deep nest of concrete. The foundation, however, of the Victoria or Record Tower, as it is called, has passed through the quicksand; because of the great weight the tower will have to sustain, a very ticklish operation was performed last week near the ventilating shaft of the present houses. To prepare for new buildings, it was necessary to excavate immediately close to this shaft, and even below it. The workmen proceeded, almost inch by inch, stopping down the quicksand the instant it began to rise. Fears were entertained for the safety of the shaft, which weighs 200 tons, but no accident whatever happened. The danger is passed, and the works are nearly done. It was curious to see the excavations exhibiting at once the old and new Houses of Lords and Commons, Westminster Hall, the crypt of St. Stephen's, the foundation of the ventilating shaft, &c.—The Bristol Mirror.

A CEMETERY AT HULL is talked of, and a public meeting is to be called to consider the proposition.

Tenders.

The tenders for Twenty-four Engines--sixteen of The tenders for Twenty-four Engines—sitten of 43-inch cylinder, or about 45 h. p., and eight of 12 h. p.—were received at Exeter by Mr. Brunel and the authorities of the South Devon Railway. The contracts were taken by Boulton and Watt, and Messrs. Rennie—the amount from 40,000%. to 50,000%. The principal Cornish engineers and founders were in attendance.

Tenders delivered for Finishing a House, com-menced by J. Brown at Walworth, for Mr. Ireland. Charles Foster, Esq., Architect, 3, Northampton-street, Islington.

NOTICES OF CONTRACTS.

For erecting and completing the Lower Sluice and Sluice-Pit at the top of the Eau, Brink Cut, about 4 miles above Lynn. — Messrs. Walker and Burges, 23, Great George-street, Westminster; or Mr. George Game Day, Clerk to the Middle Level Drainage Commissioners. St. Ivan. February 10

Drainage Commissioners, St. Ives. February 10. For the erection of New Buildings in Pembroke College, Oxford. - Plans, &c., prepared by Mr. Haywood, Architect, may be seen at the Master's

House. February 11. For the erection of two Fever Wards in the workhouse at Slough.—C. P. Barrett, Clerk of the Union, Eton. February 11. For the erection of a Cast-iron Tank, 52 feet dia-

meter and 16 feet deep; and for a double or Teles-copic Gasholder, to work in the same. Also for a double or Telescopic Gasholder, 70 feet diameter, to work in a tank 18 feet deep.—Mr. John Rofe, Engineer, Gas Works, Preston. February 12.

Engineer, Gas Works, Preston. February 12. For a supply of Railway Fastenings for the Great Southern and Western Railway, Ireland.— Mr. William Taylor, Secretary, 3, College-green, Dublin. February 17.

For such Mason's and Pavior's works (stone For such masons and raviors works (stone paving only) as may be required by the Commis-sioners of Sewers of the City of London, for the term of three years, from the 25th of March next. Joseph Daw, Esq., Guildhall, London.—February 25.

For the supply of Granite or other hard stor for the service of the Stone's End district of the Surrey and Sussex Roads.-Road Office, Charing Cross, and W. S. Gaitskell, Esq., 21, Stamford-street, Blackfriars' Road.

For supplying the Great Western Railway Company with such quantity of the following articles as may be required from the 1st of April, 1845, to the 31st of March, 1846; viz. Bar and Pig Iron the 31st of March, 1846 ; viz. Bar and Pig Iron —Castings—Bolts and Rivets—Copper (sheet and ingots)—Ironmongery, screws and nails—Brass and Iron clasp, closet tacks and wirework—Lead and Zinc—Steel for springs—Timber—Tubes, brass, copper, iron and zinc—Patent Wheel-tire, and va-rious other articles.— Chas. A. Saunders, Esq., Secretary, Paddington. February 27.

Secretary, Paddington. February ar. For the Mason's and Pavior's Works, supply of Guernsey Granite Chippings and Yorkshire Paving, for one Year, from the 25th of March next, for the which of St George. Hanover-square. Mr. R. parish of St. George, Hanover-square. Mr. R Lees, Clerk to the Paving Committee. March 4.

For the supply of 20,000 tons of Iron Rails, and 7,000 tons of Iron Chains, for the Newcastle and Berwick Railway.—George Hudson, Esq., Railway Office, York, and at 24, Great George-street, Westminster. March 4.

For the supply of 100,000 Railway Sleepers for the Newcastle and Berwick Railway.—George Hud-son, Esq., Railway Office, York. March 4.

For the supply of 11,000 feet of nine-inch iron Pipes for a new line of Aqueduct to be laid in the Island of Malta.—Vin. Casolani, Collector of Land Revenue, Office of Land Revenue and Public Works, Valletta, Malta. March 31.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

February 10.-At the Gun Inn, Eridge Green; 4,300 superior Fir Trees of various kinds, long 1. Solv superior in incess of various industriate, long length, large size, and clean growth; also a large quantity of capital Larch, 32 large Ash Trees, about 900 smaller ditto.—Mr. Hart, auctioneer, 1, Wilton-place, Grosvenor-road, Tunbridge-wells; and Mr. H. Hickmott, Eridge Castle.

February 13.-Under the Arches in the Railway Path between the Spa-road and Greenwich : A large quantity of Portland, Granite, and Bramleyfail Stone in blocks, coping. caps, steps, sleepers, paving, foot stones, Bath blocks, &c. &c.—Messrs. Southey and Son, Auctioneers, 191, Tooley-street. THE

BUILDER.

February 14.—At the Cock Inn, Rocester, Staffordshire; various lots of Oak, Ash, Elm, Alder, Aspen, Willow, Poplar, Larch, Chesnut, Fir, and Beech Trees, all lying on the banks of the Cauldon and Uttoxeter Canal.—The office of Sir William Home Southeaster building Chester William Horne, Southampton-buildings, Chancery-

William Horne, Southampton-Dultings, Challery-lane; or Mr. William Pegg, auctioneer, Uttoxeter. *February* 17, at Bristol; Feb. 18, at Dorsley; Feb. 19, at Cirencester; Feb. 20, at Leominster,— a number of Maiden and Pollard Oaks, and Maiden

a number of Maiden and Pollard Oaks, and Maiden Elms.—Messrs. Clark, Medcalf, and Gray, so-licitors, 20, Lincoln's.inn Fields; and Messrs. J. P. Sturge and Co., surveyors, Bristol. *February* 20.—At the back of St. George's-terrace, Dalston Rise; 300,000 sound new Stock and Place Bricks, and a large quantity of Burrs and Bats.—Messrs. Humphreys and Wallen auc-tioneers 68 Old Broad.street.

tioneers, 68, Old Broad-street. February 21.—At Garraway's Coffee-house, Cornhill: 300 loads Quebec Red Pine; 100 loads Yellow Pine; 100 loads of Ash; 80 loads of Oak; 10,000 Yellow Pine deals and battens; 10,000 Spruce deals and battens.

February 25.—At the King's Arms Inn, Hemel reorwary 20.—At the King's Arms Inn, Hemel Hempstead; a large Fall of capital Oak, Ash, Elm, and Beech Timber Trees, the greater portion of which are of very large dimensions and superior quality.—Mr. James Adams, auctioneer, Clarence-street, Staines, Middlesex.

COMPETITION.

Plans and estimates are required for a Work-house, to contain about 1,180 persons. The whole to be done in a plain and substantial manner, without any expensive embellishments. The plans and architects' estimates to be sent to Robert Mercer, the Clerk of the Clifton Union, Pennywell Road, Bristol, on or before the 17th of February next, and the Board of Guardians will adjudicate on the 28th. The architect producing the best plan in the estima-tion of the Board will be employed at a sum not exceeding 5 per cent. on the outlay, and a gratuity of 25 guineas will be given to the architect producing the second best plan in the opinion of the Board.

TO CORRESPONDENTS.

"Ignoramus" asks if "such a work is to be had as a dictionary of all terms used by architects and surveyors as applicable to buildings ?" An excellent glossary of such terms (170 pages) is to be found in Guilt's "Encyclopædia of Architecture." We

in Guilt's "Encyclopedia of Architecture." We are glad of an opportunity to say this Encyclo-padia is a monument of ability and industry. "Scrutator."—The correction is not advisable. "Honestas," "A Builder," and other corre-spondents who have favoured us with communica-tions on these still accident subdates. sponaents who have javourea us with communica-tions on those stir-exciting words in the Buildings Act, "commenced before," must pardon us for not publishing them. They would occupy the whole of the journal. The subject is discussed in more than

one part of the present number. "J.H. (Pontypool)" wishes to know the materials used for polishing marble, and how they are to be emplied applied. "G. R.,"

applied. "G. R.," if he will kindly refer to former numbers of THE BUILDER will find that the fallacies of London Building Societies have already been fully exposed in our pages. The pamphlets and his request shall be forwarded. We shall be happy to hear from him on other subjects.

ADVERTISEMENTS.

TO STONE MERCHANTS, MASONS, CONTRACTORS, AND BUILDERS. CLIFF and HUSLER take this oppor-

Utiff and HOSDER take this opposi-regement they have received since opening their Stone Wharf near the Ferry-house, Isle of Dogs; and, while expressing their gratitude, would assure their numerous customers that no exertion shall be spared to render this wharf a dept where at all times their orders can be supplied with Stone of the best quality, and with promptitude and disnatch.

with Stone of the best quality, and with promptitude and dispatch. There is now a large stock of Self-faced and Tooled York Landings and Paving, Tooled Steps, Sinks, and Coping; fine Slabs for Chimney-pieces and Hearths. All kinds of Yorkshire Block Stone, Bromley Fall, Harchills, Parkspring, and Robinhood. A large and choice selection of Portland and Bath Stone from the best quarries. Fire Bricks, Lumps, Tiles of every description; Lump and Ground Fire Clay. N.B.—Orders for Cargoes to be delivered direct to a wharf or in the river, executed at short notice and on the most liberal terms. A powerful Crane on the Wharf, and Stone and Goods Landed and Re-shipped on reasonable terms. Agent: JOHN TRICKETT, No. 14, Ferry-street, Iale of Dogs.

HATCHER'S BENNENDEN TILE-MACHINE, Manufactured and Sold and Sold and MACHINE, Manufactured and Sold only by COT-TAM and HALLEN, Engineers, Agricultural Implement Makers, &c., 2, Winsley-street, Oxford-street, London.

This is the most efficient Machine that has been invented for the purpose of making Urain Tiles. Any shaped Tile can be made by merely changing the die, which can be done in a few minutes. It requires but few hands, vis., one man and three boys. With this amount of labour, the pro-duct of a day of 10 hours is as follows, vis:--1 inch diameter of Tile, 11,000 12, ..., 8,000 12, ..., 8,000 12, ..., 8,000 12, ..., 8,000 12, ..., 8,000 12, ..., 8,000 12, ..., 8,000 12, ..., 8,000 12, ..., 8,000 13, ..., 8,000 14, ..., 8,000 15, ..., 8,000 16, ..., 8,000 17, ..., 8,000 17, ..., 8,000 18, ..., 8,000 19, ..., 8,000 19, ..., 8,000 10, ..., 8,000 11, ..., 8,000 12, ..., 8,000 12, ..., 8,000 13, ..., 8,000 14,

TO BRICKMAKERS AND OTHERS. **J**ONES'S PATENT BRICK and TILE-MAKING MACHINE.—With the view of making the public more extensively acquainted with the Advantages resulting from the use of his Machines, the Patentee has had a Brick-making Machine, with all the recent improve-ments, erected by Mesers. Easton and Amos, Kngineers, and the same may be riewed at work at the Patentee's premises. Queen's Wharf, next the Star Coal Wharf, King's Roed, Old Street, Pancras Road. on and after the 13th inst. between the hours of eleven and three. These Machines will enable the Brick-maker to mould cheaper and better Bricks, which will dry in one-third less time, require less straw and stack ground, and burn better, and will save the expense of pug-mills and moulds. Machines supplied or let on hire, and licences gra ted on application to the Patentee at the above address, where Prospectuses may be procured, as also on ap-plying by letter (post paid) to Mesars. Cardale Cardale and Jliffe, Solicitors, 2 Bedford Row.

SATURDAY, FEBRUARY 15, 1845.

3 T is much to be desired that the construction of our ordinary dwelling - houses should be improved. The system at present pursued in row after row, and square

after square, is defective in the extreme, and contradicts very strangely our assumed advances in scientific knowledge. Use begets indifference : whatever has answered the purpose once will do so again, it is thought, and so men go on year after year in the same defective course, without once thinking of its inefficiency or making any efforts at improvement, which in many cases might be effected without any immediate increase of expense, and in all with a positive saving ultimately. The assistance of architects is seldom sought in the construction of small houses; their attention, therefore, is hardly called to the subject, and the result, unfortunately, is that even in cases where they are employed, the same beaten track is pursued; additional effect, if any thing, is alone aimed at, and the employer sometimes finds that his houses have cost him more money, but are little improved in stability, arrangement, or convenience, by the interference of the man of taste. It is a study that would amply repay serious consideration, and loudly demands it; and that not merely as regards sound construction, but as to the mode of heating, ventilating, draining, and lighting houses, to which little or no attention is ever paid. Let us look at one of the "eight roomed houses," of which hundreds are in progress towards completion in the suburbs of the metropolis at this moment. A shell of 9-inch brickwork forms it, divided in the centre by a few upright pieces of timber reaching from floor to floor, and framed into a head and cill:-in some there is no cill, the head of the lower partition forming the cill of that above it, and the omission is a gain. At the top of the building a gutter plate, supporting the rafters of the roof on either side, passes from the front wall to the back in the middle of the house, and rests in the centre of its length on the head of the upper partition. The timber in the partitions, which is usually saturated with water, necessarily shrinks in drying, and reaching in lengths, as it does, from the bottom of the house to the top, of course allows the roof and floors to sag very considerably; and the mischief is further exhibited by numerous cracks in the plaster and paper in every room. In the front-wall the openings are usually so placed as to bring the upper masses over the lower voids, and are always covered by an arch of such defective construction as to be literally useless. When, in addition to these and numerous other errors, we see the mode in which the brickwork is often executed-mortar-joints, or rather mudjoints, three-fourths of an inch thick, upright joints one over another, and scarcely any beaders running through the wall-it becomes surprising that so few accidents are heard of. It must not, however, be supposed, that none occur; walls are constantly falling, houses not unfrequently, but very few of these mishaps become known to the public. We have examined two or three fallen 9-inch walls within this last week, and have found them have great faith. Going on then to treat of

consist of two half-brick leaves, which had separated, bulged, and fallen; and we do not hesitate to assert, that there is a tendency to this same result in the greater number of walls now raised by speculative builders. Nothing, indeed, can be worse than the greater part of the brickwork raised in and round London, and we cannot too strongly condemn it or too loudly call for an alteration. The use of Flemish bond has greatly aided to make bad workmanship general, and it is much to be desired that the prejudice which exists against the appearance of English bond could be overcome, as it is certain that by this mode the greatest strength is attained. nine-inch wall properly executed in English bond, with only just enough mortar (of stonelime and Thames sand) to connect the bricks, is stronger, and more effectually keeps out the weather and keeps down the damp, than a wall double that thickness of brickwork such as is too generally found in ordinary buildings. An improvement in the construction of houses concerns us all: we shall lose no opportunity to revert to the defects of the present system, and to suggest the means of remedying them.

MR. COCKERELL'S FIFTH LECTURE ON ARCHITECTURE.

MR. COCKERELL commenced his lecture on Thursday, the 6th inst. (at the Royal Academy), by saying he should treat of the distinctions made by the ancients between civil and sacred architecture, and which, unfortunately, were not regarded by the moderns; and afterwards speak of various buildings used by the Romans -mural decorations, arrangement of ceilings, c. The method he had adopted in this &c. course, namely reviewing ancient buildings, and more especially Greco-Roman remains, was not for the purpose of displaying erudition, but from conviction of the practical advantages that would result to the students from pursuing it. The last half-century had greatly in-creased our materials for such an examination, and there was no excuse if we neglected it. To make these lectures merely antiquarian, would have been waste of time; his object was to make them practical. In examining the works of the ancients, we should strive to graft their ideas on our own. The architects of the sixteenth century confessed the superiority of ancient works over those of the middle ages. Bramante practically studied Vitruvius, so did Palladio and others, and laid down principles which have been received, and raised works that are models for imitation. The professor mentioned Colonna as being imbued with love for ancient art, and spoke of his imaginative work on the arts, which took you into the solitude of ancient cities, and raised beautiful visions of ancient skill. If reading Robinson Crusoe had made many sailors, Colonna's work should make many architects. Mr. Wightwick's "Palace of Architecture" was formed on this model, but he had omitted to enlist the feelings.

Genius afterwards became fettered by the rules which had been laid down, and the result was a revolt in the time of Bernini. He again referred to Canina's work, as affording materials for study. The more completely ancient works were investigated, the greater would the reputation of Vitruvius grow. With Canina for a guide they could not fail to be improved.

The recent devotion to Greek art had done good, but had been exclusive. Practically, architecture had suffered since Vitruvius had lost his credit. The want of distinction between civil and sacred architecture, to which he had referred, was a crying sin in modern practice, as also was the manner in which interiors were treated. Vitruvius expressly interiors were treated. Vitruvius expressly stated that the entablature should be diminished in interiors, but we used the same mass as if it were in the air, which always had the effect of reducing it. The architects of the Revival had observed these distinctions, but not rule. He then examined the Palace of the Quai d'Orsay, at Paris, and some of the works of Schinkel, in whose ability he professed to

civil buildings, he described the Theatre of Pompey, 1,000 feet long, and 532 feet wide, and a few of the porticoes at Rome. The magnificence of some of the theatres was almost incredible: they were used as a sort of Parliament House. In the centre of the scene in theatres of late date an apse was formed, probably to aid the voice. He deformed, probably to aid the voice. He de-scribed the magnificent velarium or awning put up by Nero.[•] Sir Christopher Wren had taken a hint from this for his theatre at Oxford. The velarium at one of the theatres was 550 feet by 450 feet. It required great Its prin-dge. The skill, and was managed by sailors. ciple was that of the suspension-bridge. The professor remarked that when he restored the ball and cross at St. Paul's Cathedral they were obliged to employ sailors in the operations

Returning to the subject of proportions for interiors, he ridiculed the practice of applying details from the exterior of the Parthenon in a drawing-room, or executing in joinery the doorway from the Temple of Erectheus for a doorway from the Temple of Erectheus for a small chamber. It was illogical to employ the same proportions for two different purposes. When speaking of large rooms, he mentioned the Bank parlour as a very admirable apart-ment. By pictorial art we might make rooms seem much higher than they really were. The appearance of extent given by using a number of small parts is shewn in Gothic works. The Adams', considered the side of a room as much as the front of a house. It was de-sirable that it should be represented on paper to a large scale, so as to induce the introduction of greater number of parts to fill the space. When speaking of courts of justice the professor remarked that modern courts of justice were very badly arranged, especially as regarded ventilation.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

An ordinary meeting of the institute was held on Monday evening, the 10th inst., Mr. J. B. Papworth, vice-president, in the chair, when Mr. John Burley Waring and Mr. Nathaniel Thomas Randall were elected associates. Herr Gruner acknowledged the honour of his election as corresponding member, and invited all members of the institute to visit

him when they came to Rome. Mr. George Hawkins read a description of King's Scholars' Pond Sewer, particularly with reference to some recent constructions at Pimlico, which will be found at length in another part of the journal. The paper led to an in-teresting conversation. Mr. Poynter remarked on the badness of the drainage in Paris. As late as the year 1832, when the cholera was talked about, there was no sewer in the Rue Castiglione or in many other equally important streets, although there was every faci-lity for discharging them into the river. Mr. Fowler said, that Berlin was even now quite destitute of a system of sewers. Being built on a sandy flat, little or no fall was to be obtained: deep gutters were dug in the streets, and into these the soil was allowed to run and to remain there for some time. At Hamburg since the great fire, they have adopted a most complete system, under the direction of Mr. Lindley. A plan for the whole was laid down in the first instance, and would be gradually carried out. It was such an extensive work, that thousands visited it, as one of the lions of the place. In order to carrie the miner to remain there for some time. At Hamburg the place. In order to carry the main sewer across the river, it was made to dip about 4 feet; the accumulation of deposit was prevented by periodically allowing a flush of water to pass through it.

Mr. Rode Hawkins then submitted some drawings of a restoration of one of the edifices at Xanthus, from sketches taken on the spot, accompanied by an explanation of the sculptures and architecture. A description of the building will be found in our report of Mr. Cockerell's fourth lecture.

Relative to cleaning the sculptured portions of it, now in the British Museum, Mr. C. H. Smith said he had observed a labourer at work upon them in a very injurious manner, and hoped greater care would be taken. t was understood that Sir R. Westmacott had been deputed to superintend the operation, and we may, therefore, rest quite satisfied that it will be properly performed.

THE BUILDER.

ON THE DRAINAGE OF A PART OF LONDON.

WITH & DESCRIPTION OF THE KING'S SCHO-LARS' POND SEWER."*

At the present day it would be superfluous to dwell at any length upon the benefits derivable in a social point of view from a complete and efficient system of drainage. Its increasity and importance are now universally recognized and admitted; a fact not only evidenced by the very generally expressed desire upon the part of the community to promote its extension, but likewise by several recent legislative enactments framed for its special provision and regulation, and the still increasing interest elicited by the subject.

The wisdom of ancient Rome was not the less conspicaous in her external policy than by those internal arrangements and municipal regulations by which the health, comfort, or convenience of her citizens appear to have been specially studied; and certainly among those public edifices and monuments, whose magnificence is recorded by the historian, or whose ruins now arrest the attention of the traveller, there are nonewhich more forcibly exhibit to us the wealth, magnitude, and extent of the Roman city, than the remains of those subterranean adits formed to receive and convey away the sewage and refuse of her immense population.

In a warm elimate, and among a people where the bath may be considered the almost indispensable luxury and appendage of every dwelling, it is obvious that, next to providing the requisite supply of water, the most important consideration was to secure a ready and expeditions means of discharging the waste from each, as well as from the numerous public fountains and aqueducts of the city: we accordingly find the arrangement and conservation of the sewers to have been at all times an object of especial care on the part of the Roman government.

The laying out and construction of the Roman sewerage upon any definite and regular system is said to have been first commenced in the reign of Tarquinius Priscus, about 600 years before the Christian era. To the same years before the Christian era. To the same period is ascribed the building of the Cloaca Maxima, a work of both historical and architectural interest, since in its date is involved the question of the antiquity of the arch. Some writers, however, are disposed to attri-bute the present covering of the Cloaca Maxima to a much later period, probably when the sewers generally were repaired by M. Agrippa. But a monument which still continues to exist, after the lapse of nearly twenty-five centuries, may, independent of any other circumstance, still excite our interest and admiration, more especially when we consider that in the midst of the degradation and ruin attending her proudest works of art, this great and useful structure of the Roman city retains in some degree its original purpose, and may still be supposed to minister to the health and comfort of her modern citizens.

The arch of the Cloaca Maxima is formed in three concentric semicircular rings, with an aggregate thickness of 5 feet 11 inches. It is built of Peperino stone, and there are occasional introductions of large blocks of Travertine, which no doubt have been inserted in some of the later reparations of the sewer. The interior is perfectly regular, and for so much as remains in continuation, which is about 44 feet, is generally in good preservation; it is about 13 feet in width, and as many in height. In the walls are stone brackets to support the ends of the waste pipes of the fountains; each block of stone measures 7 Roman palms 3 inches in length, and 4 palms 4 inches in thickness. The course of the Cloaca Maxima corresponded nearly with what has been considered to be the most ancient limits of the city. It had its origin very near the site of the arch of Severus, then it passed under the Via Sacra to the Temple of Julius, turning thence under the Via Nova, and skirting the Palatine Hill to the Forum Boariam, which it crossed; it proceeded in a straight line towards the Tiber, into which it discharged a little below the Ponte Rotto, and nearly beneath the "little Temple of Vesta," the whole length being altogether about 1,800 feet (2,500 palms).

As affording some notion of the importance

* Read by Mr. G. Hawkins, at the Institute of Architects.

and extent of the Roman sewerage, it is re-corded by Dionysius of Halicarnassus that upon an occasion when they had become neglected, the censors concluded a contract for their cleansing and reparation for the sum of 1,000 talents, equal to 193,000%. For the maintenance of the public sewers, there was For the a tax levied called the cloacarium, and in the time of the emperors they were placed under the control and charge of the public officers specially appointed for the purpose. In re-garding the extent of these works and the great expenditure which must have necessarily been incurred by the Romans in the perfecting and maintaining such a system of sewerage, we must not lose sight of their extreme and vital importance to a city, of which the ordinary daily supply of water by the various aqueducts alone, irrespective of that derived from wells RIO and other sources, has been estimated at 50 millions of cubic feet, a quantity nearly ten times the present supply of the metropolis by the different water companies, and of which some adequate notion may be formed when we consider that it is more than equivalent to that contained by a lake 380 acres in extent, and 3 feet in depth. However large, therefore, the capacity of the Cloaca Maxima may appear, it cannot be considered much more than adequate to the ordinary duty it had to perform even in dry seasons, and without the concurrence of those sudden and violent storms to which the climate and latitude of Rome are subject.

In England the earlier statutes and laws, upon which the constitution of the different commissions of sewers is based, appear to have had more particular reference to the drainage of open fen-lands, and the protection of districts subject to inundation, or the overflow of the tide. In fact, in the establishment of the various commissions, little else was contemplated beyond providing a quick and ready conveyance of the surface-waters to their respective outfalls. The circumstance, however, of several of the commissions of sewers embracing within their jurisdiction large portions of town districts have, in complicating their functions, necessarily induced an extension of the objects for which they were originally founded.

Before the general adoption of arched sewers, London was subject to the plague and other periodical endemics; and the accounts of contemporary writers of the filthy and disgusting state of the public streets, arising from a want of proper municipal regulation and defective drainage, even so recently as towards the close of the seventeenth century, are scarcely at the present time credible; and the surprise is not so much at the often times fatal and devastating effects of these visitations, but that the city should ever have been free from their influence.

The intimate connection between the sanatory condition of a town and its state of drainage was strikingly illustrated by Dr. Southwood Smith in his evidence before the committee of the Health of Towns. "If," said he, "you were to take a map, and mark out the districts which are the constant seats of fever in London, as ascertained by the records of the fever hospital, and at the same time compare it with a map of the metropolis, you would be able to make out invariably, and with absolute certainty, where the sewers are, and where they are not, by observing where fever exists; so that we can always tell where the Commissioners of Sewers have been at work by the track of fever."

From a strict and perhaps necessarily limited interpretation of the original statutes on the subject, it was not before the commencement of the present century that soil-drainage was allowed to be passed into the public sewers; previously to that period each house had its system of cesspools, into which not only was discharged the whole of the excrementitious matter of the inhabitants, but the almost equally offensive suillage of the sinks and sculleries of the dwellings, the cleansing of which cesspools was a regular and periodical operation, entailing great expense not only to the occupiers, but likewise much annoyance to the inhabitants of the vicinity. This system, however, is happily almost superseded, and the business of nightman, formerly so offensive, is now scarcely known.

But upon closer investigation, and taking into consideration the circumstances of the period, the necessity for cesspools, and consequently these restrictions, were not without some reasonable ground; the limited supply of water for domestic purposes was considered insufficient to drive the more solid matter through the drains into the sewers. This objection, however, can no longer hold, since the water supplied by the different companies is both abundant and sufficient to act as an effectual scour not only to the private drains of the hoases, but also to the public sewers into which they are discharged. The metropolis and its immediate vicinity is

The metropolis and its immediate vicinity is divided among seven different commissions or trusts, in whom are vested the charge and control of the public sewers, with the power of raising rates for their maintenance and improvement. Among these the most important, both from the value of the property within its operation and the extent of country subject to its administration, is the Commission for the "City and Liberty of Westminster and part of Middlesex," the active jurisdiction of which extends from Temple Bar, along the northern shore of the river Thames to Fulham, and northwards from the Thames as far as Hampstead and Willesdon.

This district, comprising an area of nearly 18 square miles, is divided into four divisions or valleys, upon which separate assessments of the sewers' rates are levied. These are known as the eastern and western divisions of the Westminster Sewers, the Ranelagh, and the Counters Creek. The above arrangement is not arbitrary, but is indicated and marked out by the natural configuration of the country itself, being in fact four distinct levels of drainage, each discharging, independently by its own outlets, the waters collected on its surface.

With these few general observations I shall at once proceed to the main object of the present paper, which is to give a brief description of some of the most important improvements effected within the last few years in the sewerage of the second or western division of the Westminster Sewers, more particularly as connected with its main line of outfall—the "King's Scholars' Pond Sewer," which receives by its various collateral branches nearly the whole drainage of this district. The course of this main sewer is pretty nearly through the centre of the valley or district drained by it, and almost in the channel formerly occupied by a rivulet known in early days as the Aye brook, having its source at Hampstead, from the overflow of a spring still in existence, called the Shepherds' well. This, before its stream had become polluted by the encroachment of buildings on its banks, supplied a pond used in those times by the King's Scholars of Westminster for bathing, and supposed to be situated somewhere near to the present site of Vincent-square, from whence it is believed originated the present name of this sever. The whole area of the western district is about 2,300 acres, of which nearly 2,000 are drained by the King's Scholars' Pond sewer; of this surface about 1,500 acres are covered by streets and houses, the number of assessments being about 16,000.

In considering the King's Scholars' Pond sewer as a discharging line of drainage, it must be borne in mind that there belongs to it this essential feature peculiarly distinguishing it from the Fleet, the Ranelagh, or other main outfalls of the metropolis, and which involves a principle of operation entirely differing from them. I allude to the fact, that the whole of the lower portion of the district drained by this sewer, including the larger section of Westminster, comprising an area of nearly 500 acres of valuable house property, is below the ordinary high tide level of the Thames.

As a security to this low district, it is therefore essential that a free emission of the sewage into the river be restrained always at that point by which it might through the ingress of the tide be affected, and consequently the action of the discharge is necessarily limited by gates at the outlet to a short period preceding and subsequent to the flood, being altogether scarcely six hours in the twelve. As an additional protection against any sudden and accidental irruption of the tide, each of the collateral sewers and drains of the main line is carefully guarded, as far as the high tide level, by self-acting flaps. Thus it is obvious, that independently of

Thus it is obvious, that independently of receiving and discharging the drainage of u surface amounting to upwards of 2,000 acres this sewer has to retain at its lowest end, at a secure level to the district, for a period of six hours in the twelve (during the rise and recession of the tide), the whole of the sewage accumulated in that time.

The usual quantity of water thus held back, in dry weather and under ordinary circumstances, is about 100,000 cubic feet; but during storms and falls of rain, this, it is evident, must be far short of the actual quantity passing down the sewer, which, to act effectually as a reservoir, ought to be of sufficient capacity to meet every emergency, otherwise upon the concurrence of a heavy storm of rain with a high flood tide, the same liability would arise of submerging the district; but in this latter case, by the water pent back within the sewer.

This consideration has been the chief difficulty attending the question, and has oc-casioned what may at first view appear to have been an unnecessary enlargement of the sewer at its lower end. When, however, we take into account the extent of surface drained, and estimate the quantity of rain falling upon it during the six hours when the gates are closed at half an inch in depth over the whole surface (which is a moderate computation), and supposing even one-half of this quantity absorbed by the ground, there would still remain nearly two millions (1,815,000) cubic feet of water passing down the sewer, requiring a reservoir of nearly seven acres in extent, and six feet in depth,-we are not surprised to learn that even the present large capacity has been occasionally found insufficient, that more than once the water within the sewer has risen to the height of the external tide, or nearly 14 feet above the cill of the gates.[•] It is evident, therefore, that those few and general principles applicable to the drainage of ordinary districts are, from the peculiar circumstances already alluded to, insufficient for the relief of the one under consideration, and consequently the question of its efficient drainage has at all times been a matter of frequent and earnest consider-ation with the Westminster Court of Sewers. About the commencement of the present century the attention of the court was seriously and more particularly drawn to the subject, and to the necessity of providing an improved outfall for the general relief of the district. Among the reasons which more particularly concurred to urge this, not the least was the fact that, in consequence of the recent great increase of buildings and paved streets in the district (independent of the proportionate increase of sewage thereby occasioned), any sudden fall of rain, from there being less absorbing and retaining surface, was carried immediately into the main sewer. This was not only found to be altogether insufficient in capacity, but, from its irregularity of levels and extremely tortuous course, had the effect of so far damming back the stream, as to occasion, more than once, considerable damage to the adjoining property. It was, moreover, in parts exceedingly old and dilapidated, and the increasing value of the ground near Pimlico, as well as towards the lower parts of the district about Westminster, called strongly for some more efficient protection.

As the present object is more to describe the improved state of this sewer than its original capacity or condition, I need merely observe that, in consequence of these reasons and representations from the inhabitants, complaining more or less of the inconvenience and madequacy of the relief afforded by the old line, the court was induced to seek the professional assistance of the late Mr. Rennie, upon whose report, and that of the late surveyor, Mr. Tredgold, much of the subsequent improvements have been effected. These have comprised within the last forty years an entire re-construction of the old line, from the I names to St. John's Wood, at a lower level and considerably enlarged capacity, a diversion of its course where it passed underbuildings, or was otherwise objectionable, with new outlets, gates, and gate-house, including at the lower end a recervoir for the back-water, these last carried

• Taking the total number of houses drained by the Erzr's Scholars' Pond sever at 16,000, the ordinary daily account of back water would give about 22 cubic feet of wware for each house in the twenty-four hours, about 10th short of the average supply to each tenement by the Bra River and other water companies. The deficiency may 17 and the taken as a approximate measure of that lost by www.retuon and absorption before passing into the public sever. But in the case above assumed of a fail of rain, the Brandruck density absorbed would, no doubt, be Transferribly higher.

out under the direction of the eminent engineers Messrs. Walker and Burgess.

It was before observed that the King's Scholars' Pond sewer was originally known as the Aye brook, a small rivulet, which, in common with the Fleet and others of the now scarcely remembered streams of London, and recorded by the old chroniclers as being both the pride and recreation of her citizees, had its source in the hills near Hampstead, and, following the valley of the western district in a direction nearly north and south, discharged itself into the Thames at no great distance from the site of the present outlets.

The King's Scholars' Pond sewer runs very nearly in the original channel of the Aye brook; commencing at Hampstead, it still receives the overflow of the Shepherd's well, and for nearly a mile through the meadows, as far as the Marylebone and Finchley road, is open, and preserves yet much of its primitive and rural character. Thence it begins to be covered, and to the Primrose Hill road is 5 feet in height and 2 feet 6 inches in width; along the latter road to the bridge over the Regent canal it is enlarged to 6 feet in height by 4 feet in width, receiving in its progress the drainage of Portland Town and St. John's Wood. The surface of the roadway not admitting of the last height, the sewer for a short distance is somewhat reduced, and for the sake of headway is covered with cast-iron plates. From the south side of the canal it continues with a gradually increasing capacity along the Park-road, Upper Baker-street, York-place, Dorset street, and Manchester-street, where it is 7 feet 3 inches in height by 6 feet 6 inches in width. Proceeding then across the centre of Manchester-square, it passes along Duke-street to Oxford-street, when, turning to the eastward as far as Avery-row, along which continuing in a direction nearly parallel to Bond-street, it cuts the south-east corner of Berkeley-square at the foot of Hay-hill; thence, turning to the westward, it passes under Lansdowne-passage, Bolton-row, Sun-court, White Horse-street, across the Green Park, and through the court in front of Buckingham Palace, where its dimensions are 8 feet in height by 9 feet 6 inches in width. Beneath the south wing of that building, under which the sewer passes, is a vaulted chamber or subway, and within it is fixed a simple contrivance, of a cast-iron valve and pentstock, by which the water from the main line may readily be diverted for the purpose of cleans-ing the flat sewers of Westminster lying be-tween the palace and Millbank.

The line now continues along the Pimlico road as far as Charlotte-street, between which to the Stag Brewery its dimensions have en-larged to 10 feet 9 inches in height, and 9 feet 6 inches in width; beyond this it passes between the back of the houses in Trelleck-terrace, and the premises of J. Lettsom Elliott, Esq., as far as the intersec-tion of the Vauxhall bridge-road. This last portion is open and is 16 feet wide, and con-fined on each side by retaining walls 12 inches above the level of the highest known tide of the river. Beyond the Vauxhall-bridge-road, the sewer is open to Warwick-street, but with a greatly increased sectional area for the waterway, the form being an inverted elliptical arched bottom, with a chord line of 19 feet 7 inches, and a versed sine of 3 feet 4 inches, confined by sloping earth embankments, whose superior edge is raised 12 inches above the highest tide level. From Warwick-street to White's-bridge the sewer is again covered, being 19 feet 7 inches wide at the springing, with a head-way of 13 feet 4 inches; and for 140 feet be-yond this last point the size is again increased, being 20 feet in width and 14 feet 2 inches in height; whence to the gates at the outlet, pas-sing to the eastward of the works of the Equitable Gas Company, the sewer continues open with retaining walls carried above the highest tide level, being, however, for a length of 250 feet from the sluice gates further en-larged to a width of 40 feet, for the purpose of obtaining additional reservoir capacity.

The gates, of which there are two pairs, are of the ordinary lock construction, 28 feet wide, inclosing a chamber built of solid masonry; they incline to the river, and present a superficial aperture towards it of 274 square feet; they are placed under the charge of a gate-keeper residing on the spot, whose duty is to close and open them each tide. The object, I should

observe, of the second pair is merely precautionary, and used only in the event of the first being out of order or under repair.

The whole length of the King's Scholars' Pond sewer, thus described, from its source at Hampstead to the river Thames, is rather more than 51 miles, of which distance about 4 miles are arched over. The total fall from the Park-road, at the end of Baker-street, to the cill of the gates is 79 feet, giving an average current of about 1 in 220 for the whole distance. Until the last year the arched portion of the King's Scholars' Pond sewer terminated at the part near to Charlotte-street, Pimlico, but upon the application of Mr. Thomas Cubitt, whose property abuts upon the line, to arch over certain portions of the same, the Court of Sewers was induced to concede its permission conditionally upon a public roadway being preserved throughout the entire length so covered. This was guaranteed, and the work was executed according to a section furnished by the commissioners, and under the direction of their officers. It was at the same time decided that Mr. Cubitt having completed the portion undertaken by him, the remaining length of 500 feet down White's-bridge should be covered over at the expense of the district; the contract for which was subsequently taken by Mr. Cubitt for 1,350% being at the rate of 2% 14s. per running foot inclusive of shafts, &c. 'The in thickness and 19 feet 7 inches span, raised upon the old elliptical arched bottom, with counterforts or buttresses at every 10 feet, 2 feet3 inches wide by 1 foot6 inches projection. The whole backed with concrete to the height of the haunches of the arch; the first few courses above the old work are in cement,

The above portion of the sewer presents a superficial area of water-way, amounting to 210 square feet, being nearly one-third greater capacity than the Cloaca Maxima of Rome. At certain intervals there are inserted in the crown of the arch cast-iron gratings, for the purpose of giving vent to the air liable to accumulate with the descending water, which otherwise, if confined, might be apt, upon any sudden rise of the stream, to blow up the arch of the sewer, There are also, at intervals of about every 180 feet, descending shafts for the purpose of occasionally inspecting and repairing the work,

It may readily be supposed that the reconstruction of so important a work from the Thames to St. John's Wood, a distance of nearly 18,000 feet, undertaken in the crowded thoroughfares of a large city, subject to the hourly interruptions of its business and traffic, has not been accomplished without a considerable degree of labour, perseverance, and expense. The total outlay upon this sewer alone, within the last thirty years, I may venture to say, has been little short of 130,000%. But the benefits have more than compensated even this vast expenditure. Property of the most valuable description in the neighbourhood of the sewer, including Buckingham Palace, the lower floors of which are below the high tide level. and many of the streets adjacent to the sewer, between Piccadilly and the Regent's-park, have been improved to an incalculable extent. Formerly, many localities in the neighbour-hood of the sewer were inundated by every sudden heavy fall of rain, so that many of the houses in Berkeley-square, Bruton-street, Avery-row, South Moulton-street, Wigmorestreet, South-street, Baker-street, and Springstreet, were greatly depreciated in value, and some houses in Berkeley-street and Brutonstreet remained unoccupied for many months together, in consequence of the well-known fact, that in the summer months those premises were subject to have their lower floors blown up during thunder storms, and their kitchen fires extinguished by the waters descending the sewer. If, however, farther proof were required of the extreme value of a good and efficientsystem of drainage, such as that adopted by the Westminster commission, I need only instance the very important property now rendered available between the Pimlico road and the river Thames; in fact, the district below the high tide level, and formerly subject to its periodical irruption, which, from being heretofore little better than a swamp, perfectly valueless, and most injurious to the health of the neighbourhood, now promises to become one of the most splendid and luxurious quarters of the metropolis.

THE BUILDER.

HEALTH OF TOWNS.

At a public meeting held at Exeter Hall, on the 11th of December last, the Marquis of Normanby in the chair, an association was formed for the purpose of diffusing among the people the information obtained by recent inquiries, as to the physical and moral evils that result from the present defective sewerage, drainage, supply of water, air and light, and construction of dwelling-houses; and also for the purpose of assisting the legislature to carry into practical operation any effectual and general measures of relief, by preparing the public mind for the change.

The Committee have recently published the speeches that were made on that occasion, and will do good if they circulate copies of the report containing them as extensively as possible. As the noble chairman said at the meeting-

ing-"The question before the public is not one merely of bricks and mortar, of ventilators and drains. His valued friend, Dr. Southwood Smith, had proved in his evidence that filth and discomfort deteriorate the moral condition; that the worst places contain the greatest criminals." Without pretending to go through the whole

Without pretending to go through the whole of the speeches, we may allude to some observations made by speakers which escaped notice at the time. Relative to sewers, Sir R. H. Inglis said, that in Lancaster, excellently situated for drainage and sewerage, and yet most imperfectly provided with either, and where, in consequence, disease and mortality were very great, the sewers were in a square channel; a form which, if a mathematician were to sit down and calculate what would be the most unsuitable, would be selected by him; bad as it is on principle, it is equally rejected by all experience. The great sewers of Rome, indeed, built two or three thousand years ago, remain—in their arched form and their solid construction—the model of all others. Yet this square shape is persisted in at Lancaster; the doctrine being laid down, he would not say by whom, when an improvement was pointed out—" No, we don't copy *nought* here."

the doctrine being laid down, he would not say by whom, when an improvement was pointed out—"No, we don't copy nought here." Mr. B. Hawes, M.P., remarked that "peo-ple rejoice when what is called a low neigh-bourhood is visited by a new line of street. The houses of the poor are pulled down, and doubless, even as things are, good, great good even is now done. Nevertheless the people even, is now done. Nevertheless, the people even, is now done. Nevertheless, the people must find homes somewhere. New alleys and courts are built. Are they well lighted, or drained, or ventilated? Let any one go into the new districts, and see the provision made for them. Are any of the modern improve-ments introduced such as they find accertical He thought not, or at least in a very slight degree. There are plans now forming in the district in which he lived. Plans for new streets. He gave no opinion upon the merits of any particular plan. He spoke generally, and he found no provision for dwellings for the labouring classes; or if they are provided, the last thing thought of are these sanatory provisions, instead of their being the first. public opinion were directed to this subject, this would not be the case. Warming, and ventilating, and lighting, might, in well con-trived buildings for families of the labouring classes, be very cheaply provided. He thought it even would answer as a speculation. As to the economical warming and ventilating of large buildings, he would only quote a remark-able instance, that of the New Prison at Pentonville. From 30 to 45 cabic feet of pure fresh air are made to pass into every cell minute. This ventilation, and a temperature ranging from 52° to 60°, is uniformly main-tained during the coldest weather at an expense of less than a farthing a cell for 24 hours. Now, the construction of this prison is far from favourable for either warming or ventilating it. He was confident that houses might be so constructed as to secure these advantages at as cheap a rate.

Mr. Grainger said, that on visiting Nottingham three or four years ago, he found whole streets of wretched houses without drainage, without the means required by common decency, and without the least supply of water, which latter article could only be obtained from distant pumps, and then by a species of theft. The natural results followed: in fact, there was a constant sequence in the evidence of the surveyor and the medical man, and

wherever the former staled that the houses were badly built, were Undrained, and uncleansed, the latter pointed to those exact localities as the seat of sickness and fever, recurring again and again as regularly as the seasons returned.

METROPOLITAN IMPROVEMENT SOCIETY.

At the last meeting of this society communications were read from Sir Robert Peel and the Earl of Lincoln, in answer to applications from the secretary relative to the longpromised Ordnance survey and map of London, and the projected encroachment upon the carriage way of Lincoln's-Inn Fields.

On the first subject it appears that the estimated expense of a metropolitan survey having exceeded his anticipations, Sir Robert Peel had been deterred from introducing a bill for the object.

The amount of the Ordnance estimate was not stated, and, from the discussion which ensued, several members of the society seemed of opinion that the expense of a comprehensive survey for public use could not well exceed that which had actually been incurred, within the last six months, in the numerous local surveys in the neighbourhood of the metropolis by railway companies. The whole of these surveys would have been unnecessary if an Ordnance map of London, with contour lines, had existed on a scale of 5 feet to the mile; and the Board of Trade would have had a simple means of testing both the correctness and expediency of the various plans submitted to them for railroad lines with new termini in the metropolis.

On the subject of the projected encroachment on the carriage-way in Lincoln's-Inn Fields, for the purpose of insulating the new law courts, the Earl of Lincoln had satisfactory reasons for believing that the project had been definitively abandoned.

Various drawings were laid on the table embodying the suggestions of Mr. Laxton, Mr. Austin, and other gentlemen, for removing the defects of the government plan for an embankment of the Thames between Westminster and Blackfriars bridges.

The government plan had been postponed, and might ultimately be given up, but it appeared possible to obviate the objections made to it, and it was determined to seek an interview with the Earl of Lincoln to submit for his consideration the improvements required.

In the course of the evening an anecdote was mentioned by the chairman which forcibly illustrates the importance to the public of the late sanatory reports, to some portions of which the society have endeavoured to give effect. A legal friend had inquired of a medical practitioner, high in the profession, why the whole body of medical men in London did not, with one voice, address the legislature to modify the window-duties, and remove every other evil arising from either imperfect ventilation or defective drainage. The reply was the following :--

"When you gentlemen of the law petition for measures to diminish litigation, medical men may be expected as a body to agitate for the removal of all causes of disease. If a government were found able and willing to carry out all the recommendations of the sanatory reports, it would diminish the means of livelihood of the medical profession to the extent of one-half; positively one-half."

MR. N1XON'S STATUE OF WILLIAM IV.--Now that the scaffolding and hoard are removed, we will mention that the whole of this monument including the figure, is executed in Forgintor granite, and that the total cost is 2,2007. Peterhead granite would have been preferred on account of colour, but the price asked for it was so bigh as to prevent its adoption. The granite posts in the footway were devised by Mr. W. Johnson of Westminster, all the masonry was executed by Mr. Chadwick, and the iron work which surrounds the basement by Messrs. Dewer of Old-street. We can well believe that the greatest pains have been taken by the sculptor to produce a fine statue, and that his task, a first attempt in a new material, has been difficult. The effective.

delicacy of the operations requisite to carry into effect these improvements. I need merely refer to one or two circumstances connected with its progress to prove that even in a constructive point of view its difficulties were of no slight character. I more especially allude to the entire removal of two immense stone piers, which had at some former time been built in the water-way of the sewer, and which piers supported certain parts of the heavy and lofty walls of the houses in Grafton-street, St. George's. These piers, one measuring 53 feet in length, the other of a more square form, divided the water-way into two channels, and were considered for-merly advantageous to the property lower down the line of sewer, by penning back the torrent in times of storms. The work of taking out these obstructions, as also removing two great projections, and putting in a new bottom throughout the whole length of the sewer (which here ran under buildings), be-tween Hay-hill and Bruton-street, in length 550 feet, at a greatly reduced depth, was noiselessly, unseen by any one other than the work-men employed, and even without the know-ledge of the inhabitants of the houses above, wholly performed from withinside the sewer.

As affording some idea of the extreme

Another operation of scarcely less nicety was to pass the sewer, which was 8 feet wide in the clear, with side walls two bricks thick, at a depth of 22 feet and upwards, beneath White Hart-street, Piccadilly, a street only 20 feet wide, and again carrying the same sewer through Sun-court, Curzon-street, which is in width less than the external dimensions of the sewer itself; and further on, the sewer winds its coarse under and close to buildings of great magnitude nearly the whole way from the end of Berkeley-square to Oxford-street, in most instances at depths of from 10 to 12 feet below their foundations. These instances will suffice; but I may, in concluding this notice, perhaps venture to make the remark, that whether we consider the importance, the magnitude, or the beneficial results of the works carried out in this portion of the Westminster Commission, the King's Scholars' Pond sewer may justly be entitled one of the most magnificent and extensive in the structural sewerage of a great city, executed in this or any other age.

FREEMASONS OF THE CHURCH.

FEB. 11.-The Rev. G. Pocock, LL.B., in the chair.

The minutes of the last meeting were read and confirmed. Mr. Thomas Halifax was elected treasurer, and the Right Hon. the Earl of Cadogan was unanimously elected one of the vice-presidents.

of the vice-presidents. Professor Cull moved that a testimonial detailing the services rendered to architecture by the late A. Bartholomew, Esq., F.S.A., be emblazoned on vellum, and framed and glazed, to hang in the council room of the college; and that a duplicate copy of the same similarly emblazoned, framed, and glazed, be presented to the founder's widow.

Mr. J. W. Archer delivered a preliminary discourse on ancient monuments. The lecturer stated his reasons for prefacing the subject of monuments by a general discourse on ancient monuments, as he found the one in all cases intimately connected with the other. He alluded to the perfection of the earliest existing brasses as something different from other early conditions of art.

After going into some speculations on the source of this branch of art, he proceeded to describe the knowledge of the Saxons in the art of working in British metals, the analogy between some Saxon remains of goldsmiths' work, and the transition of the early engraver from the occupations of goldsmith and chaser.

He distinguished between certain factitious Saxon monuments and such as were undoubtedly genuine, and instanced many early forms of monumental decoration.

After mentioning the brasses of foreign countries, and their inferiority to those of England, he made a remarkable exception in favour of Denmark, and urged the probability of a Scandinavian origin for the art, which he illustrated by a description of the decoration of Scandinavian monuments.

NEW MODE OF CONSTRUCTING BUILDINGS.

LIEUTENANT HIGGINSON has obtained patents for a mode of construction to obviate danger from fire. We insert the inventor's description of the system, but shall withhold our opinion upon it until we can examine his models and drawings :---

" To avoid (says the author) anything like exaggerated pretension or egotistical assump-tion, has been my primary object. And as all inventions are now necessarily but the adoption of known forms and principles to novel purposes, I have no wish these improvements should be considered more than the result of a fortunate experiment, originating in the exigencies of maritime adventure, subsequently, however, atter much labour and consideration, adapted to shore architectural purposes; the object being to remedy those defects in the existing system of construction most pregnant with danger to the community; and without attempting to alter either the present princi-ples or practice of house building, by the sub-stitution of iron for wood generally through-out the structure, to render erections not only fire-proof, but by having no perishable mate-rial inserted, quadruple the strength, obviate their tendency to decay.

" These desiderata are attained in the following manner :-- The patent joists of cast or rolled iron, T shaped, have at each end of any required length a dovetail projection all of one size, fitting into flanched mortices on the iron girders and bonding sockets. The iron gir-ders, of proportionate strength, are likewise <u>J</u> shaped, but reversed, having flanched dovetail mortices cast on each side of them, one foot or eighteen inches apart, as necessary, to re-ceive the dovetail ends of the joists. The iron bonding sockets are of the size and shape of a brick, cut off angularly before, cone shaped cast hollow; in the shorter side having a like The dovetail mortice to receive the joists. short iron trimmer joists compass the chimshort iron trimmer joists compass the chim-neys in the usual manner, fitting by dovetail ends into mortices cast on the principal trimmer, at one end, and intu the bonding sockets, built into the house wall, beside the chimneys, at the other. The usual arch for the support of the hearth being provided for by iron bearing-pieces fitting in mortices between the short trimmer joists, with an iron ulse to unbeld the hearth watter with an iron plate to uphold the bed of mortar under the hearth stone; thus rendering the whole frame-work of the floor perfectly inde-pendent of support from the stack of chimneys, the entire isolation of which obviates all danger of that sinking which occasinally takes place from their greater weight in chimney stacks recently erected. The wells, or openings for staircases, are formed by iron trimmers cast with dovetail mortices on them to receive the joists, and may be obtained of any required torin, size, or description. Additional means of support being provided, when requisite, by iron pillars with a screw in the centre of the lower end, fitting into a female screw socket, drilled into the trimmer beneath-a tenon or projecting piece, at the upper end of the pillar, entering a recess, cast or drilled to receive it, in the trimmer of the floor above. Breast-trimmers for shop-fronts, gateways, and other purposes, may be cast with the mortices for the joists on the inside; and any description of ornamental device, name, or entablature without — trussing spans, to support great weights of superstructure, being likewise, where requisite, annoxed. And when the nontransmission of sound between different apartments is required, however near as a substitute for the usual filthy and destructive method of pugging, slight sheet iron, or tin cases, fit-ting in breadth and depth, between the iron joists, are inserted; which cases, when made, are supported internally from collapse by strong iron upright wires; and the atmo-spheric air within being displaced by passing a body of steam into them—upon hermetically sealing, and allowing the steam to condense, a sufficient approximation to a perfect vacuum is obtained to prevent the transmission of either heat or sound. Unlike the mould and either heat or sound. Unlike the mould and saw-dust now used, adding little to the super-structural weight; and effectually preventing extended combustion, should even the wooden floors and furniture of one apartment be ignited and destroyed.

to the required height, from floor to floor, the patent iron joists are laid in precisely the same way as if of wood, on an iron bond, observing that at every fourth joist, an iron, brick-shaped bonding socket is built into the wall, to receive the dovetail end of the joist; the like bonding sockets being likewise inserted in the party walls when no girders are used-the inside ends of the joists fitting into the flanched dovetail mortices cast on the girders and trimmers, as before described, wherever both or either are in use. By these means the whole fabric is tied together and supported as one solid mass, the bonding sockets in the front walls uniting by dovetail the joists to the girder, or party-walls, in the interior; this central holding being again connected by the iron joists with the bonding sockets built into the back walls. One great saving effected in material and workmanship it may here be admissible to particularize. Supposing the depth of joist required in wood to be fifteen inches, an iron joist nine inches deep would be more than adequate; and thus, with the same pich of ceiling upon every story, two courses of bricks around the entire fabric, with the mortar and workmanship, would be saved. There are other advantages equally obvious, although, perhaps, of minor importance-such as entire exemption from vermin of every de-Notwithstanding this, the conscription. struction of barns may be to the farmer of very serious moment, when the ravages committed by vermin are considered.

"In cases where the floors are intended to be of wood, a groove is run along beneath the upper arms of the patent iron T joist, to receive an iron bracket. The floor planks being laid, and temporarily cramped, or shored down, upon the iron joists, a projecting, square-headed, shouldered screw is inserted by a panner, through the upper arm of the bracket, into the lower surface of the floor plank, which is thus effectually secured to the joist. It being noticed, that should the boards shrink, they may be forced together and the interstices filled up by one piece in any convenient posi-tion, in consequence of the brackets moving along the grooves in the joists, and each plank heing secured independently of the others. The unsightliness of a shrunken floor is thus not only remedied, but as no nuil holes are visible, the screws beneath not perforating the entire thickness of the plank, one unbroken sur-face is presented, which for the purposes of cleanliness and appearance is alike desirable. Magazine or warehouse floors, for goods liable to spontaneous combustion, may, however, be laid of either metal, slate, or stone, rivets being substituted for screws in attaching such to the iron joists beneath-which joists are of many forms as well as that specified, when applied to different uses.

As respects internal ceiling and plastering, these iron joists admit of the common lath being used; in which cuse, to hold the lathing nails, a small fillet of wood is driven into a recess formed to receive it in the lower edge of the joists. But as it is desirable that decay as well as fire should be provided against, per-forated common tin, or thin galvanised iron plates, being punched full of holes, or rosed, ike the nose of a watering-pot, with the rough side towards the plaster, are substituted for the laths; to which the mortar, being applied by the usual process, forces itself through the perforations, and keys at the back of the plate in precisely the same manner it would do between laths. One-half of the ordinary labour, time, and material are in this instance likewise saved, two coats of plastering only being re-quired-and the same sound transmitting ceiling and wall-surfaces preserved. These plastering plates are attached by means of a small double-ended iron key passing through them edgeways, into mortices in the iron joists, and battens, adapted to walls; being by a spanner afterwards turned across the entering orifice, and thereby effectually and immoveably annexed. A house thus constructed cannot be destroyed by fire, and has but little tendency to decay; whilst the expense of erection, taking all items into consideration, does not exceed that of the present method of building with perishable and inflammable materials. It is however, perhaps, impossible to describe in words all that has been practically accom-plished; and I shall therefore be happy to "It may be necessary to recapitulate, that the walls having been built up in the usual manner ples, models, or patterns of these inventions."

WORKS OF ART AT BRITISH INSTITUTION.

THE exhibition of works of modern artists, at the British Institution, in Pull Mall, wa opened to the public on Monday last. It consists of 509 paintings, and 12 pieces of sculp-ture, and the catalogue states that 275 other pictures were returned from want of room. Until the present year works previously ex-hibited elsewhere were admitted, and the best places were usually occupied by pictures already known to frequenters of the Royal Academy exhibition, and which, moveover, had Academy exhibition, and which, moveover, had been sold, while other pictures not exhibited were returned. This was a manifest hardship on the painters of the latter, and being felt as such by the directors, a resolution was passed to prevent the admission of pictures which had been publicly exhibited before. The present collection then consists of

The present collection, then, consists of entirely iresh works, and may be considered a successful issue of the new arrangement. The Royal Academicians, it was said, would not paint pictures purposely for this exhibition, whereas we find here Edwin Landseer, Etty, Knight, Lee, Stanfield, Hart, Howard, and others, stronger in numbers than usual. The first, E. Landseer, has some wonderful profirst, E. Landseer, has some wonderful pro-ductions of the class to which unfortunately, as we think, he confines himself. Decoyman's Dog and Ducks (No. 1), King Charles's Spaniels (No. 134), and Retriever (No. 199), are inimitable. Etty has some charming studies. The Forsaken, although small and elight, is a magnificent piece of colour. Stan-field has three beautiful pictures, of which On the Hollands Diep (No. 129), is the most important.

important. We will pass rapidly through the catalogue, and point out some of the most noticeable works. Fruit (26), by Lance, is a fine speci-men of art, and Scraps from a Burgomuster's Table (102), by the same painter, is equal to any work of the sort ever executed.

any work of the sort ever executed. Belgic Galliott aground on the Shallows off Bergen-op-Zoom (44), by E. W. Cooke, is ad-mirably painted; the same may be said of his Dort, Morning (90). Mr. Cooke has three other pictures which deserve examination. The Widger's Banefit Nicht (59) by F

The Widow's Benefit Night (59), by F. Goodall, is one of the gems of the exhibition. It represents the interior of an Irish cabin, with dancers and revellers, and is full of character and humour. Every head is a study. The Soldier's Dream (197), by the same rising painter, is a fine picture, but less perfect than

A Water Mill (124), by H. Bright, is full of beauty

Mr. Müller has greatly distinguished himself in the present exhibition. Rhodes, with the Pacha's Palace on the right hand of the picture (140), and Tomb in the water, Telmessus (498), are not surpassed in excellence by any land-

scapes in the gallery. *Music* (311), and *Poetry* (314), both designs for freeco by H. N. O'Neil, are full of sentiment and grace.

A Summer Afternoon (312), by J. D.Wing-field, is a view in the gardens of Hampton Court Palace, charmingly painted.

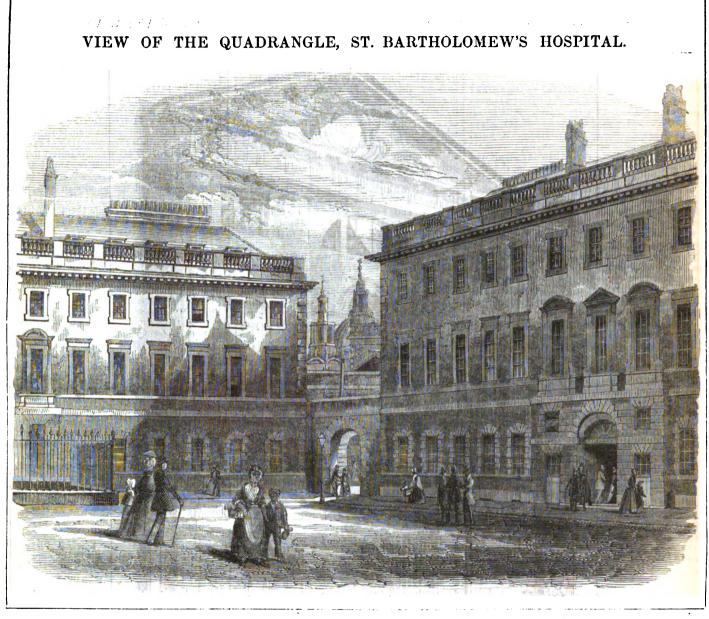

Here, thou great Anna ! whom three realms obey, Dost, sometimes counsel take, and sometimes to Hither the heroes and the nymphs resort." To taste awhile the pleasures of a court."

This picture and one by F. Danby, The Gate of the Harem (401), an admirable work, have been purchased by Prince Albert.

Our limits forbid any lengthened observations: we must content ourselves with com-When the sentence of the second secon (248), by Alexander Johnston, Stray Hounds, (233), by Josi, Entrance Porch of the Church at Cannes (150), by A. E. Goodall, Highland Refugees on the Coast of France (409), by Mrs. Mclun, and Dutch Boats of Ostend (287), by C. Bentley.

There are several bad pictures by men who ought to do better, but with these we will not meddle.

The Wesleyan Society are about to erect a chapel in the Belgrave-road, between Eccleston-square and Wurwick-square. Mr. Seth Smith and Mr. Archbutt have subscribed 1004. each, and Mr. Edge 504. Digitized by

ST. BARTHOLOMEW'S HOSPITAL.

AT page 42 of the present volume, we noticed the foundation of this establishment, and presented an engraving of the principal gateway in Smithfield. We now furnish a view of the quadrangle and a view of the gateway in Giltspur-street. The hospital commenced by Gibbs in 1730, as we have already mentioned, consists of four piles of buildings around a court, connected by stone gateways at the angles. The buildings are all faced with stone, have dressings around the door and window openings, and are terminated by a cornice and balustrade. Although plain and unpretending, there is a considerable degree of elegance about the arrangement of these fronts, but they are not in a fit state to be judged of.

An inscription on the hospital, after setting forth the date of its foundation and of the reconstruction of the edifice in the 18th century, states, that a general repair was commenced in 1814, and finished in 1820, under the direction of Thomas Hardwick, Esq. Looking, however, at the fronts of the building, it hardly seems credible that it was repaired so recently. The stone work is more decayed and dilapidated than that of many buildings centuries old. The window-heads are broken, the cornices decayed, and the whole front disfigured, the certain result of the use of Bath stone. All over the surface may be observed a sort of eruption, the operation of which is to throw off layers of

the stone. It appears in the first instance, in | National Gallery, &c.), he is entitled to conthe shape of slight swellings, which, increasing in size, gradually meet, when they burst and the crust falls off. A punster might take it for a small-pox hospital. The matter, however, is too serious for joking, and should serve as a warning to living architects. There is actually danger in allowing the stone-work to remain as it is, and something must speedily be done to remedy it, or the fall of some of the outside will furnish the inside with inmates. It was recently proposed to case the whole of the exterior with Portland stone, simply cutting away such parts of the present work as might be necessary to obtain good fixing. The object of that mode of proceeding was of course to avoid throwing open any part of the building, and so interfering with the patients.

The gateway in Smithfield, and that of which we now give a view,* are constructed of Portland stone, and present a striking contrast to the main building, being perfectly sound and whole, although of earlier date. Eight or ten years ago, the sides and back of the first gateway were cased with stone, by Mr. Malcot, in consequence of the removal of the houses which, until that time, adjoined it, but few or no repairs were required to the existing stone-work, or even to the figures sculptured in it. According to Mr. Malcot's opinion, indeed, and as a practical mason who has been engaged for fifty years in repairing old churches and raising new buildings (the Post Office,

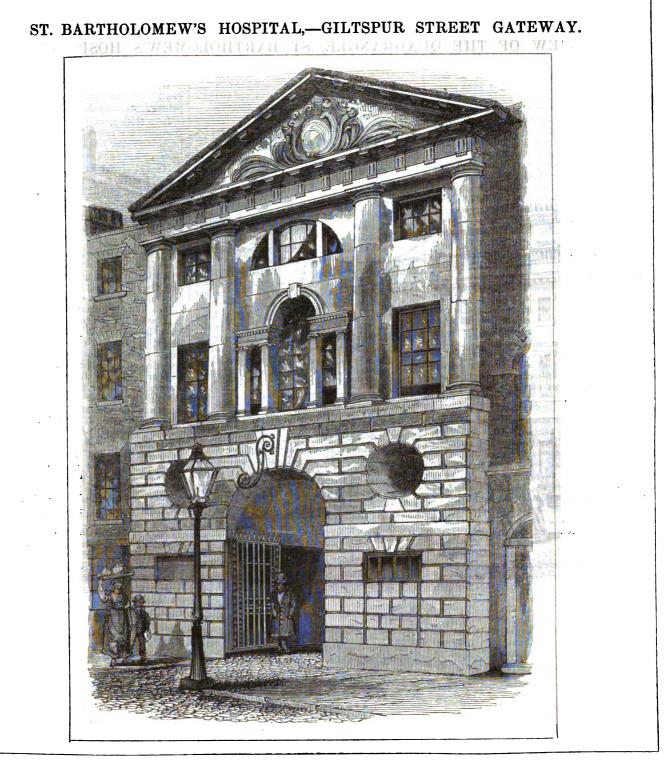

• This illustration is not so satisfactory as was desi and would have been cancelled if time had permitted.

sideration,-good Portland stone never decays, although the surface may be worn by long exposure to the weather.

The gateway in Giltspur-street is Roman-Doric, and presents four attached columns on a rusticated basement, supporting an entablature and pediment, and having two tiers of windows between them: the centre intercolumniation is wider than the others are, and admits a Venetian window in the lower part.

Attached to the hospital is the church of St. Bartholomew the Less, formerly the chapel of the establishment. The interior of it is curious, although little of the old building remains. In plan it was originally square; but George Dance, the architect, in 1789, having first destroyed the interior of the old building, formed it into an octagon, chiefly with timber. It was re-constructed on this same plan in 1823 by Mr. Thomas Hardwick, who substituted stone. The roof is of iron.

Returning to the hospital, it may be stated that no mention is made of it in the volume of designs which Gibbs published, although the second edition of this collection did not appear till some time after the commencement of the works, namely 1739. Gibbs, a favourite of fortune when alive, was considerably under-rated afterwards, and at this time is hardly so well estimated as he deserves to be. A memoir of him will be found in the first volume of THE BUILDER, p. 203.

PUBLIC MONUMENTS.

WE stated in a recent number that a committee was being formed in the city for the purpose of erecting by subscription a fulllength marble statue of Prince Albert in the Royal Exchange, in commemoration of his having laid the first stone. Since then, a meeting has been held of the most eminent merchants, bankers, shipowners, underwriters, and others interested in the commerce of London, when it was determined that the statue should be executed by Mr. J. G. Lough, the sculptor, now engaged on the statue of her Majesty, which is intended to be placed in the centre of the quadrangle of the Royal Exchange.

the quadrangle of the Royal Exchange. At the 24th annual meeting of the Seamen's Hospital Society held last week, it was announced that it had been decided to place another monument in the Royal Exchange in lieu of the one destroyed by fire, in honour of the memory of Mr. J. Lydekker, one of the most munificent benefactors of the Hospital, permission for that purpose having been granted by the Gresham and Royal Exchange Committee.

The Dublin correspondent of the Morning Herald states, that Lord Heytesbury has recently visited the studio of Mr. Kirk, the sculptor selected by Sir Robert Peel to execute the statue of Sir Sydney Smith, intended

for Greenwich Hospital. The work is nearly finished, and in a short time it will be ready for removal to England. His Excellency expressed his satisfaction with the spirited character of the figure, and with the correct likeness, which, he observed, he felt competent to declare, from his personal knowledge and vivid recollection of that heroic soldier.

THE PORTLAND VASE.

ALL England has heard by this time of the destruction of the celebrated Portland, or Barberini Vase, one of the finest specimens of Greek art in the world, by a miscreant called William Lloyd. It was deposited in the British Museum in the year 1810 by his Grace the Duke of Portland, and has always been considered to be his property, hence the name of the "Portland Vase." It was found about the middle of the sixteenth century, about two miles and a half from Rome, in the road leading from Frascati. At the time of its discovery it was inclosed in a marble sarcophagus within a sepulchral chamber, under the Mount called Monte di Grano. The material of which the vase was formed was glass; the figures, which were in relief, were of a beautiful opaque white, and the ground was in perfect harmony with the figures, and was of a beautiful dark trans-

parent blue. The subject of the figures has hitherto remained in obscurity, but the design and sculpture were admirable. This vase was for more than two centuries the principal subject of admiration in the Barberini Palace. It was purchased about thirty years ago by the Duchess of Portland from Sir William Hamilton, and in the year above stated was deposited in the British Museum for the gratification of the public.

Such is the defect in our laws that no punishment can be inflicted on the rascal (our pen will not write a milder word) who has committed this wanton and distressing outrage. If it had been worth less than 5*l*. a magistrate could have inflicted a fine of that amount; but being above it, an action for damages is the only step that can be taken to obtain redress. This being the case, the charge against him for breaking the vase was abandoned, and he was fined 3*l*. for breaking the glass which covered it!! It is to be hoped that immediate steps will be taken to obtain a law for the protection of works of art. For our own part we would willingly assist to nail this fellow's ears to the gates of the museum, that he might serve to deter others from similar outrages. We are glad to be the first to convey to the public the intelligence that the vase can in all probability be restored satisfactorily, notwithstanding the number of pieces into which it is broken.

HARBOURS OF REFUGE.

THE select committee of the House of Commons on shipwrecks, which sat during the session of 1833, had their attention drawn to the formation of harbours of refuge. In their report they purposely refrained from recommending any particular situations for such harbours, from a conviction that such points would be best decided on by a body composed of scientific and competent persons, whose attention should be specially and exclusively directed to the subject.

In consequence of this, Sir Robert Peel recommended that a commission, to consist of the following gentlemen, should be appointed to inquire into the most eligible situations for such harbours in the channel, viz.:--Admiral Sir Byam Martin, G.C.B., chairman; Lieut. Gen. Sir Howard Douglas, Bart., G.C.B.; Rear-Admiral Deans Dundas, C.B.; Captain Rear-Admiral Deans Dundas, C.B.; Captain Sir William Symonds, R.N.; Captain John Washington, R.N.; Lieut. Col. Colquboun, R.A; Lieut. Col. Alderson, R.E.; Sir J. H. Pelly, Bart; Captain Fisher, R.N.; James Walker, Esq., President of the Institution of Civil Favionom Civil Engineers.

These gentlemen were accordingly appointed, and their report has just made its appearance. It contains the following important conclusions to which the commissioners arrived after an inspection of the various channel harbours :-"First,-That a harbour be constructed in Dover Bay, with an area of 520 acres up to low-water mark, or 380 acres without the two-fathom edge; with an entrance 700 feet wide on the south front, and another of 150 at the

east end. "Entertaining the strong opinion we have expressed of the necessity of providing, without delay, a sheltered anchorage in Dover Bay, we venture to urge upon your lordships' attention the advantage of immediately beginning the work by carrying out that portion which is to commence at Cheesman's Head.

"Whatever may be finally decided upon as to the form and extent of the works in Dover Bay, the pier from Cheesman's Head, run out into seven fathoms water, appears to be indispensable as a commencement, and it will afford both facility and shelter to the works to be subsequently carried on for their completion.

" This will give sheltered access to the present harbour during south-west gales, and protect it from the entrance of shingle from the west-ward; it will afford time also for observation on the movement of the shingle within the bay, and for further inquiry as to the tendency which harbours of large area, on

this part of the coast, may have to silt ap. "These inquiries the commission consider to be of essential importance, and the results will afford the means of determining on the greater or less width that should be given to the en-

trances of the proposed harbour. "Secondly,—We propose that a breakwater be constructed in Seaford Road, in a depth of about seven fathoms of water, one mile in extent, and sheltering an area of 300 acres.

" Thirdly,-That a break water be constructed in Portland Bay, to extend a mile and a quarter in a north-eastern direction, from near the northern-point of the island, in about seven fathoms of water, having an opening of 150 feet at a quarter of a mile from the shore, and sheltering an area of nearly 1,200 acres. "If only one work is to be undertaken at a

time, we give the preference to Dover, next to Portland, and thirdly to Seaford.

MODE OF CONSTRUCTION.

"We are directed by your lordships to report on the expense to be incurred by the completion of the works which we recommend; but as no approximate estimate of this can be made without determining the general principles and modes of construction, we have examined the engineers who have come before us and other authorities upon these important points.

"The various opinions have been considered by the commission, who prefer for the construction of breakwaters, and for the security of the works of defence upon them, the erection

of walls of masonry. "The commission do not offer any opinion as to the profile or degree of slope necessary to insure to the structure the re-quisite stability. They consider that this will quisite stability. They consider that this will be best decided by the government, under professional advice, when the works shall be finally determined on.

"The cost of either mode of construction having been stated to be nearly the same, whether it be masonry or long slope of rough stone similar to that of Plymouth Breakwater, the commission beg to lay before your lordships an approximate estimate of the works at the several places, viz :---

| Dover | £2,500,000 |
|----------|------------|
| Seaford | 1,250,000 |
| Portland | 500,000 |
| Harwich | 50,000 |

BATHS AND WASH-HOUSES.

A NUMEBOUS and important meeting of the clergy and gentry of the parish of St. Pancras took place last week at the vestry St. Paner rooms, Gordon-square, for the purpose of carrying into effect the establishment of baths and wash-houses for the labouring classes in that populous and extensive district. Mr. J. Harris, of the Hampstead-road, occupied the Harris, of the Hampstead-road, occupied the chair, and amongst the gentlemen present were the Rev. W. Dodsworth, the Rev. Dr. Stebbing, the Rev. H. Hughes, the Rev. D. Lang, Mr. J. P. Gibbons, Mr. E. Wilson, Mr. W. Douglas, Mr. J. H. Smith, &c. A report was presented, from which it appeared that in the second computing time having been consequence of a communication having been received from the Central Society for the Es-tablishment of Baths and Wash-houses for the Labouring Classes, recommending the forma-tion of a branch association in that parish, a committee had been appointed, who had come to a resolution, "That the establishment of baths and wash-houses was highly desirable for the comfort and cleanliness as well as for the health of the labouring classes, and they therefore cordially approve the formation of a branch society in the parish of St. Pancras, to carry out that object." The committee felt it their duty to make an earnest appeal to the inhabitants to furnish them with funds necesinhabitants to furnish them with funds neces-sary for the erection of public baths and wash-houses on a suitable scale in one or more dis-tricts of the parish. The report having been adopted, it was resolved that deputations should wait on his Grace the Duke of Bedford, the Marquis of Camden, Lord Southampton, Lord Somers, and other great landed proprietors of the district, to solicit their aid and co operation

The following instance of liberality on the part of a public company as setting a noble example, will, we trust, not be without its effect. At the annual meeting of the proprieeffect. At the annual meeting of the proprie-tors of the Birmingham Fire Office held last week, it was resolved that 50% be given in aid of the funds now being raised for the esta-bishment of public baths in that town. From Bath we hear that the committee of

gentlemen who have taken up the laudable object of providing baths and wash-houses for the poor of that city, are prosecuting their in-quiries on the subject, and that they have been in communication with Messrs. Green and Simms, the lessees of the baths, with reference to the availableness of the surplus hot water of their establishments (which, we are informed, amounts to 5,000 hogsheads per week). During the last four years about 4,000 gratuitous hot baths have been annually furnished to the poor by the lessces of the baths, upon the simple recommendation of any medical gentleman, stating that the individuals recommended were likely to be benefited by the waters, and unable to pay for their use.

OPENING OF THE CITY HALL, PERTH. This edifice was opened last Wednesday week with a civic banquet, combining also the attraction of a grand concert and the eloquence of public speakers. The arrangements were on a liberal scale and well regulated, and although at least from 1,300 to 1,400 persons were accommodated within the walls of that one apartment, there was no crowding, no confusion. The Perth Constitutional says, "The decorations are in the first style of taste, and will have grander appearance when the skill of the painters shall have been brought to bear upon them. On this occasion all was white—the drapery of the platform and cover-ing of the tables, which were of a light crimson, contrasting finely therewith. The sixteen tall pillars, serving for as many candelabra, sur-rounded with ornamental branches (eight on each of the principal four, and six on each of the rest), send forth a flood of light without producing any degree of shadow.

LIST OF NEW PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &c., GRANTED FOR ENGLAND.

Furnished by Mr. A. Prince, of the Office for Patents of Inventions, Lincoln's-Inn Fields.

[SIX MONTHS FOR ENROLMENT.]

William Hannis Taylor, of West Strand, gentleman, for certain improvements in propelling. January 2.

John Gollop, of Charles-street, Middlesex, engineer, for improvements in spring binges, in spring roller blinds, and in applying springs to easy chairs and carriages. January 11.

Henry Cartwright, of the Dean, near Brosely, Salop, farmer, for certain improvements in the construction of paddle-wheels. January 11.

Robert Griffiths, of Smethwick, Birming-ham, engineer, for improvements in the manufacture of bolts, railway pins, spikes, and rivets. January 11.

George Spencer, of Hungerford-street, Strand, engineers' draughtsman, for improve-ments in propelling vessels on inland waters. January 11.

Stephen Perry, of Woodland-place, St. John's Wood, gentleman, for improvements in the application of springs to locks and other fastenings, to paper-holders, to cundlelamps, to blinds, window-sashes and doors, and to seats and elastic surfaces for sitting and reclining on. January 11.

rectining on. January 11. Henry Charles Lacy, of Kenyon-house, Manchester, esquire, and George Watson Buck, of Manchester, civil engineer, for a new manufacture for and method of sustaining the rails of railways. January 14. John James Osborne, of Macclesfield, gen-

tleman, for certain improvements in the manu-facture of iron and steel, and in the furnaces to be employed for such or similar manu-(Being a communication). Jafactures. nuary 16.

Henry Adolphe Dubern, of Paris, merchant,

Henry Adolphe Dubern, of Faris, merchant, for improvements in atmospheric railways. (Being a communication.) January 16. James Palmer Budd, of Ystalyfera iron works, Swansea, merchant, for improvements in the manufacture of iron. January 16. John Melville, of Upper Harley-street, es-quire, for improvements in propelling vessels.

January 21. William Yates, of Manchester, upholsterer, and Denis Dolan, of the same place, scagliola manufacturer, for certain improvements in plastic manufacture or composition, part of which is applicable to decorative and useful purposes, and part as a fireproof cement or plastic. January 21.

John Clay, of Edgeley, Chester, corn-dealer, for an improved apparatus for consuming smoke. January 23.

January 23. Peter Borrie, of Princes-square, Saint George's-in-the-East, engineer, for improve-ments in the construction and fitting. or equip-ping of ships or vessels. January 23. William George Henry Taunton, of Liver-William George more senter in pa-

pool, civil engineer, for improvements in ma-chinery for revolving windlasses, barrels, spindles, shafts, and for pumping. Janu-

ary 25. The Earl of Dundonald, for an improved rotary engine to be impelled by steam, and rotary engine to be impelled by steam, and which may be also rendered applicable to other purposes (being an extension for the term of 14 years of letters patent granted to him by his late Majesty King William the Fourth, for the said invention). January 28. George James Norton, of Weymouth, cook

and confectioner, for an improved cooking apparatus, parts of which are also applicable to the purposes of lighting and heating. Janu-

square, tailor, for improvements in stores and square, tailor, for improvements in stores and tilating. January 28.

Mathew Allen, of Worship-street, Shore-ditch, builder, for certain improvements in stores and apparatus for heating. January 30.

Henry Page, of Cambridge, painter, for cer-tain improvements in the mode of painting or decorating with oil and other colours. Janu-

ary 30. Thomas Middleton, of Loman-street, South-wark, engineer, for improvements in ma-chinery for the manufacture of artificial fuel, bricks, tiles, and other similar articles. Janu-

ary 31. itized by Google

IMPORTANT TO ARCHITECTS AND CONTRACTORS.

LAST week an action was brought by Mr. Mansfield, the landlord of Oliver's Coffee-house, at the foot of Westminster bridge, to recover compensation from the defendants, Messrs. Grissell and Peto, the contractors for building the new Houses of Parliament, and Mr. Charles Barry, the architect, for damage done to the coffee-house in sinking the foundations for a portion of the new structure. It seemed that in the progress of the works, which were carried on in 1842, it became necessary to obtain a solid foundation for the clock tower, which now raises its ornamented turreta within a few yards of Oliver's Coffee-house. Excavations were accordingly made, but from some cause or other the foundations of the plaintiff's house, which is built on a quicksand, as are all the buildings in the city of West-minster which are near the river, were so much minster which are near the river, were so much weakened, that the superstructure cracked and yawned in several places, and Mr. Mansfield and his family entertained great apprehensions that the building would tumble about their ears. Representations were accordingly made to Mr. Barry about the state of the house; and some palliation, in the shape of shoring and cement, were applied; but the excavations for the foundation of the clock tower were still continued, and in the middle of June, 1842, the foundations of the coffee-house sank so much, that the whole of Mr. Mansfield's family, about 9 or 10 o'clock, fled, many of them in their night-dresses, out of the house for their lives. The precautions taken, however, preserved the house from coming down, but the proprietor was seriously injured in his business during the progress of the works, and the house has been so much shaken, that it is doubtful whether it can ever be put in a state of thorough repair without pulling it down and rebuilding it. The question for the deci-sion of the jury was, whether the defendants had been guilty of negligence; and the testimony adduced was of a very contradictory character. On the part of the defendants, the witnesses stated that every possible precaution had been taken in order to prevent the catastrophe which had occurred ; while the evidence given on the part of the plaintiff certainly went to shew that all was not done which might have been done.

Mr. Justice Coltman summed up; and the jury returned a verdict for the plaintiff,—damages 700/.

New Books.

The Pictorial Gallery of Arts. Charles Knight, London: 1845.

In this work, published every month, it is proposed by the aid of *three or four thousand* engravings to open to view the entire kingdom of technical skill in all its more important operations: to shew man in every region of the earth labouring to surround himself with those necessaries, comforts, and conveniences, which constitute the elements of civilization, and then, going forward into the higher range of arts, surrounding his life with the attributes of taste, and ultimately reaching the highest develop-ment of the principle of beauty. This, which for any other publisher would be a very expen-sive work, Mr. Knight is able to effect at very small cost, by employing engravings already used in other works, and which when brought together, assist each other to elucidate par-The first volume will be devoted to what are generally called the useful arts, the second will illustrate architecture, sculpture, and painting. The first part, now before us, treats of the arts contributory to food. As calculated to lead the young we cannot recommend it too strongly.

The Builders' Price Book for 1845. By W. LAXTON, Surveyor, 10, Fludyer-street, London.

*

This is the 19th edition of Mr. Laxton's useful volume, and contains upwards of eight thousand prices, and three thousand valuable memoranda. It needs no recommendation, or we would gladly give it.

Correspondence.

COMPETITION FOR LAYING OUT GROUND, KING'S-ROAD, READING.

SIR,--After all that has been written upon architectural competition, you will perhaps be unwilling to devote much more of the space in your valuable journal to the subject, but I think Mr. Blendy's letter in the last number of THE BUILDER should not be allowed to pass without comment, as the plan he adopted for obtaining a decision on the designs in the late competition at Reading, appears, as far as I can learn, to have produced any thing but satisfaction. This may not arise so much from any defect in the plan itself, as from the manner of carrying it out. He states that in consequence of a letter in THE BUILDER, he determined to make the competitors themselves the judges of the designs, and that he is well satisfied with the result of the experiment, there being so many almost equally balanced in point of merit, and with a view of proving this, has sent you a list of the designs which obtained votes and the number recorded for each, which certainly shews the diversity of opinion; but then, I would ask, was there any standard laid down for the judges to go upon? For amongst upwards of forty competitors great variety of design was to be expected, and consequently great difference of opinion with regard to the merits of each. Judging from a letter in your journal a short time since from a "Regular Subscriber," who, I presume, has seen the designs, two great mistakes appear to have been made by the promoter of this competi-tion. In the first place, a set of *rules* is printed for the guidance of the competitors in preparing their designs, which it is stated in the preamble "the proprietor will require to be adhered to by those who intend to compete."

The first condition is, "That the designs shall be delineated upon plans of the same scale as the one now furnished (being one chain and a half to the inch), and be drawn in simple outline with Indian ink, the roads coloured vellow and the sewerage blue."

loured yellow and the sewerage blue." The second is, "That if it should be considered hy you desirable that uniformity should be observed in the erection of a class or classes of houses, that a ground-plan and elevation of such houses should accompany your design, and the estimated cost of erection stated."

And with reference to the award of the premiums it is stated that "each competitor will be required to attend in Reading on a certain day to be notified to him, then and there to give me his opinion in writing, which design he considers possesses most merit, and which is the next deserving (of course he must omit his own design)." Now, to the first of these rules, very few of

Now, to the first of these rules, very few of the competitors have thought proper to attend, beyond drawing their designs to the specified scale, for the plans are in many cases got up very elaborately and tickled up so as to attract the eye, the buildings being deeply back-lined in dark lake colour, and the grounds all laid out in walks and beds of different colours; and such is, I am assured, the case with those plans to which the premiums have been awarded.

To the second rule, several competitors have paid no attention, and have merely sent in block-plans, without elevations or groundplans of the houses as required.

And thirdly, if Mr. Blendy is correct as to the number of competitors, they cannot all have attended to give their votes, for by looking over the list of those who have voted (the publication of which, by the way, the competitors will, I should imagine, look upon as a breach of confidence) the names of only twentysix will be found, thus leaving upwards of fourteen who have not chosen to go to the expense of a visit to Reading for the purpose of giving their votes, but who, nevertheless, have been allowed the chance of obtaining votes for their own designs from those who did attend, by not having them withdrawn from the competition, which seems to me to have been the proper course to pursue; for surely some distinction ought to have been made between those who complied with all the rules and conditions, and those who did not. In conclusion, I would I ask, where is the

In conclusion, I would I ask, where is the use of having rules and conditions printed for a competition, if it is made optional with the competitors whether they abide by them or not, as has been done in the present instance? Where instructions are given, the first thing for the judges to ascertain should be, in which designs they have been most closely followed, and thus the anthor of such designs would be placed in a proper and fair position; but in the late competition every one has been left entirely to his own caprice and fancy in his award of the premiums. Would it not have given much more satisfaction if a set of questions had been prepared, and a copy given to each competitor; in which, in addition to stating which two plans he considered most deserving, he should have also been required to state whether such plans were in accordance with the printed instructions, and if not, with which had they not complied, and also in which two designs he considered the authors had most fully complied with the said rules? and then the premiums should have been awarded to those designs which had a majority of these opinions in their favour.

If I am misinformed as to any of the details I have alluded to, I trust that some of the competitors, who I dare say are readers of your useful journal, will be good enough to set me right, as my only object, in thus addressing you, is to state what I consider ought to have been the course adopted in order to give so novel a mode of deciding on the comparative merits of a set of designs, a fair and impartial trial, and which I consider, unless great caution is used in its application, is open to great abuse.

Apologizing for thus intruding so much on your valuable space,—I remain, Sir, yours, &c. Feb. 5th, 1845. FAIBPLAY.

FRESCORS AT BUCKINGHAM PALACE.

S18,—Observing in your number for 1st February a notice that the frescoes in the Casino of the gardens at Buckingham Palace had failed, I venture to say you will, upon inquiry, find this general condemnation incorrect. It is to be regretted that uncertain rumours obtained circulation respecting this first but distinguished effort to introduce to England a specimen of the higher examples of Italian decorative art, they being calculated to check any extending desire among geutlemen of taste and fortune to engage British talent upon similar works.

The principal spartment, forming an octagon, terminates in a cupola, the walls judiciously panelled with brilliant arabesques, relieved by delicate stuccoes and gilding, rendered subservient to eight frescoes, illustrative of Milton's Comus. The fine compartment by Mr. Eastlake is alone sufficient to prove the entire success awaiting our native artists in works of fresco. A second apartment is successfully painted in *encaustic*, powerful in colour, and firmly executed; while her Majesty's closet presents a magnificent adaptation of Italian art.

These beautiful decorations will not be finished for some time, and therefore any detailed notice would at present be injudicious. To the royal personages, at whose suggestions and private expense these works are creating, the British artist will have cause to be very grateful. An example of the highest class of decorative embellishment executed by Englishmen, and under such distinguished encouragement, will at the present time be of eminent service, and confer the highest honour upon its noble promoters.—I am, Sir, your obedient servant, JAMES CRABB.

67, New Bond-street, Feb. 6, 1845.

UNDERPINNING OLD WALLS.

Sir,—I should feel obliged if I could be informed, through the medium of your useful journal, whether I should incur any danger of a settlement by undersetting one side of a large house, for the purpose of adding a building with a cellar underneath. It is proposed to build the cellar 4 feet be-

It is proposed to build the cellar 4 feet below the foundation of the old building. The foundation is beach. How can a settlement be prevented if the undersetting be done with bricks and mortar, the latter being a long time before it gets dry?

It seems to me that undersetting much superincumbent weight can only safely be executed by using cement instead of mortar, but that would be expensive.—I remain, Sir, yours obediently, A SUBSCRIBER.

[Cement must be used; the first expense is the least.-ED.]

ON ARCHITECTURAL COMPETITION.

Singer Vol. 11, p. 52, Singer As, almost all complaints on the SIL, ... As, almost all complaints on the subject of competitions which reach the public seem to derive their publicity from your pages, and a these appeared in the issue of last weak a promise to publish particulars of future mal-practices as they may come to your knowledge, Losend a few extracts from a correspondence to which I have been lately engaged, from which you will be able to judge of the to me, apparent injustice pursued on a very recent occasion. I do not give you the names of the parties, as the correspondence was certainly on one side never intended for publication ; but one side never intended for publication; but you will be satisfied with the recognition of the hund which pens this letter.

The secretary of a committee for obtaining competition designs for a new church, which yes to be built for 4,000*l*, with aid from the

huilding societies, returned to me a set of drawings with the following note:— "Sir,—I have this day returned your plans by rail, car. paid, and hope they will reach you in safety. They were much liked, but not chosen.—I am, &c."

1. In answer to a request to know who was successful, the reply was dated November 4, 1844, and commenced—"Sir,—I did not know that it was customary to give the information you require," adding the name of the parties. "I own myself vexed at what appeared to me rudeness as well as ignorance; and, in conrudeness as well as ignorance; and, in con-sequence of rumours as to an injudicious decision, I wrote twice, giving those reports at full length. To my first a decidedly evasive answer came; and to the second the chief part of the reply was this :--

",December 2, 1844. "" You write that you would be obliged for an applicat answer to your last letter, which you would head one to infer was this :-- 'In shurt; 'I beg you to do me the justice to say (for whether the committee has decided properly your powerful assurance of the wish of the members to for right) if the premium is or will be puid to Mr. — or Mr. —, as I under-stand one of those names is attached to the successful design; and if that design without alteration holds 1,000 people conveniently on the ground-floor without seats in the chancel, which the building societies will not allow; and whether that design, without alteration, can be executed for 4,000% in the judgment of practical men (I do not mean the authors of it, and none but practical men can judge). These questions will be easily answered by yes or no.' Where in your letter of the 11th of November Where in your letter of the 11th of November are these or any such questions asked? You must allow me to say there is something here I cannot understand, and my safest plan is to inform you that the committee having ad-vertised for plans under certain conditions, will, ~I have no doubt, adhere to them..... Yours obediently, &c. " P.S. I hope this correspondence may now cease."

That is, Sir, that one month after the return of my design, and also after stating the name of the successful competitor, I am told, after pressing for a denial of the reports de-scriptive of the successful design, the committee WILL probably decide according to the condition.

I believe that there is no means of investigating the case, or I should feel inclined to learn with certainty what has been done.— I am, Sir, your obedient servant, J. W. P.

[Our correspondent refers to the competi-tion plans for St. Thomas's New Church, Winclester, concerning which, letters are printed at p. 557 and p. 564, vol. ii. We are in-formed that it is not clear even at this time which of the two gentlemen is the successful candidate.-ED.]

SPAPIELDS' BURIAL-GROUND.

SIR,—Seeing in your paper of last week an article under the head of "Burial-ground Nuisance," containing an account of infamous practices taking place in this ground, the whole of which is grossly false, and as proceedings are about to be commenced against the author, I hope you will, in justice, find a corner in your next BUILDER for this communication. I am, Sir, your obedient servant, Feb. 12, 1845. A. BIBD, Manager.

A. BIRD, Manager.

MR. COCKERELL'S LECTURES.

SIR,--I am quite astonished to learn that sor Cockerell should have recommended, Profe ex cathedra, the not particularly artist-like practice of literal and wholesale copying, alias piracy, from books of design. If such doctrine is to prevail, adieu to architectural design altogether; we have only to follow the patterns which are ready prepared for us, and that, as which are ready prepared for us, and that, as is proved, by the professor himself, a builder is capable of doing just as well as an architect. I am tempted to fascy that the professor spoke somewhat isonically of the "exceedingly fine portico" produced by the builder, and intended his remarks to be interpreted com grane salis. I remain, Sir, yours, &c., An Architect.

WHEN TWO BUILDERS, WHICH IS TO GIVE NOTICE ?

SIR,--I have some alterations to make to a house, which my client wishes to be done by two different persons, one to carry out the bricklayer's, and the other the carpenter and joiner's works. Now the new Building Act expresses that the *builder* is to give two days' notice to the surveyor before alterations are commenced; but as there are to be two separate tradesmen employed, upon whom does the duty devolve? By answering this question, you will greatly oblige your constant reader and admirer, WILLIAN FREEMAN. Paddington, Feb. 10, 1845.

[The Act provides that notice shall be given I ne Act provides that notice shall be given by "the master-builder, or other person em-ployed to execute any work; or if there be no master-builder, or other person so em-ployed, then the owner of the building, or other person for whom, or by whose order such work is to be done." If there be two master-builders, he who begins first should give notice, for which and other reasons we point to the bricklaver = 6 npoint to the bricklayer.-Eo.]

Miscellanea,

INCREASE IN LIFE ASSURANCE .- The reports read at the meetings of the several assurance associations held within the last few weeks make known the fact that during the weeks make known the fact that during the past year there has been a great extension in the number of persons who have secured for their families the provision which the system of life ussurance is designed to afford. It has been an anomaly in the action of society, that a people so sensibly impressed as Englishmen peculiarly are by a desire to provide for their families, and yet, at the same time, strongly influenced by the pride of present circum-stances, should have hitherto been so indifferent to the means furnished by the principle of life assurance, for overcoming the apparent insuperable difficulty of securing a large future Insuperable dimiculty of securing a large future benefit without any material present sacrifice. We are glad to find this indifference no longer exists; and that, under the exposition of the benefits of life assurance, promulgated by various offices, and the collateral aid of the press, the subject is becoming well understood and extensively acted upon. At a recent and extensively acted upon. At a recent general meeting of members of the Scottish Provident Institution, held at the Star Hotel, it was remarked, however, that of eight or nine offices which had arisen within the last few months, only one appeared to be constituted with exclusive reference to the interests of the assurers, namely the British Mutual Life Assurance Society of London, which was founded on the principle of mutual contribu-tion, or of dividing the whole profits among the assured. The rates of premium were much lower than those charged by other mutual offices, and have been adopted for the use of the society from the Scottish Provident Institution, which has met with unexampled success.

which has met with unexampled success.--Post Magazine THE IRON TRADE.-The make of iron in the United Kingdom at the present time is near 1,400,000 tons annually. Scot-land furnishes almost one-third part of the supply-being 450,000 tons annually, or at the rate of 9,000 tons per week. But in the course of two months there will be nine new furnaces put in operation in this new furnaces put in operation in this neighbourhood alone, and their combined yield may be calculated at 1,350 tons weekly, or 70,000 tons per annum.—Glasgow Constitutional.

WESTMINSTER IMPROVEMENTS. -Yesterday week a large meeting of the inhabitants of Westminster was held at the Mechanics' Institution, Great Smith-street, for the purpose of considering the best plan for the purpose at of the district. Amongst the gentlemen on the platform were Mr. B. Hawes, M.P.; the Hon. Captain Rous, M.P.; Mr. C. Hindley, M.P.; Colonel Short, Mr. Humfrey, Mr. R. Wason, Mr. C. Wood, &c. The Hon. Captain Rous, M.P. Rous, M.P., was ananimously voted to the chair, and he having briefly introduced this object of the meeting, Mr. Wilson opposed the plan of Mr. Wason; because it would not remove many of the existing inconveniences, and be urged the necessity for the formation of some street to run from Westminster Abbey over the ground now occupied by Tothilistreet, destroying the old and dilapidated courts and alleys in its way, and leading direct to Pimlico. In conclusion, he read extracts from Parliamentary reports, to shew the dreadful condition of the neighbourhood, as regarded drainage, ventilation. cleanliness, and health; and moved a resolution to the effect, that no part of the metropolis more urgently required improvement than the space between the Houses of Parliament and Buckingham Palace. Mr. Bignell moved, as an amendment, "that a committee be appointed to examine the various plans, and to draw the attention of the Metropolitan Improvement Commissioners and the legislature to that which they considered the best." Mr. Hawes, M.P., said that before the committee could come to a determination the plan of Mr. Wason would be in execution. It would be advisable to pass a resolution to It would be advisable to pass a recontinue – endeavour to suspend proceedings in Parliament until the best plan should be determined upon by the inhabitants of Westminster. The reby the inhabitants of Westminster. The re-solution proposed by Mr. Wilson was then carried, and also others, to the following effect:---"that a committee be appointed to consider the improvements suggested; and that they, be directed to impress noon the Government the propriety of withholding any plan which is not approved of by the inhabitants generally." Mr. Hindley, M.P., moved "that in any line of streets formed attention be paid to the im-provement of the dwellings of the poorer classes." This resolution having been carried, and the committee appointed, the meeting so-parated. carried, and also others, to the following effect:parated. THE TOWER.-

63

いいち だんかがい いたい かい ひかい きゅうちょう きょうかい たいきょう

THE TOWER.—A few days since a deputa-tion from the British Archaeological Association from the British Archeological Associa-tion paid a visit of inspection to the Tower, where they were received by Major Ebrington, the deputy governor, Major Hall, Captain Vernon, and Mr. Stacy, who conducted the members over all parts of the building, without any reserve. The alterations now in progress have laid open several new sources of anti-nuarian interest not the least of which are the quarian interest, not the least of which are the quarian interest, not the least of which are the architectural peculiarities of the celebrated Traitors' Gate, most of which have been pre-viously unnoticed. The causes which led to the visit were the disposition shewn by the authorities to preserve all relics and monuments of interest which are not inconsistent with the necessary improvement, as was evinced by their reclaiming from the City the portion of the Old London wall, on Tower-bill, from the destruction to which it had been consigned by the corporation. The results of the inspection, when complete, will be made the subject of an official report to the autho-rities. Upwards of 300 coffins have been removed to the catecombs at the back of the church of St. Peter ad Vincula, which were previously interred in the burial-ground, and displaced in the excavations made for the foundations of the new barracks which are to be erected on the side of the old Small Armoury .- Times.

Armoury.—*Times.* IMPROVED METHOD OF MAKING BRICES: N. J. Wyeth, Cambridge, Massachusetts.—The object of this composition is, to produce bricks which will admit of driving nails into therm, to avoid the necessity of introducing in walls what are known amongst mechanics as "wooden bricks." This composition consists of clay, mixed with either sawdust, charcoal, peat, or tan-bark, after it has been used by the tanner. The proportions may be varied, but the **patentee** The properties and the second by the tanner. The properties may be varied, but the patentee recommends three parts of clay to five parts of either of the combustibles above mentioned. *Claim*: "I do not claim mixing combustible materials with clay for making bricks, but I claim mixing them in such proportions as will produce bricks passasing the above approximation. produce bricks possessing the above-named

THE THAMES TUNNEL SURPASSED .--A submarine tunnel has lately been discovered at Marseilles. It passes from the ancient Abbey of Victoria under an arm of the sea to Fort St. Nicholas. The *Débats* says that the structure is considered by M. Matayras, an architect, to be Roman, and much finer than the Thames Tunnel, being one-fourth longer, and formed of a single vault of 60 feet span.

HEALTH OF TOWNS -- Mr. Mackingen has given notice that on the 18th inst. he will call the attention of the House to the necessity the attention of the health of towns by preventing oburial of the dead within their precincts; and that on the 20th instohe shall move for leave to bring in a bill prohibiting the muisance of smoke from the fornaces of fantinies. /

DWELLINGS OF THE POOR .- The landlord will do nothing but exact an exorbitant rent for houses unit to be inhabited; the poor man is either too ignorant, too indifferent, or too powerless to help himself; the Com-missioners of Sewers abandon him; the Woods and Forests hunt him like a wild beast from one end of London to another. To whom shall he resort in his distress? Will the Government help him? To be sure they will. They have shewn the best disposition ìn the world. They have collected a vast deal of valuable information, they know all about Punderson's gardens and Laub's-fields; they are most desirous of doing all they can for his comfort. Our streets for the future are to be wider, our houses are to be much better built, we are to inhabit cellars no longer, and it is we are to inhabit centrs no tonger, and it is now fairly to be expected that, as party-walls have been long insisted on as means of pre-venting the destruction of property, a supply of water and proper sewers will be given us to preserve our lives from fever. But when are the good intentions of the legislature to take effect it is consistent when a supply of effect? It is for existing things that legislation is urgently required. We do well to provide for the future, but the present ought not to be kept out of sight. -Dr. Southwood Smith points out-two regulations as being of paramount importance, and of universal application to the dwelling houses of the humbler classesthe prohibition, under adequate penalties, of the letting of any house as a dwelling-house in which water is not laid on, and to which there is no privy sufficiently screened from view. To the enforcement of these regulations he sees no practical difficulty; nor do we. Will the legislature have the more to sees no practical difficulty; nor do we. Will the legislature have the moral courage to compel the landlords to the performance of their duty? We shall see. They must first expect a little discussion as to the meaning of the phrase "rights of property." Have they the courage to put a reasonable interpretation upon it? We shall see.—Medical Times.

SAWING BY MACHINERY .--- In reply to request from the sawyers of Oldhams, that Lord John Russell would aid in obtaining a tax on mechanical inventions, his lordship has very properly refused to do so. "If I were to comply," says his lordship, "I could not stop with your trade. Nail-makers are in a similar situation, owing to the new machinery for the manufacture of nails; other artisans and agricultural labourers will pray for the like interference, to prevent the use of new machines which interfere with manual labour. Now, my belief is, that those inventions tend to the im provement of our condition as a people, and to enable us to support the great weight of taxation to which we are subjected. Ever since I have known this country, machinery has been in progress towards perfection, performing more and more the task of human hands, and, at the same time, a great number of people have found profitable employment. I know, and I deplore, that while this progress is going on, many a workman loses the wages which skill and experience have enabled him gain. But instead of the perilous course of ing duties on machinery, which would soon to gain. lay enable foreign nations to outstrip us in the score of competition, I am of opinion that we ought to give greater freedom to trade, and, if possible, so extend the demand for labour, that our population, greatly increased as it is, may obtain a good price for their day's work. I do not mean to pronounce any opinion on the late tariff, so far as regards timber. If the sawyers of this country are subject to unfair competition, they have a cause for redress so far as colonial timber is concerned."

LECTURES AT THE ROYAL ACADEMY .- Sir Richard Westmacott will commence his course on sculpture on *Monday* the 17th inst., and con-tinue it on the 24th March, 3rd, 10th, 17th, and 24th. Mr. Howard, on painting, will begin on Thursday the 20th inst., and continue on the 27th, the 6th of March, the 13th, 20th, and 27th. Mr. Cockerell concluded his course on Thursday last. We shall give a full report of the lecture in our next.

SCULPTURE .--- The Marquis of Landsdowne has commissioned Mr. Watson, the sculptor of the Eldon and Stowell statues, to execute two bes-reliefs of a poetic nature, for Mr. Barry's new gate to the noble marquis's seat at Bo wood.

PRESERVATION OF TIMBER.—Mr. Toplis recommends the introduction into the pores of timber of a solution of sulphate or of mariate of iron; the solution may be in the proportion of about two pounds of the salt to four or five galloas of water.

PROPOSED NEW PIER AT ERITH.—A meet-ing was held last Monday, at the Bell Inn, Erith, for the purpose of erecting a new pier, in consequence of the monopoly of the Diamond Company, who have the sole privilege of calling at the present pier. Mr. Noakes presided. Resolutions were passed in accordance with the object of the meeting.

STONE DRESSING MACHINERY.—A patent has been granted for this purpose to Mr. H. Ward, of Charles Town, Massachusetts, who thus describes it. The block of stone to be pecked and dressed is placed upon a carriage, which passes it, by a slow motion, under a series of pecking and dressing chisels. These chisels slide in a frame inclined to the plane of the carriage, that they may act on the stone obliquely, instead of vertically, and, for the purpose of changing this inclination, one end of this frame is jointed to the main frame of the machine, and the other may be elevated and pressed at pleasure. The chisels are held and pressed at pleasure. The chisels are held up by springs, and forced against the face of the stone by hammers actuated by tappets on two shafts, one at each end of the frame. The first and second rows of these chisels are pointed, for the purpose of pecking, and the others are flat, for dressing the surface. For squaring, or forming, the edges of the stone, there is a phiel on each eido with the lower there is a chisel on each side, with the lower edge at right angles with the side, and operated in the same manner as the peckers and dressers; these break off the stone, and form the edge, so that when the block is turned over to have the other faces dressed, the sharp corners shall not be broken off.

THE MONSTER BELL FOR YORK MINSTER. -The bell, intended to be put up in the south tower of York Minster, has recently been manufactured at the foundry of the Messrs. Mears, Whitechapel, and is larger than any other in the United Kingdom. Its weight exceeds twelve tons; it is 7 feet 7 inches in height, and its diameter is 8 feet 4 inches, height, and its diameter is o reet 2 inches, being heavier by seven tons than the celebrated "Tom" of tLincoln, and by five tons than "Old Tom" of Oxford. The metal took twelve days to cool, from the 18th of January when it was poured into the mould to the 30th ult. The clapper is not yet put in, but this will weigh between three and four cwt. The tone of it is described as being ex-The tone of it is described as being ex-ceedingly grand, and to be compared to the full swelling diapason of an organ. The arms of the city of York, and those of the archbishop (the cross keys), are on the bell in opposite positions to each other. The follow-ing inscription, in Lombardian characters, is round the upper rim :--- "In sanctæ et æternæ Trinitatis honorem pecunia sponte collata Eboracenses faciendum curaverunt in usum ecclesiae metrop. B. Petri ebor." And on the lower rim are the words, "Anno salutis MDCCCXLV Victoriæ reg. VIII. Edwardi Archiepi XXXVIII. C et G Mears, Londini, fecerunt." The cost of it is about 2,000*l*., this having been raised by voluntary sub-scriptions, as alluded to in the above inscrip-tion. It is intended by the executive committee, previous to its removal to the cathedral at York, where it will be conveyed by railway, that the public should have an opportunity of seeing the bell (which is to be named "Peter of York") and which it will require the united efforts of twenty horses to draw.

Cenders.

Fon making a Sewer-in the town of Cambridge. To be cylindrical and 2 feet diameter in the clear. The length about 385 yards, and the average depth about 9 feet.

The Commissioners of Pavlag and Lighting met the 21st ult., to examine the several te which had been cent in. NOT BE SE OUTS IS

college to the proposed course.—This objection made before the confirming of the minutes of former meeting, and some difficulty was relied to the reception of tenders for the drain, which had been advertised for.

The tenders were received conditionally, that the work be not begun until an arrangement was made with the college, and a motion was passed to the effect that formal application be made to the college and the lessee. The following tenders were given :-

Thomas Brook, Hackney, Middleser [hid mide in consequence of the blanks not being filled up].

Joseph Coulson, East-road, sower St. 6d. per yard-cesspools 2/. 8s. each-lateral ds 3s. 6d. per yard. 41-1

3s. 6d. per yard. James Stevens, Quay-side, sewer 8s. 5d. - osss-pools 2l. 7s. -- lateral drains 3s. 6d. - pools John Bennett, James-street, sewer 7s. 11d. --cesspools 2l. 10s. -- lateral drains 3s. 3d.

cesspools 21. 10s.—lateral drains 3s. 3d, Pell Hall, Castle-end, sewer 8s. 5d.—cesspools 21. 8s. 6d.—lateral drains 3s. Then cesspools are likely to be required. Mr, W. Swann proposed, and Mr. H. S. Foster second-ed, that Bennett's tender be accepted. Mr. S. Adcock proposed that Coulson's tender be accepted, on the ground that you should have a man who will do his work well; some complaint had been made of the way in which Bennett had done his work, and there was an objection to Bennett also, because Mr. Asby, a commissioner, was a sarety for him. Mr. Cream seconded the motion of After 5 because Mr. Asby, a commissioner, was a survey as him. Mr. Cream seconded the motion After a noisy discussion on the merits of these parties, Sta-vens' tender was proposed by Mr. Gropley, but not seconded. A show of hands was taken, when there appeared 9 for Coulson and 8 for Bennett. The names were called for, when the following voting took place :---

War-Coulson.-Messrs. Adcock, Favell

wicker, Swinton, Headly, Haslem, Cropley, Cream, Papworth, and Woodley, -10, or Bennett.-Messrs. Balls, C. F. Foster, H. S. Foster, Hatt, Swann, Matthew, Marshall, For Bennett.-

and Asby,-8. Mr. Ekin declined to vote. Coulson's tender vas accepted conditionally. a subject of the state of the s

February 20.—At the Hall of Commerce, Threadneedle-street, 540 Logs of St. Domingo Ma-hogany, of superior quality and large dimensions.

hogany, of superior quality and large dimensions. —Thomas Edwards, broker, 1, Pinners-hall, Great Winchester-street.

February 20.—At the back of St. George's-terrace, Dalston Rise; 300,000 sound new Stock and Place Bricks, and a large quantity of Burrs and Bats.—Messrs. Humphreys and Wallen auctioneers, 68, Old Broad-street.

February 21. — At Garraway's Coffee-house, Cornhill: 300 loads Quebec Red Pine; 100 loads Vellow Pine; 100 loads of Ash; 80 loads of Oak; 10,000 Yellow Pine deals and battens; 10,000 Spruce deals and battens.—T. and J. Simson,

Spruce deals and battens.—T. and J. Simson, brokers, 5, Change-alley. February 21.—At No. 38, Mincing-lane, 300 tons of fine fresh Lima Wood. — Charles Roberts, broker, 38, Mincing-lane. February 21.—Equi-distant between Lynn and Downham Market; 3,000 Larch, Scotch Spruce, Oak, Elm, and Birch Poles. They are principally Larch. of good dimensions and ouality. from Larch, of good dimensions and quality, from twenty-five to thirty years' growth. — Messrs. Mumford and Casebow, auctioneers, Lynn, or Downham Market.

February 25.—At the King's Arms Inn, Hemel Hempstead; a large Fall of capital Oak, Ash, Elm, and Beech Timber Trees, the greater portion of which are of very large dimensions and superior quality.—Mr. James Adams, auctioneer, Clarencequality.-Mr. James Adam street, Staines, Middlesex.

COMPETITION.

COMPETITION. The Committee of the Liverpool Docks are desirous of receiving Plans for the most convenient mode of landing or embarking passengers, carriages, &c., &c., at George's Pier-head. A Premium of 2001. will be given for the Plan selected and acted upon, and a Premium of 1001. will be given for that Plan which may be deemed to be the next in utility.—Daniel Mason, Esq., secretary, Dock Offices, Revenue-buildings, Liverpool. March 19.

TO CORRESPONDENTS.

"S. A. H." (a earpenter).—Section XLI. in the old Building Act, provides that the person at whose expense a party wall shall be built, agreeably to the directions of that Act, shall recover from the adjoining owner when the wall is used, after the rate of 71. 15s. per rod; but even in cases where the wall was pulled down without any desire on the part of the adjoining owner, a greater price was generally allowed, as it was known that brickwork costs more than that sum. At all events, an addi-tion equal to the duty on bricks imposed since the passing of the Act, could, perhaps, be insisted on leagth. In the case mentioned, we do not think legally. In the case mentioned, we do not think he could avail himself of the Act, but this can be determined only by one who hears all the particu-lars. The ground landlord should be appealed to. If the wall stood wholly on our correspondent's ground, as might be inferred from part of the letter, he would have no right to touch it, and might be punished.

"H. Rose."—The article "Stonehenge," in the Penny Cyclopædia, written by Mr. Britton, will refer you to all that has been said on the subject.

"M. Pepys," (Ghent).—We shall be glad to receive any information he may be able to send. "M. Daly."—Where can we see the "Revue" in London.

"Association of Architectural Draughtsmen,"

"Association of Architectural Draughtsmen," next week. "Mr.W. Herbert" complains of a paragraph in our last number, headed "New Street to Long Acre." He may rest assured we shall not in ter-fere with the private rights of any. The paragraph in question was simply an acknowledgment of letters received by us from others, and on which we gave no opinion. The fact, that Mr. Herbert is build-ing many of the houses in the street named, is an ausurance to us that they will be done well.

ing many of the Aduses in the street named, is an assurance to us that they will be done well. "J. W." (York), and "G. R.," next week. "Bernan's History of Warming and Ventilat-ing."—Our thanks are due to Mr. Bell, the pub-lisher, for the use of the cuts which illustrated the extract from the above work in our last number. We have already recommended Mr. Bernan's book to our readers.

We have already recommended in the second of the second se

materially on the plan. "A Subscriber" (Burton-upon-Trent), asks the height of St. Paul's Cathedral, from the ground to the top of the cross.—340 feet. "L." will be glad to know where the best in-formation on Terra cotta is to be found. "O" withes to be dimented in the heat archi-

"O." wishes to be directed to the best archi-tectural drawing school. We will inquire. Received.—Minutes of Proceedings of the Insti-tution of Civil Engineers.

MEETINGS OF SCIENTIFIC BODIES During the ensuing week.

MONDAY, February 17. — Statistical, 11, Regent-street, 8 P.M.; Chemical (Society of Arts), Adelphi, 8 P.M.; Medical, Bolt-court, Fleet-street,

Adeiphi, 8 P.M.; Medical, Bolt-court, Fiet-street, 8 P.M. TUESDAY, 18.—Linnæan, Soho-square, 8 P.M.; Horticultural, 21, Regent-street, 2 P.M.; Civil Engineers, 25, Great George-street, 8 P.M. WEDNESDAY, 19.—Society of Arts, Adelphi, 8 P.M.; Microscopical, 21, Regent-street, 8 P.M. (An-niversary); Ethnological, 27 A, Sackville-street,

B P.M.
THURSDAY, 20. — Royal, Somerset House, 8¹/₂

ADVERTISEMENTS.

1

NEW CONGREGATIONAL CHAPEL, HOLLOWAY, THE BUILDING COMMITTEE of the above Chapel beg to inform those Gentlemen who have favoured them with designs, that they have selected the one marked "E. D. O.," and that the remainder may be had on application at C. A. Bartlett's, 66, Paternoster-row, Lendon. one marked had on application at London. February 10, 1845.

TO BUILDERS.—To be LET, on BUILDING LEASES, some excellent BUILDING GROUND, to form a square around a church now very nearly completed, in an increasing neighbourhood, near the West-end. Money advanced as the work proceeds. Apply to Mr. Frances E. H. Fowler, architect, 28, Sackville, street, Piccadilly.

street, Piccadiny. Great Reduction in the price of Farleigh Down Bath Stone. G. WELLER, of STEEL YARD WHARF (late Drew's), has the pleasure to inform Contractors, Builders, and Dealers, that he has just con-cluded arrangements which will enable him to place cargoes of this celebrated and unequalled Free Stone alongside any wharf in the river, at the unprecedented low price of 1s. 64d. per foot. The same stone may be had in large or small quantities, at a great reduction from former prices, at the wharfs of Mr. Hanson, Kensington, Mr. Foot, Westminster; Mr. Scarle, Wapping; and Messrs. Dance, Chelsea. N.B. Six-inch Ashlar, 9d. per foot. TTT SNOYELL 96 OULADRANT

N.B. Six-inch Ashlar, 9d. per foot. SNOXELL, 96, QUADRANT, REGENT-STREET, Inventor and Patentee of the REVOLVING SPRING WOODEN SHUTTER.— These Shutters oombine economy with perfect security, the cost being very little more than common shutters; and of such simple construction, that the largest establishment can be opened or closed in a few moments with the greatest pussible ease, and without the use of machinery. One great advantage over all other revolving shutters consists in there being made without metal hinges, consequently cannot rust, or get out of order.

TO ARCHITECTS AND BUILDERS. TO ARCHITECTS AND BUILDERS. DULTON AND WATTS, LAMBETH POTTERY, LONDON-Manufacturers in TERRA COTTA of VASES, FOUNTAINS, &c., for Pleasure Grounds. PIGURES for Public Buildings, and AECHI-TECTURAL WORK of all kinds. This TERRA COTTA has all the appearance of Stone, and being subjected to a high degree of fire is imperiabable; thus possessing a decided supersority over cement or artifi-cial stone. Stone-ware, Water-pipes for Houses, Drains, &c., Water closet pans, with simple and perfect trap; the cheapnes-efficiency, and easy adaptation of which ronder them d esire able not only for public institutions, but for every house.

able not only for public institutions, but for every house. SUBSTITUTES for GLASS, for the windows of Manufactories, Workshops, Warchouses, school-rooms, Offices, Out-buildings, Stviights, Horti-cultural purposes, &c. - GERARD ARNEY and Co.'s TRANSPARENT WATERPROOF GLAZE PAPERS, LINEN, and CALICO. The great support which the Proprietors have hitherto received induces them again to solicit the attention of Builders, Proprietors of Factories, warchouses, &c., to their Substitutes for Glass. They afford a light very similar to ground-glass, and the frames for their support need only consist of a lattice-work of wood or wire. Builders will find them very serviceable for temporary windows, &c. Prices, &c.:-Glaze paper, 23 inches wide, 6d. per yard, calico, 31 inches wide, 1s. per yard ; line, 28 inches wide, 1s. dol per yard, in 6-yard lengths. The Proprietors also prepare the COMPOSITION for rendering paper, linen, calico, and other suitable fabrics, transparent and waterproof, at the under-mentioned prices:--Pints, 2s.; quarts, 3s. 6d. each. Each pint, when dilated with turpentine, will make about a quart sufficiently fluid for use. Every information and amples of the prepared fabrics

for use. Every information and samples of the prepared fabrics may be had upon application (by letter post-paid) to the Manufactory, High-hill-ferry, Upper Clapton, Middlesex. For Agency Appointments apply as above.

E. WOLFF & SON'S NRWLY-INVENTED

MATHEMATICAL PENCILS,

MATHEMATICAL PENCILS, FOR POR METHEMATICIANS, ARCHITECTS, & ENGINEERS, Warranted to retain a very fine Point. Te. WOLFF AND SON, in introducing their Extra Hard Lead Pencils for Mathematical and Architectural purposes, beg to draw attention to the advantages resulting from their adoption in preference to the ordinary Pencils. They are made to six distinct sizes, by which means they can be fittered to all instruments, and are so constructed that each Pencil's each of a length, and most convenient for use, and obviating the difficulties existing with respect to the ordinary Pencils. E. W. and Son have also half-round Pencils, suitable for the Spring Bow, thus preventing the necessity of tividing the Pencil down the centre. They are made of a stremely Hard Lead, of the finest quality. which will retain a very fine point and give a clear, even, and distinct line. Price 4s. per dozen. PATTERN OF SIZES. F round 1 2 3 4 5 5

round 1

ing a star

A sample of each size will be sent by Post to any part of the Kingdom, on the receipt of Postage Stamps equal to

ine Aingdom, on the receipt of Postage Stamps equal to the amount. Drawing Pencils of the best quality, for Architects Trail Engineers, warranted free from grit: the nint and users particularly recommended.—Price 5s. per dozen. May be had of all Instrument Makers and Station and at the Manufacturers', 23, Church-street, Spitalness, Loudon.

SATURDAY, FEBRUARY 22, 1845.

HE recent investigations of circumstances affecting the health of the masses, have caused the importance of pure air and light to be more generally understood

now than it was before. The simple fact set forth by Dr. Arnott long ago, that a canary bird suspended near the top of a curtained bedstead in which people are sleeping will generally be found dead in the morning, should have been sufficient to shew the danger of breathing a vitiated medium, and the necessity for providing a constant and ample supply of fresh air in our dwellings.

Impure air, however, cannot be seen,—its effects are not immediate,— and so it has been allowed quietly to kill its thousands annually, and to lay the seeds of disease in other thousands ready to be developed by assisting circumstances, without an effort to stay its ravages, and almost without a knowledge of its agency.

A healthy man respires about twenty times in a minute, and inhales in that period about 700 cubic inches of air. Fresh air contains rather more than twenty-three per cent. of oxygen, and about one and a half per cent. of carbonic acid: by the process of respiration the oxygen is reduced, in round numbers, to eleven per cent., and the carbonic acid is increased to rather more than eight per cent. Now, three and a half per cent. of this gas render air unfit to support life ; so that a man in respiring 700 cubic inches in a minute, vitiates about 1630 cubic inches (to say nothing of the effect produced by the exhalation from the skin); and this will serve to give some notion of the large quantity of air required for the healthful occupation of a building by a number of persons.

All this, however, was for long unthought of, as we have already said, but the concurring evidence of scientific investigators and able medical men, shewing the effect of imperfect ventilation, especially in producing consumptive diseases, fever, and scrofula, repeated in all shapes by the press, has at last made the public aware of its destructive effects, and anxious to prevent them. The great interest in the subject which has been awakened is exhibiting itself, amongst other ways, in a widely-spread agitation against the windowtax. Meetings have been held, not merely in several of the metropolitan parishes, but in the provincial towns; a deputation of delegates had an interview with Sir Robert Peel, ineffectually; the matter has been broached in the House of Commons, and petitions are to be forwarded to aid in obtaining the removal of this obnoxious impost.

All are unanimous in terming it a tax on cleanliness, a tax on ventilation, a TAX ON REALTH.

"A window-tax is an injustice," says one, "and of the grossest kind, to all classes and conditions of men. We may be told that houses under seven windows being exempted, the tax does not fall upon the poor; but if we consider how many of this class live crowded in large lodging-houses, and how many families occupy, for economy's sake, the same domicile, we find that only a fraction of the poor

are freed from the weight of this impost. Besides we urge upon higher grounds, that the free light and air of heaven have no right to be supplied in limitation to mankind. God gave them abundantly to satisfy the necessitics of his creatures, and no man has a right to rob his fellow-man of their full service. It has been proved by the statistics of public health, that the maladies and mortality of the poor are mainly owing to want of pure air. Is it not, we ask, the most flagrant tyranny to limit a man to a domicile lighted and ventilated by only seven windows, and to tell him, if he knocks out a few extra bricks that he may breathe more freely, he must pay for his privileges? Can any greater dishonour be perpetrated upon humanity than to confine it under conditions which are noisome and unhealthy, and should it desire better things, to visit the improvement with a penalty? The wealthy, to whom such an infliction is no burthen, can afford to protect themselves against an impure air, and the prospects of infection, but the poor man must be sacrificed either in his health or his pocket."

As Mr. Hickson too, justly observed to the Health of Towns Commissioners, "The window-duties as now assessed operate as a premium upon defective construction. The legislature now says to the builder-Plan your houses with as few openings as possible; let every house be ill-ventilated by shutting out the light and air, and as a reward for your ingenuity you shall be subject to a less amount of taxation than your neighbours." Sir Robert Peel said, in his late financial statement :-" It is supposed that a case is made out for the remission of the window-duties. Just let us look at the case of the duty on glass, and see what a much greater effect it will have upon the comfort of the labouring classes. Let us see how much more advantageous to the community will be the reduction of the duty on glass than the reduction of the windowduties. There are in Great Britain, as it is estimated, about 3,500,000 houses. There are not more than 500,000 houses which are chargeable with the window-tax. There are therefore 3,000,000 houses which require glass for the purpose of comfort, which, if you sanction the removal of this tax, you are about to benefit." Now the first part of this statement, if correct, and which the Premier feigned to consider a triumphant argument against the supposed necessity of a remission of the window-duties, is in reality a strong argument in favour of the loudly called for remission, since it shews that there is an immense number of residences badly, or much less perfectly, ventilated than they ought to be. Without questioning the good effects which will follow the reduction of the duty on glass, we would say, how much will it avail the poor man to know that glass windows can be formed more cheaply than before, when he cannot have the advantages of them because of this hurtful and unholy impost?

The question is one of vital importance to the public; we hope that the recommendation of the metropolitan delegates will be attended to, and that the rate-payers of every city, town, and parish, will present petitions to the House of Commons, praying for a repeal of the inconvenient, unsalutary, and unequal window duties; they are a tax on architectural appearance, a tax on cleanliness, a tax on MEALTH, and we might add, a tax on MORA-LITY,—for the connection between dark, dirty ill-ventilated dwellings, and degradation and vice, is close and indisputable.

MR. COCKERELL'S SIXTH LECTURE ON ARCHITECTURE.

On Thursday, the 13th instant, the professor concluded his course at the Royal Academy. He said he had confined himself to Roman architecture because it was the most practicable for us of all the styles, uniting variety, con-venience, and applicability, and because Canina's work, already so often alluded to, illustrated so many works of this style. It was to be regretted the students had not referred with him to the original authors. Few of them un-fortunately had made themselves acquainted with the modern languages, and the best works on their art were therefore a dead letter with them. We were greatly deficient he thought, in English works calculated to exalt the mind and increase the resources of the student; comparatively worse than we used to be. In 1610, an edition of Serlio was published, and various editions of Palladio in English followed. None of the architectural classics had been published since, with the exception of Mr. Gwilt's version of Vitruvius, which was a very good translation. Fragments of Vasari were published, but not the complete work, which was to be regretted, as it ought to be generally read. It had been translated into French only recently. Many of the modern works, published every day in Italy, Germany, and France, deserved to be studied. Any foreign catalogue would shew how deficient we were in books of the same description. He wished the body of English architects, taking Quatremere de Quincy's Dictionary as a model, would produce a perfect cyclopædia of the art, one . man executing one part and one man another, under the direction of an accomplished editor. All would surely be glad to aid in such a work, which would be of the greatest use, and would reflect dignity and glory on all concerned. It especially devolved on the association of architects now in existence. He trusted he was not stepping out of his path in making this suggestion; such a work was not within the province of the Academy, and he was anxious to see it commenced.

The professor then proceeded to treat of the Triumphal Arch as an especial feature of Roman architecture. It was gratifying to find that the recent applications of monuments of triumph were in commemoration of great and good men rather than of conquests. The late war might well have produced triumphal monuments, but had not done so, the sense of the country was against it; our great captain said the army had only done its duty; and Nelson looked to nothing beyond a place in Westminster Abbey. Our rivals had raised the *Arc de l'Etoile*, and must feel abashed by our forbearance.

All must admire the Roman triumphal arches; the earliest had but a single arch: they were probably perfected by Apollodorus, in the time of Trajan. The propylea of Egyptian buildings were somewhat analogous.

After explaining the proportions adopted by the Romans in their triumphal arches, the professor remarked there were two ways of varying these proportions, namely by the supply of height or the supply of width. The the sublime was produced by excess of either. The sublime produced by excess of latitude was seen under the large arch of a bridge. He urged the application of the triumphal arch for a railway arch, and said for a novel purpose a novel effect should be sought. He then referred to the quadrifrons, or arch of four faces, and suggested that such monuments might be introduced with effect in our circusses, in Regent street, and elsewhere, as memorials of great men. The Obelisk to Waithman at the end of Bridge-street, was not of great cost, nor important as a work of art, but nevertheless, as a memorial of an honest and able citizen, had a striking moral effect.

He would next direct their attention to the mausoleum. That at Xanthus, which was described in the 4th century (uniting architectural and sculptural decorations), was very important in an archæological point of view, as it served to guide us to that of Mausolus, which from its magnificence gave the name to all buildings of that class. Pliny said the latter was one of the wonders of the world. Scopas and four other sculptors were employed upon it. The professor exhibited a restoration of it, according to Pliny's account, shewing a

85

high stylbate, columns; and entablature, crowned by a pyramid in twenty-four steps. The whole height was 140 feet, the number of columns thirty-six. In this monument and that at X anthus several new principles of great beauty were set forth. The parallelogram approached the square very nearly. The high stylobate furnished room for thesculptor. Its use in the tomb of Mausolus was hardly credited before, but was now confirmed by the discovery at Xanthus. The introduction of statues between the columns, mentioned in the fourth lecture, was a new arrangement to us, and a good one. The pyramid with which the structure terminated was adopted by Hadrian in his mausoleum long after.

The monument of Augustus, in the field of Mars at Rome, of which parts still remain, was a surprising work. This building was circular, with a portico, and was crowned by a pyramid of terraces, planted with the cypress and other trees, thus uniting the tumulus with the built pyramid. Strabo's account of this monument was the only one existing, and that was very slight. Very little was said about this extraordinary work (its portico was higher than the portico of the Parthenon), a proof that such were universal. We owed our knowledge of this monument, the professor said, to the researches of Canina. The tomb of Cecilia Metella was supposed also to have had cypresses at the too.

said, to the researches of Canina. The tomo of Cecilia Metella was supposed also to have had cypresses at the top. The mausoleum of Hadrian, erected 114 years after that of Augustus, was scarcely less remarkable. It was framed more on Greek models, and had two orders. The body of it still remained, and was known as the Castle of St. Angelo. The statues, which adorned it, had been thrown down on invaders, and were occasionally fished out of the Tiber, which runs at the foot of it.

Such works would not be attempted now by individuals, but might be by public companies. The cemeteries would soon become filled if some fresh arrangements were not made. The professor had proposed to one cemetery company an adaptation of the mausoleum of Augustus, filled with cells, and approached by inclined planes, with four chapels in the lower part, but the proposed outlay frightened them. Government might carry out such a scheme advantageously on Primrose-bill, or other elevated spot. Interment was a fitting subject with which to conclude the course. In taking leave of them, he would say,

"Make the Greek anthors your supreme delight, Read them by day, and study them by night."

It was chiefly by the study of great productions that artists became great; no one could examine the works of the great architects without deriving advantage. They must allow no opportunity for improvement to slip. In their magnificent profession the exercise of every faculty was called for; they must embody every discovery for the use of the public, and obtain general acquaintance with all the sciences. They must prepare themselves to meet men of all stations, from the prince to the mechanic, and must sustain a high moral character; they might then rely on obtaining the respect of all.

FALL OF A BRIDGE.—The new Victoria Bridge at Spalding, which was considered an ornament to the town, and was lately erected by subscription, at the cost of upwards of 3,000l, fell on the 26th ultimo, in consequence of an unusual high tide, accompanied by a tremendous storm, the effects of which in various parts we had occasion to record a fortnight since. A local paper states that "the bridge was upon the ' bow and string' suspension principle, with side-braces to prevent vibration during a gale of wind; and it is certainly possible that, in consequence of the tide having risen considerably above the usual level, a gang of lighters might swing foul of the side-stays, and draw the bridge out of its perpendicular; if so, the principle of the erection was destroyed, and as a matter of course its own weight brought it down. No blame is thought to be attributable to the contractor, though it would have been a fortunate circumstance, had it been considered at the time, to have had a few piles driven at each corner of the bridge, as a preventive against such an unfortunate and expensive mishap."

DRY ROT AND WORMS IN TIMBER. BY JAMES WYLSON.*

In the first volume of THE BUILDER, at p. 268, will be found a full description of the Pavnizing process for preventing dry rot, and which appears to possess considerable advantage over the Kyanizing method : the materials employed are sulphate of iron and sulphate of lime, both being held in solution with water; the timber is placed in a cylinder containing the solution of iron, the air is withdrawn by means of the sir-pump, and the solution strikes into the wood so as thoroughly to pervade its pores; it is then placed in the solution of lime, and immense pressure being applied, the latter is forced into a combination with the iron, and immediate consolidation takes place; the timber is then found to have greatly increased in weight, and to have become unignitable; we may also reasonably infer that, with such a compound in its pores, decay must be greatly retarded, and the liability to worms reduced; the greatest drawback consisting in the increased difficulty of working. Between this process and Kyan's we see the marked dis-Another of the patent processes in use, namely Margary's (see THE BUILDER, vol. i. p. 320), we should fear is of the latter class, the method consisting in steeping the wood in an open tank, with the hope of thorough saturation; in this process the material is sulphate of copper in solution with water, in the proportion of 1 lb. to 8 gallons. Dr. Parry recommended a preparation composed of bee'swax, roll brimstone, and oil, in the proportions of 1, 2, and 3 oz. to \$ of a gallon; to be boiled together, and laid on hot. Dr. Darwin protogether, and laid on hot. Dr. Darwin pro-posed absorption, first of lime-water, then of a weak solution of sulphuric acid-drying between the two, so as to form a gypsum (sul-phate of lime) in the pores of the wood; the latter to be previously well seasoned, and when prepared, to be used in a dry situation. A Mr. Bill is said to have discovered an insoluble varnish, of small cost, which enables wood by saturation, to resist decay for five years under

the most trying circumstances. In a report by Mr Pritchard, C.E., of Shoreham, in 1842, respecting the preservation of the timbering of the Chain Pier at Brighton, he states his perfect success in establishing pyrolignite of iron and oil of tar, as a preventive of dry rot; the pyrolignite to be used very pure, the oil applied afterwards, and to be perfectly free from any particle of ammonia; in that report, reference is made to a patent which it appears is held by Mr. Bethel, of Vauxhall Tar Works, for preparing wood by impregnating it with either or both of these materials; this treatment, as Mr. Pritchard remarks, supersedes the necessity of covering marine timbering with iron nails, as practised at Plymouth Dock and elsewhere.

The above preparations, and those noticed in a previous article, have for their object the prevention of dry rot; with respect to cure, when such has taken place, it is recorded that in a ship called the Eden, every trace of fungus was eradicated by its remaining eighteen months under water; now, it is well known that common salt, in small quantities, conduces to the decomposition of vegetable matter, and would, if applied, be liable to increase the evil; and, therefore, it must be inferred that a solution for the purpose in view — circumstances being supposed to admit of its adoption, —must be of a strength closely assimilating to sea-water, and which, while it destroyed the fungus, would have the effect of suspending decomposition in the ligneous fibre of the timber. Where facility is afforded for making it available, a degree of heat sufficient to destroy vegetable life may be adopted with great certainty for arresting the progress of any fungus growth, and destroying the power of regenerating; but it is attended with difficulty, since as much as 300° of heat is required to produce the desired effect. Where the disease is internal, and far advanced, the best cure is cutting out the parts affected; this is often necessary where it is external, but thoroughly scraping away the vegetable matter, and washing over with a powerful solution of one or the other of the kinds hereafter mentioned, and which are calculated to kill any infectious germ that may exist, will probably eradicate and permanently remove the evil : painting affords

* See page 32 unte.

no protection against it: gary's process has been pplied with success for arresting the progress of the disease where it has commenced; this Prescription we believe is old enough, and unpatented, the only difference consisting in its being used four times as strong, which may be supposed to be necessary, since cure is generally more difficult than prevention.

prevention. When we consider the disastrous results proceeding from dry rot, the trouble and expense which it occasions, how often it originates io imperfect seasoning, and already exists in timber before it is converted to use, we see the importance of exercising the utmost precaution: as regards timber beams, they should invariably be sawn up in the middle of their breadth, the fresh surfaces turned outwards, and the growth reversed; and be thus bolted together, separated a little by blockings where the bolts pass through; by following this rule, it is ascertained whether decay has begun in the heart of the timber, and if so, whether to such a degree as to require the piece to be laid aside; the seasoning is sooner perfected, and by reversing the ends the strength of the of timber may often be ascertained by sounding it with some metal instrument.

Timber, besides being subject to have its natural decay anticipated by premature decomposition, proceeding from unseasonable feiling, imperfect seasoning, or the other destructive agencies to which we have referred, is liable from similar and other causes to be destroyed by various worms and insects; the soft and tender woods, and such as are of a saccharine tender woods, and such as are of a saccharine nature in their juices, are the most liable to be assailed by them; those which are bitter are generally, if not invariably, exempt; it is ob-vious, therefore, that those palatable juices, which are so conducive to their production and propagation, should be got rid of by thorough seasoning, and if further precaution be necesseasoning, and, if further precaution be neces-sary, that the infusion of some bitter decoction into the pores of the wood will be an effectual preventive; and for which those woods that are of a regular grain afford sufficient facilities. Ash, if felled when abounding in sup, is very subject to worms; beech is also very liable to their attacks, likewise alder and birch; in these woods, water seasoning is found to be a considerable preventive; the sap-wood of oak also is by it rendered less liable; smoke drying, or burning fern, shavings, &c., ander the wood, by impregnating it with bitter particles, also renders it exempt from worms; the silver fir is subject to them; the sycamore is rather so; alder is said when dry to be very susceptible of engendering them; the cedar, walnut, plane, cypress, and mahogany, are examples of woods which discourage their advances. For the extirpation or prevention of these destructionists, see recipes appended to this article.

Besides the common worm to which timber in its dry condition is liable, there are a variety of a more formidable character which commit their ravages on the bottoms of ships and the timbering of sea works: of these the most common are the pipe-worm (or *teredo navalis* of naturalists), a species of pholas (*pholas striata*), the lepisma, and another mentioned by Smeaton, which is almost invisible. The pipe-worm was originally brought from India to Europe; when first produced from the egg it is very small, but it soon attains a considerable size, in general acquiring a length of about three inches, and in the more favourable woods, the fir and alder in particular, fattening to its utmost size, and sometimes reaching full twelve inches in length. The more compact woods offer more impediment to its progress, although, from the formation and hardness of its head, it is enabled to penetrate even the most dense; bitter woods they do not at all attack, yet charring the surface of wood has not been found to he of any use as a preventive measure. Timber constantly under water, and which has been subject to their operations, has been aptly compared to a honeycomb, so extremely contiguous are their habitations, yet at the same time perfectly distinct; but while the perforation is so complete, it is unfortunately concealed within a thin external shell of undisturbed wood, which prevents the apparent, the infinitude of minute perforations by which they have communicated and the second by which they have communication with the water being invisible to the eye. The pholas

above particularized, does not confine its work of destruction to timber alone, but extends it to stone and other materials; it penetrates the wood when young, making an entrance of about a quarter of an inch in diameter, and enlarging it as it advances inwards and matures growth, thus becomes imprisoned; it in leaves off boring when full grown, and never extends its operations beyond reach of the water, from which it partly derives its sustenance. The lepisma attacks woods in the East-Indies inimediately they are immersed in sea-water, and, though small, is very destructive in its operations, having been known to eat through the unsheathed bottom of a boat or four weeks. The small white in three worm last mentioned above, differs from the common ship-worm in its boring obliquely across the grain instead of lengthways; and its mode of operation consists in dissolving the substance of the wood rather than cutting into it, the harder woods offering the most obstruction to its progress, yet so far from sufficiently, "that a three-inch oak plank will summerently, "that a three-inch oak plank with be destroyed in eight years, by its action from the outside only." It appears as a small white soft substance like a maggot, but indistinct without a magnifier, and it is said not to live in the part of piling that is imbedded, or in any timbering situated above the tidal influence, that supply being necessary to its existence. These creatures yearly render necessary heavy repairs in the sea-dykes of Holland, from which we may imagine the Sampson-like achievement they might accomplish, if unheeded, amongst the piles whereon Amsterdam is built.

In the report before referred to, Mr. Pritchard disapproves of the use of Stockholm tar as a coating for marine timbering, considering it, in common with other tars containing vegetable matter, as detrimental to timber when exposed to salt water; and also, from its not penetrating the wood, being very soon eaten away by the salt acid of the sea. Common gas or coal-tar he also considers as doing much harm instead of good, forming a hard and brittle crust on the wood, which prevents "the damp and unnatural heat from the possibility of escape, owing to its containing ammonia, which burns the timber, and in a few years turns brown and crumbles into dust:" the pipe-worm, and others, he says, will destroy timber thus prepared in five or six years; and respecting such as has undergone the Kyanizing process, mentions a piece of heart of English oak in Shoreham Harbour, which was eaten to net-work by the worms in four years. For a sure defence against these assailants, he recommends the pyrolignite of iron and oil of tar, as specified by him for dry-rot. It appears that there has been used for years at the port of Liverpool, a wood called mora, or greenheart, the properties of which are well understood there, and which entirely resists the attacks of sea-worms; some of this timber seems also to have been imported into London within the last two or three years, but it is by no means generally known, although evidently it is of high importance that it should be so.

Besides worms, timber is exposed, chiefly in the Indies, to most dreadful havoc by some species of the ant tribe; from the destructive jaws of the termite or white ant there is nothing secure, unless it be of stone or metal; roofs, floors, and the other parts of buildings that are constructed of wood are infested by them, and when painted will present a solid appearance while they are completely hollowed; furniture and wooden utensils alike undergo their devouring ravages. The red ant of Batavia is another little devastator.

The following summary of the most approved formula for preventing and curing the evils of which we have treated, will, we believe, be acceptable to those interested in this particular subject; of course a recapitulation is avoided of those remedies which are already suggested by the tenor of our remarks;—

TO PRESERVE WOOD WORKS THAT ARE EX-Posed to wet or damp.

For those of an extensive nature, such as bridges, &c.-1. A coating of pitch and tar, strewed with powdered shells and sea sand, or smithy ashes, beaten small, is used by the Dutch, and found to be an excellent protection. 2. A paint composed of sub-sulphate of iron (the refuse of the copperas pans) ground up with any common oil, and thinned with coal tar oil having a little pitch dissolved in it, is flexible

and impervious to moisture. 3. Linseed oil and tar in equal parts, well boiled together, and used while boiling, rubbed plentifully over the work while hot after being scorched all over by wood burned under it, strikes an inch or more into the wood, closes the pores, and makes it hard and durable, either under or out of water. For those of a more domestic nature, a coating either of coal-tar or paint sanded over, are generally considered good defences; but they require renewal from time to time: the painting is most durable when sanded.

. TO PREVENT ROT.

1. Boiling the wood for a few hours in sulphate of iron (green copperas), and leaving it for some days in a warm place to dry, renders it hard, compact, and impenetrable to moisture. 2. A very strong impregnation of common salt (muriate of soda) is a good protection where dryness is not an object. 3. Charring will fortify timber against external infection. 4. Coating with coal-tar will also serve that end: in both, the timber must have been thoroughly seasoned.

TO CURE INCIPIENT DRY ROT.

1. A pure solution of corrosive sublimate (corros. mur. of mercury) in water, in the proportion of an ounce to a gallon, used hot, is considered a very effectual wash. 2. A solution of sulphate of copper (blue vitriol), half a pound to the gallon of water, laid on hot, is another excellent wash, and cheaper than the preceding. 3. A strong solution of sulphate of iron is sometimes used, but is not thought such an effectual remedy as the copper. 4. A mixture of the solutions of copper and iron is occasionally adopted.

TO PREVENT WORMS IN TIMBER.

1. Anointing with an oil produced by the immersion of sulphur in aquafortis (nitric acid) distilled to dryness, and exposed to dissolve in the air, secures the wood, and imparts to it a not unpleasant odour. 2. An impregnation of lime is an excellent preservative, especially for sap-wood when in a dry situation. 3. Soaking in an infusion of quassia, by rendering the wood bitter, is a good protective. 4. The oil of spike is a good remedy. 5. The oils both of juniper and turpentine are efficacious in some degree. 6. For small articles, cover freely with copal-varnish or linseed-oil.

TO PREVENT WORMS IN MARINE TIMBERING.

1. A mixture of lime, sulphur, and colocynth with pitch, is a good protecting coat for boards. 2. Saturating the pores with coal-tar, either alone or after a solution of corrosive sublimate has been soaked and dried into the wood, also forms a good protection. 3. Sheathing with thin copper over tarred felt is esteemed the best protection for the bottom of ships from all marine animals; the joints should be stopped with tarred oakum. 4. Studding all the parts which are under water with short broad-headed nails soon covers the whole surface with a strong coating of rust, which is found to be proof against their penetration.

TO DESTROY THEM.

1. Rub the wood with poisonous ointments. 2. Whale oil is stated to have been applied with success.

TO DESTROY ANTS IN WOOD.

1. Kyanize the wood, corrosive sublimate being an effectual poison to them. 2. Arsenic is a good destructive. 3. Oils, especially essential oils, are good preventives. 4. Charring prevents their depredations. 5. Cajeput oil has been proved effectual for destroying the red ant.

WARNING RAILWAY CARRIAGES. — The Philadelphia correspondent of the *Chronicle* says:—" They are warming the passengercars on the railroad between New York and this city with hot water, in copper pipes along the floor and sides. These pipes proceed from a small boiler placed over the stove in each car—a capital invention."

NEW METHOD OF IMPELLING LOCOMO-TIVES.—A patent has recently been obtained by Mr. G. C. Coffin, of Lunaford, Wilts, for certain improvements applicable to locomotive, marine, and stationary-engines. Mr. Coffin's proposed plan is an attempt to introduce the pendulum as a motive agent in machinery.

THE MUSEUM OF ECONOMIC GEOLOGY.

The office of Mining Records and museum of Economic Geology is situated at Nos. 5 and 6, Craig's-court, Charing-cross. It is freely open to all persons every day in the year, except Sundays, Good Friday, and Christmas-day, with no other restriction than the visitor's writing his name in a book. The hours are from ten to four, from November to February inclusive; and from ten to five during the remainder of the year. The museum is in the department of the Commissioners of Woods and Forests, and is under the immediate direction of Sir Henry de la Beche, F.R.S., F.G.S., Mr. R. Phillips, F.R.S., being curator, and Mr. T. B. Jordan, keeper of the mining records.

It originated in a suggestion of the present director, who, in July, 1835, submitted to the Chancellor of the Exchequer that the persons employed upon the ordnance geological survey had opportunities of collecting specimens, and pointed out the advantage which would be derived from those specimens being arranged under the care of the Board of Public Works, and marked with the names of their localities referred to in corresponding maps. The specimens desired were of substances used in roads, for works, or buildings, and for useful and ornamental purposes in the arts, and from which useful metals are extracted. Apartments were allotted for the collection formed, and in February, 1837, Lord Duncannon, then Chief Commissioner of Woods and Forests, requested the present director to undertake the duties of the office, which he has since filled gratuitously, with zeal and ability. In 1839 Mr. R. Phillips was appointed to the office of curator; his duties being to make analyses on moderate terms, and to receive pupils for instruction. In the same year the place became the deposit of the mining records, Mr. T. B. Jordan being appointed keeper; the preparation of plans and sections, and of models of mines and machinery, in the workshops beneath the museum, being under his care. Permission is readily granted to make use of the plans and drawings, on application to the keeper, who is daily in attendance.

The building is easily recognized by the five granite-posts in front, which are specimens sent for those in the centre part of Trafalgarsquare. Commencing near No. 5, the first post is from Aberdeen, the second from Peterhead, the third from Penryn, in Cornwall, the fourth from near Dublin, and the fifth from Dartmoor; only the two last are solid blocks. The museum consists of an entrance-hall, an apartment on the groundfloor, 46 feet by 18 feet 6 inches, a gallery on the first-floor, 103 feet long, and varying in width from 17 feet to 25 feet, a room on the second floor, a record-office, fitted up with folios and cases for plans, a private room for the director, a laboratory, and workshops.

In the room on the ground-floor, over the fire-place, is a painting on cement formed from the refuse of copper furnaces; it has a highly polished surface, and the capabilities of the composition are therefore hardly to be judged of on a small scale.* This room contains the specimens of building stones, procured by the commissioners appointed in 1838 to visit the different quarries for the purpose of selecting stone to be used in the new Houses of Parliament. These specimens are six-inch cubes, 197 in number, arranged according to their mineral composition, having the names of different buildings in which they have been employed labelled upon them, as well as the designation and locality. These are the specimens referred to in the report of the Building-stone Commission, dated August 27, 1839, No. 574, which document is already out of print. We find that the stones used in the Houses of Parliament are the following:— 1. Oolite limestone, from Painswick, Gloucestershire, employed in the internal masonry. 2. Limestone of the oolite series, from Caen, Normandy, employed in the interior. 3. The magnesian limestone, from Steetly, Derby-

• In the Athenæum of July 22nd, 1943, we find the following :-- "The Lady Chapel of the church of Saint Nicholasdes-Champe, Paris, has recently been enriched by a Christ, of colossal proportions, painted on lava, on a gold ground, by M. S. Perlet, after the manner of the Byzantine movaics, which still adorn some of the Italian churches. This modern painting on lava is said to be one of the first essays of a kind peculiarly adapted to a northern climate, by its presenting a surface enamelled by fire, and therefore prof against damp."

87

shire, between Worksop and Chesterfield, used for the small internal courts. 4. Magnesian limestone, from Woodhouse, Mansfield, Nottinghamshire. This stone has a beautiful yellow tint, with very small black spots, and takes a smooth face. 5. The magnesian limestone, from Bolsover, Derbyshire, held, in the published report, to be the most eligible of the number : of coarser grain than No. 4. 6. Magmesian limestone, from Stone Ends, North Anston, Yorkshire, between Worksop and Sheffield, used for the plinth of the building towards the river. 7. The magnesian limestone, from Woodhouse, near Mansfield, Nottinghamshire, Lindley's Bolsover Quarry, used for a portion of the mouldings and carvings. 8. Magnesian limestone, Norfall, Anston, Yorkshire, between Worksop and Sheffield, used for the structure generally. 9. Another specimen of magnesian limestone, from Steetly, Derbyshire, used for the small internal courts. 10. Magnesian limestone, from North Anston, Yorkshire, between Worksop and Sheffield, used for the superstructure generally. The colour of this stone is dark yellow, being darker than that from Norfall Anston.

In the collection is a specimen of the stone from Taynton, Oxfordshire, used in the interior of St. Paul's Cathedral; it is a coarse shelly colite. The sand-stone used in the restoration of Hereford Cathedral, is from Capler Quarry, eight miles south-east of Hereford, on the Wye, and is in colour a reddish drab. The pieces of granite and marble are some of them very beautiful. We found the black serpentine, the black and the veined gray, and reddish marble, s the white alabasters of Devonshire, Derbyshire, and Scotland. Many of these are exhibited wrought into tazzas and ornamental vessels. The history of porcelain is exhibited in specimens of pottery from Egypt, Etruria, and Mexico, down to our times, when it is formed into tiles for church pavements, and into such rich and elegant forms as are here exhibited by Messrs. Copeland and Garrett. There are specimens of Keene's cement, Broseley clay, Stourbridge clay, and a series illustrating the uses of plaster of Paris. Mr. C. H. Smith has contributed an Egyptian capital, copied by himself, we believe, in granite, from one in the British Museum, by way of illustrating the perfection to which the art of tempering steel is brought in modern times .- The gallery on the first floor is devoted to specimens of coal, and of the English and foreign ores. There are also some interesting illustrations of the various states which metal assumes under the influence of art or nature ; as of the change which iron undergoes from the fibrous to the crystalline state when employed in axles. Copper, There is a beautiful series illustrative of the mode of preparing dies for coinage, and the electrotypes are the best collection that we ever saw. The process of making swords and gun-barrels is illustrated, and most clearly explained by Mr. Wilkinson, of Pall Mall. Though the ornamental is not professedly sought after in the collection, it happens that there are several curiosities most interesting to the artist and the man of taste. Among these is a model of the monument to William de Valence, senior Earl of Pembroke, half-brother of Henry the Third, who died in 1304, exhibiting the use of enamel in the costly tombs of that period. The model was prepared under the direction of Albert Way, Esq. The figure is entirely gilt, and the shield emblazoned in blue, red, and gold, the horizontal surface of the the tomb being covered in diaper, with heraldic achievements. The collection of enamels is highly interesting, and includes, amongst other things, a reliquary of the 12th or 13th century, and a casket of the 14th century, emblazoned with the arms of England and Valence. There is a candlestick of the 14th century, and a pyx is a candiestick of the 14th century, and a pyx of the same date. On the wall of this room is suspended a "Flemish Monumental Brass, of Lodewyc Cortewille, of Cortewille, near Liege, who died 1504, and of his wife, Colyne Van Castre, who died 1496;" the analysis gives the following result :--

| Copper Zinc Lead | 64 29 | 0 5 |
|------------------------|----------|--------|
| Tin | 3 | 0 |
| | 100 | 0 |

The room on the second floor contains surveying instruments and mining tools, specimens of bricks and tiles, and models. The skill of our ancestors is evidenced in a coat of mail, weighing seventeen pounds, and containing many thousand links, each one being separately rivetted. In conclusion, we advise our professional brethren to avail themselves of the advantages which this collection offers; it has hitherto been little visited, and it is with the view of gaining it a greater share of attention, and the assistance in contributions which architects can often so easily afford, that we have been led to devote so much space to it.

COVENT GARDEN IN THE SIXTEENTH CENTURY.

In the last part of the "Archæologia," there is a copy of the counterpart of a lease from the Earl of Bedford to Sir William Cecil, afterwards the Lord Treasurer Burghley, of part of the "Enclosure or Pasture, communely called Covent Garden, scituate in Westm'." It was executed in 1570, and is interesting to investigators of metropolitan antiquities, as affording information with regard to the state of a portion of London now occupied by a numerous population; but which, in the reign of Elizabeth, presented a very different appearance. The portion in question is said by the lease to be "dyvyeded from the rest of the said Enclosure called Covent Garden on the west syde of the said porcyon or p'cell nowe demysed wth certayne stulpes and Rayles of wood, and is fenced with a wall of mudde or earth on the East next vnto the Comune high waye that leadeth from Stronde to St. Gyles in the fyeldes, and on the west end towardes the South is fensed wth the orcharde wall of the said S^r Willm Cecyll, and on the South end wth a certayne fence wall of mudde or earthe, beinge therebye devyeded from certayne Gardens belonginge to the Inne called the Whyte Heart, and other tenementes scituate in the high streate of Westm', co-munly called the Stronde." Mr. Albert Way, Mr. Albert Way, the present accomplished director of the So-ciety of Antiquaries, who laid this document before the members, remarks in a letter which

accompanied it :----"With regard to the limits of Covent Garden, as defined in this lease, I must appeal to those who are versed in the ancient topography of the metropolis to explain the position of the various boundaries described in the document : but I would offer an observation on the modes of inclosure whereby, in the reign of Elizabeth, property so immediately in the vicinity of the city of London was fenced, even where it adjoined the great highways at the very entrance of the metropolis. It is curious to com-pare the approaches of London, as they now appear, with their aspect nearly three cen-turies since, as set forth in the terms of this lease, and to view the advances of civilization and luxury, illustrated by the comparison of the conspicuous public monuments and suit-able fences which now adjoin Hyde Parkcorner, or the Cumberland-gate, with the mud walls and 'stulpes' which presented themselves to the visitor of London in the 16th century at the gates of the city. At that period the ancient process of forming walls by means of indurated earth was still extensively employed : in the eastern counties this was called dawbing, and the term is still retained in Norfolk and Suffolk; but the process is now used, to any considerable extent, in the more remote county of Devon only. The subject of the cob-walls of the western counties, and of the use of concrete, generally, in all ages, and particularly in Spain, where important ancient structures formed with mud walls may still be seen, has been curiously illustrated in the "Quar-terly Review," Vol. LVIII., by the able pen, as I believe, of Mr. Richard Ford, of Heavitree.

"Sir William Cecil had his dwelling, originally built by Sir Thomas Palmer in the times of Edward VI., upon the site of the parsonage-house of St. Martin's-in-the-fields, situate in the High-street, at the south end of Druy-lane. Sir William had bestowed much pains in beautifying this his abode, which adjoined the property of the Earl of Bedford, and had an orchard contiguous to the inclosure, known as the Covent-garden, a portion of which was leased to him by the earl. This portion is described as divided by certain stupes

and rails of wood. This obsolete term, stulp, is now retained only in the dialect of Norfolk, and is used to signify \blacklozenge low post fixed as a boundary. In the first English Dictionary, which was compiled in Norfolk during the reign of Henry VI., called the 'Promptorium Parvulorum,' this word occurs, as well as the greater part of those archaic terms which are now retained almost exclusively in the East Anglian dialect. In this curious dictionary is found 'stulpe or stake, paxillus.' The same term is used by the chronicler Fabyan to denote the bulwark or fence at the approach of London Bridge on the Southwark side, where he relates how the rebel Jack Cade drove back the citizens of London 'from the stulpes in Southwarke, or brydge fote, unto y' drawebrydge.' A.D. 1450."

BATHS AND WASH-HOUSES FOR THE LABOURING CLASSES.

THE committee, after a month's consideration, have selected the plan of Mr. P. P. Baly, as the best of twenty-two which were submitted to them in competition.

The unsuccessful candidates have received intimation that their drawings will be returned, on application at Crosby-square, after the 27th instant, and that the committee have resolved that the successful competitor shall not be permitted to see the plans of the other competitors. We do not see the necessity or advantage of this resolution, and if it is to be used as a reason for the exclusion of all persons from an examination of them, utter a decided protest against it. We have already received letters from competitors inquiring why their drawings are to be detained till the 27th: we trust it may be for the purpose of exhibiting them. We shall hope to lay information on the subject before our readers next week.

DANGER OF IMPROPERLY FIXING STOVES.

The carelessness with which close stoves are constantly placed so as to jeopardize whole neighbourhoods, is deserving of severe reprehension and really calls for some interference. We constantly see them put up in immediate proximity to wooden fittings, even in a recess *lined* with wood and sometimes with the smokepipe passing through a hole in a chimneyboard! Because no accident occurs immediately, it is thought to be perfectly safe; they forget that the wood so exposed to the heat becomes every day more and more ignitible, and are not awakened to the danger till the house is in flames, which further, may reach the property of others not equally deserving of such an infliction.

Only a few nights ago, a house in Charlottestreet, Bloomsbury, would probably have been burnt down from the above cause, if the occupier of the adjoining house had not been aroused by smoke and the smell of fire, and obtaining entrance, succeeded in stopping the progress of the flames.

Many of the late fires have originated in this manner, but experience unfortunately seems to have very little effect until it is paid for.

The constant occurrence of fires in the metropolis is a subject for most serious consideration. The amount of property destroyed annually, to say nothing of the loss of life, is immense; if but a small part of it were yearly expended by the community in a proper way, this might be prevented and all its consequent distress and miserv.

COURT OF CHANCERY.—The ancient hall of Lincoln'-inn, in which the Chancellors of England have sat for so many years, is nearly stripped of all the armorial bearings which decorated its walls, and the stained glass that ornamented the windows, the whole of which have been removed to the new hall, Lincoln'sinn. The admired picture of "Paul pleading before Agrippa," which has so long ornamented the end of the hall, has also been removed to the new building. It is said that it is in contemplation to add the present kitchen (which is only divided by a passage) to the present hall, and then divide the building into three courts, one for the Lord Chancellor, the others for the Vice-Chancellors. If this plan is carried into execution, the temporary courts at present occupied by Vice-Chancellor Knight Bruce and Vice-Chancellor Wigram will be nulled down — Cloba

pulled down, Globe. Digitized by GOOgle

DISSOLUTION OF THE CAMBRIDGE CAMDEN SOCIETY.

SIR HERBERT JENNER FUST'S Judgment in the stone altar and oredence table cause, printed in a recent number of this journal, and the retirement from the Cambridge Camden Society of the Bishop of Exeter, the Bishop of Lincoln, the Chancellor of the University, and others, have led to a proposal for the dissolution of that association, and will, it is to be hoped, prove a heavy blow and great discouragement to those who have insidiously endeavooured for some time past to guide the sation to Rome.

On Thursday, the 13th inst., while the honorary secretary was reading to the society a report from the committee --

The president rose, and said, that the announcements he had just made of accessions to the society, however gratifying, especially by their promise of the extension of the society's usefulness in distant colonies, would not adoquately supply the vacancies which he felt it his duty, though not required by the rules, to announce from the chair. The members were aware that one of their patrons, the Bishop of Exeter, had not only withdrawn, but had published his retirement and disapprobation the world, assigning reasons of which it did not now become him to contest the validity, however much he might be prepared and desirous to disavow the imputations therein conveyed. Another of their patrons, the Bishop of Lincoln, had since withdrawn his name, on grounds similar to, and brought to his notice by, those adopted by the Bishop of Excter; and subsequently the committee had received an intimation simply announcing the retirement of the Chancellor of the University, followed, as was to be expected by the usual eti-quette, by that of the Vice-Chancellor. If the members were really animated, as he believed to be the case, by the principles which had always been professed by the society, he felt assured that they would neither be surprised nor offended, however much they might be distressed, by the remainder of the report of the committee, the reading of which he had in-

"The retirement of two of its episcopal patrons, accompanied in the case of one of them by public expressions of disapprobation, and followed by that of the chancellor and his representative, have appeared to them to place the society in a position incompatible with its character as an association of members of the church and university. They feel satisfied that any advantages which might be expected from its continued operations would be insufficient to counterbalance the positive evil that must result from even an apparent disregard of the sentiments of those invested with anthority. They therefore recommend unanimously that the society we preserve.

the SOCIETY BE DISSOLVED. "This recommendation can only be carried into full effect at the anniversary meeting. Till then the ordinary meetings, which have been already convened, will be held proformal for the despatch of necessary business. The interval will be occupied in winding up the society's affairs. The recommendation now announced will be submitted at that meeting for, what the committee earnestly hops it will receive, its ratification." This was received with a dead silence. It

This was received with a dead silence. It was evident that the announcement had taken the meeting by surprise. The president proceeded — He was well aware that the recommendation which the committee had felt it their duty to make to the society, was one which largely taxed its confidence, as well as its obedience to the man principles by which it had been always governed. Still it would never do for him, it would never do for them, to walk about the university, and feel that they were members of a society from which the Vice-Chancellor had withdrawn his countenance. No time for dissolution could be more appropriate than the present, and for any sacrifices required by duty they would console themselves with the reflection that the society had done its work, though its work was done. They would remember a sentence to that effect in his address to them in May

last, where he had dimly foretold the consummation to which they were now invited : a sentence suggested, as the context would shew, partly by the considerations which he had been now urging upon them, and partly by the prospects of that change in the condition of the society, which had been anticipated as the consequence of the near removal of himself, and other its founders and principal managers, from the University. His career here was closed: it was a satisfaction, amidst some regret, that their light should go out together. Neither let them suppose their good would be lost, though he hoped that whatever harm, if any, had come from their operations, this act, en consummated, would blot out for ever. The principles of union in church-membership, to say nothing of architecture, which had been generated and fostered by the society, would fructify more generally and forcibly, stripped of whatever was frivolous or inappropri-ate, in other ground and in other forms. Whathe had said would, he trusted, reconcile the society to the decisive and unmistakeable step recommended by the committee. It had, in addition, the highest sanctions of which it was capable. He felt assured that the society would feel that it was more in conformity with their position and their sense of duty, than to prolong, however. effectually, an uneasy existence.

And in May next, therefore, unless a fresh arrangement be made, the Cambridge Camden Society will terminate its existence. To a looker-on, this step seems extreme and unnecessary; and many will say, with a corre-spondent, "Is there no other course open? Must a society, constituted for useful and praiseworthy ends, be dissolved because grave errors have been committed? Cannot its management be amended? Is its original and proper object inseparably connected with the course of proceeding objected to? Is the 'Study of Ecclesiastical Architecture,' to which these high personages are favourable, not capable of being pursued unless in connection these with the encouragement of Popish absurdities er errors? Cannot useful hints be given to eharchwardens for the preservation of sneight and sacred edifices intrusted to their charge, without intruding into the office and duties of the archdeacon? Cannot a design be furnished for a church at Hong Kong, unless a Romish almanac be simultaneously printed at the Pitt Press, by a secretary of the society, or the envelope of the plan be stamped with the effigies of saints of the Romish calendar?

"The dissolution of the society, by its own act, because of complaints made on grounds here hinted at, amounts to a confession on its part that it considers its avowed object not worth carrying out, unless it can be made the means of promoting other ends not avowed; and which, if they had been avowed, the society would never have been composed of its present members."

The following letter takes the same view of the subject :---

"Sir,—As a young member of the architectural profession, and therefore deeply interested in whatsoever concerns it, I venture to solicit your favourable consideration of this address.

"I have observed that your able periodical is ever ready to advance and uphold the principles and study of ancient ecclesiastical architecture, apart from the superstitious and subtle feelings now too generally prevalent in describing and encouraging the admiration of the beautiful remains of our forefathers. Surely, this may always be done without making it the vehicle for disseminating those dangerous views entertained with strange infatuation by many members of the two universities. I have been led to these remarks by a rumour of the intended dissolution of the Cambridge Camden Society, and, in common with many, I should regret the benefits likely to be lost to the profession and to the community by such a proceeding. For when we see so influential and able a society, composed of men who, from their stations, intellects, and pursuits, are so capable of rendering good service to the study of Gothic architecture, if their information be conveyed according to a proper spirit-i. e., apart from the advocacy of Romanism-all sober-minded men will lament that so much advantage should be lost by the cessation of their labours. I, for one, cannot see that because most of our glorious specimens of ancient

architecture were the offspring of mistaken minds in matters of religion, it necessarily follows, we, in these reformed days, should inseparably mix up in our admiration and study of them the same feelings that actuated their founders. "Let us hope, then, that should the Camden

"Let us hope, then, that should the Camden Society resolve upon a dissolution, it may only be for the purpose of remodelling and cleansing itself from the views and opinions which have hitherto characterized it, and will pursue its labours for the advancement of Gothic architecture, purely as an *architectural* society, and leave theology for a separate and distinct study.

"In the hope that you will not deem these remarks unworthy of notice in your next number, I am, &c., "H.H. "February 18, 1845."

PROFITS ARISING FROM GAS APPLIED TO PUBLIC IMPROVEMENTS.

It is not generally known that the very large annual profits arising from the Manchester Gas Works are applied (by a committee called the Improvement Committee), for the purpose of forming new streets, widening existing ones, opening such as appear to require increased ventilation, and in general to such improvements as more especially relate to the forming of better thoroughfares in the town.

These gas-works, now the most extensive in Great Britain, or in the world, were first commenced in 1817, and in December of that year, the Manchester public were first supplied with gas, from the establishment, at the charge of 15s. per 1000 cubic feet. The funds for this purpose were provided by the Commissioners of Police, out of the police funds. At the present period, the smallest consumer only pays 6s. per 1,000 cubic feet, and the largest (say of 80,000 feet) only 5s. per 1000 feet. With these comparatively low charges the gas committee will, however, pay, or have paid, during the present year, a sum exceeding 50,000*l*. to the committee of the improvement fund ! Extensive as are the Manchester Gas Works at the present moment, a further extension is, it is esid, now contemplated. Such is the increasing demand for gas, and such its probable immediate want, that the public need not wonder if, in the next two years, the works should be further extended 33 per cent.

It can only arise from an ignorance of these facts that other towns do not follow the example set by Manchester. How many improvements deeply affecting the health and comfort of towns are continually postponed or entirely laid aside for want of means. Here is a plan by the adoption of which an income to supply this very want may be derived, and, at the same time, a pecuniary benefit would accrue to each gas-consumer, in paying less than he does at present for the light he has occasion for.

While on the subject of gas, we would advert to a plan, lately put forth by a Mr. Blofield, for supplying London (and all other towns situate on or by the principal railway lines) with gas at a much cheaper rate than at present. Mr. Blofield says :--

"In the first place, I propose that extensive gas works be erected, either near Birmingham, upon the Staffordshire coal field, or somewhere upon the Derbyshire, Nottinghamshire, Lancashire, Yorkshire, Newcastle, (the best locality) or Bristol coal-fields.

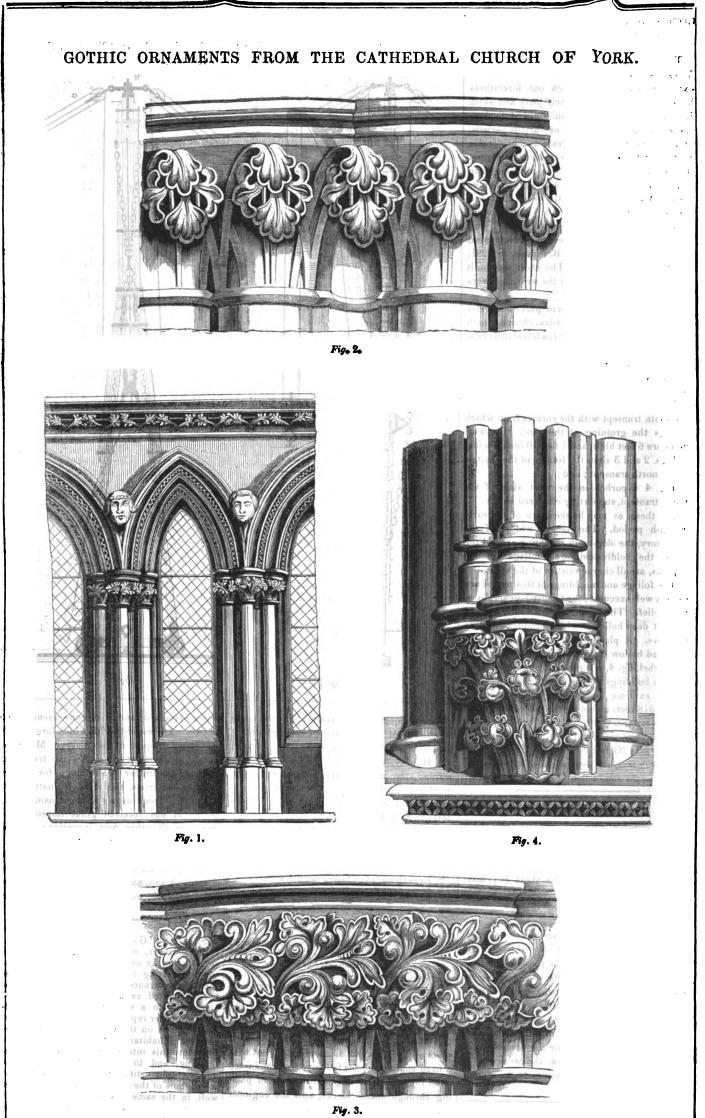

"The gas to be manufactured in the country upon the spot, and conveyed through pipes, luid along the railways, to a large reservoir in the neighbourhood of London.

"By making the gas in the country, in the neighbourhood of the pit's mouth, instead of in London, it would save the following expenses, among several others :--

"It would save the expense now paid for having the coal conveyed such a distance. "It would save all those other numerous

"It would save all those other numerous intermediate expenses, incurred between its purchase at the pit's mouth and its delivery in London.

"It would save the enormous expense of the eighteen *separate* gas manufactories at present in the metropolis, with all their numerous establishments, independent of those in the country on the lines of railway." H.

GOTHIC ORNAMENTS FROM THE CA-THEDRAL CHURCH OF YORK.

THE metropolitan church of St. Peter, at York, is one of the most beautiful of those extraordinary edifices which our forefathers have left us, in proof of their piety and skill. Like many of our ancient buildings, it displays the workmanship and style of various periods, and may be made to illustrate a considerable portion of the history of pointed architecture. The crypt under the choir was commenced in 1171. The south transept was built by Archbishop Walter Grey, about the year 1227; and the north transept by John le Romayne, treasurer of the church, between 1250 and 1260. The nave and aisles were commenced by his son, Archbishop le Romayne, in 1291, and finished about 1330. The choir was built between 1361 and 1400, and the western towers soon after the latter date.*

The above engravings form part of a series of ornaments from this cathedral church, which we propose to lay before our readers at intervals. They are reduced in size from Halfpenny's work, † and will be found as beautiful per se, as they are valuable from exhibiting the style of different epochs.

Fig. 1 represents part of the clerestory in the south transept with the cornice from which springs the groining of the roof. The windows are 6 feet high, and 1 foot 10 inches wide. Figs. 2 and 3 shew the foliage of the capitals

in the north transept; and Fig. 4 a corbel in the west aisle of the

north transept, supporting clustered shafts.

All these, as may be seen, are of the early English period. The lancet widow of the elerestory, the dog-tooth moulding around the arch, the boldly-sculptured foliage of the capitals, areall characteristics of the style.

The foliage and mouldings of this period are usually well executed; the former is generally in high relief. The monidings are boldly cut, and present deep hollows, which produce effective shadows. A plain round with a good projection, and hollow below it, such as is seen over the corbel, fig. 4, is a moulding very generally used in buildings of this style.

The extreme length of York Minster outside is 518 feet, including the projection of the battresses, the width 140 feet, the transepts from north to south 241 feet. The height of the nave is 93 feet, the height of the centre tower 198 feet, and the height of the western towers to the top of the pinnacles 200 feet.

PORTLAND VASE.

WE observe with indignation that some charitable individual, unknown, has paid the fine of 37. levied on the tipsy rascal who destroyed this interesting and unique relic, and has thus saved him from the short imprisonment to which, in default of payment, he had been sentenced. We regret that we cannot make known, for public gratitude, the Samaritan who has thus stepped in to prevent the infliction of the very immensurate punishment permitted in the present defective state of the law, and has offered a premium to some other sot for the destruction possibly of some choice illuminated MS. at the Museum, or of the last new picture at the National Gallery. It is to be hoped that the legislature will promptly pass a law for the protection of such works, and not allow the weakness of one individual to offer impunity to the vicious habits of another.

See Mr. Britton's history of the building in his "Caents in the Cathedral Church of York."

Fig. 2. engine attached, and it is consequently loco-In consequence of the reference to the mode motive. The rapidity with which large stones adopted by Mr. Tomkinson for raising building are raised is quite extraordinary. Mr. Tommaterials at Liverpool, made in page 34 ante, kinson also first put in practice the travellingcarriage on timber scaffolding, for raising building materials, the idea originating with one of Mr. Tomkinson's foremen, named John Day. It has received great improvements

> from experience, our greatest tutor." We examined the machine for raising stones by steam in operation at Liverpool a short time ago, and saw that it accomplished its work with wonderful rapidity and precision.

> since, as all other first inventions will do,

ST. JOHN'S GATE, CLERKENWELL .--- In a recent number, we mentioned some proceed-ings under the new Buildings Act relative to this interesting relic. For some time past, the lodge entrance to the old monastery has been tenanted as a public-house, and it is apparently in a very dilapidated state from want of proper repairs and attention. A strong desire exists on the part of many antiquaries and the inhabitants of the neighbourhood, to restore this interesting part of the ancient building, and to convert it into a literary and scientific institution, for the benefit of the inhabitants of the crowded district of Clerken. well, in the same way as Crosby-hall for the city, as it might easily be made available for the purpose.—Globe.

Digitized by Google

Mr. Hawley, the clerk of the works, has for warded the annexed representations of the machine, drawn on a scale of 16 fect to l inch. Fig. 1, shews the side of the derrick, fig 2, the end. The wheels run on a tram-way laid parallel with the walls of the

building. A. Cat-head : four sheaves.

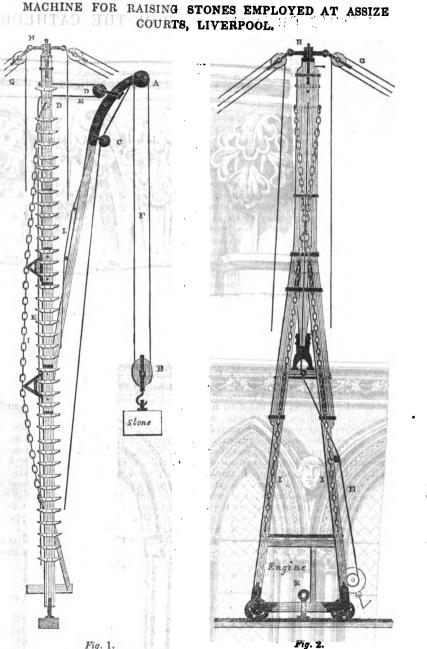

- B. Large three-sheave block.
- C. Single sheave to keep hauling part from stone. D. Strong single sheaves for derrick-rope to pass over to
- the crab. E. 7 in. rope for hoisting and lowering derrick.

F. Fall for hoisting stone, &c., worked with 31 he

G. Guy-ropes; three parts to each worked with single purchase crabs.

- H. Swivel-cross for attaching the four guy ropes. I. Chain back-braces.
- K. Screw for hoisting sheaves when turning corners. L. Braces for strengthening derrick.

Mr. Hawley says, " I believe Mr. Tomkinson is the only builder that has this kind of shear legs in use at the present time. He first used them at the Liverpool Custom-house, but with a fixed engine, and the fall-rope was conducted from the legs to the engine by means of passing through snatch-blocks, and the engineer was guided by signals. We have the same legs in use at the new Assize-courts, with the

LONDON BURIAL-GROUND PRACTICES.

SIR,-You did me the honour to insertacommunication in THE BUILDER of February 8, on "Spatields Burial-ground," and observing in your journal of the 15th inst., that a person, signing himself "A. BIRD," and who calls himself "Manager" (I presume of the grave-yard bearing the above name), has thought fit, not only to venture an attempt to invalidate my statements but has done invalidate my statements, but has dared even publicly to question my right to make them, I will trouble, you, Sir, with the following additional remarks, premising that I do not retract a single word of my former communication, whilst I hurl the most uncompromising defi-ance at Mr. A. Bird, the "management," and the "proceedings about to be commenced." As Mr. Bird states only in general terms his determination to commence "proceedings;" as he assumes, nay, apparently has, in his own belief, long occupied the position of an ill-used and injured man,* I, pending his legal proceedings, in disclaiming any *personal* motive in the contest he has chosen to enter upon, invite Mr. Bird's most serious attention to the observations and statements I may deem it necessary to make, reminding him that, under any circumstances, the PUBLIO have a far deeper and more important interest in this question than individual disputants — and that grave-yard PROPRIETARY INTERESTS, of the nature of those represented by their, for aught I know, self-elected champion, Mr. A. Bird, like other interests, must submit their claims, it may be, reveal their condition, to, and abide by the decision of, PUBLIC OPINION, represented by a free, a vigilant, and an independent press.

From a very long conviction, based on no slight grounds, I have from time to time, as the occasion offered, or opportunity served, the occasion offered, or opportunity served, endeavoured to convince my countrymen of the folly and wickedness of tacitly permitting the continuance of our present system of BURIAL IN TOWNS; and having, I think, abundantly proved that this iniquitous and permicious practice has prostrated, and will continue to prostrate, numberless victims, I call upon the readers of your journal to apply their most serious consideration to this unartion assuming them that it will afford them question, assuring them that it will afford them abundant material for salutary contemplation, and, if I mistake not, will supply a most powerful incentive to energetic, and determined, and united action.

In the mixed condition of society in all large towns, it is impossible to draw a line of demarcation between the various classes, neither is it necessary to attempt to apportion to each individual his own share of inevitable, well-deserved punishment attendant upon his neglect of the first dictates of natural feelings and common sense; but it especially concerns the middle and poorer classes to reflect that circumstances, frequently inseparable from their condition, compel their residence in localities principally the seats of shamefully-overcharged burying-grounds; that it is an *indispensable* condition of healthy existence that the atmosphere they breathe shall be in a pure condition; that in the immediate neighbourhood of, and even at a considerable distance from, all such places, annoyance, discomfort, disease, and death, are the invariable and abiding concomitants; that the locality, the area, the condition of the soil, the numbers buried in a given period, the depth at which bodies are interred, the constant upturning of earth yet portunities afforded by free ventilation for the dissipation of the invariably injurious products of human decomposition,---that these circum-stances must and do influence the sanatory condition, most certainly, of the surrounding residents, and even the health of the entire district.

Sir, these statements, which I unhesitatingly make, are true or false. Perhaps Mr. Bird, whilst arranging his counter-statements to disprove my allegations, will favour your readers

with his opinions, as I understand that he entertains some original notions on the buryingground question. I do not wish to press un-necessarily upon Mr. Bird, but the course he has thought proper to pursue is so little in accordance with irrefragable facts, that I beg to assure him, and all whom it may concern, that he or they must convict, or be convicted, for I will neither offer nor accept a compromise ; mean-while I publicly ask Mr. Bird for distinct and unequivocal answers to the following questions :-

lst. What is the area of your buryingground?

2nd. How long has it been employed for the interment of the dead?

3rd. How deep are the graves dug?

4th. How many bodies are placed in one grave in a given period of time? 5th. What depth of earth is ordinarily

placed over the topmost coffin ? 6th. What lateral thickness of earth is

allowed between each grave?

7th. How many bodies on an average have you interred on Sundays, and how many on the remaining days of the week, since you became "manager?"

8th. Why do you constantly keep from five to fifteen graves open in expectancy, and do you consider the practice of keeping "open graves" injurious to the health of the district ?

9th. As the soil of Spafields buryingground is in a *peculiar* condition, I believe from the mode of "management" adopted, in how short a period, in your experience, do the soft parts of the human body resolve themselves into their ultimate elements?

10th. How long do the coffins remain entire or undecayed?

llth, and lastly. Do you persist in re-iterating your assertion, reported in the *Times* of Dec. 23, 1843, "that the statement" (a memorial on the condition of your buryingground, from some of the surrounding in-habitants) "was altogether false;" and do you now express your "surprise that any respectable newspaper could give insertion to matter destitute of foundation and so unsupported by proof?" I am. Sir. &c...

I am, Sir, &c., GEORGE ALFRED WALKER. 11, St. James's-place, St. James's-street, Feb. 19th, 1845.

WORKS IN THE PROVINCES.

AT Brighton a great improvement is about to be effected by widening of the King's Road, and putting back of the battery. The width of the present road (about 40 feet) is to be doubled by means of a sea-wall which will connect the eastern marine promenades with the western. In the immediate vicinity of the battery this width will be much in-creased by the present site of the battery being thrown into the road. The estimates amount to 14,000?. A subscription has been set affect and is proceeding most presumally set afloat, and is proceeding most prosperously, for the erection of a fountain on the Steyne.

At Cirencester, the committee of the pro-posed Agricultural College have selected the design of Messrs. Daukes and Hamilton, ar-chitects of Gloncester and Cheltenham, from a large number, among which were some from architects of eminence in London. The college will occupy the delightful site on Lord Bathurst's grounds known as Port-farm, near the railway station at the junction of the Stroud and Tetbury roads, thus presenting a perspec-tive of two bold fronts. The design is in the **Tudor style, of three stories high; the upper** story being lit by picturesque old fashioned dormer windows, of the style prevalent among the collegiate buildings of Oxford. The centre is occupied by a tower, the upper part of which is intended to form an observatory for meteorological and other scientific purposes. At the Privy Council held on Tuesday week, her Majesty was pleased to approve of the grant of a charter of incorporation of the subscribers to this important institution.

At Manchester the subscriptions for public parks, &c., amounted, at the close of last week, to more than 30,0002. It is highly gratifying to find that a sum has been thus obtained, which promises, at all events, that the first steps in this important measure of public health and

the extent and importance of this vast hive of industry. The subscription is equivalent to one of 2s. each from every man, woman, and child in the community, assuming the population to be 300,000.

At Romford a new corn Exchange is about to be erected. Two premiums are at the present time advertised for the two best de-

signs to be sent in by the 1st proximo. At Harrow, a very handsome subscription has been raised for the purpose of re-building the head master's boarding-house, which was destroyed by fire in the year 1838. Further means being requisite for the attainment of the object in view, the committee have publicly solicited the assistance of Old Harrovians.

At Liverpool the stock-brokers and shareholders have determined on building a new and splendid Stock Exchange. The subscription, which was but recently opened, has augmented most rapidly, and the list now amounts to 50,0001.; one sharebroker alone subscribed 4,0001.

At Carnaryon, the fine old castle which has been for some time in a dilapidated state, is by order of the Commissioners of the Woods and Forests, to be put in complete repair.

At or near Stratton St. Margaret's, Wilt-shire, the guardians of the Highworth and Swindon Union have resolved on building a new union workhouse.

At Coventry, land has been purchased for a cemetery, and it is the intention of the town council to complete the work, so essential to the health as well as to the feelings of the inhabitants, without delay. The province of Ulster will, ere long, pos-

sess a college for the education of the future ministry of the Presbyterian Church. The contributions towards the building of the new college are proceeding most satisfactorily. Already from forty-two contributors a sum of 2.500% has been realized, besides 500% more in smaller sums, making in all 3,000%. Concurrently with this movement, a deputation is at present in London, to solicit from her Majesty's government an endowment for the proposed college

At Huntingdon, Lady Olivia Sparrow has purchased the theatre for the purpose of con-verting it into a chapel of ease. The *Globe* states, that an eminent architect is to be engaged to effect the necessary alterations in the appearance and interior of the building, and the sanction of the bishop of the diocese will be obtained for its consecration. Funds will also be provided for the endowment of it, a considerable portion of which will be given by Lady Olivia.

The rage for building is now exhibiting itself in the neighbourhood of Stratford. Between three and four hundred houses are being erected on a farm, recently in the oc-cupation of Mr. Thomas Spence. On Wanstead Park, the like number of villas, besides various others on a minor scale, in other parts of these localities, will soon be in a habitable state.

INSTITUTION OF CIVIL ENGINEERS.

FEB. 11, 1845 .- The President, Sir John Rennie, in the chair.

The first paper read was a description, by Mr. Thomas Hughes, Assoc. of the method employed for draining some banks of cuttings on the London and Croydon, and London and Birmingham Railways, also a part of the retaining wall of the Euston inclined plane. The method adopted was the introduction of Watson's drain-pipes, which were made of the iron-stone clay of Staffordshire; their surface is pierced with numerous apertures, small externally and enlarging inwardly, tures, small externally and enlarging inwardity, which form prevents their being clogged by the earth, and allows whatever enters to pass freely into the pipe. In their application on the London and Croydon Railway, a longi-tudinal trench, 4 feet deep, was dog on the crown of the bank, at a few feet from the edge, and other trenches, about 30 feet apart, descended from it to the open drain by the side of the permanent way. On the London and Bir-mingham Ruilway the descending trenches were 80 feet apart, and varied from 3 to 6 feet in depth ; the pipes were introduced into these trenches, and the clay which had been dug out was then laid over the pipes; from the longirecreation shall be taken on a scale worthy of tudinal line of pipes, upright pipes were occa-

^{*} CLERKENWELL.—Yesterday a respectable-looking man, who stated that he was the manager of the burial-ground at Spafields Chapel, came before the magistrate to com-plain of a report from that court in the newspapers of that morning relating to that burial-ground. He declared the statement which appeared was altogether false, and expressed his supprise that any respectable newspaper could give insertion to matter destitute of foundation and so unsup-ported by proof. The applicant said it was very hard that such a report should remain uncontradicted. He would certainly push the matter further.—Times, December 23rd, 1843.

sionally introduced, for the purpose of ventilation. The panels of the retaining wall were drained by boring holes through the brickwork at given distances by a powerful auger worked by a machine, and then inserting castiron pipes of the same form as those of clay. This process proved so effectual, that the wall which before shewed evidence of water being lodged behind nearly the whole length, was now evidently drying fast, and the water oozed out from the pipes at all times, even during the severe draught of 1844.

The paper induced an animated discussion upon retaining walls, in which Mr. R. Stephenson gave an interesting account of his views at the time when he designed the walls of the Euston incline, the changes which subsequent experience had worked in his opinion, and the reasons which induced him to adopt the process of staying the walls with cast iron beams, stretching from one side to the other.

The next paper read was a description of the Ouse Bridge on the Hull and Selby Railway, by Mr. W. B. Bray, Grad. The Act for this railway was obtained in 1836, and it forms with the Leeds and Selby, which was opened two years previously, a direct communication between Leeds and Hull; they were both surveyed and executed from the designs of Messrs. Walker and Burges. The river Ouse at Selby is 176 feet wide and 14 feet deep at low-water; the tide rises 4 feet at neaptides, and 9 teet at spring-tides. The bed of quicksand, beneath which is bard clay.

The foundations of the abutments were formed of piles driven into the clay, and on these longitudional sleepers and transverse sills were tenoned, the intermediate spaces being filled with broken stone grouted thin mortar. On this platform, brick abutments with stone quoins, string courses, and copings were built. They were subsequently tied by wrought-iron rods to heavy stone piers. There were six pieces placed in pairs, which were founded on piles driven into the clay, and tenoned to receive the cap sills, on which cast-iron frames were strongly bolted, the ends being furnished with cutwaters of cast-iron plates. The superstructure consisted of six ribs of cast-iron an inch and a half thick, resting on transverse girders, one being placed under each line of rails, and one under each handrail, the rails themselves being laid on longitudional sleepers, 12 inches wide and 6 inches deep. In the Act there was a clause requiring that this bridge should have an opening arch for the passage of steamers and vessels with fixed masts ; this consisted of two versels with fixed masts; this consistent of two similar leaves each keyed on to a cast-iron shaft 9 inches square, with turned journals, plummer blocks, and trusses. The total weight of iron-work was 590 tons, and the erec-tion of the bridge was let to Mr. Briggs, of Party on Trant and the Buttarlay Iron Com-Ferry-on-Trent, and the Butterley Iron Company. The communication was accompanied by a register of the tides at Selby during the year 1842, and was illustrated by a wellexecuted model, presented to the institution by Mr. James Walker

Mr. J. B. Redman exhibited a portion of a fender pile which had been driven into the works of the new terrace pier at Gravesend, in 1843, and in which the "teredo navalis," a pipe-worm, had made great inroads. It appeared, however, that the ravages of this insect were confined to a space of about 3 feet above the level of low-water spring-tide, and that therefore if wood-work was well defended by copper sheathing or scupper nails at and below that point, no great injury would be received by piles in any situation. The meeting was adjourned to Tuesday

The meeting was adjourned to Tuesday evening, the 18th instant, when the following paper was read :--

" Description of the Great Britain steamship, with an account of the trial voyages," by T. R. Guppy, Associate.

THE FINE ARTS.—The number of foreign artists now studying in Rome amounts to 405; 300 of whom are painters, 58 sculptors, 39 architects, and 7 engravers; 158 of those artists are Germans, 25 Freach, 33 English, 17 Russians, 7 Poles, 13 Swedes and Norwegians, 31 Danes, 19 Belgians, 3 Dutch, 11 Hangarians, 10 Spaniards, 7 Portuguese, and 14 Americans. The Italian artists are 542 in number, besides 2,000 mosaic-work makers.

DECORATIVE ART SOCIETY.

On Wednesday, the 12th inst., an introductory paper was read by Mr. Vicary, "On the physiology of timber trees considered with reference to manufacturing purposes." He commenced with a notice of the few

He commenced with a notice of the few Government and private collections of specimens of timber in this country, and expressed regret that a scientific arrangement had been seldom attempted, whereby a study of the varieties of timber could be promoted. He contrasted in a forcible manner the attention devoted in our national museums to stuffed birds, &c., with the almost total neglect of a useful classification of timber, although entering, as it does, so largely into our everyday comforts and conveniences.

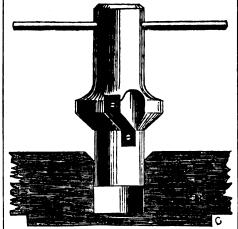

The growth of trees, and the capillary action of the sup, &c., the formation of knots, and the consequent weakness wherever they occur, were next noticed, as also the effects of pruning and lopping at a wrong season, thereby generating what is usually termed "dry rot." The patent processes of Mr. Payne were introduced, exhibiting in a series of experi-

The patent processes of Mr. Payne were introduced, exhibiting in a series of experiments his modes of preserving timber from decay, and rendering it incombustible, also of hardening any English woods, and dyeing them of various colours, so as to make them available for the purposes of the cabinet-maker.

On Wednesday, the 26th instant, a paper will be read "On the interior decorations of the Collegiate Chapel of St. Stephen, at Westminster, as finished by Edward III., A.D. 1348." L.

TOOL FOR CHAMFERING TRACERY.

SIR,—I beg to hand you a sketch of a tool used in chamfering tracery, after being pierced by the one shewn in page 621, Vol. II. A, represents the tracery as cut; B, a piece of plank

fastened to the tracery by hand-screws, to keep the tool steady; C, a slip of wood screwed to the plank to prevent the tool cutting too deep. The arris, or principal part of the part chamfered, should be cut away, which would much accelerate the work. The block should be made of dry, hard wood, as much depends on its being kept steady to its work. Your insertion of this would oblige,

Yours respectfully, Newport, Jan. 7, 1845. JAS. PIOKARD.

How TO PUT OUT A CHIMNEY ON FIRE.—A correspondent of the Carlisle Journal states that while visiting a few days ago in Berwickshire, "I saw applied by a lady the following mode of putting out a chimney on fire, which I think should be generally known, for its simplicity, efficacy, and expedition. The chimney of the parlour, where an additional supply of wood was put upon the fire, at once caught fire. The lady immediately brought a plate full of common salt—shut the door of the apartment to prevent a current of air, and sprinkled a few handfulls of salt upon the fire. In about a minute and a half the fire in the chimney, which roared like distant thunder, was quenched. This neither caused smoke, nor precipitated soot, nor put out the fire, nor disturbed the operations of the breakfast, which were going on. The *rationale* of this I believe to be, that, in the process of burning the salt, muriatic acid gas is evolved, which extinguishes fire."

CHURCH NEWS.

A NEW church has just been completed at Yeovil, in Somerset, under the direction of Mr. Benjamin Ferrey. The style of the building is early English; it is cruciform in plan, and capable of accommodating 800 persons. The expense of the building has been about 3,000/. - The new district church at Montpolier, Bristol, was consecrated a few days since. The edifice is cruciform, in the style of ar-chitecture that prevailed at the end of the 13th century; it is rather plain, built of native stone, with freestone quoins, dressings, &c. A tower is placed at the centre of the west front; it was originally intended to have carried a lofty spire, which, with the tower, would have been 140 feet in height, but this important feature has been postponed, and thus the pleasing appearance of the exterior is greatly diminished. The pulpit is of stone. panelled diminished. The pulpit is of stone, panelled on either side, and supported by a corbel of deeply-sunk mouldings. The lectern is of oak. The chancel is ascended by five steps. oak. The The altar-piece is composed of arcaded panelling, with detached shafts, cornice over, set with the ball flower, and the spandrels filled with foliage. The roof is devoid of plaster, and the characteristic Gothic feature carried out by rendering the construction ornamental. In the nave the roof is not light as in the chancel, in consequence of the Incorporated Society having prescribed the use of the tie-beam. The whole of the woodwork is stained and varnished, and has the work is stained and varnished, and has the appearance of oak. The font, placed near the western and principal entrance, is of stone, the sides ornamented with elegant foliage, &c.; round the pedestal are four detached shafts; the whole stands on an octagonal base. The archi-tect is Mr. John Hicks. — Cherter Cathedral is about to undergo a thorough restoration, for which purpose a liberal subscription has been entered into. The cost of the works already contracted for is 2,504l., but the sum required contracted for is 2,504*l*., but the sum required will be 5,000*l*. Amongst the contributors are his Royal Highness the Prince of Wales, 105*l*.; the Dean and Chapter, 100*l*.; the Dean of Chester, 100*l*.; the Marquis of Westminster, 105*l*.; Earl of Stamford, 105*l*.; Bishop of Chester, 100*l*.——It is in contemplation to open the new church at *Willon*, Wilts, at Easter. The raised chancel is to be paved with porcelain tiles of a gorgeous pattern, ex-cept one small portion, which will be covered with amall aquares in agate. lava, and precious with small squares in agate, lava, and precious stones collected abroad by the Counters of Pem-broke. No pews or galleries will be admitted, open sittings in carved oak being already placed on the floor of the building. A spacious area is preserved around the exterior, termiarea is preserved around the exterior, termi-nating in a stone palisado-work on the side next the public highway.——A new church of large dimension is to be erected at *Ashby Wolds*, Leicestershire, towards the funds for which her Majesty the Queen Dowager has liberally subscribed. The Marchioness of Hastings has given a site; and amongst the other contributors are the Earl Howe, the Bishops of Peterborough and Lichfield, the vicar of Ashbyde-la-Zouch, Colonel Buckley, Mrs. Lane Fox, &c. — The Honourable and Rev. G. M. Yorke, formerly of Queens' college, rector of St. Philip's Birmingham, has commenced soliciting subscriptions from the parishioners for the necessary repairs of that sacred edifice. We understand that donations amounting to 1,000% have been received, and that about 600%. nore will be required.—An appeal for con-tributions in aid of building a church in the new district of *Pembroke Dock*, has been ex-extensively circulated. There is now a popu-lation of 4,000 inhabitants (still repidly increasing) without a church nearer than Pembroke, a distance of two miles and half. The incumbent of Pembroke has promised, con-ditionally—that is, if the church shall be built and consecrated during his incumbency, a donation of 2001. A subscription having been opened, the sum of 400% has been placed in the hands of the treasurer, exclusive of the above donation, which is available only under the aforesaid conditions.

An Artesian well is being sunk in Berkeleysquare, in lieu of the old pump which has for so many years past supplied the square and its vicinity.

dem Books.

The Botanic Gerden; or, Magazine of Hardy Flowering Plants: to which is added, The Fruities; a Description of the best Apples, Pears, and other Fruits, their Qualisies, Habits, and Culture. By B. MAUND, F.L.S. Small 4to, and 12mo. January, 1845.

THIS work has enjoyed an uninterrupted career of twenty years, and is thoroughly established in public favour. Such a result is, well merited, for the editor has evinced his sense of the support he has received by so many successive additions to the original plan, without in any instance increasing the price, that we have long regarded it as the most ample, elegant, and cheapest horticultural periodical in the kingdom. But, as if to outdo his farmer self, Mr. Maund seems to think that having borne flowers of all bue, it is time his work should bear fruits; accordingly, he has now added "The Fruitist." This is a most valuable addition, and we must recommend it to every one who has a garden, from the peer to the peasant. Indeed, it is from regarding the advantage of the cottager that we are chiefly induced to notice it here. The instructions for the culture of the fine varieties of fruit-trees figured in it are mainly adapted for dwarf-trees, so that there is scarcely a labourer's garden so small as not easily admit three or four of these, which he can omlive at his leisure, and find his recompense in the ornamental blossoms they will put forth in spring, and the substantial and savoury fruit they will yield in autumn.

We deem it one of the most gratifying signs We deem it one of the most gratifying signs of the times that the well-being and comfort of the labourer now occupies the thoughts and attantion alike of the legislator and the phi-lanthropist; that efforts are every where making to implant in his heart the feeling, then bench an it that he is not an too long banished from it, that he is not an intruder here, but a valuable, essential, and integral part, of the body politic. Few things will conduce more to offect this blessed change than, giving, big a garden with a few fruit-tress, which may be at once his pride and his proj. How truly does Mary Howitt, who knows the deputs and has taken the soundings of the poor man's heart, sing, " like an angel in the glouds," of the Poor Man's Garden :----

But he, the poor man, sees his crops,

- at a Por he thinks all through the winter exclusion blow rich his board will be! (at a The rich man has his wall fraits,
- In the And his delicious vines :

 - The fruit for every season, His melons and his pines.
 - The poor man has his gooseberries, His currants white and red ;
 - His apple and his damson-tree,
 - And a little strawberry-bed
 - A happy man he thinks himself,
- A man that's passing well
- To have some fruit for the children. And some besides to sell."

. All success, therefore, to the "Botanic Garden" and "The Fruitist."

Correspondence.

ASSOCIATION OF ARCHITECTURAL DRAUGHTSMEN.

S1B, — As you have on many occasions afforded space in your widely-circulating journal for the purpose of disseminating the rules and principles which govern the Association of Architectural Draughtsmen, I beg, with your kind permission, again to call the attention of the profession generally, and more especially of your correspondent of January 11, to the address and real objects of the society, premising, for the information of those who possess copies of the laws of the association at first issued, that during its operation, now two years and a half, it has been found expedient to ma-terially remodel the rules which first go-versed it.

The meetings of the association take place on the first and third Wednesdays in every month, and are held at 33, Southampton-street, Strand.

A leading object in its formation, that of securing to unemployed members and invalids a weekly stipend, was that which received on the part of the committee of management the most serious consideration; it also at-

tracted considerable attention out of the society, and many objections having arisen against it, it was found eventually expedient to make it a mere voluntary "benevolent fund," to which members might or might not subscribe, as their means or inclinations prompted. This accumulating fund tells its own purpose, and in proportion to its amount, so will be its utility if discriminately laid out.

The next object of importance, that of providing employers with assessments and "unem-ployed members" with situations, has been found fully to answer every expectation of its promoters, many members having secured eligible situations through its influence, and formed connections with architects which are likely to be of material and permanent benefit to them.

Among the new rules an exemption is provided in favour of members in practice for themselves in regard to the quarterly contribution drawings, architectural prints being made admissible instead; the fines also against members generally for the non-production of the said drawings are limited to 5s., which those who have occasion from press of business or other circumstances, can avail themselves of; and, further, with regard to these "quarterly drawings," members are allowed to withdraw their first when they contribute their ninth, and so on in rotation, leaving at all times eight in the folios of the society; this rule has given great satisfaction to every one. Apart from the general management of the society, a number of the members have formed a "book club," which is conducted in the usual manner, an architectural work being selected. the members ballot for the reading and the choice of purchasing the work at half its original cost. Having now stated the leading objects of the society, allow me to press upon such of your readers as belong to the architectural profession the importance of support-ing by their fellowship, activity, and talent, this most useful and laudable society. It requires co-operation in all its branches, additional members to secure on every meeting night a full and attentive audience to its various papers and topics of discussion-numbers to co-operate in the purchase of more valuable works, and to swell the already valuable collection of drawings, that examples may be amassed of every class of executed works, practical and ornamental, classic and Gothic, from the earliest ages to our own day and last, though not least, as usual, we want numbers to augment the funds, that its operations may be carried on with spirit, and that we may engage permanent premises suitable for the collecting of casts, models, books, drawings, and engravings, and annually to form a public exhibition of purely architec-tural subjects apart from the glitter and gorgeous frames that surround the few annually hung at the Royal Academy.

Allow me, in conclusion, to apologize to you for the length of this communication, and to remain, Sir, your constant reader,

A MEMBER OF THE BRITISH ASSOCIATION OF ARCHITECTURAL DRAUGHTSMEN. London, Feb. 6th, 1845.

COMPETITION FOR LAYING OUT GROUND, KING'S-ROAD, READING.

SIR,--Having submitted a design for laying out for building purposes ground situated in the King's-road, Reading, I can bear testimony to the correct statement, dated 5th Feb., and signed "Fairplay," which appeared in the last week's number of your highly useful journal. I paid two visits to Reading, the first to examine the site, and the second to attend at Mr. Blandy's office, for the purpose of giving my opinion in woriting upon the merits of the two designs which in my judgment should appear most worthy of the premiums offered. This was by no means so difficult a task as might have been expected, for although forly-seven designs had been submitted, I found, upon examination, not more than half that number to be finished and completed in accordance with the instructions issued. Some of the designs exhibited were so largely at variance with the rules laid down, that I felt surprised they had not been at once rejected. It would, therefore, be a satisfaction to learn that the successful designs *ars* in rule and order; and perhaps Mr. Blandy, through the medium of your widely-circulated journal, may

be induced to communicate that fact for the gratification of those gentlemen who have by their exertions afforded him so much profes-I am, Sir, &c., sional information. London, Feb. 18th, 1845. V ERITAS.

. . . .

CORRESPONDENCE ON NEW METRO-POLITAN BUILDINGS ACT.

JURISDICTION OF OFFICIAL REFEREES. SIR,-In consequence of my letter upon this subject, which appeared in your journal of the 8th instant, I was applied to on the following Monday to attend before the official referees Monday to attend before the official referees on the succeeding Thursday, to argue a case for a party who had received a summons then to attend, upon the information of a district surveyor, for alleged irregularities under the "New Metropolitan Buildings Act;" which was an opportunity I gladly availed myself of, as some nice points were involved in the peculiarities of the case, that may, in the present state of excitement upon the question, be interesting to your readers. I of course shall carefully avoid remarking on what occurred at the conference, confining myself to statements that came to my knowledge as to statements that came to my knowledge as instructions, but I will not omit the opportunity thus afforded of stating the great courtesy with which we were received, and the evident desire to elicit the truth. From the course of proceeding adopted, I feel satisfied that substantial justice will be done through the medium of the equitable powers intrusted to the referees for all matters in difference arising after the 1st January last, thus avoiding the ruinous litigation that has arisen heretofore upon the construction of various clauses of the old Act.

My ground of complaint is, that they have assumed an authority for works "commenced" previous to 1st January, which, being upon construction of terms in a penal act, are open to be discussed in a court of law, upon the ground of maintaining civil rights, which every citizen[®] is entitled to do, unless controlled by such an equitable jurisdiction as is evidently given to the referees after the lat January.

If this view be correct, and a doubt exists as to the construction to be put upon terms or words, it appears the rational course would be for the referees at their own cost, upon a case put, to seek the best legal advice, and not by summons to individual parties, put them to considerable expense to argue points that must all tend pretty much to the same result.

Under my advice, we appeared by protest. After this long exordium, we will now to the facts, which, if contrived for the purpose, could not more completely have met two important points for the object of raising the question, viz. the "bona fides" of the natter, and the intended buildings projecting beyond the line of other houses. I will confine myself in this letter to the "bons fides," as, if that is esta-blished, the other point falls to the ground. A party having determined some years since to erect five fourth rate houses within the operation of the old Act (but prevented by circumstances over which he had no control), gave due notice to the district surveyor of his intention on the 27th December (the case is surrounded with much matter distinctly proving "bona fides" within the knowledge of the district surveyor, who had been in correspondence upon the subject, and assented in writing nearly two months previous that such a proceeding would be in accordance with the Act). I prefer assuming he had not heard of the intention until the 27th December, as more completely raising the argument upon other cases so circumstanced.

The party, between the time of notice and lst January, proceeded with the work 28 rapidly as possible, having put in the footings of the whole length of the front wall and of one end wall, and indicated by projections the party-walls of the five houses, with some few courses of the walls in addition to the footings. The work was steadily proceeded with until 14th January, when the builder received a notice to suspend operations. The opinion of the referees, as addressed to Mr. Allen, noticed in your journal 25th January, must now be taken as their dictum, as in this case the district surveyor founded his complaint to

This word appears to be an apposite illustration of the word "commencement." I contend for using it in its largest sense, and retues to be limited as meaning a citizen of London.

94

.....

the referees upon this their opinion; and upon such grounds they issued the summons.

The peculiarity of this case is, that an ad-mitted legal notice was given under the then existing Act, neither that nor the present Act in any way controlling the progress of works, except that under the new Act, if suspended for a certain period, fresh notice must be given, evidently only to inform the district surveyor when the works being in operation require his superintendence; sec. 13. A controlment of time as to roofing in (for finishing I repudiate, unce as to rooms in (for unishing i reputitie, see my letter in your journal of the 8th inst.) clearly applies to houses commenced before 1st January, and that only in new districts. I also contend that any the slightest com-mencement is provided for in schedule A, housing heap so commend unce level action

having been so commenced upon legal notice under the former Act, and I must presume this schedule has been overlooked in the issuing of the summons, inasmuch as the schedule declares the former Act, 14 Geo. 3. c. 78, is repealed except as to certain points, one of which precisely meets this question :-"And except as to offences committed, penalties incurred, and fees payable, and any proceedings taken or commenced, or which might ceedings taken or commenced, or which might be taken or commenced under the said Act on or before the said 1st day of January, 1845." I contend that the word "proceedings" must be taken in as large a sense as the word " com-mencement." Legal notice having been given, mencement." Legal notice having been given, the works if not, "might have been com-menced," and to prove that it could not mean legal proceedings, it will be necessary only to proceed through a few more paragraphs of the "Extent of Repeal," where we find, to prevent any doubt, it is stated, "and to legal proceed-ings in respect of accidental fires." The party complained of would willingly have given a fresh notice under the new Act, as the thickness of walls, &c. would have been precisely similar; but the sanction of the referees to the further ground of complaint of the district surveyor, that these buildings projected beyond the general line of houses, would have implied the impossibility of building on the ground if the present footings wars repudiated. This is a question of considerable importance in future operations, and I will endeavour to prove in a subsequent letter, that whatever the intention of the Act may have been, there is

no such existing enactment. Your obedient servant, . GREENWAY ROBINS, Architect. Hill-street, Peckham, Feb. 15, 1845.

SHOP-FRONTS UNDER NEW BUILDINGS ACT. SIR,—In schedule E of the new Metro-politan Buildings Act, under the head "Wooden Shop-fronts and Shutters," it is stated that the woodwork of any shop-front must not be fixed nearer than 41 inches to the centre line of a party-wall. Again, the succeeding clause requires that, in case the woodwork be fixed at such distance, then a pier or corbel, built of stone or of brick, and of the width of 44 inches, must be fixed in the line of the partywall, so as to be as high as such woodwork, and so as to project one inch, at the least, in front of the face thereof. Does this mean that an unsightly mass of brickwork is to be carried out from the face of an external wall to the distance of an inch beyond the projection of the cornice, or merely have refer-ence to breastsummers and story-posts? Your valuable opinion upon these points will confer a favour upon, Sir, yours obediently,

A SUBSCRIBER. Islington, February 12, 1845.

[The words of the Act are perfectly clear. If the woodwork be put up 44 inches from the centre line of the party-wall, a pier or corbel, 44 inches wide, built of stone or brick, or other incombustible material, must be fixed in the line of the party-wall, so as to project one inch, at the least, in front of the face of such woodwork. The object, and a very important one, is, of course, to prevent the communication of fire from house to house by means of the entablature. We do not wish to suggest evasion; but it is obvious that if the wood work he any thing more than the inches work be any thing more than 41 inches, say even 5 inches, the corbel cannot be insisted For the general good, however, the inon. tention of the enactment should be adhered to. It will not be difficult to prevent the corbel or pier from injuring the appearance of the front; better still, the entablature, &c., may be formed of incombustible material.—ED.]

Aliscellanea.

DIVING BELLS .- The first diving bell we read of was nothing but a very large kettle suspended by ropes, with the mouth downwards, sit on fixed in the centre of the and planks to concavity. Two Greeks at Toledo, in 1588, made an experiment with it before the Emperor Charles V. They descended in it with a lighted candle to a considerable depth. In 1663, William Phipps, the son of a blacksmith, formed a project for unloading a rich Spanish vessel sunk on the coast of Hispaniola. Charles II. gave him a ship, with every thing necessary for his undertaking, but being un-successful, he returned in great poverty. He then endeavoured to procure another vessel; then endeavoured to procure another vessel; but failing, he got a subscription, to which the Duke of Albemarle contributed. In 1687, Phipps set sail in a ship of 200 tone, having previously engaged to divide the profits ac-cording to the twenty shares of which the sub-scription consisted. At first, all his labours proved fruitless; but at last, when he seemed almost to despair, he was fortunate enough to being us on much treasure that he returned to bring up so much treasure that he returned to pring up so much treasure that he returned to England with the value of 200,000/. Of this he got about 20,000/., and the Duke of Al-bemarle 90,000/. Phipps was knighted by the king, and laid the foundation of the fortunes of the present noble house of Mulgrave. Since that time, diving bells have been often suc-cessfully employed.—Mechanics' Magazine.

HARDENINGOF IRON NAILS, SCREW CASH -When electro-deposition is used in coat-&c.ing iron with copper, the iron is liable to be corroded either during the process or after-wards, an oxide of iron being formed beneath the copper coating. To prevent this, it is proposed to coat, or case-harden, the iron with lead, or an alloy of lead, before the coating of copper by electro-deposition is applied. A patent for this invention has lately been granted to Benjamin Brunton Blackwell, of Newcastleto Benjamin Brunton Blackwell, of Newcastle-on-Tyne, Gent.; and William Norris, of Exeter, C. E. The case-hardening is per-formed by first freeing the surface of the articles from any scale that may attach to them, and then placing them, with parings of hoof, horn, or bone-dust, in a crucible well luted, and subjecting them to a red heat, taking care to remove the articles as soon as a thin surface of case-hardening is obtained. taking care to remove the articles as soon as a thin surface of case-hardening is obtained. The articles may be coated with lead or an alloy of lead, by first freeing their surfaces from scale, and then plunging them into a vessel of the metal in a molten state. The alloys of lead which are preferred for the purpose here stated are, first, from one-tenth to one-fifth of tin combined with a given quantity one-fifth of tin combined with a given quantity of pure lead; and secondly, one part of anti-mony, two parts of tin, and fifteen parts of pure lead. When the articles have received this first coating, they are next to be placed in a solution of copper, exposed to the influence of a galvanic battery kept at a temperature of from 80° to 100° of Fahrenheit. The claim of the patentees consists in first coating the articles with lead or an alloy of lead, and afterwards coating them with cooper by means afterwards coating them with copper by means of galvanism.

IMPROVEMENTS IN LEAD PIPES .- A patent for this purpose has recently been secured in America by Messrs. C. and G. E. Sellers, of Cincinnati. In manufacturing lead pipes by this process, the metal from which it is to be formed is fused, and poured into a receiver of cast-iron, or other metal of great strength, which receiver is heated by means of a suitable furnace, so as to preserve the metal in a fluid state. The lower part of the receiver contains a die, having an opening through it of such size as to adapt it to the forming of the outside of the pipe, and a case or mandrel to determine the size as the writhin. It also inclosed the its size or calibre within. It also inclosed the apparatus which is employed for the purpose of cooling the pipe as it leaves the core, and also of keeping the temperature of the core below that of melted lead, by which means we effectually prevent the combining of the lead with the surface of the core, which takes place when lead is in a fused state, and is subjected to heavy pressure. The fused lead is to be forced out by means of a ram or plunger, made to fit the cylindrical cavity containing the lead, the said plunger being brought down by means of an hydrostatic press. The patentees state that "what we claim as our invention is the employment of a tubular core or mandrel, divided longitudinally into chambers, through

which heated water, sir, or steam, is to be passed, in the manier deveribed, and for the purpose of preserving the said core at a tem-perature somewhat below that of melted leady by which device the lead is effectually pre-vented from adhering to the mandreli. We claim the manner of forming the packing of the ram, by attaching to its end the piece of wrought-iron, rendered thin at its lower edge, by forming the face of the said piece concurs, for the purpose above set forth. (The purpose here alluded to is, keeping the piston tight," and preventing the escape of the melted tead around the edges of the run or piston.) WW claim the combination and 'arrangement" of claim the combination and arrangement of the parts constituting the water chambely con-sisting of the tube, the bed-piece, and the conical die---the supply of water thereto being given, and governed substantially as described. ARTHUR'S CON.---This curious specimen of

Roman masonry was destroyed many years since. In a work entitled Caledonia Romana, recently published by Bell and Bradfute, it is thus described This building was of a circular form, its shape in some measure resembling that of a common bee hive. It measured at the base from twenty-nine to thirty yards in chme dimencumference, and continued of the sa sions to the height of eight feet, from which point it converged gradually inwards in its ascent, till at an elevation of 22 feet, the walk terminated in a circle, leaving in the top of the dome a round opening 12 feet in diameter. On its western side was an arched doorway, 9 feet in extreme height, and above it an ap المحمد rest in extreme neight, and above it an aper-ture resembling a window, of a slightly trid-angular form, 3 feet in height, and averaging¹¹ nearly the same in width. The whole was formed of bews freestone, laid in regular how risontal courses, the first of them resting upon" a thick magnitude theman material. a thick massive basement of the same material, which, to follow out the simile, represented with curious fidelity the common circular board on which the cottage hive is usually placed. The interior of the structure core: placed. The interior of the structure core responded with its general appearance from without; the only difference being in the con cavity of the shape, and in its having two pro-jecting stone cornices round its interior sur-face, the one is a height of A and the other of 6 feet from the ground. The style of the workmashin was a interiard without or do workmanship was singularly perfect, and showed an intimate acquaintance with masonic snewed an intimate sequisintance with masonic art. No cement of any description, had been made use of in its construction, yet the stones were so accurately joined together, that even the difficult process of forming so diminutive a cupola by the concentration of horizontal courses was accomplished there in the most skilful and enduring manner."

NOTICES OF CONTRACTS

For the execution of the whole Works on the Slamannan Junction of the Edinburgh and Glasgow Railway, being about a mile long.—H. G. Wright, Secretary, Railway Office, Queen-street, Glasgow. February 24. For such Mason's and Pavior's works (stone

paving only) as may be required by the Commissioners of Sewers of the City. of London, for the term of three years, from the 25th of March next. Joseph Daw, Eq., Guildball, London.—Febraary 25.

For the supply of Granite or other hard stone for the service of the Stone's End district of the Surrey and Sussex Roads.-Road Office, Charing

Sarrey and Sussex Roads.—Road Omos, Charley Cross, and W. S. Gaitakell, Eaq., 21, Stamfords; street, Blackfriars' Road. For the supply of from 4,000 to 5,000 yards of Iron Railing for inside drives of Birkenhead-park. —Mr. Hornblower, architect, Hamilton.buildings, or Mr. Walker, Town-hall, Birkenhead.—Feb-

ruary 26. For supplying the Great Western Railway Com-pany with such quantity of the following articles as may be required from the 1st of April, 1845, to the 31st of March, 1846; viz. Bar and Pig Iron —Castings—Bolts and Rivets—Copper (sheet and ingots)—Ironmongery, screws and nails—Brass and Iroa clasp, closet tacks and wirewerk—Lead and Zinc—Steel for springe—Timber—Tubes, brass, copper, iron and zinc—Patent Wheel-tire, and ta-rious other, articles.— Chas. A. Saunders, Beq., Scretary, Paddington, February 27. For taking down and rebuilding the Tower of: Grendon Church.—Mr. John Baker, Churchwarden, Grendon, near Atherstone. March 1, For building twelve Boats and Engines for the

For building twelve Boats and Engines for the. City Steam-boat Company. — Charles Hancock, 17, Earl-street, Blackfriars.

For surveying and mapping at per acre an Agricultural Parish in Bedfordshire, consisting O Agricultural Parish in Bedfordshire, consisting of about 4,000 acres.—Mr. James Butler, 51, Wig-

about 4,000 acres.—Mr. James Butler, 51, Wig-more-street, Cavendish-square. February 26. For Sarveying and Valuing the Property in Austin-ward, Humber-ward, Trinity-ward, St. Mary's-ward, Whitefriars-ward, and North-ward, all in the parishes of Holy Trinity and St. Mary, Kingston-upon-Hull.—John Moxon, Clerk to the Governor and Guardians of the Poor, Workhouse, Hull. Marrh 1

Governor and Guardians of the Poor, Workhouse, Hull. March 1. For the erection of a Station House and Strong Rooms for the use of the Staffordshire Con-stabulary Police Force at the Town of Wol-verhampton. — James Smith, County Surveyor, Stafford. March 1. For a survey of the Messuages, Lands, and Hereditaments liable to poor rates, in the parish of Tydd St. Mary, Lincolnshire; together with a plan thereof, upon a scale of three chains to an inch, a tracing of such plan. and a book of reference in

thereof, upon a scale of three chains to an inch, a tracing of such plan, and a book of reference in duplicate. The parish contains from 4,000 to 5,000 acres. — Mr. Edward Key, Clerk of the Union, Holbeach. March 3. For the furnishing, delivering, and fixing a Steam-engine, with boilers, pumps, &c., at the Water-works, Green-lane, West Derby, Lancashire. —Edward G. Deane, Clerk to the Paving Com-missioners, No. 1, Parish offices, Fenwick-street, Liverpool. March 4. For the Mason's and Pavior's Works, supply of

For the supply of 20,000 tons of Iron Rails, and 7,000 tons of Iron Chains, for the Newcastle and Berwick Railway.—George Hudson, Esq., Railway Office, York, and at 24, Great George-street, West-minster. March 4. For the supply of 100,000 Railway Sleepers for the Newcastle and Berwick Railway.—George Hud-son, Esq., Railway Office, York. March 4.

son, Esq., Railway Office, York. March 4. For a supply of thirty iron Lamp-posts and

Columns, according to pattern, each weighing at least four cwt.—Robert Oldersham, Parish Clerk,

For completing the Works connected with the inclosing and annexing certain Land lately pur-chased for the improvement of Newport Bridewell, in the Isle of Wight.—Mr. Woodham, Deputy Clerk of the Peace, Winchester. March 8. For repairing the footway pavements, and pro-viding and laying new curb and other stone; for manicing the carriage way pavements and pro-

viding and laying new curb and other stone; for repairing the carriage-way, pavements, and pro-viding and laying new granite and other stone, during one year from Lady-day next, for the united parishes of St. Andrew, Holborn, and St. George-the-Martyr, Middlesex.—Clerk's office, 13, King's-road, Bedford-row. March 8. For the supply of 11,000 feet of nine-inch cast-iron Pines for a new inc of Aqueduct to be laid in

iron Pipes for a new line of Aqueduct to be laid in the Island of Malta.—Vin. Casolani, Collector of Land Revenue, Office of Land Revenue and Public Works, Valletta, Malta. March 31.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

February 25.—At the King's Arms Inn, Hemel Hempstead; a large Fall of capital Oak, Ash, Elm, and Beech Timber Trees, the greater portion of which are of very large dimensions and superior quality.—Mr. James Adams, auctioneer, Clarencestreet, Staines, Middlesex.

street, Staines, Middlesex. February 25. — At Elmer Farm, Beckenham, near Sydenham, Kent; 145 Elm Trees of large dimensions and prime quality.—Mr. Warren, land and timber surveyor, Isleworth. February 26.—On the Estate of the Earl of Denby, at Monk's Kirby; 70 Lots of very superior Ash Poles, a few Fir Poles, 74 Lots of very straight Larch Poles of good size, 24 very large Ash Poles. 300 Beech Trees, a few Fir sud other Timber 300 Beech Trees, a few Fir and other Timber Trees.—Mr. T. Nixon, auctioneer, Claybrook.

February 27.—At the Coach and Horses Inn, Nazing, about two miles from Waltham Abbey, and four from Epping; 300 Oak, 150 Elm, and 50 Ash Trees of good dimensions and clear growth.

50 Ash Trees of good dimensions and clear growth. -R. B. Andrews, Esq., solicitor, Epping; and Mr. R. K. Davies, anctioneer, 68, Mark-lane. February 28.—At Garraway's Coffee-house, Cornhill; 150 logs of Cuba and African Maho-gany, 67 logs of New South Wales Cedar, 1,600 planks of Bahia and Rio Rosewood, 848 Lancewood Spars.—Alexander Simson, broker, 75, Old Broad-street street

February 28. — At Trumpington, Cambridge-shire; Ash and Alder Timber Trees, Oak, Ash, Ehm, and Larch Spires and Poles. The Larch Poles are very clean, and of large girth, varying in length from 20 to 50 feet; the Ash and Elm Spires are also very straight and of large dimen-sions.—Mr. W. Smith, gamekeeper, Trumpington; and Mr. J. Wentworth, austioneer, Cambridge.

February 28. - At Garraway's Coffee-house. Cornhill; 300 loads Quebec Red Pine; 100 loads Vellow Pine; 100 loads of Ash; 80 loads of Oak; 10,000 Yellow Pine deals and battens; 10,000 Spruce deals and battens.—T. and J. Simson,

brokers, 5, Change-alley. March 3.—At the Greyhound, Sandy, Bedford-shire; a large fall of remarkably large Larch and excellent Scotch Spires .- Mr. J. Carrington, auc-

excellent Scotch Spires.—Mr. J. Carrington, auc-tioneer; Potton and Biggleswade, Befordahire. March 4.—At the Green Man Inn, Plashet, Esser; 220 capital Timber Trees, 200 superior Poles, of large dimensions, part nearly timber-girth, consisting of Lime, Ash, Beech, Oak, Black Poplar, Birch, and Hornbeam.—Mr. Mills, land and timber rveyor, 24, Poultry. March 4.—In the Wood on the Deadmonsey

Batrica 4.—In the wood on the Desamonsey Estate, near Market-street, Herts: 1,100 large Oaks; 3,500 smaller Oaks; 400 large Beech; 600 smaller Beech; 1,000 Oak poles. The estate is twenty-eight miles from London, and about seven miles from the Grand Junction Canal at Boxmoor.

miles from the Grand Junction Canal at Boxmoor. --Mr. George Hudson, Auctioneeer and Surveyor, Woolwich; or Mr. Mellor, Auctioneer, Dunstable. March 7.--At the Hall of Commerce, Thread-needle-street: 500 loads of large Yellow Pine Timber, 20,000 Baltic and Colonial Deals.--Churchill and Sim, brokers, 75, Old Broad-street. March 10.--A quantity of excellent Scaffolding, the back used in survive of Worth boxed.

&c., lately used in erecting a division of Westbourne-terrace, near the Great Western Railway. — Mr. Charles Green, Auctioneer, 8, Grove-end-place, St. John's-wood-road.

March 11.--At the King's Head Inn, Enfield, March 11.—At the King's Head Inn, Enneld, Middlesex; 200 Oak Timber Trees of large dimen-sions and excellent quality, 34 Elm and 24 Ash Trees.—Mr. Henry Cobb, surveyor and land-agent, 18, Lincoln's-Inn Fields.

Shortiy.—A valuable cargo of Mahogany and Cedar in Logs and Planks. — Mr. R. Marvin, auctioneer, 34, Queen-street, Portsea.

COMPETITIONS.

Designs and Plans are required for a Corn Ex-change, to be built in the centre of the Corn Market, at Romford, Essex. Ten guineas will be given for the most approved Design, and five guineas for the next best. — Mr. Harvey George, Romford. March 1.

Plans and Elevations for a new Workhouse with the requisite offices, capable of a new worknows with inmates, for the Canterbury Incorporation. The architect is requested to state the amount of premium he will require for the use of his plan and specifications in the event of the Court of Guardians adopting the same, and appointing their own sur-veyor to superintend the works.—Mr. W. M. Smithson, Clerk, Canterbury. March 8. The Committee of the Liverpool Docks

The Committee of the Liverpool Docks are desirous of receiving Plans for the most couvenient mode of landing or embarking passengers, carriages, &c., &c., at George's Pier-head. A Premium of 200*l*, will be given for the Plan selected and acted upon, and a Premium of 100*l*, will be given for that Plan which may be deemed to be the next in utility.—Daniel Mason, Eaq., secretary, Dock Offices, Revenue-buildings, Liverpool. March 19.

TO CORRESPONDENTS.

Received with thanks .- A Proposition on the Received with thanks.—A reposition on the National Debt, by Luke James Hansard; Sug-gestions for a Collection of Studies of our National Architecture, by C. B. Lamb; Prospectus of Tardley's Pneumatic Wind Guard; Rules of East London Building Association. "Dr. D." is thanked; a notice of the meeting

was in type before his letter arrived. "Caouchous" has our thanks. "J. W. Archer."—The addition is not advis-

able. "A.P. (Datchett)."—Without wishing to say

any thing to the prejudice of the other materials mentioned, we should give the preference to Claridge's Seyseel Asphalte. "Embryo Architect" will find an answer to

MEETINGS OF SCIENTIFIC BODIES During the enquing week.

MONDAY, February 24. — Geographical, 3, Waterloo-place, 84 P.M.; British Architects, 16, Grosvenor-street, 8 P.M.; Medical, Bolt-court, Plant draw and a statement of the statem

10, Grosvenor-street, B F.M.; Szealcal, Bolt-court, Fleet-street, 8 P.M. TUESDAY, 25. — Medical and Chirurgical, 53, Berners-street, 81 P.M.; Civil Engineers, 25, Great George-street, 8 P.M.; Zoological, Hanoversquare, 84 P.M.

WEDNESDAY, 26.—Society of Arts, Adelphi, 8 P.M.; Geological, Somerset House, 81 P.M.; Pharmaceutical, 17, Bloomsbury-square, 9 P.M.

P.M.; Geological, Somerset House, 53 P.M.; Pharmaceutical, 17, Bloomsbury-square, 9 P.M. THURSDAY, 27.— Royal, Somerset House, 84 P.M.; Antiquaries, Somerset House, 8 P.M.; Royal Society of Literature, 4, St. Martin's-place, 4 P.M.; Medico-Botanical, 32, Sackvillestreet, 8 P.M.; Numismatic, Somerset House, 7 P.M.

FRIDAY, 28.—Royal Institution, Albemarle-street, 81 P.M.; Philological, 49, Pall Mall, 8 г.м.

SATURDAY, March 1.—Asiatic, 14, Grafton-street, 2 P.M.; Westminster Medical, 32, Sackvillestreet, 8 P.M.; United Service Institution, White-hall-yard, 9 P.M. (anniversary); Medical and Chirurgical, 53, Berners-street, 81 P.M. (anniversary).

ADVERTISEMENTS.

DERSONS having Second hand Deal Frame, Saws, Tools for Matching and Planing Boards, or for Rebating or Cutting Moulding, suitable for Working with Stear Power, may hear of a Purchaser by ddressing a letter to B., at the Office of "The Builder."

HENDRY and GLOVER, IRON-ENDRY and GLOVER, IRON-FOUNDERS, beg to inform their customers that they have removed their Foundry (from Smart's-buildings) to CHARLES-STREET and 168, DRURY-LANE, where they have adopted every improvement to enable them to compete successfully in quality, price, and punctuality. They have also an extensive and well-arranged stock of patterns for every description of Castings.

BY HER MAJESTY'S ROYAL LETTERS PATENT. IEUTENANT FRANCIS HIGGER-girder, all floor-supporting, well-covering, and strengthen-ing parts of house-suiding, by which the remotest possibility of danger from fire is obviated, without in anywise inter-fering with, or altering the present methods or principles of construction. May be obtained from Messrs. Boulton; and Soho, Birmingham; by application to the Inventor and Patentee, Lieutenant Higginson, Saint Margaret's Bank, Rochester, Kent. All letters pre-paid.

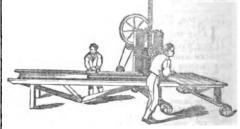

TO ARCHITECTS AND BUILDERS. DULTON AND WATTS, LAMBETH POTTERY, LONDON.-Manufacturers in TERRA COTTA of VASES, FOUNTAINS, &c., for Pleasure Grounds. PIGURES for Public Buildings, and ARCHI-TECTURAL WORK of all kinds. This TERRA COTTA has all the appearance of Stone, and being subjected to a high degree of fire is imperiabable; thus possessing a decided superiority over cement or artif-cial stone.

cial stone. Stone-ware, Water-pipes for Houses, Drains, &c., Water-closet pans, with simple and perfect trap; the cheapness, efficiency, and easy adaptation of which render them desire-able not only for public institutions, but for every house.

RCHITECTS.-NOTICE is hereby **A INCLUST S.**—NOFICE is hereby given that the TRUSTEES appointed by SIRJOHN SOANE will meet at the Museum, in Lincoln's-Inn Filds, on Monday, the 24th of March, at three o'clock in the after-noon precisely, to distribute the dividends which shall have accrued during the preceding year from the sum of 5,000. reduced 3 per cent. Bank Annuities invested by the late Sir John Soane, among distressed Architects, and the Widows and Children of deceased Architects left in destitute or dis-tressed eircumstances.

Forms of application may be had at the Museum, and Forms of application may be had at the Museum, and must be filled up and delivered there on or before Saturday, the 15th of March, after which day no application can be received.

HATCHER'S BENNENDEN TILE-MACHINE, Manufactured and Sold only by COT-TAM and HALLEN, Engineers, Agricultural Implement Makers, &c., 3, Winsley-street, Oxford-street, London.

This is the most efficient Machine that has been invented for the purpose of making Drain Tiles. Any shaped Tile can be made by merely changing the die. which can be done in a few minutes. It requires but few hands, viz., one man and three boys. With this amount of labour, the pro-duct of a day of 10 hours is as follows, viz.— 1 inch diameter of 12 inches diameter of Tile, 11,000 24 ..., 3,200 The Machine is moveable down the drying-shids, so that it requires no extra boys to carry the Tiles, nor are shelves required in drying. It has been in full operation for upwards of four months at Heupstead Park, tear Cran-brook, Kent. No charge made for Patent dues or licence. The purchase of the machine includes free use of it.

elient Building Materials, Whitton, near Hounslow and

Excellent Building Materials, Whitton, near Hounslow and Twickenham. MR. M. ADAMS will SELL by AUC-TION, on the Premises, on Tuesday, March 4, and following day, at Eleren precisely, on account of the number of lots, the whole of the valuable MATERIALS of a MANSION, known as Whitton Dean House, formerly the residence of Colonel Campbell; comprising 350,000 malm, stock, and grässled bricks, thirteen tons of lead, twelve squares of slating, 3,000 fest of York and Portland paving, 16,000 glased pantiles, stone stircases, stone steps and entrances, strings, copings, marble chim-ney-pieces and elabs, glased sashes and frames with plate-glass, moulded and carved doors, oak and deal floor boards, girders, joists, and all the internal fittings, register stoves, two water-closets, large lead cistern, force-pump, the handsome fittings up of a dairy with mahogany shelves, and lined throughout with about 1.600 Dutch tiles, dreasers, shelves, lead pamps, coppers, and the whole of the useful meterials. Whitton is only one mile and a half from the Thames, from whence the great advantage of water-carriage mast render the above materials peculiarly deserving of attention. Catalogues (3d. each) may be had on the premises ; at the Georgs and Bell Inna, Hounalow; the King's Head Inn, Twickenham; the Northumberiand Arma, Chequers, and George Inns, laleworth; the White Hart and Red Lion, Whitton; and of the auctioneer, Mr. M. Adams, Isleworth, and 3D, Hart-street, Bloomsbury, Note. — No person will be adminited on the premises without a Catalogue.

SATURDAY, MARCH 1, 1845.

N examination of the very interesting example of ironwork at Chelsea Hospital, represented by the accompanying engraving (p. 102), leads us to express regret

that art is now so seldom employed on this material, and that in the modern manufacture of works in iron right principles are not pursued. It is a blot upon the age, that modern art has done so little in a material with which modern science has done so much. Cast iron has taken the place of wrought, and in many respects offers considerable facilities, and might be very advantageously and effectively used in architecture if it were applied in accordance with true principles, in forms adapted to the material. Ironwork should look like ironwork, and stone should shew itself to be stone. An ancient iron railing has a beauty of its own, quite distinct from the beauty of a stone balustrade; but we unfortunately seldom use iron in any other way than as an imitation of some other material.

To apply iron in construction properly, very different proportions should be used from what would be necessary for stone, and these would lead to new combinations, and ultimately to a new style of architecture. We have the means in our bands to produce very extraordinary effects, but as yet we don't know how to use them efficiently.

What we are now about to say, however, relates chiefly to iron applied decoratively, not structurally. In ancient works, such as hinges, locks, bolts, rivets, railings, or screens, the greatest ingenuity to produce beauty, in addition to skill to render the work sound and fit for its purpose, is apparent. You see that the man was an artist as well as a smith, that he understood the material on which he was working, and knew how an effect was to be obtained by it. The beauty of the foliage in some works of the 16th century formed out of thin iron plates, simply twisted up by a tool, is marvellous. Tracery was produced by plates differently pierced, laid one over the other, without any attempt at disguise, and flat bars were rivetted together, and made ornamental by the very rivets. These men, as we said before, were artists as well as smiths : one of them, indeed, Quentin Matsys, shewed himself so to the world in another material; but his reputation as the worker of the iron screen

of King Edward the Fourth's tomb in St. George's Chapel, at Windsor, is as great as it is for his well-known picture of the Misers, at Windsor Castle.

That extraordinary piece of ironwork is now under repair at Messrs. Bramah's, and must be considered one of the finest specimens in the country, presenting paneling and tracery, crockets, finials, and minute ornaments, wrought in the most perfect and artistical manner. Inquiring of one of the firm whether he would be able to produce a similar work, his reply was, " Certainly ; but not by contract, or under limitation of time :" and these, there is no doubt, are the great bars against the improvement of our own mechanics and artisans. The master cannot afford to develope a

man's ability; what he is obliged to seek for is, the greatest quantity of work in the smallest space of time: excellent work won't do; work that will pass is all that he can hope to give. And the result, as might have been expected, is a lamentable decline in many of the constructive arts.

To return to the ironwork by Matsys;--it is to be regretted, that in the repairs now making, cast iron is partially employed, probably on the ground of expense. In a work of this sort, however, expense should not be considered; and if the screen be restored at all, it should be restored in the most perfect manner possible. The cast portions, notwithstanding the able hands to which the work is confided, contrasts very badly with that which is wrought, having none of the sharpness and vigour which distinguishes the original. In saying this we do not wish to attach the slightest discredit to the workmanship,-the defect is a consequence of the material; it is to the use of this we object; and we hope, as there is still much to be restored, that the remainder will be executed as nearly like the original as possible, and this can only be done with wrought iron.

Another fine work by Matsys is to be seen at Antwerp, near the Cathedral. It is a sort of cage over a well, and displays great skill.

Formerly, there were many admirable examples of ancient ironwork around the tombs in Westminster Abbey; but, about the year 1820, they were taken down and sold as old iron to one Samuel Tansley. Some stir was made in the House of Commons at the time, and part of the railings from Henry the Fifth's tomb was sent back ; but all the other railings were lost irretrievably. The ironwork from Queen Eleanor's tomb was very beautiful, and included eleven divisions of scroll-like foliage, all varying in design. The screen round Henry the Seventh's tomb in the Abbey, which still remains, is a fine specimen, and shews fully the principle which the ancient workers in metal pursued.

DOINGS OF THE OFFICIAL REFEREES.

WE mentioned some time ago, amongst other matters connected with the new Buildings Act, that the surveyor of the Greenwich district had laid before the official referees, a complaint against the owner of a certain house for an alleged illegal projection of a shop-front, and cellar-flap and way, but that as he had omitted to state all the grounds and particulars of his objection, and the parts of the new Act to which the said works were not conformable, its consideration was deferred, in order that he might do so. Since then, the matter has been formally investigated and decided; and, as the award in this case deter-

mines one question which has been submitted to us on several occasions, we will briefly state the admissions on both sides, and the referees' decision.

The surveyor's objections to the shop-front were, that the end adjoining the neighbouring were, that the end aujoining the neighbouring houses was not formed of fire-proof materials: that it was a new structure, having been put up since the 1st of January, and extended over part of the front where no projection over part of the front where no projection existed before: that the projection of part of the shop front, not being the cornice, was sixteen inches, which was contrary to the statute. The objection to the cellar-flap was, that it was not formerly adjoining to the passage-way; that the alteration brought it within the meaning of the Act, and therefore it was unlawfully placed, projecting as it did before the front into the street or public way. The owner's reply was, that the shop front

had not been disturbed, merely the windows; that it did not extend over any other part now than it did before, and that the alterations both of the front and the cellar-flap were menced before the 1st of January. com-At the menced before the 1st of January. At the hearing before the referees (not insisted on by them, it is as well to state, but required by the owner), the surveyor admitted the commencement of works before the 1st, but urged that each alteration was a distinct feature : also that the old entablature remained, and did not extend over any other part now than it always did.

The owner admitted that the refiring was begun after 1st January; that the oblong and circular portions of the front were removed circular portions of the iront were removed before the lst; that the new structure extended over parts of the front, where no portion but the entablature existed before; and that the formation of the cellar-flap and way had not commenced before the 1st of January.

The decision of the official referees was, that the alterations, so far as related to the projec-tion of the shop-front and of the cellar-flap, were within the statute, and ought to have been executed according to its provisions; that these provisions had not been attended to; that these shop-front, so far as it had been made by the alterations to project into the street (in parts not being the cornice), more than 10 inches[®] from the face of the wall to which it is annexed, should be pulled down, and that the cellar-flaps should not be made to encrosch upon any part of the public way. We have received two or three letters com--

plaining of the refusal, on the part of the re-ferees, to give any information without a, "case" and a fee, and of the time occupied in making their award, whereby builders are in-jured. One correspondent, who signs himself jured.

Censor," further says-"Sir,-Have you had occasion to make any application to the official referees or registrar in 'Trafalgar-square ? If so, have you ever seen them?

"From my own experience, I suspect they wish to make themselves as inaccessible as eastern potentates ; petitions or representations must be submitted before the oracular response can be obtained. Nothing can be done without written applications (the fees for which are, of course, carefully registered and charged, or a notice sent you, that unless the fee is paid, they will not be laid before the officials), or else you are referred to the clerk, who can, of course, settle or do nothing, except book the charge for the interview.

"On calling in Trafalgar-square, you are always met with the reply 'The registrar or referees are engaged with the board.' Can you tell me who, and what is 'the board?' as I can find no allusion to it in 'the Act.'

"I hope the three gentlemen appointed to carry the Act into effect will not require all the formularies of a master in chancery's office, or we should have been enabled to get dis-puted points settled under the old Act quicker by going to law, than under the present one. It was anticipated that the reverse would have been the case.

"There is no want of courtesy in words, but I apprehend the present feeling of the pro-fession is that 'the board' are not giving the facilities for carrying on building works which they expected to obtain from the supervision of professional gentlemen.

"I hope we shall not find registrar's law as troublesome as the old magistrates' law.'

> * The street is above 30 feet wide. Digitized by GOOgle

Now, we do not insert this letter as agreeing with the statement in it, our own experience contradicts it completely, but as a timely hint to the excellent official referees to use as much despatch as may be, to simplify their proceedings, and to aid in rendering clear the intention of the Act. To ask them to see every gentleman who called in Trafalgar-square to make an inquiry, would, however, be a very foolish request on the part of those who wish them to get quickly through their business. At present every thing is new, and requires more deliberation than will hereafter be necessary. The difficulty in the way of obtaining information, too, will be very much lessened in a short time, as every case decided by the referces is fully recorded, and will be made accessible on payment of some small charge, perhaps sixpence.

A PAPER ON MONUMENTS AND NATIONAL MAUSOLEA.

THE corpse of the Gothic king Alaric was laid in the bed of the river Busentinus, in a sepulchre adorned with spoils of vanquished Rome. The stream had been diverted by the labour of the captives, afterwards murdered that the place of burial might remain con-cealed. And it seems well that no visible monument should mark the grave of him, who spread rapine and bloodshed through the whole of Italy. The body of the barbarian Attila was inclosed in coffins of gold, of silver, and of iron; spoils of conquered nations were thrown into the grave, and the prisoners who had opened the ground were massacred. But we, in later times, delight to bonour the virtues which accelerate, rather than the vices which retard the progress of civilization. Our poets, artists, and philosophers, have bequeathed to us living monuments, in works which, like the waves circling on the pool, will continue to undulate, in effect, on the ocean of time, long subsequent to the earlier and more sen-sible agitation. The works of Homer, of Raphael, of Newton, are their best monuments, and all have concurred in praising the peculiar appositeness of that epitaph so well known to architects, which in the words, "Lector ! si monumentum requiris, circumspice," points to the self-created monument of a great artist.

But, if by the evidence of a monument, and an appropriate epitaph, we can evince our gratitude for benefits conferred, and thus, by publishing that efforts are appreciated, stimulate emulation in others; if it be merely a delight to honour the memory of the departed great, and to be reminded that they had "senses, affections, passions," like ourselves, we should foster these pleasurable emotions with such tangible record. The monuments of the dead are the most interesting records which one age can hand down to another; they exist while temple and dwelling alike moulder and disappear, reflecting on succeeding ages the manners and habits of their originators, and the memory of great names and noble deeds. The name of Watt will live long as England's arts shall flourish, yet do we look with pride and pleasure on the monument to that lofty genius which made England great among the nations. Let us, therefore, grant that this homage to the manes of our illustrious men is, if not the vital principle, at least an important function in the matter of our progress, and now call to mind in what manner we have executed the duty.

we nave executed the duty. Monuments may be classed, according to their distinctive objects and characteristics, as religious or "ecclesiastical," and civil, or as monuments to the dead and to the living. In the first category should be included all such as are placed in churches, and tombs or erections over the grave of the departed, in which the design should be conducive to all that may draw the mind of the beholder to thoughts of virtue and immortality. In contra-distinction to these are such as direct an honourable ambition to paths where fame awaits the philanthropist, the discoverer, and the defender of his country. Each description of testimonial requires a distinct mode of treatment, which must also be considered in reference to the intended *locale*. Of all styles of monumental design, none observe the rules of propriety so strictly as the Gothic ; they have all a devotional character, and, until the later period of decline in the art, are devoid of allusion to earthly honours and achievements. But up to the present moment in modern times, we have entirely disregarded these obvious canons of art, repeating the same gods and goddesses in the cathedral and the public square, and altogether shutting out a style of design which would present to modern sculptors, from its comparative novelty alone, a fertile source for invention, and a greater scope of design in a right channel, than the mythology and farfetched allegory to which they have bitherto restricted themselves.

Whoever has examined the images in our Gothic cathedrals, will have been struck with their peculiar form and impress. Their attithe folds of their drapery, their whole tudes. execution and design, bear an assimilation to the character of the edifices, of which they are part. The smaller decorations of the capital or the boss often shew great grotesqueness of fancy, and pliancy of curvature, but the larger figures, which partake less of detail, and more of the general effect, have an expression of stability in accordance with that of the mass. In all points these are strictly architectural; the crusader rests in unbroken sleep, recum bent on the tombstone, the saint stands erect in solemn meditation. In other styles of architecture, we find not an equal propriety of design. It is forgotten that sculpture is for the most part seen in connection with architecture : it should be subservient to it whenever the arts are employed together.

The sculptures on the fronts of Grecian temples, faultless as they are in themselves, have less of accordance with that motionless character, if we may thus apply the term, which the Grecian style, more than any other, pre-The centaurs, in violent contest sents. with the Lapithæ, are huring huge rocks at their opponents, whilst women, with fluttering gar-ments, are flying from the scene of action. In the Panathenaic procession in the Par-thenon, the horses bound with their riders, and no one can look at this fine frieze, without feeling the impression of motion in the actual marble before him, most powerfully depicted in his mind. During two thousand years these sculptures have remained unsurpassed, and it may seem little short of hypercriticism to question in any respect their propriety as works of art. In the buildings of the later Italians, we find statues beautiful, perhaps, if they could be viewed apart from the edifices which they are designed to decorate ; but, placed in a niche or a pediment, they are entirely out of keeping with the building. Palladio, in his designs, has given figures with extended arms and distorted attitudes, and Wren himself, in his statues on St. Paul's, has shewn some want of the architectural character for which contend.*

Westminster Abbey is inferior to several of our cathedrals in its exterior effect, but is surpassed by none in the majesty of its interior. While, as we shall presently shew, its archi-tecture has suffered, it has yet all but escaped the greatest opponent to architectural beauty, alike delighted in by the country church-warden and the improving rector—the detestable whitewash. As we have before said, it would be infinitely better to do nothing in the way of repairs than to convert beautifully foliated capitals into shapeless knobs, by repeated colourings and whitewashings, of which we could name a hundred instances--of others, in which the whole character of a church has been destroyed by absurd attempts at improvement. It is scarcely too much to say, that what the Protestants did in the sixteenth century, and the Puritans in the seventeenth, the restorers and improvers of Gothic edifices have again done-with no religious zeal to extenuate-in the nineteenth. We must hope that the English Government may follow the example of those of other countries, and preserve the still existing relics from decay.

But to return to the abhey: huge monuments, in the style^s prevalent during the reigns of Elizabeth and James, or before the art of sculpture had been created in England by Bacon and Flaxman, block up the aisles or the windows, whilst architectural decorations of surpassing beauty have been cut away, to make room for tasteless monuments to men unknown to the pages of history. In the east walk of the cloisters, over the door leading to the Record office, may be seen the most beautiful bit of architecture which the abbey affords. Two brackets support mutilated figures of angels, and the third is thought to have borne a figure of the Virgin and child; the whole being surrounded with scroll-work of most beautiful design : but in the very centre of the composition a square tablet has been inserted. Of such barbarisms there are several hundred instances. The range of beautiful arches beneath the windows of the aisles, once enriched with colour and gilding, have almost disappeared, being replaced by tablets of the most objectionable character. Every part of the building is crowded; a figure of Watt nearly fills the chapel of huge St. Paul, a window in the south aisle is blocked up with a mountain of clouds; even the elegant chapel of Henry the Seventh is defaced. It is much to be deplored that the dean and chapter do not take it into their immediate and anxious consideration, whether some change in the disposition of the monuments may not be effected less detrimental to the fabric itself, and more conducive to the ends of monumental design. It has been suggested * that the chapter-house would be an appropriate place for some of the monuments, but we should deprecate any step, which would only remove the evil, and prevent the restoration of the building to the exact state in which it formerly existed. The triforium issufficiently lofty for a large portion of the monuments; it is well lighted, and would, in our opinion, be the most desirable place. There is no architectural decoration which they would interfere with, and we urge that the advantages of this po-sition be well considered. We have not had sition be well considered. We have not had the opportunity of personal examination, but we believe that the height of the triforium is nearly 15 feet in the highest part, from which it takes the slope of the roof; it is lighted by the upper range of windows, and is, of course, the same width as the aisle, and has a good floor laid upon the groining. The monument to Wilberforce, an admirable work, though hardly adapted to its locality, is 9 feet high, including the pedestal, and the greater part of the objectionable works are much smaller. The monument to William Pitt, Earl of The monument to William Filt, Earl of Chatham, is the largest in the abbey, reaching to the capitals of the piers; several others are near the same size, and for these another locality must be found, unless they are consigned to the lime burner, a way of getting rid of them, which, for ourselves, we should hardly regret. Whether some of them could be placed in St. Paul's, without injury to that edifice, or whether, as has been suggested to us, a cloister could be built in Dean's-yard for their reception, is matter for very careful consideration; but we could well consent to their remaining as at present, if other monuments were removed.

From all we have said, it seems that an edifice in which monuments, not of a devotional character, may be erected to individuals, in commemoration of actual services, and of private or public worth, is urgently demanded. Mr. Barry has allotted a space in his design for the New Houses of Parliament, which, if devoted to the reception of monuments, as he suggests, will answer the object, provided the modern style of sculpture can be made to accord with that of the building. Some space might be got in Chelsea Hospital, and a score of statues to great naval heroes might be advantageously placed in the colonnades of Greenwich Hospital. The terrace in front of Somerset-house, which most unaccountably is always closed to the public, might be made into a magnificent promenade, if thrown open, and enriched with appropriate works of sculpture.

In St. Paul's Cathedral the sculptures are nearly all well placed, and add to, instead of detracting from, the beauty of the building. They in part fulfil the intention of the archi-

• First by Mr. G. Godwin, in "Civil Engineer's Journal," 1813, and afterwards by Mr. Richard Westmacott, A.R.A. Digitized by

[•] That talented architect, Sir William Chambers, speaking of statues on a building, has said, "Their attitudes must be upright, or, if any thing, bending a litt e forwards, but never inclined to either side. Their legs must be close to each other, and the draperics close to their bodies; for whenever they stand straidling, with bodies tortured into a variety of bends, and draperics waving in the wind, as those placed on the colonnades of St. Peter's, they have a most disagreeable effect, especially at a distance; from whenee they appear like lumps of unformed materials, ready to drop upon the heads of passengers."

tect, whose original idea may be seen in the published section; and all must regret that his design has never been carried out. A proposal was once made by Barry, Reynolds, and other high-minded artists, to decorate the building, free of expense; but their offer was declined on grounds which could hardly have weight in the present day. Whilst the cathedral of St. Peter displays the accumulated enrichments of centuries in its interior, our own St. Paul's has not a single painting. Popery does not entirely consist of pomp and decoration ; and it is to be hoped we have passed the time when men could be so led away from truth. Rather is psinting a powerful instrument, in the hands of a true religion, for good. The best evidence that an improvement is in progress is observable in the altered character of our new churches. The church-commissioners did indeed try their utmost to stem that progress, and have inundated the land with a multitude of cheap structures, to which the term Gothic is, in one sense, rightly applied. But we now bear of new painted windows for our cathedrals, and in the Temple Church decoration has

and in the Temple Church decoration has been carried to an extraordinary extent. There can hardly be a richer treat than Westminster Abbey affords in its epitaphs alone; and it must be allowed that its monu-ments, if not all displaying the originality of a Roubiliac, or the dexterous chiselling of a Chantrey, are at least interesting per se, as forming a complete history of the art of sculpture in England.[†] Though the greater part are remarkable,

Though the greater part are remarkable, ther from the individuals with whose either names they are associated, from their epitaphs, or from their design, it must, as we have said, be regretted that, to erect some of the least interesting, architectural decora-tions of surpassing beauty have been tions of surpassing beauty have beauty hav it be, instead of multiplying such instances, to revive the monumental brasses, than which there can hardly be a more beautiful and expressive form of commemoration. The Dean of Chichester has adopted the painted window as a memorial, and thus has not lessened, but increased the beautiful effect of the cathedral.

Ille est hic RAPHARL, timuit quo sospite, vinci Rerum magna Parens, et moriente mori."

The last lines of Kneller's epitaph,

" Living, great Nature fear'd he might outvie Her works ; and, dying, fears herself may die," might pass for a translation. The lines on Lord Mansfield's monument,

"Here Murray, long enough his country's pride, Is now no more than Tuliy, or than Hyde,"

are also Pope's, with slight variation. The monument to Sir Palmes Fairborne has an epitaph by Dryden, and that to Gray one by Mason. The epitaph on Draiton's monument, said to have been written by Jonson, is worth preserving, as it will shortly be effaced:--'' Michaell Draiton, Esq., a memorable poet of this age, exchanged his laurell for a crowne of glorye s' 1631.

631.
⁴⁴ Doe, pious marble, let thy readers knowe What they and what their children owe To DAITON's name, whose sacred dust Wee recommend unto thy trust, Protect his mem'ry, and preserve his storye, Remaine a lastinge monument of his glorye, And when thy ruines shall disclaime To be the treas'rer of his name, His name, that cannot fade, shall be An everlasting monument to thee."
The monument to Chaucer, exected about the

His name, that cannot fade, shall be An everlasting monument to thee." The monument to Chaucer, erected about the time of Edward VI., has the character of decline which marked the architecture of that age; but even its association with the name of one who has the credit of being the father of poetry in England, has not prevented its wilful descration. Near Chaucer's monument are deposited the remains of Denham, the poet; and near St. Benclict's ehapel those of Beaumont, the dramatist: but neither have of Sir Samuel Morland, Bart., with inscriptions in the English, Greek, Hebrew, and Ethiopic languages. In all ages, whether from a want of power to express the virtues of the deceased, or otherwise, there has been a great love of abort epitaphs; and we find in the Abbey two singular examples.—On the grave of D'Arenant are the words, "O rare Sir William D'Avenant!" and on Jonson's monu-ment, as well as upon his grave. "O h rare Ben Johnson!" the name having erroneously the letter "h" inserted. This "affectation of simplicity in sequichral insertioptions is com-mented upon by Lord Byron in his notes to Childe Hurold. He complains that was of fouchark lark the tothe time in which the monument was erected, and have no means of ascertaining whether it was an actual tomb, or a simple tribute to a living hero. "Machiavelli's earth returned to whence it rose" affords an example. "Tatot nomin nullum par elogium Niccolars Machiavelli's"

"Tanto nomini nullum par elogium Niccolavs Machiavelli "

are the words on his monument in the church of Santa Cro Lord Byron, in another note, gives the epitaph on Co Merci, "Siste, vintor-heroa calcas."

If, instead of the slabs and spiritless relievos with which our cathedrats are patched in black and white, windows and pinnacles were restored, or unfinished portions completed, the same end would be attained as of old, when one good Christian gave the stone and another bequeathed money to crect the spire ; and, in-stead of our pleasure being mingled with regret, we should look through " the long-drawn aisle and fretted vault" with no emotion but one of unqualified delight. E. II.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AT an ordinary meeting of the Institute, held on Monday evening, the 24th inst., Mr. George Smith, of Mercers'-hall, in the chair, Mr. Bland Hood Galland was elected an associate. Mr. Matthew Habershon exhibited a Doric capital, and other architectural remnants, found at Mount Sion, 30 or 40 feet below the surface, when excavating for a church, which is about to be erected there. Mr. Scoles remarked that the capital resembled those he had seen in the valley of Jehosophat, and was probably not older than the time of our Saviour. The echinus was peculiarly our Saviour. The echinus was peculiarly straight. These relics were interesting, as being the only fragments in this country, connected with Jerusalem.

The hon. sec., Mr. Bailey, read the report of the council on the essays submitted in competition for the institute medal. From this it appeared that three had been received, and that the council considered one of them sufficiently meritorious, as a careful com-pilation, to deserve the offered reward. One of the three was a verbal transcript from an Encyclopædia, and the council commented in strong terms on the author of the attempted imposition. For the Soane medallion no de-signs had been received in time. A set, signed "H., an associate," had been recently forwarded, which, if sent by the stated date, would probably have been rewarded.

It gave selected essay was then read. The the derivation and nature of slate, and traced its introduction and increased use in England. It was not employed in London before the end of the eighteenth century; Spafields' Chapel was one of the earliest buildings slated. For some time after its introduction it cost from 21. 15s. to 21 18s. per square. A square foot of slate weighing only 111 lbs., while a square foot of tiling weighed 161 lbs., it was found that lighter timbers might be employed in roofs; and this, with other circumstances, led to its constant use. Slates were at one time imported from France, but were found to be indifferent; and now Bangor slates are sent by us into that country. Its power of resisting damp was shewn by the fact that the whitewash on many slate cisterns, which had been in use ten or fifteen years, was in no degree bulged, which would have been the case if any dampness had exuded. It was too soft for paving, but well adapted by its strength for balconies. Slate, I inch thick, was equal to Portland stone 5 inches thick. It might be advantageously used to make buildings fireproof. Without following the essay further, suffice it to say it contained a fair amount of information, and was a praiseworthy effort for a student, but certainly was not of that character which the institute might expect, or were called on to reward with their medal. The author was found to be Mr. S. J. Nicholl, of Argyll-place. Mr. Poynter, in a conversation on the subject which afterwards took place, mentioned that in Pembrokeshire slate was used for every thing. They made even posts and rails of it, of the same scantling as if of wood. The walls of buildings were of square blocks, rought-cast. Having a range of stables to build there, he had used rough blocks for the walls, but had made all the door and window-frames of worked slate. There was a prejudice against the use of squared blocks of slate without plastering them, on the ground that they admitted damp. This he thought singular, as slate was not absorbent, and was used for cisterns. He had found, however, that if there was the smallest hole in the slate, or if, as was often the case from the want of absorption, that the joints were not per-fectly close, that the rain drove through; and this explained the origin of the prejudice. He obviated the difficulty by laying every block with the bed lightly inclining outwards.

Mr. Tite then made a number of observations, displaying, as what he says usually does, sound sense, and great knowledge, and urged on the younger members of the profession the on the younger members of the profession the importance of obtaining practical informa-tion, and of the study of construction. Notes bearing on these points they would find useful throughout their practice. He drew attention to what was called Horsham slate, but was in reality a limestone. There was no limit to its durability, but being very heavy, proper prepa-ration was necessary for it; they must avoid the fashion of rafters 4 inches by 24 inches when they used it. He had had experience of French slates: they were very light and French slates; they were very light, and should be used on boards, not battens, or the wind would act on them. The French were in the habit of bedding them in plaster on the boarding, and this was a good arrangement. We should be careful how we altered any modes adopted in a country until we knew exactly all the requirements and peculiarities of the locality. A slate with the colour of Westmoreland slate, and at the price of Bangor, was a desideratum. In their specifications it was desirable to state weight per square of the slating required. Slates were now made so thin, that without this being specified the architect might not have power to obtain a sound covering. As to the use of slates to make buildings fire-proof, he did not consider that any slate would stand fire, and would not himself risk its employment for such a purpose. He would offer one caution in the use of non-absorbent materials, which should be borne in mind, and that was, to guard against the effect of condensation. In some of our cheap churches-too cheap churches, as he thought,—the slating was sometimes made to form the ceiling. The external The external atmosphere kept this cold, and the result was the condensation of all the moisture which ascended to the roof. In one that he had seen, where iron beams were employed, the water dripped on the congregation to such an extent that an action was brought against the archi-tect for forming an unsound roof. In a chapel built by himself, where the gallery was supported on iron beams, the condensation was so great as to form a positive drip at the lowest end of each beam. In exposed situations near the sea, if the walls were only nine inches thick, the external atmosphere condensed the internal moisture. What was wanted was a space to contain an internal atmosphere, as by that means rank acoling was prevented. The that means rapid cooling was prevented. The meeting was then adjourned till the 10th of March.

BATHS AND WASH-HOUSES FOR THE LABOURING CLASSES.

In reply to a formal application for leave to examine the various plans submitted to the committee, we received the following note:-

"SIR,-I regret that I have not at present any instructions that will authorize my giving the permission you request to examine the plans submitted in competition.

plans submitted in competition. "The plans have not been shewn to any one not of the Committee of Works, or of the Committee for General Purposes.

"By a resolution of the committee for general purposes, the committee of works was instructed not to allow the plans to be seen by any but members of that committee and myself, until they should have come to a decision; and since the decision, the ex-hibition has been restricted to the committee

for general purposes. "I will take care to lay your note before the committee at the first meeting, which, however, will not be for some days, and I will immediately inform you of the result. I shall have much pleasure in shewing you the plans, if the committee so direct .- I am, Sir,

"Your most obedient servant,

"GEOBGE STONHOUSE GRIFFITH, "Assistant Secretary.

"Committee-room, Crosby-square, "February 20th, 1845."

The 27th, however, has passed (the day named for the return of the drawings to competitors), and no permission has been given. Far be it from us to impute motives which may not exist, but the general im-pression out of doors raised by this determination of the committee to prevent any examination, will unquestionably be, that their decision could not be justified. We protest

in the strongest terms, in the name of the profession and the public, against the course adopted by the committee, and will spare no pains to ascertain in what way they have discharged the duty confided to them. Correspondents complain, amongt other things, that they were put to considerable extra trouble by the largeness of the scale on which the drawings were required to be, and that they received no thanks (a cheap return), in the letter informing them they might obtain their drawings again. As, however, we do not wish to raise an angry feeling, if it can be avoided, we refrain from printing the letters, and further comment at this moment.

DISSOLUTION OF THE CAMBRIDGE CAMDEN SOCIETY.

A BEPORT to the effect that the society intended to appeal against Sir H. Jenner Fust's judgment in the stone-altar case, which was very generally circulated a fortnight ago, was afterwards nerally circulated a fortnight ago, was afterwards as generally contradicted. A few days since, however, at a meeting of the parishioners of St. Sepulchre's, the parish in which the Round Church stands, it was formally announced that the report was correct, and that an appeal to the Privy Council, on the part of the Camden Society, was in progress. The result Camden Society, was in progress. The remains to be seen, but is hardly doubtful.

The proposed dissolution of the society has led to much correspondence, as might have led to much correspondence, as might have been expected, especially in the local papers. One of these writers says, if it is to be abolished, why, "at any rate, should not another society be modelled upon its remains? In the sister university, a society has existed even longer than the Camden; and, notwithstanding the theological contests with which the harmony of the university has been disturbed have of that university has been disturbed, has pursued a quiet course of usefulness. Why net, then, establish afresh an architectural society at Cambridge, as well as at Oxford? And why should not one go on as quietly and usefully as the other has done? The very title of the Camden Society was a misnomer; no one knew what it meant; whether it was assumed in honour of our late revered chancellor, during whose term of presidency over the university the society was formed, or whether it derived its name from the author of the "Britannia," there being in London a society already bearing that title. Let the therefore, of the society be changed, name. and let its constitution be changed also; but let not the country lose the benefits which such a society must confer."

As a further inducement to the re-modelling of the society, it is suggested " that, unless a new society be formed, the valuable collections of books, drawings, models, plans, &c., of the old society will be dispersed, which would be a sin and a shame : but if a new society were formed, I have little doubt, from the well-known liberality of the Camden Society, that they would be glad to transfer this collection to the keeping of the new society, as the nucleus of a more extensive collection."

It is to be regretted that in controversies such as that produced by the proceedings of this society, advocates adopt the most opposite extremes. Thus the Rev. Mr. Close pub-lishes a sermon, entitled "The restoration of churches is the restoration of popery while a late Hulsean lecturer issues a d discourse, headed "The restoration of Churches is the duty of Christians." So that a Romish logician might say, as the conclusion of the syllogism with protestant premises, "there-fore, the restoration of popery is the duty of Christians.'

We insert, with pleasure, the following letter from a revered and accomplished correspondent :-

Sir,-I have just read in THE BUILDER, with much painful interest, the report of the late meeting of the Cambridge Camden So-ciety, and the announcement of its intended dissolution

Surely this is both an unwise and unnecessary step. The society has been the means of doing a vast amount of good in various ways, and is in a position to direct, or at least to assist, the growing taste for the study of church architecture, of late years unhappily, but little understood.

I was one of its earliest members, and shall be one of its latest defenders. I am no sup-porter of any of the extreme ecclesiastical and

theological opinions which have been mixed up in the minds and doings of some, and do not see any necessary connection between the simple study of architectural design and those views referred to.

Cannot the Society be remodelled and reformed, and its objects be definitely and deci-sively determined? This done, it would be the means of yet greater utility, and secure the co-operation of many who have looked upon it with coldness or suspicion, or even utter dislika

At least, it is due to the members (and especially to those who, like myself, have com-pounded by one subscription for all future payments), to give them an opportunity of ex-pressing their opinion as to the question of dissolution. That such an evil may be averted, and that the present unhappy dissension in our church may soon pass away, is the earnest wish church may support of your's, truly, A Yorkshire Camdenian.

INSTITUTION OF CIVIL ENGINEERS.

FEB. 18 .- Sir John Rennie, president, in

the chair. The paper read was by Mr. De la Garde, with a supplement, by Mr. James Green, M. Inst. C.E. It contained a history of the Canal of Exeter, from the year 1540, when it was first projected, to the present time.* In 1563 the Chamber of Exeter engaged John Tren, of Glamorganshire, as their engineer, and under his directions a canal, with pound locks, similar in all essential points to those of the present day, was constructed from Wear to The depths of the canal at first was Exeter. 3 ft. by 16 ft. in width ; subsequently, at various periods, as the commerce of the city increased, the dimensions were enlarged, and after an arduous struggle, which extended from the year 1563 until 1835, when the Chamber ceased to exist as a corporate body, it suc-ceeded in perfecting a ship canal from Turf, near Topsham, on the river Exe, capable of conveying vessels of 500 tons burthen to the quays of Exeter. The latter work was accom-plished by Mr. James Green, whose reports were given, confirmed by those of Mr. Telford. They abounded in interesting illustrations of engineering difficulties, and the method of overcoming them. We may mention one. This was in the excavation for the entrance lock at Turf, which, after being carried to a depth of 20 feet through a stiff alluvial clay without water, was pressed down by the embankment 10 feet, and the bottom of the lock-pit rose to a greater height than the sides, exhibiting on its surface peat moss, marine plants, fern, &c. A com-plete kerbing or sheating of whole timber piles as therefore driven, the same being strutted by transverse timbers, and the excavation made and the lock founded in lengths between the transverse struts: as it was feared that the pressure of water from the tide would have a tendency to raise the invert and gate platforms, trunks of elm planking were laid in the rubble masonry, forming the bed of the invert, which were carried under and throughout the lock. and terminated in a vertical well beyond the higher gates of the lock ; this allowed the subwater to circulate and rise without obstruction.

This, as well as other ingenious modes of overcoming impediments encountered by Mr. Green, was highly applauded. The archæo-logical researches of Mr. De la Garde, and the extracts from old acts and charters respecting this canal, were of an interesting character, and deserve careful attention, as it must be concluded that this is the oldest canal, with locks, in the kingdom, having been commenced nearly fifty years before the Sankey cut.

The discussion which ensued, drew from Mr. Cubitt a promise of a description of the works and oblique weirs on the river Severn, which have excited so much discussion among engineers.

The meeting was adjourned to Tuesday evening, the 25th inst.

HOUSES IN HULL.-Mr. Cardwell, in a lecture "on the architecture of the present age," seys, for bad construction, no town in the kingdom can furnish a greater number of houses than the town of Hull.

• An account of this canal, by Mr. De la Garde, will be rand in the "Archseologia," vol. axviii. p. 7.-ED.

THE MARQUIS OF NORTHAMPTON'S FIRST SOIREE.

ON Saturday last, Lord Northampton gave his first soirée to the Fellows of the Royal Society. The rooms were crowded with men of station or of note. Royalty, rank, wealth, and talent, were all represented. The noble, the legislator, the poet, the man of science, the artist, were all congregated together, to confer mutual pleasure, and, by extending each other's views, mutual advantage.

Amongst the various objects of interest dis-played on the tables were a *fuc-simile* of the "late lamented Portland vase" (as a shop-keeper in Regent-street calls it); a model of the Chapter House of Salisbury Cathedral, orbitistic hu M. Britton to a more the invested exhibited by Mr. Britton; a recently invented instrument, called the "volute delineator," for forming the lines of the characteristic feature of the Ionic capital; a fine portrait of George IV., in mosaic, from Mr. Rogers's collection, and some specimens of glass pave-ment. The noble and amiable host exerted himself, as he always does, to increase the gratification of his guests.

ON PORTLAND STONE. BY C. H. SMITH.

At the Isle of Portland there are the remains of several buildings that were erected with stone from the neighbouring quarries, long before that material was generally known or considered of sufficient value to be used in the construction of the principal buildings of the metropolis. A large portion of the island has been the property of the Crown during many Henry centuries and so early as the reign of the Eighth, that monarch caused a castle to be erected at Portland, and another on the opposite shore, near Weymouth; one of these has been continued as a garrison to the present time, the other has long since been left to ruin; nevertheless the stone with which the walls are built does not appear to have undergone any decomposition worthy of notice. Holinshed, who wrote his Chronicles of England prior to the year 1574, has given rather a long account of Portland Isle; he has also, in another part of his works, devoted an entire chapter to the subject of "Quarries of stone for building;" but in neither case has he made even the slightest allusion to Portland stone. Camden the historian (who died in 1623) has also minutely described the Island of Portland, without mentioning the stone quarries; and it is worthy of remark, that in the next paragraph he describes the island of Purbeck distant about fifteen or twenty miles, as having "many sorts of good stone, from which large quantities are carried to London, to the great advantage of the inhabitants." From these two eminent writers being wholly silent on the subject of Portland stone, we may reasonably infer that at that time it was a material not generally known or used, except in the immediate vicinity of the quarries.

James the First appointed Inigo Jones his chief architect and surveyor-general of his Majesty's works; under this appointment he had to survey the crown lands at Portland; and his discrimination very soon led to the introduction of Portland stone for all the principal buildings in and about London. The banquetting-room, or military chapel at White-hall, was begun in the year 1619, and finished in two years. As far as I can search or learn, this is the earliest building of magnitude constructed with Portland stone in London, or at any considerable distance from the quarries. In 1631, Inigo Jones received orders to repair In 1631, Inigo Jones received orders to reprint the old cathedral of St. Paul; this was per-formed by "casing great part of the outside, and adding a grand Corinthian portice to the west front, all of Portland stone." From that time it became the chief material used for ornamental architecture, not only in the south of England, but in many parts round the coasts of this country and Ireland.

After the fire of London in 1666, up to the beginning of the present century, the archi-tects and builders of London scarcely ever thought of using any other kind of stone, except for pavements and similar subordinate purposes. Sir Christopher Wren used Port-land stone for St. Paul's Cathedral and other public buildings, because he considered it the best material then known, and on account of the quarries belonging to the Crown, as well as their being most eligibly situated for water

carriage. Among the writings of Sir Christopher Wren relative to the stone for St. Paul's, he states, that "All the most eminent masons of England were of opinion that stone of the largest scantlings were there to be found, or no where. An inquiry was made after all the good stone that England afforded; and next to Portland, Rock Abbey stone,* and some others in Yorkshire, seemed the best and most durable; but large stone for the Paul's works was not easily to be had even there."

At first, all the stone brought from Portland was obtained from the crown lands on the north-east of the island; but, as the demand increased, private property in different parts became more valuable, and large quantities of stone were brought from the west and southeast cliffs, without the slightest regard to quality, durability, or any other consideration of fitness, except that of meeting with an immediate sale in the market. I have carefully looked over many specifications for public and private buildings, and find the materials usually described to be of the best quality; but the general tenour of those parts describing the stone to be used rarely amounts to any thing more than the mere well-known name, preceded by an adjective, such as "good Portland stone;" but what is to constitute that "goodness" is altogether undefined.

Large quantities of Portland stone of an inferior quality are brought to London, not because the island is deficient in the best kind. but because all our large buildings are executed by contracts, at so remarkably low a price, that the mason's study is not what kind of stone will be most durable, but what stone can be wrought by the workmen most expeditiously, and thereby yield the largest profit; and of course the proprietors of quarries will only send such stone into the market as is likely to suit his customers. St. Paul's Catheand many of the churches and other large drai. buildings, erected in the reign of Queen Anne, were constructed with stone very superior, as far as regards durability, to the greater quantity now used; and yet the quarries from whence those sources were derived have been deserted beyond the memory of any inhabitants now living at Portland; and the only reason as-signed is, because the merchants find they cannot sell such stone, on account of its being a little harder, and thereby more expensive to work.

Whenever a number of large buildings are being erected at the same time, the demand for stone of the best quality is greater than the quarries already opened can supply. The con-tractors are bound under a heavy penalty to finish the work by a given time, and hence are compelled to use a material which perhaps they would otherwise reject. It may be owing to circumstances of this kind that portions of the stone used in buildings so recently erected, as the park entrances from Piccadilly, are slready in a state of decomposition; the same remarks may be applied to some of the stone used about the new buildings of the British Museum. Most readers are probably aware of the deplorable condition that Blackfriars Bridge was in before the repairs were comed: I have been informed by persons who men recollected the building of it, that the masonry presented innumerable evidences of slow, though certain decay, before the bridge was quite finished, in the year 1770. I shall notice one more example, merely to shew how com-pletely this subject has been neglected heretofore, even by men of first-rate eminence. He, whom we all admired for his abilities and munificence, who had risen to the most distinguished rank in his profession, whose percep-tion and discernment in most things were more acute than in the generality of men,-yez, the late Sir John Soane, about twenty or twentyfive years since, allowed the front of his own freehold residence in Lincoln's-Inn Fields to be constructed with Portland stone of such an inferior quality, that it is already evidently mouldering away. It is probable that too much confidence was placed in the mason, who ought to have known better, and have acted

differently. Abundant examples of defective Portland stone might be pointed out; but when we consider that the stone brought from the island, good, bad, and indifferent, is all shipped from

⁹ The asbiar at the east end of Greenwich Hospital appear to be Roche Abbey stone, which is likely to be the case, a Sig C. Wren had a high opinion of that material. the same pier, which is a very small oue, and that notwithstanding the blocks are marked in the quarry, so as to denote from whence they were obtained, it is possible that some of them may be misplaced, we ought not to be surprised if occasionally a very bad stone is conspicously placed in a building that is otherwise in excellent condition; and this we find more particularly to be the case in our modern structures, arising no doubt sometimes from ignorance or inattention, but often from some trifling interest, such as using a stone because it is just of the dimensions required.

These events seem to have brought about an important investigation, in which the reputation and interest of persons connected with architecture are deeply concerned. The Portland merchants had enjoyed the supply of stone to London and the south of England for an almost uninterrupied period of more than 200 years; I say almost, because in the year 1804 a duty of 261. 8s. per cent. was imposed on all stone conveyed by sea from one port of Great Britain to another. This was a temporary injury to the Portland trade, for large quantities of Bath stone were brought to London by canals, and consequently free of duty; but in 1823 the coast-duty was taken off, and Portland again took the lead for all superior buildings. But its character was stained, and public confidence was lost, in consequence of a few individuals bringing shiploads of rubbishing stone into the markets, which was used by the unwary masons for all purposes. Many of our noblest structures, which were constructed with these defective materials, rapidly assumed the appearance of premature ruin; the architects and proprietors of buildings united in one universal outcry against all kinds of Portland stone; and it has been condemned without inquiring into the cause of complaint, as wholly unit and unworthy of being used in substantial edifices.

To explain and illustrate the numerous qualities and localities of Portland stone would far exceed the usual limits of an essay. You will see by analysis* that the ingredients are apportioned in this stone much the same as in most other oolites, therefore, its quality depends greatly upon the manner in which the component parts are united. There are not fewer than fifty or sixty quarries already opened at the Isle of Portland, most of them along the north-east and north-west cliffs, at an elevation of several hundred feet above the sea. The stone from each of these quarries, and from different beds in the same quarry, almost always presents some minute particularities, which, on very attentive examination, serve to distinguish it from others. In many instances, these distinctions are so conspicuous as to be evident on the most casual inspection.

By minutely and attentively examining a specimen of Portland stone that is found after fifteen or twenty years' exposure to the weather, to be in a decomposing condition, its characteristic features will be on the whole lighter coloured than such as is known to be good stone, arising partly from the entire mass being less crystalline, and from spots, veins, and rings of a lighter tint than the ground. The whitest parts are generally least cemented and most friable; the stone is altogether of an open, powdery texture: and the pores or vacuities being numerous compared with the bulk of solid matter, render it deficient in weight for its size.

Portland stone of the most durable quality is comparatively heavy, of a uniform colour, or rather darker than the last described, owing to the quantity of cement of a compact crystalline texture regularly dispersed throughout the pores; and hence it will resist a

• The following analysis of colites, as given by Professor Daniell, in the report on the selection of stone for building the new Houses of Parliament, will shew how nearly the proportional quantities of the component parts in four specimens, possessing very different degrees of durability when exposed to the weather, approach each other. They are chiefly composed of carbonate of lime; the greatest difference does not amount to three per cent. of that material, and the Portland contains a small quantity of silica.

| | Ancas- ter. | Bath, Box Quarries. | Portland, Way-croft Quarries. | Ketton. |
|---|--|---|--|--|
| Silica Carbonate of lime Carbonate of magnesia Iron alumina Water and loss Bitumen | 93·59 2·90 ·80 2·71 A trace, | 94·52 9·50 1·20 1·78 A trace. | 1.20 95.16 1.20 .50 1.94 A trace, | 92'17 4'10 '90 2'83 A trace, |

greater force to crush it, or to disintegrate the particles. The following comparison will shew the relative peculiarities of good and bad Portland stone, considering the specimen when examined, subject in every respect to the same conditions, such as being equally wet, or dry, &c.

| GOOD. | | | BAD. |
|-------------------------|----|----|-----------------------|
| Preponderance of weight | •• | •• | Deficiency of weight. |
| Dark coloured | •• | •• | Light coloured. |
| Uniform colour | •• | | Party coloured. |
| Compact and crystalline | •• | •• | Open and powdery. |
| Hard to crush | •• | •• | Friable. |
| | | | |

What are technically called glass veins vary from a line to an inch or more in breadth, and often run completely through a block; they retain their original whiteness, while all the remaining surface becomes covered with lichens; or if, in London, with soot and dirt; whereas the "party-coloured" just named looks more as if some whitish fluid had been sprinkled or thrown upon the stone in patches. Glass veins may be considered unsightly, but they are by no means perishable, neither do they facilitate decay in way whatever. If they occur in steps, pavements, or any other situation, subject to considerable wear, there hardness will soon occasion them to be conspicuously above the general level; therefore such variation of colour is no defect beyond appearance, and causing a surface to wear irregularly.

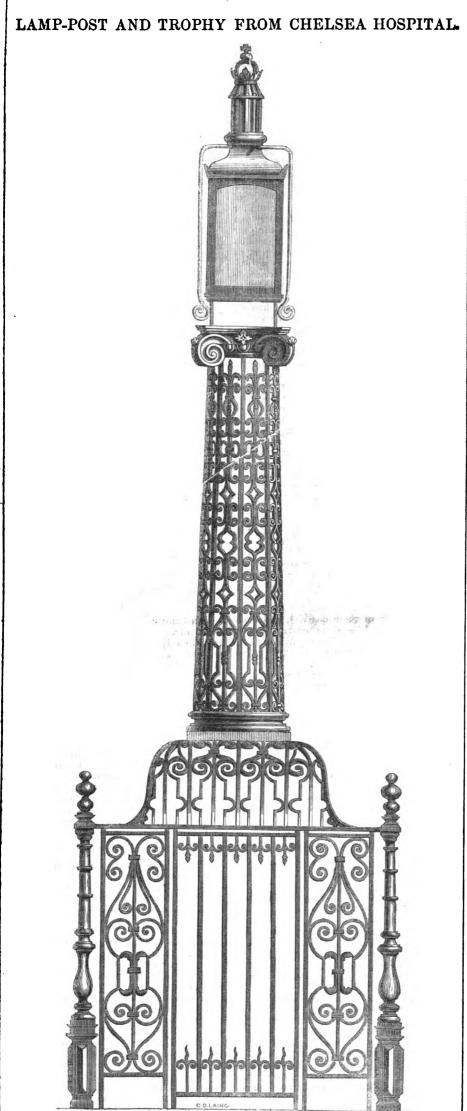

According to the observations of Professors Daniell and Wheatstone, at the end of the report on the selection of stone for building the new Houses of Parliament, the following inference may be drawn: that in all stones of the same class, the heaviest kind, or that which has the greatest specific gravity, is the most durable and best suited for architectural works; this is given as a sort of general rule, "though linble to individual exceptions;" but it appears to hold good with all the varieties of Portland stone. The specimens from which the following weights have been nost tested by exposure to weather :--

Weight per Cubic Foot.

THE SMOKE NUISANCE. - On Thursday week. Mr. Mackinnon moved for leave to bring in a Bill to "prohibit the nuisance of smoke from the furnaces of factories." hon. gentleman stated, that the bill was almost identical in its provisions with that he obtained leave to bring in last session. He proposed to take the discussion on the second reading. After a conversation between Mr. Bright, Mr. Ferrand, Mr. Ricardo, Mr. Milnes, Mr. Borthwick, Mr. Hawes, and Mr. M. Phillips, the Earl of Lincoln said he apprehended that there were two questions before the housefirst, whether it was possible by any legislation to suppress this nuisance, and in the second place, whether the scheme proposed was practicable? With reference to the first question, he was inclined to believe that it was possible considerably to abate, if not altogether to re-move, the nuisance. He had been in communication with some scientific gentlemen on the subject, but he doubted whether the bill of his hon. friend would be operative. If on discussion the house should be of that opinion, he should be prepared to introduce a measure of his own, being persuaded that the subject itself was not only important with reference to the public health, but also in an economical point of view. Mr. Muntz said that there were many difficulties connected with the subject. It might be practicable to effect the hon. mover's object in respect of some trades, but it would be impracticable in the case of others. Any attempt of the sort with respect to the iron trade would ruin it. Any legisla-tion on the subject required great care, and words from Mr. M. Phillips, Mr. Becket, Mr. Gill, and Mr. Alderman Copeland, leave was given to bring in the bill.

* The reason of this stone being so much heavier than any other marketable stone in the island, is its being so full of abells, which are of much greater specific gravity than the general mass; we must not thereby infer that this stone is considerably more durable than any of the others, notwithstanding its weight far exceeds them,

IRON LAMP-POST AND TROPHY FROM CHELSEA HOSPITAL.

SIR,—I have been long desirous of adding to the beautiful collection of sketches which have appeared in your journal. The continued publication of judiciously-selected examples from the works of ancient and modern art is of infinite use to the inquiring reader; and forms a very powerful auxiliary to the attempts which the Government is now making to diffuse a correct taste among all classes.

With this idea, I have sent you a drawing of what at first sight may appear a very humble subject. It is but a lamp-post, but it is one designed by the master-hand of Sir Christopher Wren, and it illustrates in a remarkable manner what may be done in small matters by the pencil of genius, and how the admiration of the spectator may be excited without straining after effect, or violating the laws of propriety.

The lamp-post stands in the middle of the west court of Chelsea Hospital. It is of iron, and 19 feet in height; the pedestal 5 feet 8 inches square.

There appears to be no doubt that it is as old as the hospital, the first stone of which was laid by King Charles II., in 1682, and the buildings were completed in 1690, from the design, as is well known, of that unrivalled English architect, Sir Christopher Wren.

Such a composition as this simple stand, placed on two or three steps with proper angleposts and curb, would make a very much better ornamental centre to some of our public thoroughfares than many which have been put up of late years. Compare it, for instance, with the strange affair at Charing-cross, the bodkins at the end of the Poultry, the Waithman block, or that poor dear departed monument they have just pulled down at Battle-bridge (I suppose because it was so ugly, as to make the omnibus horses shy at it) with its statue of George IV., immortalized by the satiric needle of George Cruickshank as resembling at a distant view a sack of flour, and at a nearer approach Dusty Bob in a blanket.

As an inhabitant of Chelsea, I may perhaps be excused for my excessive admiration of Wren's noble building; I devoutly believe, and I know several eminent architects are of the same opinion, that the chapel of Chelsea Hospital is a finer work of art than the chapel at Greenwich,—the latter was designed by Athenian Stuart.

I have endeavoured to represent in my smaller sketch one of the military trophies

carved in stone at the entrance gates, which are very original and of striking beauty. These sketches from the outside of the building afford some little proof of what might be obtained from the structure itself.

LANDLORD AND TENANT.

In a report on the agriculture of Norfolk by Mr. Barugh Almack, published in the last part of the journal of the Royal Agricultural Society of England, there is a valuable chap-ter on "Tenure," wherein the writer very properly urges :-

"lst. That to induce a man to exert to the utmost such ability as he possesses, you must shew him that his doing so will be rewarded by benefits to himself, and not merely to others, who have no just claim to the exclusive ad-vantages of the fruit of his labour; in other words, to prompt men to great and extraordi-nary industry, you must satisfy them they shall certainly be rewarded for their exertions, by at least participating in those permanent improve-

"2nd. That, in order to gain the advantage of first-rate talent, added to sufficient capital, you must not trust to chance, but hold out some advantages to attract and secure to your-self those select men as tenants."

The late Mr. Coke (afterwards Earl of Leicester), to whom Norfolk owes great part of its fame as an agricultural district, acted on these principles, and both granted leases and offered inducements to good tenants.

"To secure the assistance and advantages of "To secure the assistance and advantages of first-rate talent in the improvement of his estates," says Mr. Almack, "Mr. Coke gave, not only security that each should reap a certain portion of the benefits arising from his own exertions and skill, but he provided superior houses, and other ac-commodation, for his first-class tenants. This, undoubtedly, was well adapted to the object in view. I am not about to advocate a great onliay. in every case, on farm-houses and great outlay, in every case, on farm-houses and farm-buildings, nor any outlay inconsistent with the occupation and business of the tenants ; but there should be, on all farms, such buildings, conveniently arranged, as are necessary for the economical carrying on of the farm, and no more than are necessary, so that they may be kept in good order at moderate expense.

"There should also be such a dwelling-bouse as is suitable for the management of the farm, and appropriate, as a residence, for the family of a man who possesses talent, and such an amount of capital, as is invested in that occupation. When, in any thing, we are de-termined to have the best of its kind, we must be prepared to pay the best price for it, more especially in this case, when the value is cer-tainly known to the party who has it to disof." pose

The advantages of this course are so appa-rent, that we might expect to find it univerfollowed. Such, however, is not the case ; sally for though landlords may admit it to be the best means of obtaining great and permanent improvement in the soil, they are not willing to give up the power they have over their own property

In order to meet this objection, Mr. Almack says, - "I would venture to submit, that if Great Britain were divided into three parts, and each let separately under one of the fol-lowing agreements, all the land might be cul-tivated in the highest possible manner; for, although this division would allow each owner and each tenant to select the one agreement best suited to his own feelings, all would be so far founded on justice to the party who ex-pended his capital for the improvement of the soil, as to insure the most liberal outlay of it : "lst. Leases.

"2nd. Insert a clause in the lease granted, ander which the owner should have the power to cancel it, on giving eighteen months' notice, and paying to the tenant such sum as two arbitrators (one for each party) should think a fair compensation to the tenant for his perma-ment improvements, bearing in mind all the circumstances of the case affecting landlord or tenant.

"3rd. By giving the tenant a clause, under an agreement as a yearly tenancy, by which he would be entitled to a fair and equitable allowance for all permanent improvements made at his expense, but with the sanction of the owner, on written notice of such intended improvemente having been given to the latter or his agent, and not having been answered within a given period, or in time to prevent that outlay which the owner of the land would not sanction

We recommend this view of the question to the consideration of all landowners.

LETTERN-STAND, LITTLEBURY CHURCH.

the reading-desk in the choir of ancient part of allettern beinging to Littlebury Church churches was termed a lettern, or lecturn, from lego, to read; and a reader was called a lector, or lecturer. The earliest letterns known in this country are of wood, but many are found of brass, often in the shape of an other rubbish, was the font-cover. The plan of the stand is six-sided; each side eagle, with extended wings, upon a pedestal. is slightly curved inward. It bel The annexed engraving represents the lower last period of pointed architecture.

THE reading desk in the choir of ancient part of a lettern belonging to Littlebury Church It belongs to the

WORKS IN THE PROVINCES.

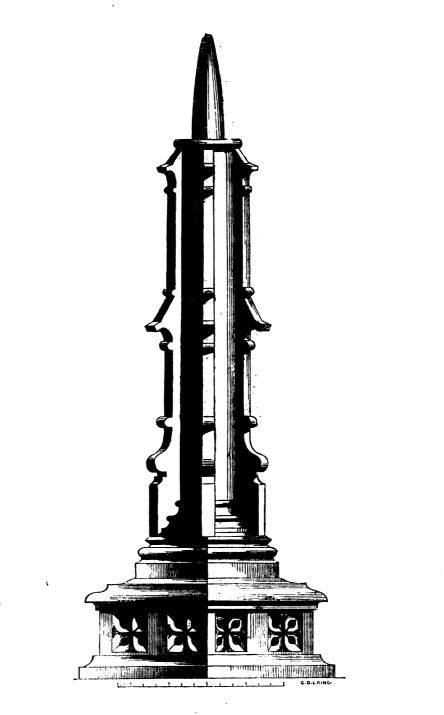

AT Portsmouth, the fortifications are being repaired and strengthened. The old gun-carriages on the King's Bastion have been replaced by new, and eight 32-pounders, instead of four, mounted. Blockhouse Fort, commanding the mouth of the harbour, will abortly diaplay a double instead of a simple for shortly display a double instead of a single (as formerly) row of teeth; and it is contemplated to remove the old victualling store, upon which stands the old telegraph on the platform, in order to extend the Platform Battery to the Round Tower. Works will also be erected on Southsea Common, between the Castle and the King's Bastion.

At Wolverhampton, a project is on foot to establish a company for the purpose of sup-plying the town with water. The services of Mr. Thomas Wickstead, the engincer, have been secured. The estimated outlay required is 25,500%.

At Louth, a public meeting was lately

held, for the purpose of determining the best mode of testilying respect for the memory of the late William Allison; when it was resolved that the most appropriate mode of testifying the public estimation of his worth would be in the erection of alms-houses in the town of Louth, to be called "Allison's Alms-houses," the patronage of which shall be invested in the family and descendants of the deceased, in such manner as shall be hereafter settled by a deed of trust. Subscriptions were forthwith entered into. At Southend, the extension of the pier is

roceeding so rapidly as to leave no doubt of its being completed early in the approaching season. With the exception of only twenty-seven piles, the whole of them have been driven, and most of them braced. The plank-ing is also ready, and the workmen are em-ployed in preparing the railing, which is to be ployed in preparing the railing, which is to be of wood. This important addition, when completed, will afford to the visitors a distinct view of the fleets, both inward and outward bound,

conveying the commerce of the world. At the head of the pier, ships of every burthen will not only be distinguishable, but in most instances within hail; and the depth of water will enable them to land or receive passengers during the ebb of the tide.

during the ebb of the tide. At Bungay, the theatrical speculation having so entirely failed as to bring the stage properties and theatre to the hammer, the building has been purchased by a company, who intend immediately to convert it into a corn-hall. The building, being in the centre of the town, is eligibly situated, and easy of access. It is intended to throw ample light upon the stalls from the roof, and it is understood that there will be one or more rooms attached, suitable for committees or other parties requiring a public place of meeting.

there will be one or more rooms attached, suitable for committees or other parties requiring a public place of meeting. At Wisbeach, a great addition to the number of houses has been made in the last few months. Several pieces of land have been sold at high rates for building purposes. The piece known as the late Mr. Girdleston's garden, near Blackfriars-brige, has been built upon and graced with the names "Angenoria" and "Ruby" streets. Other new streets are in course of erection at the back of the new parade, in East-field. A stimulus to improvement in domestic architecture has been given by the examples of Messrs. W. and A. Peckover, the bankers, whose new erections on the north beach are now approaching completion, and present a striking contrast to the dingy dwellings which until lately occupied their sites. Mr. W. Peckover's residence is in the old English style, with high pitched roofs, ornamental gables, twisted chinneys, &c. That destined for Mr. A Peckover, though less ornate, forms a more substantial-looking pile, and has a good appearance.

At Lincoln, it is confidently expected that during the present year greater improvements will take place in that city than have ever taken place in one year before, so that mechanics and labourers will be fully employed. The county goal is to be enlarged at the cost of several thousand pounds; the hospital is also to be enlarged; the temperance hall will be erected; a public walk constructed; many of the shops are to be pulled down and rebuilt in the London style, and it is expected that not less than fifty new houses will shortly be commenced. Extensive sales of household property in Lincoln are continually taking place, and generally speaking the prices obtained are exorbitant.

At York, a new lecture-hall for the Mechanics' Institute is about to be built. The money already raised amounts to 520/.

At Sandwich, it is in contemplation to erect a new day school in connection with the Independent Chapelin that town. W. Harris, Esq., who upon all occasions affecting the wellbeing of the poor is foremost to assist, has contributed 100% towards the building fund.

At Burton, in Lincolnshire, a new day school, in connection with Wesleyan Dissenters, has just been completed. The huilding consists of two stories, with a wide passage in the centre. The upper room is for the school, and is 53 feet long by 25 feet wide. Beneath, on one side of the passage, is a comfortable house of three rooms for the teacher, and on the other side, a room, about 23 feet by 25 feet, possibly for an infant school, at some time. The whole of the common bricks—the front is of stock-bricks—amounting probably to seventy thousand, were the gift of a wealthy member of the Wesleyan body.

THE CHURCH OF ALL SAINTS, DOR-ORESTER, has been recently rebuilt, under the direction of Mr. Benjamin Ferrey. It formerly stood in a very objectionable position, blocking up the pavement, and at the west, and close to the entrance, were fish shambles. These, by the interference of the Town Council, have been removed. The new building is erected in the Decorated style of architecture: it consists of three bodies separated by arcades; the whole building is finished in a superior manner. The stained glass in the east window will be presented by the Bishop of Salisbury. At present the tower terminates a little above the roofs; but it is intended that it shall be surmounted by a lofty stone spire. The expense of the building, exclusive of the spire, has been about 3,0004. The church contains 700 sittings.

THE EXCAVATIONS AT POMPEII.

THE Academy of Fine Arts, in Paris, has received a report from its perpetual secretary, M. Raoul-Rochette, on the present progress and condition of the excavations at Pompeii, in which he earnestly calls attention to the rapid decay by which the exhumation of these remains is speedily followed, for want of due precautions.

"While rendering justice (he says) to the intelligence with which these explorations are conducted under the direction of a minister so enlightened as the Chevalier Santangelo, it is impossible to see without pain the gradual decay of the buildings of Pompeii. After an interval of six years I have found almost effaced paintings which I had previously be-held fresh and uninjured. This ruin, with which Pompeii is threatened, seems owing to the neglect, in the majority of instances, of the most simple precautions demanded for the preservation of paintings; such, for instance, as that of adding a roof to the walls on which they are found; or, better still, covering them with glazed frames, as has been done in parts, and might be done everywhere at trifling ex-pense. For want of repair, however, these frames, where they have been employed, are rendered ineffectual, as I found lamentably proved in the 'House of Adonis.' A general belief prevails in Naples that Pompeii is destined once more - and this time irrevocablyto perish at no distant day; and owing to this anticipation, but too well grounded, there is a disposition to abaudon the place to its fate without an attempt at retarding the destruc-tion by measures of precaution, which in any case would cost but little, and which might be more effectual than is imagined. The Neapolitan Government will owe a serious reckoning to the learning of Europe, when the disap pearance of Pompeii, daily going on before its eyes, shall have been consummated by the fault of those whom fortune had made the masters of such a treasure. They seem to think they do all that can be required of them when they transport from the old city to the museums of Naples its most important paint-ings. But how are these very paintings, affirmed to be thus snatched from destruction, treated? They are placed between layers of plaster, and shut up in wooden cases, where they remain for years buried in the warerooms of the Museum. Thus, the paintings removed before my former visit, more than six years ago, from the street of Fortune, and that of Mercury, are still at this moment in their prison of plaster and wood—as completely lost to us and science as they were beneath the volcanic crust, and far more compromised as to their preservation under the present than the former covering. Who shall venture to say in what condition these paintings will be found when withdrawn, at the close of seven or eight years, from their plaster beds? And what, at any rate, can justify this seclusion, for a term so prolonged, of these works in a museum, all whose treasures should be open to the student and the public?"—Globe.

THE ROYAL EXCHANGE.—It appears from a report presented to the corporation that the payments already made in respect of the new Exchange, and the new Gresham College, amount together to the sum of $\pounds 100,244$. 17a. 7d., and the amount yet required is estimated by the committee at $\pounds 15,000$. A detailed report is promised at Midsummer next.

DRAWINGS BY THE LATE ADAM LEE.— We perceive that the entire series of very beautiful and highly interesting drawings in water-colours, by Adam Lee, Esq., F.S.A., deceased, late resident officer of the Royal Office of Works at Westminster, are to be sold by auction towards the close of April. They consist of plans, sections, and perspective views of the ancient Palace of Westminster, in the times of Edward the Confessor, Rufus, Stephen, Edward III., Richard II., and Elizabeth; particularly, two most elaborate and beautiful drawings of the interior of St. Stephen's Chapel, as it appeared in the time of Edward III., beautifully illuminated with gold, and giving all the elaborate details of the painted glass and architectural ornaments. Also, plaus for restoring the Palace, and views illustrative of the coronation ceremonials of George IV. and William IV.

New Books."

The Geometric Tracery of Brancepeth Church, in the County of Durham. By ROBERT WILLIAM BILLINGS. Published for the Author by T. and W. Boone. London, 1845.

This is a further exposition of the mode in which the Gothic architects produced by rule their apparently capricious tracery, as before set forth in the author's "Geometric Paneling of Carlisle Cathedral," and should be studied by all who wish to understand the spirit of pointed architecture. The paneling here illustrated belonged, it is supposed, to the ancient rood-screen of Brancepeth Church, and is attributed to about the year 1500. Although only about 10 feet long, and 4 feet 3 inches high, it contains twenty-seven panels of tracery; each widely differing from the other, yet all formed on geometric principles.

"It is satisfactory to find (says the author) that the more we examine Gothic architecture, the more we are convinced that chance was in no possible way connected with the linear designs of construction. The most exuberant richness of contour can, by a careful analysis, be reduced to simple geometric rules; and, in the investigation of laws of description which we have here endeavoured to exhibit, it has been curious to observe how extraordinary an alteration, in the general features of such panels as have fallen under our notice, is effected by a very slight deviation in that most simple of all curves — the arc of a circle."

We propose to represent one of the Carlisle panels in an early number of this journal; and, by means of it, to explain the mode adopted to produce them: in the interim we recommend all our readers who are engaged either in designing or executing Gothic tracery, to obtain the little volume of which we are now speaking. Mr. Billings, although still a young man, has produced a number of elaborate and excellent works on architectural subjects, and is entitled to warm commendation and support. His work on Carlisle Cathedral contains fortyeight drawings; that on Durham Cathedral, seventy-five; and his first book, the Temple Church, thirty-one; the latter, moreover, were wholly engraved by the author, as well as drawn.

The Antiquarian and Architectural Year Book for 1844. Newby, Mortimer-street, Cavendish-square. London: 1845.

The object of this work, which is to be continued annually, is to gather into one view all discoveries and proceedings for the year, both in primeval and mediæval antiquities; to afford notices of new ecclesiastical structures, and the restoration of buildings of the same character, where the erection or adaptation are of sufficient magnitude to warrant description; and to supply information on important works on antiquities and architecture, published during the year.

We think the idea a good one, and cordially wish success to the attempt. Nor indeed is there any reason to doubt it, for, as the editor remarks in his preface :--" No time can be more propitious for the publication of such a volume than the present. Our national monu-ments, nay every relic of our country which volume than the present. has undergone the baptism of years, is re-garded with an interest which, though perhaps newly, has nevertheless been powerfully, awakened. Antiquity and the study of it is ceased to be objects of contempt, or, to speak mildly, of derision. Antiquity has become popular. It has found its way out of the popular. It has found its way out of the libraries of the learned, and made for itself an abiding place in the book closet of the man of business—of the poor scholar—of the artist. It is among all and with all. Its professors find honour among us, and they who study any of its multiform divisions are regarded with more than common attention, and their labours looked upon with interest. Every literary effort, therefore, which has for its object the illustration of the past for the better knowledge of the present or the future, is likely to be received into favour, and its efforts crowned with success."

The present volume is dedicated, with great propriety, to "John Britton, Esq., F.S.A., as a slightacknowledgment of the high estimation

entertained for his talents and his labours;"* and forms a very interesting record of fugitive essays on archæological subjects that have come before the public during the past year, antiqua-rian investigations, and published works. The 'l'he various articles are arranged under the heads,primeval antiquities, medizeval antiquities, ecclesiastical architecture (chiefly notices of old churches and restorations), and bibliography. There are not many original communications, but these may be expected to increase in ensuing volumes when the publication is known. The principal papers are those which were read at the Canterbury meeting of the Archæological Association, a meeting which has led to more writing and printing than could possibly have been anticipated by those who projected and arranged it. We shall be glad to learn that the "Anti-guarian and Architectural Year Book" has

had a large sale.

Correspondence.

JURISDICTION OF OFFICIAL REFEREES AND CONSTRUCTION OF SCHEDULE (E) AS TO PROJECTIONS.

SIR,-In accordance with my promise to continue the discussion of this subject, I would first, to supply an *hiatus* in my last letter, set out the form of notice from the district surveyor, issued in consequence of an application from him to the official referees: "That the from him to the official referees: "That the said works were not a sufficient commence-ment prior to the 1st day of January, 1845, to take them out of the operations of the Metro-politan Building Act, 7 & 8 Vict.; and that, in the event of your proceeding therewith without giving me such notice as is required by the aforsaid Act, the said work will be liable to be abated as a nuisance."

Here is a palpable recognition of a "com-mencement," and where is the authority to define the extent of it? more especially, as stated in my last letter, the "commencement" having been made upon admitted legal notice under the former Act. The ground of complaint to the official referees, upon which by their decision the summons was issued (a copy of which was sent to the party complained of), also raised the question of the proposed buildings being in contravention of sect. E as to projections. The official referees upon this ground of complaint issue, or sanction the district surveyor issuing, his summons, and, with a plan of the locus in quo before them, evi-dently admit the operation of sect. E, as restraining buildings from projecting before the general line of buildings in any street: with this impression (signified in the same summons), that under the new Act no such buildings could be erected, it would appear to be a farce to complain "of your proceeding therewith withoutgiving me due notice, as is re-quired by the aforesaid Act," which brings us to the discussion of schedule E as relating to to the discussion of schedule E as relating to projections. The ground of complaint by the district surveyor to the official referees being thus: "and, lastly, the whole are projected buildings beyond the general line of the fronts of the bouses, viz. being 29 feet before those already erected in Princes-place, vide plan, and contrary to the said schedule E." The his-tory of the matter is this :--Princes-place, as stated, is 29 feet from the public road, then comes a vacant piece of ground on which these five fourth-rate houses are commenced, and then another row of houses in a line with Princes-place. The information to the re-ferees states that the intended houses commenced next the road have a return wall 24 feet deep, or 5 feet short of the front of the above-mentioned houses.

The heading of the clause in the Act is, "Projected buildings beyond the general line of buildings, and from other external walls;" it will be perceived in the above quoted information to the official referees, that the district surveyor has quoted the words of this recital, without pursuing the inquiry as to what the enact-ment was, viz.: "And with regard to buildings already built or hereafter to be re-built, as to bow windows or other projections of any kind."

The words here used seem clearly to define that what was contemplated as to projections related only "to buildings already built or hereafter to be rebuilt;" and then follows, "Such projections must neither be built with, nor be added to any buildings or any face of an external wall *thereof*, so as to extend beyond the general line of the fronts of the houses." Using the term projection in its ordinary sense (not claiming the limitation of the above clause), would imply buildings proceeding from, and not, as in this case, being commenced at, the edge of the road actually advancing in progress towards the general line of the houses in the street. After the great deliberation that was given to the subject, many sessions passing over before the bill was in a condition to become an Act, it would be injustice to the framers of it to imagine that other than the common sense reading of the above extract was their intention. Had the intention been that the district surveyor assumes, sancwhich tioned by the referees, it is impossible to imagine that the talent engaged in the prepara-tion of the Act could have lost sight of the few words that, suggested in parenthesis, in addition to the existing enactment, would have made the matter thoroughly intelligible. "And with regard to buildings already built

or hereafter to be rebuilt, as to bow-windows or other projections of any kind" (and with regard to buildings hereafter to be build) " such projections must neither be built with, nor be added to, any (such) building on any face of an external wall thereof" (and no new building shall be erected) "so as to extend beyond the general line of the fronts of the houses, &c."

It would also appear, that to any new buildings now or hereafter erected, at a future period, projections might be made thereto "beyond the general line of the front of the houses," as not being controlled by the words "buildings already built or hereafter to be rebuilt."

A most important point presents itself for discussion, as to the extent of application of the large equitable powers intrusted to the referees, which would appear to have been so intrusted to them to accommodate the Act to peculiar cases not precisely met by any positive direction, and not to be applied in contravention of a special enactment. I shall be glud to induce the opinion of some of your correspondents learned in the law upon a case thus cir-cumstanced, in which I am now professionally concerned, by putting the facts before them in a subsequent letter.—Your obedient servant, a subsequent letter.—Your obedient servar GREENWAY ROBINS, Architect.

22nd Feb. 1845.

SALE OF ABCHITECTURAL PRINTS AND DRAWINGS.

SIB,-I read the letter of a member of the Association of Architectural Draughtsmen in your last number with pleasure, and am glad to find that they are looking forward to the establishment of a separate and distinct exhi-bition of architectural drawings and a museum.

In the first volume of THE BUILDER I ventured to offer a few suggestions to this society with every feeling of respect, and am now about to make a proposition, which I trust, will be received by them in the same spirit.

I am very fond of the study of architecture, and in my leisure hours can enjoy the luxury of being possessed, if only for a time, of a good engraving or drawing, and having but small means, as is the case with many of my class, I find some difficulty in supplying my wants for contemplation and study. Lallude to the great difficulty found by young men who are anxious to obtain information from such sources, their being no place in London where architectural prints can be obtained in any great variety or quantity, therefore beg to call the attention of the above society to the consideration of the following plan :

If they have an exhibition of architecture, they must have a large room, I therefore propose that they establish a depot for the sale and purchase of prints and drawings of all styles of architecture, and every art and trade connected with it. With regard to myself, I often buy engravings, &c., that may strike me as having some peculiar effect, a door or window, or other feature which I may introduce into a design or sketch to advantage, or some place I may have visited or be about to do so, and when I have made such use of it, would be

glad to dispose of the same at a cheap rate, or exchange it for others, consequently should exchange it for others, consequently should find such an establishment very acceptable. Working drawings of buildings actually exe-cuted, machinery, furniture, &c., however rough and dirty, would be useful and readily purchased by those requiring such in their early studies, and again, after being copied, find their way back for the use of new comers, at a very triffing cost to all parties; nothing should be refused; and this plan will offer the opportunity to young artists to send their drawings for sale, and bring their names before the public; assist them greatly in obtaining employment, and induce them, when taking sketches from the actual buildings, to make them more accurate, as the sketches will be-come valuable to those who have not been there, and sell for a small sum.

The plan of management would be simple, and might be arranged as follows :--each party sending a drawing or print for sale would write the name and price at the back, inclosing a letter with his name and address, which would be kept private; after being numbered, it would be entered in one book open to the public; and when sold, struck out and entered in a ledger, the name, address, and price being stated and paid when demanded, deducting a commission, which may be agreed upon. The drawings, &c., by a little judgment could be arranged in the various styles, so as to be shewn immediately.

snewn immediately. During the continuance of the exhibition, the drawings and engravings might be kept in portfolios on a large table in the centre of the rooms, so that the public would have the additional advantage of inspecting and pur-chasing plans; and when the exhibition was termined they might be placed on the wells terminated, they might be placed on the walls, and the public admitted free.

By the assistance of the county members of by the assistance of the county inclusions of the society, or others that might be appointed as agents to collect and send up portfolios of drawings, &c., and, in return, have such subjects as they may require, thus keep up a correspondence and diffusion of knowledge all over the kingdom, and, in the course of time,

establish similar exhibitions in the large towns. And you, Sir, might, by lending your powerful aid in THE BUILDER, assist them by having a weekly head; say-

Such information would be very extensively circulated by the assistance of your excellent journal, and would be found useful. Your most obedient servant,

WILLIAM J. SHORT.

2, Spring-terrace, Lambeth, Fobruary 22nd, 1845.

THE PORTLAND VASE.

-As the Portland Vase has been lately STR. brought into lamented notoriety, and you have noticed it with just execution of the vagabond sot who destroyed it, perhaps the following particulars, which will be found in "Granger's Letters and Miscellanies," may not be unin-teresting in your journal. He, Granger, is describing the Portand Museum. I am, Sir, &c., H. B. H.

"The most celebrated antique vase or se-pulchral urn, from the Barberini cabinet, at Rome. It is the identical urn which contained the ashes of the Roman Emperor Alexander Severus, and his mother Mammea, which was deposited in the earth about the year 235 after Christ, and was dug up by order of Pope Bar-berini, named Urban VIII., between the years 1623 and 1644. The materials of which it is

[•] The capital required would be very small—a table, portfolio, and a little furniture; and the whole might be managed by a clerk and boy, or porter. The clerk ahould be a draughtaman, well acquainted with the subjects he has to arrange; and if he be a man of talent, he might in the evenings, when the rooms were not otherwise engaged, give lectures to the younger members of the profession on the various styles and construction shewn in the numerous draw-ings and engravings on the walls, with instructions as to the best mode of pursuing their studies; thus making them useful when even under sale; and, by means of the foces, increase his salary, making the situation worthy the accep-ention of a man of character and ability.

[•] We hear that a committee is being formed for the purpose of paying some public compliment to this estimable pendeman is acknowledgment of his long career of exten-ine asschunces. We will gladly aid such a proposition.

composed emulate an onyx, the ground of a rich transparent dark amethystine colour; and the snowy figures which adorn it are in basrelief, of workmanship above all encomium, and such as cannot but excite in us the highest idea of the arts of the ancients.

"Its dimensions are 93 inches high, and 213 inches in circumference. A more particular account of this famous vase may be found in Montfaucon's Antiquities, vol. v. book ii. chap. 6; in Signor Bartoli delle Sepulchri Antichi; in the Ædes Barberinæ; in Wright's, Breval's, and Misson's Travels; in Winckleman on the Arts of the Ancients, &c. &c.; and an accurate engraving, with a particular description of it, was given in "Gentleman's Magazine," vol. lvi. p. 97. 1,0294."

N.B. This sum is the price it fetched at the sale of the Duchess of Portland's collection, by Mr. Alderman Skinner, who was thirtyseven days employed in the sale at the duchess's house, in Privy-gardens, commencing his labours on the 24th April, 1786. I presume it was bought in by the family.

SLAB SLATING-CONDENSATION OF MOISTURE.

Sin,—It is generally known that the great objection to the use of slab slate as a covering to a building is the fact of its being liable to dampness on the underside in certain states of the weather. The evil no doubt arises from damp air, which, as it comes in contact with the slate, condenses and falls in drops of water; this especially occurs after a frost. If any of your readers are acquainted with an application as a simple remedy to prevent this defect, and would make it known through the medium of your journal, it would be a means of greatly extending the usefulness of that valuable material.

I am, yours, &c., &c., Southampton. AN ARCHITECT.

[Our correspondent will find some remarks on this subject in the notice of proceedings at the Institute of Architects, in our present number. The evil would be lessened by covering the slate outside with any non-conductor of heat. —ED.]

Miscellanea.

NOVEL APPLICATIONS OF IRON.—Experiments have for some years been in progress, chiefly under the superintendence of Herr Dase, inspector of mines in Richmond, in the Duchy of Branswick, with a view to make cast-iron, as the cheaper and more durable material, applicable to the preparation of stereotype plates. The success of these experiments is attested by the publication of a cast-iron stereotype edition of the Bible, published at Nordhausen, the price of which, with marginal readings, is 9 ggr. (13d.) Another application of the same metal has lately arrested our attention, and for which it possesses certain capabilities. We refer to the use which is beginning to be made of it in perpetuating the memory of the dead. Sepulchral monuments, formed of cast-iron, are already to be found in our metropolitan church-yards and suburban cemeteries. We believe that to the late Mr. Thomas Wedlake, of the Fairkytes Foundry, near Romford, must be awarded whatever credit is due for the novelty of the application.

THE NEW CHAPEL, COLCHESTER, WAS erected in 1844, from the design of Mr. W. F. Poulton, architect, Reading. It is built of white Copford brick, the strings, entablature, &c., being formed of moulded brick. Stone is used only for the caps and bases of pilasters and for the impost mouldings. The colour of the facing brick being uniform, the building has the appearance of a stone erection. The size in the clear is 40 feet 6 inches by 51 feet 6 inches — accommodation for 500 persons. There is a shallow gallery across the entrance end. The pulpit is suspended from the back wall, with entrance by steps direct from the minister's private vestry. The size of vestry is 30 feet by 11 feet 6 inches. The contract (by Mr. Kemp, builder, Colchester), for the chapel and vestries, was 1,011. Amount of extras, 18/. 15s.

MAHOGANY AND ROSEWOOD VENKERS.— A question of some importance to the im-porters of foreign furniture woods has recently been raised by the customs officers at Hull. A parcel of veneers of mahogany and rosewood, cut from the log, were imported into that port from Hamburgh, which the revenue offi-cers placed under detention, as being contrary to the navigation laws, i.e., as being the produce of Asia, Africa, or America, and īm. ported into this country from Europe, the logs, in this instance, having been imported into Germany from the place of growth, and there cut or sawn into the very fine thin slices of wood used in the making of cabinet farniture, and known by the trade as veneers. The officers, however, considered that this operation, per-formed in Hamburgh, did not constitute a manufacture, inasmuch as the wood retained its original state, having been simply sawn or cut from the log, and would require polishing &c., here, previously to being fit for use for the purpose to which it is applied. It has, however, been decided that, under the Trea-sury order of the 23rd February, 1833, the parties are entitled to the admission of the veneers as the manufacture of the country from which they were imported, although the wood itself, in its raw state, be the produce of either of the other quarters of the globe. This decision has been communicated to the officers for their information and future government.

FIRST JUDGMENTS ON NEW DISCOVERIES. However void of practical utility any discovery may at first appear, it is impossible to tell to what important results it may eventually lead. Who could have foreseen an acquaintance with the minutest wonders of the heavens from the child of a spectacle-maker amusing itself with convex glasses—the marvellous re-sults of steam machinery from the steam issu-ing from a kettle—or the illumination of our of a tobacco pipe? One ingenious contriver of a steam-ship was advised by a former president of the Royal Society to employ his time on some practicable scheme, and not on a vi-sionary speculation; and thus it is that the sus-picion and distrust with which any novelty is commonly received has tended to damp in-quiry and retard science. I have been assured by that eminent geologist, the Rev. W. D. Conybeare, that his early investigation of the more recent strata of this kingdom, and especially of the Portland oolite, &c., was treated as an idle occupation of time, and as leading to no useful purpose ; whereas the progress of geology, since that time, has shown that the stability of our great public edifices depends on a proper selection from the rocks best adapted for building; and Mr. William Smith, who shared in the obloguy of following such useless pursuits in the infancy of the science, was in his old age employed by government, in conjunction with Mr. De la Beche and others, to examine the various strata of the United Kingdom, with a view to selecting the best stone for building the new Houses of Parliament.-T. Sopwith on Glaciers in Great Britain.

SCHOOLS OF DESIGN .- Mr. Edward Bannister, of Hull, in urging the establishment of a school of design in that locality, where, at present, there is no place for the study of the finearts, remarks very justly : -- "For the pursuit of that knowledge which is essential to the cultivation of design as applicable to our arts and manufactures, every facility should be afforded and every means held out to induce the artizan to become skilful and ready in the execution or to become skilled and ready in the execution or invention of patterns which he may be called upon to produce. The acknowledged supe-riority possessed by the French in design is so generally admitted, that any observation in proof thereof would be needless. The demand by the public for all actions whereas in charge by the public for all articles wherein elegance of design is exhibited fully proves that the people are already capable of appreciating their merits, and that in order to compete with other nations we must bring into operation an equal amount of talent in the production of goods both of a useful and ornamental nature. De. sign is the same arrangement and fitness of parts, to form an harmonious whole, whether employed in the grouping of materials for a shawl pattern, or in the disposing of figures for a cartoon; it may exist in the commonest and most ordinary article, rendering it chaste verdict given in and beautiful, whilst without it the most costly the other points.

and elaborate works are vulgar and contemptible. Designs must also be adopted suitable to the purposes for which the articles may be applied—a triangular coin or a square tea-cup would be as absurd as a fat Hamlet or a lean Falstaff; how often do we see used the most ridiculous and unmeaning patterns; nature in all her freaks never produced anything so incongruous, the willow pattern to wit, and the grafting of various flowers and fruits upon one stem, exhibiting monstrosities in form and colour which the painted Indian could never rival, nor the gay Chinese surpass."

PUBLIC FOOTPATHS.—A few evenings since, Mr. Aglionby called the attention of the House of Commons to the unprotected state of the public footpaths, which are now frequently crossed and intersected by ra'lway constructions, quite regardless of the rip ats and convenience of the neighbourhood. The consequence of this state of things was that footpaths to the church, the village, and through the fields, might be intersected by r ailwaycuttings, 20 or 30 feet deep, so that there would be a descent, and then an ascent of that magnitude, to be accomplished before the footpath could be regained. What he desired to have was, that public footpaths should be protected the same as railways. Lord G. Somerset expressed his willingness to give the subject his best consideration.

GALVANISED IRON.-An action brought by Patteson and others, against Holland and others, for the infringement of a patent granted in 1837, for an "improvement in coating or covering iron or copper for the prevention of oxydation," was heard last week in the Court of Common Pleas. The defendants pleaded-first, that they were not guilty; secondly, that the plaintiffs, or those they represented, were not the first and true inventors, and, further, that the specification did not particularize and determine the nature of the invention, and in what manner the same was to be performed. The evidence, on the part of the plaintiffs, related to very few points, the main question being, that if the patent were valid, whether the defendants had in-fringed it. No witnesses were called on the part of the defendants, who relied upon the cross-examination of the witnesses put forward on the part of the plaintiffs; but several scientific persons were examined on behalf of the plaintiffs, and upon whose cross-examined on the defence was rested. The examination the defence was rested. The specification stated, that the zinc by which the iron or copper was to be coated might be used either in a state of fusion, or in a solid state reduced into powder. The iron was to be previously scoured by immersing the metal in water acidulated with sulphuric acid, or by water acidulated with surplusive way, ..., or dipping it into a solution of sal ammoniac, or in water acidulated with muriatic acid. metal pieces, after being dipped, were to be dried immediately, and, as the specification stated, might be dried by holding them over a reverberatory furnace. The zinc was to be melted in a crucible of earthenware, or of cast-iron with bricks, or an earthen lining of some lined kind. The specification then stated, that the zinc, being melted, must be skimmed care-fully, and the surface covered with sal ammoniac, after which the plates of iron or copper were to be slowly introduced into the melted zinc. With regard to small pieces of metal, such as nails, small chains, &c., they were to be thrown into the melted zinc, covered with sal almoniac, and afterwards put into a rever-beratory surface, and covered with charcoal. A red heat was to be maintained there during a quarter of an hour, while the mass was moved and shaken, until the pieces of metal had dis-charged the excess of zinc which they had taken up. It was admitted, by the witnesses for the plaintiffs, that the coating of iron with zinc, as a means of preventing its oxidation, had been known in England, at least half a century. There was no evidence to shew that a reverberatory furnace had ever been used; and one of the witnesses admitted, that, although it might be possible to use an earthenware crucible, it would, practically speaking, be im-practicable.—The jury, after an absence of half an hour, returned into court, finding for the plaintiffs on all the issues but the fifth, which they found for the defendants; thereby substantially, giving a verdict for them, and thus, in a great measure, stultifying verdict given in favour of the plaintiffs the on

SCOTT MONUMENT .--- The committee for this monument are now turning their attention to the necessary decoration of it, by proceeding to raise a fund for the purpose of filling its niches with figures of characters appropriately selected from the works of the Scottish Shakspeare. Those already erected are the figures of the Last Minstrel, Lady of the Lake, Prince Charles, and Meg Mer-rilees, which severally represent his first poem, his most popular poem, his first novel, and his most popular novel. We are glad to hear that the committee are bestirring themselves for the purpose of raising additional funds to enable them to have the other niches filled in a similar manner, as without this, Mr. Kemp's design would be left incomplete in its most important object, that of filling the mind of the spectator with recollections of the great author's wonderful works.

OLD FAIRLIGHT CHURCH, NBAR HAST-INGS.—The Times, says this humble, but curious and ancient structure, is about to be pulled down. It is one of the last of a class of religious edifices now almost swept from the land by the ruthless hand of modern taste, the land by the ruthless hand of modern taste, and there seems to be really no just grounds for destroying this church; it is not in a ruinous state, and is quite large enough for the wasts of the place; in fact, in the winter months it is never full, and only so in the summer, when visitors attend from the neighbouring watering-place, chiefly on account of its quiet, retired situation. The old inhabitants of the parish are against its demoli-tion; they feel that if the building be not gay or attractive in itself, it is nevertheless the old church wherein the rude forefathers of the hamlet worshipped for many ages, and around which many take their eternal rest, and they view with surprise and aversion its removal to make way for a new structure. A very small sum would be enough to put it into good repair, and it is to be hoped that the dignituries of the church will yet avert the doom to which the building will in a few days be consigned unless they interpose.

BELGIAN ENGINEERING.-A short time since, a portion of the tunnel of Cumptiel, on the line of railway between Belgium and Rhenish Prussia, gave way, but without causing loss of life. Since that occurrence, the comloss of life. Since that occurrence, the com-munication between the two countries has seriously been retarded, both from apprehen-sions on the part of the public, and obstructions created by the recent heavy falls of snow. These circumstances attracted the notice of the Government, who accordingly, a few days since, brought before the Chamber of Representatives a project for substituting an open cut for the tunnel in question, and applied for 300,000f. to carry out that object. It was stated during the discussion, that the falling in of a portion of the tunnel was to be ascribed to the bad quality of the bricks which had been used in the construction, and to the want of sufficient lime thickness in the partition walls. One member demanded the Minister of Works to institute a special inquiry into the causes of the accident, with the view of ascertaining whether there were not sufficient grounds for prosecuting the engineers. The Minister, in reply, observed, that Belgian engineers were highly estimated abroad—that they had been engaged in the majority of the German States, where the formation of rail-ways was commenced or contemplated—and that in no foreign railways had more talent or science been displayed than on the Belgian, and that none presented greater prospects or guarantees for safety.

CAIRO AND SUEZ RAILWAY .- By advices which have recently been received from Alexandria, it appears that His Highness Mehemet Ali has arranged with Mr. Galloway, the London engineer, for carrying out forthwith the execution of this long-projected railway. The vast importance of this work to Great Britain, and the advantage and facility it will afford to our Indian passengers and mails, inasmuch as the crossing this desert of eighty miles now occupies as much time as going from Alexandria to Cairo, a distance 220 miles, must be evident to every one; besides which, it is well known that the faligue, inconvenience, and expense of the desert journey in many cases deter travellers from availing themselves of the overland route to India. When this rail-

road is completed, the journey across the desert may be accomplished in three hours with ease, comfort, security, and economy, as it will no longer be necessary to send out supplies of food and water to the desert, which at present are requisite, in consequence of the time occu-pied in the journey. We sincerely hope, that pied in the journey. We sincerely hope, that before three years shall have clapsed we may have it in our power to congratulate Great Britain on the achievement of this useful and gigantic work. The following are the distances across the desert between Cairo and Sucz, dividing the line into stations :---

| | м. | | | |
|---|----|---|----|--|
| From Cairo to No. 2 station | 17 | 4 | 18 | |
| From No. 2 to 4 station | 20 | 5 | 7 | |
| From No. 4 to 0 station (First stage hard and regular, last hard but rugged.) | 23 | 7 | 8 | |
| From No. 6 to Suez | 23 | 1 | 4 | |
| (Both stages hard and level.) | | | | |
| Total distance | 85 | 1 | 31 | |

NOTICES OF CONTRACTS.

For a survey of the Messuages, Lands, and Hereditaments liable to poor rates, in the parish of Tydd St. Mary, Lincolnshire ; together with a plan thereof, upon a scale of three chains to an inch, a tracing of such plan, and a book of reference in duplicate. The parish contains from 4,000 to 5,000 acres. March 3.

For the Mason's and Pavior's Works, supply of Guernsey Granite Chippings and Yorkshire Paving, for one Year, from the 25th of March next, for the parish of St. George, Hanover-square. March 4.

For the supply of 20,000 tons of Iron Rails, and 7,000 tons of Iron Chains, for the Newcastle and Berwick Railway. March 4.

For the supply of 100,000 Railway Sleepers for

the Newcastle and Berwick Railway. March 4. For repairing or new-paving the Foot-ways and Carriage-ways in the parish of St. John the Evangelist, Westminster, and parts of St. Marin the parish of St. John the march 4.

For a supply of thirty iron Lamp-posts and Columns, according to pattern, each weighing at least four cwt. March 5.

For supplying 21 inch Yorkshire Paving, Granite Kerb, Circular Kerb, Granite Channel Paving, and faced Granite Stones for crossings, within the district of Camden Town for three years from the 25th of March next. March 6. For completing the Works connected with the inclosing and annexing certain Land lately pur-

chased for the improvement of Newport Bride in the Isle of Wight. March 8. well.

For repairing the footway pavements, and pro viding and laying new curb and other stone; for repairing the carriage-way, pavements, and pro-viding and laying new granite and other stone, during one year from Lady-day next, for the united parishes of St. Andrew, Holborn, and St. George-the-Martyr, Middlesex. March 8.

For paving and repairing the Carriage-ways and Foot-ways within the parish of St. Paul, Covent-garden. March 11.

For supplying and laying down about 400 yards of cast-iron Pipe, of 10 inches diameter, for the Commissioners of the Southampton Water-works. March 13.

For building a Sewer in the City-road, St. Luke's, near Charles-street, in length about 401 about 130 feet. March 14.

For the repairs and restoration of the Tower and Nave of St. Mary's Church, Nottingham. March 17.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

March 3 .- At the Greyhound, Sandy, Bedfordshire; a large fall of remarkably large Larch and excellent Scotch Spires. March 4.—At the Green Man Inn, Plashet,

Esser; 220 capital Timber Trees, 200 superior Poles, of large dimensions, part nearly timber-girth, consisting of Lime, Ash, Beech, Oak, Black Poplar,

Birch and Hornbeam. March 4.—In the Wood on the Deadmonsey Estate, near Market-street, Herts: 1,100 large Oaks; 3,500 smaller Oaks; 400 large Beech; 600 naller Beech; 1,000 Oak poles. March 4.-At the Red Lion Inn, Worksop; smaller Beech; 1,000 Oak

large quantity of very valuable Oak, Lard Beech, Elm, and other Timber Trees, now standing at Worksop, Clumber, and Martin, near

Bawtrey. March 4.—At the Harrow Inn, Lower Warn-borough, Wilts; 72 Elm Trees, 2 Oaks, and 1 Ash.

March 4 .- At Whitton, near Hounslow and Twickenham; 350,000 Malm, Stock, and Grizzled Bricks, 13 tons of Lead, 12 squares of Slating, 3,000 feet of York and Portland Paving, 10,000 Glazed Pantiles, &c. &c.

March 7.-At the Hall of Commerce, Thread-

medle-street: 500 loads of large Yellow Pine Timber, 20,000 Baltic and Colonial Deals, March 11.—At the King's Head Inn, Enfield, Middlesex; 200 Oak Timber Trees of large dimen-sions and excellent quality, 34 Elm and 24 Ash Trees.

The last week in March, or the first week in April next.—A large quantity of Oak and Elm Timber, of superior quality and large dimensions, principally growing in the woods on the Orchard-leigh Estate, near Frome, Somerset.

Shortly. — At Portsea: a valuable cargo of Mahogany and Cedar in Logs and Planks.

COMPETITIONS.

Plans and Elevations for a new Workhouse with the requisite offices, capable of accommodating 400 es, for the Canterbury Incorporation. inmate The architect is requested to state the amount of premium he will require for the use of his plan and necifications in the event of the Court of Guardiana adopting the same, and appointing their own surveyor to superintend the works. March 8.

Plans for the most convenient mode nding or embarking passengers, carriag of landing or embarking passengers, carriages, &c., &c., at George's Pier-head, Liverpool. A Premium of 2001. will be given for the Plan selected and acted upon, and a Premium of 100*i*. will be given for that Plan which may be deemed to be the next in utility. March 19.

MEETINGS OF SCIENTIFIC BODIES During the ensuing week.

MONDAY, March 3.—Entomological, 17, Old Bond-street, 8 P.M.; Chemical (Society of Arts), Adelphi, 8 P.M.; Medical, Bolt-court, Fleet-street, 8 P.M. TUESDAY, 4.—Linnæan, Soho-square, 8 P.M.;

Horicultural, 21, Regent-street, 3 p.m.; Civil Engineers, 25, Great George-street, 8 p.m.

WEDNESDAY, 5.—Society of Arts, Adelphi, 8

THURSDAY, 6. - Zoological, Hanover-square. 3 P.M.; Royal, Somerset House, 81 P.M.; Antiquaries, Somerset House, 8 P.M.

FRIDAY, 7. — Royal Institution, Albemarle-street, 81 P.M.; Botanical, 20, Bedford-street, Covent-garden, 8 P.M.

SATURDAY, 8.—Royal Botanic, Regents-park, 4 P.M.; Westminster Medical, 32, Sackville-street, 8 P.M.; Medical, Bolt-court, Fleet-street (Anniversarv).

TO CORRESPONDENTS.

"W. F. P."-The sketch is declined with thanks. "New Corn Exchange, Romford."-We cannot lend ourselves to attacks on individuals without being fully satisfied that they are just. The papers sent give no such assurance. As to the amount of premium offered, if architects can be found sufpremium opered, if architects can be found suf-ficiently foolish to submit plans for a Corn-Exchange, Lecture and Reading-rooms, &c., to a tribunal of which they know nothiny, for the remote chance of obtaining ten guineas! they will deserve just what they are likely to get, namely, their trouble and outlay for their pains and weakness.

"Pro bono publico" (Colchester) must member that we have many classes of readers to gratify. His wishes, however, shall not be it sight of. "The Rev. W. D." (Montreal).—Any informalost

tion on the state of architecture and building in the colonies will be acceptable. "A Hand-railist" inquires "what course we

"A Hand-rallist" inquires what course we would recommend to a person who knew how to construct an exceedingly useful and valuable machine of novel character, but whose means were not such as would enable him to obtain a patent."—

Consult confidentially some capitalist. "The Rev. J. F." (Yorkshire).—The appeal shall be read. As to the drawings, it would be wrong to answer without seeing them; but we have no doubt they would be useful.

D. W. B."-We " are quite willing to aid the wishes and intentions of those who are resolved to agitate the subject of Architectural Competitions, unlil a system, acknowledging principles of justice and honesty (at least), shall become recognized;" but we think the "Translator" has hardly case enough at present. "M. B. A."-No

-Next week.

"A Subscriber" (Liverpool) wishes to be re-ferred to the best works on copper-smelling, and the construction of smelling-furnaces, with the names of the publishers.

"G. L." (City-road) shall be written to. "Railway Masonry."-Messre. Groombridge and Sone, of Paternoeler-row, and Mr. Thurnam, of Carlisle, intend very shortly to issue a new edition of the late Peter Nicholson's work on Railway Masonry.

Rainbay Masonry. Received: Parl I. of Dr. Young's Lectures on Natural Philosophy; edited by the Rev. P. Keiland. (Taylor and Walton.)—Dolman's Ma-gazine, No. 1.—Minutes of Proceedings of the Institution of Civil Engineers — D. Finney— J. W. 8—An Enquirer.

ADVERTISEMENTS.

TO ARCHITECTS.—To be SOLD, Sir WILLIAM CHAMBERS'S TREATISE on the DECORATIVE PART of CIVIL ARCHITECTURE, with valuable Notes and Examinations of Grecian Archi-tecture, by Joseph Gwilt. "Aumerous fine plates, two very large vols., imperial 8vo., half-morocco, gilt backs, for 32s. 1926. Apply to Thomas Cole, bookseller, 58, Princes-street, Leicester-square. Only a few copies remain for sale. "The only text-book in the language."—Walpole.

THE BUILDER.

EMBARRASSED CIRCUMSTANCES. EMBARRASSED CIRCUMSTANCES. --PERSONS IN DIFFICULTIES being desirous of availing themselves of the Beneft of LORD BROUGHAM'S HUMANE ACT, are requested to apply to MESSRS. GRAND AND CO., of 54. Coleman-street. City, where every information may be obtained, FREE OF EX-PENSE, or arrangements can be made with Creditors, by which means the painful necessity of resorting to BANKRUPTCY or INSOLVENCY may in many cases be avoided.--N.B. Partnership accounts adjusted.

IMPORTANT TO INVENTORS AND PATENTES. PRACIICAL ASSISTANCE GIVEN to parties taking Letters Patent, by Mr. J. WILSON, Esgineer and Patent Agent. Every description of business relating to or connected with Patents, Registration of De-signe, Patent Agency, &c., conducted at his offices, 16, CHANCERY-LANE, opposite Carey-street. Negotiations patented from our parties wishing to dispose of or purchase patented or registared inventions. Every necessary infor-mation may be obtained at the offices as showe, where also may be had printed instructions (gratis), to which Mr. W. begs particularly to draw the astention of parties about to take out patents. Mechanical drawings of every description, original designs for machinery, models, &c., executed with dispatch and sconoary.

100 MARBLE CHIMNEY-PIECES. THE WESI MINSTER MARBLE COM-THE WESTMINSTER MARBLE COM-PANY embrace this opportunity of announcing to Builders and the Public generally, that in the first week in March they will offer their very large assortment of Vein, Statuary, Black and Gold, Bardilla, and Black MARBLE CHIMNEY-PIECES, manufactured in a superior manner by machinery, at prices considerably below prime cost, which are far superior in quality and workmanship to those manufactured for public auctions. By purchases made from this stock a great saving will be effected, in addition to the auction expenses. The Company's reason for making this sacrifice is their intention to make new extensive alterations in their Shew-rooms, previous to setting up their new stock for the emsuing season, of which further notice will be given. Direct, WESTMINSTER MARBLE COMPANY, EABL-STREET, MOLYWELL-STREET, MILLBANK.

TO CIVIL ENGINEERS, RAILWAY CONTRACTORS, &c.-A most respectable Young Person (educated as CIVIL ENGINEER), who has had the care and superintendence of important and extensive Works on Railways, Docks, Bridges, &c. He has a practical know-ledge of Drawing, Surreying, Levelling, Setting out of Cuttinge, Embankments, Tunnels, and Engineering-works ge-nerally, and being naturally possessed of great talent and perseverance, would be found useful to go through any hard and difficult works. He would not object to any other oc-cupation in which he might be useful either at home or abroad, and accept a moderate salary, and produce most sa-isfactory testimonias from eminent engineers and scientific men. Address to Alpha, at Mr. Everett's, bookseller, John-son's-court, Fleet-street, London.

G,'S TRACING-FAFER. warranted to take Ink, Oil, or Water colour, and is sold by MESSRS. ROBERSON AND CO., SOLE AGENTS, 51, LONG-ACRE, at the following cash prices:-THIN TRACING-PAPER.

GENTS, 51, LONG-ACRE, at the following cash prices:-THIN TRACING-PAPER. 60 by 40, at 144. 0s. per Ream, or 18s. 0d. per Quirs. 40 by 30, at 74. 0s. , 7s. 6d. , 50 by 20, at 34. 15s. , 4s. 6d. , THICK TRACING-PAPER. 40 by 30, at 144. 0s. per Ream, or 15s. 0d. per Quirs. 50 by 30, at 74. 10s. , 8s. 0d. , N.B.-Every sheet is stamped with the Initials of the anufacturer.

N. B. -- Every sheet is stamped with the initials of the Manufacturer. This beautiful and unequalled article is allowed to be the cheapest and most useful Paper hitherto introduced to the public, as will be best proved by a trial.

E. WOLFF & SON'S NEWLY-INVENTED

MATHEMATICAL PENCILS, FOR

METHEMATICIANS, ARCHITECTS, & ENGINEERS,

METHEMATICIANS, ARCHITECTS, & ENGINEERS, Waranted to retain a very fine Point. E. WOLFF AND SON, in introducing their Extra Hard Lead Pencils for Mathematical and Architectural purposes, beg to draw attention to the advantages resulting from their adoption in preference to the ordinary Pencils. They are made to six distinct sizes, by which means they can be fitted to all instruments, and are so constructed that each Pencil may be cut in halves without waste; thus making two Pencils each of a length, and most convenient for use, and obvinting the difficultus existing with respect to the ordinary Pencils. E. W. and Son have also half-round Pencils, suitable for the Spring Bow, thus preventing the necessity of dividing the Pencil down the centre. They are made of extremely Hard Lasd, of the finest quality, which will retain a very fine point and give a clear , even, and distinct line.— Price 4s. per dosen. PATTERN OF SIZES.

PATTERN OF SIZES.

:-- ⁵ round 1 6 3

A Sample of each size will be sent by Post to any part of the Kingdom, on the receipt of Postage Stamps equal to the amount.

the Kingdom, on the receipt of Postage Stamps equat to the amount. Drawing Pencils of the best quality, for Architects and Engineers, warranted free from grit: the BBB and BBBB are particularly recommended.—Price 5s. per dosen. May be had of all Instrument Makers and Stationers, and at the Manufacturers', 23, Church-street, Spitalfields,

J. J. R E TO AND CO., MANUFACTURES, 11, GREAT MARLBORO UGH.STREET, LONDON. Offer to Painters, Builders, &c., Painting Brushes of a quality far superior to those generally offered for sale, to which they bog to call the attention of all who prefer quality and durability to apparent cheapness.

000000.-7 in. Dusters. 000000.-7 in. ditto, extra. 0000.-Ground Brushes.

0000.-Ground Brunes. Plasterer's Brushes. Distemper ditto. Ground and Unground. Sash Tools, and Common Tools. Tar Brushes and Masons' Brushes, and all other Brushes used by Painters and Artists.

Lists of Prices of Painting Brushes, and of all other kinds of Brushes, forwarded on application. Established 1777.

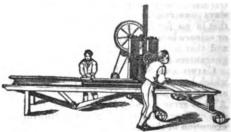

HOLBORN AND FINSBURY SEWERS, MIDDLESEX THE COMMISSIONERS of SEWERS for the LIMITS give NOTICE, that their Office, Hatton Garden, is open daily between the hours of Ten and Four, where information can be obtained (gratis) by persons about to Purchase or Bent Houses or Property, or take Land for Building purposes, of the altuation and level of the public Sewers, capable of affording sufficient Drainage, and which they recommend all such Persons to apply for at the above Office. By the Court, STABLE and LUSH, Clerks.

STABLE and LUSH, Clerks. TO BUILDERS AND OTHERS. NOTICE IS HEREBY GIVEN, that the Commissioners of Sewers for Holborn and Finsbury divisions, Middlesex, will meet at their office in Hatton-garden, on Friday, the 14th day of March next, at Two o'clock in the afternoon precisely, to receive TENDERS for building a Sewer in the City-road, Saint Luke's, near Charles-street, for a length of about 401 feet; and lowering an existing Sewer southward, to the extent of about 136 feet, conformably to Plans and a Speci-fication, which may be seen daily between the hours of ten and three. The parties offering must attend at the above time of meeting with their Tenders sealed up, which must contain the names of two surcise, for the due execution of the works. The Commissioners will not coasider themselves bound to accept the lowest Tender. By the Court, Stable and Leak, Clerks. Office of Sewers, Hatton-gardes, February Stud, 1845.

COURT OF SEWERS FOR WESTMINSTER, AND PART OF MIDDLESEX, No. 1, Greek-strest, Soho-

COURT OF SEWERS FOR WESTMINSTER, AND PART OF MIDDLESEX, No. 1, Greek-street, Soba-square. TO BUILDERS and Others interested in buildings or in ground for building upon, within the district under the jurisdiction of this Court, drained by water-courses falling into the river Thames, between the city of Dondon and the parish of Fulham. The Commissioners hereby give notice, that by an Act of the 47th Geo. III. (chap. 7, local) it is required that, pre-viously to the making of any new sever in any street, lane, or public way, or to carry off or drain off water from any house, building, yard, or ground, into any sewer under their management, or within their jurisdiction, a notice in writing that such new sever or severs shall be constructed and made in such manner and form as shall be directed by the said Commissioners, and not otherwise. Ad, in order to prevent the serious serils and inconveni-have directed that, upon splicatic being made at this office, and that such new sever or severs shall be constructed and made in such manner and form as shall be directed by the said Commissioners, and not otherwise. Ad, in order to prevent the serious serils and inconveni-have directed that, upon splicatic being made at this offeo previous to the accevative is 1 such ground, information shall be given as to the lowest depth at which the same can be drained. And the Commissioners do also give notice that, when-sense hows faors or pavements of buildings shall have been laid so low as not to admit of their being drained with a proper current, they will not allow any severs. or drains into severs, to be made for the service of such buildings. It is recommended to all persons shout to purchase or take on the premises, to accretain whether such premises have separate and distinct drains into common severs. All petitions will be called on in the order of their appli-cation, and the name of any party not present when called in to support the application will be struck out, and the pro-cedings must in consequence be commenced

HATCHER'S BENNENDEN TILE-MACHINE, Manufactured and Sold only by COT-TAM and HALLEN, Engineers, Agricultural Implement Makers, &c., 2, Winaley-street, Oxford-street, London.

Ehe Builder.

SATURDAY, MARCH 8, 1845.

HE applications made to us for information on various points in the Metropolitan Buildings Act are still so numerous, as to lead us to believe that a large propor-

tion of our readers are greatly interested in the subject. The inquiry, When may we omit sending for the district surveyor? has been repeated, it is hardly necessary to say, oftener than any other. One correspondent, a respectable builder, whose letter represents a dozen others now before us, asks :--

"Can you inform me, if it is really necessary that notice should be given to the district surveyor of such trifling works as the following, viz.: in fixing a kitchen range, for instance, it is generally necessary to cut or bore a hole through the jaumb, to lay on the service from the feeding cistern; another case is, that of laying on service-pipes or gas-mains to houses, where it is often necessary that the pipes should be carried through the walls? Surely no district surveyor would compel the giving of notice in such cases, although I am well aware the wording of the Act is very strong, two days' notice being required to be given, sec. 13, 'before any party wall, external wall, chimney nack or flues, shall be begun to be built, pulled down, rebuilt, cut into, or altered.' Another case of far greater importance, is that respecting chimney-tubes, &c., above four feet high. Schedule F states that all such pots, tubes, &c. 'shall be fixed two feet at the least into the brick orstone-work of the flue;' now if I make my tubes so as to slip down two feet into the fue, is it necessary that I give notice to the district surveyor before so doing? This appears to me to be a point of great importance to the building trade, and I trust will soon be settled officially. It appears to me it can never be meant that in all such trifling cases notice must be given, and a (I will not say the) fee paid, as in many cases the fee would be far more than the value of the work done, and what for? It would simply have the effect of increasing the fees of the district surveyor, without any adequate advantage to the public, who would have to bear the expense, which, in very many cases, would be equal to the poor rates. In order that these, and many other points of such great importance to the builder, should be settled without delay, I would suggest that a society be formed by the builders for their protection; for should a difference arise between the builder and the district surveyor, it would be well that such a matter should be settled at once, and that the best advice should be had. It would fall hard on a single individual to be put to the expense and inconvenience of settling points which concern the trade; besides, the district surveyors have a society of their own for that purpose."

We referred to the points raised in the foregoing letter in our leading article of January the 25th (p. 37 ante), and expressed our opinion that, strictly speaking, a man may not let in an iron air-brick, for example, to his front or back wall, or make a hole for a bell-wire at the street-door, without sending notice to

1.6.4.5.1

THE BUILDER.

the district surveyor, and paying such fee as may be ordered by the official referees. Section 13 says two days' notice shall be given before any matter or thing shall be done which by this Act is placed under the supervision of the surveyor, unless specially excepted. And schedule L provides, that for any service performed by any surveyor, which is required by this Act, but not comprehended under the stated heads, such a fee is to be paid as the official referees may order, not exceeding 21.

There seems to be no doubt that wherever instructions are given in the Act for the performance of certain things, wherever a mode is prescribed for the execution of works, they are placed under the supervision of the surveyor, and he may demand notice and a fee. Relative, then, to fixing chimney-pots, tubes, funnels, or cowls, if more than 4 feet above the brick or stone-work of the flue, insomuch as schedule F provides, that in that case they must be fixed at least 2 feet into the brick or stone-work of the flue, notice to the district surveyor (whose duty it is to see the provisions of the Act carried out) is required, and a fee may be demanded. Mr. Biers, in a letter to us on this subject (p. 45 ante), says, it cannot be admitted that the Act requires any notice to the district surveyor, and less so that any fee is payable if the directions be properly attended to. "I am borne out in this opinion," continues Mr. Biers, "upon reference to the amended Bill in the committee of the House of Commons, previous to the amendments and alterations proposed to the committee of the House, and assented to by them. In that Bill, among a great many other objectionable fees, was a fee specially set forth, of 10s. for inspecting chimney-pots, shafts, funnels, &c., above a certain height;" and which Mr. B. says, was expunged in consequence of the objections raised.

Taking out the special fee, however, while the clause remained that the fee for any service required by the Act and performed by any surveyor, not specified, should be appointed by the referees, did not get rid of its payment, but simply left open the question of "how much." Let us hope that the referees may name a fee for this, and similar trifling services, so low as to prevent just complaint. If, moreover, the enactment in question should lead to greater attention to the construction and arrangement of flues and fire-places, so as to obviate the necessity for unsightly and dangerous long pipes and cowls, it will, after all, do good service.

The steps to be pursued before taking down and rebuilding party-walls are matters in dispute, and shall have our early attention. Several cases are now before the referees, and will be decided in a few days. A letter on one of them will be found in another part of the present number.

An award of considerable importance has been recently made by the referees. Schedule K provides, with regard to back yards, or open spaces attached to dwelling-houses, that " every house hereafter built or rebuilt, must have an enclosed back yard or open space of at the least one square, exclusive of any building thereon, unless all the rooms of such house can be lighted and ventilated from the street, or from an area of the extent of at the least threequarters of a square above the level of the second story, into which the owner of the house to be rebuilt is entitled to open windows for every room adjoining thereto." The builder of three houses at the corner of St. Martin'slane and Cranbourn-street, thought that this

provision did not require one square, or even three-fourths of a square, for *each* house, but that a building owner might, if he pleased, light and ventilate even three or more houses into an open area of only one square, and in this opinion he was supported by an eminent architect. The district surveyor, however, thought differently, and as at the houses in question the area left was only 17 feet 6 inches by 10 feet 7 inches, making little more than $1\frac{3}{4}$ square for the three houses, the works were stopped, and the case submitted to the referees.

Their award was, "that inasmuch as according to the plan which was submitted, the buildings are to have each a back yard, each such back yard must be of at the least one square, containing one hundred superficial feet, exclusive of any building thereon. And that if the site of the proposed back vards were occupied by buildings to the level of the third floor, then, inasmuch as the light and air would not have to descend so low, an area of three-quarters of a square, that is to say an area of seventy-five superficial feet, to each house instead of such back yards of one square each would suffice, but subject to the condition that the owner of every such house be entitled to open windows into such area for every such room adjoining thereto. And that if more than one of such houses be lighted and ventilated from one and the same area, then such area must consist of a space as many times greater than three-fourths of a square of 100 superficial feet, as there are more houses than one having rooms to be lighted and ventilated therefrom, subject as to every house, to the aforesaid condition, that owners thereof are entitled to open windows into such area for every room adjoining thereto."

The portion of schedule K which relates to back yards, and under which this award is made, seems obscure and defective, and the referees have doubtless decided according to what they believed was the intention of the legislature. By requiring an area of threefourths of a square for each house, they ask no more than is necessary for health, but it is certainly doubtful whether the strict words of the schedule go so far. The requirement is, that every house must have an enclosed back yard or open space, of at least one square, unless all the rooms can be lighted and ventilated from the street, or from an area of at least threequarters of a square above the level of the second story; but the schedule certainly does not say that this area shall be appropriated exclusively to this one house, any more than that the street should be. And before this award was made, we unquestionably should have urged, there was nothing in the schedule to prevent the erection of three or more houses, around an area equal to three-fourths of a square (inefficient as such an area would he), provided the other requirements of the schedule were complied with.

BRITISH ARCHEOLOGICAL ASSOCIATION.----We have purposely omitted any allusion to the unfortunate differences which have arisen in the council of this association, hoping that a little consideration would lead to an adjustment, and knowing that every word that was printe d would probably make this more difficult. The objects of the association are so excellent, and its organization so far advanced, that we should greatly lament to see its existence jeopardized by what is, after all, a mere personal dispute

dispute. Digitized by Google

WESTMINSTER ABBEY.

IN the last number of this journal, will be In the last number or this journey, found some suggestions for the better arrangebelieve that the subject has long engaged the attention of the Dean and Chapter, and im-portant changes would doubtless have been made ere this, were not very considerable difficulties in the way of alteration.

It is considered. that the removal of monuments, originally in churches, to buildings of distinct character, would be attended with impropriety. If this view be persevered in, it will be quite sufficient to obviate the removal to Mr. Barry's proposed quadrangle in New Palaceyard. The arrangement advocated by us, has been found to answer well in the Temple Church, and would unquestionably be a great improvement to the Abbey. However, matters are not likely to remain long as they are, and the attention bestowed, by those now in authority, to the improvement of the building in some other particulars, augurs well for its future condition. It has been decided to eject the organ from its present objectionable position over the doorway of the rood-screen, where it greatly impedes the view, from the nave, of the eastern extremity of the building. It will be divided into two portions, each of which will stand on opposite ends beneath the arches, the small choir organ being allowed to remain. We are by no means ready to assent to the opinion of Mr. Cockerell, and to consider the organ well placed, as it now stands in the Abbey, and in most of our cathedrals. The length of the Gothic cathedral unquestionably adds to the majesty of the pile, and we would not sacrifice the effect, resulting from the long perspective of the interior, which the original architect tried successfully to gain, for the supposed advantage in the modern arrange-We do not deny that the situation of a building, and the approaches to it, do not receive that attention in this day, which resulted in so much delight to the beholder receive in the temples of the Greeks. Our monu-ments may not be effectively placed at the ends of streets, or in open squares, but to sacrifice the unquestionable advantages of space, size, and length, in a building, is, we deem extending a favourite theory for the we deem, extending a favourite theory farther than sound judgment warrants. Also, it may be well to recollect, that the same rules are not always applicable to what we are looking at, and which is before our eyes, as to that we are standing in, and which is around and about us. The Gothic architects were probably as well aware of the adjuncts to beauty in a building as those of any age.

The organ at Westminster, seen from below, is somewhat ineffective, but, on close ex-amination, proves to be rather rich in ornament, carved with elaborate care and delicacy, and evincing considerable feeling for the style.

The stained glass for the windows of the south transept has been completed by Messrs. Ward and Nixon, and is already within the

Ward and Nixon, and is already within the precincts of the Abbey. We may, therefore, expect to see something of it very shortly. We believe that no decision has yet been arrived at, as to the placing of seats for the overflowing congregation in the transepts, which change was so strongly commented upon in some of the daily papers. If in-creased accommodation be urgently demanded, we trust it may be gained in some way loce we trust it may be gained in some way less opposed to the distinctive character of a Gothic The works of architecture are the church. most valuable records of the past, but their importance is lessened or destroyed whenever an innovation is permitted to creep in. The nave and triforium were at one time occupied by worshippers, and a considerable number might find room in either now. Were the nave made available, there would probably be a greater observance of decorum than appears to be now practised by the visitors : people are too much accustomed to consider all that is not in the choir the same as what is without the walls of the church. The removal of the monuments would have similar tendency.

We hope at no distant period to see the unsightly stalls of the choir replaced by rich and elegant carving, equal to any existing. The skill of modern artists in this branch is not inferior to that of their predecessors, yet, strange to say, it is little known or called for. The space castward of the star The space eastward of the stalls should be enclosed with parcloses of wood or stone, as in the cathedrals. E. H.

ON RENDERING PAPER-HANGINGS USE-FUL AS WELL AS ORNAMENTAL. BY MR. F. WHISHAW.

PAPER-HANGINGS are of several kinds. some of which are made in imitation of velvet, damask, chintzes, &c., while others are in imitation of marbles, stucco-work, &c.

There are three methods by which paperhangings are painted: the first by printing on the colours, the second by means of the stencil, and the third by using the pencil as in other kinds of painting. In the first method the impression is

made by wooden blocks, in which the patterns are cut, the parts to be shewn being made to project from the surface by cutting away all the other parts. The blocks being charged with the required colour, properly tempered, are pressed on the paper prepared with a proper ground of colour or varnish.

The colour to be used by the printer is spread on oil-cloth, laid on a flat block a little larger than the print; this operation is perwith a brush on the block, between every stroke and impression made by the printer.

When the sheet is printed throughout, it is hung up to dry, and the operation is repeated with another piece of paper.

For each separate colour in a particular pattern there is a separate block, so that a piece of paper has to pass under the printer's hands as many times as there are distinct colours in the pattern to be produced; some modern papers have required as many as seventy-two separate blocks. The placing of the different blocks in blocks. the exact position on the paper requires con-

siderable skill on the part of the printer. The second method, which is adopted for common paper-hangings, is merely to print the outlines, and fill in the colours by stencilling.

The stencils are either of leather or oilcloth, and are cut out to correspond with all the figures to be printed in one colour, and, being placed flat on the paper to be printed, the colour is rubbed over the upper side, thus passing through all the parts cut out, the upper side, and giving the proper impression on the paper below.

This method is only applicable for patterns of the most common description, it being im-possible to represent fine lines by the stencilling process.

The third method, viz., by pencilling, is only used for the more costly hangings in imitation of Chinese and India papers, and is performed in the same manner as other paintings in water or varnish; sometimes the outline is printed, and then the colouring performed by pencilling. The first of the three methods which I have endeavoured briefly to describe is the one in ordinary use, in which the order of printing is first to lay on the ground colour, next the various shades, then the lights, and lastly the outline. Very fine lines and points, or dots, are in-troduced by means of rules and points of the particular forms required, which are let into the wooden blocks, as types are let into the small blocks used for printing illustrations to books.

The above is only an outline of the ordi-nary methods used; but, as my object is to introduce a system of useful paper-hangings, I need not enter more into detail with regard to methods in practice of producing the finest specimens of hangings, but proceed at once to the object of this communication.

My mind has long been impressed with the idea of rendering the modern hangings of walls useful as well as ornamental.

For this purpose I have proposed that useful information should, in the more or-namental patterns, be so blended with the design as not to disfigure it, and thus ornament, with amusement and instruction com-bined, would add greatly to the value of paper-hangings, and often serve as a ready mode of reference for information desired. When wanted especially for use, without any regard to ornamental appearance-as, for instance, Sunday and other schools, for the lecture-room of colleges and seminaries propose to introduce the information in panels.

I have arranged, mixed with several ordinary patterns, some specimens illustrative of my proposition; and, I think, it will be

allowed that in one of two of them the patterns are not disfigured by the introduction of the useful information they contain in the shape of historical and other facts.

In one pattern I have introduced words in several languages, which would be especially useful if carried out to a sufficient extent.

The greatest-indeed I believe the only obection which has been raised against the introduction of these useful paper-hangings is the cost.

Now, for patterns likely to be extensively used in infant and other schools and semina-ries, it would be worth while to cut out the writing in wood blocks, or fix in metal letters for each particular sentence to be introduced.

Another mode I propose is, to have move-able types introduced into a frame, so arranged as to form a substitute for one of the numerous blocks required in cases where the pattern is made up of a variety of colours. Thus, when as many copies as are likely to be required at the time have been printed, the type is to be distributed, and again set up for another piece of information, while the rest of the pattern is printed with the different blocks as usual.

A third mode which I propose is to print the patterns complete in the ordinary way, leaving, however, spaces for the writing to be inserted according to the style and fancy of individuals. This is by no means so expensive a method as persons unacquainted with the process would be led to suppose. - Transactions of Soc. of Arts, Vol. LV.

[A similar suggestion appears in Loudon's "Encyclopædia of Cottage and Villa Architecture." There is no reason but the expense, says the Encyclopædia, why a geographical paper should not be formed; or one exhibiting the principal rivers, mountains, and cities in the world; or the portraits of eminent men with their names; or perpetual almanacs; or lists of weights and measures; or chronologi-cal or arithmetical tables; or, in short, any useful and instructive subject which it would be beneficial to the cottager to have constantly be-fore his eyes. We all know how easily, and yet how deeply, the mind is impressed with objects that we are continually in the habit of seeing; and that what is learned through that medium in childhood is rarely, if ever, for-gotten in after life. There is also a paper on gotten in after life. There is also a paper on this same subject in the ninth volume of the "Penny Magazine," p. 52, with an engraved pattern. We should be glad to see it carried pattern. V out.—Ev.]

BURIAL-GROUND PRACTICES.

SINCE the publication in our journal of Mr. G. A. Walker's communications on the subject of proceedings at Spafield's burialground, evidence has been adduced not simply confirmatory of all that was then asserted, but of horrors and atrocities almost incredible, and public attention is so fully aroused, that we may now confidently expect, before long, some legislative enactment to protect her Majesty's lieges from the fatal evils of the system. One witness, a lady, stated before the magistrate at Clerkenwell, that she lived in a house near the grave-yard, but had been obliged to leave it, as well as many other persons in the neighas well as many other persons in the heigh-bourhood, in consequence of the intolerable and unearthly stench proceeding from the bone-house. One frosty night the smell was still worse than usual. She and her son ascended the top of the wash-house, which commands a view of the ground, thick volumes of smoke and sparks were issuing from the chimney of the bone house; she saw two men carrying something in a basket which appeared very soft and to shake; took it to be human flesh. Her tenants who lived near the place were constantly complaining of illness from the smell. The weather became bot, and two of the children died from putrid fever. "Great sensation" was excited by this statement, say the

newspaper accounts; and well there might be. The loud cheering with which Sir James Graham was greeted in the House of Commons, when he said this case was one in which, if clearly made out, he should certainly be inclined to interfere, shewed plainly the state of public opinion on the subject. The audacity displayed by the manager, Mr. A. Bird, in the cool denial of the facts as first mentioned, and threat of legal proceedings, which we admitted

into our columns, almost hoping, for the sake of humanity, that the statement of which he complained *was* exaggerated,—has seldom been surpassed. This *rara avis* will be thought a "black swan," we fear.

TRAFALGAR-SQUARE FOUNTAINS.

AFTER many months of expectation and preparation the two fountains have at last made their appearance in the centre of the two large basins made to receive them, which have been so often and so facetiously reported upon by our ubiquitous friend *Panch*. The first thing that strikes the spectator, on looking at these tazza, is their diminutiveness when compared to the extent of the square, and also to the basins in which they are placed; there is no doubt but that they are a trifle too small. I venture to think myself that the effect would have been much better if the upper tazza of each of the fountains had been equal in size to the bottom one as now erected, and the bottom one itself some three feet larger in diameter.

Perhaps the difficulty of getting good sound blocks of granite, suitable for a basin of such large dimensions, was considered as a matter of too much uncertainty to run the risk of attempting; but still even admitting the probable difficulty, I think an attempt might have been made to get a block sufficiently large that the whole proportion of the fountains might have been very considerably increased, so as to render them suitable to the great space they have to fill.

The fact of their being surrounded on three sides with a high wall, and on the remaining side with a lofty column, is a certain argument that unless they were of large dimensions, they would appear smaller than they really are, and look comparatively insignificant when viewed in juxtaposition with the surrounding objects overtopping them on all sides.

Taken by themselves, without any reference to their local position, they are exceedingly chaste in design, plain, simple, and unadorned as all works in granite ever should be, without any attempt at minute detail, or elaborate sculpture. Ornamental work, when made of granite, loses all its effect, if cut up into any thing like florid design, tracery, or open-work, as it is quite contrary to the character of the stone; so far, then, these fountains are strictly in keeping, in my opinion, with the character of the material of which they are made, and, with the exception above alluded to, also in keeping with the prevailing design of the square itself. Not that I consider the design of the terraces, &c., the best that might have been adopted for such a situation, as I feel convinced that there are several errors in the artistic perspective of the general planning of the square and terraces, which, in certain positions, have any thing but a pleasing effect.

With respect to the work manship and skill displayed in the finish of these fountains, I think it may be unhesitatingly stated, that there is nothing in the country of the same material to surpass, if indeed to equal them; they are made of fine, deep red-coloured Peterhead granite, so finely chiseled and polished, as to be equal in brilliance to the finest and smoothest statuary marble; on this head, at least, they have elicited the highest admiration from practical men and connoisseurs in such matters.

They are the work of the Messrs. Macdonald, who made the pedestal for the Wellington statue in front of the Royal Exchange, also a very beautiful specimen of granite work; the hydraulic part of the matter is intrusted to Messrs. Easton and Amos, who are well known for their practical acquaintance with such matters; the water to supply the fountains is obtained from two wells, one in front of the National Gallery and the other behind it which are connected together by means of a tunnel, that of course passes directly under the National Gallery, behind which is also placed the engine-house for raising the required water into the tanks, &c., before it is forced through the fountains, which will be at the rate of between five and six hundred gallons per hour: it will be forced up a considerable height from the central jet; it will then be received into the first or upper basin or tazza, over the sides of which it will flow into the second basin or tazza in a continuous stream, and from hence into the large basin; in addition to which there are four spouts from the

dolphin's heads immediately under the bottom basin. The lower fall, however, would be much more effective if it stood on a higher base than at present.

JOSEPH LOCKWOOD, Surveyor. 6, Childs-place, Temple.

JOHN SMEATON, THE ENGINEER.

MR. PARKER has commenced the publication of a series of instructive books at low prices for general use in families, under the title of "Collections in Popular Literature." They include history, biography, science, travels, and miscellanies, and though uniform in appearance and ob ject, each work is complete in itself. To one of the volumes of this series, in the class of science, we have already referred. The following sketch of the life of Smeaton is from the biographical series, wherein it is proposed to connect with the life of an individual the history of the particular department of knowledge that he aided to extend. Thus, with Watt, the steam-engine would be spoken of; with Brindley, canals; and with Smeaton, light-houses. In our present extracts we confine ourselves to the individual, and may perhaps speak of his great undertaking hereafter.

after. John Sineaton was born the 28th of May, 1724, at Ansthorpe, near Leeds, Yorkshire. Little is recorded of his parentage or early education: but we find that his father was a respectable attorney, and that the family lived in a house built by the grandfather of the younger Smeaton.

Smeaton seems to have been born an engineer. The originality of his genius and the strength of his understanding appeared at a very early age. His playthings were not the toys of children, but the tools men work with; and his greatest amusement was to observe artificers, and to ask them questions. Having watched some millwrights at work, he conceived the idea of constructing a windmill, and, to the alarm of his friends, was one day per-ceived on the top of his father's barn attempting to fix his model. On another occasion he accompanied some men who went to fix a pump at a neighbouring village, and observing them cut off a piece of bored pipe, he managed to procure it, and made a working model of a pump that raised water very well. These anecdotes are related of him while he was yet a mere child in petticoats, and probably before he had attained his sixth year. At the age of fourteen or fifteen he had made for himself an engine to turn rose-work, and he made several presents to his friends of boxes in wood and

In the year 1742, Mr. Holmes, afterwards his partner in the Deptford Water-works, visited Smeaton, and could not conceal his astonishment at the mechanical skill displayed by the young engineer; he forged his iron and steel and melted his metal; he had tools of every sort for working in wood, ivory, and metals. He had made a lathe, by which he had cut a perpetual screw in brass, a thing very little known at that day. All these resources were not furnished to him by rich and wealthy parents, nor had he the advantage of masters in his various pursuits; on the contrary, by the strength of his genius, and by indefatigable industry, he acquired at the age of eighteen an extensive set of tools, and the art of working in most of the mechanical trades, and Mr. Holmes, himself a good mechanic, says that few men could work better.

Astronomy was one of his most favourite studies, and he contrived and made several astronomical instruments for himself and friends. In later years, after fitting up an observatory at his house at Ansthorpe, he devoted much time to it when he was there, even in preference to engineering.

Smeaton's father being an attorney, was desirous to educate his son for the same profession. He was therefore sent to London in 1742, where during a few terms he attended court; but finding the legal profession distasteful to him, and not to suit "the bent of his genius," he wrote a strong memorial on the subject to his father, who had the good sense to allow him from that time to pursue the path which nature pointed out to him. He continued to reside in London, and about the year 1750 he commenced the business of mathematical instrument maker. In 1751 he invented a machine to measure a ship's way at sea, and a compass of peculiar construction, touched by Dr. Knight's artificial magnet. He made two voyages in company with Dr. Knight for the purpose of ascertaining the merits of these contrivances.

In 1753 he was elected a fellow of the Royal Society, and his admirable papers in-serted in the Transactions of that body sufficiently evince how highly he deserved that distinction. In 1759 he received by an unani-mous vote their gold medal, for his paper entitled "An Experimental Inquiry concerning the natural powers of wind and water to turn mills and other machines depending on a circular motion." This paper was the result circular motion." This paper was the result of experiments made on working models in 1752 and 1753, but not communicated to the society till 1759, by which time he had had abundant opportunity of applying these experiments to practice in a variety of cases, and for various purposes, so us to assure the society that he had found them to answer. He discovered by these means that wind and water could be made to do one-third more than was before known. In the year 1754 he made a voyage to Holland, travelling for the most part on foot, or in the trekschuiten or drag-boats, the national conveyance of the country, and thus made himself acquainted with the most remarkable works of art in the low countries.

In December, 1755, the Eddystone Lighthouse was burnt down. Mr. Weston the chief proprietor, and others, were desirous of rebuilding it in the most substantial manner, and through the recommendation of the Earl of Macclesfield, whose friendly conduct to Smeaton we have already noticed, they were induced to appoint Smeaton as the most proper person to rebuild it.

Smeaton undertook the work, and completed it in the summer of 1759. The completion of the work does not seem to have had the immediate effect of procuring him full employment as a civil-engineer: in 1764, being in Yorkshire, he offered himself a candidate for the office of one of the receivers to the Greenwich Hospital estates;* and on the 31st December in that year he was appointed, at a full board at Greenwich Hospital, in a manner highly flattering to himself. In this appointment he was greatly assisted by his partner Mr. Walter, who managed the accounts, and left Smeaton leisure and opportunity to exert his abilities on public works, as well as to make many improvements in the mills, and in the estates of Greenwich Hospital. By the year 1775 he had so much business as an engineer, that he wished to resign this appointment, but was prevailed upon to continue in the office about two years longer.

Among the many valuable public services of Smeaton a few only can be mentioned in this place. He completed the erection of new lighthouses at Spurn Head at the mouth of the Humber: he built the fine bridge over the Tay at Perth : he laid out the line of the great canal connecting the Forth and Clyde, and made the river Calder navigable; a work that required great skill and judgment, on account of its impetuous floods. On the opening of the great arch at London-bridge by throwing two arches into one, and the removal of a large pier, the excavation around and under the starlings was so considerable, that the bridge was thought to be in great danger of falling. Smeaton was then in Yorkshire, but was sent for by express, and arrived with the utmost dispatch: on his arrival the fear that the bridge was about to fall prevailed so generally, that few persons would pass over or under it. Smeaton applied himself immedi-ately to examine it, and to sound about the starlings as minutely as possible: his advice to the committee was to repurchase the stones which had been taken from the middle pier, then lying in Moorfields, and to throw them into the river to guard the starlings. This advice was adopted with the utmost alacrity, by which simple means the bridge was probably saved from falling, and time afforded for securing it

^{*} This was the Derwentwater estate, which was forfeited in the year 1715, and its revenues applied by Parliament towards the funds of Greenwich Hospital. It consists of mines of lead, containing much siller, as well as lands. It required careful management, and the knowledge of mining details to make it prontable. Smeaton contrived more efficient machines and better modes of working the mines and managing the estate.

in a more effectual manner. " This method of stopping the impetuous ravages of water," says Mr. Holmes, "he had practised before with success on the river Calder; on my calling on him in the neighbourhood of Wake field, he shewed me the effects of a great flood, which had made a considerable passage over the land; this he stopped at the bank of the river, by throwing in a quantity of large rough stones, which with the sand, and other materials washed down by the river, filling up their interstices, had become a barrier to keep the river in its usual course.

In 1771 Smeaton and Holmes made a joint urchase of the water-works for supplying Deptford and Greenwich with water. On examining the books of the former proprietors, it appeared to have been a losing concern during many years; but the skill of Smeaton soon brought the undertaking into such a state as to be of general use to those for whom it was intended, and moderately profitable to himself and partner. In noticing this subject Mr. Holmes makes a few general remarks on the character of Smeaton :-- " His language either in speaking or writing was so strong and perspicuous, that there was no misunderstanding his meaning, and I had that confidence in his abilities as never to consider any plan of improvement which he proposed, but only to see it executed with scrupulous exactness; at the same time, he was so open to reason in all matters, that during a constant communication of our opinions for upwards of twenty years, after we had laid them fully before each other we always agreed, and never had the slightest difference."

It must be remembered that Smeaton lived before the time when the genius of Watt had rendered the steam-engine the useful and obedient servant of man; and consequently that much of the power now furnished by steam was then supplied by the wind. Hence the mechanics of windmills was an important study to the engineer, and Smeaton erected a vast variety of mills in which he turned to useful account the results of his experiments in 1752 and 1753. His usual habit was to in 1752 and 1753. His usual habit was to confirm the conclusions of theory by direct experiment. He also erected a steam-engine at Ansthorpe, and made experiments thereon to ascertain the power of Newcomen's engine, which he improved and brought to a far greater degree of certainty both in its construction and powers.

During many years the opinion of Smeaton was held in such high esteem, that no great works were undertaken throughout the kingdom without first applying to him; he was constantly consulted in parliament, and was re-garded as an ultimate reference on all difficult questions connected with his profession. was his constant practice to make himself fully acquainted with every subject before he would engage in it, and then his known integrity and lucid powers of description secured the re-spect and attention of all. In the courts of law he was frequently complimented by Lord Mansfield and others for the new light he threw on difficult subjects.

About the year 1785 Smeaton's health began to decline, and he then endeavoured to retire from business in order to gain time to publish an account of his inventions and works. This was one of the wishes nearest to his heart, for as he often said, "he thought he could not render better service to his country than by doing that." He had just completed his ac-count of the Eddystone lighthouse when he was prevailed on to continue his services as engineer to the trustees for Ramsgate harbour. The works at Ramsgate were begun in 1749, but had been conducted with very indifferent success until Smeaton was called in to super-intend them in 1774. He completed the magnificent pier and harbour of this place in 1791, and thus established a secure and much needed place of shelter in the Downs.

A man whose life is so beneficially devoted to the service of the public can scarcely hope to enjoy leisure and retirement during which he may look back upon the past, and leave a written record of his exertions. Smeaton was so constantly and urgently employed, that he could not achieve much with his pen. On the 16th September, 1792, he was seized with an attack of paralysis, induced by over-exertion, and this attack carried him to the grave on the 28th of the next month, in the 69th year of his age.

During his illness he dictated several letters to his old friend Mr. Holmes. In one of them he describes minutely his health and feelings, and says, "in consequence of the foregoing, I conclude myself nine-tenths dead, and the greatest favour the Almighty can do (as I think) will be to complete the other part, but as it is likely to be a lingering illness, it is only in His power to say when that is likely to hap-pen." His daughter, Mrs. Dickson, says that pen." His daughter, Mrs. Dickson, says that he always apprehended the attack which terminated his life, as it was hereditary in his family. He dreaded it only as it gave the melancholy possibility of outliving his faculties or the power of doing good; or, to use his own words, "lingering over the dregs after the spirit had evaporated." Indeed, the decay of his mental faculties seems to have been that which he most dreaded. He would sometimes complain of slowness of apprehension, and would then excuse it with a smile, saying, "it could not be otherwise, the shadow must lengthen as the sun went down." When seized with paralysis he was resigned to the event, anxious to soften any alarm to his family, and was thankful that his intellect was spared. But his invariable wish was to be released. He expressed particular pleasure in seeing the usual occupations of his family resumed; and read-ing, drawing, music, and conversation excited the same interest and the same cheerful and judicious observations as ever. One evening he was requested to explain some phenomena respecting the moon, which was seen from the room shining brightly. He gave a full explanation, then fixed his eyes full upon the object in question, and after regarding it sted-fastly for some time, he observed, "How often have I looked up to it with inquiry and wonder, and to the period when I shall have the vast and privileged views of an hereafter, and all be comprehension and pleasure.'

We learn from his daughter Mrs. Dickson, that early in life Smeaton attracted the notice of the eccentic Duke and Duchess of Queensbury, on account of the strong personal like-ness which he bore to their favourite Gay the Their first acquaintance was made in a poet. singular manner: it was at Ranelagh when walking with Mrs. Smeaton, he observed an elderly lady and gentlemen gaze steadily upon him, they stopped and the duchess said, I don't know who you are, or what you are, but so strongly do you resemble my poor dear Gay, that we must be acquainted; you shall go home and sup with us, and if the minds of the two men accord as do the countenance, you will find two cheerful old folks who can love you well, and I think (or you are an hypocrite) you can as well deserve it." The invitation was accepted, and as long as the duke and duchess lived the friendship was cordial and uninter-rupted. During his visits cards were some-times introduced. Smeaton detested cards, and could not confine his attention to the game. On one occasion the stakes were already high, and it fell to Smeaton to double them when, neglecting to deal the cards, he was busily occupied in making some calculations on paper which he placed upon the table. The duchess asked eagerly what it was, and Smeaton replied cooly, "You will recollect the field in which my house stands may be about five acres three roods and seven perches, which, at thirty years' purchase, will be just my stake, and if your grace will make a duke of me, 1 presume the winner will not dislike my mortgage." The joke and the lesson had their effect, for they The never played again but for the merest trifle.

Smeaton procured a situation in a public office for a clerk in whom he placed the greatest confidence, and jointly with another became security for him to a considerable amount. This man committed the crime of forgery, was detected, and given up to justice. Mrs. Dick-son says, "The same post brought news of the melancholy transaction, of the man's compunc-tion and danger, of the claim of the bond forfeited, and of the refusal of the other person to pay the moiety! Being present when he read his letters, which arrived at a period of Mrs. Smeaton's declining health, so entirely did the command of himself second his anxious attention to her, that no emotion was visible on their perusal, nor, till all was put into the best train possible, did a word or look betray the exquisite distress it occasioned him. In the interim, all which could soothe the remorse of

wij a characteristie be were exerted for him, will a chan nevolence, active and unobtrusive."

Smeaton was a man Of indefatigable industry and great moral probity. With ample oppor-tunity of amassing wealth, he rendered its ac-quisition but a secondary object on all occaions; his first aim always being to execute the task intrusted to him in the most skilful and perfect manner. Had his object been to amase a fortune, he might have received many lucrative appointments besides those which be actually held. The empress Catherine of Russia attempted to secure his services for her own country by most magnificent offers; but Smeaton preferred to dedicate his time and talents to the service of his country. "The "The disinterested moderation of his pecuniary an-bition," says his daughter, "every transaction in private life evinced; his public ones bore the same stamp; and after his health had withdrawn him from the labours of his profession, many instances may be given by those whose concerns induced them to press importunately for a resumption of it; and when some of them seemed disposed to enforce their entreaties by further prospects of lucrative recompense, his reply was strongly characteristic of his simple manners and moderation. He in-troduced the old woman who took care of his chambers in Gray's Inn, and shewing her, asserted "that her attendance sufficed for all his wants." The inference was indisputable, for money could not tempt that man to forego his ease, leisure, or independence. whose requisites of accomodation were compressed within such limits! Before this, the princess Daschkaw made an apt comment upon this trait of his character; when, after vainly using every persuasion to induce him to accept a carte blanche from the empress of Russia as a recompense for directing the vast projects in that kingdom —she observed "Sir, you are a great man, and I honour you! you may have an equal in abilities, perhaps, but in character you stand single, The English minister, Sir Robert Walpole, was mistaken, and my sovereign has the mis-fortune to find one man who has not his price.'

In all the social duties of life Smeaton was most exemplary; and he was a lover and en-courager of real merit in whatever station of life he found it. To strangers, his mode of ex-pression appeared warm and even harsh; but Mr. Holmes refers it to the intense application of his mind, which was always in the pursuit of truth, or engaged in investigating difficult subjects: hence, when any thing was said that did not tally with his ideas, he would some-times break out bustily. As a friend, he was warm, zealous, and sincere; as a companion, always entertaining and instructive, and none could spend their time in his company without improvement. In his person Smeaton was of middle stature, but broad and strong-made, and possessed of an excellent constitution. He was remarkable for the plainness and simplicity of his manners.

After his death, his papers, consisting of plans, reports, and treatises, on almost every branch of engineering, were published by the Society of Civil Engineers.

THE MORMON TEMPLE AND ITS BUILDERS.

AT the summit, overlooking the whole landscape for nearly twenty-five miles in all directions, stands the Mormon temple, the largest structure in any of the western states. When completed, it is assumed that the entire cost will not vary much from four hundred thousand dollars. Nothing can be more original in architecture—each of its huge pilasters rests upon a block of stone, bearing in relief on its face the profile of a new moon, represented with a nose, eye, and mouth, as sometimes seen in almanacs. On the top, not far from fifty feet high, is an ideal representation of the rising sun, which is a monstrous prominent stone face, the features of which are colossal, and singularly expressive. Still higher are two enormously large hands, grasping two trumpets, crossed. These all stand out on the stone boldly. Their finish is admirable, and as complete as any of the best specimens of chiselling on the Girard College, at Philaa prisoner, every means which could save (which did, at least from public execution), apartment, about 128 feet by 80, simply sub-

divided by three great veils of rich crimson drapery, suspended from the ceiling overhead. drapery, suspended from the ceiling overhead. Neither pews, stools, cushions, nor chairs are to encumber the holy edifice. In the basement is the font for baptism, which, when completed according to the design, will be a pretty exact imitation of the brazen laver in Solomon's Temple. The tank is perhaps eight feet square, resting on the backs of twelve carved even of peaks of twelve carved peaks of the set of the s oxen. They are of noble dimensions, with large spreading horns, represented to be standing in water half-way up to their knees. The execution of the twelve oxen evinces a degree of ingenuity, skill, and perseverance, that would redound to the reputation of an artist in any community. When they are finally gilded, as intended, and the layer is made to resemble cast brass, together with the finishing up of the place in which this unique apparatus of the church is lodged, as a whole, that part of the temple will be one of the most striking artificial curiosities in this country. When the officiating priests, in their long robes of office, lead on a solemn procession of worshippers through the sombre avenues of the basement story, chanting as they go, the effect must be exceedingly imposas they go, the enerci must be exceedingly impos-ing even to those who may deplore the infatua-tion of a whole city of Mormon devotees. Although estimated to cost so large a sum, the walls of the temple are gradually rising from day to day, by the concurrent, unceasing labour of voluntary labourers. Every brother gives one day in ten to the undertaking. Thus there are always as many hands employed as can be conveniently on the work at the same time. The architect and different masterworkmen are constantly at hand to direct the operations. Each day, therefore, ushers in a new set of operatives. Some fine brick buildings are already raised on the different streets, and stores are continually growing up. Even were the Mormons to abandon the cit as it is asserted that they will, somebody will own the property; and a city it is, and a city it will continue to be, of importance, unconnected with the false religious tenets of its inhabitants. But the Mormons will never leave Nauvoe; no, never! Its associations are hallowed to their excited imaginations. They would re-linquish life as soon as they would voluntarily, en masse, leave their glorious habitation, which to them is the gate of heaven.—Boston Paper. Is this account American in more senses than one?—ED.]

RECOMMENDATIONS CONTAINED IN THE SECOND REPORT OF THE HEALTH OF TOWNS COMMISSION. FEB. 1845.

1st. THAT in all cases the local administrative body, appointed for the purpose, have the special charge and direction of all the works required for sanatory purposes, but that the Crown possess a general power of supervision.

2nd. That before the adoption of any general measure for drainage, a plan and survey, upon a proper scale, including all necessary details, be obtained, and submitted for approval to a competent authority.

3rd. That the Crown be empowered to define and to enlarge, from time to time, the area for drainage included within the juris-diction of the local administrative body.

4th. That the local administrative body appoint the executive and other officers under it; that the appointment and dismissal of the chief surveyor be subject to approval; that such officer produce proof of his qualification for the office to which he shall be appointed, and, if required, be subject to an examination.

5th. That upon representation being made by the municipal or other authority, or by a certain number of inhabitants of any town or district, or part thereof, setting forth the defects in the condition of such place as to drainage, sewerage, paving, cleansing, or other sanatory matters, the Crown direct a competent person to inspect and report upon the state of the defects, and if satisfied of the necessity, have power to enforce upon the local administrative body the due execution of the law.

6th. That the management of the drainage of the entire area as defined for each district be placed under the jurisdiction of one body

7th. That the local administrative body be

empowered to raise money for purchasing the rights of mill-owners or others, when the milldams or other obstructions injuriously affect the drainage of the district comprised within the area defined, inquiry in each case having been previously made by the proper officer into the necessity of the purchase and the amount to be paid.

8th. That the construction of sewers, branch sewers, and house drains, be intrusted to the local administrative body. 9th. That the landlords of houses be rated

for the purposes of the Act when the houses are let in separate apartments, or when the rent is collected more frequently than once a quarter, or when the yearly rent is less than en pounds, such a deduction being made from the gross amount of the rate, as may be con-sidered a fair equivalent for the labour and losses incident to the collection of rent on

such property. 10th. That the duty of providing the funds necessary, be imposed upon the local admi-nistrative body, and that the cost of making the main and branch sewers be equitably dis-tributed among the owners of the property benefited; and that the expense of making the house drains be charged upon the owner of the houses to which the drains are attached. That the expense remain a charge upon the properties, to be levied by a special rate upon the occupiers, and recovered with interest by annual instalments within a certain number of years, unless the owners prefer to pay the cost in the first instance, and except in the cases mentioned in the ninth recommendation.

11th. That some restriction be placed on the proportionate rates in the pound to be levied in each year; but if the local adminis-trative body finds that there is need of larger funds for the immediate execution of the works for sanatory measures than can be provided by such rates, it be empowered to raise by loan on security of the rates, subject to the approval of the crown, such sums as may be requisite for effecting the objects in view. That profor effecting the objects in view. That pro-vision always be made for the gradual liquidation of such debts, within a limited number

of years. 12th. That the whole of the paving, and the construction of the surface of all streets, courts, and alleys be placed under the management of the same authority as the drainage, and that the limits of jurisdiction, for both purposes, wherever practicable, be co-extensive. That the principle above submitted, in respect to the cost of making drains and sewers, and the equitable distribution of the expense, be adhered to in the case of laying out, levelling, and paving of streets, courts, and alleys; but for the purpose of ensuring the greatest effi-ciency and economy in the execution of the work, it be performed by the local public officers. 13th. That the provisions in local Acts

vesting the right to all the dust, ashes, and street-refuse, in the local administrative body be made general; and that the cleansing of all privies and cesspools at proper times, and on

due notice, be exclusively intrusted to it. 14th. That many of the more common nuisances which prevail within towns, such as large collections of dung, be declared a nuisance, and be summarily abated. 15th. That, after such a period as it may be

deemed advisable to fix, the provisions in local deemed advisable to hx, the provisions in local Acts for preventing the escape of dense black smoke from furnaces and steam-engines in towns, be made general. Also that these provisions be applied, so far as is practicable, to steam-boats usually plying within the limits of any city or town, subject to the operation of such Act. 16th. That in cases where complaints shall be subtentiated that the inhabitants of any

be substantiated, that the inhabitants of any house, street, or district in towns, are in-juriously affected by the noxious exhalations of any factory, power be given to the local administrative body to ascertain the cause of such exhaustions, and to take legal proceedings for the abatement of the evils, in the event of such evils not being removed on due repre-

sentation. 17th. That it be rendered imperative on the local administrative body charged with the sentation. 17th. That it be rendered imperative on the local administrative body charged with the management of the sewerage and drainage to procure a supply of water in sufficient quanti-ties not only for the domestic wants of the in-habitants, but also for cleansing the streets, scouring the sewers and drains, and the ex-

tinction of fire. That the said body have power to contract with companies or other parties or make other necessary arrangements.

18th. That where any independent body has the management of the supply of water, it be liable to comply with the demand of the local administrative body on equitable terms; and that further, the local administrative body be empowered to purchase the interest in waterworks, subject to the control of the Crown whenever the proprietors are willing to dis-pose of them. Further, that on the establish-ment of new companies, it be made a condition that the local administrative body be enabled to purchase the works after the lapse of a certain number of years, upon certain terms, and upon a rate of interest to be fixed; and that with a view to economy, competition between water-companies be discouraged as

between water-companies be discouraged as far as practicable. 19th. That as soon as pipes are laid down and a supply of water can be afforded to the inhabitants, all dwelling-houses, capable of benefiting by such supply, be rated in the same way as for sewerage and other local purposes; and the owners of small tenements be made liable to pay the rates for water as already re-commended in respect to drainage. 20th. That every facility be afforded to fur-

nish ample supplies of water to public haths and wash-houses, that may be established for the use of the poorer classes. 21st. That for increasing the protection of

property from fire, in all cases the supply of water in the mains be not only constant, but also at as high a pressure as circumstances will permit, and that fire plugs be inserted in the mains at short intervals.

the mains at short intervals. 22nd. That, subject to proper control, the local administrative body be empowered to raise money for the purchase of property for the purpose of opening thoroughfares, and widening streets, courts, and alleys, so as to improve the ventilation of the densely crowded districts of towns, as well as to increase the general convenience of traffic.

23rd. That courts and alleys be not built of less width than 20 feet, and that they have an opening of not less than 10 feet from the ground upwards at each end, the width of the court being in proportion to the height of the houses.

24th. That such provisions be made general, and that after a limited period the use of cel-lars as dwellings be prohibited, unless the rooms are of certain dimensions, are provided with a fire place and window of sufficient size and

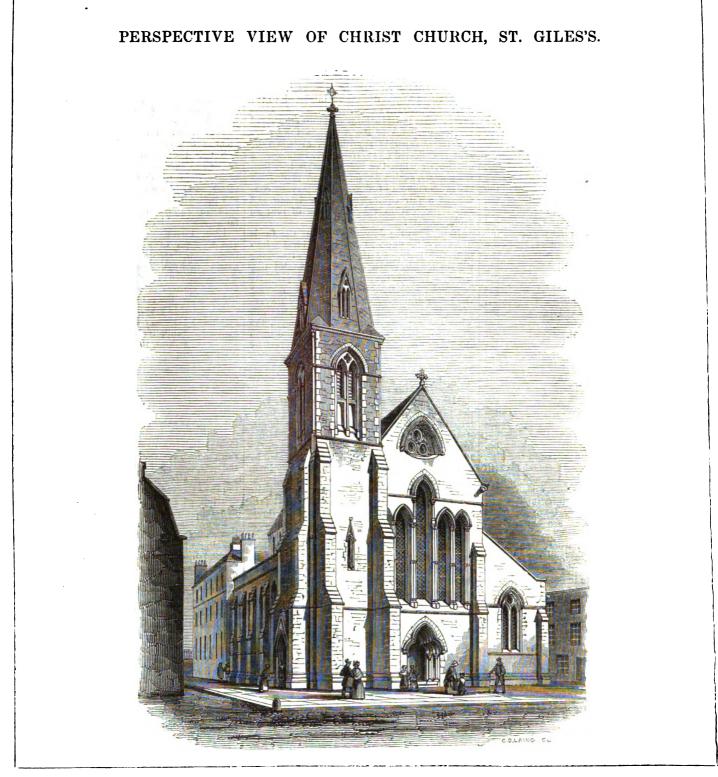

made to open, and have an open space in front, and the foundations be properly drained. 25th. That the provisions above referred to be made general, and that all new houses be provided with proper necessaries for the ac-commodation of the inmates.

commodation of the inmates. 26th. That measures be adopted for pro-moting a proper system of ventilation in all edifices for public assemblage and resort, especially those for the education of youth. 27th. That on the complaint of the parish, medical, or other authorized officer, that any

house or premises are in such a filthy and un-wholesome state as to endanger the health of wholesome state as to endanger the health of the public, and an infectious disorder exists therein, the local administrative body have power to require the landlord to cleanse it properly without delay, and in case of his neglect or inability, to do so by its own officers, and recover the expense from the landlord.

28th. That magistrates have power te license and to issue rules to be approved of by the Crown, for the regulation of lodging-houses for the reception of vagrants, trampers, and other such wayfarers. 29th. That the local administrative body

have power to appoint, subject to the approval of the Grown, a medical officer properly qualified to inspect and report periodically upon the sanatory condition of the town or district, to ascertain the true causes of disease and death, more especially of epidemics increasing the rates of mortality, and the circumstances which originate and maintain such diseases, and iniuriously affect the public health of such town

CHRIST CHURCH, ENDELL-STREET, ST. GILES'S.

THIS church is built in the new street, leading from Long Acre to Broad-street, High Holborn, now in progress under her Majesty's Commissioners of Woods, authorized by certain Acts of Parliament for the improvement of the metropolis. The opening was very much wanted, and an improvement it unquestionably will be, but half its value is destroyed by the imperfect character of the plan adopted. As originally proposed, the new street would have been commenced exactly opposite to Bow-street, and would have been altogether a new street as far as Belton-street. In order, however, to save a comparatively trifling immediate outlay, an existing street to the west of Bow-street (Hanover-street), was made use of, and the line rendered crooked, so that every vehicle coming from the north to the theatres, the market, or elsewhere, will have to turn a sharp corner to get into Bow-street. Moreover the street itself will never be a good one, for however handsomely the houses on the

new side may be built, the general appearance will be destroyed by the old side left standing. There can be no doubt that it is better economy in the end to form an entirely new street than to widen an old one, as in the first case a double frontage of greatly increased value may be obtained, while in the other, the value of the one new frontage is kept down by the character of the houses which are left.

This was forcibly urged by the *Westminster Review*, and by the Metropolitan Improvement Society, hefore Endell-street (as it is now called), was commenced, but ineffectually; the result, it is already clear, will shew the correctness of their anticipations.

The ground on which the building stands, is of very contracted dimensions, and the church commissioners having stipulated that it should contain 1,000 sittings, every inch was required in order to get the necessary accommodation. Further, on two sides little or no light could be obtained, as the east end abuts against the workhouse, and the south side is to form the party-wall between the church and the new houses, so that the architect had many difficulties to contend with.

In order to obtain light, the building has been carried up very high so as to get a lofty clerestory with a series of unobstructed windows; and by the aid of a small well-hole or area, taken from the workhouse, some partial light has been obtained for the east window. The wedge-like shape of the ground regulated the position of the tower and spire, at the north-west angle.

As may be seen in the engraving, the building is designed in the early English style (the style of the 13th century), and is faced externally with Kentish rag, and Bath stone dressings. The principal features of the west front are the five lancet-headed windows seen in the engraving, ornamented with dog-tooth mouldings. In the gable above them is a triangular window, and below them is the principal doorway, recessed and ornamented. There is another entrance on the north side of the tower. The height of the building as compared with its length is very observable

externally, and gives it a continental character.

Inside, aisles are formed in the nave by columns and arches, and in the chancel by open wainscot screens. The columns of the nave are built of blue lias, from Glastonbury, in Somersetshire, which is a tolerable substitute for Petworth marble, and was often so used in ancient buildings. There is a gallery in each aisle, which injures the appearance of the interior, but under the circumstances was unavoidable. They are supported on iron columns behind the blue lius columns, and have an open front. The roofing is open, and is stained to represent oak. So also are the seats, which, being all free, have no doors. In this particular, that none of the seats are appropriated, Christ Church stands alone in the metropolis. The old and infirm occupants of the workhouse are specially cared for, and are enabled by means of a communication with their wards on the south side of the east end of the church, to attend service without going into the air.

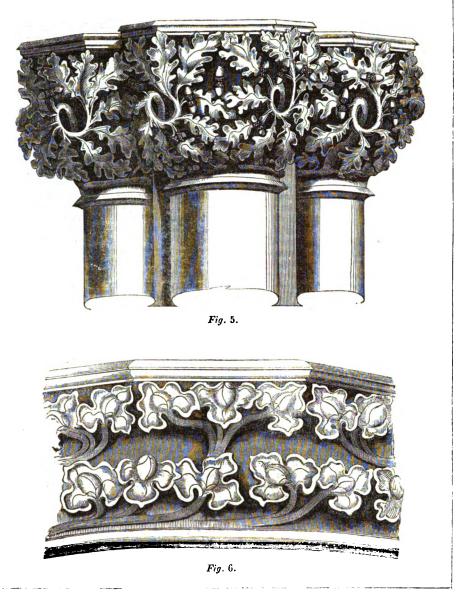

The chancel is paved with encaustic tiles, presented by Messrs. Copeland and Garrett, and some of the windows are filled with stained glass; that in the east window, a triplet, was an offering to the church made by Messrs. Hudson, pupils of Mr. Dyce. In the chancel aisles there are some small obituary windows of stained glass, executed by Mr. Willement, and presented by him, Captain Hardy, and others, to the church. One on the north side is inscribed "To the memory of Ellen, daughter of Benjamin Ferrey and Annie, his wife. She departed on the 22nd day of June, A.D. 1841, aged twelve months." Mr. Ferrey was the architect under whose directions the church was built, and descrives much praise for the ability displayed.* The width of the church within the walls is 50 feet, the whole length 64 feet 6 inches. The width of the nave is 22 feet 6 inches, and the height, to the apex of the roof, 52 feet 6 inches. The height of the spire is 120 feet.

The site cost 1,250/. The whole expense of the building, inclusive of every charge, will be under 4,800/. Mr. Winsland was the builder.

The church was erected by Her Majesty's Church Commissioners, aided by grants from the Metropolis Churches Fund, the Incorporated Society, and private subscriptions. A small fund has been raised for the endowment, and the rector of St. Giles's, the Rev. James Endell Tyler, in whom the presentation is vested, has nominated the chaplain of St. Giles's workhouse to be the first minister. An additional amount is required, and the excellent rector, by whose exertions chiefly the church has been obtained, has issued an appeal, which we gladly insert :--

"The munificence of the church societies, and the bounty of individual benefactors, have enabled us to provide a church of stone, capable of containing one thousand persons. The whole church being free, and there being, consequently, no income from pew-rents, our chief anxiety now, is to realize an endowment sufficient to secure for ever the daily performance of Divine worship, and for this object subscriptions are still earnestly solicited. Whilst, however, we have good hope that under God's blessing adequate means will be supplied by Christian benevolence, we unfeignedly desire not to lay an additional burthen on those who have with such unsparing liberality already assisted in this work and labour of love."

GOTHIC ORNAMENTS FROM THE CATHEDRAL CHURCH OF YORK.

In continuation of the series of details from this noble building, commenced on page 90 of the present volume, we here give two from the nave and aisles, commenced, as before mentioned, in the year 1291, and completed about 1330.

Fig. 5 represents the capital of one of the semi-pillars attached to the wall in the south aisle of the nave. It is 1 foot 2 inches in height, and 26 feet from the floor. It is composed of three cylinders with a flat surface between them; the centre cylinder is 9 inches in diameter, the others 6 inches in diameter. From these pillars spring the groins of the vaulting by which the aisles are covered. The foliage is sharply cut, and is very beautiful.

Fig. 6 represents the foliage in the capital of one of the pillars in the nave. All these capitals are different, and display great luxuriance of fancy. The aisles of the nave in this building are very lofty and magnificent, perhaps more so than those of any other of our cathedrals. The windows are in three lights with quatre-foils in the arched heads, and the wall below them is adorned with paneling, which displays crocketted gables and pinnacles in great profusion. The whole of this part of the minster, namely, the nave and aisles, belongs to the decorated period of Pointed architecture, but being an early example, some of the ornaments have much of the character of the previous style.

THE INTERIOR DECORATIONS OF ST. STEPHEN'S, WESTMINSTER.

ON Wednesday, the 26th ult., a paper was read by Mr. Crabb, before the Decorative Art Society, upon the "Interior decorations of the collegiate chapel of St. Stephen, as finished by Edward III., in his palace of Westminster, A.D. 1348."

The paper was interesting, the information it contained being unpublished, and derived from Mr. Crabb's acquaintance with the original painting, and with Adam Lee, Esq., who for twenty-five years was the officer in trust of the buildings that had formed the ancient palace of Westminster. In 1800 the act of union rendered it necessary to provide accommodation for the Irish members, and in taking down the wainscotting, it was discovered that the walls of the House of Commons were covered with paintings and gilding; copies of those at the east end were taken, and published by Mr. Smith in 1807, as also by the Antiquarian Society. Extensive subsequent discoveries were made, and the hon. speakers, Lords Sidmouth, Colchester, and Canterbury, gave every facility and encouragement to Mr. Lee, who eventually obtained sufficient information to make out the original plan of the painted decorations which had adorned the chapel, and to restore them in a miniature series of most interesting water-colour drawings.

Mr. Crabb then noticed the localities of the ancient palace of Westminster, describing the decorations of various apartments, particularly the *Chamber of the Holy Cross*, built by

[•] Mr. Ferrey was a pupil of the late Augustus Pugin, and has executed numerous creditable works; one of which, the Dorset County Hospital, is mentioned elsewhere in the present number of the journal.

Henry III., and adorned with historical paintings, which continued to be used as a council ings, which continued to be used as a council room down to the age of Queen Elizabeth; also many precepts of this king. In one he directs "That a list or border shall be made well painted," with images of our Lord and angels with incense pots scattered over the border; also the four Evangelists. Another lorder are to encour the paintings ordered to leads one to suppose the paintings, ordered to be done in a certain low chamber in the king's garden, were intended to be representations of the siege of Antioch, taken by the Christians in the first crusade, 1098, as a book in French on that subject is ordered by a former mandate to be delivered to Henry, the

keeper of the wardrobe, for the Queen's use. The Painted Chamber, St. Edward's, was of great interest, the ceiling flat and curiously designed with scroll-work and the heads of pro-phets, and the seraphim with seven wings from Isaiah. The walls had been painted with subjects, part of which were battle-pieces taken from the two books of Maccabees; these were certainly as old as 1322, probably older, for in a MS. of Simson Simson and Hugo, the illuminator in the year 1322, existing in the library of Bennett College, Cambridge, this passage occurs : "At the other end of the city London), is a monastery of black monks, named Westminster, in which all the kings of England lie buried, and immediately joined, is that most famous palace of the king, in which is that well-known chamber on whose walls all the histories of the wars of the whole Bible are painted beyond description, and with most complete and perfect inscriptions in French, to the great admiration of all beholders, and with the greatest regal magnificence." Many other records exist of great interest where the name of Master William, the painter and monk of Westminster and of Florence, is men-tioned, and thus we know he was an Italian. Henry III. was a great admirer and encourager of the fine arts, and by the Exchequer mandates we obtain an insight into the nature of the painted decorations in use at this early period, and by the examination of the items in the Exchequer Rolls of Edward I., relative to the first chapel of St. Stephen, such as white period. lead, red-lead, vermilion, and azure, gold and silver oifs and varnishes, we learn that oil-painting was in use as early as 1292, 150 years prior to its supposed invention by John Van Eyck.

Mr. Crabb proceeded to mention that, in conformity with the ancient custom of attaching a chapel to every residence of im-portance, the first chapel for the use of the palace of Westminster was founded by King Stephen, A.D. 1150. And upon King Edward III. and his Queen Philippa's return from their conquests in France, they determined to rebuild the chapel with the utmost magnificence, in a style that should surpass whatever had been previously attempted in any land. The *principle of design* upon which the ar-rangement and decorations of the chapel were made was explained, with observations upon the richness of dress at the period, and the interest attached to these peculiarly illuminated edifices raised by our ancestors at a time when the arts, struggling for existence, yet appear to have held no inconsiderable power over the warlike taste of the period. Bearing in mind this feeling for magnificent effect, we can entertain with comparative ease the accom-panying desire for its extension to their buildings and to their architectural embellishments by an assimilating sumptuousness of style in coloured decorations, and much more easily understand the plan of the *design* adopted by our munificent Edward for his chapel royal, our munificent Edward for his chapel royal, produced on the principle that no work of beauty should be "void of signification." The architectural design would thus be formed in conjunction with the sculptured and pictorial embellishments. The chapel consisted of a nave without aisles, the roof rising to a very birth picch: the five windows on each eide high pitch; the five windows on each side were remarkably enlarged by deep splayings, thus a strikingly peculiar effect was obtained. The piers narrowed, richly painted, and relieved by gray purbeck marble shafts embel-lished with thousands of gilt paterse, continued one successive varied, but unbroken, effect of magnificence along the whole side, again carried upwards by the coloured and gilded cornice, and timber roof. In the piers it was purposed to place the statues of our kings from the Norman Conquest down to Ed-

Upon the walls, under a superb ward III. canopy of open tracery and slender clustered columns, were (painted figures of angels, each bearing a mantle emblazoned and of different colours, being the armorial bearings of noble contributors, and the holy knights to whose contributors, and the holy knights to whose honourable keeping the edifice was particularly intrusted. At the east end, upon each side of the altar, were to be introduced the king and his family kneeling; and upon the walls them-selves, together with the windows, were to be depicted the history of the Bible, all the leading events from the Creation to the death of the Apostles. The quarterings of the French arms and the English lions were to be freely introduced, as also the fleur-de-lis and rench lily, as marks of Edward's supremacy

Thus the general notion will be understood as one to create an apartment of magnificent as one to create an apartment of might before size, to adorn it with a picturesque roof, rich architecture elaborately sculptured, and to fill the walls and windows with a connected series of historical paintings of our faith, and the minor portions with single figures, emblazonry, and gilded and painted tracery-work. The and gided and painted tracery-work. The babiliments of the priests were also provided of the richest materials, as also others for the court to wear during mass. The paintings were peculiarly treated, and the most careful finish pervaded the whole.

The chapel was suppressed, and its wealth transferred by Henry VIII. The lecturer traced it down to the period of 1800, giving the authorities upon which his descriptions were founded, and quoting the existing Exchequer Rolls relating to its first erection and sub-sequent repairs by different kings. And he concluded by saying, "That magnificent example of Italian ecclesiastical decorative art I recently had the pleasure of bringing before you should not be forgotten on the present occasion. The rebuilding of St. Stephen's resulted from a vow made by Edward and his Queen during the French wars, and was Guen uning in eighteen years, A.D. 1348. The Certase of Pavia, whose sumptuous decorations were continued with equal taste and spirit and expense during three centuries, and spirit and expense during three centuries, and form a perfect chain and example of the fine arts in Lombardy, was commenced A.D. 1396; and arose from the fruits of repentance in one of arose from the fruits of repentance in one of the noble house of Visconti, who had murdered his uncle and his family. In atonement for this guilt, and in expitation of his crimes, Visconti, in dedication to the Queen of Heaven, laid the foundation of a mass of dedicate destinate to heave a division sonouedifices, destined to become a glorious monu-ment of perfection in every branch of the fine Those who are disposed to pursue for arts. themselves the gratifying inquiries which my limited leisure only allows me to hint at, will discover the close connection of the funda-mental principles of design exhibited in each building for its peculiar purpose. The chapel of St. Stephen, intended for a sumptuous temple fit for princes to worship in, was a single space uninterrupted by pillars, of rich and elegant Gothic architecture, every ingenuity being used to increase richness by the aid of an unusual breadth of light gilding and colour. Its roof, pavement, walls, and windows combined in solemn history with the richest habiliments to produce an apartment suitable for the chapel of a royal palace, and justly rendered it the most magnificent the arts of the era could produce.

The church of the Certosa was later. Art was then advancing with giant strides towards the creation of names yet continuing to shed an undiminished lustre over the country. This building was for a different purpose. The building was for a different purpose. interior, with all its profusion of rich expenditure, was to prepossess the spectator with so-lemn grandeur, its massive columns, wide-spread arches, subdued light, quietly illuminating the lengthy vista of marble walls, and rendering dimly visible the sparkling of gilded stars, from its deep azure-coloured vaults, all tending, as a portion of the design, to produce the impression of indefinite space. Grandeur and rich harmony which tends, through the power of effect, to soothe those turbulent and stormy passions of man's mind, which yields to the subduing tones of music and of colour, were produced.

It may not be exactly within my province to notice, but there does appear something greatly to be admired in the idea, of a temple of religion thus exhibiting in its churches a combination of studied magnificent effects as a whole, and an endless application of the highest excellences in the details, must be allowed to speak an intelligent language plainly indicative to the general people of that perfection required in the worshipper. Let no labour or expense be thought too great which will contribute to the honour and embellishwill contribute to the honour and embelian-ment of the House of Prayer, was the precept of those men whose works we have this evening been considering." On Wednesday next (the 12th), a paper on the Interior Decorations of the Royal Exchange

will be read.

INSTITUTION OF CIVIL ENGINEERS.

FEB. 25.—The President. Sir John Rennie. in the chair.

The paper by Mr. P. W. Barlow "On the comparative advantages of the Atmospheric system of propulsion on Railways," was the result of an examination of the system, with a view of determining as to the propriety of adopting it on the Tunbridge Wells branch of the South-eastern Railway.

The author first examined the comparative advantages of the atmospheric system over advantages of the atmospheric system over that of traction by a rope, and then he stated the reason for supposing it to be inferior to the locomotive system. He premised that on lines similar to the Greenwich and Blackwall, where the traffic was nearly uniform, and at short intervals, the power used admitted of mathematical computation; but that on rail-ways generally, the power required must be irregular, both as to the amount required and the duration of its employment, and that there-fore a power which was restricted to carrying between certain given points only and certain intervals, would lead to great inconvenience in practice. It would be inconvenient also to have a power which could not be employed for the ordinary repairs of the road, ballasting, removing slips, conveying building materials, working the coal and lime traffic at sidings, moving goods, trucks, carriages, &c. at the stations, all of which was done at present by the locomotives with a great saving of time, and of the expense of men and horses. If locomotives were employed for these purposes only, it nust be at a great expense, as the keeping up a small locomotive establishment was very costly, and, moreover, the gradients and curves of the line must be adapted for working locomotives, and thus do away with one of the great arguments in favour of the atmospheric system.

It was contended that the subsidence of embankments, which at present constantly occurs without interrupting the usual traffic or being perceived by the passengers, would suffice to rupture the air-pipe, or strain it in such a manner that the valve would not close, and thus cause a stoppure of the line. and thus cause a stoppage of the line. Many other and similar practical objections were stated against the system, but the main point was in the comparative cost of haulage when examined with stationary and with the locomo-tive engines. With the former it was contended that on lines with unfrequent trains the small portion of time the power was actually employed and the number of hours for which the steam must be kept up in order to be always ready, would be so disproportionate as to make the stationary engine system far more expen-sive than locomotive power. The lines with sive than locomotive power. The lines with very steep gradients were of course excluded from this position. It was considered also that with the atmospheric system, steep gra-dients increased the expense of power in the same ratio, as the power must always be exerted in whatever way it was applied.

Several experiments were then given to shew the great expense of fuel per ton of goods on the Atmospheric Railway; the results were decidedly in favour of the locomotive. The cost of construction was then examined, and it appeared, that referring to the calculation of the cost of working the London and Birmingham line, to lay down the atmospheric ap-paratus of a double line with a pipe of the re-quired area would not be less than 10,000/. per mile or a total cost of 1,120,000/. the interest of which sum at 5 per cent. would be 56,0002. or 500/. per mile, which sum nearly equalled the average nost of working the line by lage worship exhibiting the perfect production of every ingenious art which the bounty of the Creator has pleased to bestow upon man. A motives, and was greater than on many lines.

In fact, that a contract might be entered into for working a line by locomotive power for the interest of the sum which would be expended in the establishment of an atmospheric apparatus.

'The general results deduced were in accordance with these observations, and it was assumed that the atmospheric system could be most advantageously adopted on short lines, with frequent traffic near large towns, where the absence of noise was important; and that railways on steep inclines in one direction, as at Dalkey, was most favourable to the system.

In the discussion which ensued it was contended that many of the objections urged by Mr. Barlow were not well founded, and that many of the practical difficulties he had advanced had been overcome by the mechanical arrangements now in progress of execution on the more extensive lines which were destined to be worked on the atmospheric system. That both sidings and level crossings were practicable; by a very simple contrivance, a self-acting platform could be so arranged as not only to guarantee the pipe from any injury by the traversing of a cart across the line, but that, by the action of the vacuum in the main, a barrier could be raised on the passing of a train which would effectually prevent the tra-versing of any vehicle, and thus avoid the possibility of accidents. That instead of the possibility of accidents. assumed liability to be thrown off the rails, it was shewn, that the leading carriage being tied down to the piston, greater security was attained, and that on one occasion the leading carriage on the Dalkey line had started before its time, and had actually traversed the distance at a speed of nearly seventy miles per hour, going round curves 130 to 180 yards radius. That the power stated to have been expended in the conveyance of a given gross load was assumed at too high a ratio, and the fuel also, and that as to the question of cost by haulage, by the adoption of small steam power worked only for pumping water, to be used only at the time of forming the vacuum for untrequent or for light trains, a system of pro-pulsion might be established which would be more economical than that by locomotives under the best management.

THE ARCHIMEDIAN SCREW APPLIED TO RAILWAYS.

A PATENT for this purpose has been granted to Mr. Isaac Farrell, of Dublin, which, if satisfactorily established, will lead to the most important results. The following description is extracted from a letter addressed by the patentee to Mr. Purcell, chairman of the Great Southern and Western Railway:--

"The invention consists simply in a screw, called the screw propeller, laid down continuously in the middle of the track, fixed in the direction of its length and turned under its axis, by steam or other power, communicated to it at proper intervals, say every three miles along the line. This screw may be of any given diameter, say from 18 to 24 inches, formed in lengths of from 12 to 15 feet each, and consists of a shaft of cast or rolled irontubing 4 inches in diameter, supporting, by means of wrought-iron arms keyed on the shaft, a rolled-iron spiral, which is bolted to the ends of the arms.

"The power is communicated to the screw by means of spur-wheels, turning a pinion fixed on one end of each line of shafting, of one and a half mile in length; it is situated so as to drive two such lines, that is, one in each direction from it, and the gearing is so contrived as gradually to bring the screw propeller into motion, and also to transfer the power from one line to the other without stopping the train. The motion of the screwpropeller is communicated to the trains by means of a pair of wheels or rollers, so attached to the framework of the leading carriage of the train, as to bear upon the rim or spiral rail that forms the thread of the screw, and thus carries on the train forward; the other acts as a check-wheel, and prevents the train from moving with an unequal motion, or running forward by acquiring acceleration.

"The screw propeller is capable of acting in both directions; and, on the motion being reversed, that which before acted as a checkwheel becomes the propelling wheel, and vice versid. These wheels, which form the only connection between the trains and the pro-

peller, are perfectly under the control of the conductor, who, by turning the handle of the vertical screw, can press the wheels when he scess it necessary with more power upon the screw propeller, or in a moment disengage them from it; and, having done so, can instantly apply the break to the bearing wheels, by continuing the movement of the vertical screw and thus stop the train at any point without interfering with the motion of the propeller.

"The advantages proposed to be derived from this invention are—economy in the construction of railways, from the facility it affords for ascending inclined planes of almost any angle, and the consequent reduction in cuttings, embankments, bridges, &c.; also in the use of light rails instead of the heavy rails required for the locomotive system; also, in the use of lighter carriages than those at present in use, and hence less useless load; economy of power for locomotion by the use of fixed engines, or water power in the place of locomotive-engines, and the consequent avoidance of the expense of erection and support of those costly establishments required for the latter. Injury to passengers, by collision or the running of the trains off the rails, being rendered impossible.

"One of the greatest advantages this system possesses over any other is the facility it affords for transmitting a succession of trains at very short intervals. Provision may thus be made for the most extensive traffic without increasing the engine-power: for instance,—a train, capable of carrying 50 tons on the present system, could be divided into four trains of five or six carriages each, at ten minute intervals, an arrangement by which 12,960 passengers might be conveyed in a day of twelve hours, and the expense of locomotion not exceed six shillings per day."

WORKS IN THE PROVINCES.

Ar Cromer, in Norfolk, it is in contemplation to erect a new jetty, or breakwater, and sea walls for the purpose of protecting the town from the further encroachments of the sea. It is also proposed to erect other works and defences on the beach and cliff, with convenient promenades. Application has already been made to Parliament for leave to bring in a bill to this effect. The Secretary-at-War has decided upon

The Secretary-at-War has decided upon the erection of five experimental military prisons, to which superintendents, selected from the half-pay list, are to be immediately appointed, at a salary, in the majority of cases, of 2000, per annum.

of 2007, per annum. Lord Middleton purposes expending 15,0007. upon improving the town in the county Cork, from which he derives his title.

At Canterbury the labours of the workmen employed in the restoration of the ancient church of St. Martin are nearly concluded. The new pewing is completed, the whole of which is of foreign oak, and in character with the antiquity of the building itself, which is said to be the oldest ecclesiastical structure in this kingdom. Little of the ancient part however remains.

In Cumberland it has at length been determined that the memorial to the late Earl of Lonsdale shall consist of a statue in marble. Whether it is to be an in-door or out-door statue, and the site, are left for further consideration, to be determined upon by a committee specially appointed for those purposes.

At Camarthen a preliminary meeting was held last week, having for its object the erection of a monument to General Nott, the hero of Ghuznee and Candahar. A committee was formed, and a subscription opened, to which Lord Ellenborough has contributed 1001.

At Rugby a monument has just been erected to the memory of the Rev. Dr. Arnold. It was executed by Mr. John Thomas, in Caen stone; the figure is recumbent, under a rich Gothic canopy, and has given so much satisfaction to the committee, that they have rewarded the artist with 100% beyond the sum agreed upon.

In York Minster, a monument is about to be erected to the memory of the late Dr. Beckwith. It is to consist of a high tomb of the decorated period surrounded by pinnacled buttresses, between each of which are to be ogee arched panels with crockets and finials; in each panel will be inscribed the name of one of the charities which the doctor aided by his benevolence. The cover of the tomb will be of black marble, having on a splay the inscrip-

tion in incised brass. On the tomb will repose a whole-length effigy of Dr. Beckwith, the size of life, in white marble. The head will be a faithful likeness, the sculptor, to whom the work has been committed, J. B. Leyland, having had the advantage of carving and modelling the bust previous to the doctor's death. The tomb is to be placed in the east end of the south aisle.

In the cometery at Nottingham, a monument has just been erected to the memory of Robert Millhouse, the poet. It is about 6 feet high. Over the surbase is a tablet, containing the following inscription from the pen of Mr. Spencer Hall, who was the intimate friend of poor Millhouse. It is creditable both to the head and heart of the writer.

IN MEMORY OF BOBBET MILLHOUSE, AUTHOD OF THE DESTINIES OF MAN, EMERWOOD FOREST, THE SONG OF THE PATRIOT, BLOSSOMS, AND OTHER FORMS, WHO DIED AT NOTTINGHAM, APRIL 13TH, 1839, AGED 50 YEARS.

When Trent shall flow no more, and blossoms fail

On Sherwood plains, to scent the springtide gale; When the lark's lay shall lack its thrilling charm, And song forget the patriot's soul to warm; When love o'er human hearts hath lost all sway,

When love o'er human hearts hath lost all sway, His fame may pass—but not till then—away: For nature taught, and freedom fired his rhyme, And virtue dedicated it to time."

And virtue dedicated it to time." Emblematical of the subject, over the in-

Emplematical of the subject, over the inscription, is a lyre entwined within a wreath; the whole is surmounted with an elegant cross fleury. The work was committed to the charge of Mr. Widdison, sculptor, of Edwinstowe. Thorwaldsen's celebrated statue of Lord

Thorwaldsen's celebrated statue of Lord Byron, which was originally intended for Westminster Abbey, is about to be placed in the library of Trinity College, Cambridge. The poet was a member of this distinguished body, having graduated M.A. (hon.) 1808.

At Pembroke Dock, a new church is about to be erected. As Government own a good deal of house property in the town, they have considerately granted 500*l*. towards the building.

ing. In the Potteries, a district church for Fosbrook and Blythe Marsh is being built. The Queen Dowager has recently presented a donation of 20% towards the building fund.

JURISDICTION OF OFFICIAL REFEREES —PARTY-WALLS.

SIR,—Before addressing myself to the task of explaining the painful position in which I am placed with the official referees, I will state the case that has induced the discussion. The trustees of a chapel hold a vestry-room on the ground floor, in the rear of, and over which, are rooms belonging to the owner of the adjoining property, consequently coming under the denomination of "intermixed buildings." This chapel was rebuilt in a most substantial manner in 1817, having an 18-inch wall against the adjoining premises, now perfectly sound, and in thorough repair. The owner of the adjoining property being desirous of pulling down his erections for the purpose of putting up other buildings, applied to the referees, who issued their authority to serve notices both by the "building owner" and the district surveyor, appointing a day for meeting on the premises.

Two distinct notices were served—one as to the party-arch between the intermixed rooms, the other as to the above-mentioned wall; in respect of which wall a tenable objection might be taken, that it is an external wall, inasmuch as it was built entirely on our ground, and not being within the operation of the former Act of Parliament, the common law of the land would preserve our right to it. But as, with the exception of the preservation of ancient lights, no objection would have been raised to the "adjoining owner" using the wall, we will assume, for the purpose of raising the argument, that it was a "sound party wall" (presently, also, contending that it is a "sufficient one"). I attended the meeting on the part of the trustees of the chapel, protesting against the survey; the building-owner was attended by his surveyor, who, I presume from the statements I made, declined to take any part in the matter; and whatever the opinion of the district surveyor may have been from

our discussion, he stated he had no alternative but to proceed in obedience to the directions of the official referees, and consequently pro-

ceeded alone in his survey. I then took the liberty of addressing the referees, assuming they were an appellant court for the public as for the district surveyors. Setting out the particulars of the case, and the points of objection, I thus reasoned— "If the public are entitled to hope for a de-claration of your opinion upon such points claration of your opinion upon such points as controlling future practice, this point, it appears to me, is one of considerable importance. My reading of the intention of the legislature would be, that in all cases of intermixed property, questions relating to taking down and rebuilding party-walls, or any matter where two adjoining owners were mutually interested, that it is competent to them to assent to the principle involved as applicable to their case; and that it would then become the duty of the district surveyor, in respect of the fee pre-scribed to be paid for his superintending the work, to advise the parties (if doubt arose) as to what was required, in conformity with the to what was required, in conformity with the provisions of the Act, and not to drive parties to an expensive mode of proceeding, frequently to result in irritation. The portion of sect. 34 to which I refer is, "That if a party-wall or party-arch cannot be built without pulling down such buildings, and so laying parts thereof to each other; and if in *defunit* of the consent of all proper parties, the official reference &c."

referecs, &c." After having made this communication without having sufficiently looked into the matter, and finding that I had confined my objections to their authority more exclusively as to intermixed property, I took occasion on the following day again to address them, extracts from which, and copies of the letters to the "building owner" and district surveyor, will perhaps best tend to explain my views. I would here remark that the wall is a suf-ficient and sound one. Even in such cases the "building owner?" may take down such a wall, under form of notice, No. 14, which is headed "Notice to be given (three months before commencing operations) by an owner to an adjoining owner, where no survey is required," which survey is dispensed with in consequence of the liability of the "building owner" by sec. 26 "to reinstate and make good all the internal finishings and decorations of the adjoining premises;" my ground of complaint, therefore, is that in each case the proceedings are ab initio wrong, as a costly mode of proceeding.:-

(Extracts from Second Letter to Official Referees.)

"Since taking the liberty of addressing you yesterday, I have met Mr. —, who proceeded with his survey, the surveyors on either side taking no part. My grounds of objection have been further strengthened by closer at-tention to the subject and a bar tention to the subject; and as I am satisfied it is not your desire to overstep the powers intrusted to you, I would draw attention to my further reasons for the opinion yesterday ex-pressed, that parties might assent by private arrangement. I now hold that any proceedarrangement. I now noid that any proceed-ings taken in moving your office or calling in the district surveyors is, as a primary step, illegal (I use not the term offensively, but merely as being repugnant to the express provisions of the Act). "My ground of complaint, as expressed in a letter to Mr. ______ is, that as in the case of

letter to Mr. ----, is, that as in the case of party-walls, each section is read as complete and conferring authority per se, whereas I read them as contexts to sec. 20, which first declares the various points treated of in the subsequent sections, and after setting them all out, and describing the characters or denominations of the respective parties, says, ' that if the adjoining owner shall have consented thereto, or if without such consent,' which is a looser term, fully, however, strengthened a few lines further by these words-' and subject to the provision for supplying the want of consent of the owners.' It is perfectly un-necessary to repeat these words in the sub-sequent sections, as such sections can only come into operation in default of such consent; and sec. 24 provides for 'supplying want of consent of adjoining owners,' necessarily im-plying the necessity of first seeking this consent.

"I am aware that you may in rejoinder say,

every person is bound to know an Act of Parliament, and to read for himself; but I feel equally satisfied that you would desire to render a complicated Act as intelligible as possible, through the medium of the large and novel powers intrusted to you."

(Copy of Letter to District Surveyor.)

"Dear Sir,-Since meeting you this morning, I have given the subject somewhat more consideration, and understanding that you have paid much attention to the subject, I can only express my surprise how plain language can possibly be so misinterpreted. I have again written to the official referees, stating, in my opinion, that they, or the district surveyor moving in the matter, is thoroughly illegal with respect to any matter until difference shall have arisen. "The mistuke you have all fullen into, is

reading a section per se, and imagining what was there directed primarily clothed you with authority. In the case of party-walls, all the sections subsequent are merely contexts of the declaratory section 20, and it would be a monstrous proposition that every party should be called upon to move the office of the referees, and through them the district surveyors and through them the district surveyors. I hold that neither the one nor the other have any jurisdiction until differences arise, and further that it is the duty of the 'building owner' to endeavour to obtain the 'consent' of the 'adjoining owner,' and this obtained, it is the duty of the district surveyor in respect of his prescribed fee, to direct the operation in accordance with the Act.

"I trust I shall, as has always been my habit, treat my professional brethren with courtesy, and pay obedience to a recognized law; but I shall oppose every attempt at undue coercion under this obnoxious Act; and you must perceive that in any, the most trifling matter, the course prescribed would imply large costs."

(Copy of Letter to the Building Owner.)

" Sir,-A notice from you, accompanied by one from Mr. —, the district surveyor, having been put into my hands, respecting property of yours intermixed with that belonging to the trustees of —— Chapel, I have sent a statement of the facts to the official referees, as it appears to me the notices have been served prematurely; inasmuch as sec. 34 states that such proceedings are to be taken only 'in default of the consent of all proper parties.' We have received no communica-tion upon the subject; had we so received it, we should have been, and are prepared to consent to carry out the operation in conformity with the Act.

" Understanding you are about to erect some houses on the ground, it appears to me desirable for both parties to come to some arrangement that would obviate the present inconvenience of the admixture of property; and I am prepared to make a proposition that appears to me to be mutually beneficial, if you will favour me by making an appointment, or refer me to your surveyor."

I afterwards received a communication from the registrar, appointing a day for hearing the matter.

This conference I shall, of course, decline. It would be but an appeal from Cæsar to Cæsar, having yet to learn that the referees are clothed with powers that will close a court of law against an appeal, that the proceedings are ab initio repugnant to the express provisions of the Act. Were such a principle ad-mitted, the triumvirate of Somerset-house or that of the official referees and registrar of Trafalgar-square, would hold a power beyond the jurisdiction of our judges in equity; no party being entitled to issue process from their courts, unless he has conformed to principles prescribed by enactment or precedent.

I am quite aware that it may be said the " building owner " moves the office of the referees at his own peril; but it would appear the more convenient course, that he should be re-quired in his application to state what steps he had taken, and that in addition to the questions already put by the official referees, the one I have suggested to them should be added viz. : if the consent of the adjoining owner had been sought? and that in default of that, no such proceedings should be taken. I regret to say there are many other points

of difficulty, some of which the district sur-

veyors declare themselves unable to solve. would suggest the importance of the subject appears to demand, that a public meeting be held, to address the House by petition at this

Acw Books.

Lectures on Natural Philosophy and the Me-chanical Arts. By THOMAS YOUNG, M.D. A new Edition with references, by the REV. P. KELLAND, M.A. Taylor and Wal-ton. London. 1845. Parts I. and II. DR. YOUNG'S lectures, delivered in the

theatre of the Royal Institution, are too well known to need commendation. The edition, of which part is now before us, will be pub-lished in eight or nine monthly parts; all the plates belonging to the original work will be given, and the text reprinted entire, with co-pious references to recent treatises on the subjects, and notes on such discoveries as may have been made since the lectures were first published. We shall recur to the work when further advanced.

Correspondence.

MISTAKES IN ESTIMATES-HERNE-HILL CHURCH.

-In your publication for January 25th, Sin you did me the favour to insert a letter of mine relating to the contract I entered into for the mason's works of the new church at Herne-hill. In that letter I complained that the quantities I had to work by were considerably more than those which were supplied for the purpose of enabling me to make my calcula-tions by, so much so indeed, that the difference in one item amounted to upwards of 1,000 feet of stone, to which may be added the labour bestowed upon it. In a note which you appended to my letter, you state that my remedy is against the party who took out the quantities; and in your number, February 1st, page 59, is a letter from Mr. Bloomfield, who states that Mr. Alexander, the architect himself, took out the quantities, and that he, Mr. B., only made copies of them for the several parties desirous of sending in tenders. Since the appear-ance of this letter, I have been weekly expecting to see in your pages some explanation from Mr. Alexander, but in this expectation I and many others, who feel deeply interested in the question on public grounds, have been dis-appointed. The omission cannot have arisen from his ignorance of the correspondence, for I by chance know that his attention was lately at Herne-hill specially directed to it; nor can I suppose that you would refuse insertion to any explanation he might send you. The points I am anxious to elicit are these : whether there were two sets of plans and specifications, namely, one to work by, the other to contract by, or whether alterations were subsequently introduced into the plans, from which the quantities which governed my estimates were taken. The difference I complain of, and which has created so much interest among the great body of master masons in the metropolis, must have resulted either from design or from accident. If from the latter, you will be conferring a boon upon a large class of your readers by assisting to unravel the mystery, for in so doing you will draw atten-tion to the rock on which I split, and thereby warn others; but should it be found to result from design, I trust that you will not be wanting in that bold and unflinching spirit which has hitherto characterized your journal, to expose and denounce such disreputable practices.

I am, Sir, &c., Gravel-lane, Southwark, W. SUGDEN. March 3rd, 1845.

NEW CORN MARKET, ROMFORD.

Sin,-In your last week's publication, there was a notice to a correspondent respecting the new corn market at Romford. I beg to forward you the particulars of my visit to the spot, presuming that you will favour the members of the profession by the insertion, leaving it to their option to avail the mselves not of the advantages presented by the advertisement.

The advertiser is Mr. Harvey George, who

requires a design for a corn market, subscription room, lecture room, and sundry other conveniences, appropriating the present build-ings for the purpose, which, by the bye, I find cover a space of 51 feet frontage, by a depth of 168 feet.

To effect this, your readers are aware that it will be essential to take a plan of the premises as they at present exist. The time required to take this plan, to lay it

down on paper from the rough dimensions and sketch, and make a design for the purposes required, would, at least, occupy any one, with the assistance of a clerk, four days, besides the expenses of travelling by railway there and back, twenty-four miles. Thus I calcu-late that the "fortunate competitor" (rather a negative term, by the bye, under the circum-stances) would be a decided loser.

But the chances against this enviable position are more dreadful than at once presents itself, for Mr. George asserts that he has already received 150 designs, and I have no reason, from the authority that I quote, to doubt the truth of his having so stated; except that there must be 149 weaker men in the profession than falls to its average lot, and from the circumstance of his having in a from the circumstance of his having in a second advertisement postponed the period of receiving the designs for fifteen days, trusted to that weakness, in expecting a few more. When I incurred the first expense of going to Romford, I inferred, although not so stated in the advertisement, that the successful competitor would be chosen as architect, to carry out the work; but there I reckoned without my "advertiser," for I find that Mr. George makes no secret in stating that he has already a design of his own, which he intends to adopt, modified and doubtlessly improved by the kind suggestions of these numerous professional friends. This much in-formation did I glean at the expense of some 10s. ("5 per cent. on the *probable amount*, as we say"); but who formed the committee nobody knew. In vain 1 asked as the advannobody knew. In vain 1 asked, as the adver-tisement suggested, "for full particulars" of of Mr. Harvey George, and, as my own instinct prompted, of the builders in the town. The only certain knowledge I could acquire was, that Mr. Harvey George had taken the pre-mises on lease, with the option of purchasing; that he projected the scheme, and advertised it; that he intended himself to build it; and that there appeared to be but one opinion, which was, that he would be his own architect, and, like one who would be his own lawyer, that he was well worthy of being his own client.

I think that the profession deserve this cau-tion, and to vouch for its authenticity I enclose you my name. AN ARCHITECT.

MEASUREMENT OF BRICKWORK IN BARREL DRAINS.

SIR,-Will you be kind enough to inform me through the medium of your journal, how I am accurately to measure the contents of a 12-inch barrel drain,—a friend disputing my method.

In my opinion the outer circumference should be measured thus :--12 inches diameter of drain, half brick on each side == 8 inches; total 20 inches, by three times for circum-ference, gives 60 inches, or 5 feet of 4 inch brickwork, which say in 100 feet, will give 166 feet 8 inches reduced brickwork.

The other method is, to measure the diameter and one rim, making 16 inches instead of 20, which in 100 feet will give only 133 feet 4 inches, a material difference.—Your kind information will oblige

AN ENOUIRER.

[Our correspondent is wrong; the exterior and interior circumference should be added together, and the half of it taken as the mean. This multiplied by the length and divided by 3 (if the sides are half brick thick), will give the quantity of reduced brickwork. The mean quantry of reduced brickwork. The mean circumference is obtained for practical pur-poses, by adding the internal diameter to the thickness of one rim, and multiplying the re-sult by $3_{\frac{1}{2}}$. Thus 12 inches, the diameter of the drain in question, $\times 4_{\frac{1}{2}}$ inches (the rim)= 161 inches, which being multiplied by 34 gives 4 feet 4 inches the circumference. This being multiplied by the length, 100 feet, we have 433 inches or 144 feet 5 inches reduced. feet 4 In precise terms, the diameter of a circle is to the circumference as 7 is to 22.-ED.]

MATHEMATICS AS APPLIED TO CARPENTRY. Sin,-I very much wish an answer to the following :---By what means can I learn to apply Log. cos. cosec., &c., &c., to constructive car-pentry, in calculating the several weights required and thrusts produced, to calculate weakness, &c.? If in a work ou the sume, glad of the name of it.—I and, Sir, &c., A READER. ness, &c.? If in a work on the same, I shall be

SHOP-FRONTS UNDER NEW BUILDINGS ACT. SIR,-Your "Subscriber" is not bound to sin, - 1 our "Subscriber is not could to carry up an "unsightly mass of brickwork" of the same projection as the cornice of his shop-front, or an inch beyond it. The schedule requires merely a pier or corbel of "incombustible material." He can, therefore, form in the line of the party-wall a cement pilaster, 9 inches wide, with face and cap-mouldings, and cornice, similar to those of ĥf molitings, and cornice, similar to those of the wooden shop-front and story-posts, but breaking one inch before them. The pilaster and cornice would be both "pier" and "corbel;" and, especially in a continued range of shops, would be far from "unsightly." M. B. A.

I am, Sir, &c.,

Aliscellanea,

BRICKS .- A correspondent of the Mining Journal remarks, that "should the clay of which bricks are made be contaminated with fragments, however minute, of chalk or limestone, the consequences may be very serious. On transference to the furnace, the carbonate is converted into quicklime, and when the bricks are moistened, they necessarily burst, and crumble to pieces. In the case of bricks used in tunnels, this is of paramount moment, and will explain the destruction of the tunnel of Comptiel, between Belgium and Rhenish Prussia. The fault lay with the brickmaker, not the engineer. I have seen the destruction of an earthenware vessel from this cause, as soon as water was poured into it."

THE DORSET COUNTY HOSPITAL is now THE DORSET COUNTY HOSPITAL is now drawing towards completion, and, when finished, will be capable of accommodating 300 in-patients. It stands in an open part of the city of Dorchester, near the West-walks, upon ground presented by Robert Williams, Esq., of Bridehead. The north wing of the build-ing has been opened for the recention of has been opened for the reception of ients for some time. This institution is ing patients for some time. supported by voluntary contribution. When we see the number of patients within its walls, it seems surprising that Dorset should so long have remained deficient of a county hospital. Mr. Benjamin Ferrey is the architect employed.

FALL OF PART OF THE IRON ROOF OF A WAREHOUSE. - Considerable alarm was exvia the buildings of the Manchester Bond-ing Warehousing Company, Chapel-street, which for many years was used as the cotton warehousing in an antiwhich for many years was used as the cotton warehouse in connection with the mill of Messrs. Philips, Lee, and Co. The gable end of this building fronts Chapel-street. The building is about 120 feet in length and 40 feet wide. The roof was an old cast-iron one, much decayed, and was supported by two ranges of iron columns (the building being free-proof) dividing the building longitudingly fire-proof) dividing the building longitudinally into three bays. These columns were very slight, and from iron cups let into the top of these pillars very light principals of cast-iron were carried at a shallow spring to support the roof, or rather roofs, for it was in three divisions. Several workmen and others were upon the roofing, which was undergoing repairs, when, about twenty minutes before eleven o'clock, the whole of the division next the yard of the premises fell at once with a loud crash, and this, dragging the tie-rods down, dislodged the pillars on one side of the centre bay; about the third of the roof of which next fell, followed by a rather larger proportion of the roof of the other outer bay, so that in all about two-thirds of the roofing fell. Amongst the individuals on the roof was a clerk of Mr. A. Mills, architect, who escaped without injury. Upon further inspection, it has been found that nearly all the cast-iron cups in one range of pillars had been cracked or torn, apparently for a long time, by some severe shock or strain, and one of the principals was also broken .- Manchester Guardian.

RAILWAY IN SPAIN. - A railway from ALLWAY IN SPAIN. — A railway from Barcelona to Mataro has been decided on, the first Spanish line, and many of the shares are subscribed for. We cordially wish it success, believing that an improvement in the means of communication will greatly aid in consolidating this unfortunate country.

ST. MARY-LE-BONE BANK FOR SAVINGS.— The fifteenth annual general meeting of this institution was held on Thursday, the 27th ult., at the office, in Welbeck-street, Cavendish-square. It appeared from the several reports read to the meeting, that the progress of this bank continues to be of a very favourable descrip-tion, no less than 2,654 new deposits having been made in the last year. 15,124 deposit accounts remained open on the 20th November less of which 0.503 held the new deposits having last, of which 9,503 held balances averaging less than 41.5s. 10d. each. Upwards of 350,0897. was then invested with the commissioners for the reduction of the National Debt; this amount has since risen to 353,0897. 4:. 7d., and is rapidly on the advance. The continued evidence thus on the advance. The continued evidence thus afforded of the strong and growing disposition of the working classes to provide against the casualties of life, will prove a source of grati-fication to all reflecting minds. THE FOUNTAINS IN TRAFALGAR-SQUARE. The hours of the menutic here well.

The labour of the mountain has produced a mouse. After the long-heard note of prepara-tion, we looked for something, more than or-dinarily beautiful and original, and are therefore annoyed to find that the new fountains are nothing more nor less in design than might have been purchased, dolphins and all, ready-made, at any of the artificial stone shops in the Paddington-road. The beauty of the material, polished red granite, is the saving clause.

FIRES.-The late fire at Captain Duncombe's in Grosvenor square was another result of the incautious fixing of stoves. It was caused by the overheating of a hot-air stove, which com-municated with the flooring of the hall.

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our readers, however, they are entered in a book, and may be seen on application at the office of "The Builder," 3, York-street, Covent-garden.]

ADVERTISEMENTS.

HEAL & SON'S LIST OF BEDDING. —Containing a full description of weights, sizes, and prices, by which purchasers are enabled to judge the articles that are best suited to make a good set of Bedding, sent free by post, on application to their establishment, the largest in London, exclusively for the manufacture and sale of Bedding (no Bedsteads or other furniture being kept). Heal and Son, Feather Dressers and Bedding Manufacturers, 196, opposite the Chapel, Tottenham-court-road.

100 MARBLE CHIMNEY-PIECES

THE WESTMINSTER MARBLE COM-THE WESTMINSTER MARBLE COM-PANY embrace this opportunity of announcing to Builders and the Public generally, that in the first week in March they will offer their very large assortment of Vein, Statuary, Black and Gold, Bardilla, and Black MARBLE CHIMNRY-PIECES, manufactured in a superior manner by machinery, at prices considerably below prime cost, which are far superior in quality and workmanship to those manufactured for public auctions. By purchases made from this stock a great saving will be effected, in addition to the auction expenses. The Company's reason for making this sacrifice is their intention to make new extensive alterations in their Shaw-rooms, previous to setting up their new stock for the ensuing season, of which further notice will be given. Direct, WESTMINSTER MARBLE COMPANY, SABL STREET, HOLYWELL-STREET, MILLBANK.

LIFE ASSURANCE.

THE BRITISH MUTUAL LIFE AS-SURANCE SOCIETY entertains proposals of any acription from 201. upwards, involving the contingency of man life, and offers the following advantages to its mem-

BONUS ANNUALLY (in shape of low Premiums), al to those of other offices, granted every three, five, or

A BONUS ANNUALLY (in shape of low Premiums), equal to those of other offices, granted every three, five, or seven years, and THE PROSPECT OF A LARGER BONUS than can possibly be obtained at those offices, in the peculiarly bene-ficial mode adopted in the distribution of the surplus. Prospectuses and every information may be had on ap-plication at the office, 17, New Bridge.street, Blackfriars.

THICK TRACING-PAPER. 40 by 30, at 141. 0s. per Ream, or 15s. 0d. per Quire. 30 by 20, at 71. 10s. , 8s. 0d. , N.B.-Every sheet is stamped with the Initials of the anufacture.

N. D. - Every succes is scattped with two instance of the Manufacturer. This beautiful and unequalled article is allowed to be the eheapest and most useful Paper hitherto introduced to the public, as will be best proved by a trial.

EMBARRASSED CIRCUMSTANCES. -PERSONS IN DIFFICULTIES being desirous of availing themselves of the Benefit of LORD BROUGHAM'S HUMANE ACT, are requested to apply to MESSIS. GRAND AND CO., of 54, Coleman-street, City, where every information may be obtained, FREE OF EX-PENSE, or arrangements can be made with Creditors, by which means the painful necessity of resorting to BANKRUPTCY or INSOLVENCY may in many cases be avoided.--N.B. Partnership accounts adjusted.

WINDOW BLINDS. TO ARCHITECTS, BUILDERS, CONTRACTORS, AND OTHERS.

F. A. DE WILDE, (Late Mills and De Wilde),

73, WELLS STREET, OXFORD STREET, LONDON, MANUFACTURER of the much-admired MANUFACTURER of the much-admired SPANISH BLIND. VENETIAN SHADES, adapted to either inside or outside, so much in general use. Blinds for Shop-fronts, Spring Roller Blinds, on the most improved Principle. PATENT ROLLER BLINDS, Mounted with the newly-improved Scotch Furniture. PATENT WOVE WIRE BLINDS. DWARF VENETIAN BLINDS, &c. Verandahs to any Design. Transparencies, and every description of Sun Blind, on the most improved principle, and oftherery best workmanship and well-seasoned Materials. P. A. De Wilde begs to observe he pays particular atten-tion to the manufacture of Blinds for exportation; he also invites all parties to pay his Establishment a visit, where they may see every description of Blind in use. Holland Blinds Clasmed, Calendered, and re-made. Vene-tian Blinds Painted, Taped, and Lined. Estimates furnished. N.B.-Old Blinds renovated and made equal to new.

PAINTING BRUSHES OF SUPERIOR QUALITY. TO PAINTERS, BUILDERS, &c.

J. J. KENT AND CO. MANUFACTURES.

11, GREAT MARLBORDUGH-STREET, LONDON, Offer to Painters, Builders, &c., Painting Brushes of a quality far superior to those generally offered for sals, to which they beg to call the attention of all who prefer quality and durability to apparent cheapness.

aunity to apparent encapters. 000000.--7 in. Dusters. 000000.--7 in. ditto, extra. 00000.--Ground Brushes. Plasterers' Brushes. Distemper ditto. Groued and Unground. Sash Tools, and Common Tools. Tar Brushes and Masons' Brushes, and all other Brushes used by Painters and Artists.

Lists of Prices of Painting Brushes, and of all other kinds of Brushes, forwarded on application. Established 1777.

E. WOLFF & SON'S

NRWLY-INVENTED MATHEMATICAL PENCILS,

FOR

METHEMATICIANS, ARCHITECTS, & ENGINEERS,

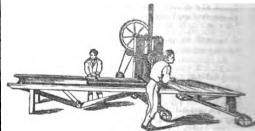

METHEMATICIANS, ARCHITECTS, & ENGINEERS, Warranted to retain a very fine Point. E. WOLFF AND SON, in introducing their Extra Hard Kead Pencils for Mathematical and Architectural purposes, beg to draw attention to the advantages resulting from their adoption in preference to the ordinary Pencils. They are made to six distinct sizes, by which means they can be fitted to all instruments, and are so constructed that each Pencil may be cut in halves without waste; thus making two Pencils each of a length, and most convenient for use, and obviating the difficulties existing with respect to the ordinary Pencils. B. W. and Son have also half-round Pencils, suitable for the Spring Bow, thus preventing the necessity of dividing the Pencil down the centre. They are made of extremely Hard Lead, of the finest quality, which will retain a very fine point and give a clear , even, and distinct line.— PATTERN OF SIZES.

| round 1 | 2 | S S S S S S S S S S S S S S S S S S S | 4 | 5 | | б |
|---------|---|---------------------------------------|-----------------|---|---|------------|
| | | | 1. 4 8 1. | | - | 1.20.00 -1 |

A Sample of each size will be sent by Post to any part of the Kingdom, on the receipt of Postage Stamps equal to the amount. Drawing Pencils of the best quality, for Architects and Engineers, warranted free from grit: the HIH and HIHH are particularly recommended. — Price 5s. per dozen. May be hed of all Instrument Makers and Biationers, and at the Manufacturers', 23, Church-street, Spitalfields, London.

London.

HATCHER'S BENNENDEN TILE-MACHINE, Manufactured and Sold only by COT-TAM and HALLEN, Engineers, Agricultural Implement Makers, &c., 3, Windey-street, Oxford-street, London.

This is the most efficient Machine that has been invented for the purpose of making Drain Tiles. Any shaped Tile can be made by merely changing the die, which can be done in a few minutes. It requires but few hands, viz., one man and three boys. With this amount of labour, the pro-duct of a day of 10 hours is as follows, viz:--' inch diameter of [12] inches diameter of Tile, 11,000 [2] ..., 3.200 12, ..., 8,000 [2] ..., 3.200 14, ..., 8,000 [2] ..., 3.200 15, ..., 8,000 [2] ..., 3.200 15, ..., 8,000 [2] ..., 3.200 16, ..., 8,000 [2] ..., 3.200 17 The Machine is moreable down the drying-sheats, so that it requires no extra boys to carry the Tiles, nor are shelves required in drying. It has been in full operations for upwards of four months at Hempstead Park, Decar Cran-brook, Kent. No charge made for Patent days or licence. The purchase of the machine includes free use of it. Digitized by GOOgle

SATURDAY, MARCH 15, 1845.

--

NE of the great objects of the "Metropolitan Improvement Society," when it was established in January, 1842, was to point out the evils which have arisen from

considering the improvement of different parts of London only in detail, with a view exclusively to the wants of a local district,-and to urge upon the legislature the importance of looking forward ten or fifteen years, and of employing fit and qualified persons to prepare a plan, founded upon an accurate survey, of all the improvements required in the metropolis which might be carried into effect within the period named. It was believed justly, that this would tend to the realization of various plans, which, however excellent in themselves, had failed because brought forward as private questions, and not as part of a general measure which could alone receive public support, and would prevent the adoption of inferior or inefficient schemes, which private views and influence might otherwise thrust upon the public.

When a deputation from the society waited on Sir Robert Peel, he said that his own opinions coincided with the views of the deputation; that he considered it desirable that an efficient board should be appointed to institute proper inquiries, and take a broad and comprehensive view of the whole subject; and promised that a general plan of the metropolis, on a large scale, should at once be prepared from actual survey as an indispensable first step.

The Metropolitan Improvement Commission was issued soon afterwards, but though three years have nearly passed away, the survey is not commenced, and the commissioners have effected nothing.

We are induced to recal these circumstances to the memory of our readers, and to arge on the premier the performance of his promise, by recent proceedings in West-The necessity for alterations there minster. has long been felt, and numerous plans have from time to time been proposed ; but each and all have been set aside, and the much needed improvement, including the drainage, the ventilation, the health, and the morals, of the distriet, prevented by private interests and the equabbles of rival claimants for public How much longer this is to be approval. carried on is uncertain, but it seems clear that the question is now as open as ever, and that unless the public or the Government come forward to obtain a settlement of it, will either remain so, or be closed in such a manner as to effect much less good than ought to be the case. Parts of Westminster are at this time the very sinks of iniquity, hot-beds of crime, and the birth-place of disease; whence vice and death are brought to all the quarters of the metropolis ;---none of it is well-drained, little of it well-ventilated, and it is of course to ameliorations in these respects, and to obtain good leading thoroughfares for the advantage of the whole community, that public money should be applied. It is not to be wondered

at that individuals who may know that their property will be more benefited if the new street be formed in this way than in that, should exert themselves so to regulate its arrangement, and every consideration should of course be shewn to private rights and interests, but certainly these ought never to be allowed to outweigh the general good, and prevent important public improvements.

THE BUILDER.

Mr. Wason's plan, as it is called, which has been introduced in the House of Commons with the sanction of Government, was opposed, our readers will remember, by some of the inhabitants of Westminster, and a public meeting was held, whereat a committee was appointed to obtain and examine other plans, and to draw the attention of the legislature to that which they considered the best. Wednesday last was the day named by advertisement for receiving plans from any parties who might be disposed to submit them, and several are now before the committee; it remains to be seen what other steps will be taken. The majority of those who oppose the present plan do so, it cannot be denied, on personal and interested grounds; Mr. Hindley, M.P., and others, assist them because they think that many of the existing inconveniences will not be removed, and that drainage, ventilation, cleanliness, and health may be better advanced by some other plan. If so, and we will not now go into this part of the question, it is of course desirable that the plan should be altered; but we beg these latter gentlemen not to be made the means of opposing all plans, and so of still further driving off the long-required improvements. The matter should be looked at in a broad and comprehensive manner, individual interests weighed. but the public good chiefly considered. If no plan is to be carried out that does not meet the views of all the inhabitants, as was urged at the meeting, Westminster will long remain in its present dreadful state-a disgrace to the metropolis.

The chief defect of the intended line, as it seems to us, is the hend made to avoid the workhouse of St. Margarets. The consequence of this will be, partially to build out of sight the western front of the Abbey, of which, otherwise, an uninterrupted view would be obtained from a considerable distance.

At the last meeting of the Metropolitan Improvement Society, it was resolved to make a second application to the commissioners to induce them, if possible, to embrace the present opportunity for effecting a complete inolation of the Abbey. Plans were produced shewing that, by a slight deviation from the intended line, the road-way might be brought on the south side of the Abbey, leaving the cloisters untouched, and terminating with the Victoria Tower of the new Houses of Parliament. The south front of the Abbey is now wholly lost to the public, and yet it is from the south that all buildings should be viewed, from the superior play of light and shade produced by the direct rays of the sun. If the Abbey were thrown open on the south side, the effect to the public from its novelty would be almost equivalent to a new architectural creation in the metropolis. The cloisters would appear as an appropriate and picturesque foreground to the elevation; but a new façade would be required to the existing cloister bounding wall. The buildings to be removed to effect this object (belonging to the Dean and Chapter) are of an inferior class, and

more eligible sites could be found for them on ground at present unoccupied, but which in the case supposed, would enjoy a valuable frontage.

In a neighbouring district, Chelsea, considerable improvements are contemplated, and the necessary steps have been taken to enable the parish to get an Act of Parliament during the present session. It is proposed to open a variety of new roads, and to widen old ones : including two new communications between the King's-road and the Fulham-road (one in the line of Battersea-bridge, to lead direct to Kensington, and the other opposite the World's End public-house), and straightening the King's-road between Park-place, where it now turns awkwardly to the south, and Stanleybridge. To effect these improvements, they ask power to raise 30,000% by a local rate. The greater part of Chelsea has been ruined by being injudiciously laid out; and the fact that the inhabitants now feel it necessary to tax themselves to amend their past errors, should serve as a warning to other districts not yet covered.

In connection with this movement the parishioners have forwarded, or are about to forward, two memorials; one to her Majesty the Queen, and the other to the Commissioners for Metropolitan Improvements. The first sets forth that with a population of 40,000, in consequence of the rapid increase of buildings, they have no open space for recreation, and prays that the grounds in front and rear of the Royal Hospital may be planted and thrown open to the public. "In soliciting this boon," say the memorialists, "they are not aware that they are asking any thing inconsistent with the interests of the institution. Viewing it as a national asylum for the invalid veterans in the royal service, it seems more consistent with those interests that the whole of the grounds (with such exceptions as might be necessary to secure the privacy of the officers) should be thrown open to the inmates for healthful recreation, and that the public should be admitted to participate in their enjoyment, and to witness how they are cared for, than that the inmates and public should be restricted to the limited portions of the grounds now accessible to them." The second memorial is to urge the Commissioners to use their exertions so that the embankment of the Thames may be carried out without delay, and will be found at length in another part of the journal.

Among other suggested improvements in London is an arcade, to be called the Gresham Avenue, commencing in Lothbury, at the end of Bartholomew-lane, opposite the northern entrance of the Royal Exchange, and terminating at the corner of Moorgate-street, with a branch to Finsbury-circus. We have seen a prospectus, too, for the formation of an under-ground avenue through London and Westminster, to connect the various railways, but are not in a position to do more than allude to them. A very circumstantial statement appeared in the daily papers a short time since, to the effect that a new line of street, extending in continuation of St. James'sstreet and Albemarle-street, direct from St. James's Palace to the Regent's Park, was to be proceeded with without delay, at the express desire of her Majesty. Although this has been since pronounced a hoax, we should not be very much surprised to find some truth in it, for we happen to know that surveyors have been employed in that direction for some time past.

COMPETITION PLANS FOR BATHS AND WASH-HOUSES.

IT gives us much pleasure to relate that the various plans submitted in competition to the committee for obtaining baths and washhouses for the labouring poor, were ex-hibited to parties more especially interested in them on Wednesday and Thursday last, and that arrangements are in progress for the further exhibition of them to the public. The committee have acted most wisely in ulti-mately coming to this determination, notwith-standing they had previously resolved that the plans should not be seen, and deserve the best thanks of all who desire that architectural competitions should be well and honestly conducted. It is so seldom that committees will retrace a step once taken, however wrong the direction may be, that this praiseworthy exception should not pass unnoticed. The designs exhibited are twenty-one in

number, from eighteen competitors, and are developed in 137 drawings; twenty-two sets were submitted; but one competitor refused to allow his drawings to be seen, and withdrew them. Of course this gentleman will not think of examining the drawings that are exhibited.

The names of the competitors in the order in which the plans are hung are as follows, together with the estimated cost of carrying out their designs :-

| - | |
|-----------------------------|---------------|
| 1. George Truefitt | E10,000 |
| 2. Wigg and Pownall | 13,207 |
| 3. J. H. Taylor and Son | 14,000 |
| 4. P. Prichard Baly | 11,700 |
| 5. Cope and Eales | 20,000 |
| 6. Arthur Mee | |
| 7. John Tarring | 9 ,963 |
| 8. Charles Parker | 16,500 |
| 9. Lee and Burnett | 12,974 |
| 10. Savage and Foden | 9,272 |
| 11. Scott and Moffatt | 11,778 |
| 12. William Brooks and Son | 10,125 |
| 13. Garland and Christopher | 10,000 |
| 14. Owen Jones | 16,000 |
| 15. John Barnett | 9,915 |
| 16. Sylvester and Miles | 8,487 |
| 17. F. J. Francis | 6,800 |
| 18. James Harris | 12,540 |
| | |

Thus ranging in amount from 6,800%. to 20,000/.

Nos. 9, 12, and 14 have each two sets.

Feeling, after a general examination of the plans, how difficult it was to estimate properly their relative merits without very long and careful examination, we took some pains to learn the course which had been pursued by the sub-committee to whom they were re-ferred. We were informed that they met daily eighteen or nineteen times, and examined every plan in relation with a series of what they thought the most important points to be considered. The extent of agreement or otherwise, of each design with these various requisites was then registered in a very ingenious table, which, when the examination was completed, presented at one view the merits and demerits of the different plans, and enabled the committee to weigh one against the other.

The first and most important deduction said to have been made was, that not one of the designs agreed in all respects with the published instructions. No. 1, for example (which is nicely drawn, by the way), is on a smaller scale than was required, while one near it, although on the proceeded account of the second although on the proper scale, occupies considerably more area than was prescribed, and so on, through the whole twenty-two. The selected design, No. 4, by Mr. Baly, is in several respects at variance with the instructions, so that to justify the choice, the first assertion must be admitted.

We are not disposed at this moment to doubt it, but reserve to ourselves the right of expressing an opinion when we have examined the drawings more fully. Mr. Baly has given much consideration to the subject, and has produced an elaborate set of drawings, sixteen in number, entitled to great commendation. Every part of the design is fully explained, and in none, so far as we could see, are the arrangements for ventilation, and for economically carrying on the business of the institution, more perfect. The plan is square, with a high tower in the centre, used chiefly for the supply of fresh air and the removal of that which is vitiated. The area occupied is 11,600 feet, for which the estimate, accidentally of

course, is 11. per foot. The elevation is plain, but appropriate; and here it may be remarked, that architectural effect has not been aimed at in the designs generally; nevertheless, some of them display considerable skill. Next to the selected design, No. 8 (Mr.

Parker's) is perhaps the most elaborately worked out (consisting of twelve drawings), and has many points of excellence. No. 3 and No. 9 are both clever designs; but we may not pretend to particularize without a fuller

examination than we have yet given. Our thanks are due to Mr. Stonhouse Griffith, the secretary, for the manner in which he answered inquiries.

THE THAMES AND ITS EMBANKMENTS; WITH REMARKS ON THE MOTION AND ACTION OF EUNNING WATEE.

BY JOHN PHILLIPS.

On entering the valley of the Thames from the sea, and tracing its winding course upwards, it appears that there is not a situation upon its banks that offers a more salubrious, extensive, and commodious position for a town, than the locality where the city of London is situated: therefore the selection of the spot whereon this great city is erected was eminently judicious. The proximity of its situation to the deep, wide, and magnificent river flowing before it, and from which its natural surface has an easy and convenient elevation; with the wide ex-panse and undulation of the country to the north of the city, renders this peculiarity of position the most favourable for a number of human beings to congregate together in com-munity. Historians tell us that for a considerable period antecedent to the invasion of Britain by the Romans this site was covered with the rude huts of the ancient Britons; with the indeed, that such was the case there can be but little doubt, as its peculiar and favourable position, and also its natural facilities, made it a conspicuous and easy landing-place from the river, which, at the same time, presented an excellent and safe anchorage for the numerous craft frequenting its shores. After the subju-gation of the Britons by the Romans, the wisdom and good taste of the latter were peculiarly exemplified in their retaining this spot for a station, and for the purpose of building their residences. The Roman domi-nation in Britain lasted somewhere about 476 years, and during their occupancy of the city of London, they greatly improved its situation, the extent and limits of which were more clearly defined by the wall they built around it, the remains of which are in ex-istence to the present day.

Antecedent to the occupation of London by the Romans, very many and vastly extended tracts of land contiguous to it were inundated by the flowing and rising of the tide up the Thames, thus forcing and ponding back the river waters. There is no doubt that considerable portions of the surface of the ground, on the south side of the river from Wandsworth to Woolwich, belted by the Surrey and Kent hills, and also a great portion of the lower part of Westminster, extending beyond Fulham, as well as the whole of the surface of the present broad meadows opposite Woolwich, stretching from the river Lea eastward up to the Essex hills, were entirely inundated during the times of the high-water of the spring-tides; and from the elevated position of London, the whole expanse, looking towards Wandsworth, and to beyond Woolwich, appeared as an extensive lake, and London a promontory jutting out from the main land. Maitland, in his "History of London," says that "the greatest marshes on the south side of the river Thames, before the embanking of the said river, reached from Wandsworth in the west to Woolwich in the cast." Pennant also says that "all the land round Westminster Abbey was a flat fen, which continued beyond Fulham;" and "the Surrey side was, in all probability, a great expanse of water or lake;" and that "the expanse of water might have filled the space expanse of water or lake;" and that "the expanse of water might have filled the space between the rising grounds at Deptford and those at Clapham, and been bounded to the south by the beautiful Surrey hills." These appearances would most certainly indicate that the valley of the Thames was anciently an arm of the sea, and thus presented more the appear-ance of an extensive estuary than that of a river. The surface-soil of the lower part of Westminster, the Isle of Dogs, and the Essex marshes, on the north bank of the river, and

the whole of the extendive marsh-land, upon which Battersea, Lambeth, Southwark, Bermondsey, Rotherhithe, and Deptford are stand-ing, on the south bank of the river, is composed of alluvial matter, brought down by the river Thames, and the many collateral and subsidiary streams and water-courses flowing into it; and the alluvium, held in suspension and driven along by these waters, was de-posited, in consequence of being spread over these spaces by the flowing of the tides.

By what race of inhabitants, or at what period of time these extensive tracts of prolific marsh-land were acquired history does not inform us. That they were gained during an age of very remote antiquity is evident, from age of very remote antiquity is evident, from the fact of no mention having been made by any one in reference to it; neither do our au-thentic records reach back so far, or throw any light whatever upon the subject. It is not prolight whatever upon the subject. It is not pro-bable that the construction of the embankments which were thrown up at the edges of these marshes were the works of either the ancient Britons, or of the Saxons who suc-ceeded them. The former could not, by any possibility, have produced a work of this magnitude, bearing evidence of advancement to so high a state of civilization, as they were a people at once ignorant, barbarous, and not in any vay conversant with the mechanical arts of a civil state; and although the latter were some-what farther advanced in the scale of civilization, yet they had not the talents and skill to invent, much more the tact to direct and car out, these stupendous constructions. It would appear, therefore, but just to attribute the em-bankment of the Thames to the east and west of London, to the Romans. 'The well-known enterprising character of that people, their great discipline, industry, and thorough know-ledge of the arts and sciences, as evidenced by the remains of all their works, point to them as the authors of these great and noble con-structions. In fact, there is no doubt that the reclaiming of these extensive marshes on both sides of the Thames, by embankments, pretty nearly in the state we now see them, and by these means as well, producing something like an uniformity and regimen to the river, were effected by the superior knowledge and talents of the Roman legions, to whose perseverance and proficiency in the science of civil engineering at that time we are indebted for these The histogreat and admirable works. rian Tacitus, who very probably was in Eng-land at the time, affirms that the Britons were employed by them " in sylvis et paludibus emuniendis, i.e. in clearing the woods and banking the fens;"† and that while thus engaged they frequently complained of the great toil and extreme severity of the labour of such works.

From time immemorial the preservation and reparation of the Thames embankments, as well as of all others throughout the realm of England, was considered of the utmost importance, and in consequence their defence was strictly enjoined. Nevertheless, the extensive marsh, pasturable, and arable lands, and other low grounds adjacent to these embankments low grounds adjacent to these embandments and rivers, "heretofore through politic wisdom won and made profitable for the great com-monwealth of the realm," from the flowing, reflowing, and violence of the tides, and from the neglect of those whose duty it was to have maintained and repaired them, were occasionally very disrupt, and allowed to fall to decay. The first mention of any thing in Charta, The Great Charter, A.D., 1225, 9th Henry III., wherein, amongst other things, it is ordained that no person should be called upon " to make bridges nor banks, but such as of old time and of right have been accustomed to make them in the time of King Henry, our grandfather;" and that from hence-forth "no banks shall be defended but such as were in defence in the time of King Henry, our grandfather, by the same places and the

same bounds, as they were wont to be in his time." As was previously observed, the re-claiming of the immense marshes to the north and south of the Thames was anterior to all our authentic records. But it appears that the first commission of sewers issued in England for the express purpose of viewing and land for the express purpose of viewing and repairing these embankments, of which our public records take notice, was in the year 1295, 22nd Edward I. This commission was directed to his beloved and faithful, John de Metingham, and William de Carleton, who were authorized to view the banks, ditches, gutters, sewers, &c., and repair the same be-tween Lambeth and Greenwich: and about three years afterwards, through the neglect of main-taining the banks at Rotherhithe, considerable breaches were made in them by the violence of the tides, such that a great part of the adja-cent marshes was inundated. From time to time other commissions were issued for the repair of the embankments betwixt Lambeth and Greenwich. In the year 1329, 13th Ed-ward II., John Abell, and John de Evredon, were appointed to view the said banks, and to supply speedy remedy for their repair; and six years afterwards another breach took place in those banks, which occasioned great damage in the neighbourhood.

In the neighbourhood. Commissioners were also appointed to view and take order for the reparation of the banks, ditches, &c., for the protection of the marshes lying between Dartford, Woolwich, and Greenwich, the first mention of which occurs A.D. 1324, 8th Edward II., John Abell and John de Hortone being appointed commissioners to view and repair these banks; and early in the following year another commission was issued for the protection of the same banks and marshes. Six years after, from the violence of the tides, a considerable breach was made in the bank between Greenwich and Woolwich. Commissioners continued to be appointed from time to time for the purpose of maintaining and repairing these banks. In the year 1341, 15th Edward III., Robert de Sadyngton, Thomas de Blaston, and Gervase de Wilford, were the first appointed commissioners to view and order the repair of the bauks on the north side of the river between a place called the Neyt and Temple Bar, within the precincts of Westminster and the parts adjacent, the said banks having become broken and decayed by the force and violeuce of the tides. Concerning the extensive marshes of Essex, the first mention of them is in King John's time, Roger de Crammavill being then attached to shew cause why he did not stand to the determination made in the said King's Court, by a fine with the prior of St. John of Jerusalem, touching the banks, gutters, and ditches to be

In ancient times the conservancy of the river Thames was most strictly attended to, and our forefathers were very jealous of maintaining and preserving the purity of the Thames water; and so intent were the authorities of old times on preventing the river from becoming contaminated by any foreign or noxious matters, that in order to preserve its purity, many enactments were made by Parliament, as well as orders by the Common Council of the City of London, in pursuance of those enactments. In the sixteenth year of the reign of Richard II., A.D. 1392, it was enacted, "that no person do throw, or cause to be thrown, or laid, any filth, or ordure, muck, rubbish, or laystage, in the said water of Thames, of the one side or the other, between the Palace of Westminster and the Tower of London, on pain of the forfeiture of 10*l*.; and butchers or others are prohibited from casting entrails, &c. into the river, on penalty of 40*l*." An Act of Parliament was also passed in the twenty-seventh year of the reign of Henry VIII., A.D. 1535, in which it was enacted, "that if any person or persons do, or procure any thing to be done, in the annoying of the stream of the river of Thames, by casting of dung, or rubbish, or other thing into the said niver, he shall forfeit for so offending the sum of 100 shillings."

During the period of nearly two centuries, the bed of the river has always afforded an abundant supply of most excellent sand and gravel. The sand from this source has always been preferred by builders, and has been and is now being procured with much avidity, in consequence of its sharpness and cleanness, which are the most essential properties in the

composition of mortar. From the bed of the river considerable quantities of gravel have also been and are now being procured for the purpose of forming the modern composition of concrete, and for ballasting very many of the numerous outward-bound shipping. In order to supply the demands for these materials, and for the purpose of removing shelves or accumulations which obstructed the channel, a system of constant dredging has been going on during this period, and this has had great influence in making and maintaining a more uniform and much deeper channel. In pursuance of the last-mentioned enactment Parliament, the Common Council of the city of London, during the year 1667, first issued an order allowing and authorizing any "person or persons to dig, carry away, and take away sand, gravel, or any rubbish, earth, or any thing lying and being in any shelf or shelves within the said river of Thames, without lett or interruption of any person or persons, and without any thing paying for the same, and after that to sell the same away, or otherwise occupy or dispose of the said gravel, sand, or other thing, at their free liberty and pleasurc." And moreover, with reference to the jurisdiction which the city authorities exercised over tion which the city authorities exercised over the city and the grounds adjacent, they also ordered " that all paviours, bricklayers, tilers, masons, and all others that occupy sand or gravel, shall endeavour themselves with all diligence to occupy the said sand or gravel, and none other, paying for the same reasonably, as they should or ought to pay for other sand or gravel digged out of other men's grounds about the said city, which after is filled again with much filthy things to the great infection with much filthy things, to the great infection of the inhabitants of the said city, and all others repairing to the same." The noble and majestic river Thames, running east and west through what may now be called the middle of London, and whose waters were formerly of a London, and whose waters were formerly of a pure and pellucid character, is now the *Cloaca Maxima* or main drain of London, as the stream after passing Putney-bridge becomes loaded and contaminated with the outpouring filth discharged from the various sewers

It appears that through the apathy of the constituted bodies under whose care the conservancy of the river Thames was subsequently placed, very many encroachments upon the channel, on both banks by the advancement of the wharf lines, were permitted from time to time by those bodies. The encroachments were, with few exceptions, never formed with a view to the improvement of the navigation of the river, and in consequence many of the projections that were thrown out into the stream formed direct obstructions to the passing currents, which reflected their motions, produced eddies, deposits, and accumulations of mud and silt at the sides, as well as shoals of sand and gravel upon the bed. While the flowing of the tides up the river Thames was left to their own undeviating

While the flowing of the tides up the river Thames was left to their own undeviating course, and before any obstructions were formed, either by embankments or otherwise, the channel of the river must have been considerably shallower than it is at present, for the various embankments must have had considerable influence in deepening the channel to which the flowing of the river was confined, the contraction of the stream producing a greater velocity, and consequently an increased scour upon its bed. That the river was anciently much shallower than at present is evident from the numerous fords which existed, where persons could cross from one side to the opposite on foot as well as on horseback at the time of low-water, whence the Horseferry, by Lambeth Palace, takes its name; and Maitland says that he discovered an ancient ford "about 90 feet west of the south-west angle of Chelsea College Garden, and at lowwater it was only 4 feet 7 inches deep;" and in consequence of the strong winds downwards the previous day the water was not so deep by a foot; and he also says that, "it is probable that at such tides, before the course of the river was obstructed, either by banks or bridges, it must have been considerably shallower."

it must have been considerably shallower." The learned and indefatigable Camden in bis "Brittania" says, "that the Thames receives the tide about 60 Italian miles from the mouth. And there's no other river in Europe that I know of, where the tide comes up so many miles, to the great advantage of those that live by it. Whether it be, that from this place (Shene) there

are hardly any crookings, but 'tis carryed eastward in a more direct channel, generally fenced with higher banks, and opens a wider mouth than other rivers to let in the sea." But since the removal of old London-bridge the tide has risen much higher and runs upwards to a farther distance, in consequence of the increased velocity imparted to the flood, which causes a greater quantity of water to flow in the same time.

flow in the same time. Although the surfaces of the streets and roads of the whole of London have been artificially raised and will of necessity be getting higher, still a considerable portion of the lower part of Westminster, Wapping, and the whole of Lambeth, Southwark, Bermondsey, and Rotherhithe, are now under high-tide level. These places are protected from inundation by the embankments, and by the flaps to the mouths of the sewers; hence the great importance of maintaining such defences, and of keeping them in good repair. But there are times, especially at spring tides assisted by strong north-east winds, when the embankments are overflowed, inundating the streets, premises, and cellars, to the great detriment and annoyance of the inhabitants.

Hence a question arises as to what effect the contemplated embankment of the river Thames may have by the abstraction of water-space in raising the high-tide level above its present height. The momentum of the tidal wave height. The momentum of the tidal wave flowing up the channel of any river receives a considerable check, which is proportional to the acclivity of the channel. Immediately that the tidal wave arrives at and enters the river, the issue of the ebb is in consequence restrained and forced backwards. The check it receives continues to operate upon the dis-charge from the mouth of the river upwards to the highest point of the reach of the tide; for the tidal wave in meeting and striking the downward current of the river water causes a retardation of both streams, and, in con-sequence, a rising of the waters is produced. A contracted channel accelerates the velocity of both the flood and ebb tides, and in propor-tion as the momentum of the one strikes that of the other, the height of the water will increase and will be dependent; for whatever produces a retardation of the natural velocity of a running stream, either from the cause already suggested, or the irregularities and resistance of the channel, has a considerable tendency to augment the height of the stream. The force of the efflux of the river water running through a contracted channel is sometimes such, that its momentum is much greater than that of the flowing tide; therefore, during freshes the former may be running along the channel in the direction of the discharge, while the latter, being reflected and checked by the superior power, flows in imperceptibly on the top; and the narrowed section may be the means of causing the rise to be somewhat higher than the natural elevation of high-water from the tide alone. The surface of high-water in a river is always much higher upwards than the natural elevation in the open sea, the increased rise being assisted by the shelving shores, the acclivity of the channel, and the pent-up river water.

The velocity and motive power of the water of both the flood and ebb, all along their course, should be as equable and regular as possible; but in order to produce a scouring action on the bed, the longer the duration of ebb-tide lasts beyond that of the flood, the greater will be the prevention of accumulation of silt and mud. The extension of the ebb beyond the duration of the flood in the Thames is produced by the flood-tide ponding back the river waters. The matter held in suspension by the water of tides is nearly in a constant state of oscillation, and the scour of many ebbs is necessary before the *debris* discharged into the river can find its way to the sea. Nearly the same quantity of matter carried downwards is forced up again with the return of flood, but not to the same distance, so that it gradually works downwards, and thus the discharge of ebb ultimately carries it out to sea. The conjoint force and action of the back-water in combination with the river water, more especially during freshes, have a greater mechanical effect as a means of scour when the channel is fixed and limited in its transverse section. But the limit to compression should not interfere with the admittance of a sufficient body of tidal water upwards, for the purpose of

acting as an efficient scour in its descent. Every change in a river whose channel is in a state of regimen, produces a change in the relative velocity, which, again, is attended with a loss of power. It is well known that a series of alternate expansions and con-tractions of the channel of any running stream of water materially retards the velocity and quantity of discharge. If a uniform channel be in any way expanded in parts, the expense of water will be diminished; those parts where the channel is expanded imparting a much greater degree of friction, eddies are produced, and the hydraulic mean depth is also lowered, which together diminishes the velocity, and consequently the discharge. And a negative quantity of dis-charge will also be the result when a uniform channel is contracted at parts. For whatever may be the form of the section of any contraction or obstruction which is presented to the run of the tide, it more or less checks the velocity and free flow of the currents, raises the height, and causes reflected motions and eddies, which produce deposits and accumulations. The quantity of water discharged through any section of a stream running in train along a regular and uniform channel would be equal in the same time, because the velocity of the stream, from the equality of friction and hydraulic mean depth would be uniform, and the declivity of surface would be equal throughout its length. But immediately that the section is narrowed at any part and continued for some distance, the previous uniform velocity is destroyed, the height of the stream will be somewhat augmented behind the point of contraction, and the check thus produced will diminish the velocity backwards. The increased velocity at the contracted part does not make up for the diminution of velocity behind, as might be supposed, for under the circumstances, the same quantity of water passes through the compressed section, as through the larger. would appear, therefore, that a retardation of both the velocity and quantity of water would be the result of a contraction, independent of the abstraction beyond, for as the velocity backwards is diminished, the velocity, mul-tiplied by the section, gives the discharge through that section.

When a dam or sluice is placed across a stream running in train upon a channel which the action of the water has adapted to it, it is very remarkable to witness the diminished effect that is produced in the velocity of the upstream. The declivity and form of the channel which accelerates the motion of the water is destroyed, and the height of the stream is immediately augmented until it adapts itself under the circumstances to the discharge. When the channel of a stream or river is contracted, an im-mediate augmentation of the height is produced, which is quickly followed by an in-creased velocity. Both the flux and reflux of the tides between the parts to be embanked, will receive a permanent augmentation of velocity, in consequence of the contraction of the channel and the uniformity of its width; and the velocities of the stream will vary in in-verse proportion to the areas of the transverse sections, increasing where the channel is contracted, and diminishing where it expands. For the quantity of water discharged through a given area, A, with a given mean velocity, is evidently proportional to the area and velo-city conjointly, or to $A \times V$; and as the area remains constant, the velocity also remains the same; therefore, when the area, A, varies, the quantity of water being the same, the mean velocity, V, also varies inversely as the area; and if a given quantity of water pass through any other area, a, with a given mean veloany other area, a, with a given mean velo-city, v, $a \times v$ must also vary in the same time; consequently, $A \times V = a \times v$; and A:a::v:V. Ex, let A = 17,000 sup. ft.; a = 21,000 sup. ft.; v = 4.583 ft. per sec.; then V = 5.6014 ft. per sec. For as 17,000:21,000:: 4.583: 5.6614; and \therefore (17,000 \times 5.6614) = (21,000 \times 4.5622) and $(17,000 \times 5.6614) = (21,000 \times 4.583)$ = 96,243 cubic ft. per sec. = the discharge. So that the same quantity of water passes through each section in the same time; in fact, this must always take place, in order to keep up a regular discharge. Now the depth of a running stream is dependant upon the de-clivity of the channel and the form and width of the transverse section. The consequence of allowing the tidal waters of a river to expand over extensive lateral tracts of land adjacent to the main channel, is to produce in some is the architect.

degree a depression of its depth, and both the flux and reflux will, from this cause, be of a diminished velocity. But immediately that the spaces of those lateral tracts of land are abstracted, and by embankments the transverse section of a river is narrowed, the waters will flow and reflow with an augmented velocity throughout the whole of the confined channel, but more especially at the surface in the middle of the greatest run of the stream; and at the same time the stream will increase in height. An enlargement of the transverse section, therefore, as at present, produces a diminution of depth and velocity, and as the section increases, the amount of water is augmented in much greater proportion; and conversely by contracting the width of the channel at that part an increased depth and velocity will be imparted to the stream, and a somewhat less quantity of water will be forced up by the tide. This must have the effect of plac-ing those situations on the banks of the Thames in jeopardy which have hitherto been barely out of its influence, and a solid em-bankment of the river Thames would have a considerable tendency towards producing this effect. But the excellent plan proposed by Mr. Page can only cause an increased height in a very slight degree, providing the tide be al-lowed to flow regularly in and out of the docks; as the cubical contents of the wall itself, and the spaces proposed to be filled up in front of Whitehall and the Temple-gardens, would be the only abstraction of water-space, and this abstraction is to be compensated for by dredging above low water mark, bringing the low water line to the base of the terrace.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

AN ordinary meeting was held on Monday evening last (the 10th), Mr. H. E. Kendall in the chair, when Mr. Charles Freeman was elected a fellow, and Mr. William Beck, Mr. Thomas Hayter Lewis, and Mr. Edwin Nash, were elected associates. Amongst the donations was a curious edition (from Mr. Webb), of Cæsar's Commentaries, translated by Palladio. and published at Venice in 1518.

of Cæsar's Commentaries, translated by Palladio, and published at Venice in 1518. Mr. R. W. Billings then read a paper on the carving machine patented by Mr. Samuel Pratt, and exhibited a number of specimens executed by it. We shall notice this very valuable invention in the ensuing week.

The honorary secretary announced that the medals of the Institute would be awarded next year to the authors of the best essays on the following subjects :---

1. On the adaptation and modification of the orders of the Greeks by the Romans and moderns.

2. On the history and manufacture of bricks. And that the Soane medallion would be awarded to the best design for a royal chapel, with seats for five hundred persons, inclusive of the suite, attendants, and choir; the building to be detached, and in a classic Roman, or Italian style. The drawings of the elevations and two sections to be to a scale of one-quarter of an inch to the foot; the plans and perspective view to one-eighth of an inch to the foot, and tinted with India ink or sepia only.

We are anxious to draw attention to these premiums, and express a hope that some of our readers may be induced to enter the lists and carry off the prize. The competition is not confined to members of the Institute.

DAS MAURICHE BAD. — A very extensive structure in the Moorish style has recently been erected at Kaunstadt, in Wirtemburg. It consists of baths, picture-galleries, rooms for balls and assemblies, and spacious conservatories furnished with the choicest plants, and disposed in the most tasteful manner. It is constructed of stone of two different tints laid in alternate courses, and all the architectural members and ornamental details are said to be faithfully rendered from the finest specimens of Arabian architecture in Spain. One conspicuous feature in the design is a copper dome richly gilt; and the octagon conservatories, whose sides are composed of lattice-work filled in with glass, have also gilded domes. Its name is not yet determined upon, so at present it is known only by that which it has obtained from the public of "Das Mauriche Bad," or the Moorish bath. Zanth is the architect.

INSTITUTION OF CIVIL ENGINEERS.

MARCH 4.—Sir John Rennie, President in the chair.

The paper read was "A description of the Great Britain steam-ship, with an account of the trial voyages," by Mr. T. R. Guppy, Assoc. under whose superintendence the vessel and engines were constructed. The paper first gave an account of the origin of the Great Western Steam-ship Company, by a few of the proprietors of the Great Western Railway, who thought that when their railway was completed, Bristol would become the natural port for a direct line of communication with New York; hence the building of the Great Western steamer, which succeeded beyond the expectation of the proprietors, with the single exception, that, like many other steamers, the machinery and fuel occupied so great a space, comparatively with that devoted to passengers and goods, as to operate prejudicially in a pocuniary point of view. The company then projected a second ship, and after much consideration, decided upon building it of iron, with peculiar direct acting engines, and in consequence of the apparent success of the experimental "Archimedes," they determined upon using the screw propeller. The details of the given; of the latter, as they have so repeatedly been published, it will suffice to mention only a few;—the length of keel, 289 feet; length aloft, 322 feet; main breadth, 50 feet 6 inches; depth of hold, 32 feet 6 inches, tonnage, 3,444 tons. The weight of iron used in the hull is 1,040 tons; the weight of woodwork in decks, &c., is 370 tons; weight of the engines and boilers without water is 520 tons; the total weight is therefore 1930 tons. She will take 1,000 tons of coal, and 1,000 tons of measurement goods, at a draft of 17 feet of water forward, and 17 feet 6 inches aft.

The engines employed to drive this screw consist of four cylinders, each 88 inches in diameter, with 6 feet stroke, working with steam at 44 lbs. pressure, and cutting it off at § th the length of the stroke. The connecting rods act directly in pairs upon crank pins at either end of the main shaft, 17 feet long by 28 inches in diameter. Upon the main shaft is a toothed drum 16 feet diameter, around which work four pitched chains, encircling also a lower drum 6 feet in diameter upon the propeller shaft. The chains work quietly and smoothly, and when the engines are making eighteen revolutions per minute, the speed being nearly 2.95 to 1, the screw makes about fifty-three revolutions per minute. A considerable portion of this shafting was 30 inches diameter, hollow, and formed of two courses of plates § inch thick rivetted together.

The account of the trial trips in the Bristol Channel, and the voyage from Bristol to London, abounded in curious facts. It appeared that with the engines making 183 revolutions, the speed of the vessel would be 113 knots, and the slip of the screw 13 per cent. : even during the voyage round, with a heavy gale dead against her, she made upwards of 93 knots. The ship behaved remarkably well, steered well, and although disadvantageously loaded, with no weight in her bottom, she rolled easily. In the heaviest weather the engines worked uniformly, and never made those variations in speed which are observed in steam-boats when the puddle-wheels are alternately plunged deeply, and then nearly out of the water.

RAILWAY IN INDIA.—A company has been formed to construct a 'railway to connect Bombay with the mainland, and ultimately with the city of Poonah, and the Deccan. Government has expressed its willingness to allow a free passage through its lands, and has recommended an Act of incorporation. The leading native landholders have also come forward to declare their concurrence to grant a free passage through their lands. There are no remarkable difficulties for the engineering department between the fort of Bombay and Tamah, and the traffic in goods, produce, and passengers is very great. Of the advantages of the railway there is not the smallest doubt; the direct trade from Bombay into the interior has no other line for a road.

•••

At the last meeting of the society, held March 6th, five new members were admitted, and the following report was read by the secretary :---

"The committee have to announce the publication of the sixth part of the 'Instrumenta Ecclesiastica;' which contains working-drawings of a parclose, a bier, coffin-lids, a lichgate, and a font-cover.

gate, and a font-cover. They have also put in hand the sixth number of the 'Illustrations of Monumental Brasses,' which will complete that series in a single volume. The subjects chosen for illustration are a priest, from S. Margaret's, Horsmonden, Kent; a judge, from S. Peter's, Gunby, Lincolnshire; a knight and a priest, from S. Mary's, Broadwater, Sussex.

Grants of money have been made towards the restoration of S. Mary's, Stogumber, Somersetshire; S. Mary's, Rampisham, Dorsetshire; Holy Trinity, Rudgwick, Sussex; S. Peter's, Frome, Somersetshire; and a small grant has been given in token of approbation of the design for a new church at Chapeltown, in the parish of S. John, Ecclesfield, Yorkshire.

A third part of the Transactions is in progress.

They would take this opportunity of making known that the Messrs. Powell, of the Whitefriars Glass-works, London, have applied themselves to the manufacture of flowered quarries from the designs put forth by the society in the 'Ecclesiologist,' Nos. 25, 26, and the 'Instrumenta Ecclesiastica,' Part III. The manufacturers have secured a patent for their process. The removal of the tax upon glass will now enable church-builders and restorers to bring flowered-quarries into general use.

The committee give notice, in pursuance of law 16, that at the next meeting, on April 24, they will propose that the 16th law of the society be suspended on the anniversary meeting of May 8th, in order to facilitate the general discussion of the recommendation from the committee which will then be submitted to the members.

They have further determined that nonresident members shall be allowed to vote on that occasion by proxy. Forms of proxy will be furnished to each member at an early opportunity."

To be, or not to be, is still the question; and the advocates of either side are actively canvassing for supporters on the day of trial. The admission of proxies is considered by some to have nearly settled the doubt, and they look upon the society as re-established.

We are not quite so certain of this ourselves, as we know that many of the non-resident members have regarded with sorrow the proceedings of the association. Fully impressed as we are, with a knowledge of the improvement in church architecture which this society has materially aided in effecting, we would rather see it completely dissolved than that it should be permitted to pursue the dangerous path into which, by insidious hands, it has been guided,—a path, the end of which is too plainly visible.

MABBLES OF NORTH DERBYSHIRE. — There still exists a considerable portion of ambiguity respecting the ancient trade and commerce of England. The district of North Derbyshire, from the difficulty of its approach, being nearly surrounded with mountainous ridges, and intersected by deep defiles and mountain passes—is equally difficult. These combined features give that part of North Derbyshire denominated the High Peak, a duth, heavy, isolated character. Nevertheless, a district like North Derbyshire, abounding as it does with the useful ores of lead and iron, with other natural productions, would necessarily have some intercourse of trade in early ages. There is sufficient evidence to prove that a very large and considerable quantity of Derbyshire marble, and fluor spar were objects at that time of exportation. At the different spar manufactories in Derby, Matbek, &c., this elegant material is worked into a variety of ornamental and useful articles; such as vases, cups, necklaces, ear-drops, &c. Thousands of these are exported to foreign markets.

FREEMASONS OF THE CHURCH.

MARCH 11th, 1845.—The Rev. G. Pocock, LL.B., in the chair. The minutes of the last meeting were read and confirmed. Mr. W. P. Griffith, F.S.A., was elected secretary. The following additional vice-presidents were elected: Lord John Manners, M.P.; Sir Walter James, M.P.; C. Baring Wall, Esq., M.P.; Benjamin D'Israeli, Esq., M.P.; and C. Newdigate Newdegate, Esq., M.P.

M.P.; Benjamin D'Israeli, Esq., M.P.; and C. Newdigate Newdegate, Esq., M.P. Mr. W. G. Rogers exhibited a specimen of ironwork from Hampton-court Palace, consisting of a portcullis and a porter's guard: also a portrait of George IV. in mosaic, from the picture presented to Pope Pius VII., the only Protestant portrait in the Papal palace. Mr. J. W. Archer exhibited a cast from a seal of Bramber Castle, Sussex, found lately underground.

On the motion of Mr. W. P. Griffith, it was resolved that a deputation, consisting of the Rev. Hugh Hughes, B.D., Rector of St. John's, Clerkenwell; the Rev. G. Pocock, LL.B.; Messrs. C. H. Smith, T. Dighton, W. G. Rogers, and Mr. J. Finn, should wait upon Messrs. Reid and Co., to endeavour to dissuade them from disfiguring St. John's Gate, Clerkenwell, with compo, now commenced, and if successful, that the secretary should call a public meeting to adopt immediate measures for its careful restoration. Mr. J. W. Archer then read a discourse

Mr. J. W. Archer then read a discourse upon the existing monumental brasses of England.

The lecturer explained, that monuments described by the conventional term brasses, were composed of various alloys, some of which he described. He then spoke of the knowledge of the principles of architecture and of the arts, generally cultivated by churchmen of the middle ages, and ascribed to them the design of some of the monumental brasses. This was followed by some description of the process by followed by some description of the process by which a brass was executed, and the work-manship was ascribed to the goldsmiths of the time; the tombs of Richard II. and Queen Eleanor were as evidence of the combined operation of the goldsmiths, and en-gravers' work. After this, the lecturer touched upon the arts of the thirteenth century, and produced arguments in support of the existence of an original school of art in England previous to the revival in Italy. Some circumstances indicating the introduction of certain features of Greek art during the thirteenth century were mentioned, and seve-ral brasses of the fourteenth, fifteenth, and sixteenth centuries described. In the examination of certain tombs a resemblance was discovered between the appearance of the body and the effigy on the tomb. A monumental brass, recently found in the city, was men-tioned, as affording evidence of the use of colour, and the nature of the material. The destruction of brasses, both before and after the Reformation, was commented upon, and some suggestions were thrown out with regard to the possibility of brasses, which had been concealed in troubled times, being discovered.

The lecturer, in conclusion, spoke of the utility of the monumental brasses, as guides to historical painters for costume, &c.; described the decline of the art, and its ultimate disuse, and delivered some reasons for its revival, which he had undertaken and made some progress in. He expressed a hope that, in the awakened inquiry now going on relative to church architecture and decoration, the beauty and religious character of the old nonumental brass might entitle it to due attention and an appropriate place among the accessories of pointed architecture.

ORPHAN WORKING SCHOOL, CITY-BOAD.— The great increase of claimants upon the benefits of this charity have induced the committee to ercet a larger and more commodious building, which is now being carried into execution at Haverstock-hill, Hampstead-road, under the superintendence of Mr. Ainger, who has furnished the design. In a circular issued by the committee, it is stated that 6,200*l*., out of the benefactions of deceased governors and friends, have already been expended, by order of the general court, in the purchase of the ground. About 14,000*l*. are required for the completion of the plan.

MUSEUMS OF ART.

MB. EWABT a few evenings since obtained leave to bring in a bill to enable town-councils to establish museums of art in corporate towns. The advantages that must arise from encouraging a taste for the arts by the means proposed, are so great, so various, and so evident, that no diversity of opinion was expressed in the House.

In introducing the subject, the hon. member took occasion to say that there existed peculiar circumstances at the present time for affording facility in the diffusion of works of art throughout the country. By the railways, specimens might be sent down to the different large towns, and it would be the fault of the Government if there should be one without a museum of such a character as would give a sound taste for the arts, and thus enable the people to apply the skill they thereby attained to manufactures. He trusted, therefore, that before long he should see the system of schools of design generally perfected throughout the country. But exhibitions of works of art were moreover necessary to educate the eye of the people. It was well known that until the Romans had an abundance of specimens, and, as it were, were educated by the eye, they never themselves made any great progress in the arts.

Mr. Wyse, in seconding the motion, pointed out the number of contingencies to which voluntary institutions were subject, and how difficult it was to guarantee the continuance of them if they depended solely on the disposition of the inhabitants of large towns.

Sir Robert Peel suggested, that instead of giving the town-council too extensive powers to tax the people for the purposes contemplated, they should first endeavour to obtain by voluntary contributions, sufficient money to provide the museum; the edifice being erected by such means, on the clear understanding that it would be henceforth maintained by local taxation. Such a plan would insure the permanency of the museum, and afford a guarantee and an encouragement to the rich and liberal to come forward in order to establish the museum. The same experiment had been tried successfully in respect to the endowment of new churches. If the town-council should obtain the power proposed, he hoped they would thus make it subservient to local liberality and improvement. He had no doubt that the effect of such a plan would be to lead many of the resident gentlemen of each neighbourhood not merely to assist in rearing the edifice, but in supplying it with valuable presents.

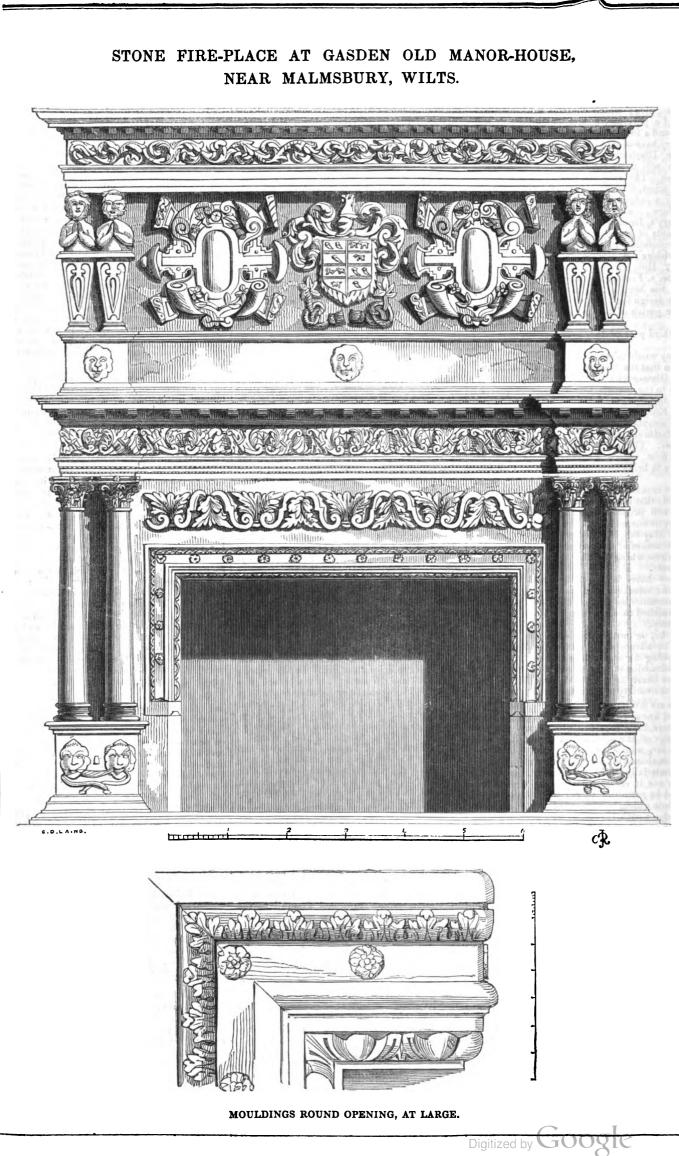

Mr. Brotherton submitted a calculation he had made with regard to a large town with which he was connected, by which it appeared that a tax of one halfpenny in the pound would be sufficient to raise a building which should cost 50,000*l*. He further stated, that it was much better to cultivate a taste for the arts at the public expense, than to raise a large amount of taxation for the prevention and punishment of crime.

Mr. M. Gore thought that the proposed step would tend not only to raise the arts and sciences to a loftier eminence, but at the same time, while improving the morals and purifying the spirit of the people, it would extend the basis on which rested the foundation of peace, security, and national prosperity.

Mr. Labouchere observed, that the proposed measure would afford a very important assist-ance in the promotion of the objects of the school of design, which was extending its ope-rations throughout the country, and accomplishing the greatest good in many branches of He thought it to be of great manufacture. importance that the people should have opportunities of seeing models of works of art of the highest class; and without it all schools of design would labour in vain to diffuse a correct taste in art and drawing. The very best models happened to be those which could be supplied at an extremely cheap rate-casts of the best statues of antiquity and bas-reliefs. The late Sir F. Chantrey, who, to his honour, raised himself from humble circumstances, used to be a constant attendant in the School of Design, and often regretted that he had not had his mind trained and his eyes educated by being accustomed to such works of art from an earlier period of his-life.

THE BUILDER.

STONE FIRE-PLACE AT GASDEN OLD MANOR-HOUSE, NEAR MALMSBURY, WILTS.

THE fire-place represented on the adjoining page, is in my opinion, a much better example of the architecture of James I. than either of those from Hickes's Hall* or Boston House.+ This is in the great chamber of the old manorhouse at Gasden, in Wilts, situated near the picturesque village of Charlton, and is entirely of stone.

The building, which is now occupied as a farm-house, contains little else worth notice, excepting one or two good ceilings, and some very rich iron turn-buckles to the lead casements. I have not been able to meet with any history of the building, neither can I get much information respecting the shield of arms in the centre of the firstly of arms in the centre of the fire-place; it appears to contain the arms of Oldgrave or Owlgrave, and Colt (the latter was a Wilts family); the former bore azure, a fess engrailed between three owls argent; Colt bears argent, a fess azure, between three horses courant sable. These are apparently the arms, but repetigree shews no connection between them. It must remain conjectural as to whom the shield belonged.

C. J. RICHARDSON.

THE PARISH OF CHELSEA, AND THE METROPOLITAN IMPROVEMENT COMMISSIONERS.

THE inhabitants of St. Luke's, Chelsea, have addressed a memorial to the Improvement Commissioners to the following effect; we hope the example will not be lost sight of by other parishes :-

"That, looking upon London as the centre of the monied world, and, as a necessary con-sequence, the place where the business of the United Kingdom, its colonies, and dependen-cies, and the business of the whole world, to a great extent, must be concentrated; viewing it also as the seat of Government, the focus of literature, art, and science, it is obvious that it must, with its present extraordinary and daily increasing facilities of communication, go on attracting larger and larger numbers to it from all parts of the world.

That successive governments, foreseeing this, and bearing in mind the increase of traffic which must necessarily spring from it, have, with a wise forethought, which is greatly to be admired, done all in their power to improve the leading thoroughfares of the metropolis by widening them where practicable, and making more direct communications, and opening up new ones, where required.

That by these means the city and the spproaches to it from all parts, have been im-proved to an extent which would have been deemed impracticable half a century ago.

That, notwithstanding these great improvements, however, it is obvious greater facilities of communication will soon be required; and since little more can be effected in the formation of new lines of thoroughfare than is now being effected, or about to be effected, the question naturally arises, what other arrange-ments can be made to meet the expected increase of traffic?

That, in the opinion of your memorialists, there is no other mode of making this provision but by rendering the river Thames, which runs through the very heart of the metropolis, more available for steam-boat traffic.

That, considering the wonderful increase of traffic by these boats of late years, and the advantages they hold out in point of cheapness, celerity, and comfort to the passengers, there is little doubt they would become the common means of transit to all persons residing along the densely-crowded shores of our river, provided proper stations were made at convenient spots along its banks, and proper accommodation were provided at them for passengers whilst waiting for embarkation.

That by this mode it appears to your memorialists, provision might easily be made for an increase of traffic to any conceivable extent, not only to the great relief of the main thoroughfares from the vehicles that would otherwise be crowded therein, but the great advantage of the public. That, important as this provision for the

* See page 562, vol. ii. † See page 570, vol. ii.

growing traffic of the metropolis would be, commercially considered, there is another point of view in which it would be of equal, if not greater, importance; viz. as a means of cheap and ready conveyance to the large multitudes of the working population who reside in the densely-crowded neighbourhoods on both sides of the Thames, to open spots on the banks of the river beyond the metropolis, which might now be easily secured, for their exercise and healthful recreation. That, considering the rapid rate at which the

suburbs of the metropolis are extending in all directions, and the distance people must consequently travel from the centre of the metropolis, through crowded thoroughfares, before they can reach the open country for air and exercise,— the importance of providing larger open spaces on the banks of the Thames as places of resort to the working classes, cannot possibly be overrated.

That, under this impression, your memo-rialists have heard with great delight the inten-tion of her Majesty's commissioners to recommend an embankment of the Thames, so as to form a handsome road from Vauxhallbridge to Battersea-bridge, considering as they do, that such embankment, with a broad and handsome foot and carriage way attached to it, would not only be one of the greatest orna-ments of the metropolis, but a great advantage to all classes therein, and in particular to the working classes before referred to.

That to make such embankment, however, of the greatest public utility, your memorialists humbly submit that the means of continuing it onward to Fulham ought at once to be secured. if not rendered immediately available. They would, therefore, strongly urge upon your bonourable Board the necessity of purchasing a belt of land along the banks of the river, of a sufficient breadth for carrying out the three following purposes :- lst. The formathree following purposes :- 1st. The forma-tion of ornamental walks next the river, for the use of the myriads of working people, who would avail themselves of the convenience and cheapness of steam-boat transit, to enjoy the pure air and delightful scenery that would be thus afforded them. 2nd. The construction of a handsome carriage-drive from Chelsea to Fulham, for the use of the upper classes. And 3rd. The erection of a series of villas along that line of road, the sites of which would, in the opinion of your memorialists, sell for more than would pay the whole expense of the purchase of the land in its present state, and the formation of the embankment.

That if this noble undertaking were carried out in the style in which the Government has hitherto been accustomed to carry out its plans, your memorialists confidently believe that it would excel in real utility and beauty of design, any thing which has yet been ac-complished in any city in Europe.

That your memorialists, besides forming part of the of the community to be benefited by the admirable work, conceive they have an especial claim to urge its execution, inasmuch as they are inhabitants of a parish containing a population of upwards of 45,000 persons, who have been paying for many years the extra duty of 8d. per ton upon all coals brought into London, and have thereby contributed towards the carrying out the improvements in other parts of the metropolis, while they have as yet derived no advantage from any improvement effected in their own locality.

That your memorialists, contemplating the improvement which would be effected by the embankment upon a part of their parish, have been induced to seek the aid of the legislature, for the purpose of effecting improvements in other parts of the parish at their own expense, and a bill for that purpose is now before Parliament.

That as a parish in the vicinity of the royal palace, struggling to emancipate itself from the very degraded position in which it has been left for many years, your memorialists confi-dently look forwards to the embankment as a work that would have a greater effect in stimulating improvement in their neighbourhood, and raising it in the scale of metropo-litan districts, than any thing else that could be devised.

For these reasons, therefore, your memo-rialists earnestly entreat your honourable honourable Board that you would be pleased to use your best exertions to cause the embankment of the Thames, from Vauxhall-bridge to Battersea-

bridge, on the Middlesex side, to be carried out with the least possible delay, and also to insure the continuation of the same onward to Fulham in the mode above referred to as soon as practicable.

And your memorialists will ever pray. &c."

LAYING OUT STREETS AND ALLEYS.

-I will further intrude on your columns SIR upon the remaining question in the circular of the official referees concerning streets, quoted in your leading article of the 25th January. Upon this point the opinion of the referees is thus given :—"Streets formed after the passing of the Act must be built in conformity with the provisions of the Metropolitan Buildings Act, see section 52, and that the mere setting or laying out will not be sufficient to take them out of the Act." Feeling that in some cases out of the Act." Feeling that in some cases this might press hardly, they say, "If parties are prejudiced by the enactment, they must seek relief under the 9th or 10th sections." Did this proposed relief exist, it would be but an appeal to them from their own previous decision, expressed by sanctioning the issuing of a summons; but by some oversight they have quoted sections that have literally nothing to do with the matter ; these sections referring exclusively to parties who have entered into agreements by which they were permitted to form streets and alleys of a dimension and form proscribed by the Act, to assess the amount of damage they sustain as against their landlord; and consequently can have no effect in relation to parties having laid out such streets on their own land, or under an agreement or lease where no such operation formed part of the consideration.

To make the matter intelligible, it may be well to state, the date of the passing of the Act was 9th August, 1844, set up by the dictum of the referees versus 1st January, 1845. I am the referees versus ist January, 1943. I am aware of the difficulty of proving a negative, but their assumption of a particular date (the passing of the Act) would tend affirmatively to prove that in their opinion streets formed previous to that period might be built upon; and for the term "built" I thank them very much.

I object to the substitution of the 9th August for the 1st January, for this reason: the public had permission given them to do certain acts before 1st of January, amongst others, by section 2, under the head "Hereafter to be built," we find "to apply to all streets or alleys not laid out before the said 1st day of January, or which, being laid out, shall not be rendered fit for use within twelve months thereafter." Here is a positive enactment, in my opinion, not at all controlled by section 52, which, being uncertain, would not be per-mitted to over-ride such positive permission. It is stated in section 52, "Be it enacted with regard to such streets and other ways hereafter formed, so far as relates to securing a sufficient width thereof." I contend this precedent formed, so far as relates to securing a sufficient width thereof." I contend this precedent paragraph, by the word "hereafter," applies to section 2, "already built," as above quoted, and then comes "That from the passing of this Act all the conditions, regulations, and directions contained in the schedule (I) to this Act annexed shall be duly observed and performed;" here is at least contradiction against previous, positive, and intelligible permission.

This brings us to the discussion in what yay such streets or alleys laid out before the 9th August, or 1st January (as the case may be decided), may be built upon. It is quite clear that parties may now, as heretofore, at any time lay out streets or alleys, of what form and size they please, provided no attempt is made to build upon those not in accordance with the Act. The referees have negatively admitted that such streets and alleys may be "built" without reference to the new Act, if formed (as they state) previous to the passing of the Act. As practical men, they saw, being of the Act. As practical men, they saw, being under the head "already built," it implied erections to be put thereon, and not the mere forming the street; this will remove a world of doubt as to what a "commencement" is. It appears to me evident that any party having so laid out a street or alley before 1st January, and completing the same within twelve months, may cover it with buildings perfectly irremay cover spective of the new Act.

In your leading article of 25th January, Digitized by GOOGLE

you quote, as the opinion of the official referees, "as to the mode of erection which may be pursued with regard to buildings so commenced" (*i. e.* duly commenced before January 1), "we are of opinion that as to such buildings within the operation of the old Buildings Act (14 Geo. 3, c. 78), they must be built according to the provisions of that Act, since these proceedings, commenced or taken under that Act before the 1st January, are not repealed." In the case stated in my letter 22nd February, I feel that I owe the referees an apology for venturing to assume they had overlooked this exception; but with this knowledge included in the circular to the district surveyors, how came the district surveyor, having received admitted legal notice under the old Act, to issue the summons? And still more startling is it that the referees, in opposition to their own dictum, appointed a hearing of the case, attended on our part by three surveyors and witnesses. Who is to pay

Having now touched upon each point in the circular from the referees, I propose for the present to intrude on your columns with one further letter only, proposing concisely to set out the points at issue—to bring the whole matter by a kind of abstract before your readers, that such course may be taken as shall be deemed expedient. It must be evident the referees cannot notice such statements; and being but the opinions of an individual, they can lead to no practical result. In my last letter I stated my intention of declining the proposed conference with the referees; upon consideration, I felt I was not justified in so doing, inasmuch as the interview was not proposed to discuss the merits of the case (another day being named for the hearing thereof), but simply to discuss my allegations of irregularities in the proceedings. I am really glad that I attended the meeting; and have much pleasure in stating that in an extended conference, free discussion was permitted on the smallest point, and an evident desire evinced to elicit the truth.

Although I do not feel myself at liberty to give to the public the details of the discussion, it has enabled me to arrive at a conclusion in my own mind of what the duties were intended to be, and as my allegations and the reply of the district surveyor, whom I met, have become public records, I do not feel the same hesitation in bringing them forward in illustration of my arguments in my promised concluding letter. My present impression is, that the duties of the official referees are more defined than we have imagined, but that difficulty to some considerable extent, will arise from a want of controlling power to prevent parties unnecessarily calling in the district surveyors, and through them moving the office of the official referees. My present view is, that the machinery once put in motion, there is no alternative but to proceed; but it would be a disgrace to the intelligence and science of the present day to imagine that a well-constructed drag might not be adapted to check a body impelled by the most fearful impetus; and I have a glimmering of hope that a safety valve may be constructed through the medium of the Com-missioners of Works and Buildings, by the power delegated to them by sec. 11, upon a fair and candid representation being made to them of difficulty having arisen in the construction to be put on certain clauses.

GREENWAY ROBINS.

THE CHURCH.—At a meeting, held two weeks ago, of the Incorporated Society for promoting the enlargement, building, and repairing of churches and chapels, grants were voted towards building two new churches viz. at Seer Green, near Slough, and at Sandown, in the Isle of Wight; and towards rebuilding, with enlargement, the churches at Croxdale, near Durhan; Illogan, near Redruth; Puttoxhill, near Silsoe; Runcorn, Cheshire; Goytreas, near Pontypool; Bradpoole, near Bridport; and Woolfardsworthy, near Crediton. And likewise towards the enlargement or otherwise increasing the accommodation in the following churches—viz. Whimpole, near Honiton, Devonshire; Market Bosworth, Leicestershire; Haverfordwest, South Wales; and Coombe Bisset, near Salisbury.

WORKS IN THE PROVINCES.

Ar Bury St. Edmund's, a move has already been made towards establishing a museum of art in that town. The chamber over the abbey gate has been suggested as being welladapted for the purpose, both as regards size and locality. A correspondent of the Bury and Suffolk Herald states, that from the well-known liberality of the Marquis of Bristol, but little doubt exists of his willingness to grant it for the object proposed.

At the great Highland gathering, in August next, in celebration of the "forty-five," and which is to take place in the centre of one of the most wild, beautiful, and picturesque scenes in the Highlands, a magnificent celtic cairn is to be erected to the memory of the author of "Waverley." Every individual present, of whatever country, will have the opportunity of "adding a stone to the cairn" of the mighty wizard.

At Liverpool, a new observatory has recently been erected by the corporation. It is near the south-west corner of the Waterloo Dock, and a few yards from the river wall. The building is of hewn red free-stone two stories in height. The principal front is to the south, with a central semi-circular projection. There is a smaller frontage to the west, affording a fine view of the river and the Cheshire shore. The chief apartments consist of the chronometer room, the transit room, and the equatorial room. The primary object of the observatory is not so much for general astronomical observations, as for the practical purposes of ascertaining *true time* for the accurate rating of ships' chronometers,—in other words, for the immediate use and benefit of the port, in this respect, a desideratum which has long been felt.

Application will shortly be made to Parliament for an Act to construct certain reservoirs at the head of the river Kent, in Westmoreland. It appears from a petition lately presented to the House of Commons from the inhabitants of Staveley, that the falls of water on the river have been the great source of trade, and, by the drainage of land and a lake called Kentmere Tarn, the river is more easily influenced by floods and drought, so that many have suffered severely from the want of water in dry seasons. That many falls are still unoccupied by mills whose value would be increased by a constant supply of water. That coal is very dear, and consequently water is the only power obtainable in the neighbourhood; and that unless reservoirs are constructed, the river Kent will become altogether unprofitable for manufacturing purposes.

unprofitable for manufacturing purposes. At St. Ives, the new National Schools are progressing very fast towards completion; the style is Gothic, and the building will be ornamental to the town. The master is appointed, and the schools will be opened this spring.

At Goventry, a commodious and substantial new school-room, belonging to Bailey's charity, has recently been erected at the back of the old premises in Little Park-street. It was opened for the first time on Sunday morning last, in the presence of the school trustees and several clergymen.

A public meeting was held last week at Rotherham, Yorkshire, for the purpose of adopting measures for the establishment of public baths. A company has in consequence been formed, and the necessary funds are to be raised by the issue of shares of 5/. each. A provisional committee was appointed to canvass the town and neighbourhood for subscribers, to look out for an eligible site, obtain plans and estimates, and to report to a future meeting of subscribers at the earliest possible opportunity. A letter was read from Mr. Buller, one of the secretaries of the London committee for forming public baths and washhouses, offering any aid which might be in his power to facilitate the object of the meeting.

A public company has been formed for the purpose of improving the outfall below Lynn, in Norfolk, and for reclaiming from the sea 30,000 acres of land, part of the estuary called "the Wash," between the counties of Norfolk and Lincoln. To carry out the object, it is proposed to raise a capital of 500,000/. The trustees consist of Earl Fitzwilliam, Sir Thomas Hare, Bart., Earl of Orford, Lord George Bentinck, M.P., William Bagge, Esq., M.P., and W.W. Chute, Esq., M.P. The Duke of Portland has subscribed 5,000/. towards the undertaking.

At Deal, the Commissioners of Pavement have determined upon purchasing the houses at the south of the Esplanade, and throwing the sites thereof into the street. The town will be considerably improved by this judicious step on the part of the trust.

At Northampton, a dispensary is about to be erected in commemoration of her Majesty and Prince Albert passing through that city on their late visit to the Marquis and Marchioness of Exeter, at Burleigh House. The noble marquis, as lord lieutenant of the county, has addressed a communication to the Mayor of Northampton, signifying her Majesty's consent at the intended new establishment bearing the name of "The Victoria Dispensary."

the name of "The Victoria Dispensary." At Exeter, the members of "The Episcopal Free Church" have purchased a site on tha east side of Southernhay, nearly opposite the entrance to the cathedral close, for the purpose of erecting a sacred building.

entrance to the cathedrai crose, so and of erecting a sacred building. At Hull, the Victoria Promenade is progressing most favourably, although little has lately been heard of it. Lord Fitzwilliam, Lord Milton, and the Hon. Mr. Fitzwilliam, have recently become shareholders. The promoters have had their attention up to the present time almost entirely directed towards procuring the requisite land. The committee of the Church Building Fund have fixed upon the neighbourhood of Kingston College as an eligible site for the proposed new church at Hull. The church is to be dedicated to St. Paul.

The proposal to build a bridge over the Mersey has been revived, and Mr. William Stuart, a Scottish engineer, has submitted a very ingenious plan for carrying the project into effect.

The political friends and admirers of the late Lord Holland have subscribed 5,000*l*. for a monument to his memory, to be placed in Westminister Abbey. The committee of management have intrusted the execution of the work to Mr. Baily, the Royal Academician.

The Earl of Shrewsbury has just concluded a treaty with a building company in Cheshire, by which his lordship receives 35,000/. for 85 acres of his extensive property in that county.

An important project is in contemplation, which, if carried out, will prove of immense advantage to Maidstone and the surrounding country. The proposition is to deepen and widen the River Medway, so as to make it navigable up to Maidstone.

navigable up to Matastone. The Council of the United Service Institution, in Scotland-yard, have lately purchased the adjoining house of Lord Stuart de Rothsay, for 3,500*l.*, subject to a ground-rent of 250*l.* **a** year. The purchase has been made with the view of enlarging the museum, and constructing a capacious lecture-room. The Earl of Arundel, who is vice-president, has contributed the liberal donation of 100*l.* towards the contemplated improvements.

templated improvements. It appears that Prince Albert was so much delighted with the game of tennis whilst at Brighton, that it is his Royal Highness's intention to build a tennis court at Buckingham-palace.

ARLES.—Plans have been made (says the *Constitutionnel*) for the restoration of the Amphitheatre of Arles, and the Church of St. Ouen at Rouen. The estimated expense of the first is 400,000f. and of the second 1,400,000f.

WALLS BUILT OVER WELLS. — A short time ago, when a shepherd's wife at Aspenden, near Buntingford, was sitting with her children before the fire, the fire-place, hearth, stove, the children's seats, and every other article in the vicinity disappeared, sinking down, as through a trap-door. It turned out that the fire-place sunk into an old well that had been built upon for more than half a century. The aperture left is about six feet in diameter, and the depth, as far as can be ascertained, for the debris, sixty feet, and containing a great quantity of water. About seventy years since the premises were in the occupation of Mr. Penn, a brewer, and it is supposed that the well was not arched over when built upon. Very recently we observed a new party-wall built upon oak planking over a well, without an arch. It is to be hoped the above recorded narrow escape may serve as a warning against

such a practice OOSIC

Rew Books.

The Geologist's Text Book. By PROFESSOR ANSTED. Van Voorst, London: 1845.

A KNOWLEDGE of the principles of geology isalmost essential to engineers and architects In making roads and canals, tunnelling, the selection of sites, and the materials for buildings, digging for water, and draining lands, it will be found of the utmost value. It is not to be expected, neither is it necessary, that every architect should be a professed geologist; but knowledge of he should have such a general the science as shall shew him where to go for information when the special occasion arises, and how to avail himself of it efficiently.

The publication before us is not intended for those who have no previous acquaintance with the study, but as a companion in the field or closet to a student who has been taught the principles, but is not yet familiar with the practice, of the subject. In fact, it is an analysis, and a very able one, of a larger work on geology by the same author,—a summary of the actual condition of the science, and an intimation of how far conclusions in vogue may be admitted as sound, and acted on with confidence. It is an able work, and may be safely consulted.

A Report of the Proceedings of the British Archæological Association, at the first Ge-neral Meeting held at Canterbury. By ALFRED JOHN DUNKIN. J. Russell Smith, London : 1845.

THIS volume, of which only 150 copies have been printed, contains a full and very correct account of all that occurred at Canterbury in September last, and cannot fail to be ac in September last, and cannot fail to be ac-ceptable as a record, to those who attended. Sir William Betham's paper, "On the origin of Idolatry;" the Rev. J. B. Deane's valuable essay "On the early sepulchral remains extant in Great Britain;" Mr. Lowe's paper "On the Pelham Buckle;" and the result of Mr. Stapleton's erudite researches illustra-tive of the succession to the barony of William of Arques; are given at considerable length. The most interesting part of its contents to us is the translation of Gervase's account of the burning of the ancient cathedral of Canterbury in the year 1174, and its re-erection in 1175-1184, by Mr. Edward Cresy, jun.; to which we may perhaps return on another occasion. The editor states in the preface, what is pro-bably true, that "he had no pecuniary object in printing this report, else he might have realized a large sum by extending the im-pressions;" but was actuated solely by a desire to pay a tribute to those gentlemen who either actually attended at Canterbury, or by their papers or gifts contributed to its success.

The future fate of this association is somewhat doubtful; unfortunately at this moment there are two committees in existence carrying on its business, and we all know the insecurity of two stools. Those who wish well to the association will endeavour to remove existing difficulties, aid by persuading each party to yield something, and in effecting an harmonious coalition.

CONTINENTAL ARCHITECTURE. --- Professor Gartner of Munich, is about to follow the examples set by Schinkel and Klenze, in publishing a series of all the principal buildings he has executed. The professor succeeded Klenze as the king's special architect, and has erected most of the recent monumental structures in the Bavarian capital. The work will doubtless be an interesting and valuable addition to the architect's library. PRINCE ALBERT.— His Royal Highness

continues to manifest considerable interest in matters of science and art. A few days since, after presiding at a meeting of the commission for promoting the fine arts in the rebuilding of the Palace of Westminster, the Prince went over the new structure with Mr. Barry and the con-Highness visited Lord Northaupton and the feilows of the Royal Society, and examined with much apparent pleasure, the various inventions and works of art which were ex-bibited. We should like to see the Prince occasionally call around him at the palace some of our poets, artists, and men of science. The names of such, strange to say, are never seen in the list of the " royal dinner party."

Correspondence.

THE OFFICIAL REFEREES.

SIR,-The letter of your correspondent "Censor" will, I think, justify me in troubling you with a few remarks upon the subject of the manner in which business is conducted by the Trafalgar-square "Board." "Censor," it would appear from his letter, expects that the referees and the registrar should be con-tinually on view to any person who may wish to look at them. On this point, since reading his letter, I have thought much, and on look-ing to "the Act" I find that one of its pri-mary objects is to prevent, for the future, the "diversity of practice" that has hitherto ex-isted. Now, Sir, I should like to ask "Censor" whether if he were to be permitted at all times to see the referees, this object would not in all probability be defeated; it could not be ex-pected that they should be always together, and if they were not so, it would be quite possible for a man to obtain orders diametrically opposing each other from the "referees;" and and it were possible for these gentlemen even if (they being in the same profession) always to see things in the same light, what is to be done about the registrar? he has the power of refusing to sanction their proceedings if, in his opinion, they are contrary to law. Assuming, therefore, that I am correct in my pre-mises, what arrangement can be better than that all matters should be determined by the referees and the registrarsitting as a board ? In this manner the chances are, that diversity of practice will not, at all events, find its way to head quarters. Again, the Act requires that all cases should be registered; how, I would ask, could this be done if the business were half transacted in the private rooms of the referees, without the knowledge of the registrar? It should also, I think, be borne in mind that the referees are referees, and that in consequence it would be highly improper for them to hold any conversation with one person, upon a matter whereon they may afterwards have to decide as *judges* between him and others. If 1 understand "Censor," he would have us believe, that so great is the desire to obtain *fees*, that even the clerk cannot be seen without a fee. This uppears to me to be a particularly unfair part of his letter. The professional character of the gentlemen in question ought to have protected them from such a charge; but has "Censor" really been made to pay for his conversation with the clerk? If he has, he has been treated very differently from myself or any of my acquaint-ances : a scale of fees hangs up in the waitingroom, but no unnecessary allusion thereto has ever been made to me by the gentlemen that I have seen. Much more might be said upon the subject of "Censor's" communication, but I fear that my letter has already exceeded the limits that will enable you to give it a corner in your valuable journal. I am, Sir, &c. FAIRPLAY.

COMPETITION-CANTERBURY WORKHOUSE.

SIR,-The profession are, I think, more indebted to the articles in your valuable pages on the subject of competition, than to all the other sources they now have of obtaining or diffusing information. May I request you to have a vigilant eye on the Canterbury Incorporation.

I first saw the notice in your number of February 22nd. A fortnight only was given to prepare the plans. Not too much, if an architect has any thing else to do. I accordingly wrote by the same night's post for infor-mation, and waited day by day for an answer, till, in fact, I gave the matter up. However, on Saturday last, I received (too late to be answered by that night's post), a letter from Canterbury, wherein I was informed that the writer had enclosed me a sketch of the ground and all other particulars. Well, I thought this civility came rather too late, for it only left me four days to make my designs, as on Friday they must have gone down to be opened on Saturday; but fancy my dismay, Sir, when I went to look further, there was neither sketch, nor particulars, in the envelope. In fact, all I had was, "Sir, I have the honour to enclose" —and the enclosed was—nothing !!—Now I must have written again to Canterbury, ex-plaining the mistake, and must have received

my answer back, and I should like to know what time I should then have had left. Pray keep your eye on the Canterbury Incorpora-tion ;--there will be something curious in that tion ;--there will be something curious in that matter before they have done. The official, whoever it was, takes half the time allotted to do all the work to answer a letter ; and then he sends me a nice little parcel of moonshine. Again I say, pray keep your eye on the Can-terbury Incorporation !!--I am, Sir, &c.,

AN ABCHITECT.

IMPURE AIR FROM SEWERS.

SIR,-In THE BUILDER of Feb. 15, I was pleased to read a communication by Mr. G. Hawkins, at the Institute of Architects, on the subject of sewerage. Much credit is due to that gentleman for his valuable and gratifying information; but a great, if not the greatest, evil was unnoticed,—that is, with regard to the most efficacious means of preventing the effluvia, and impure air or gas, arising or escaping from the sewer through the gratings in the street

The reports of the most eminent physicians prove that during the time the cholera raged in England, the greatest number of victims to that disease was to be found in the immediate neighbourhood of open sewers, and near those gratings from which escaped the impure air, or gas, generated in the covered sewers which are formed under our streets. My attention was first seriously drawn to this subject by my occupying a house near one of those gratings, from which the effiuvia arising frequently com pelled me to close my windows in the summer. I propose, where the gratings now are, to insert an aqueduct which will admit all fluid to pass an aqueduct which will admit all huid to pass freely, while it entirely prevents all impure air from ascending from the sewers; it is of trifling cost, and cannot be put out of order: also to erect ornamental or plain shafts at also to erect ornamental of plane suitable places, 15 feet or 20 feet high, through which the impure air may escape. With your permission, I will send you a model of an aqueduct, and hope soon that the inhabitants aqueduct, and hope soon that the innaomanus of the metropolis (especially of some parts of it) may not have to complain of the ill-effect produced by the noxious gas arising from the sewers. I am, Sir, &c., W. ROWLAND.

14, Passmore-st., Pimlico, Feb. 26, 1845.

CHELSEA HOSPITAL.

SIR,-As an old inhabitant of Chelsea, also SIR,—As an old inhabitant of Cheisea, also a constant reader of your valuable publication, I was much pleased with your illustration on page 102, having frequently admired the iron lamp-posts of the hospital, for there are two of them; one is in the east court, which is sur-rounded by shrubberies, and seems to have escaped the observation of your contributor, who has given us so perfect a sketch of the one who has given us so perfect a sketch of the one in the west court; they are, however, facsimiles of each other.

I should like to draw the attention of "C." or Mr. C. J. Richardson, who has given us a proof of his skill in such works, to the chimney-piece in the state-room of the hospital, which is an exquisite work of military trophies, carved in oak. "C." having stated the opinion of several

having stated the opinion of several architects of the chapel's superiority over that of Greenwich, it is to be lamented the commis-sioners suffer it to remain in the very dirty state in which it is at present. A few years back there was a magnificent sounding-board over the pulpit, of inlaid woods, similar to the altar-piece, but this has been removed, and converted to a much more ignoble purpose by the present clerk of the works for his own

There are some remarks in another paper by " E. H." that room might be found in the hos-"E. H." that from might be found in the hos-pital for some of the monuments of the Abbey. I think it cannot be known to the commis-sioners that a beautiful painting by West now lies rolled up in the gallery of the great hall, for want of room, it is said, to hang it; it was hung for a short time, on its first arrival, on one side of the hall, against the windows. The heat of the sun causing the paint to blister, the picture was taken down and placed in its present position, where, if not speedily released, it will rot unseen: the subject is, I believe, the victories of the Duke of Wellington, and its size 35 feet by 20 feet. I am, Sir, &c., W.

COMPETITION DRAWINGS, KING'S ROAD, READING.

Sis,-The letter which appeared in your number of the 15th instant, signed Fairplay, on the subject of the architectural competition for laying out ground in the King's-road, Reading, contains such distinct allusions to the part which was taken by me in the manage-ment of that competition, that I feel sure you will favour me by the insertion of these few remarks in your next number. And that the win layour the by the inscitton of these two remarks in your next number. And that the utmost fairness and attention may be given to Fairplay's strictures, it may be well to premise, that I was not previously aware that the deci-sion of the designs had appeared to any per-son at all acquainted with the subject " to have produced any thing but satisfaction;" on the contrary, no such impression has been con-veyed to me by any individual except by one of the competitors, who stated his opinion to be, that his were the only drawings that were in accordance with the instructions; unfor-tunately for that gentleman, his designs did not obtain a single vote from any other com-petitor. I do not, therefore, feel it incum-bent upon me to say any thing in answer to that opinion, as it will occur to your readers, that towards those persons who have thought themselves right and all the rest of the world wrong, it is not usual to address the ordinary wrong, it is not usual to address the ordinary mode of reasoning, in order to convince them of the fallacy of their views. All other perdeclared themselves perfectly satisfied with the adjudication of the premiums, and gratified that some scheme has been successfully adopted which could secure the advantage of com-petition without those evils which so gene-rally accompany it.

To the first question then of your cor-respondent, "Was there any standard laid down for the judges to go upon ?" he gives an answer in the same sentence, namely, "A set answer in the same sentence, namely, "A set of rules was printed for the guidance of the competitors in preparing their designs, which, it is stated in the preamble, the proprietor will require to be adhered to by those who intend to compete." Again, he charges, that "two great mistakes appear to have been made by the promoter of this competition. In the first place a set of rules were printed, &c." Is this one of the mistakes that rules were printed for the guidance of the competitors? I would ask your correspondent what fair play there guidance of the competitors? I would your correspondent what fair play there id hum here in lumi ask ask your correspondent what fair play there would have been in leaving every competitor to his own fancy in preparing his designs? I believe such directions are invariably adopted in fair competitions. What the other mistake is into which the promoter of this competition has fallen wour correspondent does not inhas fallen, your correspondent does not inform us.

Now with reference to the conditions in the set of rules referred to, no other answer is ne-cessary than that those designs which were not in conformity with those conditions were rejected by the adjudicators, and the designs to which the premiums were awarded are strictly in accordance with the instructions. On this in accordance with the instructions. On this point all parties had an opportunity of satisfy-ing themselves at the public exhibition of the designs at Reading; there were, I doubt not, many drawings at variance with the conditions, and as such, were very properly excluded from the premiums by the appointed judges. It is quite true that several of the competitors did not attend to give their works, but had their

did not attend to give their votes, but had their plans been chosen, of course they would not have received a premium; this I presume is the "distinction which ought to have been made between those who complied with the made between those who complied with the rules and conditions, and those who did not." The calculation, however, of the number of those who did not attend at Reading to give their votes is very erroneously stated when it is computed at fourteen, for several of the competitors sent two or more designs, not-withstanding which they were permitted only to give one vote. The question in conclusion, "Where is the use of having rules printed for a competitors whether they abide by them or competitors whether they abide by them or not, as has been done in the present instance?" scarcely needs the reply, reject the plans which are not in accordance with the condiwhich are not in accordance with the condi-tions, and take care that the accepted ones are conformable thereto, as has been done in the present instance. I cannot think that the pro-position of a set of questions, one of which should be "Whether such plans were in ac-cordance with the printed instructions,"

would have given much more satisfaction: surely, I had no right to assume that the in-structions would be unobserved while I had a reasonable ground for concluding that the ad-judicators, from their personal interest in the competition, would take care not to lose sight of so important a feature in the claim to re-ward the designs. I cannot consider the publication of the votes as any breach of confidence, for as the name of the competitor is not attached to his motto, no competitor could know which is the motto of any other individual.

In conclusion, although "Fairplay" says his only object in addressing you is to state what he considers ought to have been the course adopted, yet he does not appear to be quite clear as to whether he would have sub-mitted the drawings to the adjudicators or taken the matter in his own hands, had he been the proprietor of the land; but it has been my object to avoid the latter mode of awarding the premiums in the present instance, and until some more pertinent remarks than are made by your correspondent come under my notice, I see no reason to suppose that any thing besides universal satisfaction has been the result of this competition; and for the information of your readers, I have only to add (in direct con-tradiction to the statement of your anonymous correspondent, who would have shewn more fair play had he formed his own judgment on fair play had he formed his own judgment on the plans), that the designs to which the pre-miums are awarded, are not "got up very elaborately, and tickled up so as to attract the eye," nor are the "buildings deeply back lined in dark lake colours, and the grounds all laid out in walks and beds of different colours," but as far as I am able to judge, they are in conformity with the instructions, which will be a sufficient reply also, to the letter signed "Veritas" in your last number. I am, Sir, &c., J. J. BLANDY.

Reading, February 28th, 1845.

CUTTING AND POLISHING MARBLE.

SIR,-In THE BUILDER of the 8th February, your correspondent "J. H." (Pontypool) inyour correspondent "J. H." (Pontypool) in-quires the materials used for polishing marble, &c. I have copied the following from page 801, of Dr. Ure's "Dictionary of Arts, Manufactures, and Mines," which may be useful to him.—I am, Sir, your obedient servant, C. II. C. C. II. C.

" Cutting and polishing marble.—The marble saw is a thin plate of soft iron, continually supplied during its sawing motion with water and the sharpest sand. The sawing of mo-derate-sized pieces is performed by hand, but that of large slabs is most economically done

"The first substance used in the polishing process is the sharpest sand, which must be worked with till the surface becomes per-fectly flat. Then a second and a third sand of increasing fineness is to be applied. The of increasing increases is to be applied. The next substance is emery, of progressive degrees of fineness; after which tripoli is employed; and the last polish is given with tin-putty.• The body with which the sand is rubbed upon the marble is usually a plate of iron; but for the subsequent process a plate of lead is for the subsequent process, a plate of lead is used with fine sand and emery. The polishing rubbers are coarse linen cloths, or bagging, wedged tight into an iron planing-tool. In every step of the operation a constant trickling supply of water is required."

BVILS OF NEW LAWS.

SIR,—In the *Times* of February 24, 1845, there is a report of a cause in the Vice-Chancellor's Court (Ellice v. Goodson), in which Sir Thomas Wilde makes some ob-

which is in Thomas whice makes some ob-servations on a new law relating to the matter in question, which, I think, are particularly applicable to the Metropolitan Buildings Act. Sir T. Wilde.—" Legislation on such a subject should have been as cautiously entered on as the repair of an old house; before a beam is removed, it should be ascertained what it supports. Under the old law we knew to say the least, it is not so." His Honour the Vice Chancellor.—" Every

one understood what was meant by the

* White Oxide of Tin.

old fictions, and yet they were abolished because they were fictions, and a new fiction substituted."

This last, by changing the word "fictions," into *faults*, will be quite pertinent, I believe, to the new Buildings Act; and I trust it will not be considered impertinent to say so, and to predict of it, "Opera parit opus."—I am, Sir, &c., PHILOCLARUS.

HERNE-HILL CHURCH.

SIR, - My attention has been directed to Sig. — My attention has been directed to several letters which have appeared in your valuable publication relative to the contracts of Herne-hill Church. The inconvenience at-tendant upon the assertion of ex-parte state-ments of this kind is so evident, that I am sure I need not enlarge upon it. With re-, ference to the statements I have only to say they are untrue. I am. Sir & c. they are untrue.—I am, Sir, &c., G. Alexander.

6, Clement's-Inn, Strand, March 11, 1845.

SIR,-Having been a clerk to Mr. Alex-ander at the time the estimates were made for Herne-hill Church, I beg to say that on Mr. Broomfield noticing the time was short that was allowed for their preparation, Mr. Alex-ander went himself to the Church Commisander went nimself to the Church Commis-sioners to get the time enlarged, which was not done. Mr. Broomfield then asked as a favour to be allowed to inspect Mr. Alex-ander's estimate, which was at first refused, but on Mr. B.'s again applying, Mr. Alexander remarked that as he understood that on the Great Western Railway contractors were allowed to see the enrineers' cuantities he the Great Western Kallway contractors were allowed to see the engineers' quantities, he saw no objection to allow the inspection of his abstracts and dimension books to compare; but I distinctly told Mr. Broomfield that in no way would Mr. Alexander be responsible for the same, and Mr. Alexander also distinctly repeated the same to Mr. Broomfield. I am positive no sltartions were made in the aposi positive no alterations were made in the speci-fication, of which a duplicate was lodged with the Church Commissioners, and could no doubt be seen; besides one of the builders tendering made a copy of the specification. As to the drawings, there was but one set, and there was no alteration made in them.

I am, Sir, &c., Joskph Gibbins.

6, Portland-place, Hammersmith-gate, March 11, 1845.

NEW CLAY FOR MODELLING.

SIR,—I have much satisfaction in bringing to your notice the discovery of a new clay, or conversion of an old clay, for the purposes of modelling, and which promises to be of essential service to the modeller, and may not be unimportant also to the builder.

be unimportant also to the builder. In my paper read at the Society of Arts, on Wednesday last, March 5, "On the Construc-tion of Models for Ethnographical Purposes," I have alluded to it, and at the same time produced some beautiful models in this clay by Mr. Sangiovanni, an artist who has made use of it with much success for some years past, and who has never found it to perish or crack, sais the case with clave in ordinary use

as is the case with clays in ordinary use. It has all the appearance of hard stone or metal when oiled over the surface, and in this

state is not affected by moisture. Its component parts are of the ordinary clay of London and ground slate, in the propor-tion of three or four of the former to one of the These must be well amalgamated till latter. brought to a proper consistence for working. I am, Sir, &c., Edwin Dalton.

5, Fitzroy-street, Fitzroy-square, March 10.

BLISTERS IN LIME.

BLISTERS IN LIME. SIR,--I have not seen the question of "H.S.S.," page 35 ante, fully replied to yet. Your query in the note must be answered doubtless in the negative. The lime in question should have been run. I presume "H.S.S." to be neither a plasterer, nor a plasterer's labourer, or he would not have asked the question; I shall, therefore, explain the term run. The lime is put into a tub or cistern, water is then added as it slakes, until the whole is converted into thick paste or

Miscellanea.

SOCIETY OF ARTS .- March 5th. Joseph SOCIETY OF ARTS.—March 5th. Joseph Hume, Esq., M.P., V.P., in the chair. R. Bowie and Jos. Bennett, Esqrs., were elected members. The secretary read a paper, by Mr. E. Dalton, "On the construction of models for an Ethnographical Museum, and the materials heat suited for the purpose." the materials best suited for the purpose." The design for an ethnographical museum, for the illustration and study of mankind, originated with the author more than a year ago, and the object of the present paper was to bring forward the general advantages of such an institution, and the result of inquiries and experiments as to the material best suited for the construction of models suitable for carrying the construction or models suitable for carrying out this important design. The possibility of casting *entire* from the living model is not perhaps generally known. The late Sir Francis Chantry effected this upon a negro man. The specimen is lodged at the College of Surgeons, and presents a faithful representation of the original. The moulds of this cast are in the possession of Mr. Weeks, the sculptor, to whom Sir Francis left the greater portion of his studies. The model of a New Zealander, of the Ngatiawa tribe, now in London, was exhibited to the meeting, as an example of the illustration of the different races of man, proposed to be collected by the ethnographical society. The head and arms of this specimen consist of wax, and were cast separately, and then attached to the body. The hair is removable, so as to allow of an inspection of the conformation of the scull. The time required for completing this model was about fourteen days; and its cost including costume is estimated at 20%; whereas a similar model, completely undraped and cast entire, would amount to about 401. The wax of this model had been painted in oil colours, so as to represent the tints of the flesh, and render it capable of being cleaned. A new clay was proposed by Mr. Dalton for such models: a notice of it by the inventor will be found in another page.

DIFFICULTIES OF VENTILATION .--- A laugh able conversation took place in one of the committees of the House of Commons a few days since, relative to the temperature of the room, which had much annoyed hon. members during the day. Mr. Barneby, on entering the room, wished the hot foul air to be expelled, but the valves had not long been open for that purpose, when the chairman complained of the coldness of his legs. Dr. Reid was at last sent for; and on Mr. Aglionby stating to him the nature of his complaint, said that if air was expected to go out, air must be let come in-a statement which the chairman did not dispute, but nevertheless did not seem to think any good reason why his legs should suffer. If that were ven-tilation, the less of it they had the better. Dr. Reid remarked upon the difference of temperature desired by hon. members. Some said they were too hot-others complained of the cold. If they would select any hon. member as their index, he (Dr. Reid) could adapt the thermometer to his particular satisfaction. Where extremes existed, it was evident that an adaptation of a medium could not be effected. Mr. Aglion by had a decided objection to the process of adaptation being carried on against his legs; and Mr. Buller said, that instead of bon. members' feet being warm and their beads cool, their feet were cool and their heads warm. Several members having commented upon the rarying state of the thermometer, and ex-pressed their individual opinions as to the temperature, Dr. Reid gave orders for the cold air valves to be closed, and stated that he would send in hot air as soon as the furnaces were heated. We have yet much to learn on this important subject.

FLOATING DOCK .- A floating dock has FLOATING DOCK.—A floating dock has been invented by a Mr. Lennox and submitted to the Admiralty. The Director of Works at Woolwich yard has been ordered to prepare detailed drawings of the scheme. HOUSE OF COMMONS. — The new com-

mittee-rooms are now completed, with one or two trifling exceptions. During the past week the doors were hung, and fires placed in each apartment to allow them to be properly aired. The rooms vary in size, some of them being very spacious, with a view of affording accommodation to a great number of witnesses and others who are engaged on important bills. The tables are also so arranged, that the confusion so much complained of at present will be entirely obviated, ample space being allowed between the tables and at the sides for the persons in attendance.-Globe.

THE ROYAL ACADEMY .--- As we were the Academicians had resigned the public that the Royal Academicians had resigned the privilege of each exhibiting *eight* pictures as heretofore enjoyed, and limited it to six (although our excellent contemporary the Art-Union fancies he learnt the fact form a previously and he learnt the fact from a provincial news-paper), it is necessary we should state that the resolution has been since rescinded, and that the old right of hanging eight pictures has been re-established. We lament this step on the old right of hanging the lament this step on the part of the Academy very much, and fear they will have cause to repent it. They seem to have made up their minds that reform shall come from without; how much wiser would it be for themselves to render it unnecessary.

Tenders.

TENDERS delivered for the erection of a New Church in Charlotte-street, Fitzroy-square.—Hugh Smith, Architect, Bedford-row.

ADVERTISEMENTS.

NOTICE. -- INVENTORS desirous of NOTICE, — INVENIORS desirous of obtaining LOANS ON or of SELLING their IN-VENTIONS, or Patents, should apply to Mr. M. JOSCELIN COOKE, at the OFFICE for PATENTS, 20, Half Moon-street, London, where English and Foreign Patenta are ob-tained, and Designs registered. An INDEX is kept for inspection of all Patents granted for the last century; also copies of every Patent of importance. Instructions to Inventors and a list of charges gratis on application.

IMPORTANT TO INVENTORS AND PATENTEES.

IMPOBTANT TO INVENTORS AND PATENTEES. PRACTICAL ASSISTANCE GIVEN to parties taking Letters Patent, by Mr. J. WILSON, Engineer and Patent Agent. Every description of business relating to or connected with Patents, Registration of De-signs, Patent Agency, &c., conducted at his offices, 16, CHANCERY-LANE, opposite Carey-street. Negotiations entered into with parties wishing to dispose of or purchase patented or registered inventions. Every necessary infor-mation may be obtained at the offices as above, where also may be had printed instructions (gratis), to which Mr. W. begs particularly to draw the attention of parties about to take out patents. Mechanical drawings of every description, original designs for machinery, models, &c., executed with dispatch and executed.

TO ARCHITECTS, BUILDERS, &c. TO be disposed of a large quantity of good, sound, well-burnt Red Kiln Bricks. A spe-cimen to be scen, and particulars obtained at Mr. F. C. M. SPEARMAN'S, Auctioneer, &c., 77, Old Broad-street, Royal Exchange.

BRICKS.—A large quantity of New White, and Red Bricks of the very bast quality for Sale. Samples may be seen, and prices known, by appli-cation to Mr. George Knight, Auctioneer and Commission Agent, Crosby-hall Chambers, Bishopsgate-street.

TO BUILDERS and Others.—A cheap substitute for high priced bricks, well worthy the attention of speculative gentlemen, and other capitalists who intend building this season. This article is stone, which may be worked with great advantage. It is in pieces from 3 to 5 inches in thickness, and averaging from 14 to 20 pounds in weight; it is about the same weight as bricks, and will be sold in London at 12s. 6d. per ton. Any quantity may be had from 100 to 200 tona per week; not more would be guaranteed per week, as it will come by railway. A fair sample of 10 or 12 tons may be seen at the proprietor's at any time.—Addreas, JAMES PERREN, 1, Victoria-place, Surrey-square, Walworth.

E G.'s TRACING-PAPER.—It is warranted to take Ink. Oil, or Water colour, and is sold by MESSRS. ROBERSON AND CO., SOLE AGENTS, 51, LONG-ACRE, at the following cash prices:—

THIN TRACING-FAPER. 60 by 40, at 14/. 0s. par Ream, or 15s. 6d. per Quire. 40 by 30, at 7/. 0s. ,, 7s. 6d. ,, 30 by 20, at 3/. 15s. ,, 4s. 0d. ,,

THICK TRACING-PAPER. 40 by 30, at 14/. 0s. per Ream, or 15s. 0d. per Quire. 20 by 20, at 7/. 10s. ,, 8s. 0d. ,,

N. B.-Every sheet is stamped with the Initials of the anufacturer.

This beautiful and unequalled article is allowed to be the cheapest and most useful Paper hitherto introduced to the public, as will be best proved by a trial.

PAINTING BRUSHES OF SUPERIOR QUALITY. TO PAINTERS, BUILDERS, &c. J. J. KENT AND CO., MANUFACTURERS.

MARUPACTURES, 11, GREAT MARLBOROUGH-STREET, LONDON, Offer to Painters, Builders, &c., Painting Brushes of a quality far superior to those generally offered for sale, to which they beg to call the attention of all who prefer quality and durability to apparent cheapness.

000000.-7 in. Dusters. 000000.-7 in. ditto, extra. 0000.-Ground Brushes.

0000.-Ground Bruanes. Plasterers' Brushes. Distemper ditto. Ground and Unground. Sash Tools, and Common Tools. Tar Brushes and Masons' Brushes, and all other Brushes used by Painters and Artists.

Lists of Prices of Painting Brushes, and of all other kind of Brushes, forwarded on application. Established 1777.

E. WOLFF & SON'S NEWLY-INVENTED

MATHEMATICAL PENCILS, FOR

METHEMATICIANS, ARCHITECTS, & ENGINEERS,

METHEMATICIANS, ARCHITECTS, & ENGINEERS, Warranted to retain a very fine Point. E. WOLFF AND SON, in introducing their Extra Hard Lead Pencils for Mathematical and Architectural purposes, beg to draw attention to the advantages resulting from their adoption in preference to the ordinary Pencils. They are made to six distinct sizes, by which means they can be fitted to all instruments, and are so constructed that each Pencil seach of a length, and most convenient for use, and obvirating the difficulties existing with respect to the ordinary Pencils. E. W. and Son have also half-round Pencils, suitable for the Spring Bow, thus preventing the necessity of dividing the Pencil down the centre. They are made of extremely Hard Lead, of the finest quality, which will retain a very fine point and give a clear , even, and distinct line.— PATTEEN OF SIZES.

6

PATTERN OF SIZES. -

A Sample of each size will be sent by Post to any part of the Kingdom, on the receipt of Postage Stamps equal to the amount. Drawing Pencils of the best quality, for Architects and Engineers, warranted free from grit: the HHH and HHHH are particularly recommended.—Price 5s. per dozen.

May be had of all Instrument Makers and Stationers, od at the Manufacturers', 23, Church-street, Spitalfields, ondon.

FOX'S PAPER VARNISH, 6s., 8s., and FOX'S PAPER VARNISH, 6s., 8s., and 13s. per gallon; satin size, 21s. per ewt. Carriage Varnish, 10s. per gallon, warranted to stand for outside work; every description of gilders' and decorators' materials. Burnish gold size, 1s. and 1s. 6d., oil gold size, 3s. and 4s. per lb., warranted; burnishers, pencils, tips; gold, 5s. per 100. Grainers' colours kept ground; badgers, combs, &c.— At the manufactory, 50, Old Compton-sirect, Sobo. Prices lower than any other house. Strong and clear size always ready. N.B. Country orders attended to with dispatch.

Composition which Measure Geo, and Those Wallis have the satisfaction of introducing to the trade, possesses the im-portant qualification of effectually stopping Knots in Wood, however bad, and preventing them eating through and dis-figuring the paint above. Many substances have been used and much time spent in endeavouring to find a cure for a bad Knot, but hitherto without auccess. Measure Wallis therefore feel much plea-sure in offering to the public an article so long and anxiously called for.

called for. In the application, skill is not required; a boy can use it as well and effectually as the best workmen: it is put on to the work with a brush like common paint, can be used in all climates and situations, and does not require heat.

Sold wholesale and retail, by Measrs. G. and T. Wallis, Varnish, Japan, and Colour Dianufacturers, No. 64, Long Acre. Price 20s. per gallon,

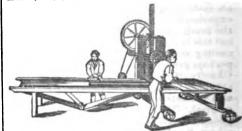

WARNISH.—It has long been a desideratum amongst the consumers of Varnish to obtain a good and genuine article : brilliancy, facility of drying, hardness, and durability are the qualifications necessary, but these are seldom if ever found united. The experience of a life-time devoted exclusively to the manufacture of this article, the great and important discoveries of modern chemistry, and the daily improvements in machinery, have enabled Messra. George and Thomas Wallis to produce Varnishes (both oil and apirit) unrivalled in every respect, and they confidently recommend them to the trade, as deserving of notice both in price and quality. rice and quality.

price and quaity. Builders, Coachmakers, Painters, and others may depend on being supplied with a genuine and unadulterated article, Fine Oil Varnish, from 10s. per gallon; best White Spirit Varnish, 21s. ditto; Best Spirit French Polish, 20s. ditto; White Lead, Oil, Turps, and Colours of every description at the very lowest prices.—WALLIS'S Varnish, Japan, and Colour Manufactory, 64, Long-acre, one door from Bow-street. Established 1750.

TO BUILDERS A ARCHITECTS.-LAND may be had for building, under circumstances of a peculiarly favourable character, in the immediate vici-nity of a railway, and with is hours' distance from the metropolis. It is the object of the proprietor to establish a town of some of the most eminent men in the trade, to make the success of the project certain, and to secure very great profit to those who embarst in the undertaking. Full particulars will be explained, and plans and elevations of the intended buildings will be exhibited, on application at the offices of G. H. Wathen, Esq., architect, Carlton-chambers, 13, Regent-street, or to Sir George Stephen, 17, King's-arms-yard, Coleman-street.

yard, Coleman-street. HIP TILES to suit slate roofs in colour; Ridges, with plain or rebated joints, roll tops, and vertical ornaments; drains, many sizes, with plain or socket joints; paving in squares, hexagons, octagons, &c., dif-ferent colours; roofing; in Greein or Italian styles, other devices also, or plain; conduits, which do not injure pure water; fire-bricks and tiles; clinkers, and out-door paving; sundry wall-coping, garden-borders, chimney-tops; also tubular and other flues of peculiar material. No see the sundry wall-coping, garden-borders, chimney-tops; also tubular and other flues of peculiar material. No see the sundry wall-coping, surden-borders, chimney-tops; also tubular and other flues of meculiar material. No see the sundry wall-coping, surden-borders, chimney-tops; also tubular and other flues of peculiar material. No see the sundry wall coping, surden-borders, chimney-tops; also tubular and other flues of peculiar material. No see the sundry wall coping, surden-borders, chimney-tops; also tubular and other flues of peculiar material. No see the sundry wall coping, surden-borders, chimney-tops; also tubular and other flues of peculiar material. No see the sundry wall coping, surden-borders, chimney-tops; also tubular and other flues of peculiar material. No see the surdent of tubular and see tubular direct of any inland place; or to the Mersey for the coasts, the colo-nies and elsewhere.

HATCHER'S BENNENDEN TILE-MACHINE, Manufactured and Sold only by COT-TAM and HALLEN, Engineers, Agricultural Implement Makers, &c., 2, Winaley-street, Oxford-street, Loadon.

This is the most efficient Machine that has been invented for the purpose of making Drain Tiles. Any shaped Tile can be made by merely changing the die, which can be done in a few minutes. It requires but few hands, viz... man and three boys. With this amount of labour, the pro-duct of a day of 10 hours is as follows, viz...

duct of a day of 10 hours is as follows, viz :-1 inch diameter of Tile, 11,000 14, , , , , 8,000 14, , , , , 8,000 The Machine is moreable down the drying-shedt, so that it requires no extra boys to carry the Tiles, nor are shelves required in drying. It has been in full operation for upwards of four months at Hempstead Park, near Crea-brook, Kent. No charge made for Patent dues or licence. The purchase of the machine includes free use of it.

LIFE ASSURANCE.

THE BRITISH MUTUAL LIFE AS-SURANCE SOCIETY entertains proposals of any description from 20. upwards, involving the contingency of human life, and offers the following advantages to its mem-

Ders. A BONUS ANNUALLY (in shape of low Premiums), equal to those of other offices, granted every three, five, or seven years, and

seven years, and THE PROSPECT OF A LARGER BONUS than can possibly be obtained at those offices, in the peculiarly bene-ficial mode adopted in the distribution of the surplus. Prospectuses and every information may be had on ap-plication at the office, 17, New Bridge street, Blackfriars.

Messrs. J. L. Bicknell and J. C. Lethbridge. The attention of the unassured portion of the community cannot be too pointedly drawn to the unusual advantages offered to the Fublic by this Society over those of many others, as it enables all classes to effect life assurances in the manner most convenient to themselves, and amongst other of its popular features that of allowing the Assured (by Table 2) to leave HALF THE ANNUAL PREMICHS unpaid for serve years, will not be found undescript public attention. Interdiate and deferred ANNUTIES, and every description of Life ASSURATE ANNUAL PREMICHS of this Society. Prospectuses and all other requisite information will be furnished on application to the Secretary, or the Country Agents of the Society. EDWARD T. RICHARDSON, Secretary.

SATURDAY, MARCH 22, 1845.

E have received from several quarters an inquiry to the following effect :-- "I am about to fix the shop-fronts to some houses commenced before the 1st of January

last, and admitted up to this time not to be within the control of the new Act. Due notice was given to the district-surveyor under the old Act, and I intend to carry out the plan and elevation to which he then assented. Is it necessary I should now give him notice under the new Act, and make my shop-fronts in accordance with its provisions?"

On inquiry we are told, that the districtsurveyors have obtained information that this course is to be insisted on. They are advised, we learn, that the provisions in schedule E, entitled "Wooden shop-fronts and shutters," apply generally to all buildings, whether already built or not; and in regard to already-built houses, that all projections specified in the same schedule, as not forming part of the external wall, if not completed before the lst of January, must be conformable to the Metropolitan Buildings Act.

Having great confidence in the opinion of the referees and registrar, we are disposed to think our information must be incorrect, or that the district-surveyors misunderstand their instructions. Whether so or not, however, we cannot avoid saying, called on as we are to express an opinion upon the question, that we do not coincide with this reading of the Act. If it were asked us, Is it better that all shopfronts now to be put up should be in accordance with the provisions of the new Act than as heretofore permitted? we should say certainly yes; insomuch as those provisions are for the public safety. Party-walls are insufficient to prevent the spread of fire if there be a continuous wooden entablature to carry it from house to house; and the clause in the new Act which provides that this communication shall be cut off by the interposition of some incombustible material or otherwise, has been long called for.

But this is not the question now raised. The question simply is, whether or not the provisions of the Act which relate to shop-fronts extend to houses built before the 1st of January, when the shop-front was not put up before that date? and with the greatest deference to authorities, and a proper consciousness of the possibility of overlooking the force of portions of a document so voluminous and so recent as the Buildings Act, we venture to express our belief that they do not, provided the house be made fit for use before the 1st of January, 1846. We will tell our readers why.

The fifth section of the Act (which makes the schedule referred to operative), " for the purpose of regulating the building and the rebuilding upon sites of former buildings, and the enlarging and altering of all buildings of what nature soever," enacts, " with regard to every such building hereafter to be built" (with certain exceptions named) "so far as relates to building the same, and with regard to every such building either already or hereafter built" (with aforesaid exceptions) "so far as relates to the rebuilding and the enlarging or altering the same," that every such building shall be

THE BUILDER.

built. rebuilt. enlarged, or altered, in conformity with the rules and directions set forth in certain schedules, one of which is the schedule (E) in question.

From this it is perfectly clear, that if we build a new house or rebuild an old one, or if we enlarge or alter either an old or a new house, this must be done in accordance with the Buildings Act. But surely nothing here calls upon us, when we have no desire to alter, to pull down any part of an old or new structure, not in accordance with the Act, and forthwith to make it so? The provisions of the Act do not come into operation until we of ourselves begin to alter the building.

Now, the house duly commenced before the lst of last January is, in the eyes of the law, already built; the shop-front, if shop-front were intended, and be necessary to make the house complete, is, in the eyes of the law, already up; and we find nothing in the Act to force us to take it down. If one shop-front has been put up, and we remove it, the case is changed, and the new front must be in accordance with the directions given in the schedule. because the Act provides that no building already built shall be enlarged or altered but in accordance with those directions.

The clause in schedule E, relating to "Wooden shop-fronts and shutters," says no more than the clause in schedule D relating to "brestsummers;" yet it is not asserted that an intended brestsummer of a house duly commenced before January 1st must be put in in accordance with the directions contained in that schedule.

It is true, that in schedule E, the fourth paragraph says, "with regard to buildings already built or hereafter to be rebuilt, as to bow-windows, or other projections of any kind, such projections must neither be built with nor added to any building on any face of an external wall thereof, so as to extend beyond the general line of the fronts of the houses, except so far as is hereinbefore provided with regard to porticoes projected over public ways, and with regard to projections from face-walls and shop-fronts," &c.

This refers to "projected buildings beyond the general line of buildings, and from other external walls;" it is so headed, indeed, and would seem to have nothing to do with wooden shop-fronts. But even this contemplates an alteration or addition ; it does not enact that a bow-window, if bond fide commenced before the 1st of January, must be taken down. Such a bow-window, in the eyes of the law, is then built, and this clause refers only to those which are to be built with a new building, or added to an old one.

The longer we consider the subject, the clearer it seems to us that, as before stated, the regulations in schedule E, do not control shopfronts forming a necessary part of buildings bond fide commenced before the 1st of last January, provided they are finished before the lst of the ensuing January.

The correctness of this view of the question is made even more apparent, as it seems to us, by an examination of these regulations (headed "Wooden shop-fronts," &c.), for it is there further set forth, that if the street in which the shop-front is situate be less than 30 feet in width, no part of such shop-front must be higher than 15 feet. Now it may happen that a carcass was carried up before last January, in a street less than 30 feet wide, prepared with brestsummer, &c., for a shop-front (like one on Ludgate-hill for example), 18 or 20 feet high, with the concurrence, too, of the district-surveyor under the old Act. And surely that same

district-surveyor would not consider himself authorized by any thing in the new Act, to prevent the completion of such a shop-front and insist upon an alteration (which would probably entail the pulling down of the upper part of the house)? because that would be a manifest injustice to the owner (who had complied with the existing law), and would be directly contrary to the evident intention of the new Act, wherein such an injustice is carefully provided against by the arrangement, that if a building were even commenced before the Act came into operation, the provisions of the Act should not affect it. Yet, if the doctrine said to be held by the district-surveyors be maintained, such a proceeding might unquestionably take place.

THE NEW HOUSES OF PARLIAMENT.

IN consequence of inquiries in the House of Commons as to the total estimated cost of the building, the following particulars were laid upon the table by Lord Lincoln a few days ago :-

| Sum stated by Mr. Barry in evidence before the select committee of the House of | £. | 8. | d. |
|---|-------------|----|----|
| Commons of last session Deduct for purchase of pre- mises and miscellaneous ex- | 1,016,924 | 12 | 9 |
| penses | 90,605 | 6 | 6 |
| Add for alterations at Vic- | 926,319 | 6 | 3 |
| toria Tower, &c. | 80 0 | 0 | 0 |
| And for residence of Clerk of the Crown | 1,794 | 0 | 0 |
| Estimate of the total cost of the building, according to | 928,913 | 6 | 3 |
| the latest plan approved | 928,913 | 6 | 3 |

The works are proceeding satisfactorily, and it is asserted that the new houses will be ready in 1847.

The centre and curtain portions of the river front are roofed in. The north wing is up in readiness for the roofs, part of which are already fixed, and the remainder are being put on. The south wing is nearly up to the level on. The south wing is hearly up to the lovel of the roofs, which are prepared, and in readi-ness for being fixed. A considerable portion of the north flank of the building is now being roofed in, and the south flank is up to the level of the roof, which is being prepared, and will soon be ready for fixing. The remainder of the north and south flanks, together with the the present year. The Victoria Tower is car-ried up to a height of 38 feet, and the clock tower is at a height of 38 feet, and the clock tower is at a height of 36 feet above the ground. The House of Lords is roofed in, and the ceiling and other fittings of that chamber are in hand. The central tower is carried up to a height of 28 feet above the ground. The House of Commons is about 30 feet above the ground. The other portions of the building are, upon an average, 30 feet above the level of the ground, some of which are in readiness roofs (now nearly ready for fixing), for the while others are being roofed in. A contract has been entered into for the finishings of the entire building, and those of the House of Lords, and the rooms provided for the business of that House are in hand.

Mr. Barry states, that some delay has taken place in the fixing of the iron-work of the roofs, owing to the unsettled state of the iron trade, and difficulties with workmen, and that the stone for the exterior of the building is still continuing to be supplied in great abundance,

and of most excellent quality. The iron roofs used are exceedingly light and elegant. They are covered for the most part with large slates from Valencia Island county of Kerry, where quarries of considerable extent have been opened recently, and afford employment to a large number of people. Much iron is used throughout the building,

and this material will probably be more em-ployed elsewhere in consequence. The roof of the House of Lords is composed wholly of wrought and cast-iron galvanized. The joists and flooring of this House are also of iron, and are now in progress. We sincerely wish Mr Barry health to carry out his fine design,

THE THAMES AND ITS EMBANKMENTS: WITH BEMARES ON THE MOTION AND ACTION OF BUNNING WATER.* BY JOHN PHILLIPS.

The action of running streams upon their , and the channels depends upon the declivities channels depends upon the declivities, and the nature of the soil; but the action of the aug-mented velocity at the parts to be embanked will ultimately produce an increased depth of the channel, as the scour will continue to act with greater mechanical effect, more par-ticularly upon the bottom of the channel in the middle of the run of the stream, until the resistance offered by the hardness and tenacity of the soil, and also the diminished declivity, and becomes somewhat equal to the velocity and the abrading action of the water. It is im-possible that the resistance of any material, mathematically considered, can ever be equal to the power exercised by the abrasion of the water; but in order to produce and retain an uniform channel, and by these means a regimen artificial, have generally an influence, and are brought in to aid this purpose. The momentum of the velocity of the river water, assisted by the inclination of the bed, have considerable influence in checking and retarding, during the first quarter, the flow of the tide, as far as the action of the latter reaches; and the resistances offered by either are as the squares of their reciprocal velocities; so that whichever has the greatest momentum (the flowing tide against the reaction of the river-water, and vice versa), the other must give way to it as a matter of course; but as soon as the action of the flood from the momentum of the sea overcomes the partial resistance of the river-water, the velocity and power of the former will begin to augment accordingly. In many parts of a tidal river these conflicting actions of the streams have considerable tendencies towards producing shoals and bars across the channel. Where the downward stream meets channel. Where the downward stream meets the flood, the ripple and regurgitation of the contending waters disturb the loose sand and gravel of the bed, which being suspended, are carried away with the set of the revolving waters, and thus become deposited as shoals and bars in the eddies. But shoals and bars cannot occur where the material of the bed is such as to offer a sufficient resistance to these actions, and when the stratum is perfectly hard and indurated; and as the tidal water and the pent-up river-water act as a scour during the ebb, the detritus, such as sand, gravel, silt, and mud, will be carried outwards to the sea, and the conflicting actions of the flood and ebb being stronger at the mouth of a river, have a greater tendency to throw up alluvial shoals and hars at that point. Now the velocity and mechanical power of a uniform stream of running water are increased by the augmentation of its depth; and the actual increments of the former vary as the square roots of the hydraulic mean depths, and of the sine of inclination conjointly, and of the latter as the quantity of water and the squares of the velocities. But in the case of tidal rivers, as, for instance, in the Thames, the increase of both the velocity and the power are only partial, as is plainly observable some time before and at the time of high-water. After overcoming the resistance of the river-water, the flow of the tide increases upwards for some time (prohably about two-thirds of the time of its flow), from whence its velocity and power gradually diminish to the time of highwater.

There is a point of time too when the ebb tide has the greatest velocity, and this varies, in some degree, very probably, at every ebb. The ebb does not meet with retarding powers altogether similar to the flood. Immediately that the tide begins to recede, its velocity goes on increasing, and the mechanical action upon the channel also, until a certain time previous to low water, or when it loses that amount or body of water upon the channel, both in depth and power, which produces and con-stitutes the greatest velocity. In some degree, the precise time when the velocity is greatest will be dependent upon extraneous causes of retardation or acceleration. Thus the power of the wind acts, when ever it blows, either as an accelerating or retarding force, and, in consequence, may influence the precise or natural time of both the greatest veloci-ties, and of low or high water. From

• Continued from page 124.

observations, and by noting the fall of the tide, it appears that the greatest velocity is at about one-third of the ebb; and under ordinary circumstances the flood runs up five hours, and the ebb runs down seven hours. The gradations of the velocity and power of the ebb go on increasing from high-water up to a certain point, and then diminish to nothing down to low-water. Diagrams shewing the increments and decrements of both the rise and fall of the flood and ebb tides at every quarter of an hour, and also the velocities due to the heights of each at the same time, and during the time of full and new moon, and from new to full moon, would be of great value to all persons engaged on, or in any way connected with the river. From knowing the times of high or low water one would, by inspecting the diagram, be enabled to see how much either the flood or ebb had increased or diminished at any point and time of the tides, and also the velocities at those points and times. These could be taken at various points in the river between Putney and Blackwall, and would serve as valuable indices to the state of the tides between those points; but such experiments should be placed under scientific supervision, and verified proper accordingly.

The bed of the river between London and Battersea bridges has been considerably deepened by dredging, and by the increased volume and action of the tides since the removal of old London-bridge; so much so as to have exposed the bases of the piers of Blackfriars and Westminster bridges; and, in consequence, placed their stability in considerable danger. At the low-water of the spring-tides the footings of the north piers of Waterloo and Southwark bridges are exposed, the dredging and action of the tides having ploughed much deeper channels between them than when they were first built. Since the removal of the great obstruction to the river, old London bridge, the motive power of the ingress and egress of the tides has considerably increased beyond the tenacity and con-sistency of the soil and the stability of the channel; and there is no doubt that the conchannel; and there is no doubt that the con-templated embankment would produce a much greater change in the depth of its bed, so much so as that many of the bridges would require increased protection. The present greatest velocities of the ebb of the Thames between Westminster and London bridges increase as the breadth decreases. From the former of these points the breadth gradually diminishes to the latter, and consequently the velocities to the latter, and consequently the velocities increase inversely as the areas of the sec-tions. The following table will shew the greatest velocities of the ebb between those points :-

From Westminster to Waterloo bridges the greatest velocity at the surface is - 40 in. per sec. From Waterloo to Blackfriars, do do. - 50 ,, Blackfriars to Southwark, do, do. - 65 ,, Southwark to London, do. do. - 70 ,,

These are the velocities at the surface of the river in the run of the tide, but the water at the bottom, from the unevenness of the channel and other retarding causes, does not move with the same velocity as that on the surface. The latter is found thus: from the square root of the velocity at the surface in the middle of the stream, expressed in inches per second, subtract 103; the square of the remainder will be the velocity at the bottom; therefore, according to this rule,---

From Westminster to Waterloo bridges the velocity at the bottom is = 28'031 in. per sec. From Waterloo to Blackfriar's, do. do. = 35'295 , Blackfriarsto Southwark, do. do. = 49'513 , Southwark to London do. do. = 53'825 ,

It is of the utmost consequence attentively to consider and produce the stability and per-manency of the channel. It is observable that by contracting the channel an augmentation of the velocity is imparted to the water, and this very materially increases the mechanical action of the stream; therefore it is essential, in order to obtain a stable and permanent channel, that the increased velocity and action correspond with the tenacity and consistency of the soil which form the bed of the river. According to the nature and ingredients of the soils which forms the bed of the stream, and

Therefore and to carry or drive them along. the substances will be acted upon by a momentum, more or less, according to the various velocities of the stream. An acquaintance with the velocity at the bottom of a running stream is most essential, in order to calculate what effect it may have upon the soil forming the bed of the river. In order to preserve an equilibrium between the action of the water and the tenacity and resistance of the channel, the nature and quality of the soil must be re-ciprocal to the momentum and abrasion of the ater.

The motions of all running streams are excited and diminished in their rapidity by certain accelerating and retarding forces. The velocities which they begin to acquire in their descent would go on increasing as the square root of the perpendicular height of the declivity of the channel, and the depths of water due to their heads, were they not impeded by other retarding forces. That which makes all running streams uniform in their motions arises from the friction of the channels, and arises from the friction of the channels, and the tenacity, or the viscidity with which all the particles of the water are held together; and the velocities are owing to, and depend-ant upon, the declivities of their channels; the quantity of water discharged is also de-pendant upon the amount of the declivity; and, as was before observed, the quantity dis-abarmed is as the valoaity that the valoaity is charged is as the velocity; but the velocity is acquired from the inclination, for the surface of every fluid at rest is horizontal, and therefore cannot move until the surface is inclined fore cannot move until the surface is inclined to the horizon, when it immediately moves in obedience to the natural law of the force of gravity, as every particle of the stream en-deavours to seek the lowest state of repose. Now the vertical section of a running stream varies as the inclination of the channel, for the varies as the inclination of the channel, for the declivity produces the velocity: thus, if a stream move along a channel with a mean velocity of 5 feet per second, and have a sec-tion 3 feet wide and 4 feet high, the discharge per second would be $3 \times 4 \times 5 = 60$ cubic feet; but if the same stream run further on in a similar channel, but with an increased de-divity, which produces a mean velocity of clivity, which produces a mean velocity of 10 feet per second, the vertical section of the stream will be diminished to balf the area of the former; for $3 \times 2 \times 10 = 60$ cubic feet as before. An increased velocity of a stream somewhat diminishes the pressure on the bed, and this also diminishes the friction

and the resistance of the channel. In order to preserve the channel of a river in a state of cleanliness, and to retain its In order to preserve the channel or a river in a state of cleanliness, and to retain its uniformity, the scouring action of running water is the most efficacious mechanical agent; and this action becomes more power-ful in preventing the deposition and accu-mulation of mud, and also of shoals of sand mulation of mud, and also of shoals of send and gravel, when the quantity of running water is large, and moves with a high degree of velocity. A greater quantity of back-water is necessary in those rivers where the course is winding, for the purpose of keeping the channels free from deposits and accumu-lations than in these where course are discu lations, than in those whose courses are direct and straight; for in the former case a considerable quantity of the impetuosity and power of the moving current becomes de-stroyed by the reflected motions and eddies that are produced by striking spainst the sinuosities and projections of the banks, and from the centrifugal motions that are imparted to the stream in winding through the concave parts of the channel. Where the course of a river is of a serpentine form, it is observable that the mechanical action, from the greater velocity of the water along the concave portions of the banks, has deepened the channel much more at those parts than at the convex sides; and the abrading action of the currents upon the conceptities is constantly the concavities is constantly wearing upon upon the concavities is constantly wearing away those parts, the water carrying off the earthy particles of the soil, leaving the stony particles deposited upon the bed; because as the currents are reflected from the concavitie on the one side into those on the other, the obliquity of the motions acts upon and wear away the bottom and banks, consequently, the convex banks are always less inclined to the channel, and much wider. But the decivit of the bed of a stream, whose channel is of the weight and size of the materials that lie upon the channel, from fine sand to large stones, a certain degree of proportional power is re-quired to overcome the inertia of these bodies

proportionally to their radii, the declivity is most where the length of curve is least Now it would appear that the velocity of the stream must increase where the inclination is greatest, but the momentum of the flowing water reverses the action at those bends. A stream of water running from a straight channel into a curvilinear one, from the impetuosity of its motion, is carried onward and strikes the concave side, from which it is reflected to the opposite bank, at an angle approaching to the angle of incidence-for it cannot be equal to it, on account of the inelasticity and friction of the soil, and the viscidity of the particles of the water-from whence it is sgain reflected to the opposite bank; leaving the intermediate parts of the banks much less acted upon; and thus a series of convexities and concavities are formed along the channel. Therefore, a great portion of the momentum of the stream is expended along the concavities, from the progress of the water having somewhat of an angular motion, although not strictly so.

It has been deduced directly from observations and experiments, that a running stream of water moves with the greatest velocity at or near the upper surface in the middle of the stream, and that the velocity gradually diminishes from thence to the bottom and sides of the channel where it is the least; and the mechanical action of the water is always strongest where the depth and velocity are greatest; for in proportion as the depth and velocity decrease from the middle of the upper surface towards the bottom and sides, the mechanical action of the water upon the channel is also diminished in the same ratio. As the depth of the stream increases, the abrasion upon the channel must also increase in proportion to the pressure, but, although the abrasion increases with the pres sure, it is somewhat proportionably less for larger pressures than for smaller ones. When pressure is removed and a body of water is al-lowed to flow, motion always takes place first in the middle of the stream, for according to the general law of gravitation, the mobility of the particles of the water when set in motion presses them against each other in endeavouring to obtain their lowest position; therefore, the filament in the middle is the first that seeks to escape, and the lateral filaments by losing their stability, slide or fall towards the centre of the channel; and when the stream is constant, they are continually endeavouring to supply the places of the middle ones. It is a well as-certained fact, that the channels of rivers and running brooks, assimilate very much to the concave curve of a circle transversely to the flow of the streams. When water collects into channels, it becomes a powerful mechanical agent in wearing away and carrying along the detrited soil, and both the widths and depths of all channels are dependent upon the nature of the substances of the ground and their degrees of in-duration, the banks sloping towards the channels at angles, which are peculiar to the nature of the soils; it is evident that the outline of the channel must be influenced by the peculiar quality and induracy of the soil, but it would appear that the regime of concavity is caused by the actions of the gradations of mechanical the velocity and pressure of the several filaments upon the channel, for the regular diminution the velocities of the stream from the middle of the surface to the bottom and sides, and the proportional pressures of the water upon the base, produce a proportional diminution of abrading action upon the surface of the channel; thus, by the spontaneous operations of nature, the varying and proportional actions of the various velocities of the stream, and the proportional pressures of the water in contact with the bed, produce its curvilinear form.

In obedience to the natural law of the force of gravity when a stream of water is in motion down an inclined plane, every particle of the fluid endeavours to seek the lowest position to which it can attain, in order to find a state of repose. In pursuit of this object, every particle of the fluid from the farthest extremity of the stream at the sides towards the middle, in endeavouring to attain a central position, acts with a proportional increase of pressure against those next to it, and thus produces a maximum velocity in the middle of the stream. And in all cases the gravitating action of water by its exertion while descending to the lowest accessible level, and when collected into narrow

circular channels, produces a power which becomes a most efficacious mechanical instru ment in collecting and carrying along with it all the deposits and impediments it may come in contact with in its course, as well as the animal and vegetable refuse of towns. But in order to render the water available in lifting these excrementitious and other substances and of sufficient power for promoting the necessary transmission of this refuse, a constant and copious supply is absolutely essential. As, in proportion to the quantity of water and the energetic impulse of the stream upon the removal of these substances its channel, is mainly dependent; and the mechanical power of the water, that raises these substances and carries them along in suspension, is more or less according to the depth and quantity, as well as the velocity with which it moves; and the augmentation of the latter is dependant in great measure upon the declivity of the channel.

IIII

A considerable retardation of the velocity and power of a running stream, is produced by the resistance it receives from the friction of the surface of the channel, and the amount of friction is in proportion to the extension of the surface with which the water, while in motion, is in contact, as every point of the surface of the channel exerts a force directly opposed to the motion of the current. And it is this friction which imparts a resistance throughout the moving body, neutralizing the celerating power of gravity and abrasion of the water, and making the stream to move with a uniform velocity along its various sections and declivities. It appears from the well-known law, of extent of surface retarding the motion of water, that if a stream of water be spread out, and allowed to run, in a rectangular channel, the amount of friction and consequent retardation will be much greater than if the same amount of water be confined to a circular channel, for the perimeter of the circle is less than that of any other figure of the same area, and conversely, the circle contains the greatest area of any polygonal or rectangular figure of the same perimeter, therefore, with a given sectional area of water, the amount of the abrading surface, or friction upon the bed. increases as the surface of contact increases, and will be determined by the form and perimeter of the channel through which it flows. Circular channels, therefore, are the most advantageous, where velocity and power of running water are required, as circles have less frictional and resisting surfaces under the same area; and it is for this reason that pipes are made circular for the quick conveyance and distribution of water, gas, smoke, sound, and many other contrivances in the arts. But the applicability and adaptation of these pro-perties of the circle are the most essential in the formation of water channels, for the transmission of noxious animal and vegetable matter by the mechanical agency of suspension in running water, as for instance, house-drains, and public sewers. Now as a contracted circular channel meets the conditions of increased depth, velocity, and power of the stream, then unquestionably, according to the nature of the ground, a circular or elliptical form, with the longer axis upwards, is by far the best for of-fering the greatest resistance to external pressure with the same amount of materials, and for the quick transmission of any substances by the agency of running water; therefore, this form should in all cases be adopted for house drains, and public sewers; in fact, in a scientific point of view, that this is the best form, there cannot be the least doubt.

By observing the motions of running waters, it would appear that the particles do not move in straight and parallel lines, whatever may be the form and direction of the channel, for, in consequence of the resistance imparted to the current by the friction and asperities of the bed, the particles in contact and moving along the bottom are divided, diffused, and reflected in all directions, to distances that are proportional to the velocities of the stream; and the advancing and progressing force and momentum of gravitation of the waters turns and carries the reflected particles along in revolving and curvilinear motions: and it would appear that these conflicting motions by crossing, recrossing, and intermingling with one another, and with different velocities, retard the equal and uniform motion of the

stream throughout its or provident and the velocity increases proportionally from bottom to the upper surface, or, the velocity and action increases from the bed upwards as the resisting motions of the particles of the water reflected from the channel become expended and destroyed by the descending action of the force of gravity; for if the particles of water, from the momentum of the stream in moving along the channel, are reflected by the friction and asperities of the bed, may not each particle, however minute, be likened to any other projectile, and be subject to the same law of retardation and acceleration of gravity, and may not the diminution of velocity from the surface to the bottom and sides be thus accounted for?

In consequence of the winding courses of most tidal rivers, the channel which suits the current of the flux may be altogether different to that which suits the reflux, and the obliquity of the reflected streams of the former may not take place at the same points and fly off at the same angles as those of the latter; thus, an oscillatory and sideway motion of the soil on the bed will be produced, and the actions of the flood and ebb alternately cause shoals and ridges of sand and gravel to collect in the channel, and, in consequence of these obstructions, much of the power and velocity of the currents is checked and expended by breakers and eddies, and the water escapes and flows with an increased velocity between the channels formed by the shoals. In all tidal rivers the courses of the alternate currents, and those parts where their actions upon the channels are most strong, are peculiarly marked and observable when the cob at spring tides is at the lowest. The winding course of rivers and rivalets lengthens and reduces the declivity of the channel, and the velocities are much less and the water higher in the elbows and bends; and where the currents move with the greatest rapidity the channels are most frequently the straightest. When a stream is constrained to move in the direction of a curve, its motion and course is constantly varying, because, from the centrifugal force of its motion, every concentric filament of the stream running round the curve evinces a tendency to fly off, or quit The velocities of each conit at a tangent. centric filament will be greater or less in pro-portion as their relative distances from the centre of the circle are greater or less, and the centrifugal force increases in proportion as the radius of curvature increases; therefore, the velocity of the stream augments as it recedes from the convex side. All angles and bends very much diminish the progression of the passing currents, and the retardation increases with the smallness of the curves and the abruptness of the angles.

The viscidity of the particles of the fluid and the friction of the channel conjointly, by their action, produce a uniformity in the motion of the water; and when all the obstructions, friction, and resistances of the channel, together, become equal to the force which accelerates the motion of the water, the stream will be uniform, having then no parti-cular mechanical action on the bed, the velocity and abrading action of the stream and the sum of the resisting forces being mutual. When this takes place, and not till then, a permanency of the channel and a regimen of the river will be obtained. The disintegration of clayey and gravelly bottoms takes place by imperceptible degrees, the lesser particles of the soil being removed; then the larger ones, being left free and not held by other tenacious substances, the power of the water drives them along, and these in their progress lick away the soft and impalpable particles, and thus those bottoms not possessing resisting qualities become worn down by the superior mechanical action of the water. All soils have a certain stability consistent with the velocity of the water acting upon them; and by examining separately the effects produced by variations of the velocities of water upon soils, a know-ledge of the actions of the running waters of rivers upon their beds is obtained. As different kinds of soil constitute the bottoms of rivers, a knowledge of the various velocities which act upon and carry along different-sized bodies, is of great importance in determining the nature of the soil for the bed, which shall maintain a certain breadth, depth, and velocity of a river. Now it has been ascertained from various experiments, that water flow-

It would appear, therefore, from these experiments that in order to maintain the present breadth, depth, and velocity of the river between Westminster and Waterloo bridges, very coarse gravel is required for the bed; between Waterloo and Blackfriars bridges, gravel 1 inch diameter is required for the bed; between Blackfriars and Southwark bridges, gravel 1 inch diameter is required for the bed; and between Southwark and London bridges, gravel-stones 2 inches diameter are required for the bed. This shews at once that the indurated mass of gravel and clay, of which the present bed of the river is composed, does not offer a resistance, in the greatest run of the tide, sufficient to counteract the momentum of the flowing and reflowing of the tides; and, in consequence, the reason of the deepening of the channel (assisted, indeed, by dredging), is strikingly manifested since the removal of the great dam or obstruction to the flowing and ethe jing of the tides. namely old London-bridge.

ing of the tides, namely old London-bridge. London and its environs now contain a population of upwards of two millions of souls, and nearly all the impurities that are en-gendered within this great city and its suburbs are permitted to be discharged into the sewers by drains; almost every dwelling or other premises may now be drained, as sewers, which are of comparatively modern construction, are arranged and placed at such depths below the surface of the lower floors of buildings as are considered sufficient to afford perfect drainage from the various tenements. It must be obvious that the impurities, when discharged into the sewers, should not be allowed to deposit and accumulate within them, but should be carried off to the river as fast as engendered, and with the greatest possible speed. The same prin-ciple is also applicable to the discharge of the impurities, when received into the river. Nearly all the sulliage matter, as it is dis-charged by the Westminster, the City of London, the Tower Hamlets, and the Surrey sewers, into the river, becomes deposited upon banks. Between Putney and London its bridges the river is of a serpentine form, and its banks are of very unequal width. At low-water, vast quantities of mud and *living* corruption are exposed to view, at those situa-tions upon its banks which are flat and wide. These accumulations are by far more frequent on the north shore of the river, and are the deposited matters brought down and discharged into the river by the various sewers. Numer-ous accumulations of it may be seen between Battersea and Blackfriurs bridges, and the shore at low water in several places is of a reddish colour. When examined, the cause of this colour is found to arise from myriads upon myriads of small red living worms, em-bedded in the mud, and entwined together for several inches in depth. At one place between the Horseferry and the new Houses of Par-liament, there is an extensive bauk of mud, varing in depth up to 5 feet, and the surface of this bank is nothing else than a congeries of worms entwined together, and exceeding a foot in depth. When disturbed, the heaving of the mud is very perceptible, and the stench from them is noisome in the extreme.

In front of Whitehall-gardens, the accumulation of matter from the sewers is nearly 6 feet deep. Nearly the whole of the surface at this point is of a reddish colour, and is also covered with myriads of worms; and at lowwater, carrion-crows may very frequently be seen feeding upon them. In warm weather streams of exhalations are evolved from these extended heaps of abomination; and the effluvia being mixed with the atmosphere, are wafted into the streets and dwellings, and, of course, are inhaled by passengers and by the neighbouring inhabitants. The residences of the Duke of Buccleuch, Marquis of Ailsa, Earl of Harrington, and Sir R. Peel, are situate in this locality; and these noblemen and gentlethus living surrounded by a bog, and most nauseous descrip-

men are inhaling air of the

GOTHIC TRACERY PRODUCED BY MACHINERY.

/T1++-

WE mentioned last week that Mr. Billings had brought under the notice of the Institute of Architects, Pratt's patent carving machine. From the time of the revival of pointed architecture in England to the present day, archi-tects, even when they had skill (too seldom alas !), have been trammelled in their efforts to produce works approaching in excellence to those of the middle ages, by the great cost at which alone it was to be effected. At this are better understood than they ever were, and but for the circumstance just mentioned we might hope to see structures raised equal in beauty to the wonderful productions of our forefathers. In designing an edifice in this style, however, the inquiry, now ever present to architects is, what can be done without -how much decoration can be omitted, and yet the characteristics of the style be retained? and so they are compelled to pare, and shear, and leave out, and necessarily fall very short of the early works, which were usually the result of a long period of time, and were effected without regard to the total cost. A variety of expedients in the shape of imitations have been resorted to, but are now very properly abandoned.

By the machine recently patented, and which we have examined with great satisfac-tion, the difficulty here alluded to will be considerably lessened, insomuch as by its means, the most elaborate tracery can be carved out of the solid wood or stone with great rapidity, and for about one-third of the sum it would cost if executed by hand. It is capable of working any form, however elaborate, even to the tracing of a map, and is yet so simple in its operations, that a few hours' practice will enable any mechanic to work it. It may be described as presenting a union of the lathe, drill, and pentegraph. A small cutting tool is made to revolve very rapidly by means of steam power, while, at the same time, it is enabled to pass over the lines of a pattern (formed of cast-iron) which is fastened down on to the wood or stone that is to be A further motion is given by means carved. of the table on which the material is placed; and it is in the production of these various motions that the invention chiefly consists. The tool is said to make 3,000 revolutions in a minute, and, as it presents eight cutting edges on its circumference, 24,000 cuts. The hardest oak, the softest pine, and the most brittle stone are equally operated upon; and the largest spandrel of a roof, or the smallest screen-work can be produced. The patterns being inexpensive, it is stated that every panel of a screen may be different without much increasing the cost. The machine was invented by a Mr. William Irving, and was used in the first in-stance simply for inlaying floors, &c. The credit of its application to carving and other architectural purposes belongs, we believe, to Mr. Pratt, who, discerning its capabilities, effected an arrangement with the inventor, and patented the machine. He has executed, amongst other works, a roof for Ravensworth Castle, and a screen for Great Malvern Church.

We cannot avoid regarding this invention as a most important occurrence for the interests of architecture, and anticipate from it the best results. It has not even the disadvantage which in the first instance usually attends machinery, that of superseding manual labour: on the contrary, it will probably increase the occasion for it, by introducing a description of work not hitherto within the architect's means; and, as the artist's hand is required for the bosses, crocketts, and other enrichments (which the machine merely blocks out), may call into operation a school of carvers.

PROTECTION OF WORKS OF ART.-- A bill for this purpose has been brought into the House of Commons by the Solicitor-General.

ROYAL ACADEMY OF ARTS.—A notice has been issued to the effect, that all works of painting, sculpture, or architecture, intended for the ensuing exhibition in Trafalgar-square, must be sent in on Monday the 7th, or by six o'clock in the evening of Tuesday, the 8th of April next, after which time no work can possibly be received, nor can any works be received which have already been publicly exhibited. BRICKS A BRICKMAKING.

IN one of the previous numbers of THE BUILDER, the Whiterobserved an extract from the Mining Jots/Mal, relative to the manufacture of bricks, in which it was stated that an admixture of chalk with the clay from which they are made is injurious to the quality and strength of the bricks; this to a certain extent is true, but not so much so as the author of that paragraph would lead us to infer. Some soils used in the manufacture of bricks are so loose and incohesive, that unless they are held together, as the workmen term it, by an intermixture of chalk, it would be scarcely possible to make them into bricks of any value, either for the market or for building. It must, however, be admitted, that if there is an over proportion of chalk thrown into the clay, more particularly if the chalk is not well mixed, the bricks so made must of necessity be bad both in appearance and quality.

mate must of necessity be bad both in appearance and quality. And as it mostly happens that chalk is accessible to brickmakers, they do not fail to employ a very considerable quantity of it in their process of manufacture, which, being badly prepared and improperly used, unquestionably deteriorates the useful value of their bricks; so long, however, as they can contrive to keep them of good colour, they are satisfied even if they possess no other recommendatory quality; because they can always dispose of their stock to cutting builders, who care but little for the quality of the material they use in any kind of building, the speculative, of course, not excepted. Good clay is a great thing in brickmaking; but *time* and *labour* are as great, if indeed not greater, for indifferent clay with plenty of time and labour will make quite as good bricks as the best clay improperly used; if the labour in either case is stinted, the quality of the bricks will be injured one way or another.

If pure argillaceous earth is to be used, it should always be mixed with chalk and sand, care being of course taken not to put in too much of either ; the sand should be as clean and free from impurities as possible, and the more silex it contains the better, as it will then harden the bricks when they are burnt; if, however, there should be too much silicious matter, they will either fuse and run together into clinkers, or else they will turn out too brittle and shaky to be of much service to the builder. If too much chalk is put in, the builder. If too much chalk is put in, the bricks will be rotten and porous, for it appears to have the effect of preventing the intimate union of the sand and clay when being burnt, but if properly applied, it improves the bricks both inquality and colour. To make good bricks, it is essential that the earth should be exposed freely for some time to the action of the atmosphere, after it has been first dug out of its native bed, and if it be subjected to the action of frost for some weeks before it is ground up, so much the better for the quality of the manufactured article; the more the clay is pulverized and beaten, the better will it be tempered, so that labour, as I before observed, is one of the very best materials in the whole range of brick-making, as it is with every thing else; but time and labour being of high price, the brick-makers of course avoid high price the use of them both as much as possible. Good silicious sand when mixed with the clay fuses when at a red heat, and incorporates itself intimately with the other particles of matter in the bricks, and, like most other fused ingredients, it solidifies on cooling into a hard, ingredients, it solidifies on cooling into a hard, close-grained, compact body, capable of re-sisting the alternate changes of the atmosphere longer pehaps than any other material not of similar production: it is the silex that gives the brick the sharp sonorous ring when struck together, and if there is not too much of it, and it is not too highly scorched in the clamp or kin, the brick will be more durable than most of the stones used for building purposes. If chalk is mixed with clay merely in a broken state, without being washed and ground, the bricks are sure to turn out more or less faulty; the best way of using chalk is to grind it in the large mill, and reduce it to a kind of hydrate, and then pour it over the clay, previously pre-pared to receive it; as soon as it has settled, the superfluous water should be run off, and after a little time, allowed for the remainder of the water partially to evaporate, it should be intimately mixed with the clay by digging, pounding, and raking, and the more thoroughly it is incorporated with the clay the better.

I have seen bricks so carelessly made with respect to the use of chalk, that on dropping one of them, it would break to pieces, and exhibit the chalk in large solid lumps; in such case, if the bricks should be saturated with water, after being passed through the clamp, they will heat, swell, and crack in all directions, in consequence of the chalk having been converted into caustic lime, by having its carbonic acid expelled when being fired in the clamp or kiln.

Bricks vary as much in colour as they do in quality, which is attributable to a number of causes, the two principal, however, are the nataral quality of the component parts of the clay, and the mode in which the bricks are treated in the process of manufacture; some clay contains a very heavy trace of iron in different shapes, varying in colour from deep brown to light yellow, according to local circumstances; it is not unfrequently tinged of a greenish blue by the presence of the silicate of iron, which causes the clay to be mottled in its appearance in the pit. Great care is required in burning bricks to produce them of a good uniform pale yellow colour, which is the favourite of the London market, for if they are burnt too rapidly in contact with a free supply of atmospheric air, they are liable to be of a dingy red colour, alternating into a coarse dusky brown; whereas if they are carfully burned with but a moderate supply of air, say just enough to turn the iron into a peroxide, it will colour them of mearly a uniform sulphur yellow, which is the preferable colour according to present notions.

One great cause of the inferiority of bricks is the unwarrantable haste in which they are made; the field is now often bought, the earth prepared, and the bricks made ready for use in a few weeks; in fact, as many months are required to prepare the earth properly as we now take only weeks to make them complete. It is a very common matter now-a-days for a contractor to take a field near where his work lies, and make the bricks in the spring that are to be used in summer. The great falling off of the quality of modern bricks is a very probable cause of the decadence of the art of bricklaying, which has sunk from a high degree of perfection to its present miserable condition.

Where are we to look at this time for such brickwork as the builders of Wren's day produced? The highest ambition of a bricklayer is now torun a few arch-heads and window-crowns in "fine stuff," never daring to come into honourable rivalry with the glorious work—neat, elean, close, and smooth—of their worthy, plodding, but not to be beaten, great grandaires.

I will conclude these few words by repeating, that until our brick-makers give more time and more labour to the manufacture of their materials, it is hopeless to look either for good bricks or good brickwork.

JOSEPH LOCKWOOD

EFFECT OF SEA-WATER ON CAST-IRON.

MR. FARADAY has addressed the following observations on this subject to Sir Byam Martin, chairman of the "Harbours of Refuge and Defence" commission :--

"Sir,-I hasten to reply to your note, though not, I fear, with any certain knowledge, for infirm health has prevented me from taking up the consideration of the action of sea-water on iron, as my observations will permit. conclude that the question is of cast-iron in sea-water. Between these two bodies there is a vigorous action. As far as I have been able to observe, it is the greatest in the water near the surface; less in deep water, and least of all when the iron is buried in sand, or earth, or building materials (into which the water may penetrate); for then the oxide and other re sults formed are detained more or less, and form sometimes a cement to the surrounding matter, and always a partial protection. Soft cast-iron, as far as my experience goes (which is not much), corrodes more rapidly than hard cast; soft cast-iron, as far as my experience goes, more rapidly than the brittle white iron. As to the amount of corrosion in any given time, I have not had the opportunity of ob-serving any good and satisfactory cases of illustration.

"In estuaries and the mouths of rivers it is very probable that great differences of corrosion will arise from the different circumstances

of ariable saltness; the soil of the river if near a town, the metallice, will much effect it; thus a wharf of cast-iron might occasionally be greatly injured by making fast to it vessels that are coppered using iron cables.

"As to the protection of iron, and first by a coating; the permanency of a coat of paint, or of tar, or bituminous matter, can only be ascertained by reference to experience. Of this I have none, except in a case where coated iron sheathed for vessels was brought to me. I was much impressed with the thorough adhesion of the coat to the iron. The process was patent, and I cannot remember whose it was. Zinced iron would no doubt resist the action of the sea-water as long as the surface was covered with zinc, or even when partially crusted with that metal; but zinc dissolves rapidly in sea-water, and, after it is gone, the iron would follow.

"As to voltaic protection, it has often struck me that the cast-iron piles proposed for lighthouses, or beacons, might be protected by zinc, in the manner Davy proposed to protect copper by iron; but there is no doubt the corrosion of the zinc would be very rapid. If found not too expensive the object would be to apply the zinc protectors in a place where they could be examined often, and replace them when rendered ineffective. In this manner, I have little doubt that iron could be protected in sea-water. It is even probable that, by investigation and trial, different sorts of iron might easily be distinguished and prepared, one of which would protect the other; thus soft castiron would, probably, protect hard cast-iron, and then it would be easy to place the protecting masses where they could be removed when required.

"Hence, though iron be a body very subject to the action of sea-water, it does not seem unlikely that it might be used with advantage in marine constructions intended to be permanent, especially if the joint effects of preserving coats of voltaic protectors were applied. Perhaps engineers are in the possession of practical and experimental data sufficient to allow the formation of a safe judgment on this point. For my own part, I am not, and therefore am constrained to express the above opinions with much doubt and reserve."

ON FIXING CLOSE STOVES.

SIR,—IN consequence of the numerous fires that constantly occur from the *careless* manner in which close stoves are generally fixed, I beg to offer the following remarks for insertion in your popular journal, with the hope that they may lead to some improvement.

may lead to some improvement. Nearly all stoves of this kind, if not properly attended to, are dangerous from getting over-heated, and consequently should be securely be securely fixed away from any combustible material. If the stoves are placed detached in the open space of a room or workshop, the wood floors should be cut away, and trimmed to at least 12 inches in length all around the stove ; an arch of brickwork should be turned under in cementand a piece of stone laid to a level with the floor, which, to the extent of 18 inches further, should be lined with lead, and the stove placed in an iron pan. If the horizontal pipe is carried into the chimney opening, the latter should be filled up with brickwork (or sheetiron) with a trap-door, so that the soot may be removed, which frequently falls down; several fires have arisen from this cause alone. If the pipe is used for heating gluepots, drying timber and other materials, the whole of the stove and pipe should be embraced by an iron fender, about 3 or 4 inches higher than both of them, or at least a trough of iron running the whole length of the pipe, leaving a space of 7 or 8 inches round the And they might in manufactories, same. workshops, &c., where appearance is not much considered, be placed on three or four courses of brickwork covered with a piece of stone having an iron rim to form a fender round its edges; another method might be adopted, and perhaps the more convenient, leav-ing the chimney open, and having an elbow to the end of the horizontat pipe with a length of perpendicular pipe up the flue, which should be filled up just above the level of the mantel with brickwork or slate, having a trap, so that the chimney might be easily swept. With this arrangement, the stove might at any time be

removed and a register grate be placed in the recess. When a stove is close to a chimney opening within the confines of the stone hearth either of the above plans with regard to filleither of the above plans with regard to hil-ing in the chimney opening may be employed, having a liberal quantity of sheet-lead spread on the floor round the same. Many flues are fixed with the horizontal pipes running through wood partitions, having holes cut just the size of the pipe; the pipe from want of cleaning gets rad, her and sate fire to the of cleaning, gets red-hot, and sets fire to the woodwork. It would be better in all such cases to take out the wood panel, and insert an iron one, which would prevent such accidents, and when painted to match, would make the whole complete in appearance. In no case should stoves or pipes be placed within less than 12 inches from any woodwork, unless it be lined with lead; and in confined places, running through cupboards, &c., there should be double pipes, leaving a space for a draft of air to pass freely between them. Lead is the best ma-terial to be employed, the cheapest, and most durable, and being pliable, may be easily dressed round mouldings and other pro-jections, and when well nailed on the floors, is less likely than iron to be turned up by the traffic of the feet. It is of the utmost importance that all stoves should be safely fixed, not only for the security of the party setting them up, but that of his neigh-bours; a few pounds laid out in the first instance would produce a saving in the end, seeing how many fires arise from them, and that the offices charge from 1s. to 5s. addiinsurance tional premium, according to the number and nature of the stoves. No extra charge is made

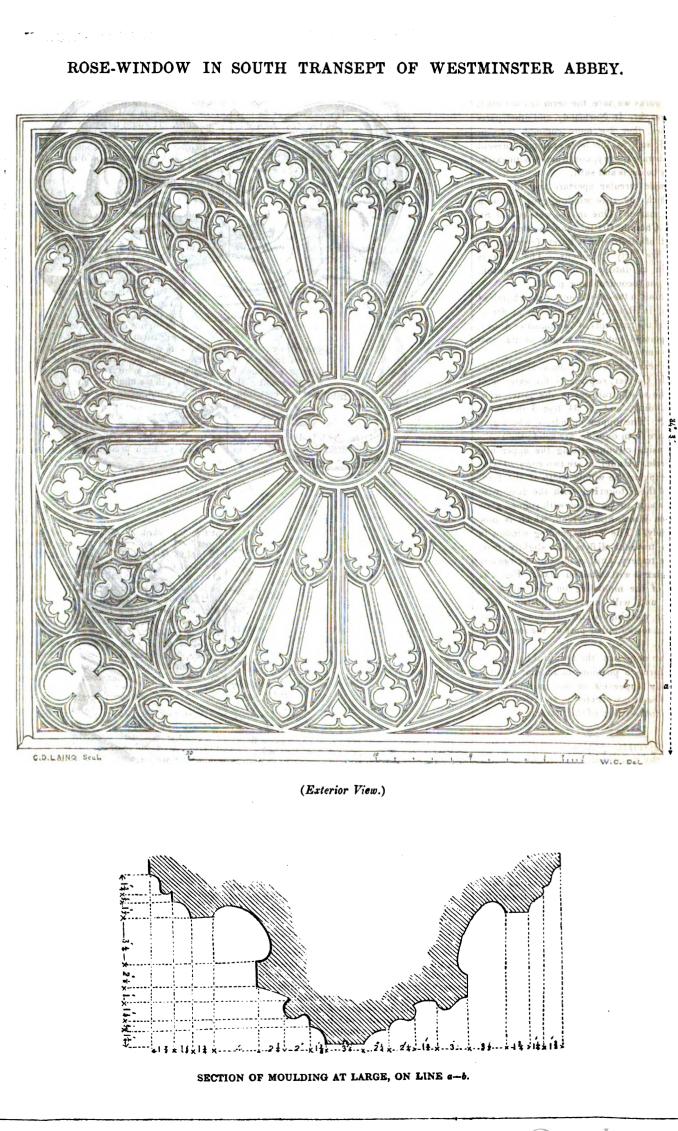

when they are properly fixed and attended to. I do not offer these suggestions as new, but as likely to prevent accidents by fire, and the infliction of high premiums by the insurance offices. W. J. S.

[Schedule F annexed to the Buildings Act, contains the following clause :---

"Close Fires.—And as to every oven, furnace, cokel, or close fire used for the purpose of trade or manufacture, it must be 6 inches at the least distant from any party-wall, and must not be upon nor within a distance of 18 inches of any timber or wood-work. And the floor on or above which such oven, furnace, cokel, or close fire shall be built or fixed, must be formed and paved under, and for a distance of 2 feet all round the same, with stone, brick, tile, or slate, at the least 2 inches thick, or other proper incombustible and non-conducting materials." It likewise provides that no metal or other pipe or funnel for conveying smoke, heated air, or steam, shall be fixed on the inside of any building nearer than 14 inches to any timber or other combustible material. —ED.]

RAILWAY NEGLICENCE.—At the Maidstone Assizes last week, two actions were brought against the South-Eastern Railway Company, to recover the value of certain stacks and farm buildings which were destroyed by fire, originating in sparks emitted from the chinney of a railway engine. Proof was adduced that means had been taken upon other lines of railway, by placing a wire guard over the top of the chinney of the engine, or by using a plate perforated with holes in front of the smokebox, to prevent the burning coals or ashes issuing from it; but that upon this line these precautions had been altogether neglected. Verdicts were returned in both actions for the respective plaintiffs; in the first, the damages amounted to 800%, in the other to 894%. 14s.

ATMOSPHERIC RAILWAY.—On the motion of Mr. Shaw, a committee has been appointed by the House of Commons, to inquire into the merits of the atmospheric system of railway propulsion. The right hon. member stated, that Sir John Rennie, Mr. Cubitt, and other eminent engineers were confident of its success; and the Messrs. Maudslay, of Westminster-road, were willing to contract for keeping the apparatus in repair at an expense of not more than 5 per cent. per annum, whereas the cost of repairing the ordinary locomotive engines was 50 per cent. per annum; and the first expense of the atmospheric railway was not greater per mile than that under the present system. Sir Robert Peel consented to the appointment of the committee.

ROSE, OR CATHERINE-WHEEL WINDOWS

CIRCULAR windows are found in the buildings of the 12th, 13th, and 14th centuries in England, France, and Germany. As well as rose, or catherine-wheel windows, they are sometimes called marigold windows; and in French works we have the term cil des ailes, rosa vitrea, &c. In Normandy, and other parts of France, they are more common than in England; and; id the later examples, present very elaborate tracery, constructed with extraordinary boldurss and skill.

A simple circular aperture was the germ from which the rose window grew to be a masonic marrol. One in the west end of St. James's Charich, Bristol, and another in the east end of Bastreston Church (recently restored), are early specimens. The latter is shewn in an interior view of the church, given in our second volume, p. 265.

And those in the west front of the church of St. Ouen, in Rouge, the cathedral at Strasburgh, and the transepts of Westminster Abbey, may be pointed out as examples of its most complete and perfect state.

The annexed sugraving, from a careful drawing by Mr. Osveler, represents the exterior of one in the south transept of the latter wonderful building, and is 34 feet 3 inches in diameter. The upper spandrels, which give it the square form outside, are solid; the vault-ing withinside circussoribing the upper half of the circle. Under it are two rows of winof the circle. User is are two rows of win-dows, occupying the whole width of the tran-sept; and these together with the rose win-dow, are shown in the filed with stained glass by Messer. We and Nixon, which is now nearly ready. The corresponding window in the north transpt differs but slightly from this in the tracery, and, as most of our readers know, is glazed with stained glass. Fig. 2 is a section of the moulding on the line, a-b, at large, and will serve to illustrate suffi-ciently the winking of the window. It may be ascribed to the latter part of the fourteenth century. century.

For some notes on the beautiful building of which it forms a portion, in addition to what has recently appeared in our journal (p. 98 and p. 110, ante), we refer to an article on the abbey in another part of the present No.

GOTHIC ORNAMENTS FROM THE CATHEDRAL CHURCH OF YORK.

In continuation of our series, we present two other examples from this beautiful building.

Fig. 7 shews one of two compartments in the spandrels formed by the arch of the door at the west end of the north aisle, and the cill of the window above it. The door in the opposite aisle has two similarly shaped compartments in the same position, but the sculpture is different in each of them. The panel shewn, represents (at the same time) two passages in the life of Samson. It is about 2 feet square, and is in high relief. The other three are much defaced: they represent various conflicts.

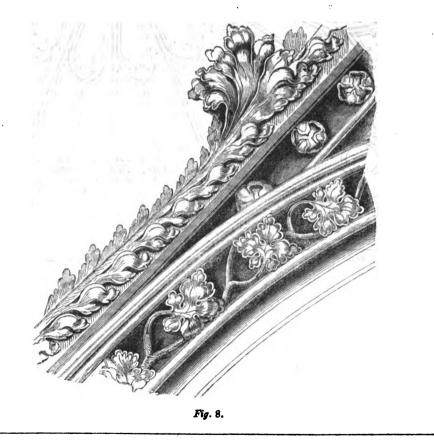

Fig. 8 represents a crocket on the lower part of the pediment of the great west door, with part of the mouldings of the arch. It is l foot 8 inches long. The crockets on the upper part of the pediment are different.

• In Rouen Cathedral there are three, 50 feet in diameter. There is a fine example in the west front of Rheims Catheiral. Amongst the earlier specimens in Norn andy are those in the Abbaye aux Hommes, Caen, and the Ducal palace in the same town.

SOCIETY OF ANTIQUARIES.

A MOVEMENT has taken place in this ancient and valuable society which is likely, we think, to have a good result. In a discussion caused to have a good result. In a discussion caused by a proposal, that in future no meeting of the society should be suspended in commemora-tion of the death of King Charles I. (Jan. 30th), it was admitted by members of the council that they scarcely ever met, and that, through neglect, the business of the society had accumulated, and was now in a complicited state. The accessing of subscript

made, and, together with the original proposition, were referred to the council, to be reported on at the anniversary

1. That the president of the Society of Antiquaries of London be requested to attend at the next anniversary of the society, and to deliver an address to the members, which may comprehend the names of the members de ceased during the past year; the number of new members; the state of the finances; the state of the arrears due to the society; the adtions amounted to more than 2,000. The following suggestions for the future conduct of the society, amongst others, were then

parts of the world; together with such obserations as he may be pleased to combine with them,-such addresses being delivered by the presidents of the Royal Society, the Geographical, the Geological, the Astronomical, and the presidents of other enlightened modern societies of London.

2. That the auditors, in their next annual report, be requested to explain the charge of 4477. 10s. allowed as salary to the officers of the establishment; and to specify the sum paid to each of them,—a practice observed by audi-tors in other societies.

3. That the librarian be allowed hereafter a competent salary in lieu of fees; and the payment to the librarian of 2s. 6d. by each member on receiving each volume of the Transactions be abolished.

4. That a general opinion having been expressed that the office of president should not always be filled by the same individual, how-ever accomplished and erudite he may be; that no person be allowed to hold the office of preno person be allowed to hold the office of pre-sident in future beyond the term of four years.

5. That if the authors or contributors of papers deemed worthy of being read be fellows of the society, they be requested themselves to read them (unless such authors or contributors prefer that these papers he read by the secre-tary); and that immediately after the reading of each paper, the members of the society be invited by the chairman to make observations upon the contents of each paper.

6. That the council do meet for the despatch of the business of the society at the usual place, at three o'clock, on the first Wednesday of every calendar month, except in September and October; and that this meeting be not ad-journed unless by the votes of a majority of two-thirds of the members present.

A CHAT ABOUT WESTMINSTER ABBEY AND GREAT MEN'S MONUMENTS.

BY G. GODWIN, F.R.S*

"They dreamt not of a perishable home Who thus could build. Be mine, in hours of fear, Or grovelling thought, to seek a refuge here; Or through the ailes of Westminster to roams, Where bubles burst, and folly's dancing foam Melts, if it cross the threshold-"

Oun metropolitan minster (west of Bt. Paul's) is perhaps without exception, the most beautiful and instructive sight in London; and yet how many inhabitants of this great city there are who but for the accidental vielt of a country cousin, which led them to seek the Lions, had never seen it ? and how many more to whom it is still unknown ground? They have travelled, perhaps, to York, to see They have travelled, perhaps, to York, to see the Minster there; they have sought objects of interest at Cologne; they have thrown their eyes round the Cathedral of Strasburgh—but Westminster Abbey, close at home, has es-caped their investigating gaze. Let them lose no time in seeking it out. We feel persuaded that few can visit this wonderful museum of skill, genius, noble thoughts, and memories of good deeds, without an elevation of mind, an improvement in taste, and a chastening in feeling which must tend in a greater or less degree to good. Walk through it, examine it, study it, as often and carefully as you may, you will ever find some fresh claim on your attention, some beauty before overlooked, or some evidence of unpretending piety, which makes you prouder of humanity and more determined to do nothing derogatory in your own person. It is, indeed, a spot "where folly's dancing foam melts if it cross the threshold;" where thoughts that are unboly die: where that are unholy die; where the past great ones of six centuries speak powerfully to you -it is to be hoped, not uselessly.

"Thinke how many royall bones, Sleep within these heap of stones. Here they lie, had realmes and lands, Who now want strength to lift their hands, Where, from their pulpits seal'd with dust, They preach, "In greatnesse is no trust !" Here's an acre, sown indeed With the richest royall'st seed That the earth did e'er suck in, Since the first man dy'd for sin."

The multitude of monuments which it contains, from that of King Henry III. upwards (omitting, for the present, any remarks on the destructive effect produced by those

erected in modern times), render it an index to English history, and a commentary; while the specimens of the workmanship of different epochs in wood and stone, and glass and metal, which these and other portions of the building present, make it a lecturer on British art, and a record of its progress. Edward the Con-fessor's chapel, at the east end of the choir, is alone a sufficient reward for a pilgrimage of a hundred miles. Here, where old Time seems to have secluded himself from the garish present, and reigns over remnants of the past, are ranged memorials of our early sovereignsthe pious Edward, Queen Eleanor, Edward I. Henry III., Queen Philippa, Richard II. and his Queen, and the gallant Henry V. It has nothing in common with the present time : it alone, and cannot be realized in the stands mind of any one of the thronging thousands, who are passing at so short a distance from the apot, if they have not visited it. Examine the pavement, examine the shrines—the chantry of Henry V., the screen next the choir, covered with minutest sculpturing-and see how the powers of art have been lavished in honour of God. Our forefathers were not satisfied with the decoration of the mere face of the part in human sight-the highest exercise of their powers was deemed hardly worthy of the temple; and so long as any portion, however remote or hidden, remained capable of improvement, so long was it deemed incomplete and requiring alteration.

Strange changes have occurred since a sacred edifice first occupied this site! What if it be not true that the Romans had a temple to Apollo here, or that Peter the Apostle raised the first chapel in the "Thorney Island," as the place was once called? There is good reason to believe that old Sebert, king of the East Saxons did, quite at the commencement of the 7th century: and this will give us a good 1200 years to talk about.

It was at first but a small building: Edward the Confessor perhaps made it larger. "With-out the walls of London," says an ancient scribe, "uppon the river of Thames, there was in times passed a little monasterie, builded to the honor of God and St. Peter with a few Benedict monks in it, under an Abbote, serving Christ: very poore they were, and little was given them for their reliefe. Here the king (Edward) intended (for that it was neare to the famous cittie of London, and the river Thames, that brought in all kind of merchandizes from all partes of the worlde) to make his sepulchre:" and so commanded that the tenth of all his possessions should be applied to its re-construction. This was probably about 1050. Hardly 200 years afterwards Henry III. went to work upon it, and erected much of what we now see, and at his own cost be it remarked, if the chroniclers speak truly. By the eighth Henry the monastery was suppressed, and Thorney Island became a city, the

abbey church, its cathedral. Of the elegance of the Abbey as a structure it is almost needless to speak; it may be termed the finest example of the pointed style of architecture ever executed in England, and remains the most complete, with the ex-ception of the cathedral at Salisbury. The combinations which its various parts form, especially at the eastern end, are as numerous as they are striking, and serve to impress a strong conviction on the mind, of the skill of the old builders, and the power they possessed of so arranging their structures as to excite pleasurable and lotty emotions. Amongst the most stiking of these combinations. Amongs the presented when standing beneath the porch of Henry VII.'s chapel, the gloom in which, most artistically devised, serves to render the full flood of light, to be found in the chapel itself, striking and effective in the highest degree. Burke remarks, in his essay on the sublime, "I think that all edifices, calculated to produce an idea of the sublime, ought rather to be dark and gloomy; and this for two reasons; the first is, that darkness itself, on other occasions is known by encourse the on other occasions, is known by experience to have a greater effect on the passions than light. The second is, that to make an object very stiking, we should make it as different as possible from the objects with which we have been immediately conversant; when, there-fore, you enter a building, you cannot pass into a greater light than you had in the open air: to go into one some few degrees less luminous, can make only a trifling change; but to make the transition thoroughly striking, you ought to pass from the greatest light to as much darkness as is consistent with the uses of ar-chitecture." This the architects of the middle "dim religious light," and accordingly built their ecclesiastical edifices, for the most part, with comparatively few openings. When, however, as in the case before us, the style When, adopted rendered larger windows necessary they reversed the arrangement, and so still obtained the required effect.

Many of the striking combinations to which we have referred are now sadly interfered with by the modern monuments, with which the Abbey is lumbered up-monuments for the most part so absurd that they would make us laugh if they did not make us sad. Mouldings, pillars, and adornments of all descripions have been ruthlessly cut away for them; openings have been interfered with, and even several of the spaces between the large clustered columns in the side aisles and chapels are blocked up to the top with tasteless and incongruous masses of stone and marble, alike unsuitable and discordant in colour and design.

The sculpture of the best periods of the middle ages has an entirely distinct and original character, prompted by the spirit of the time and carried out by genius. It is in no way imitated from the master-pieces of Pagan art, which might have been used as models; but is nevertheless full of feeling, and appeals to the sympathies rather than to the eye. In the ancient tombs at Westminster, as else-where, the sculpture is seen to be a portion of the building, conceived in the same spirit, and displaying the same feeling of reverence. All the figures are in repose, all are devotionalthere is no flutter, no action even, certainly no worldly action; they do not seek to record, in vain self-glory, any moment of the past, but carry us forward to the great hereafter, and inculcate humility. Alas! how sadly this con-trasts with those of more recent date, where every man " for his own hand," has worked in his own way, careless of the general effect, and has not worked well. Mountains of most material clouds, urns, flames, figures in ill con-ceived and violent momentary action, accurate models of periwigs and whiskers, the evanescent fashions of a period of universal bad taste, form the staple—but why endeavour to prove what nearly all seem to acknowledge?*

As the writer has elsewhere remarked, in reference to the tasteless tombs and monureference to the tasteless tombs and monu-ments with which all our cathedrals and churches have been gradually encumbered and overladen: — "Like some frightful fungus, they have spread insidiously over all parts of these structures, destroying alike their pro-priety, beauty, and stability." No more lament-able example of this evil is to be found than in Wastminton A bhow and it is the head about Westminster Abbey; and it is to be hoped that efforts will be made, not simply to prevent the increase of this abomination, but, as opportunities occur from time to time, to remove the excrescences now deforming this fine pile, and so restore its harmonious proportions and ori-ginal integrity. The triforium might be made to contain many of the monuments, as has been done at the Temple Church. Perhaps, too, the Chapter House, which is about to be cleared of its present contents (dirty shelves and presses), could receive some without injury to itself, so as gradually to restore to our

venerable Abbey its former appearance.† In spite, however, of the contemptible charater of the records, who can look around the south transept,—the poet's corner,— without emotion? Dryden, Cowley, Chaucer, Ben Jonson, Spenser, Butler, Gay, Thompson, Goldsmith, Gray, Dr. Johnson, Shakspeare, and a score of other heroes (heart-teachers, peaceful conquerors) marshal themselves before us, although not all buried here, and people the quiet aisles.

Nothing tends more strongly to elevate and refine the mind, to incite to virtue, or to deter from vice, than the contemplation of the burialplace of one who has rendered himself in either of these particulars an object of regard. The

Pallas, a heathen goddess, To lift her shield, come to protect Lord Stanhope ?—this most odd is.**

See Mr. W. Tooke's admirable edition of his poeme, 1844. † This suggestion was originally published by the writer in April 1843. It has been since urged by others.

[•] One of Churchill's earliest effusions (before 1750) was rompted by these incongruous monuments. It commence " In famed cathedral who'd expect

power of association is great: and the merest memento of a wise, enterprising, or virtuous man,-of one who has advanced the cause of civilization, or desolated countries to gratify a restless ambition,—is often sufficient to in-duce long trains of wholesome thought. When, however, we see his burial-place, his last and narrow home, the man himself passes before the mind's eye; and the impression made, the lesson inculcated, is much more powerful. If a conqueror, we see him bereft of his pomp and power, to obtain which the blood of his dependants had been lavishly shed, and conirisking enduring happiness for that which hardly is before it is not; while, at the same time, the mind is rendered more contented with its sphere; reminded, that whether powerful or weak, rich or poor, all will find the same earthly goal,—the grave; and that the time which intervenes is so short, as hardly to be worth consideration :-

"A little rule, a little sway, A sunbeam in a winter day, Is all the proud and mighty have Between the cradle and the grave."

Do we contemplate the remains of a good man? All his noble sacrifices, all the fine results of his exertions; the family saved from ruin, the generation advanced in knowledge, —pass vividly before our eyes. The heart involuntarily acknowledges the example, and good seed is sown. If these reflections be correct, it is important to a state that the mouldering remains of all men who have distinguished themselves above their fellows should be preserved and pointed out; and when party-feeling or prejudices lead to their disregard in one generation, it should be the business of the next to repair the omission.

If this were done, we should have statues, obelisks, busts, and temples at the corner of every street, in the centre of every square, and on the parapets of all the bridges. Rivals to Phidias and Praxitiles might arise amongst us; love of the beautiful and the good would be encouraged in the masses, and great changes in society would be effected. The time for it is approaching. This, however, is rambling beyond the Abbey walls. The present state of the ancient monuments there is denlocable. Those who

This, however, is rambling beyond the Abbey walls. The present state of the ancient monuments there is deplorable. Those who are in authority say they consider these monuments very sacred things, not to be touched without great care and consideration, as more harm than good might be done in attempting to improve their appearance. This is quite true, but there is nevertheless a limit to that forbearance, and this limit has been reached; if steps are not taken in several cases forthwith, nothing will be left to guide the restorer. We should be right glad to see a perfect restoration of the Abbey commenced, including the completion of the centre tower or spire, and the removal of the ugly western towers put up by Wren, who knew little of Gothic architecture, and liked it less. Relative to the erection of these towers, he wrote to the Bishop of Rochester:---"I shall speedily prepare perfect draughts and models, such as I conceive proper to agree with the original scheme of the architect, without any modern mixtures to shew my own inventions." Unfortunately, to do is not so easy as to know what ought to be done.

Amongst the earliest improvements to be made in the Abbey is the introduction of stained glass in the rose-window, and twelve lower openings of the south transept. The impulse which has been given lately to glasspainting in England is a pleasant sign, and cannot be too strongly aided. So firm was the belief that English artists in this department were inferior to foreigners, that the Chapter, it is said, had nearly determined on sending to Germany for the work in question; luckily, however, one or two members of it were staunch friends to English arti, and succeeded in appointing an English artist; the result of which, it is to be hoped, will fully justify them for so doing.

them for so doing. We have not yet looked into the chapel of Henry VII., orbis miraculum, as Leland calls it—one of the most beautiful specimens of the last period of Gothic architecture which England or any other country can boast.⁶ From its roof, "pendent by subtle magic," to the floor, the whole presents a rich lace-work of decoration. Of the roof, indeed, descrip-

* Commenced A.p. 1503.

tion can give no adequate notion. It is literally-

"Self-poised, and scooped into ten thousand cells, Where light and shade repose, where music dwells

Lingering—and wandering on, as loth to die, Like thoughts, whose very sweetness yieldeth proof,

That they were born for immortality."

The lover of architecture after studying the perfect development of the pointed style in the minster itself, \dagger with its acutely-pointed arches, its lofty attenuated columns, its infinite divisions, finds here the style which succeeded it when the arch was becoming more horizontal, and when a love of decoration threatened, as indeed did soon afterwards happen, to overwhelm good taste, and lead to the abandonment, for a time, of pointed architecture altogether.

As relates to sculpture, Henry VII.'s chapel presents one of the finest illustrations of early art in England, in the series of figures which fill the countless recesses in the walls. It is said they were once three thousand in number, but this is perhaps doubtful. They display admirable feeling for art, and deserve attentive examination. The carving, too, in the stalls here, is good, and leads us to express regret that so little encouragement is now given to this branch of art in England.

There are a considerable number of artists employed in it at this time, but unfortunately such is the dominion of fashion (another word for caprice)—it is chiefly, if not wholly, in the imitation of old work, to be afterwards stained and sold as such. The upholsterer is the *arbiter elegantiarum*, and the result is exactly what might be expected under such circumstances. The remedy for this, and many like evils, is to make artistical knowledge more general, and to induce the multitude to talk and think on the subject. With an increased public—an extended circle of admirers and employers—the powers of the artist will be more fully called into play; and the more critical that public is, the more strenuous will the efforts of the artist be to maintain himself superior to his judges.

INSTITUTION OF CIVIL ENGINEERS.

MABOH 11th, 1845.—Sir John Rennie, president, in the chair.

The discussion was renewed upon the relative merits of the screw and paddle-wheels as methods of propulsion, and was extended to so late a period, that no papers could be read. It was stated that the Napoléoa screw-

It was stated that the Napoléoa screwsteamer, in the French post-office service, made on an average, quicker voyages than any of the paddle-wheel steamers of the same power on the station; that in smooth water the latter vessels would make some way, but in rough weather the former was decidedly superior. The same result had been noticed with the Archimedes. When steaming down the river, she was frequently passed by merchant steamers, but by the time she had arrived at Dungeness, if there was any sea up, she had regained her place, and was s-head of the paddle-wheel steamers.

It was thought, however, that with the feathering paddles, invented by M. Cave, and equal power, the Napoléon would have done quite as good work as with the screw.

equal power, the Napoleon would have done quite as good work as with the screw. The peculiarities of the steaming qualities of the Rattler, in spite of her bad build, were fully described. It appeared that in heavy weather, when sailing and steaming, and when it was thought that she was dragging the screw through the water, the dynamometer shewed a very effective exertion of power, and that the slip was extremely small : that when the royal yacht was obliged to shorten sail, because of losing speed by the heeling over of the paddles, the Rattler was enabled to use all her canvas and engine power together, and to gain way in the same proportion as the other vessels lost it. The general impression appeared to be that the experiments were very satisfactory, and if the Rattler had been a well-formed ship, and the power on board had been greater.

A good adaptation of the screw was mentioned in the two schooners the Margaret and Senator, built by Messrs. Pim, at Hull, and

† Commenced A.R. 1920.

trading between that port and London. They were fine schooners of 242 tons burthen, fully rigged, but having near the stern two engines, each of fourteen-horse power, connected by wheel-work with a screw propeller. The result of a trial between the Senator and the Shannon, the latter being a regular paddle-wheel steamer of good power, was, that in the voyage between Dublin and London, the Senator arrived in London only ten hours after the Shannon, having consumed only eighteen tons of coal, while the Shannon had used ninety tons; proving that for mercantile purposes, where extreme speed was not essential, but that punctuality was desirable, the screw-propeller, adapted to sailing vessels, was calculated to be of essential service.

A curious letter was read from Lady Bentham, proving, by extracts from documents, that half a century ago, the late Sir Samuel Bentham, to whom was intrusted the building of several men-of-war, was the originator of the introduction of water-tight bulk-heads, dividing vessels into compartments, for preventing accidents from leaks, and also for stiffening them. Sir Samuel was aware of the plan having been used by the ancients, and also that the Chinese use the plan now. He also invented the wrought-iron water-tanks, and the metal casks for storing the powder, both being fitted to the shape of the ship. The letter containing these interesting facts, was remarkable for the clearness of its expression and for the accuracy of demonstration, when it was considered that it proceeded from a lady in her seventyfifth year.

Correspondence.

TO GIVE PLASTER OF PABIS FIGURES THE APPEABANCE OF MABBLE.

SIR,—I am always pleased to communicate to others any item of useful information which I may have gained either in the way of my business, or otherwise; and I often think that THE BUILDER might be made extensively useful, if parties would make a more frequent use of its pages for that purpose.

use of its pages for that purpose. In answer to the request of "C. T. L." in THE BUILDER of last week, I hope he will find the following methods satisfactory for the purpose of making plaster of Paris casts look like marble. I am, Sir, &c.,

CHARLES NEWNHAM.

Put into four lbs. of clear water one ox. of pure curd soap, grated and dissolved in a wellglazed earthen vessel; then add one ox. of white bees'-wax cut into thin slices; as soon as the whole is incorporated, it is fit for use. Having well dried the figure before the fire, suspend it by a twine, and dip it once in the varnish; upon taking it out, the moisture will appear to have been absorbed; in about two minutes' time stir the compost, and dip it again, and this generally suffices. Cover it carefully from the dust for a week, then with a fine soft muslin rag, or cotton wool, rub the figure gently, and a brilliant gloss will be produced. Or, Take skimmed-milk, and with a camel'shair pencil lay over the model until it holds out, or will imbibe no more. Shake off, or

Take skimmed-milk, and with a camel'shair pencil lay over the model until it holds out, or will imbibe no more. Shake off, or blow off, any that remains on the surface, and lay it in a place perfectly free from dust. When dry, it will look like polished marble, and this mode answers equally well with the former, except it be exposed to the wet weather.

N.B. The milk must be well skimmed, or it will not answer the purpose.

COMPETITIONS .- LUNATIC ASYLUM FOR THE County of Somerset.

SIR,—As you have expressed your desire to assist the efforts of architects in obtaining a better system of competition than at present exists, 1 beg leave to contribute my mite of experience on the subject.

I am much surprised that the profession can submit to be tricked with false pretences of rewarding the most meritorious (when it is well known that in four cases out of five favouritism has been shewn), without making some effort to bring their taskmasters to account, and thereby prevent them from attempting to make fools of them, and availing themselves of their gratuitous labours.

ing themselves of their gratuitous labours. I believe it is generally admitted that architects as a body are particularly selfish, and

possess the spirit of rivalry even to weakness. I have known many architects who, having blindly entered into competition, when they found themselves deceived, consoled themselves that their names were not made public, fell back on their more certain dependance, and resolved never more to waste time by entering resolved never more to waste time by entering into competition, unless they had some certain interest with the parties; and instead of stepping forward and calling around them their fellow sufferers, to probe the matter, they feared to mix themselves up with those beneath them, or to be regarded in the light of disappointed persons. So we go on from year to year, and competition is now become as a snare laid by the fowler to catch hungry small birds only; for in four cases out of five if the prize is not awarded to some favourite, it is sure to be given to some person who has studied the art of making bad compositions pleasing to the eye, and blinding the umpires with a few splashes from their brush.

I beg to suggest to the profession, to form a society, to be named "the Anti-competition Association," and to address every member of the profession in the United Kingdom, requesting their signature to the principles of questing their signature to the principles of the society, and that of all persons employed under them; viz. never to engage in any com-petition in which security is not guaranteed, that impartial justice shall be done in awarding the premiums, and naming the judges who are to decide on the respective merits of the designs submitted; and, at the same time, some architect of high standing as a referee in case any doubt should arise.

These thoughts have been called forth by my having recently entered into a competition for a lunatic asylum for the county of Somerset, and devoted a whole month in making the drawings, having no person to assist me. The manner in which the affair has been conducted is, to say the least, to me full of mystery! In the first place, the advertisement required a design for a lunatic asylum, including farmbuildings, lodges, estimates, and specifications, and a personal inspection of the site; all to be done in the space of fourteen days, in the depth of winter. After repeated applications from many architects to extend the time, they consented, within two days of the date fixed, to allow a month longer; but, at the same time, requested those gentlemen who had pre-pared designs to send them in by the time first stated. (Query: for what purpose, after the extension of the time?) I determined on competing. My drawings, and I presume those of the other competitors, were sent back in five days after delivery, accompanied with a two letters, one to the committee, and one to the clerk of the peace, requesting to know the names of the successful competitors, and of the visitors, and am refused any information on the subject. Should any of your numerous readers think, like myself, that justice has not been done in this case, and be able to give any information on the subject, by so doing they will oblige a subscriber to your work, who is

A FREEHOLDER OF THE COUNTY OF SOMERSET, AND A FREEMAN OF THE CITY OF BRISTOL.

March 14th, 1845.

COMPETITIONS-THE CLIFTON UNION.

SIR,-Architectural competition is a subject entertained by a great number of your readers, and it would be conferring a favour on me, as well as many others, if you would make public what has transpired in the *Clifton Union* competition, or whether it is yet made known who the successful architect is. We hope better things of this than the generality of competitions.-I am, Sir, &c.,

A SUBSCRIBER

COMPETITIONS-HOLLOWAY CONGREGA-TIONAL CHAPPEL.

-In answer to the inquiry of "A Com-SIR. petitor" and for general information, I beg to state, that the successful competitors in the Holloway congregational chapel competition are Messrs. Emmett and Chadwick of the Adelphi, whose plans are stated to have been distinguished by the *letters* E. D. O. (See THE BUILDER, No. 106, page 84.) The committee have refused to exhibit the

drawings (even to competitors), and have de-clined to give any further information. Should any of your readers be acquainted with more particulars, I (and no doubt the rest of the disappointed) shall feel obliged by their giving them publicity.

their giving them publicity. At the same time, I would suggest that in this, and all similar cases, the remedy is in a great measure in the hands of competitors themselves. Let them all units to exhibit their emselves. Let them all unite to exhibit their designs themselves, and surely the successful candidates would (if for no purer motive), for very shame join them.

I am, Sir, &c., Another Competitor. March 17th, 1845.

BUILDING SOULETIES.

-I have carefully reviewed the whole SIR. of Mr. Wiltons remarks on this subject which appeared in your journal, and, in my opinion, they have left the question in a worse position than it was; for this reason—in defiance than it was; for this reason—in defiance of the positive evidence of such societies having been in successful and beneficial operation at Liverpool for nineteen years, Mr. Wilton denounces them in toto; and that upon assumed grounds as thoroughly errone-ous as the fallacies he proposes to expose. You have termed it an "abstruse subject;" for such a reason, would it not be a disgrace to the intelligence of the present day that these societies should not be placed upon an intelli-gible footing? Mr. Wilton has evidently bestowed much attention on the matter; and agreeing as I do with him that the London and Westminster society is a most thorough bubble, he has not touched one of the practical objections to it; and it appears to me to be quite open to any advocate of that society to shew that he has created giants to slay them,--having assumed as data, propositions that have no existence in their scheme. If this be true, it must, to a great extent, relieve from blame those respectable parties who have lent their names to these bubbles, it being aside their babits to investigate an "abstruse subject" even to the extent Mr. Wilton has done. It is evident, that however palpably incorrect the statements of an opponent may be, if the subject is intricate and the arguments used as intended to prove the fallacy are themselves open to objection, the hand of the opponent is thus strengthened. I probably should have been unable to divine the whole matter had I not adopted the course of going down to Liver-pool and thoroughly investigating the subject. My objections to many of the details are just as applicable to the Liverpool as to the London societies, and at Liverpool were by intelligent men, admitted as objections.

My object is to propose the *juste milieu* between existing details and the intention of the legislature. Without entering into any details of figures (although I have made millions upon the subject) which are oppressive to the minds of parties unaccustomed to such details, I will confine myself to the evident broad objections of the London bubbles, charging with positive blame those who have with knowledge put forth such erroneous statements. I will, therefore, in this letter, only put forth such a statement as to period of duration (the broad charge against the London societies) that the commonest understanding may comprehend. If comprehended and admitted to be true, parties may then be imper-ceptibly led into further development of details, as a glimmering of truth (which you seek) will lead to an interest in a further discussion. These societies were intended for the benefit of our humbler neighbours, and, under proper regulations, would be highly beneficial. Such parties receive as true, statements sanctioned by respectable men.

The history of the transaction, as by the prospectuses proposed to them (for the mo-ment putting aside the 101 other fallacies), is this: they are told that a certain amount rill be advanced to enable them to buy or build a house upon an annual payment per share, of which 6% is termed subscription, and 2% 8s. redemption. I contend that this is neither more nor less than an annuity of 8/. 8s. A party granting an annuity naturally inquires the period for which it is to be paid, before he decides the amount (controlled by the discount he bids) he is content to receive in respect

thereof. The parties UPon whose dictum he depends distinctly declare ten years; and in some prospectuses, to establish the fact, a quotation is made thus :- "The following is an extract from the tenth and final report of the extract from the tenth and final report of the Liverpool Building Society, which terminated successfully in ten years from its commence-ment." I admit it terminated in ten years, but what were the conditions of this society? Is it not intended, an inference should be Is it not intended, an interence should be drawn, that they were *pari passu* with the pro-posed London Societies? What were the facts? In this quoted Liverpool Society, the monthly payments were 12s.; redemption-money, 8s., and thirteen payments, or lunar months, to the year. So that a party borrow-ing in the Liverpool society, paid an annuity of 13/, whilst a member of a London society would near only 8/. So, the value of abares in of 13%, whilst a memoer of a London society would pay only 8%. 8s., the value of shares in each society being 120%. This having been put forth with knowledge of the facts, would appear to be little short of a fraud. I will put forth with knowledge of the facts, would appear to be little short of a fraud. I will endeavour to elucidate this by a very simple operation of figures, and for the present there leave the question, with this remark, that the error into which Mr. Wilton and others appear to have fallen is, treating it as a purely financial question. Upon such a ground it needs no lengthened argument or complexity of figures to prove that parties proposing to lend money at 4 per cent. cannot by any process have a return made to them of their capital in ten years with 20 per cent. per annum profit. There is no doubt that these societies were originally established upon a rational theory of mutual benefit; accomplishing, by the com-bination of numbers, that which was impracti-cable for individuals. If your columns are permitted to be open to the subject, I pledge myself to prove to demonstration, that such societies may be formed upon, and existing societies conformed to, scientific and mathematically correct principles. The course I propose to adopt would be to point out the objections to existing details *seriatim*, and suggest the remedy, without embarrassing the subject with complexity of figures. I am, Sir, &c.,

đ • • • • • SOCIETIES. 30,126 8,766 13,400 ş Ń = d. • 2 2 4 • • . • • OML B,000 : 1,340 ŝ 80 ş Ń THE ÷ • : : d, • 50 i Ń 3 <u>a</u> Liserpool Sociely. 200 Shares, 13 months, at 13s., or 7/. 16s. subscrip-tion. G. R.

It will be perceived that with nearly 41 per cent. less revenue, the London society proposes to accomplish similar results in a like period. In the Liverpool society eighteen members only received 120%, and the evidence is distinct, that borrowing ceases at the end of six years.

[We have already devoted so much space to this subject, that we cannot comply with our correspondent's request. If "the objections to existing details" are not already known by our readers, they never will be .- KD.]

FURNITURE TO ACCORD WITH THE BUILDING. SIR,-Observations contained in a recent number of your publication lead me to think that an account of the manner in which the Conservative Club-house has been furnished, will be gratifying to your feelings as a man of

taste, and a sealous advocate of consistency in design and architecture.

The committee of the club has just set an example highly creditable to the order to which it belongs, and which is calculated, if followed by other bodies, or by wealthy individuals, to encourage the art of design more than any thing that has yet been done in this country.

Inis country. Disregarding the old practice of allowing upholsterers to give designs, they, instead, employed and paid a professional artist to make the required drawings, under the direc-tion of the architects of that mansion; and the result has been eminently successful, the furniture being thoroughly in keeping with the architecture, and contributing greatly to the effect and beauty of the interior, according

to the opinion of every visitor. The novelty of this plan forms a striking contrast to the principle laid down by a committee of Purliament, appointed to examine the charges for the furniture of Windsor Castle, manufactured by Messrs. Seddon; they struck out all charges for designing and drawings, setting forth as a reason that a manufacturer should be his own designer. Comment is superfluous—but the result was most mischievous, and most injurious and degrading to designers, for manufacturers could no longer charge for designs without fear of having them struck out of their estimates or charges; besides every manufacturer was, as it were, privileged by Act of Par-liament to consider himself a man of taste and a qualified designer, and quite independent of professional artists. However, brighter days are at hand, and

the public hegin to be sensible of the fact, that many years of hard study in the art of design, and exclusive attention to it, can alone make a I am, Sir, &c., D-square. H. WHITAKER. designer.

40, Brompton-square.

Miscellanea.

DECORATIVE ART SocIETY .--- On Wednesday, the 12th inst, a paper was read by Mr. Dwyer "On the interior decorations of the Royal Exchange." He referred to a former paper read in December last, and contended that the decorations did not improve upon further acquaintance; that the ceilings and public evidence of the first second seco walls contrasted painfully with the floor and pilasters; and that, admitting the style of decoration to be an approved taste, this incompleteness in such a building was much to be regretted. He suggested that an ornamental or a mosaic pavement in the ambu-latornes, comprehending in its design decided lines assisting the perspective, would tend to improve the whole effect of the interior. That the walls might have been adorned with representations from the history of commercesuch as the signing of important treaties, or by portraits of celebrated men, who have been connected with the rise and progress of our commercial greatness; and that these works ought to have been by our leading English artists, as offering to them a public gallery artists, as offering to them a public gallery for their productions. A question was put respecting "the vehicles used for the wax or encaustic painting" at the Exchange, but no satisfactory reply was obtained, and in-formation was again solicited upon this im-portant point, which, in fact, marks the distinction between encaustic and distemper painting, between durability and that which is not durable. The invention (patented by Mr. not durable. The invention (patented by Mr. Dicksee), of compressed glass mossics for pavements, for mural decorations, or for fur-miture, was explained, and some beautiful specimens exhibited in the room; this led to some further remarks on the exclusiveness of the Gresham Committee, to whom this inventor had applied to be allowed to shew his specimens, but no notice was taken of the request. It was thought that had there been a competition afforded to artists generally, much better results in the decorations of the Exchange would have been realized.

CITY BRICKLAYER.—A vacancy having occurred in this appointment, caused by the death of Mr. Cartwright, several parties have announced themselves as candidates. The appointment is in the gift of the lord mayor, aldermen, and common council, and when contested is determined by vote.

THE ELECTRIC TELEGRAPH .--- The speed of railway communication, wonderful as it seems, is infinitely eclipsed by another nobler invention, the gift of science to the useful arts, and which may be pronounced little less than miraculous: we mean the electric telegraph. A motion made at one end of the line, extending from London to Portsmouth, a distance of 88 miles, was conveyed to the other without any sensible lapse of time. It is not doubted that by similar apparatus, consisting simply of wires with powerful magnets at each end, intelligence could be conveyed in the same instantaneous manner from London to Edinburgh, or Inverses. The expense for the 88 miles was only $\pounds 24,000$, or rather less than $\pounds 300$ per mile. There is little doubt that they will be extended to all the more vulnerable extremities of the land; and it is easy to see how vastly this beautiful invention, combined with railways, will add to the se-curity of the kingdom, both from foreign invasion and domestic insurrection. The electric wires, extending over the island, may be compared to the nerves ramified over the body, which give instant notice of the slightest movement in the most distant member. The government seated in the sensorium will enjoy, when danger threatens, a sort of omnipresence. It will be able to communicate with the remotest parts in a few seconds, to know what is passing in these parts, and to direct, without the loss of an instant, the measures which the conjuncture requires. The danger known, the railways furnish immediate and gigantic powers to meet it. With their aid, a march, which in former times occupied a month, is contracted to a day; and supposing ten thou-sand soldiers to be stationed in London, they could now be sent to York in less time than would have been spent on the march to Windsor seven years ago.—Scotsman. PRESSING WORKMEN.—Our contemporary

the Literary Gazette says, a curious document has been lately published by the Comité Historique of Paris, concerning the comple-tion of the Louvre and the Tuileries. It belongs to M.A. Lenoir, and was once in the office of the Grand Provost of France. It appears from this paper that all masons and other handicraft men could be forced to work upon the king's buildings, by order of the provost, to the exclusion of all other buildings, which they were obliged to abandon for the time being. The king (Louis XIV.), after ordering all due preparations to be made for the collecting of stone, &c., commands that, while these palaces shall require the aid of a considerable number of hauds, no workmen in Paris shall be allowed to work on any other edifices whatever; and further, that no person shall presume to erect any building in Paris and within ten leagues round, under penalty of 10,000 livres fine for the first offence, and the galleys for the second. It is observed that in certain cemeteries of France-and it is known to have been especially the case within the cloisters of monasteries - there exist lofty crosses of stone, with a stone pulpit attached to them. This cross is styled the Hosannah cross, because on Palm-Sunday a procession was made thither from the church; certain prayers were offered up there, and the "Hosan-nah" sung.

ENLARGEMENT OF KING'S COLLEGE HOS-PITAL.—A public meeting was held on the 13th instant, at Willis's Rooms, King-street, St. James, under the sanction of the council of King's College, for the purpose of originating a subscription for the above object. His Grace the Duke of Buccleugh presided, and was supported by the Bishops of London and Lichfield, Lord John Russell, Sir Robert Inglis, the Governor of the Bank of England, Mr. Alderman Copeland, &c. 15,0004 is the sum required to complete the increased accommodation proposed. The contributions announced at the meeting amounted to upwards of 2,0004. The Queen sent a donation of 1001., and the Queen Dowager one of 1501. mains to be raised 13,0001. There still re-

ROYAL COMMISSION OF FINE ARTS.--Inconsequence of applications from sculptors request-ing to be allowed to exhibit in Westminster Hall specimens of their art, a notice has been issued inviting artists to send models for statues or groups, during the first week in June next, to Westminster Hall, to be there exhibited, subject to the regulations and conditions which were published relative to the former exhibitions.

RAILWAY UNDER THE THAMES .- At the annual meeting of the proprietors of the Thames tunnel, held last week, the chairman, in answer to a question whether there was any truth in the report that a proposition had been made for the construction of a railway through one of the adits of the tunnel, stated that "A plan was submitted by the late Mr. Samuda, who proposed to form a railway through the tunnel, for the conveyance of carriages and carts, one side being for footpassengers, and another for vehicles. The apparatus for the railway would cost about 10,000%. When it was sufficiently matured, the plan would be laid before the proprietors.

MASTER CARPENTERS' SOCIETY .--- A meeting of this society will be held at the Freemusons' Tavern, on Wednesday evening, the 26th instant, when, the usual business being disposed of, new members will be admitted. Several of the clauses in the New Buildings Bill will be brought before the board and discussed.

ART UNION OF LONDON .--- We draw the attention of our readers to the advertisement of this widely-spread institution in another part of the journal. The subscription lists will be closed on the 31st inst., and the general meeting for the distribution of the funds will be held on Tuesday, the 22nd of April.

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, & c., are to be addressed. For the convenience of our rescens however, they are entered in a book, and may be seen on application at the office of "The Builder," S. York-street, Covent-garden.]

A Plan, Specification, and Estimate, for a Pier, Slip, or Jetty, to be erected at Weston-super-Mare, Somerset. Twenty-five guineas is offered for the most approved plan. March 24.

For the supplying and erecting a Water-tank for the Sheffield and Manchester Railway Company. March 25.

For supplying her Majesty's several Dock-yards with Riga Hand Masts and Fir Timber, Dantsic Deck Deals and Fir Timber, and Norway Spars. March 28.

For the erection of Waiting-rooms, &c. for a Steam-boat Pier, at the Market-quay, Blackfriarsbridge. March 28.

For supplying the Commissioners of the Great Dover-road district, Newington, Surrey, with the best-tooled York Paving-stone, and the best Guern-sey Granite; also for labour and mortar in taking up, squaring, and relaying old pavement-stone. March 28. March 28.

For the supply of 11,000 feet of nine-inch cast iron Pipes for a new line of Aquedact to be laid in the Island of Malta. March 31.

For the supply of Rails and Chairs for the Eastern Counties Railway. March 31.

For the erection of a new Workhouse at Stratton,

For the erection of a new workhouse at stratton, St. Margaret, about Midway between Swindon and Highworth, Wiltshire. April 2. For certain repairs to Snake Bridge (over the River Alde), Suffolk. April 2. For Lighting Camden-town, St. Pancras, with coal-gas for five years, from the 24th of June next. April 3.

For the erection of a Church in the parish of St. Thomas, Winchester. April 5. For the erection of a Church, in the parish of St. Thomas, Winchester. April 5.

For cutting, forming, and completing a new line of Private Carriage-road, one mile in length, from Whitehaven Castle, Cumberland, the seat of the Earl of Lonsdale, to the Turnpike-road, between Bransty toll-bar and Lonsdale-place, near the town

of Whitehaven. April 7. For constructing the fourth division of the Great Southern and Western Railway. April 8. For about 250,000 Railway Sleepers not less than 9 feet long, for the Chester and Holyhead Railway. April 9.

For erecting at Alreaford, Hants, between five and six thousand feet superficial of new Brickwork, to be either neat flat, joint-pointed with white mortar, or neatly tuck-pointed. The parties to find labour and the erection of scaffolding only. April 10.

For the restoration of the Parish Church of

For the restoration of the Parish Church of Grays Thurrock, Essex. April 12. For submitting a plan of a Tread-wheel, and con-structing the same in the Common Gaol of Great Yarmouth, Norfolk. April 24. For all the Works to be done in the erection and completion of the new cast-iron Bridge over the Haven of Great Yarmouth, including the find-ing of labour, certain materials, &c. April 26.

For the construction of the third and fourth divisions of the Chester and Holyhead Railway. April 28.

For the supply of 11,000 feet of 9-inch cast-iron Pipes for a new line of Aqueduct in the Island of Malta. April 30.

For new-paying parts of the parish of St. Mary, Islington, Middlesex; and for repairing and keeping in repair the paved Footways belonging thereto, for one year from Lady-day next. Also for supplying unbroken Guernsey Granite, Core, Ballast, Gravel, and clean Flints.

For the execution of the Works necessary for the Drainage and Improvement of Lough Carrib, in the counties of Galway and Mayo. For the supply of Rails, Chairs, Sleepers, and Bolts, for the Taff Vale Railway.

COMPETITIONS.

Plans, &c., for the erection of a Commercial Middle School in connection with the committee of the Manchester Church Education Society.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

March 24.—At Bradley's Wood, Halsted, Essex: 500 good Fir Trees; 5,700 capital Hurdle and Hop Poles; 54 Loads of Wood, &c. March 24.—At Drayton, Somerset: 240 Oak Trees, almost the whole of which are sound clean

Timber of superior quality. March 27.—At the Hyde, Edgeware-road: 37 Butts of fine Elm Timber, felled and lying by

the side of the Edgeware-road. March 28.—At Garraway's Coffee-house, Corn-hill: 350 loads of Red Pine Timber; 700 loads of Baltic; 10,000 Colonial Deals; and 10,000 Baltic and Swedish Deals.

 March 28.—At Moor-house Farm, Denham,
 Baltic and Swedish Deals.
 March 28.—At Moor-house Farm, Denham,
 Bucks: 3,591 Oak Trees and Saplings; 220 Ash;
 136 Cherry; and 3 Alder Trees.
 March 28.—At Kesgrave Hall, Suffolk; Ash,
 Elm, and Birch Trees, Elm Pollards, Stock Birch,
 Bilm, Chesnut, and Alder Stands, and other Poles.
 March 31.—At 7, Store-street, Bedford-square t
 several thousand Yellow Deals, Pine and Spruos
 ditto, Battens, Planks, and Boards, Ash Felloes
 and Planks, and other seasoned Wood.
 March 31.—At Down Hall, Bredwell, Essex;
 310 Oak Timber Trees, standing with Top, Lop,
 and Bark; 213 Ash, 157 Elm, and 78 Beech Trees. Trees.

Trees. Trees. The last week in March, or the first week in April next.—A large quantity of Oak and Elm Timber, of superior quality and large dimensions, principally growing in the woods on the Orchard-leigh Estate, near Frome, Somerset. By Private Contract, before the lst of April next.—287 Oak Trees, of full growth and large dimensions, suitable for all purposes, now standing at Woodside, near Morland, Westmoreland. April 1.—At Chelmsford, Essex ; a very valua-ble, extensive, and well-assorted stock of Dry Wood in great variety, comprising fine Spanish and Honduras Mahogany, mostly cut between six and seven years ; particulaly fine Zebra Wood, English Oak, Pencil Ceder, Birch, Beech, Elm, Rosewood, &c. April 3.—At Whitley, near Baythorne End,

April 3.—At Whitley, near Baythorne End, Suffolk : a large quantity of Fir Timber.

MEETINGS OF SCIENTIFIC BODIES During the ensuing week.

MONDAY, March 24. - Medical, Bolt-court

PAINTING BRUSHES OF SUPERIOR QUALITY. TO PAINTERS, BUILDERS, &c. J. J. K E N T A N D CO., MANUYACTURES, 11, GREAT MARLBOROUGH-STREET, LONDON. Offer to Painters, Builders, &c., Painting Brushes of a quality far superior to those generally offered for sale, to which they beg to call the attention of all who prefer quality and durability to apparent chespness. 000000.-7 in. Justers. 000000.-7 in. ditto, extra. 00000.-7 in. ditto, extra. 0000... Plasterers' Brushes. Distemper ditto. Ground and Unground. Sash Tools, and Common Tools. Tar Brushes and Masons' Brushes, and all other Brushes used by Painters and Artists. Lists of Prices of Painting Brushes, and of all other kinds of Brushes, forwarded on application. Established 1777.

E. WOLFF & SON'S NEWLY-INVENTED MATHEMATICAL PENCILS, FOR

 FOR
 METHEMATICIANS, ARCHITECTS, & ENGINEERS, Warranted to retain a very fine Point.
 E. WOLFF AND SON, in introducing their Extra Hard Lead Pencils for Mathematical and Architectural purposes, beg to draw attention to the advantages resulting from their adoption in preference to the ordinary Pencils. They are made to six distinct sizes, by which means they can be fitted to all instruments, and are so constructed that each Pencil may be cut in halves without waste; thus making two Pencils each of a length, and most convenient for use, and obviating the difficulties existing with respect to the ordinary Pencils.
 E. W. and Son have also half-round Pencils, suitable for the Spring Bow, thus preventing the necessity of dividing the Pencil down the centre. They are made of extremely Hard Lead, of the finest quality, which will retain a very fine point and give a clear, even, and distinct line.— Price 4s. per dozen. 4s. per dozen.

The state of 0 0 0 0

A Sample of each size will be sent by Post to any part of the Kingdom, on the receipt of Postage Stamps equal to

the Kingdom, on the receipt of Postage Stamps equal to the amount. Drawing Pencils of the best quality, for Architects and Engineers, warranted free from grit: the HHH and HHHH are particularly recommended.—Price 5s. per dosen. May be had of all Instrument Makers and Stationers, and at the Manufacturers', 23, Church-street, Spitalfields, London.

WALLIS'S PATENT LIQUID WOOD WALLIS'S PATENT LIQUID WOOD KNOTTING. — This newly-discovered Liquid Composition which Mesars. Geo. and Thos. Wallis have the satisfaction of introducing to the trade, possesses the im-portant qualification of effectually stopping Knots in Wood, however bad, and preventing them eating through and dis-figuring the paint above. Many substances have been used and much time spent in endeavouring to find a cure for a bad Knot, but hitheste without success. Mesars. Wallis therefore feel much plea-sure in offering to the public an article so long and anxiously called for. In the application, shill is next provided.

called for. In the application, skill is not required; a boy can use is as well and effectually as the best workmen: it is put on to the work with a brush like common paint, can be used in all climates and situations, and does not require heat.

Sold wholesale and retail, by Mesara. G. and T. Wallis, Varnish, Japan, and Colour Manufacturers, No. 64, Long Acre. Price 20s. per gallon,

VARNISH.—It has long been a desideratum amongst the consumers of Varnish to obtain a good and genuine article; brilliancy, facility of drying, hardness, and durability are the qualifications necessary, but these are seldom if ever found united. The experience of a life-time devoted exclusively to the manufacture of this article, the grest and important discoveries of modern chemistry, and the daily improvements in machinery, have enabled Mesars, George and Thomas Wallis to produce Varnishes (both oil and spirit) unrivalled in every respect, and they confidently recommend them to the trade, as deserving of notice both in price and ouality.

recommend them to the trade, as deserving of notice both in price and quality. Builders, Coachmakers, Painters, and others may depend on being supplied with a genuine and unadulterated articles, Fine Oil Varnish, from 10s. per gallon; best White Spirit Varnish, 21s. ditto; Best Spirit French Polish, 20s. ditto; White Lead, Oil, Turps, and Colours of every description at the very lowest prices.-WALLIS'S Varnish, Japan, and Colour Manufactory, 64, Long-acre, one door from Bow-street. Established 1750.

HIP TILES to suit slate roofs in colour; Ridges, with plain or rebated joints, roll tops, and vertical ornaments; drains, many sizes, with plain or socket joints; paving in squares, hexagons, octagons, &c., dif-ferent colours; roofing, in Grecian or Italian styles, other devices also, or plain; conduits, which do not injure pure water; fire-bricks and tiles; clinkers, and out-door paving; sundry wall-coping, garden-borders, chinnep-tops; also tubular and other flues of peculiar material. No agent, but a depôt at WHITEFRIARS, and 22, WATER-LANE, FLEET-STREET, LONDON, under Mr. PEAKE'S per-sonal care, to supply genuine TERRO-METALLIC goods at fair prices as per quality. The TILERIES. TUNSTALL, STAFFORDSHIRE, are

The TILERIES, TUNSTALL, STAFFORDSHIRE, are near the centre of England, whence boats are sent direct to any inland place; or to the Mersey for the coasts, the colo-nies and elsewhere.

HATCHER'S BENNENDEN TILE-MACHINE, Manufactured and Sold only by COT-TAM and HALLEN, Engineers, Agricultural Implement Makers, &c., 2, Winsley-street, Oxford-street, London.

This is the most efficient Machine that has been invented for the purpose of making Drain Tiles. Any shaped Tile can be made by merely changing the die, which can be done in a few minutes. It requires but few hands, vis., one man and three boys. With this amount of labour, the pro-duct of a day of 10 hours is as follows, viz:--

BUILDER. THE

SATURDAY, MARCH 29, 1845.

HE Commissioners for pro-moting the Fine Arts, in moting the Fine Arts, in connection with the new Palace of Westminster. passed a resolution previous to the late exhibition of

works of decorative art in King-street, St. James's, to the effect, that those persons who might be selected for employment on matters of that description, should, if the commissioners thought fit, be required to produce a specimen of their art, to be completed under such conditions as the commissioners might stipulate.

They afterwards selected certain artists who had submitted carvings, and singled out one (very justly, so far as the works in his name were considered) as pre-eminently deserving to be employed in the new Houses.

On this the wood-carvers in London held a meeting, eighty were present, and, first approving the principle laid down in the resolution of the committee referred to, expressed their conviction that the artist thus distinguished was not competent to produce works equal in delicacy of execution to those exhibited in his name, and called on the commissioners to require him to execute a specimen under such regulations as might remove all doubts of his right to the position in which he had been placed. Further, they pointed out that a second artist selected by the commissioners was not a carver, and was incapable of producing work equal to that exhibited as bis, and suggested that the practical ability of all the gentlemen selected for employment as wood-carvers at the new Houses of Parliament should be tested.

A memorial, founded on resolutions passed at the meeting, was signed by ninety-three wood-carvers in London, five in Bristol, five in Warwick, three in Leamington, and three in Peterborough, and was presented at the close of last year. To this they have recently received the following reply :--

Whitehall, 1st March, 1845.

Sin.-I have to acquaint you that a petition, signed by various wood-carvers, and forwarded by you to Benjamin Hawes, Esq., M.P., to be presented to her Majesty's Commissioners on the Fine Arts, has been submitted to them accordingly, and that I have received their commands to notify to you in reply, that they are resolved in every case to satisfy themselves that artists are fully competent to execute with their own hands the works that may be allotted to them.

I am, Sir, your obedient servant,

C. L. EASTLAKE, Sec. Mr. W. G. Lock, Hon. Sec.

We have purposely avoided naming the artists alluded to, as it is to be hoped they will be able to satisfy their brother carvers of their right to the position given them : we deal simply with the principle involved.

The resolution arrived at by the commissioners is a good one. It is of the utmost importance to get rid of the third person standing between the public and the artist: until this be done, he remains simply a mechanic, and cannot hope to raise himself, any more than we can hope he will aid in raising his profession. Wood-carvers in England have been long kept down, and we

are most anxious to see the opportunity of encouraging carving, offered in the re-building of the new Houses of Parliament, made available to the utmost extent.

"We have very little opportunity of designing," said Mr. Mitchell, a wood-carver, to the Committee on the fine arts in 1841. "We are generally, which I consider the principal evil of the business, under the dominion of upholsterers; so that we very seldom design any work, or have any opportunity of doing so. The higher part of our profession is not encouraged. So far as regards the encouragement we receive at present, it is very little, or rather it tends to depress us from proceeding in any way as respects improving ourselves; for the generality of our work we receive from upholsterers, whose business it is to curtail the price as much as possible. And further, an intermediate person being employed is injurious, not so much that it affects the remuneration for our labour, as that it destroys every opportunity of rising in our profession." And this, all who have watched the effect of the system both on carving and glass-painting, and other decorative arts, must at once admit to be true, and be desirous to remedy.

We are glad to find the carvers bestirring themselves to obtain a proper place in society; still more so that they are anxious as a body to fit themselves to maintain it. In the association which they have formed, books on their art, specimens, and prints, are eagerly studied, and we fully believe that nothing but opportunity is wanting to develope some first-rate artists.

Being much interested in the subject, we have taken pains to learn the condition of this society, and find that there are now 108 members, fourteen of whom are employed in the country, and exempt from subscription, and that the number is steadily increasing. During the last three months several works have been purchased by the society for the use of its members, and a fine cast of a Saviour, from a crucifix executed in box, at Rome, for Napoleon. The last quarterly return shewed that there had been, in the preceding three months, 131 loans of books or prints from the collection, including forty-three works on Gothic designs, eighteen Elizabethan, seventeen French, six heraldic, five Greek and Roman, &c. &c. ; shewing a great demand for Gothic in proportion to other styles. Halfpenny's York Minster has the largest circulation of this class, next follows the Glossary of Architecture, and then Pugin : in the same three months there were sixteen loans of casts. They subscribe regularly to the Art-Union of London. About three years since the Society sustained a severe loss by one of the trustees absconding with more than 20%, otherwise it has prospered and increased from its formation; still, the contribution being small, few purchases can be made, and we venture to suggest to our readers that donations of prints and books would increase its usefulness.

Among the most recent carvings executed in England, the patterns for the gates of the Fitzwilliam Museum, at Cambridge, designed by Mr. Basevi, are well spoken of.

LIGHTING BY ELECTRICITY .- Mr. Weekes's plan for lighting towns by electricity is about to be carried into effect in America. The editor of the Cincinnati Mechanic states that an experiment he lately witnessed was per-fectly successful, that the apparatus is by no means costly, and that for lighting Cincinnati, two towers, it is considered, will be sufficient to illuminate the whole city. Mr. Weekes's plan was first published in this country as far back as 1831.

GLASS AND GLAZING.

"By some fortuitous liquefaction," remarks Dr. Johnson in the 'Rambler,' " was mankind taught to produce a body at once in a high degree solid and transparent, which might admit the light of the sun, and exclude the violence of the wind—which might extend the sight of the philosopher to new ranges of existence, and charm him at one time with the unbounded extent of the material creation, and at another with the endless subordination of animal life; and what is yet of more importance, might supply the decays of nature, and succour old age with a subsidiary sight. Thus was the first artificer in glass employed, though without his own knowledge or expec-tation. He was facilitating and prolonging the enjoyment of light, enlarging the avenues of science, and conferring the highest and most lasting pleasures; he was enabling the student to contemplate nature, and the beauty to behold herself."*

The removal of the duties from this very adaptable and important material has induced considerable stir in the glass trade, and cannot fail to lead to many advantageous results. T٥ the shares of glass companies it has imparted sudden value. Manufactories long since shut up have been opened again, and in other places where they have continued in operation, are forthwith to be enlarged. The Birmingham Plate Glass Company, who relinquished business two years ago, are about to renew their operations, we are told, which will have the effect of giving employment to hundreds of persons. The manufacture is to be revived in Cork, where it went to decay after the imposition of the duty. Works for after the imposition of the duty. Works for the production of glass are talked of in Worcester ; and in Sunderland Messrs. Hartley and Co. have commenced building three new glassbottle houses, which will give occupation to nearly a hundred men. Moreover, pernearly a hundred men. Moreover, per-sons heretofore in the habit of importing Bohemian glass in large quantities are about to discontinue doing so, and to turn their attention to the manufacture of the material in this country.

Sir Robert Peel asserted in his financial statement, that the square of glass which now costs one shilling would be reduced to fourpence; but, in reality, the reduction will not be quite so great, and when put into our windows the difference to the consumer will be even less, as the value of the glaziers' labour remains the same, and forms an important part of the cost of a square of glass. Common glazing in sashes will be done probably for 7d. per foot.

The immediate reduction in cost, however, although this will be considerable, is not the ultimate advantage of the alteration. The working of the present system (next week we shall be able to say, of the old system), is troublesome and oppressive, as it entails the constant presence of an exciseman, even when glass is produced in very small quantities, merely for the sake of experiments; and has had the effect of preventing efforts to improve its manufacture, and of rendering the application of additional skill and ingenuity almost

impossible. It cannot be doubted that in a very short time considerable improvements will follow the removal of restrictions, and that the actual cost of glass will be lessened very considerably. That it will be applied in numerous ways at present unthought of, seems certain. The premier spoke of the superiority of a balance-The spring of a chronometer made of glass instead of steel; and alluded to pipes of glass now being manufactured in France, for the con-veyance of water, which cost 30 per cent. less than pipes manufactured of iron, and would bear a greater external pressure than iron.

Since then we have heard of glass bells for churches, glass mountings for weavers' looms, glass pavements for streets and halls, glass milk pans, and various other novel applications of it. A provincial paper speaks of a "picture frame of common wood, the front of which is overlaid with slips of glass beautifully mottled, so as to produce the effect of veneered wood

^{*} Pliny gives the following account of the discovery of manufacturing glass. — A merchant vessel, laden with *nitrum* (salt or soda), being driven on the coast of Palestine, near the river Belus, the crew sacidentally supported the kettles on which they dried their provisions on pieces of the *nitrum*: the sand about it was virified by its union with the alkali, and produced glass.

THE BUILDER.

of the finest kind. The effect is, in act, in some respects, superior to that of the finest vencering used in framing prints, for while every description of wood may be imitated in this manner, the brilliancy and polish of the material affords a great advantage both in beauty and durability. In cheapness also, a very important point, the superiority of the new adaptation will, we imagine, be no less apparent over the working of the more ex-pensive woods." Picture-frames too, of all sorts, will be in greater request, for the cost of glass being lessened, drawings and prints will be framed and hung up more universally then fearmach. than formerly.

To horticulture the alteration will be of the greatest service; and many persons will now be able to enjoy the pleasure of a conservatory, or hot house, who have been prevented up to this time by the cost of maintaining such structures. The duty being levied by weight, and crown-glass sold by measure, the manufacturer has been led to reduce its substance as far as possible, and the result is that much glass is used which will hardly bear its own weight, or keep out the wind; and in green-houses and such erections the breakage is a constant and heavy expense.

Glass, besides being cheap, will now be more durable, for the materials of which it is composed are so inexpensive, that the manufacturer will be led, as lessening the risk to him-

self, to make the glass much stouter. There is yet a more important consideration in connection with the removal of this impost, and that is, as it concerns the general health. A prohibition of light is a direct encouragement of dirty habits, disease, and immorality. Light is as necessary as air and food, and a deficiency of it leads to numerous disorders.

So long as the infamous window tax is continued, the cheapening of glass will pro-duce in this respect but little improvement; but as that tax must ultimately be removed, or so altered as no longer to offer a premium for unhealthy arrangements, we may anticipate at no distant period most important advantages. Want of ventilation, deficiency of light, and a corrupt atmosphere, hurry thousands to a pre-mature grave, and unfit even a larger number for the due enjoyment of life. A writer in the Lancet says :---

" The fact of the multiplicity of windows being an immense advantage for health, is most important, and should be strongly im-pressed on the public mind whenever the onnortunity offers. It must not either he foropportunity offers. It must not, either, be forgotten, that in this respect we have not only the window-tax to contend with, but architectural prejudices. "Our ideas of architectural beauty are prin-

cipally derived from the buildings of southern Europe, where the intensity of light is so great, that it has rather to be avoided than courted, and where it is less necessary to favour its admission into dwellings, from the inhabitants spending so much of their time in the open air. The result is, that among architects a multiplicity of windows is considered a defect instead of a beauty, and studiously avoided. We trust, however, that no such doctrine will be allowed to exercise a permanent sway in a climate to which it so little applies, and that, however detrimental to architectural beauty windows may be considered to be, their importance in a hygienic point of view, will be the paramount consideration."

We will conclude our present notice with a brief reference to the history of glazing windows, comparatively a modern application of the material. Artisans were brought from abroad in the 8th century, to glaze the church windows at Weremouth, in Durham, and glass continued to be used partially from that time. For some centuries, however, it was considered a moveable luxury, not necessarily part of the house. In 1505 it was held in law that though the windows belonged to the heir, the glass was the property of the executors, and might therefore of course be removed by them, because the house was perfect without the glass.

So late as 1567, an entry then made in the minutes of a survey at Alnwick Castle, the seat of the Duke of Northumberland, shews that the glass casements were taken down during the absence of the family to preserve them from accidents: and even at the end of the 17th century, that the lower rooms in the royal palaces in Scotland were without them,

and had simply wooden shutters to exclude the air, and, at the same time, the light.

The first regular window-glass manufactory of which we have any account, appears to have been commenced in Crutched Friars, London, in the year 1557. The first sheets of blown glass were made at Lambeth in 1663. In 1691, the glass made at the Bear-garden on the Bankside was called "Crown window glass, exceeding French glass in all its quali-fications." The same manufactory was afterhcations." I he same manufactory was after-wards removed to Ratcliffe, and the glass be-came celebrated as "Ratcliffe crown glass." This and the other glass-houses in London were ultimately abandoned, on account of the expense of fuel, and at this time we believe there is not one left. Newcastle-upon-Tyne, Stourbridge, Bristol, Liverpool, Warrington, Birmingham, and Leeds, are the chief seats of the manufacture in England.

The duty on flint-glass is very inconsiderable, 7s. per cwt., as compared with that on crownglass, and for some time little difference will be found in the price of cut-glass articles; hereafter, however, for reasons before stated, its cost will, without doubt, be considerably lessened. Crown-glass differs from flint-glass simply in this respect, that it does not contain lead nor any metallic oxide except manganese, and occasionally a minute portion of oxide of cobalt, to destroy colour. This they do by what at first sight seems paradoxical, namely by each imparting colour. The manganese gives a slight tinge of red, the cobalt of blue, while the sand and alkali produce a yellow tinge; but the colours neutralize each other, and the result is an almost perfectly transparent material. The glass manufacturers, when the alteration was first announced, were alarmed by a state-ment, that no drawback would be allowed on the stock in hand. Several deputations at-tended the minister, to shew the injuries they would sustain by the removal of the duties, and in consequence, arrangements have been made to meet their views. The following is a copy the order issued by the excise :-

"The board have received instructions from the Lords Commissioners of her Majesty's Treasury to allow drawbacks on glass on the following conditions :

1. Warehouses at the cost of the manufacturers or dealers must be provided, and being approved by the excise, put under our lock. These warehouses to be at the different manufactories, and in each town where we have a

supervisor. 2. That no glass be warehoused excepting under the same regulations as if for export.

3. That no quantity of crown or German sheet glass less than 10 cwt. be received at the same time from any individual.

4. That each package be marked with the net and gross weight, and with the name and abode of the depositor. 5. That the bottle on the manufacturing

premises of such of the bottle makers as re quire it shall be taken account of and warehoused, or secured by the excise.

6. That on the repeal of the duty on crown, German sheet, and bottle glass, the quantities so under the excise locks shall be delivered to the respective owners, precautions being taken to ascertain that such quantities correspond with those deposited.

7. That so soon as the re-deliveries shall be completed, and the accounts have been examined and certified at the head office, owners shall receive documents authorizing them to claim the sums to which they would have been respectively entitled by way of draw-back on exportation, deducting 25% per cent. 8. That on the 5th day of April, the stocks

of plate-glass, whether in the rough, smoothed, or polished state, be taken; and on all rect-angular pieces of 6 inches by 4 at the least, and not less than 1-8th of an inch in thickness, the sum of 1s. 101d. per square foot be al-lowed, and on such as is polished and not 1-8th of an inch in thickness, the sum of 41. 4s. per cwt.; if unpolished and under 1-8th in thickness, no allowance."

HEALTH OF TOWNS .- Mr. Mackinnon has postponed his motion relative to the Health of Towns until the first Monday after Easter.

BATHS AND WASH-HOUSES.—An exhibition of the competition designs for the first model establishment will take place at Mr. Rainy's gallery, 14, Regent-street, on Monday next, and the three following days.

CONSTANTINE'S BRIDGE OVER THE RHINE AT COLOGNE.

of our readers have, no doubt, MANV visited the bridge of boats thrown across the Rhine from Cologne to Deutz; and many of them have most probably been informed by the "cicerone" that a stone bridge once united the two towns, the remains of which (as he asserts) are still to be seen at the Beyen Thurm, at the southern end of the town, and to which, as an object of interest, the traveller is generally conducted. That a stone bridge across the Rhine, or, at

least, the foundation of one, did once exist we have every reason to believe; but that the projection at the Beyen Thurm formed a part it (and which a casual observer would of it (and which a casual observer would readily suppose) is a decided fallacy. The projection, which juts at that point into the Rhine, formed the foundation of a screen, entitled "die Arck," on which two guard-houses were built, and under which was an arch for the passage of small vessels at such times as the Rhine was barred, as was the case in the years 1414 up to 1463, when Cologne was in league with the Duke of Berg against its Archbishop Dietrich von Moers. This projection was connected by a wall with the Thurm or tower. In October, 1556, the town council decided that this projection should be demolished, being of opinion that the stream was thereby fored towards Durts. This was thereby forced towards Deutz. was thereby forced towards Deutz. This order was, however, not carried into execution (although repeated in 1583) until the seventeenth century. At the northern end of the town a similar projection with tower existed, and was, in like manner, connected by a wall with the Cunibert's Thurm, the lower part of which is still standing; so that here, as at the Beyen, ingress and egress to the town could, when required, be prevented. The above has been clearly proved by historians; and by visiting St. Gereon's Church, a picture may still be seen under the altar-piece, repre-

still be seen under the altar-piece, repre-senting the projections, and shewing clearly the use for which they were designed. We have said that we have every reason to believe that a stone bridge, or at least the foundation of one, did exist. That the Roman emperor Constantine caused it to be built has been doubted by many. In 1766, the water being very low, the engineer Rheinhart en-deavoured to discover its remains, and after a lengthened search found, in the bed of the Rhine near the Salzgassen Gate, massive stone columns, as of arches, still standing. He states the distance of these columns from each other to have been 7 Ruthen, 4 inches Rheinland (86 feet 9 inches English), and the breadth of the bridge 36 feet 8 inches Rheinland (37 feet 9 inches English). Many other historical grounds may be given in favour of our opinion, and it may be safely said that Constantine commenced this bridge, but most probably did not succeed in finishing it. We read, however, that the Emperor Otto I. quarrelled with his brother Bruno I., Archbishop of Cologne, owing to the latter having caused the old Roman bridge to be demolished in the year 950, in order to make use of the materials for building the church and cloisters of St. Pantaleon. This would lead us to of St. Pantaleon. This would lead us to believe that the bridge was really finished, or why this quarrel?

According to Wallraf,* the Roman bridge, commenced at the Old Mars Gate, passed over the left or smaller arm of the Rhine, and was guarded by two towers at its connection with the Rheininsel. This assertion is not only in direct opposition to the discoveries of Rheinhart, but is also entirely ungrounded, and cannot be proved either historically or otherwise, no writers having spoken of it, and no remains having been ever found on or near the spot.

From an inscription found in St. Heribert's Abbey, in Deutz, we are led to believe that Constantine caused a tower to be built on the eastern bank of the Rhine to guard the bridge, and from which Deutz took its origin. The authenticity of this inscription is, however, greatly to be doubted. It is possible, and more than likely, that Constantine caused a castle or tower to be built on that bank to guard the passage across the Rhine from the attack of neighbouring enemies, but that this tower was a part of the bridge still remains to be proved.

• See Wallraf's "Beiträge sur Geschichte der Stadt Köln."

We have written the above to guard the continental tourist in his researches, from placing too much faith in the assertions of his accompanying "cicerone."

Cologne. W. H. PEPYS, Jun.

CHURCH OF ST. PETER'S, HOWDEN.

A STRONG appeal for funds to restore this A striking appear to have to relate the edifice has been issued; we sincerely hope it may be responded to satisfactorily, notwith-standing that it is dated "Feast of all Saints," and bears, unfortunately, other party badges. From the document in question we learn the following particulars of the early history of the

building and its present state :--"Before making an appeal on behalf of the church of St. Peter's, Howden, perhaps it will not be uninteresting to give a rapid sketch of its early history.

There was a church and priest at Howden at the time of the Domesday survey. In the days of King Edward the Confessor, the manor, church, and lands were wrested from manor, church, and lands were wrested from the monastery of Peterborough, and being in the king's hands, William the Conqueror gave them to the Bishop of Durham, who gave them to the monks of Durham. The church was first a parochial chapel, in the patronage of the priory of Durham, and A.D. 1267, Archbishop Walter Grey ordained five prebendaries, one of whom as an heb-domary to orderly keep his turn, and serve the cure of the parish by his turn, and serve the cure of the parish by his respective priest, and further ordained that the prebendary of Howden should be the first prebendary, and free from all cure of souls.

The great patron and architect of this church was Walter Skirlaw, Bishop of Durham, to whose taste and spirit we are indebted for one of the most glorious ecclesiastical edifices in the kingdom. It is true, in extent and proportion it may find many not only to compete with, but also to surpass it; but it will bear the severest comparison with the most enriched, in elaborateness of detail and finish. Like many similar structures, it has been the work of successive periods, though probably in its general construction the completion of one original design.

By reference to Hutchinson's 'History of Durham, vol. iii., we find copies of the charters, &c., of Howden, from which it appears that A. p. 1268, the church was made collegiate. It is, therefore, more than pro-bable that the re-building is posterior to that date. Indeed, we may conjecture it to have been in the following order, and the architec-tural evidences of the building confirm the supposition :-

I. The nave, transepts, and tower, up to the

leads ;

II. The choir and chapter-house; and III. The lantern-tower and school.

The whole may be included in the period from A.D. 1280 to A.D. 1400. (Bishop Skirlaw died 1405.) The particular dates it would be bazardous to fix, nor is it necessary.

At present the choir is in perfect ruin, as also, in great part, the chapter-house. The portions of the building now in sufficient repair for the purposes of Divine worship are the nave and transepts. And here it is not too much to say, that it would not be possible to over-rate the zeal and honourable pride of the parishioners, which have led them to no or-dinary sacrifices in order that their house of prayer should not lie waste. And first and foremost have stoud forth the respected vicar and his excellent churchwardens, who, mindful of the high responsibilities of their office, and with the true spirit of worthy sons of the church, have counted no sacrifices too great, and no exertions too severe, which could prove the means of putting this sacred fabric into a condition so as securely to stand the admiration and delight of four centuries to come, as it has been of the four which have passed away.

The appeal on behalf of this church is made as for a great national undertaking, to preserve and restore an edifice which may serve as a school and model for present and future instruction to the admirers of ecclesiastical architecture, which might well excite pride in our forefathers, but we fear, in these days of coldness, will be the object of our envy rather than our imitation."

SUPPLY OF WATER TO THE METROPOLIS.

At a recent meeting of the Statistical So-ciety, Mr. J. Fletcher, the honorary secretary, gave an outline of the present system of supplying the metropolis with water. London, in the first instance, derived its supply of water from shallow wells, from the Walbrook in and other streams descending from the north, and from the Thames itself, by direct carriage. In the reign of Henry III., the corporation obtained liberty to bring water from Tyburn, which they did by means of a six-inch leaden pipe carried to Charing-cross, and thence to several conduits in the city. In 1438 the corporation brought water from Highbury to a conduit opposite Cripplegate Church. to a conduit opposite Cripplegate Church. In the following year the supply to the cisterns. at Tyburn was augmented by the waters of some springs at Paddington, obtained from the Abbot of Westminster. This continued to be the only great source of supply until the middle of the sixteenth century, although the water of various springs in the neighbouring fields were brought to supply noticular, build fields were brought to supply particular build-ings or localities in the city; the conduits at Holborn-cross and on Snow-hill deriving their water from the springs collected into Lamb's-conduit, near the present Red Lion-street; that at Aldgate from springs at Hackney; one in Lothbury from springs between Hoxton and Islington; the Charterhouse from White Conduit-fields, and Christ's Hospital from the Devil's-conduit, north-cast of the present Brunswick-square. In 1543 an Act was passed to enable the corporation to bring water from Hampstead Heath, St. Marylebone, and Hackney. Nor was it until 1568 that Thames water was raised by machinery for the supply of London. The New River Company supplies all the

metropolis north of the Thames from Charingcross, Tottenham-court-road and the Hampstead-road, on the west, to the Tower, Shorestead-road, on the west, to the Tower, Shore-ditch, and the Kingsland-road, with Dalston, on the east; the East London Waterworks Company, all those portions which lie to the east of the City, Shoreditch, the Kingsland-road and Dalston, extending their mains even across the river Lea into Essex, as far as West Ham; the Chelsea Waterworks, the whole of Ham; the Unelsea waterworks, the whole of Westminster and the suburban parishes, south and west of Charing-cross, Pall Mall, St. James's-street, Park-lane, and the Uxbridge-road, as far as Kensington palace; the Grand road, as far as Kensington-palace; the Grand Junction Waterworks Company, the great square of town included by Oxford-street, Princes-street, St. James's-park, the Green-park, and Hyde-park, the Park-square dis-trict, between the Edgeware-road, the Ux-bridge-road and the Regent's Canal, and a considerable district in the angle formed by the western end of Oxford-street and the the western end of Oxford-street and the southern end of the Edgeware-road; the West Middlesex Waterworks Company, all that portion of the town lying west of Tottenham-court-road and the Hampstead-road, and north of Oxford-street, the Edgeware-road and the Regent's Canal, with the exception of the part near the junction of Oxford-street and Edgeware-road, which is supplied by the Grand Junction Waterworks—the West Middlesex Waterworks also supply Bayswater and the suburban parishes of Kensington, Fulham, Hammersmith and Chiswick; the Southwark Waterworks, nearly the whole of the parishes of St. George and St. Saviour, Southwark; the Lambeth Waterworks Company, the whole of the parish of Lambeth and parts adjacent; the South London Waterworks Company, which is also called the Vauxhall Waterworks Company, it was calculated in 1830, supplied above 300,000,000 of gallons. In addition to the works mentioned, there are the Kent the works mentioned, there are the Kent Waterworks, which supply Deptford, Green-wich, Woolwich, and Rotherhithe. The quantity of water raised by the eight great metropolitan companies in 1833 appears to have been equal to 357,288,807 imperial barrels; the number of houses and buildings supplied 191,066; and the average daily supply above 35,000,000 of gallons, or, 183 gallons to each person served. on the average. each person served, on the average.

WESTMINSTER IMPROVEMENTS. -- The committee have plans now before them from Messrs. Tarring, Donthom, Lapidge, Lewer, Alders, S. Smirke, Bardwell, H. H. Russell, and Abraham. The plan of the latter gentle-man is that known as "Mr. Wason's."

THE SMOKE NUISANCE.

THE preamble and chief enactment of the "Bill to prohibit the nuisance of smoke from furnaces or manufactories," introduced in the House of Commons by Mr. Mackinnon are as follow :

"Whereas great loss of fuel arises from the mismanagement of the fires of manufactories, and much injury to the health and comfort of the people is occasioned by the smoke issuing from the furnaces and chimneys thereof, and of the furnaces and chimneys of plying steamboats on rivers within the jurisdiction of towns boats on rivers within the jurisdiction of towns or populous places, and the same can be re-medied by proper care and attention; be it enacted by the Queen's most excellent Ma-jesty, by and with the advice and consent of the Lords spiritual and temporal, and commons, in this percent Berliament excembed and be in this present Parliament assembled, and by the authority of the same, that from and im-mediately after the passing of this Act it shall be lawful for the justices of the peace for any county, riding or division, usually acting in any special sessions division, and for the justices of the peace for any city, borough or place at any special sessions respectively, from time to time to appoint any police officer or other proper person, and they are thereby re-quired so to do, to be inspector of smoke nui-sances within the limits of such special sessions division, city, borough, or place, or any part thereof respectively; and such appointment from time to time to alter or cancel, as such justices in special sessions shall from time to time think fit, and to allow to such inspectors, or any one or more of them, such salary as the said justices in special sessions shall from time to time think fit; or in the case of any such inspector being a paid policeman, to require him to perform the duties of inspector of smoke nuisances, without any additional salary; every nuisances, without any additional salary; every such salary to be charged upon and payable out of the county rate, or such fund as is charged with the salaries of policemen for the district for which any such inspector is ap-pointed; and if there be more than one such fund, then in such proportions as the said fund; then in such proportions as the said justices in special sessions shall from time to time think fit.

And be it enacted, that from and after the first day of January, one thousand eight hundred and forty-siz, it shall not be lawful for the occupier of any furnace or chimney to permit opaque smoke to issue from such chimney for any longer period of time than is necessary for the kindling of the fire of such furnace in connection with such chimney, and previous to the running of any engine connected therewith, which time allowed for kindling such fire shall not exceed fifteen minutes during one day.

And be it enacted, that from and after the said first day of January, one thousand eight hundred and forty-siz, it opaque smoke shall be suffered to issue from any such chimney for any greater number of minutes than is bereinbefore limited in that behalf, the occupier, or any one of the occupiers of such chimney, shall for every first offence forfeit and pay any sum not exceeding forty shillings, nor less than twenty shillings; and for every second offence, any sum not exceeding pounds, nor less than forty shillings; and for

every additional offence, any sum not exceed-ing pounds, nor less than pounds; to be recovered in a summary way

before any two or more justices of the peace, in and for the county, riding, division, city, borough or place, wherein the offence shall be committed: provided always, that if such defendant shall charge that the offence mentioned in such summons was committed, if at all, through the negligence or wilful misconduct of any other person, it shall be lawful for any justice of the peace of the county, riding, division, city or place, on the applica-tion of such defendant, to summon such other person to attend at the hearing, before two or more such justices to answer the charge of such defendant in that behalf; and such charge shall be heard and determined as the justice of the case may require; and if the defendant shall satisfactorily prove that the offence mentioned in the original summons was wholly or in part caused by the negligence or wilful misconduct of such other person, the justices by and before whom the charge so brought by the original defendant is heard and determined, shall order the whole, or such part as they shall think fit, of the penalty and costs,

if any, which are adjudged against the Original defendant, to be reimbursed to him by such other person, to be levied in like manuer as penalties under this Act may be levied upon any original defendant: provided also, that if at the time of any such order being made as is last mentioned, such other person be in the receipt of or entitled to receive any wages from such original defendant, or any coparinership of which such original defendant is a member, it shall be lawful for the said last-mentioned justices to authorize such original defendant to deduct the sum, if any, so awarded to be reimbursed to him as aforesaid, out of the wages then or thereafter to become due from him or his co-partnership, to such other person as aforesaid, either in one sum, or by such instalments as the said justices shall, in any such case, think fit to award."

When Mr. Mackinnon moved the second reading of the Bill a few evenings ago, the Earl of Lincoln said he thought it would be the better course to pursue, and would tend very much to more satisfactory legislation on this matter, if Mr. Mackinnon would consent to postpone the second reading of his Bill until after Easter. He had promised that he would look into this subject. He had done so, and was still continuing his inquiries amongst scientific gentlemen as to the best mode of curing this evil of snoke in towns. It was only within the last two days that he had received additional information on the matter, but which he was not then prepared to communicate to the House. The House was already aware that a measure of a nature somewhat similar to that contained in the present Bill, but on a much larger scale, and of much greater importance to the country, was under the consideration of the Government, and he could not help thinking that it might be more advisable to consider this question in connection with the other. He would, therefore, ask his hon. friend to postpone the second reading of his Bill until after Easter, when both measures could be considered with greater propriety. Several honourable members expressed opi-

Several honourable members expressed opinions upon the Bill, and it was ultimately deferred until Wednesday, the 2nd of April. We understand that in Birmingham from

We understand that in Birmingham from eighty-five to one hundred owners of steamengines have adopted sufficient remedies to ensure the consumption of their smoke.

WORKS IN THE PROVINCES.

At Lyme Regis, very extensive improvements are in contemplation. The inhabitants have lately petitioned Parliament on the subject. The petition sets forth that the customhouse and other places in the town having been destroyed by fire, it would be advantageous to the inhabitants if a new street were formed from the east end of Broad-street to Charmouth-road; a bridge over the river Lyme; a new street from the middle of Broadstreet to the sea shore; and a reservoir for supplying water to houses not at present properly supplied.

A few weeks since a public company was formed at Chippenham for the purpose of supplying the respectable householders, and the poor gratuitously, with water, of which they are at present greatly in want. It was also intended to erect a fountain in the centre of the town, and to provide, in different parts, thirty plugs, for a supply of water in case of fire. This excellent determination has, for the present, been frustrated hy Joseph Neeld, Esq., who represents the borough in Parliament. He intimated his determination to oppose the bill unless provisions were made in it for the drainage and sewerage of the town by a tax on the *tenants* of houses, of which Mr. Neeld possesses about sixty.

In Manchester, a proposal is made to roof with glass two neighbouring streets to the Exchange, for the convenience of the congregated merchants. It is to be called the Peel Arcade.

A new Independent Chapel has lately been erected at Shrewsbury, the cost of which was 2,300/.

At Liverpool, the wealthy admirers of the Rev. H. M'Neile, are about to build and endow for him a spacious and handsome church in the park. It is stated to be the intention of the promoters of this undertaking to vest the presentation in the same reverend gentleman.

The new town of Crewe is well lighted with gas, not only in the streets, but in its cottages also. The directors of the Grand Junction Railway a short time ago gave instruction to carry gas into all the cottages, somewhere about four hundred, at Crewe, allowing one burner for 7s. 6d. per annum. The amount subscribed for the restoration of

The amount subscribed for the restoration of Chester Cathedral is nearly 3,000%, including a second donation during the last week of 100% from the Marquis of Westminster. The cost of the works already contracted for and in progress is 2,504%, and the complete restoration of the choir, it is expected, cannot be effected for less than 5,000%.

We stated a short time since that a bridge was about to be erected over the Tay, at Mugdrum. An Edinburgh paper states, that at a meeting of the town-council of Perth, on Monday, an official announcement was read from the Admiralty, intimating that the Lords Commissioners had resolved on not giving their consent to the plan of a bridge over the Tay, at Mugdrum, for the Edinburgh and Northern Bailway.

The old Market-house of Killarney is to be razed to the ground, and a Temperance Hall built in its stead. The Earl of Kenmare has given 50% towards this project. The restoration of the chancel of St. Mary's

The restoration of the chancel of St. Mary's Church, Nottingham, has been entrusted by Earl Manvers to Mr. H. M. Wood. Mr. Cottingham superintends the restoration of the other parts of the edifice.

On Monday last, the foundation-stone of a Roman Catholic Chapel was laid at Pontypool, by the Rev. W. Woollett. Mr. Scoles, of London, is the architect, and Mr. Hunt, of Newport, the builder.

The Duke of Cleveland, who expended about 2,000% last year on the improvements at Raby Castle, is about to make further large additions and alterations. The baron's hall is to be enlarged, and the circular room newlyfaced, and the Chinese dining-room is to be remodelled.

A new dock, with an area of nearly four acres, was opened at Adrossan, last week. It has been formed at the expense of the Earl of Eglintoun. Fifty ships can be accommodated in it.

A new fort is to be erected in Liverpool, at a cost, inclusive of the site, of 27,000%.

The feofees of Barnstaple-bridge are about to make a great improvement at the lower end of High-street, by pulling down the Boot-inn, and the unsightly buildings adjoining, and erecting two handsome houses with shops, designed by Mr. Gould, architect.

Seven hundred men are employed night and day on the construction of the Birkenhead Docks, and in April it is supposed there will be nearly 2,000. It is expected the docks will be partially opened within two years, and completely within three. The Dock Warehouse Company have commenced making fifty millions of bricks in order to begin building their warehouses the moment their Act is obtained.

The erection of the new schools at Magdalene College, Oxford, is delayed in consequence of a claim said to be made by the city to have the sons of freemen admitted should the proposed plan be carried out. It has been proposed to substitute stained-glass windows in the College Chapel of Magdalene, in place of the present chiaro oscuro paintings, and one of the Fellows (Mr. Roundell Palmer) has offered to resign the proceeds of his fellowship to assist in this.

in this. The dilapidated state of the parish Church of Baddesley Ensor, in Warwickshire, renders it necessary to build an entirely new place of worship. The estimate for the new church is 2,500/. to accommodate 400 persons. Towards this amount W. S. Dugdale, Esq., M.P., has subscribed 500/., Lady Sykes 50/., and the incumbent, the Rev. W. Bradley 50/. There is still wanting 1,900/.

The foundation-stone of the Cyfarthfa Rolling Mill was laid on the 18th instant by Mrs. Crawshay, of Cyfarthfa Castle, in the presence of a large concourse of spectators. The welkin rang with the vociferous cheers of the assembled workmen. They were afterwards regaled with a plentiful supply of *cwrwda*. The building will cover an area of 3,066 square yards, being 193 yards in length, and 143 in breadth.

A clear moiety of the amount required by the Ecclesiastical Commissioners for Eng-

land as a public ^{henefaction}, before they would erect a pars^{On}age house for the Incumbent of St. John's Church, Cornish-Hall-End, Finchingfield, having been raised by subscription, orders have been issued for the commencement of the works. Mr. Johnstone, of Grinstead Green, Halstead, has obtained the contract.

At Scarborough, the improvements on the South Cliff are rapidly and widely extending. The Crown Hotel, with its lofty pediment and Corinthian columns, forms an imposing feature in the great façade.

The subscribers and shareholders of the proposed Colchester Literary and Scientific Institution, have deemed it advisable to suspend proceedings until the Legislature shall have decided on Mr. Ewart's Bill for the establishment of Museums of Art in the provinces.

We have already stated that St. Patrick's Cathedral, Dublin, is about to undergo very extensive repairs. Dean Pakenham, during the past week, has addressed the Editor of the *Times* on the subject of these repairs, and the expenses incident thereto. He says, "My purpose is, first, to repair the dangerous defects in the building. The cost may be about 4,000*l.*, of which I have as yet obtained but about 2,700*l.* Then, if means increase, it is intended to lengthen the choir by moving the organ back about 20 feet into the great aisle, and keeping it on such a level as to give a view of the whole roof from west to east. This will make it necessary to groin the great aisle, which at present shews the unsightly substructure of modern slating. The west front of the organ must also be gilt. 'Tis now but a worn-out piece of bad scene painting. Forty windows, including their stone casements, must be aired, and then the beautiful arches which look into them, and which are now built up and defaced with galleries, may be re-opened without injury to the congregation. The woodwork also requires much."

In a late competition at Edinburgh for a Free Church College, Messrs. Matthews, of London (secretary to the Association of Architectural Draughtsmen), and Mackenzie, of Elgin, have been awarded the first premium, and Messrs. Clark and Bell, of Glasgow, the second premium. The committee called in the services of Mr. Barry to decide upon the best designs. The premiums were 100*l*., and 50*l*., and the proposed cost of the building is about 25,000*l*.

ARCHITECTURAL COMPETITIONS. CLIFTON UNION WORKHOUSE.

SIR,—You are no doubt aware that the guardians for the Clifton Union issued in January last an advertisement inviting architects to send plans for their new union workhouse, holding out as an inducement thereto, that the architect furnishing the best design should superintend the building at 5 per cent. on the contract, and that 25 guineas should be awarded to the next in merit.

In consequence of this, thirty-one architects of the metropolis and other parts of the kingdom, set their wits to work to devise certain accommodation for the paupers, at an expense to themselves varying from 20% to 70% each. Now, let us observe the result. From the

Now, let us observe the result. From the whole waggon-load of designs two are selected, but it is not at first decided which is to be fm building. Up to a time all is shrouded in mystery, for it is firmly and conscientiously believed, that there never was an instance in which any one of a board of guardians could even guess at the real name and address contained in the sealed envelope. At last the important secret is solved; and, who would have thought of such a coincidence? it is the very architect who has been already employed by the board, and who has also devoted much of his time in concocting certain notions of certain persons for months previous. The other belongs to an unknown and a nameless man; but many tasteless individuals had taken a fancy to it, and thought it looked rather more like a house of charity than a prison; but these, as it proved, had very mistaken notions. The battle now commences in earnest, and

The battle now commences in earnest, and calculations are entered into enough to bother the head of Sir Robert Peel; when, in the midst of the mystification, it is thought desirable that the opinion of an architect of known respectability should be taken, in order to decide the knotty point as to which is really the best design. This is done—with 1 suppose the parish to pay,—yet atter all, his opinion proves worthless, for the stupid man persists in reporting most favourably of the stranger's design; it is therefore found ridiculous and absurd to expect a professional man to possess in the state of the either taste or judgment in a matter of this kind, and a cry being raised that the nameless individual's plan had not more than enough room, and that the other had, it was finally settled that the unknown should be sent about his business.

Thus you see, Sir, 900% to 1,000% have been expended by us foolish people in complying with the wishes of the guardians, which we might just as well have kept in our pockets, had those few gentlemen who were aware of the fact before been so good as to inform us they possessed such a jewel of an architect at Bristol.

While confessing myself the fortunate winner of the very liberal premium of 25 guineas, I must own to have committed one great error, for which I here beg to offer my apology. Whether it was from some vague notions of having heard of such things as sham competitions, wherein some evil-disposed persons, for the eake of taking in the unwary, threw dust in the eyes of their colleagues who happened to be roo honest, or whether it was from not having the proper fear of the guardians before my eyes, or perhaps some old-fashioned notions, that where honesty exists there is no need for concealment, however this may be, I actually had the temerity to ask permission to see the successful design, in order that I might inform my professional brethren from ocular demonstration that they never had and never would have a chance of success in Bristol again. Would have a chance of success in Dristor again. I am sorry I did it now, but fortunately there was no danger of its being complied with. I was met by a peremptory refusal; and now I reflect on it, what right have we to inquire if faith has been kept with us; is it not sufficient that we are allowed to expend our time and money upon the faith of their advertisement? It must have been thought grossly impertiment in me, or any other of the comfitors, to make such an inconvenient request. retitors, to make such an inconvention of the board, however, speedily brought me to my senses, otherwise I might have been led to doubt if the man who obtains ny money under false pretences is the best judge of honour and integrity. There will, I fear, be some persons wicked

enough to believe, notwithstanding the protestations of the authorities to the contrary, that they have been duped, and that the whole affair has been duped, and that the whole affair has been a rank job, perhaps others may call it by an epithet not quite so polite; but these are easily put down,—call them disap-pointed people, and the thing is done. In adding my testimony to the perfection of the system of competition, I cannot but express my decided admiration of that pursued at Clifton, which, for the guidance of all those who wish the arts of the country to flourish, may be reduced to the following receipt. Take a large portion of the ordinary stuff of society, mix them up with a few gentlemen who are far above suspicion of doing any thing at all, but they must not be omitted, as they act as decoys; drop in then one or two shrewd, clever, but not over-scrupulous fellows, don't be atraid of their sinking, for their lightness of chastatuter will always keep them at the top; simmer the whole together until the scum begins to rise, and it is done. This, I assure begins to rise, begins to rise, you, is the finest mixture tects that can be procured. I am, Sir, &c. THOMAS ALLOM. u, is the finest mixture for catching archi-

March 18th, 1845.

CONGREGATIONAL CHAPEL AT HOLLOWAY.

SIB,-A well-conducted press can have no more legitimate object than the exposing abuses with a view to their removal. Your strictores upon the abuses to which competition in the fine arts is liable, prove that you are willing to lend your valuable assistance to destroy as far as possible the evil of the sys-tem, and to retain what is good. Competition of this kind, although not exclusively con-fined to architectural design, is resorted to more for that than any other object, both on account of the greater demand for subjects, and

the greater numbers of persons willing to supply that demand.

Architectural competition, in itself excellent. is rendered debasing by the manner in which it is conducted. Capable of eliciting the finest works, it has frequently produced the very worst. Interest, not talent, gains the prize; and acquaintance with a committee-man is better than knowledge of the five orders. Architects have frequently themselves to blame; young men anxious for employment compete for every thing that offers, and thus often become the mere tools of designing speculators; but what shall we say when ar chitects themselves, as is too frequently the case, become partners in the fraud.

Nothing will more effectually tend to remedy this great, this crying evil, than an exposure of every individual case in which there is the slightest appearance of trickery, or a want of manly straightforwardness; not a doubtful anonymous charge to which currency is given under the guise of "vistor" or "scrutator;" but a plain statement of facts to which for the public benefit, the writer will suffer the little inconvenience which may attach to subscribing his own name.

At the present time we think the following slight history of the competition of the Con-gregational Chapel at Holloway, will be accep-table to many of your readers. Allured by the fairness of the advertisement, we were tempted to become competitors, and on application to the quarter mentioned in the advertisement, were duly supplied with a printed paper containing very full particulars of all that was required, drawn up in the most business-like way possible; this excited inquiry, and inquiry produced the discovery that a Mr. Emmett, an architect, was a member of the committee. We immediately set to work with redoubled vigour, feeling convinced that if not ourselves successful, we should only have to succumb to greater talent, or more fortunately directed efforts, and that a committee so ably guided in the straight path, would do nothing at which the most censorious could cavil. Still doubts would intrude-we endeavoured to crush the obnoxious thought at once; could we, follow-ing in the course of that calumniator Dickens, believe there were Pecksniffs in the profession ? Never! But the still small voice would not be quieted, it had been done, and might be done again, and perhaps after all Mr. Emmett did intend being a competitor himself. To satisfy all doubts, we applied to Mr. Emmett for information respecting the arrangements necessary for the proper performance of wor-ship in a congregational chapel, our knowledge thereof being somewhat defective. The answer meagrely but civilly gave the information required; this was sufficient, more was not expected from a member of a committee, pledged to do equal justice to all. It was apparently good proof that he did not intend competing, as in that case he should certainly have stated that he himself was a competitor.

Being much engaged we made an application to Mr. Brooks, the managing member of the committee, for an extension of the time, such being frequently granted; but it was re-fused, and very properly so if not allowed to others. The drawings were sent in on the day named in the instructions, and we heard nothing more of the matter until the llth instant, when, in reply to an inquiry on the sub-ject, we received the following epistle from Mr. Brooks :---

"Lansdowne-place, Holloway, "11th March, 1845.

" Mr. Brooks's compliments to Messrs. Lahee and Mabin, and begs to say the plans of Messrs. Emmett and Chadwick, of the Adelphi, have been selected, and that the others can be obtained upon application to Mr. Bartlett, of 26, Paternosterrow.'

Thus not even deigning the empty courtesy of thanks for trouble taken; it is true one does not expect eider-down from thistles, nor sweet savours from a pole cat, but civility might have been anticipated from persons, to gratify whom some pains had been taken. In reply to further inquiry as to whether "the report is correct that Mr. Emmett is or was a member of the committee appointed to judge of the designs presented, and also whether the selected design might be seen," the following answer was received :---

" Lansdowne-place, Holloway, "19th March, 1845.

149

"Mr. Brooks's compliments to Messrs. Mabin and Lahee, and, in reply to their note, begs to say that the successful candidate (Mr. Emmett) ceased to be a member of the committee from the moment he determined upon submitting a design, and ever since has been exactly upon the same footing as the rest of the candidates; he is sorry to say that this is only one of the many falsehoods promulgated in this affair. As respects shewing the successful design, he begs to add that the committee have declined doing so.'

We have little more to add; yourself and the public are informed of all the facts as far as we know any thing of them, and comment is unnecessary. We write solely on public grounds; feeling little or no personal interest in the matter. Messrs. Emmett and Chadwick's design may have been the very best presented: a full 2,500% worth of beauties, turreted, pin-nacled, plastered, and stuccoed, in the most approved style; at any rate, they certainly enjoyed peculiar advantages for understand-ing the particular tastes and requirements of the Committee, and ought to have produced something more in accordance with their wants than any other persons: but the question is not so much whose plans are the best, or whose the worst, as whether the conduct of the Committee is just and correct, and such as those who have expended time and money, confiding in their honour, have a right to expect. 'We are, Sir, &c., MABIN and LAHEE.

16, Manor-place, North King'sroad, Chelsea.

CANTERBURY WORKHOUSE.

-In your last number you were re-SIR.quested to have a vigilant eye on the Canterbury for a short time, made all the inquiries I could, as I like fair play in every thing, parexerted for the public good, ought to be tested by competent persons. Now, Sir, there were twenty-two designs sent in from various parts, agreeable to the advertisement; and I should say the average time that was given to the architect to get up these plans was only a fortnight. How is it the guardians are pressed for time? Are they so very desirous that the inmates should be enjoying the comforts they intend giving them in the new house, or is it they wish to be sitting in the new board-room, that they are so fast? As there were twenty-two plans and specifications to be examined, will any of your readers inform me what reasonable time it would take for moderate judges to investigate and select three of the best in detail?

1 will inform you how long the eleven Canterbury guardians were in doing so; not class-ing these with other persons, as you will find by the time they took, they were never equalled. They met at eleven o'clock in the forenoon: and, unclosing the twenty-two sets of plans, examining them very carefully in all their details, reading the specifications, and comparing the estimates with the same, --will you believe me when I tell you it, occupied in all but three hours; they left at two o'clock with the three best plans selected, so that you find they are men of extraordinary skill, and I do think that in justice to the most active and skilful of the eleven guardians, their profession and call-ings should be known, as it must tend very metasimily to relieve the discussion integration materially to relieve the disappointment the architects feel on having their plans returned "not accepted" to know they have been fairly and carefully treated, and I have only to name

their professions for you to be satisfied. The most skilful amongst them is a baker, a pastry-cook from Germany; how many unions he has seen in Germany I do not know, but it is doubtful if he ever was in one in England. Another is of the Jewish persuasion, who, no doubt, has studied unions of the Gentiles. One is a horse doctor; another is a land-surveyor and auctioneer. I have been told there is one or two of them blind, and that one mostly looked at the drawings wrong side upwards.

I shall see by your next if you wish any further information. If you do, I am in a situation to send it you. The London architects ought to stir, they have been used very ill. A FAIR TRADESMAN.

THE above elegant specimen of a carved chair, drawn by Mr. C. J. Richardson, was brought into England from Germany by Messers. Pratt, of Bond-street, and now belongs to Thomas Baylis, Esq., of the Pryor's Bank, Fulham. In the back of it are the arms of Saxony; and it was stated in Germany to have been the electoral chair. The date is about 1620. It is of walnut wood, and the em-broidery in the back and seat is of most

ON THE CONSTRUCTION OF THE HAND-RAILS OF STAIRS.*

THE rules for our guidance in obtaining the moulds requisite for the formation of the hand-rail of a staircase with a level landing, hand-rail of a staircase with a level landing, are governed by the same principles as those for a winding staircase. In fig. 13, we have laid down the development of the inclination of the central line of the rail; the line il, in the triangle P, shews the position of the butt joint contiguous to the straight portion of the hand-rail, and the line gd, in the triangle O, gives the position of the joint at the end of one-half of the twisted part. The lines af, be, and dc, are the three heights by which the position of the cutting plane through the cylinder is obtained; and the line A B C is a line taken through the middle of the rail upon its plan. its plan.

its plan. In fig. 14, the line abc is the same as ABC in fig. 13, and the lines am, bl, and ck, are respectively equal to half the heights of the lines af, be, and cd; in fig. 13, the line am in the present case is drawn parallel to ck, from which by the line kmn, intersecting a line drawn through the points ca, we determine the point n of the insecting line AC'; and the point o of the same line is obtained by the

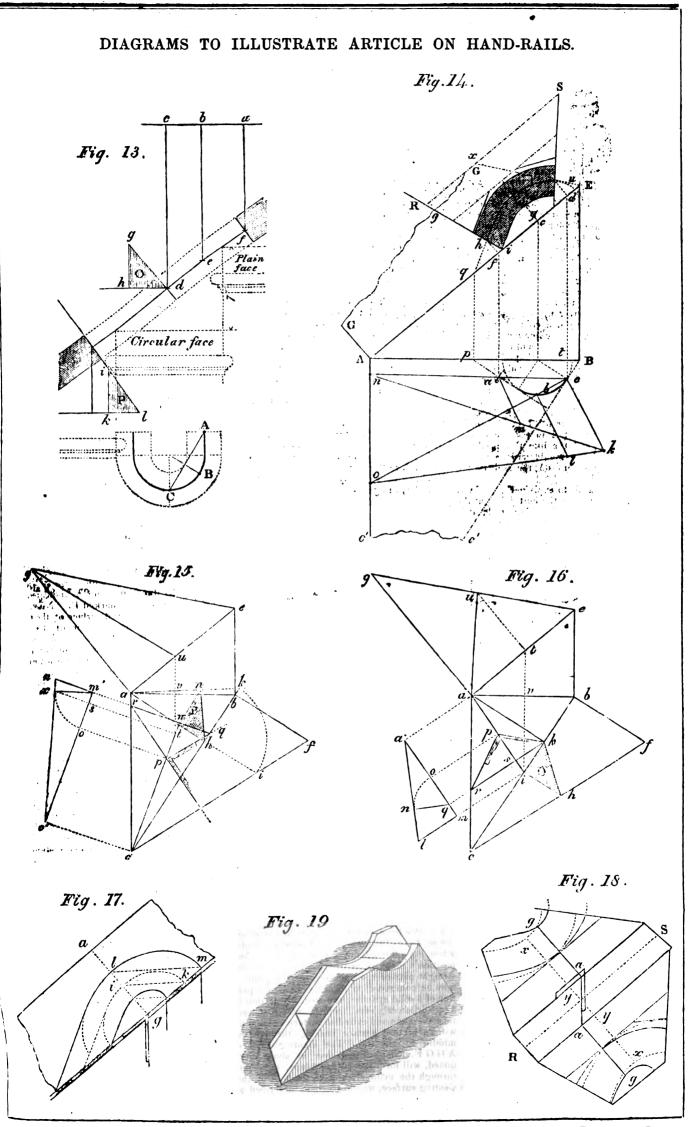

* Sce page 9, ante.

intersection of lines drawn through the points cb and kl. The line A B is drawn through the points angles to AC', and is taken in this case through the centre of the plan of the rail. The triangle A B E is conceived to be turned The triangle A B E is conceived to be turned up, and to stand perpendicularly over the line A B; the point d in the line A E is made equal in height to the line cd in fig. 13, and the point f (measuring from the base line A B) is equal in height to the line af in fig. 13. The surface A E G G is conceived to be turned over as on a hinge upon the line A E until the line A G rests upon the line A C'. We have, in a former article, explained the mode of obtaining the section of a cylinder A C'. We have, in a former article, explained the mode of obtaining the section of a cylinder when cut obliquely by a plane given in any position; the circular line δc , joined with the straight part of the line towards the point a, may be conceived to form the base of a por-tion of a solid cylinder, annexed to a portion of a quadrilateral solid, which, when united, forms a plane and cylindric surface coinciding with a vertical surface passing through the middle of the rail. The slanting surface, A G G E, when turned over as above men-tioned, will form the cutting plane, or section through the cylinder, and as the foot of this slanting surface, which we have described as its intersecting line with the plane of the base, has been determined by lines drawn down has been determined by lines drawn down

over the points k^{n} and kl, to the points n and o on the plane of the base, the slant-ing surface will plane of the base, the slant-resting points each respectively equal in height to the height of the lines af, be, and cd in fig. 13; from which the intersecting line A C, in fig. 14, was determined. Upon this slanting surface, which is here shewn in ledgement, the face-mould is laid down, first by ascertaining (as we have already noted) the centre line of the mould, which will rest imme-diately over the centre line on the plan, and the inner and outer curved lines which form the width of the face-mould are made parallel

diately over the centre line on the plan, and the inner and outer curved lines which form the width of the face-mould are made parallel to the central line, and the ends of the moulds determined in the manner which we shall point out below, and which we think is preferable to the methods propounded in our last arti-cle. In this figure the line R S represents the back of a block of wood used in forming the jointing-box, which we shall enter upon in our explanation of fig. 18. Figs. 15 and 16 are required for explaining the theory of the butt-joints: at first sight they seem difficult and complicated, but when care-fully examined and clearly understood, they are easy and simple; both of these figures represent a theorem well known during the last two centuries in ascertaining the bevels for the back of the hip-rafter of the roof of a house, or the bevel of a mill-hopper at right angles to the arris formed by the intersection of two of its surfaces. In hand-railing, the inclined surfaces of the

house, of the barris formed by the intersection of two of its surfaces. In hand-railing, the inclined surfaces of the face of the plank and the face of the butt-joint of the rail, intersect each other, and may be said to form a hip, similar to the intersecting surfaces of the hipped roof, or the angle of the mill-hopper. Let the lines $a \ b, a \ c, a \ e,$ and $b \ e,$ in fig. 15, represent the corresponding lines A B, A C, A E, and B E, when reduced to a smaller scale; let the line $a \ b$ be drawn at the same angle or bevel to the line $a \ b, a \ c, a \ t$ in fig. 15, draw the line $b \ c$ square to, or at right-angles to $a \ h$. By looking carefully at the direction of the line $h \ a$, in fig. 14, it will be seen to range in the position of a vertical plane passing down the middle of the straight portion of the rail, which plane we have shewn in fig. 13, at the end of the development of the circular face, and on which also is drawn the inclination of the butt-joint, as indicated by the shaded pitch-board marked P. Now, having the foot of the inclined surface of the plank in the line $a \ c$, and that of the inclined surface of the butt-joint in the line $a \ c$, when turned up, as on a hinge, until it stands immediately over its base line $a \ b$; and having likewise the inclina-tion of the surface of the butt-joint, taken on a plane standing perpendicularly on the line $a \ b$, as shewn by the pitch-board, P, on the same plane standing perpendicularly on the line $a \lambda_{a}$ as shewn by the pitch-board, P, on the same surface in the development, fig. 13; the lines surface in the development, fig. 13; the lines a c and b c may therefore be compared to the figure of the eaves of a house, where the pitch of the slanting surfaces are shewn by the lines a c (fig. 15), and l i (fig. 13). We are next to find the bevel of these two surfaces at right angles across the arris of their intersection. Let the line b c, when turned up perpendicularly upon the point b, be considered to represent the perpendicular of a triangular plane standing upon the line b c as a base; also let the line b f represent the same perpendicular line and f c the hypothenuse of the same triangular plane, which is now conceived to be turned down as on a hinge upon its base line b c. down as on a hinge upon its base line bc. The perpendicular line hi on the same plane will be the height of the surface of the plank, immediately over the point h of its base; and a line conceived to be drawn from the point ia line conceived to be drawn from the point iin this position down to the point a will agree with the inclination of the surface of the plank, when taken in the direction of the line ah. Let us then conceive this vertical plane upon the line ah (which, as we have already noted, is the same vertical plane, as described in fig. 13, as ranging down the middle of the straight portion of the rail), to be turned down as on a binge upon its base line ah, we should then have the triangle ahk, wherein the hypothenuse ak represents the slope of the plank in the direction of the line ah; it is also in this plane that we have the inclination of in this plane that we have the inclination of the butt-joint; we must, therefore, determine the point of intersection of the two inclined planes of the face of the plank, and the face of the butt-joint. 'Thus, let the pitch-board

marked P, in fig. 13, be placed with its base klto coincide with km, in fig. 15, the point *i* of the pitch-board will intersect the line ak in the point *n*, from which let fall the perpendicular nm, and draw the line *m c*, which is the base of the hip or arris of the two intersecting surfaces; hence then let the line *m'c'* be the base of a plane passing vertically through this arris *m'n'*, its height over the point *m* and *n'c'* is the line of the hip; from the point *m* draw the line *xm'* at right angles to *n'c'*; and with the point *m* as a centre, describe the circle *x o*, and let fall the perpendicular *op*; draw *r q* through the point *m* at right angles to *m c*, and draw also the lines *r p* and *pq*; and the angle which *p q* forms with the line *pr* is the bevel for the joint across the end of the face-mould, as shewn by the line *h* R, in fig. 14, let fall a perpendicular from the point *x*, in fig. 15, through *s* down to the point *t*; draw the line *t v* at right angles to *ab*, until it meets the line *a g* in the point *u*; and from the point *u* draw the line *ug*, having first drawn the line *ag* being made equal to *ae*; if the triangle *ab e* is again turned up on its base, and the arris formed by the intersection of the surfaces of the plane of the plank, and that of the buttjoint; moreover, the point *u* would coincide with the point *x*, if turned up, and placed vertically upon its base line *m e*. Having obtained the bevel which the line *u g* forms will be the applied to the line A E in fig. 14, and made to pass through the point λ in the face-mould to the point R; and the line R λ produced across the end of the mould will be the direction of the butt-joint on the face of the plank.

The use of fig. 16 is to explain the mode of obtaining the bevels for the butt joints at the middle of the twisted portion of the rail; it is much simpler in its details than that of fig. 15. In fig. 16, the same trihedral is taken to work upon, but instead of placing the pitch-board P upon the plane standing on the line ah, which ranges down the middle of the straight portion of the rail, we make use of the pitch-board O, which is applied on the plane surface standing upon the line bc, which is directly at right angles to the plane on the line ag, in fig. 15. Hence then, after having the base abc, the vertical plane abe, which is at right angles to the intersecting line ac, and the plane bcf, as in the former figure, begin by making ak in the same position as ah in fig. 15. Let the point d of the pitch-board marked O, fig 13, be applied to the point k on the line bc, fig. 16, when the slanting edge of the pitch-board will be found to intersect the line fc, in the point h;from h let fall the perpendicular hi, and draw the line ai, which is the base of the hip or arris of the inclined surfaces of the planes of the plank and that of the butt joint; draw any line m'a' parallel to ai, and make a'm' equal in length to ai, make the perpendicular ml equal to hi, and draw the line a'f, which is the line of the hip, standing immediately over its base line ai; from the point k, at right angles to ai, draw the line kr, which produce to g, draw the line ng at right angles to al, and with the point g as a centre describe the circle no; parallel to gs, draw the line op, join pr and pk, and the angle rpk is the bevel for the joint across the end of the plank. Care must be taken that these bevels are applied from the upper surface of the plank when the straight end of the twist is at the lower level. Argain, to find the line forming the end of

Again, to find the line forming the end of the face-mould, from the extreme end of the face-mould to the point s, fig 14. In fig 16, draw the line iv at right angles to ab, produce iv to meet the line ae, in the point i, draw also the perpendicular tu, cutting the line egin the point u, join au, which is the line or arris of the intersecting surfaces of the plane of the plank, and that of the butt joint. In this, as in the former figure, if the triangle abe is turned up on its base ab, and the triangle ag ebe made to turn over upon the line a u will coincide with the hip or arris formed by the intersection of the plane of the plank with the plane of the butt-joint.

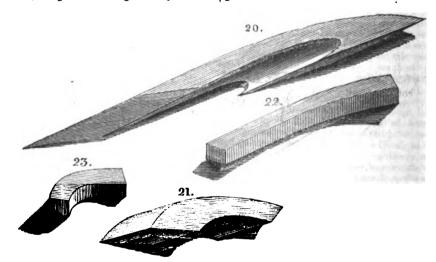

Fig. 17 shews the mode of forming the side-

moulds of the jointing-box for the purpose of adjusting the vertical sides of the wreathed rail. The central line of the side mould in this figure is the same in every respect to the central line in fig. 14, and the inner and outer curves are produced by the formation of similar ellipses, by means of the trammel, as pointed out in the earlier part of this subject. The mode of obtaining the lengths of the major axes of the inner and outer ellipses are shewn by dotted lines drawn parallel to $i \lambda$, the width from the central line to the point *l* being made equal to half the width of the hard-rail. The bevel from the point *g* shews the angle of obliquity at which the side-moulds are placed in their positions on the opposite sides of the jointing-box.

jointing-box. Fig. 18 shews the mode of forming the jointing-box. Fig. 18 shews the mode of forming the jointing-box. The block of wood, R S, in fig. 14, is here shewn on its back edge, and the sides of the box, which are curved to the contour of the side-moulds, as obtained by fig. 17, are shewn in ledgement on each side of the back of the block. This block is first formed of material planed true and adjusted to a thickness nearly the same as the thickness of the plank out of which the rail is cut; having squared the sides and edges of the block, mark off the points R and S on the line in the centre of the back face corresponding exactly with the point x, on the same line from this point x, square over and draw the lines x y and x y on each side of the block; with the bevel marked p q in fig. 15 adjust the end across the plank at the other end of the rail, as shewn by the line .S, taking care in bevelling the ends across the block that the length of the line R S, in fig. 14. Having thus adjusted the line R S, in fig. 14.

block in the manner here described, next proceed to fix the side-moulds on the faces of the block. In the line from gg on the back edge of the block, and in the point on the line R S, as drawn upon this edge, let the bevel of the line A E and B E be taken and applied to the edge of the block, as shewn in fig. 18, we have thereby the obliquity at which the sidemoulds are to be placed, as shewn by the points $a^{c}a$, from which draw the lines ag and ag, on both surfaces of the block; having done this, take the side-mould, as shewn by fig. 17; in applying which to the sides of the block, let the line aq on the side-mould be placed to correspond with the lines ag, as already marked off on the sides of the block; and the superfluous ends cut off and planed clean and true to bevelled ends of the block, as already obtained. and the ininting-block

bevelled ends of the block, as already obtained, and the jointing-block is complete. The face-mould in fig. 14 is applied to the plank (out of which the rail is cut), on both sides of the plank directly opposite or square to each other, and the solid is cut out without any obliquity whatever; a slight allowance is made at the ends of the solid material, so as to allow for the slight bevel required in the joint. Having cut the solid out of the plank, next place it in the jointing-box, apply to the sides of the box a pair of hand-screws, and adjust the solid, so as to agree with the average line of the curved edges of the side-mould; upon the side of the jointing-box, next proceed to adjust the inner surface of the hand-rail by means of a hollowing plane adapted to the horizontal curve of the rail, and shut the ends of each joint as in a common mitre block. Having then the inner vertical surface of the rail, and the height of the back of the handrail at each end in the centre of the solid, and also an intermediate height between these two ends, the twists of the rail may be joined to gether, and finished with ease.

Figs. 20 and 21 shew the quantity of material required in the formation of the twisted part of a bandrail, for a 3-inch well-hole with seven winders, according to the theory laid down by a former writer on this subject. Figs. 22 and 23, shew the comparative quantity of material required for the same

portion of the hand-rail, by adopting the mode we have been endeavouring to describe; the thickness of plank being the same in both cases.

The saving arising not only in the economy of material, but also in the diminution of the amount of labour, is too obvious to require comment. GEORGE RIDLEY.

THE DRAINAGE OF THE ANCHOLME LEVEL.

At the last meeting of the Institution of Civil Engineers, March 18th, a paper by Sir John Rennie on the drainage of the Ancholme level, Lincolnshire, was read. It commenced by describing the position of the Ancholme level, which consists of a low tract of land of about 200,000 acres in extent, situated on the south side of the river Humber, about 10 miles below its junction with the river Trent. The rives Ancholme runs through the centre of this level, and with its tributary streams, empties itself into the Humber at the village of Ferraby. The alluvial matter brought down by these streams formed a bar at the junction of the Ancholme with the Humber, which by preventing the discharge of the drainage waters, caused the level to be inundated with water, rendering this part of the land totally unfit for tillage. The paper then, after entering into great historical detail as to the works which

were executed at various periods from the time of the Romans, to render this tract of land available for agricultural purposes, stated that in the year 1801 the late Mr. Rennie being applied to for his opinion as to the best plan for improving and completing the drainage and navigation of the level, reported that he attributed its defective drainage to the deficient capacity of the Ancholme and the subsidiary drains to carry off the floods, to the cill of the old Ferraby sluice having been laid too high, and to there not being any catch-water drains to prevent the floods from the adjacent high lands descending into the level. As a remedy for these evils, he recommended that the main river, Ancholme, should be still further improved, by straightening, deepening, and enlarging its channel; and that two new locks should be placed upon it; also that, with a view to preventing the floods from the highlands inundating the level, two catch-water drains should be made, one on the east side, and the other on the west side of the river Ancholme,

THE IRON TRADE.

THE iron trade still continues remarkably active, and notwithstanding the recent ad-vances, it is confidently expected that the prices will rise still higher before the close of the month. Speculators are turning their attention to Welch pigs, which have not ad-vanced in ratio to that of Scotch. Welch pig is 61, 10s.: and the latest accounts from Wales, Staffordshire, and Scotland advise of further advances of 5s. per ton upon pigs, and from 10s. to 20s. per ton upon bars, rods, hoops, and sheets. Staffordshire iron of every description is particularly rising, and has within the last week again advanced 203. per ton, making a total increase of 41. per ton on last October prices. 51. 10s. is offered for Scotch pig, but few sellers are to be found; 61. is demanded. Bars have advanced, and are now selling at from 9/. 10s. to 10/. per ton; plates at from 13/. to 13/. 10s.

It may be a matter of some interest in the present state of the trade to know the probable supply and consumption for the current year. For this purpose the following table has been drawn up with much labour, assisted by practical men :-

Estimated Consumption for 1845. 2,000 miles of railways, to be made in 1845 and 1846—say, half in 1845 contracted for—

1,000 miles of railway, 250 tons per mile 250,000

- 50,000
- Add loss in manufacture, 5 per cent...
- Iron required for railways in progress, and passed in 1844 150.000
- Iron for waggons, stations, engines, tanks, &c., computed from inspection of railway companies accounts, that each mile of railway requires 300 tons per mile above the weight of permanent rails and chairs—1,000 miles will then
- 300,000 give port in 1844, 460,000 tons—say, from E the increase of railways abroad, and the remission of duties on iron by some of the continental states, it will be.... 500,000
- eneral consumption of iron in Great Britain (exclusive of railways), in bar-G
- iron, castings, water and gas pipes, in steam-engines, and the whole hard-ware of the country..... 480,000

Total Tons 1,803,500

70.000

3,500

The following estimated supply for the same period is based upon the amount actually pro-duced in Great Britain in 1844, to which is added a probable increase, induced by the high prices of the present year.

Pig-iron produced in England and Wales in 1844..... Tons 856,000

in 1844..... Ton Iron produced in Scotland, 1844..... 354,000

Total for Great Britain, 1844.. 1,210,000 Add for increase induced by high prices in 1845 120,000

Total for 1845 Tons 1,330,000

If this statement approaches the truth, there will be a deficiency of nearly 500,000 tons of iron, which must cause the suspension of many great public works. It is possible that from extraordinary exertions a greater quantity may be produced than 1,330,000 tons, but it cannot be materially greater.

NEW CHURCHES, &c .- The Society for promoting the enlargement, building, and repairing of Churches and Chapels, decided last week that grants should be voted towards the erection of new churches at Andershaw and Droylsden, near Manchester; Quarry and Droyisden, near Manchester; Quarry Bank, near Stourbridge; Warmley, near Bristol; West Fordington, near Dorchester; and Wooden Box, near Ashby-de-la-Zouch. Grants of money were also made towards obtaining an increase of accommodation, either by an extension of the building or a reby an extension of the building, or a re-arrangement of the seats, &c., in the parish churches of Whitechapel, Sedgehill, near Shaftesbury; Horningheath, near Bury St. Edmund's; Rudbarton, near Haverfordwest; Colmere, near Alton; Lindfield, near Cuckfield; Osmington, near Aylescombe Regis; and Rudgwick, near Horsham.

LIST OF NEW PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &., GRANTED FOR ENGLAND.

urnished by Mr. A. Prince, of the Office for Patents of Inventions, Lincoln's-Inn Fields. [SIX MONTHS FOR ENROLMENT.]

William Snoxell, of the Quadrant, blind manufacturer, for improvements in roller-blinds

and shutters, or this involution in rober of hinds and shutters. February 4. John Seaward, of the Canal Works, Poplar, engineer, for certain improvements in steam propelling machinery. February 5. Darius Isaac Green, of Villiers-street, Strand,

raising and moving heavy bodies, parts of which are applicable, amongst other uses, to

mines, vessels, and public works. February 8. Robert Bewick Longridge, of Bedlington tron Works, Morpeth, Northumberland, for an improved locomotive engine. February 10. Frederick Herbert Maberly, of Stowmarket, Suffolk, clerk, master of arts, for certain im-

provements in machinery or the apparatus for stopping or retarding railway or other carriages; applicable also for these purposes in regard to other engines or wheels. February 10.

. Thomas Truman, of Cromwell Lodge, Brompton, gentleman, for an apparatus, being an improvement for filtering and purifying February 10. water.

Richard Haworth, of Bury, Lancaster, engineer, for certain improvements in steam-engines. February 10. William Irving, of Regent street, Lambeth,

engineer, for improvements in the construction of apparatus for cutting ornamental forms, beads, recesses, and mouldings, in wood, stone, and other materials. February 10. Oglethorpe Wakelin Barratt, of Birming-ham, experimental chemist, for certain im-

provements in the manufacture of acids, and in treating the noxious vapours or gases given off from chimneys and from chemical and other works. February 10.

Joseph Quick, of Sumner-street, Southwark, in the county of Surrey, engineer, for an im-

provement in steam-engines. February 10. Thomas Brown Jordan, of Cottage-road, Pim-lico, mathematical divider, for improvements in machinery and apparatus for improvements ing, and engraving. February 17. James Graham, of Calvert-street, Middlesex, metal-refiner, for improvements in the manu-

facture of zinc, antimony, and brass, and in casting brass, and an apparatus for making

pots used in such processes. February 17. Samuel Hall, of King's-arms-yard, Coleman-street, for improvements in steam-engines, boilers, furnaces, and flues, in consuming fuel, preventing smoke, and in propelling vessels. February 20. James Murdoch, of Staple-inn, for certain

improvements in the manufacture of gas, and in the apparatus employed therein. February 20.

John Bottom, of St. Phillips-road, Sheffield,

machinist, for certain improvements in car-penters' stocks and braces. February 20. John Baptiste Vallure, of Oxenden-street, civil-engineer, for improvements in lamps and wicks. February 24.

REAL PROPERTY .- A return has been obtained by order of Parliament, on the motion of Mr. Villiers, shewing the total annual value of Mr. Villiers, shewing the total annual value of real property in each county of England and Wales assessed to the property and income-tax for the year ending April, 1843, distin-guishing that on land, houses, tithes, manors, fines, quarries, mines, ironworks, fisheries, canals, railways, &c. It hence appears that in England and Wales alone the grand total annual value of real assessed property amounts to the appears sum of 85 802 7351 thus subannual value of real assessed property amounts to the enormous sum of 85,802,735*l*, thus sub-divided, viz.,—lands, 40,167,088*l*. (or nearly one-half); houses, 35,556,399*l*.; tithes, 1,960,330*l*.; manors, 152,216*l*.; fines, 319,140*l*.; quarries, 207,009*l*.; mines, 1,903,794*l*.; iron works, 412,022*l*.; fisheries, 11,104*l*.; canals, 1,229,202*l*.; and railways, 2,417,609; other property not comprised in the foregoing, 1,466,815*l*. A similar return as to Scotland gives a grand total of 9,481,762*l*., viz.,—lands, 5,586,527*l*.; houses, 2,919,338*l*.; fines, 901*l*.; quarries, 33,474*l*.; mines, 177,592*l*.; iron works, 147,412*l*.; fisheries, 47,809*l*.; canals, 77,891*l*; and railways, 181,333*l*. The other property not included in the foregoing details property not included in the foregoing details amounts to 309,4804.

with separate and independent sluices at their with separate and independent succes at their junction with the Humber, by which means all the highland and lowland waters would be separated, and each body of water would thus be effectually discharged into the Humber without interfering with the other. The catch-water drains involved an important and novel principle, for in his opinion by the old Dutch method of simply cutting a series of straight drains to some convenient point, for discharging their water, the highland and lowland charging their water, the highland and lowland waters were mixed together, and the highland waters coming from a higher level with a greater velocity down upon the lowlands forced their way first to the outfall. The less rapid waters of the lowlands were thus kept back and were left to stagnate, the sluices being unable to discharge the whole body of water during the time when the tide with the Humber permitted the sluice doors to be opened, and it was thus impossible that the level could be drained; but by separating the bighland from the lowland waters, each body of water could be effectually discharged by an independent sluice. These catch-water drains would answer all the important purposes of frrigation during dry seasons, and for navigation.

The plans, which were also at the same period being beneficially carried into effect by Mr. Rennie, and on a more extensive scale, in the east and west and Wildmore Fens, near Boston, and also on the Witham, near Lincoln, were partially executed, but the works not being completed, and, for want of funds, not being subsequently kept in repair, the drainage was found very insufficient, and at length Sir John Rennie was called in to complete the system. He proposed that the plans of his father should be carried out, that the Ancholme should be further improved, and a new sluice made at Ferraby, with a cill placed at a lower level, and new bridges made throughout the line; also, that an overfall and weir should be constructed, with a large reservoir to catch the sand, which was brought by floods from the surrounding hills, and had previously blocked up the main and lateral drains. Minor weirs and reservoirs were also recommended for the smaller drains and works where they united with the level. These works having been executed, the effect was that the drainage was rendered complete and effective, and the district was converted into a tract of fine arable and. Subsequently another shuice was con-structed below Ferraby with its cill 2 feet below the low-water mark of extra springtides in the Humber. This sluice, which had three openings of 18 feet each in width, with draw-doors and self-acting gates, was perfect in its effect, discharging above four times the quantity of water in the same time that had been previously accomplished. The whole of these works were completed

by Sir John Rennie 43 years after Mr. Rennie's report, and 556 years after a regular system of drainage had commenced, and the district was freed from water without the aid of mechanical power, thus establish-ing what was contended to be the surest prin**ciple of draina**ge, the separating of the highland from the lowland waters by catch-water drains, and discharging them, independently of each other, by their several outfalls.

In an interesting discussion which ensued, the correctness of the principle was fully admitted, and it was shewn that by selecting proper localities for the outfalls, and by placing the cills of the sluices below low-water mark of spring-tides, there were not any fen districts in the kingdom that could not be drained without mechanical aid.

REMOVAL OF THE WESTMINSTER LAW COURTS.-Mr. Charles Buller has entered upon the books of the House of Commons a notice of his intention, "after Easter, to ask Courts from Westminster." New Church in Peter-street, West-

MINSTER .- A most liberal subscription has been entered into towards defraying the ex-penses incident to the erection of this church. The estimated cost of the site, including the site of a glebe house adjoining the church, is nearly 4,000!. The estimated cost of the church, which is to contain 1,200 sittings, is 6,000!. The contributions already obtained amount to 7,980!. 10s. The amount still required is 1,420!.

PARTY-WALLS, &c. – JURISDICTION OF OFFICIAL REFEREES.

SIR,-I regret that (having taken up the subject) I feel compelled to depart from my intention, expressed in your journal of the 15th instant, by discussing the question in a more extended form than I had contemplated. The cases placed in my hands, and the communication that I have had with the official referees, have induced an impression of what the powers intrusted to them and the district surveyors were by the Act intended to be; viz. that the district surveyors, as the appointed public officers, are bound in respect of their prescribed fee to advise parties about to commence operations within the control of the Act as to the mode to be pursued. This has been denied as the duty of the district surveyor, but assuming such to be his rational duty, I then hold in case of difference, arising from non-compliance with his instructions, the referees are an appellant court, intrusted with large powers to meet the difficulties of each case so brought before them; or in cases where the authority of the district surveyor has been set at naught; and it must be borne in mind that the express words of the Act thus clothing them with with equitable powers, is clear and distinct in the in-tention to afford relief to the public by ameliorating and accommodating clauses, that would otherwise, taken in the strict letter, press hardly upon an individual. This opinion agrees with that of the sensible letter of your cor-respondent "Fairplay," in your journal of the 15th instant: it cannot be expected that every explicit upon agrees applicant upon any crotchet is to expect a decision. And I am free to confess that the standing and respect obtained with their professional brethren would induce the belief that, in the course I have assumed, broad and substantial justice would be done by the official referees, as practical men, deciding upon points peculiarly within their province. My ground of complaint is, that they have departed from such a principle, and, as respects operations in progress before the 1st January, have issued their decision as to the interpretation to be put upon certain permissive clauses. Whatever their authority may be as to the necessity of a hearing before them for any matter in difference arising after the 1st of January (and I am disposed to believe as a preliminary step such a bearing is necessary), I am inclined, with all deference, to deny their power of interpreting clauses relating to matters in progress before such period. The Act is a public one, and I contend that it is competent to myself and my professional brethren to read it, and, upon our conviction of such reading, to advise our employers where it interferes with no appointed dutics of the referees.

It will be perceived from my letters in your journal, commencing 8th February, that I am at issue with the referees upon every point in their circular to the district surveyors. Upon some of these points I have obtained counsel's opinion which fully confirms my views. I have also obtained copies of awards from the records of the office, which, in my opinion, are at direct variance with the provisions of the Act. And in one award upon the question of commencement, which had pro-gressed to a height of 6 feet (although by a plan attached to the award, as made by an ar-chitect expressly sent down by the referees, it is erroneously stated as being only 4 feet high), such "commencement" is condemned, and the party having so commenced, paid 151. 11s. 8d. for the award. I am of opinion the award is insufficient for uncertainty, and if the party proceeds, another hearing at a similar cost must inevitably take place : it respects a question of which I have now many cases before me, except that these cases are still stronger, inasmuch as they are buildings of con-siderable extent, the walls erected, joists laid, breastsummers and story-posts up, and were completely roofed in last year. I was disposed to treat the notice as in error, or that it applied merely to the putting up the pilasters and entablature as coming within the operation of the Act, but such a vision was soon dispersed; upon writing to the district surveyor for full

THE BUILDER.

the statute, since it projects 7 or 8 feet from the face of a wall (see schedule E, paragraph 6)," it is also stated that it "is part of a projection added to a certain building 'already built' on a certain face of an external wall thereof exa certain face of an external wall infered ex-tending beyond the general line of the front of the houses." All this is admitted, but it was completed in carcases last year, and claimed to be finished (under the term "already built," sec. 2) fit for occupation before January, 1846. The perversion of the term "already built" in the case referred to as having been decided upon is more specifias having been decided upon, is more specifically defined by the referees as to be found in sec. 5. It must be recollected that sec. 1 merely declares the object of the Act, sec. 2 what is exempted and what is to be included in the future operation of the enactive clauses. Amongst which, sec. 5 declares that " the enlarging and altering of all buildings, so far as relates to building the same, and with regard to every such building either *already* or here-after built," are to be controlled by the various enactments and schedules, and then says, "subject nevertheless to any rules and direc tions in this Act contained in the same behalf." How men of intelligence can so misread plain language, I am at a loss to imagine, the per-missive sec. 2 clearly takes all works "com-menced before the 1st of January" out of the operation of the Act. The decision of the referees, however, is, that these are "additions and alterations to a building already built," they are buildings erected before 1st January, over which no law then had any control; but imagining any shadow of plausibility of setting up such a position, I fall back upon permissive sec. 2, and quote from sec. 5, "subject, nevertheless, to any rules and directions in this Act contained in the same behalf." In a case reported as heard at Greenwich before Mr. Jeremy, the magistrate, he stated, "He must take the clauses in their literal interpretation, he knew nothing about the intention of the legislature. As to the 5th being the primary clause on the subject, it was a bundle of absurdities and full of incomprehensibility. There was no less than three exceptions embraced in one proviso as an instance.

Further details and extracts from the award I shall be better prepared to lay before your readers in a subsequent letter. And I am anxious to draw further attention to the question of party-walls and intermixed property, as commenced in my letter, in your number for March 8th, being the only matter that can affect the interests of two parties. In the case alluded to, I feel I have much personal ground of complaint in the mode pursued, and if persevered in, it will be of serious and costly damage to parties so circumstanced. It must be recollected my charge of illegal proceedings, as stated in my letter to the referees, was upon the ground that no consent had been asked for, and that we were con-senting parties. I have since obtained the facts from the surveyor of the "building owner," thus :--He had copied from a form of notice in the Act, and waited on the district surveyor to know what course he should pursue, being merely desirous of legally putting himself in communication with us. The district surveyor told him a written notice would not suffice (although a verbatim copy of the form prescribed); he must get a printed form, and also serve two on the official referees; thus moving their office before, by sec. 20, consent of the "adjoining owner" had been sought, as before stated. When the district surveyor attended, neither of the surveyors surveyor attended, neither of the surveyors took any part in the matter; the district sur-veyor proceeded with his survey, and we shortly received copies of his plan and statement, condemning the whole matter in question. I wrote to the referees and " building owner," as set out in your number for March 8th, stating we were consenting parties, and that the pro-ceedings were altogether wrong. I was heard upon my allegations, but no decision given, but a power of appeal within seven days from receipt of the district surveyor's report; before, however, the expiration of this period, we received a summons to attend in Trafalgarsquare for a confirmation by the referees of the district surveyor's report. We had intended to, and did appeal, stating our grounds not be obtained, and that appear, stating on ground and not be obtained, and that the plan of the district surveyor was seriously erroneous; he had shewn the whole as one wall, whereas

with the simple means in the index of the simple means in the simple means in the source of the sour

In obedience to the summons, all parties attended in Trafalgar-square, when we were told there was no meeting, in consequence of the appeal, the period for such appeal not having expired when the meeting for confirmation was appointed. We then (instead of being heard upon the merits of our appeal) received a notice that one of the official referees on an appointed day would meet all the parties himself to view the premises. As we meant nothing warlike, all parties began to be seriously alarmed, and without loss of time we concluded a negotiation for purchase, which had been nearly effected the first day we met, during the time the district surveyor was amusing himself (certainly not for our benefit) by taking a plan of the premises. We immediately drew up and forwarded a joint memorial, intreating proceedings might be stayed, which was attended to. Who is to pay the large costs that must have been incurred I know not. We protested against the legality of the proceedings, and the "building owner," against his wiehes, was directed in the course pursued by the district surveyor. Being fearful I should get no decision upon my personal allegations of irregularity in the proceedings, I wrote and received an answer, and have since, at a cost of 4/. 3s. 8d., taken up the award. It may be well to mention that the necessity of endeavouring, as a preliminary step, to obtain consent, is recognized in Trafalgar-square, where in the table of fees, under the head "consents," it is thus stated:—" 14. For every application for consent to be given on behalf of absent, unknown, or incapacitated parties; and, if inquiry be involved, such further fees as are payable on an award, 5s. 15. For every confirmation of the sur-

15. For every confirmation of the surveyor's certificate as to works to which the adjoining owner does not consent (sec. 24), 11. 1s."

All the mass of papers received in the matter are headed "party-wall, party-arch, or party fence-wall in the absence of consent by the adjoining owner."

Having already trespassed to so great a length on your columns, I must defer setting out the details of the award—merely stating no heed has been paid to the ground of complaint. I am awarded to pay the 4*l*. 3*s*. 8*d*. and 1*l*. 1*s*. to the district surveyor, which I shall most decidedly resist, and take counsel's opinion whether I cannot recover 4*l*. 3*s*. 8*d*. of the district surveyor for his wrong-doing in the matter.

GREENWAY ROBINS.

SEWERS IN LIVERPOOL.—The Commissioners of Paving, &c., have just determined upon constructing in the north district of the town sewers, 3,585 yards in length, the estimated cost of which, including branches, is 5,736*l*.; and in the south district, 3,665 yards, at the estimated cost of 5,864*l*. The quantity finished in the north district, under the contracts of 1844, is 2,559 yards main sewers, exclusive of 475 yards of branches, at a cost of about 3,958*l*. In the south district the quantity finished is 3,130¹/₄ yards main sewers, exclusive of 530¹/₄ yards of branches, at a cost of about 4,928*l*.

FATAL ACCIDENT THEOUGH THE GIVING WAY OF A FLOOB....On the 17th instant an accident of the most appalling nature occurred at the Female Penitentiary, Holloway-street, Exeter. Twenty-one of the inmates had retired for a short time to a small room but little frequented, for the purpose of allowing the committee to inspect the spartment they usually occupied, when the floor of the room instantly gave way, and twenty of the unfortunates were immersed in the pestilential contents of an ancient cess-pit underneath; the other supporting herself on a part of the floor still remaining. The cries and appeals for assistance soon brought to their aid the committee, who succeeded in releasing the woman sustaining herself on the broken part of the floor from her perilous situation, and dragging the others from the pit. In five of these, however, we regret to say, life was extinct. The other fifteen were bruised and very ill, but under proper care are now recovering.

THE BUILDER.

Correspondence.

PORTLAND CEMENT.

SIR.-The basins in Trafalgar-square have been repaired with Roman cement: can you assign the reason they have not been repaired with Portland cement, that being the material the bottoms are laid with? If Portland cement is so superior to all other cements, how is it that they are not repaired with the same?

As this may tend to lower the estimation in which Portland cement is held, it would be well to learn the reason.—I am, Sir, &c. Kensington. A PLASTERER. Kensington.

MANUFACTURE OF BRICKS.

Sin,-If your correspondent "Mr. Lock-ood " will inform us, young brickmakers, 1st. wood What are the proper quantities of each material contained in a brick of the best quality? Does it consist of one-third sand, one-third chalk, and one-third clay; or what? 2nd. How it may be known that the materials are properly mingled together? 3rd. The mode of packing them in the kiln so as to obtain the best result? then, I think, the art of brickmaking will be benefited by his labours. Will he also tell us what may be said in favour of mixing the ash with the clay at the commencement of the winter; whether by so doing the materials would become better amalgamated, or whether an objection would exist in the ash losing a portion of its burning quality.- I am, Sir, &c., AN EABLY SUBSCRIBER.

SIB,—I have been expecting some of your numerous correspondents would have replied to the query of "An Early Subscriber," in No. 105 of your valuable publication, who "is anxious to have an analysis of a good brick, shewing the exact proportion of each material used in its composition." I should also wish to see added to it, the nature of the compound for giving bricks or tiles a durable brown colour, and the manner of laying it on, which I believe is done before burning.

I am glad to see from your last number, the Royal Institute of British Architects have offered a premium for information on this important building material.—I am, Sir, &c., P. T. Isle of Wight.

BRITISH ARCHEOLOGICAL ASSOCIATION. SIR,-Would you or some of your numerous

correspondents have the goodness to inform me, through the medium of the pages of THE BUILDER, of the simple question at issue be-tween the contending parties in the "British Archæological Society." As a member, 1 have been addressed by the supporters of each di vision, and from the apparently conflicting and almost confused statements made by each, am somewhat at a loss to understand the real merits of the respecsive claimants for my sup-port, and consequently (if there is to be a division) to which party to attach myself.

The neutrality which you, Mr. Editor, have hitherto maintained I highly approve, but think that the matter is now assuming such a decided form, that you can with much advantage to both parties, and with real benefit to the cause of archæology, step forth, in order to explain the real position of the whole case. I may also add, that your acknowledged firmness in the discussion of all matters brought before your notice will add much weight to any remarks you may make .-- Your insertion of this will much oblige your constant reader, ARCH#OLOGICUS.

. [We will endeavour to comply with our correspondent's request next week. We de-sired to see the wound healed, not opened, and so have been silent .--- Eo.]

THE PORTLAND VASE .- We are glad to be able to state, that this valuable example of ancient art has been successfully restored and will shortly be re-exhibited to the public

-The VACANT DISTRICT SURVEYORSHIP.death of Mr. Mayhew has created a vacancy in the parish of St. James, Westminster. Mr. Charles Mayhew is a candidate for the office, and as it is known that for several years, past he assisted his father in the duties of the office, it is to be hoped he will be unopposed by his professional brethren.

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, & c., are to be addressed. For the convenience of our realers however, they are entered in a book, and may be seen on application at the office of "The Builder," 2, York-street, Covent-garden.]

For the supply of Rails and Chairs for the Eastern Counties Railway. March 31.

For the erection of a new Workhouse at Stratton, St. Margaret, about Midway between Swindon and Highworth, Wiltshire. April 2. For certain repairs to Snake Bridge (over the

River Alde), Suffolk. April 2. For certain repairs to be done to the Church of

St. James, Braithwell, Yorkshire. April 2. For Lighting Camden-town, St. Pancras, with coal-gas for five years, from the 24th of June next. April 3.

For the erection of a Church in the parish of St. Thomas, Winchester. April 5. For cutting, forming, and completing a new line

of Private Carriage-road, one mile in length, from Whitehaven Castle, Cumberland, the seat of the Earl of Lonsdale, to the Turnpike-road, between Bransty toll-bar and Lonsdale-place, near the town

Bransty toll-oar and Longuage-place, and of Whitehaven. April 7. For constructing the fourth division of the Great Southern and Western Railway. April 8. For about 250,000 Railway Sleepers not less than for about 250,000 Railway Sleepers not less than

9 feet long, for the Chester and Holyhead Railway. April 9.

For erecting at Alreaford, Hants, between five and six thousand feet superficial of new Brickwork, to be either neat flat, joint-pointed with white mortar, or neatly tuck-pointed. The parties to find labour and the erection of scaffolding only. April 10.

For paving and repairing the foot-ways and carriage-way pavements of the parish of St. Clement Danes, for one year from Michaelmas next. April 10. For the restoration of the Parish Church of

Grays Thurrock, Essex. April 12. For submitting a plan of a Tread-wheel, and con-

structing the same in the Common Gaol of Great Yarmouth, Norfolk. April 24.

For all the Works to be done in the erection and completion of the new cast-iron Bridge over the Haven of Great Yarmouth, including the finding of labour, certain materials, &c. April 26.

For the construction of the third and fourth divisions of the Chester and Holyhead Railway. April 28.

For the supply of 11,000 feet of 9-inch cast-iron

For the supply of 11,000 feet of 9-inch cast-iron Pipes for a new line of Aqueduct in the Island of Malta. April 30. For laying out the Grounds of the Victoria-park Cemetery, and for draining the same, making the roads, paths, and finding all necessary trees, shrubs, materials, &c.

COMPETITIONS.

Plans, &c., for the erection of a Commercial Middle School in connection with the committee of the Manchester Church Education Society. Plans and Estimates for a House of Assembly for

the Diet of Hungary. December 1.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

March 31 .- At 7, Store-street, Bedford-square : everal thousand Yellow Deals, Pine and Spruce itto, Battens, Planks, and Boards, Ash Felloes ditto, and Planks, and other seasoned Wood.

March 31.—At Down Hall, Bradwell, Essex; 310 Oak Timber Trees, standing with Top, Lop, and Bark; 213 Ash, 157 Elm, and 78 Beech Trees

March 31.-In the Plantation adjoining Great Chiverell Common, Wiltshire: 3,000 Fir Poles, chiefly Spruce, with a few Lots of Larch. The Poles are large, and of superior quality.

roles are large, and of superior quality. The last week in March, or the first week in April next.—A large quantity of Oak and Elm Timber, of superior quality and large dimensions, principally growing in the woods on the Orchard-leigh Estate, near Frome, Somerset. Bu Pringle Contract heafore the left of Amril

By Private Contract, before the 1st of April By Private Contract, before the 1st of April next.-287 Oak Trees, of full growth and large dimensions, suitable for all purposes, now standing at Woodside, hear Morland, Westmoreland.

April 1.—At Chelmsford, Essex; a very valua-ble, extensive, and well-assorted stock of Dry Wood in great variety, comprising fine Spanish and Honduras Mahogany, mostly cut between six and seven years; particulaly fine Zebra Wood, English Oak, Pencil Ceder, Birch, Beech, Elm, Rosewood, &c.

April 1.—At Gifford's Hall, Stoke by Nayland, Suffolk: 40 Oak Timber Trees and Standels; 100 Ash Timber Trees and Standels; 45 Elm Timber Trees; 34 Cherries; 20 Poplars, Firs, and Beeches.

April 2.-At the Golden Lion Inn, Ashburton, Devonshire: 1,022 Oak, and 103 Ash Trees. The Oak Timber is of very long lengths, large

dimensions, and superior quality. April 2.—At the Feoffee's Room, Bond's Hos-pital, Coventry: 144 Oak Trees, 86 Oak Poles, and 22 Cyphers, now growing in Birchley Heyes Wood Old Wilkengter

Wood, Old Fillougley. April 3.—At Whitley, near Baythorne End, Suffolk: a large quantity of Fir Timber. April 5.—At Bower Hall, Steeple Bumpstead,

April 5.—At Bower Hall, Steeple Bumpstead, Essex: 400 Fir, Oak, and Elm Trees. April 8.—At the Spulk House, in Dean Forest, Gloucestershire, by order of the Commissioners of her Majesty's Woods and Forests: 319 Oak Timber Trees.

MEETINGS OF SCIENTIFIC BODIES During the ensuing week.

MONDAY, March 31.-British Architects, 16, Grosvenor-street, 8 P.M.; Chemical (Society of Arts), Adelphi, 8 P.M. (Anniversary Meeting); Medical, Bolt-court, Fleet-street, 8 P.M.

TUESDAY, April 1. — Linnæum, Soho-square, 8 p.M.; Horticultural, 21, Regent-street, 3 p.M.; Civil Engineers, 25, Great George-street, 8 P.M.

WEDNESDAY, 2.—Society of Arts, Adelphi, 8 P.M.; Geological, Somerset-house, 81 P.M.

THURSDAY, 3. — Royal, Somerset-house, 8 P.M.; Anliquaries, Somerset-house, 8 P.M.

prices. ELLIPTIC and REGISTER STOVES, KITCHEN RANGES, &c., lower than any other house in the trade. Lists of prices may be had at the Warehouse, or forwarded per post free.

ANGES, ac., jower than any other nouse in the trade. Lists of prices may be had at the Warchouse, or forwarded per post free. TO BUILDERS AND OTHERS. JAMES ELLIS, Brass Founder, 144, Houndsditch, London, Manufacturer of Pumps, Water-closeta, Cocka, &c. Sole Maker of Woodfield's Patent Water-closet, that requires neither Service Box, Ball Lever, Valve, Cranka, or whires, admirably adapted for situations where the Cistern cannot be fixed near the Closet. Any number of Closets can be supplied from the same Cistern. Brase Fittings for Slate Cisterna, Sinks, &c. ; Plumbing and Steam Work in its various branches; Gas Light Furni-ture Manufacturer and Fitter. Dever article warranted and supplied on the lowest terms for Cash. Experienced Workmen sent to any part of Town or Country on the shortest notice and most reasonable Terms. Pan Water-closet complete, 11. 108. CAUTION TO LOCK MAKERS, Concepts, &c.-I, THOMAS DAVIS, at present a prisoner confined in Warwick Gaol, upon an execution at the suit of Mesars. Charles Chubb and Son, of St. Pau's Churchyard, London, Patent Lock Manufacturers, for damages and costs recovered against me for such my offence, and the said Mesars. Chubb and Son awing, in consideration of the distressed state of my wife and family, by reason of my inprisonment, consented to my discharge, I do hereby delare that I have been justly imprisoned for such my offence, and the said Mesars. Chubb and Son having, in consideration of the distressed state of my wife and family, by reason of my inprisonment, consented to my discharge, I do hereby delare that I deeply regret having ever put their names on my locks, or having passed off locks of my make for articles of the sid Mesars. Chubb and Son having; Hornise that I will never again, under any circumstances, commit the same offence.-Dated 4th day of February, 1815. THOMAS DAVIS. Witness-Thomas Maycock, Turnky. The NULE DE S. CICOVES and FLD F LEDANS

Witness - Thomas Maycock, Turnkey.

FENDERS, STOVES, and FIRE-IRONS **FENDERS, STOVES, and FIRE-IRONS.** -The LABGEST ASNORTMENT of STOVES and FENDERS, as well as GENERAL IRONMONGERY, in the WORLD, is now on SALF as RIPPON and BURTON'S extensive warehouses, 39, Oxford-street, corner of Newman-street (just removed from Weils-street). Bright steel fenders, to 4 feet, from 30s. each; ditto ditto, with ormolu ornaments, from 60s.; rich brouzed aeroll ditto, with steel bar, 10s. 6d; ; iron finders, 5 feet, 4s. 6d; ; 4 feet, 6s.; ditto bronzed and fitted with standards, 3 feet, 9s.; 4 feet, 11s.; bright register stoves, with bronzed meants and two sets of bars, from 5 guineas, ditto ditto, with ormolu ornaments, from 91. 5s.; back dining room register stoves, 2 feet, 10s.; 3 feet, 30s.; bed-room register stoves, 2 feet, 10s.; 3 feet, 30s.; bed-room register stoves, 2 feet, 10s.; 1 fee, 30s.; bed-room from 81. 5s.; fire-irons for chambers, in 9d. per set; handsome ditto, with cut heads, 6s, 6d.; newest pattern, with elegant bronzed heads, 11s. A variety of fire-irons, with ormolu and richly-cut heads, at propor-tionate prices. Any article in furnishing ironmongery, 30 per cent. under any other house, while the extent and variety of the stock is without any equal. The money returned for every article not approved of.-Detailed cata-logues, with engravings, sent (per post) free. Established in Wells-street) 1820.

(In Wells-street) 1820. TO BUILDERS and Others.—A cheap substitute for high priced bricks, well worthy the attention of speculative gentlemen, and other capitalists who intend building this season. This article is stone, which may be worked with great advantage. It is in pieces from 3 to 5 inches in thickness, and averaging from 14 to 20 pounds in weight; it is about the same weight as bricks, and will be guaranteed per week, as it will come by rainty may be had from 100 to 200 tons per week; not more would be guaranteed per week, as it will come by rainty. A fair sample of 10 or 12 tons may be seen at the proprietor's at any time.—Address, JAMES PERREN, 1, Victoria-place, Surrey-square, Walworth.

Surrey-square, Walworth. TO BRICKMAKERS, BUILDERS, &c. THE MANOR PARK, STREATHAM, near the CHURCH.—TO LET for the purposes of Brickmaking, the valuable Brick-earth upon a part of this Estate. The Clay, which is of a very superior quality and coloured with marl, lies immediately below the vegetable mould, and there is running water in great abundance cross-ing the Estate; besides other advantages, the Ground ford from Streatham to Tooting, is now to be Let for Building from Streatham to Tooting, is now to be Let for Building from Streatham to Tooting, is now to be Let for Building from Streatham to Tooting, is now to be Let for Building from Streatham to Tooting, is now to be Let for Building here main Croydon Road and on the Road leading from Streatham to Tooting, is now to be Let for Building the maker and Builders, saving the Cost of Cartage. If any Speculator is willing to take a large portion of the Ground for Building purposes, he would be allowed to make Bricks, the proprietors only reserving to themselves the right of a manut will be advanced on the Building during their erection, upon Certificates given by the Architects to the Estate. For Specimens of the Earth, Plan of the Estate, or other stricular, apply to Measrs. Gough and Roumieu, Archi-tects, &c. 10, Lancaster-place, Strand, or at Mr. Brown's, Manor-park Office, Streatham.

MON'S INPROVED CHIMNEYS.— Namples of the Bricks to form the Circular Flue, now coming into general use, also those invented by Clark and Reed for a similar purpose, may be seen at the Patentee's Western Depot, New-road, near Tottenham-court-road, wher may be procured the Metal Bars and Throats, also the much-approved Caps for the prevention of Smoky Chim-neys, without causing adjoining flues to smoke, or producing turface of metal being exposed to the action of the wind. Licences are granted to Brick and Tile Makers for manu-facturing the Bricks and Tile, throughout the United King-dom, by application as above, or to Mr. ELIAS DORNING, 7, Oress-street, Manchester.

PAPER-HANGINGS on SALE at the DAPER-HANGINGS ON SALL at the following low prices for eash:-Bed-room papers, from 6d. per piece of 12 yards; dining-room ditto; from 1s. ditto; passage and staircase ditto, from 1s. ditto; marble papers, 1s. 6d. ditto; granite, 1s. 6d. ditto; oak, 1s. 6d. ditto; satin p-pers, from 4s. to 8s. ditto.-At R. CHATER'S, 46, Tottenham-court-road.-N.B. A quantity of remnants, of two to six pieces each lot, to be sold at cost price.

DUTY off WINDOW GLASS. - On

DUTY off WINDOW GLASS. — On April the 6th, Squares stouter and of better make than formerly for Glasing purposes at 6d. per foot. MURSERYMEN, MARKET GARDENERS, AND OTHERS requiring Small Glass, will find a greater variety of sizes (a large Stock of which is constantly on hand) than is kept by any other house in London, from 4d. per foot. Flattened Sheet, Stained, Fluted, the BIRNINGHAM Sheet Plate (superior in all respects to every other make), and Ornamental Glass of every description. Complete Lists of Glass, Lead, Colours, &c., at ready-money prices, may be had (gratis) on application to R. Cogan, at the Western Glass, Lead, and Colour Warchouse, 5, Princes-street, Leicester-square, London. SURVEYORS. CONTRACTORS FOR PUBLIC

Leicester-square, London. SURVEYORS, CONTRACTORS FOR PUBLIC WORKS, and the THADE generally, sending specifica-tions of quantities required, will receive by return of post an involce at the very lowest cash prices. A parcel of very Superior Spruce Oker, suitable for PLASTERERS AND PAINTERS, to be sold at 6s. per

NOTICE. - INVENTORS desirous of Notatining LOANS ON or of SELLING their IN-VENTIONS, or Patents, should apply to Mr. M. JOSCELIN COOKE, at the OPFICE for PATENTS, 20, Half Moon-street, London, where English and Foreign Patents are ob-tained, and Designs registered. An INDEX is kept for inspection of all Patents granted for the last century; also copies of every Patent of importance. Instructions to Inventors and a list of charges gratis on application.

MORTGAGE and ANNUITY OFFICE M No. 123, Chancery-lane. — Persons requiring LOANS by way of MORTGAGE, or otherwise, upon any available security, may at all times procure an advance to the estent of from 1001. to 200,0001, or so much as the property will beer, by applying to Mr. BRAY, Surveyor, Land and Estate Agent, at the offices as abore, where a Registry for the sale of Estates, Houses, Land, Life Interests, and Reversions, is kept for inspection. N.B.—To expedite the procuration, personal application at the office would in all cases be better, the party bringing with them the abstract of title, plans, &c.

All communications for Money are considered strictly confidential. Letters pre-paid.

EMBARRASSED CIRCUMSTANCES. **L**MBARKASSED CIRCUMSTANCES, --PERSONS IN DIFFICULTIES being desirous of availing themselves of the Benefit of LORD BROUGHAM'S HUMANE ACT. are requested to apply to MESSRS, GRAND AND CO., of 54, Coleman-street, City, where every information may be obtained, FIREE OF EX-PENSE, or arrangements can be made with Creditors, by which means the painful necessity of resorting to BANKRUPTCY or INSOLVENCY may in many cases be avoided.--N.B. Partnership accounts adjusted.

TO BUILDERS. - TO BE LET with **1** BUILDERS. — TO BE LET with possession at old Lady-day next, a neat and commo-dious DWELLING, HOUSE with excellent Yard, Work-shop, Saw-pit, and Sheds adjoining the same; situate in Double-street, in Spalding, in the county of Lincoln, now in the occupation of Mr. Wm. East, where a first-rate general business has been carried on for the last forty years. The Premises are contiguous to the Niver, and consequently wall situated for Loading and Delivering Materials. For further Particulars and to treat, apply to Mr. R. Ellis, Builder, Fleet, march 1846.

TO BUILDERS, CARPENTERS, AND JOINERS.

TO BUILDERS, CARPENTERS, AND JOINERS. TO BUILDERS, CARPENTERS, AND JOINERS. TO LET, with possesion at Old Lady-day next, all those Extensive Premises situate in Fleet, near Holbasch, in the county of Lincoln, comprising commodious and newly-built Dwelling-house and Office, Carpenter's and Smith's Shop, Sawpit, Deal Sheds, Office and Stable, Large Yird, and well-planted Garden, now in the occupation of Mr. Robert Ellis, builder, by whom and his late father an ex-cellent business has been carried on for uwwards of half a century. For further particulars, apply to Mr. Ellis. Fleet, March 17, 1845.

Fleet, March 17, 1845. IMPORTANT TO INVENTORS AND PATENTEES. IMPORTANT TO INVENTORS AND PATENTEES. IMPORTANT TO INVENTORS AND PATENTEES. To parties taking Letters Patent, by Mr. J. WILSON, Engineer and Patent Agent. Every description of business relating to or connected with Patents, Registration of De-signs, Patent Agency, &c., conducted at his offices, 16, CHANCERY-LANE, opposite Carey-street. Negotiations entered into with paties wishing to dispace of or purchase patented or registered inventions. Every necessary infor-mation may be obtained at the offices as shove, where also may be had printed instructions (gratis), to which Mr. W. begs particularly to draw the attention of parties about to take out patents Mechanical drawings of every description, original designs for machinery, models, &c., executed with dispatch and economy.

HOLBORN AND FINSBURY SEWERS, MIDDLESEL. THE COMMISSIONERS of SEWERS for the LIMITS give NOTICE, that their Office, Hatton Garden, is open daily between the hours of Ten and Four, where information can be obtained (gratis) by presens about to Purchase or Rent Houses or Property, or take Land for Building purposes, of the situation and level of the public Sewers, capable of affording sufficient Drainage, and which they recommend all such Persons to apply for at the above Office. By the Court, STABLE and LUSH, Clerks.

COURT OF SEWERS FOR WESTMINSTER, AND PART OF MIDDLESEX, No. 1, Greek-street, Sobo-

nguare. NO BUILDERS and Others interested in

TO BUILDERS and Others interested in buildings or in ground for building upon, within the district under the jurisdiction of this Court, drained by water-courses falling into the river Thames, between the city of London and the parish of Fulham. The Commissioners hereby give notice, that by an Act of the 47th Geo. 111. (chap. 7, local) it is required that, pre-viously to the making of any new sewer in any atreet, lane, or public way, or in any part intended to become a street, lane, or public way, or to carry off or drain off water from any house, building, yard, or ground, into any sewer under their management, or within their jurisdiction, a notice in writing shall be given to them, or to their cirk at their office, and that such new sewer or sewers shall be directed by the said Commissioners, and not otherwise. And, in order to prevent the serious erils and inconveni-neces that must arise from ground proposed to be built upon being exravated at too great a depth, the Commissioners have directed that, upon ary lication being made as this office previous to the excavation of such ground, information shall be given as to the lowest depth at which the same can be drained.

be given as to the lowest depth at which the same can be drained. And the Commissioners do also give notice that, when-ever the lower floors or pavements of buildings shall have been laid so low as not to admit of their being drained with a proper current, they will not allow any severs, or drains into severs, to be made for the service of such buildings. It is recommended to all persons about to purchase or take houses, or other premises, to ascertain whether such premises have separate and distinct drains into common severs, All petitions must be delivered at this office at least three clear days before they are presented to the Commissioners ; and all such petitions will be called on in the order of their appli-cation, and the name of any party not present when called on to support the application will be struck out, and the pro-ceedings must in consequence be commenced de noro. All communications made with any sever without leave of the Commissioners, will be cut of, and the parties making the same will subject themselves to a fine. By order of the Court, LEWIS C. HERTSLET, Clerts.

SATURDAY, APRIL 5. 1845.

OR more than two years past a committee, appointed for the purpose of obtaining the restoration of the noble church of St. Mary Red-

cliffe, at Bristol, probably the finest parish church in England, have spared no pains to raise subscriptions, and to induce their fellow-citizens and the admirers of ecclesiastical architecture throughout the country, to assist them in the proposed undertaking.

From the estimates of the architects employed to survey the church, it appears that an outlay of 40,000% is required to complete the restoration; but, after mature deliberation, the committee were of opinion they might with perfect prudence commence the work when 7,0004. should be subscribed; and it was accordingly resolved, in January last, that when such a sum was obtained, plans and estimates should be submitted to a meeting of the subscribers for their approval.

After all the efforts made, however, only 5,400% have been raised; and expenses have been incurred which reduce the amount strictly applicable to the restoration to 4,600%. The committee found that the fabric was becoming daily worse and worse, and being anxious to induce the subscribers to allow the application of their subscriptions to the substantial repair of the fabric, a meeting was held on Friday, the 28th ult , when the Mayor, Mr. R. P. King, presided, and the following resolutions, amongst others, were carried unanimously :---

" That this meeting would see with deep regret the further decay, and perhaps irretrievable ruin, of St. Mary Redcliffe Church ; and as more extensive dilapidation can only be averted by the application of the present subscriptions to the work of repair, this meeting earnestly hopes that all the subscribers will consent to an immediate payment of the residue of their subscriptions-to be applied under the direction and control of the committee, according to the recommendation contained in their report; and that the committee be requested to make early application to each of the subscribers not now present, or otherwise consenting, for their permission to apply the balance of his subscription forthwith to the same purpose."

The mayor was most anxious to aid the views of the committee, and urged that it would be a national disgrace if the beautiful structure were allowed to go further into decay. They could hardly hope at present to see the steeple restored and the church made perfect, but substantial repairs they were bound to attend to; and he hoped the subscribers would permit the amount already raised to be applied forthwith for that purpose. Mr. W. L. Clarke, in moving the first resolution, said, although they could not effect their whole object, the subscribers who assented would have the satisfaction of handing down the church in good repair to the next generation, to receive then that complete restoration, which they themselves had desired to obtain, but unfortunately could not.

Mr. James Gibbs rejoiced that the committee had resolved to begin the work; but

deplored that, in a city of merchant-princes, whose revenues might be estimated not by

THE BUILDER.

thousands, but by hundreds of thousands, and even millions, there was any difficulty in raising the sum required. He trusted, however, as the work proceeded that additional aid would be given.

Mr. W. P. King saw no reason to despair of the ultimate restoration of their noble church; such works were not effected in one year or ten. The Cathedral of Cologne had been built bit by bit, and, in fact, had never been finished. But the present King of Prussia having interfered, a spirit had arisen, and in all Germany subscriptions were being raised for its completion. All the large cathedrals had taken many years in building, and the town of Wigan owed its name to the circumstance of such a building being so long in progress, that the expression of "We began " was so often used, that corrupted into Wigan, it became the name of the place. He thought they had only to begin, and they would go on progressing; their very scaffolding, and the knowledge that they were progressing with the work, would be their best advertisement, for they could not expect people to give large subscriptions to a work not yet begun; he did not fear but the youngest among them might live to see the restoration of that beautiful steeple, which had been thrown down by the thunder-storm.

Mr. Proctor felt himself unable to assign a reason for the want of funds. Here was a fine old church, admitted on all hands to be a credit to the city and nation at large, in the midst of a professedly Christian country, and surrounded by a population who were sending money all over the known world to build churches; yet that church was going to decay, and the means to prevent it could not be obtained. The amount already subscribed might appear large; but was not the object worthy of it? Large as it was, it was less than had been expended on one mile of railway within the vicinity of its walls. He could only assign as an excuse, that persons did not believe the church was in so dilapidated a state as was stated; but he assured them they would find it so. In many parts it was so dangerous, that it ought not to be approached; many of the pinnacles were tottering, and large pieces of stone were constantly falling; and the roof over the chancel was in so bad a state, as to deter any person from proceeding along it. The time was come to decide whether Redcliffe Church should exist a proof of their fidelity to the trust deputed to them by their fathers, or a monument of the neglect and parsimony of the present generation. He considered the credit of England was at stake, and hoped that none would relax in their exertions.

We echo Mr. Proctor's words-the credit of England is at stake; and we hope all who feel interested in our ancient occlesiastical architecture will lend their aid to effect the restoration of the beautiful church of St. Mary Redcliffe. If it be allowed to fall into ruin, a disgrace will attach to Bristol, which will be hard to remove. Its beauty as a work of art, its antiquity, and its peculiar associations, render this church equal in interest to any structure in the kingdom. Well might the elegiast of Canynge, who built the greater part of the present church, and died in 1474, inscribe on his monument :---

The buildings rare that here you may behold To shrine his bones, deserve a tomb e of gold : The famous fabricke that he here hath donne, Shines in its sphere as glorious as the sonne.

What needs more words, the future world he soughte.

And set y^e pomp and pride of this at noughte : Heaven was his aime, let heaven be still his station,

That leaves such works for others imitation."

The committee have acted wisely in determining to commence the repairs forthwith, and is every reason to believe that when there they begin in earnest, additional funds will be forthcoming. We give them "God speed ye" in the good work, and shall report progress from time to time. Such monuments are the property of the nation, and should be the care of the nation. If we cannot build such now. a-days (or at least, do not, which is the same in effect). at all events let us religiously preserve those our forefathers have left us.

BURIAL-GROUND PRACTICES.

THE revolting occurrences in the Spafields burying ground, to which we assisted to direct public attention, have produced so strong an impression generally, that, whatever may be the immediate result of Mr. Mackinnon's long-expected motion for preventing interments in large towns, we may expect considerable mitigation of the evil before long. A true bill has been found against two managers and the lessees of the burying-ground in question, and the audacity of Mr. Bird in question, and the audacity of Mr. Bird in writing the letter which we admitted into our columns, is fully shewn.

At St. Saviour's, Southwark, on Easter Tuesday, the parishioners in vestry assembled, resolved to discontinue burying the dead in the grave-yard of that parish, in consequence of its over-crowded state. And it is to be hoped that the inhabitants of several parishes in the city which we could name, will forthwith determine that no more shall be added to the mass of corruption engendering disease, over which they sit some hours every week. It will scarcely be believed that an analysis

of a gallon of water from the pump in Spafields ground, lately made, shewed that it contained 160 grains of human matter.

Throughout the discussion of the subject, which has recently taken place, we have not observed that sufficient allusion has been made to the gentleman by whose exertions, almost unaided, and at considerable expense to himself, the fatal evils of the system generally, and the atrocities committed in the Spafields ground in particular, have been made known to the public. Mr. G. A. Walker has applied himself for several years past to point out the evils attendant on burying in towns, and to the reformation of abuses of the practice known to exist, and it is to be hoped that some public acknowledgment of his services in this respect will be made. It is too often the case that those who have really fought the battle are forgotten in the moment of victory.

ENCROACHMENT ON HYDE PARK.

WE view with extreme jealousy any steps tending to contract the few open spaces set apart for the enjoyment and healthful recreation of the people. The parks are the Lon-doners' privileges, the Loudoners' salvation; they are properly called the lungs of the metropolis, and as we all know what an important part of the body the lungs are, should be guarded with the greatest care, and preserved instact at any cost. We are led to make this remark by the preparations which are in pro-gress, apparently to enclose a portion of Hyde Park, between Albert-gate and Hyde Park Corner, and call loudly on those who have power, to lend their aid to prevent this en-croachment. If the intention be persisted in, a public meeting should be called, and a memorial therefrom presented to the Metro-politan Improvement Commissioners, and the Health of Towns Commissioners, soliciting

politan Improvement Commissioners, and the Health of Towns Commissioners, soliciting their interference. No time should be lost. "The true danger," says Burke, if we re-member rightly, "is when liberty is nibbled away for expedients and by parts;" and so it is with our parks. If we quietly permit this fresh slice to be taken off (as was done a few """ shall have years since next Park-lane), we shall bave the precedent followed all round its confines, even if it stop there; and afterwards the same authority which encloses, may please to plant villas and cottages in the pleasant parterres thus created. YORK MINSTER; ITS FIRES AND RESTORATIONS. BY JAMES WYLSON.

In attempting to give an account of the present condition of York Minster, we naturally turn to take a retrospect of those memorable calamities which led to the extensive operations that have been carried on of late years in that magnificent fabric. Premising, then, that, in pursuance of a survey and report thereof, made by Mr. Carr, a York architect, in 1770, the minster was put into a general state of repair by 1778; that from funds realized from minster properties, the Dean and Chapter afterwards maintained a steady counteraction to the insidious influence of time, expending therein, say 1,000% a year, it will be understood that only the occurrence of such destructive events as those to which we refer rendered necessary those public appeals, and the exercise of that munificent co-operation, by which this noble structure has been preserved from becoming a crumbling rin.

served from becoming a crumbling ruin. About seven o'clock in the morning of Mon-day, the 2nd of February, 1829, a boy named Swinbank, one of the choristers, while passing through the minster-yard, accidentally stepped upon a piece of ice, and was thrown on his ack; before he could recover his footing, he saw, in his upward view, smoke issuing from the roof of the minster. On his giving an alarm, and the doors being opened, it was found that the elaborate and beautiful carved oak fitments on the south side of the choir were in flames : from this the fire spread rapidly, and by half-past eleven o'clock the rich wood work (cathedra, pulpit, prebendal stalls, misericordia, pews, and orgau, with their exquisite canopies, tracery, and tabernacle-work), as well as the choir-roof, about 222 feet in length, was entirely consumed, the fire having been communicated to the latter from the organ. Happily, the gorgeous stone rood-screen, containing statues of our monarchs from William the Conqueror to Henry the Sixth, and which sustained the organ, occupying the lower part of the great arch between the transept and choir, and serving thus as one of the confines to the v ast furnace which raged within, sustained but little injury, as may be also said of the east window, which, from its beautiful glazing and noble dimensions, has been distinguished as "the glory of the cathedral," and "the finest window in the world;" the splendid sepulchral shrine of Archbishop Bowet, and other monu-ments were demolished, or considerably injured, as were the clustered piers of magnesian

limestone, carrying the great side arches. Upon an investigation taking place, a suspicion was found to attach so strongly to one Jonathan Martin, that a reward was offered for his apprehension. This man was a native of Hexham, in Northumberland, was a brother of the celebrated painter of the same name, had been apprenticed to a tanner, was subse-quently a sailor, and, about the time of his committing the act by which he acquired so much notoriety, obtained a livelihood by hawking about a pamphlet containing a nurrative of his life. He was taken on the Friday fol-lowing, at the residence of a relation, numed Kell. at Codlaw-hill, about three miles from Hexham, was brought to York on the Monday, examined, and committed to the city gaol; on the 31st of March, true bills for arson and felony having been found against him, he was tried at the Castle, before Mr. Baron Hullock, and, after nine hours' careful investigation, acquitted on the ground of insanity, caused by religious fanaticism. Accordingly, in pursuance of that wise regulation by which persons con-victed of serious offences whilst labouring under alienation of the mind are placed beyond the power of committing any further mischief through the mania which influences them, he was removed to London, and confined in Bethlem Hospital, where he died on the 3rd of June, 1838. It appeared that Martin, having provided himself with some tinder, matches, a penny candle, and a razor, in lieu of steel, attended evening prayers on the Sunday; then concealing himself behind Archbishop Grenfeld's tomb in the north transept, kept atill until the ringers, who were in the belfry in the evening, had left the Cathedral. **Proceeding to the belfry, he struck a light, lit his candle, cut about 90 feet from the rope of the prayer-bell, converted it into a ladder by tying knots in it at intervals, and having retraced his steps, obtained by means of the**

rope access to the choir; here he cut away the gold fringe ornaments from the pulpit, and the velvet from the Archbishop's throne, and Dean and Precentor's seats, then piled all the eusbions, surplices, and books in two heaps near the organ,—and set fire to them. His candle burnt out before he had completed his arrangements, but he procured a wax one which had been used during the service in the afternoon: it was about the middle of the night that he set about his "pious work," as he called it; he lit the fire about half-past two, stayed half an hour to watch its progress, and left the Cathedral about three in the morning, taking with him the gold-fringe, velvet, and a small bible, for the purpose, as he said, of their serving to identify him with the act. He made his escape by breaking one of the windows of the north transept, which he reached by the aid of the traveling scaffold used for cleaning the Minster, whence he looked back with great pleasure "on the merry blaze which began to shoot up." The opinions which he entertained on religion were of an ubsurd and fanatical kind, the main objects of his vituperation being the church clergy, whom he designated as "blind guides, who led the higher ranks of society astray." The writer of this article saw and conversed with him at Bethlem in 1837: on entering the day-room, he found him seated at the end of a long dining-table, reading intently in a large quarto volume; passing round to bis shoulder, and perceiving that the work which so closely en-gaged his attention was Fox's "Book of Margaged his attention was rox s "Book of Mar-tyrs," he accordingly saluted him thus :--"Good morning, Mr. Martin, that is a very in-teresting work you have got." "Ay, Sir," said Martin, launching into the topic which seemed ever uppermost in his thoughts, and expressing nearly thus : "these were the men himself that suffered for conscience' sake; when I set fire to York Minster I did wrong, and I deserved to be hung d for being guilty of trying to destroy so noble a fabric, for it was against the men and not the house that I should have directed my vengeance." When first placed there, he used to amuse himself with drawing, but his conceptions being gene-rally of the devilish order (according to the report of his keeper), the governors thought it best to deprive him of the means of exercising his talent in that way. There was a degree of wild and fervid enthusiasm in his manner, but still there seemed a seasoning of "as much rogue as fool" in his composition. He alleged that he was prompted to set fire to the minster by two dreams.

Addresses of condolence having been voted to the Dean and Chapter by the Lord Mayor and Corporation, and by the citizens, evincing the deep sympathy which was felt by all classes, a public, or rather national subscrip-tion was opened to defray the expenses of the restoration, which was intrusted to the pro-fessional experience of Sir Robert Smirke, and whose estimate of the damage done amounted to 60,000%. In two months 48,000% were collected in the county; Government gave 5,000% worth of teak from the stores of wellseasoned timber in the dock-yards; Sir E. M. Vavasour, of Huzlewood-hall, gave the stone, in noble imitation of his ancestor, Robert de Vavasour, who gave that of which the nave was built; his Grace, the Archbishop, pre-sented the communion plate; and the Hon. and Rev. John Lumley Saville, afterwards Earl of Shrewsbary, gave the organ. From the receipts of the fourth grand musical fes-tival also, which was held in the Minster on the 7th of September, 1835, the sum of 1,794/. 4s. 5d. was apportioned to the restoration fund. In consequence of a deficiency, the Deau and Chapter were obliged to borrow 8,000%, being the commencement of a mortgage on the fabric funds.

In effecting the restoration, the architect's first object was to give security to the fabric; to do this efficiently, he found it necessary to rebuild the portion of the side walls above the arches, and restore the cornice and battlements, and external screen-work on the north side. The roof he constructed entirely of teak, the extraordinary strength and durability of which, even where oak has failed, has been proved by experience; the arched ribs forming the groined vaulting he also constructed of the same wood, following in every respect the plan of the old work; but he wisely had the

interior moulded portion wrought separate, in a light American wood, a method which affords comparative facility for removing and replacing parts should circumstances render it necessary, as well as for executing the various complex curves with greater accuracy and superior finish. In the restoration of the stall-work, he availed himself of the services of Messre. Mackenzie and Wild, who had fortunately made on former occasions accurate admeasurements of the most interesting features of the Cathedral, well-seasoned oak was collected for the purpose in Holland, and the elabo-rate portion of the work was executed in London. The pulpit and throne are allowed to be far preferable to their predecessors; the former is two feet lower than the old one, and projects further into the choir : some say, that whereas the old tabernacle-work, while rough in execution, was substantial and richly clustered: the new, though sharp and richly tooled, is slight and thin, and the finials at variance with it. Exception is also taken to the known in the summer of the states of the the knots in the groining of the roof, which before presented an endless variety, but now exhibits a repetition of the same foliage. However these things may be, it is undeniable that the restoration was well carried out, and what with the drawings that existed, and the fragments found in the ruins, it was effected generally with a satisfactory adherence to its prototype. The new stone altar-screen and altar-rails are admirably finished; this screen and the oak ones which extend on either side from the pulpit and throne to meet it, have their openings filled with plate-glass, which gives at once lightness and comfort, and affords a view beyond. In August, 1830, some workmen engaged in removing the rubbish and paving inside the organ-screen, came upon some ma-sonry, the appearance of which induced a fur-ther excavation; pursuing this interesting discovery, the remains of a former choir upon a lower level, or, perhaps more properly, of a former crypt, were developed, presenting portions, as much as 7 feet in height, of massive Norman main piers, 7 feet or more in diameter, their various spiral and chequered flush-roll patterns and bases perfect; also the remains of other minor pillars, and in the foundations of the present structure, many pieces of Norman carving randomly disposed autong-t the rubble masonry. These remains, which prove the former choir to have been narrower, and to have run farther westward than the present one, were arched over with brick work to carry the paving of the choir, and are thus open for the inspection of visitors, in whom they invariably excite a deep interest : the vaults thus formed are entered from the west side of those previously known as the crypt, and descend a few steps from that level. These excavations were considered to afford confirmation of the old tradition that the Minster was founded on the site of a Roman temple, with berring-boae brickwork, being found to intersect the foundations. The bases of the massive Norman piers are curious, as being purely attic, the upper fillet of the scotia projecting under the upper torus. In the spring of 1832 the restoration was completed, having, with incidental expenses, amounted nearly to the estimate. On the 6th of May the choir was again opened for divine service

On the evening of the 20th of May, 1840, the satisfaction which the inhabitants had for eight years enjoyed in their restored Minster was agained doomed to be disturbed, and by a similar catastrophe. About half-past seven o'clock the slarm was given that a fire had broken out in the south-west tower, in which were the peal of ten bells, and the clock. The tower being much crowded with timber, the work of destruction progressed rapidly; by pine, the pest of bells had fallen-with crashes resembling discharges of artillery; the same fate had attended the clock, and the devouring element now raged through the whole height of the tower with the fury of a furnace draught-the flames issuing at every opening; by ten o'clock the fire reached the main root of the nave, along which it extended rapidly. and by twelve the whole of it had fallen in, and lay in the long aisle "like a sea of fire." The west doors being now nearly burnt through, a barricade of planks was raised against tlein, might carry destruction to the organ and choir: by this precaution, and a well-managed

direction of the water to prevent the fire burst-ing through the west window, not only was that saved, but the fire was confined to the nave, and by one o'clock all danger of further damage was over—the south-west tower and great aisle of the nave being left mere shells.

On an investigation being instituted as to the cause of this calamity, it came out that it originated in the carelessness of an individual named Groves, from Leeds, who had been engaged for some time cobbling at the clock, and had left a candle burning, a spark of which ignited the building. This worthy, on the re-cent completion of the tower, and hanging of the new bells, had the effrontery to ask perthe new bells, had the effrontery to ask per-mission to take a part in ringing the opening peal-doubtless, intending thereby to attach another laurel to his wreath, which, we believe, he wears very jauntily-regarding the men of York as in no small degree beholden to him for the superior condition to which (through his stupidity) he has been the cause of bringing the Minster.

Shortly after the disastrous event, a meeting took place in London of those interested in the county of York, and at which a subscription was commenced. On the 7th of August, a public meeting was held in York; meetings also took place there on the 31st of March and 6th of October, 1842, all of them fraught with matter of importance to the fate of the Minster. On the 25th of June, 1840, Sir Robert Smirke had reported on the damage done, and furnished an estimate of the probable cost of its reparation. On the 17th of March, 1842, Mr. Sydney Smirke, his brother, to whom the work of restoration had been intrusted, reported on the works done, and those further necessary, and, on the 29th following, on the general state of the fabric. In the former report, in reference to the work done, Mr. Smirke stated that in the interior of the tower, and there only, the fire had been more destructive than was at first supposed, much of the masonry being found to be deeply injured, and stones which appeared only discoloured, split through their whole depth; this was substantially reinstated. The tower had been permanently expanded, and seriously rent through on all sides by the intense heat,— the old cracks both in it and the west end of the nave being much increased in width: to remedy this injury it was bound together, and firmly united to the other parts composing the west front by four strong iron ties, two of them extending from its south side pcross the west front to the further side of the north tower, the two others, or cross ties, connecting these on its own north and south sides; the cracked stones were cut out and new sound ones inserted; by these means stability was given to the south-west tower and west wall. The newel stair at the south-west angle having been in two places completely broken through, and thus rendered impassable, was restored, as were also the battlements on top where damaged. The four windows on the clerestory level, as also those of belfry, had received entirely new tracery, and many new jamb-stones. The latter were filled with half-inch Welsh state loavres in lieu of the former weather-boards; in the former the glazing was in course of comple-tion, and the perforated battlements outside those on the south and west reinstated where injured, while that on the north, looking into the nave, which previous to the fire was bricked up, was now opened - new fire-proof floors occopied the places of the timber ones destroyed, those to clock and ringers' chambers com-posed of 5-inch York landings on cast-iron bearers, that to bell-chamber consisting of stone arches springing from similar bearers, with a floor of thick oak planking to receive the bell-framing. A new roof, constructed of iron and covered with lead, was also fixed on the tower: in the execution of these works about 670 tons of Huddlestone stone, and 218 of Gazeby stone, had been worked up, the latter being used where the utmost possible strength was required; the mortar was made of calcined Huddlestone stone, which affords lime of the best quality; stone dowels and iron or copper internal cramps were used, external cramps being avoided as much as possible; over the nave was constructed a new external roof of Memel oak, clad with 2-inch oak planks, and covered with thick cast lead; the parapet-gutters of lead, laid on a bed of mastic, in lieu of boarding, which is very liable to decay; the surface of the masonry

under the roof, including the wall-ribs, forming part of the vaulting yet to be done, were in progress of restoration. The work further equired comprised the reinstatement of timber rils and vaulting to nave; a portion of roof of south aisle burnt at west end; lower parts of stone piers calcined, and otherwise injured; carved masonry against walls, under windows of south aisle, mutilated at south-west angle by heat and falling of burning timbers; interior carved masonry about principal western en-trance similarly injured; doors for said entrance, and for that under south-west tower; many black and white flags forming pavement of nave broken by falling in of roof and vault-ing; and stained glass in clerestory of nave damaged.

The report on the general condition of the Minster Mr. Smirke classed under three dif-ferent heads, viz. :-- The repairs that were urgently required for the safety of the building; those of works fallen into decay, but which were not in immediate danger; and those which, however desirable for the dignity and character of this great national monument. might, nevertheless, be regarded only as orna-mental restorations. The first would comprise an entirely new roof over the centre aisle of the north transent, and reinstating in a vertical position, as far as practicable, the masonry of the western triforium there which overhung towards the west, and was the more dangerous from the whole of that side of the transept inclining also to the north; it would include also, the entire reinstatement of tracery to the southernmost window of vestibule to chapterhouse, and of three pinnacles to buttresses on the south-west of choir, with the parapets connecting them; the second referred to cracks in main walls of centre tower, to be tied with iron; decayed ends of main girders supporting roof of same, to have cast-iron shoes; the defective lead covering to be recast and laid on new oak boarding, and the gutters laid on a bed of mastic; gutters of south transcet defective and to be relaid; exterior masonry of choir (besides the pinnacles and parapet above-mentioned) requiring repair, repointing and cramping in many parts, including the other pinna-cles on both sides, and the external screen-work on the north; lead-work of roof to north aisle of nave requiring considerable repair, and gutters relaying on mastic or slate; parapet also and heads of buttresses wanting a thorough repair. Roof of south aisle still more dilapidated, carpentry ill constructed, no tic-beams, braces thrusting injuriously against south wall, above triforium, some of timbers decayed, wants early and entire re-construction; tracery of six out of seven of south clercstory windows much mutilated, should be restored with Huddlestone stone externally, the Tadcaster having proved very inferior; some considerable fractures in north west tower, should be repaired in like manner with the central tower; lead and boarding of roof much decayed, the latter should be renewed, of oak, and the former recast and relayed, the gutters to be laid on slate or mastic; louvre-boarding requiring repair, new slate louvres desirable, as adopted in south-west tower; original floors entirely gone, a stone floor with cust-iron girders, introduced near middle, would add much to the future security of the tower; upper part of south-east angle buttress of south-icest tower separated from main wall and inclining forward, wanting replacing and and inclining forward, wanting replacing and cramping; in *chapter-house* and *vestibule*, the parapets of former nearly ruinous, wants par-ial renewing and careful pointing; pin-nacles all more or less defective, two ought to be entirely rebuilt; tracery of north window! of vestibule falling into equally as bad a state as that of south one. The third class referred to evidences of decay is careful of chair on the third class referred to form. decay in exterior of east wall of choir-north pier of great east window, with its buttresses and perforated battlements in a state of general decay, requiring restoration with new work. as before done in south portion-spire of northas before done in south portion—spire of north-east pinnacle, now wanting, should be re-stored—most part of the four pinnacles at south front of south transept in a very bad state of repair; but being of modern workmanship, out of unison with the ancient work, should be replaced by others in appropriate taste. [These pinnacles, and a variety of other morceaux about the Minster, speaking a tale of sixty years since, are the emanations of Alder-man Carr's studio, and are quite à la Langley.]

The pinnacles of the three angle buttresses northern extremity of north transept wholly wanting, and their restoration greatly to be In the interior, the ornamental arcade desired. under windows of *nave*, especially towards the west, much impaired; being near the eye, the

reinstatement of this masonry very desirable, From the report of the Restoration Com-mittee, read previously to those of Mr. Smirke, it appeared that the state of their accounts and funds was as follows :---

| Disbursements Liabilities | £13,959 532 | | 7 0 |
|------------------------------|----------------|----|--------|
| Receipts : | £14,491 | 16 | 7 |
| Subscriptions | £13,545 | 7 | 8 |
| Sale of stone fragments | 35 | ō | õ |
| ,, Old lead | 318 | 16 | ŏ |
| ,, Bell metal | 437 | 19 | 4 |
| · | £14.337 | 3 | 0 |
| Subscriptions due | 91 | - | 4 |
| Deficit | 63 | Ō | 3 |
| | £14.491 | 16 | 7 |

The sum above stated for disbursements includes 3471. 9s. for the great tenor bell; that for liabilities includes 801. 10s. for the bellframe, which was ordered of such construction as to be available for the complete peal, without any alteration or removal; also 1751. for clock, and 551. for fixing same. The estimate which Mr. Smirke formed of

the works above specified is as follows :--

| | eal 1st class 2nd class | , about | 1,200 6,200 12,500 | Õ | 0000 | |
|-------|-------------------------------|-------------|--------------------------|---|------|--|
| Ditto | 3rd class | •• | 9,500 | Ō | Ŏ | |
| | | | £38.400 | 0 | 0 | |

Mr. Smirke reported also, at the same time, on the practicability of making an efficient provision against future accidents by fire, an out-line of which is as follows :- Four slate tanks capable of holding, say 1000 gallons each, to be placed in the triforium of the nave-one at each end on each side; four similar tanks and similarly disposed in the triforium of choir, and two in gallery under windows of great central tower; the tanks in the triforia to be supplied by two-inch iron service-pipes, discharging themselves by ball-cocks, or in case of firc, by engines below; the two in great tower, by two common force pumps attached to two of the former. To make use of this supply of water, a small portable engine to he kept in each triforium and one in the gallery of tower, each with an adequate length of hose. In addition to this provision, two screw fire-cocks communicating with the Water Company's main to be disposed in the choir, at the level of the pavement, that part of the Minster being more than any other ex-posed to danger. The cost, Mr. Smirke esti-mated at from 700% to 800%.—for the ten tanks, seven partable engines, four hundred feet of hose, and the requisite iron service-pipes-supposing the water company, at their own cost, to lay down the necessary main as far as the south wall of the Minster.

The remainder of this paper will be given next week.

CONSIDERATION DUE TO LITERABY MEN CONSIDERATION DUE TO LITERARY MEN AND ARTISTS.—A fortnight ago Sir Robert Peel entertained at dinner, in a kind and friendly manner, Dr. Buckland, Professor Owen, Sir Henry de la Beche, Dr. Playfair, Mr. Pickersgill, Mr. Eastlake, Mr. Wheatstone, and other scenario und estimate Ludy Peel and and other savans and artists. Lady Peel and Lord and Lady Villiers were present. This is as it should be; and it is lamentable to find occurrences of this sort so rare in our country as they are. One might almost imagine that the Premier feels ashamed of the course pursued at the palace, the want of even an appearance of sympathy there with genius and ability, and desires, so far as he is able, to supply the deficiency. His kindness lately to poor Hood, though the pension may be from the public purse,—the friendly letter which he wrote to him, will be remembered when many of his acts as a politician are forgotten. Mr. Pickersgill has just now com-pleted a portrait of Professor Owen for the Premier's gallery, and a very fine work it is, worthy alike of the painter and the subject.

ON CEMENTS, ARTIFICIAL STONE, AND PLASTIC COMPOSITIONS.

SIR.~ -Having seen much in your useful journal for and against compositions of various kinds, and as the advertisement of an article is not always to be depended on, I, as a practical man, wish to give an opinion of the merits of such materials, for much that has been said is prejudiced, far from being practical, and tends to injure a very numerous body of men. Such materials are inexpensive, compared with stone and wood; and in very many parts of a building, both for exterior and interior, in moaldings, carvings, &c., give an appear-ance which otherwise could not be attained in buildings generally with limited means; without them, we should have streets of brickfronted houses void of any architectural embellishment. But most cements, especially exterior, require great care in using them, and good sand, which is often neglected in the modern use, and hence compo may be too often classed, as one of your correspondents with dishonest materials; it 88.YS. is. and has been of late years, most shamefully ill-used by builders of crack houses, capitalists, and taskmasters, even in some of the finest streets of London, as Regent-street,—what a state that is in ! Much of the cement is sold and used at a price which prevents it from being properly done, so that it cannot possibly endurs the weather long; but when of good quality, it may be warranted to endure for a gentury. The way to do it is, pay the fair century. and make a tradesman responsible for value, the work he does; then may be obtained good work, and it will then become an honest material; but some has failed, owing to the carelessness and inexperience of workmen, an there are very many plasterers who do not understand using it in a proper manner (not even Roman cement, much more other coments). Compare some that has been done well, -- for instance, many country mansions done by Bernasconi, forty or fifty years since, -with some of the soft stones, of which much has been justly said in THE BULDER. I do not say it is better than stone, but it is better than bad stone; and where expense is no object, I do not recommend cement, but good stone, such as can be warranted to endure uninjured by the weather for a century.

Roman Cement has been in use about fifty years, and where good and properly used, remains uninjured by the weather, and is excellent for water-works and the best for general purposes: it has been in very general use, and much done by Bernasconi has had the best test of its durability on many country mansions; but this cement is the most abused, being used for cheapness' sake, so that it cannot possibly endure long, and is open to fraud, in consequence of the various prices and quality; its colour is the only objection to it for stucco, as it requires frequent colouring; but if used as a rough coat and finished with a light-coloured cement, it answers the purpose better than any other. Many have the idea that it is not so good as it used to be, but that is wrong, as the best may be had by paying the price. Atkinson's or Mulgrave Cement, is a superior

Atkinson's or Mulgrave Cement, is a superior kind of Roman cement, made from a lightercoloured stone on the estate of Lord Normanby, and is better adapted for stucco, mouldings, and ornaments; for the latter purpose, it is the best cement; but if plenty of sand is not used, it is liable to crack. Its colour is that of dark Bath stone; it was a very expensive material and not in very general use; but the price is considerably reduced lately by the agents, Messrs. Wyatt, Parker, and Co., and as it will take a greater quantity of sand than any other, it is now tolerably reasonable.

Pulham's Portland Stone Cement, or artificial stone, is so called from its near resemblance to Portland stone in colour, hardness, and durability; its natural colour is that of Portland stone, and therefore it requires no artificial colouring. It has stood the test of twenty-four years' use, and remains perfect; it has even deceived the trade, the imitation is so complete; it is excellent both for exterior and interior purposes of stucco and mouldings, and for fountains, vases, and even floors, &c.; is capable of being trowelled to a very smooth face like marble, and hardens by the influence of the atmosphere. Simple water washing is sufficient to clean it when dirty, and it does not vegetate so much as stone. It is an excellent finishing for Roman cement; its use has been allowed by the Church Building Commissioners for the exterior of a new church at West Hyde, in Hertfordshire.

Much might be done in restoring our ancient edifices and dilapidated stone-work generally in buildings; for where a stone is only decayed on the face, an inch thick of cement would answer the purpose instead of cutting out the stone; and where a stone is too much decayed it may be cut out and replaced with bricks laid in cement and covered to imitate the stone in any colour. Many of our beautiful structures are going to destruction in consequence of the great expense of restoring with stone, and it may be done to advantage at onethird or fourth the expense of stone, and answer every purpose. Much that has been done in restoring with cement has failed, owing to the incautious manner in which it has been used; nothing requires more care, especially on clunch and limestone, of which many churches are built; but I will return to my subject, although I could say much more on this point.

Inclutious manner in which it has been used; nothing requires more care, especially on clunch and limestone, of which many churches are built; but I will return to my subject, although I could say much more on this point. *Metallic Cement*, or sand, a mixture of blue lias lime and metallic powder, has been in use about ten years, and is an excellent material for exterior and interior stucco mouldings, &c. It is very hard, and promises to endure for a great length of time. Its colour is that of dark stone, and it is very suitable for waterworks and other purposes. It is almost impossible to separate stones and bricks joined with it, and is excellent for concrete. It may be used to advantage with chalk-lime for interior purposes of stucco, increases the hardness, and may be trowelled to a very smooth surface for painting on. The metallic substance improves the hardness of other limes and cements, but is best with lias lime.

Mastic or Oil Cement, has been in use about forty years, and is a material well adapted for interior purposes of stucco and plain mouldings for painting on, especially where expedition is required, as it may be painted on the next day after it has been laid on. Its tenacity is so great as to adhere to the smoothest substance, even to glass, but it will not answer for exterior purposes where exposed to the heat of the sun, as the oil is drawn out and it becomes soft and peels off. It is very expensive when properly executed, and requires to be often painted.

pensive when properly executed, and requires to be often painted. *Keene's Cement*, manufactured by J. B. White and Sons, of Milbank-street, has been in extensive use four or five years, and is an excellent material for internal purposes, where hardness is required, being as hard as stone or marble, as for dados, panelling, architraves, inlaid paving, chimney-pieces, skirtings, balustrades for staircase, &c., and for hall floors, scagliola, and many purposes of wood, it is superior; and I think it is as hard as the cement of the ancients, but requires to be worked with great care, as it has failed in places from being improperly used, especially from being put on wet brickwork. A great quantity has been used at the Hall of Commerce, Threadneedlestreet, and many other public buildings. The office of the patentee is paved with it, and is difficult to discriminate from Portland stone. It will not endure the weather, nor is it good for damp situations.

Martin's Cement is very similar and will answer the same purposes as Keene's Cement for interior work : it stands well.

Red Cement has been in very limited use several years, and is not much known: it is an excellent material for making ornamental chimney-shafts, ornamental ridges in the Tudor style, especially ridging for the ornamental or Tudor tiles and mouldings in imitation of brick, of which it is a complete imitation when pointed: it may be made at comparatively little expense. When done well, it may be warranted for a great length of time.

Maude's Portland Cement has not been in use sufficient time to test its merits, but appears to stand well for stucco and mouldings, and is of a superior colour to Roman cement: a good specimen of it may be seen in Threadneedle-street. John's Patent Stucco Paint Cement is a kind

John's Patent Stucco Paint Cement is a kind of oil cement superior to mastic; it has not been in use sufficient time to test its merits, but appears to stand well and to answer the purpose of stucco. It will adhere to most substances, even to glass, and may be used throughout the winter, which other cements cannot be: its colour is like dark Bath stone. The stucco paint appears to be very good for painting cement.

painting coment. *Blue Lias Lime Cement* is an excellent material for building purposes where it can get dry, but will not do for stucco or outside plastering, as it is very crumbly under the surface and liable to crack. The lime slacked has the same fault, but will stand for stucco in a dry situation.

Interior Plastering generally.—In writing about cements, &c., I cannot forbear saying a little in reply to an article in THE BUILDER, by a correspondent, "J. W.," who calls an ornamented ceiling a palpable falsity, and says that it contains noxious vapours, not knowing, I suppose, that there are simple means of ventilation. I should be glad to know in what re-spect it is a palpable falsity, and if it is, why has so much been done in that way in almost every house that is built, noble or simple : and most of which could not be accomplished with other materials than plastic composition of some sort. I certainly admire wood-carvings, &c. in their place, and where expense is no object; but even then, why increase the mate-rials for fire? I should be glad to see some of his (as he says) more honest and ingeni-ously and equally elaborated timber soffits by the side of an ordinary plaster enrichment, such asis used in good buildings ; it is impossible it could vie with it, let alone expense, which in wood-carving is immense. There is no material in existence that can be wrought with such relief, facility, and perfection, as plaster for decoration of buildings; and if great hardness is required, use Keene's or Martin's Cement. What can there be dishonest in a plaster ceiling? It is not intended generally to deceive or to appear to be any thing other than what it is (although mouldings and ceilings may be, and are grained to imitate oak in the old English or Tudor style, as for beams, ribs, &c.); and can any other material be made so available, and answer the purpose so well, as plastic compositions, and at so trifling a cost? and what has rendered our modern public, as well as private buildings so beautiful? Plastering endures after timber has failed, as is a well-known fact, proved in many of our ancient mansions, when plastering was very inferior, and mate-rials such as we now have unknown. As to safety, I should like to know in what way it is unsafe, and to have proof of it where re-spectable tradesmen have been employed, or an architect. It is more enduring and equally safe as wood; but the abuse of the materials, both in quality and workmanship, may well bring disgrace upon it: the manner in which some of it is done, chiefly by builders of crackhouses, capitalists, and plasterers, is scarcely notises, capitalists, and plasterers, is scarcery to be credited (London mud to wit); for when finished, it is like a man who has on a good outside or great coat,—you cannot see what is underneath. There is, I think, no trade open to more fraud than the plasterer's; where a man cares not for character or reputation, he can do work at half the price of a respectable man who warrants his work; but it is sure to be detected in a little time. The price being cut down causes bad work; but as I said with respect to cement, pay fair value and employ respectable tradesmen who understand the nature of the materials and workmanship, and then good work may be obtained. Work done badly often looks for a little time to a common observer little inferior to the other; but make every tradesman responsible for his work and the material he uses, and we shall see what plaster-work will be. This would enable a respectable tradesman to improve in his art: but I must not trespass more on your space.

I am, Sir, &c. Hoddesdon. JAMES PULHAM. *.* We do not pledge ourselves to the opinions of our correspondent, but give them place as those of a practical man.-ED.

WORKS IN PROGRESS.

Ar Bridlington, a general restoration has been determined upon of those parts of the parish church which have suffered, either from the lapse of time, or through the injudicious mode in which occasional repairs have been managed; with this view, a survey was made a few months since by Mr. Edmund This church is one of the most in-Sharne. teresting buildings, of the thirteenth century, in the kingdom; it is the Priory Church, and valuable to all who feel an interest in the history of the progress of church archi-tecture — as a building supplying the loss that the destruction of St. Mary's, at York, would have otherwise occasioned, and as affording an instance of transition from early English to decorated work of unusual character. The west end and south side are in the most dilapidated condition, and it is proposed that their restoration should be proeeded with in the first instance, particularly the west end, and the opening out of the great west window.

At Oxford, some delay has arisen in the commoncement of the new Grammar School at Magdalen College, from a doubt as to the best method of carrying out the full intentions of the founder. The plans of Mr. Derrick, the successful competitor, were exhibited at a late meeting of the Oxford Society for the Promotion of the Study of Gothic Architecture. building will be in the style of the fifteenth century, harmonising with the college, and Pugin's new Gothic entrance gateway. Many of the admirers of this splendid college will b pleased to hear that it is in contemplation to replace the present chapel windows by others in stained glass, which will add greatly to the richness of the already fine effect of the chanel.

be Queen Dowager has recently subscribed the sum of 202 towards the building fund of the intended district church at Malvern Link, Worcestershire.

The Government has purchased the lands of Broomhill, to the north of the city of Glusgow, for the erection of cavalry and infantry bar-racks. The price paid for the property is said to amount to nearly 30,000/.

The new terrace-pier at Gravesend, which is constructed entirely of iron, forms an important feature in the increasing improvements in Gravesend and Milton; the entrance is in a direct line with Harmer-street. It was opened for the first time on Easter Monday.

The breaking-up of the weather has placed the operations for the commencement of the Victoria Park in full activity, and a great many hands have been put on to commence digging for the formation of the plantations. A new and straight line of road, which will nearly reach the park, has been constructed from Grove-street, Hackney, to Old Ford, and the entrance-road across Bonner's-fields has been formed, the old erection of Bonner's Hall having been pulled down. From here the entrance to the park will be by a handsome iron auspension-bridge across the Regent's Canal.

There is every prospect of the old Tower ditch being added to the list of public walks at the east end of the town during the summer, and considerable activity is being displayed in gravelling it, a solid foundation having been laid, and the drainage made perfect. It will not be attempted to form a plantation, for which the nature of the sub-soil quite unfits it, and the vegetation will be confined to a few flower-beds. The foundations for the new barracks in the interior have made but little progress, although, in addition to the ordinary labourers, 100 soldiers are daily employed on the works, for which they receive an extra payment of 10d. per day. At Scarborough, a large number of work-

men are being employed in digging and laying out the foundations for the building of the railway station, which, agreeable to the con-tract, is to be completed by the 25th of next

month. On Tugsday, March 25th, the foundationstone of a new Catholic church was laid at Crosby, near Liverpool, by the Rev. Doctor Messre. Weightman and Hadfield, of Brown Sheffield, are the architects; and Mr. B. Holtins, of the same place, is the builder. The same architects and builder are employed in the erection of the monster Catholic church at

Manchester. Mr. Hollins is likewise erecting new Protestant church at Manchester; Mr Derick, of Oxford, is the architect.

Very extensive alterations and improvements are in progress at Poltimore-house, the seat of Lord Poltimore, in Devonshire. Hia lordship returned to this country the week before last, from Florence, to inspect the progress already made, and to give instructions respecting his newly-purchased estates in the same county. Considerable improvements are to be made on this property forthwith.

It is stated that, for internal decoration and embellishment, the Earl of Pembroke's mansion, on Carlton-terrace, will excel in splendour and taste any town residence of our aristocracy. Notwithstanding the length of time it has been in the occupation of the various artists and operatives, it will not be completed before the spring of next year.

Mr. George Baker, of London, who has taken the contract for re-forming and building additional slips and enlarging Chatham Yard, at a cost of 102,000*l*. (45,000*l*. of which sum is to be expended in the course of this year), commenced the undertaking on the 13th ult., by driving a number of piles with steam-engines. Workmen have commenced formengines. Workmen have commenced form-ing the ground on the opposite shore of Chatham Dockvard, and also clearing the mud The cost is estimated at in the harbour. about 3,000/.

Messrs. Brassey, Mackensie, and Stephenson are said to be the contractors for the Caledonian, Scottish Central, and Midland Junction lines.

ROVAL INSTITUTE OF BRITISH ARCHITECTS.

At an ordinary meeting of the institute held on Monday, the 31st ultimo., Mr. J. B. Pap-worth in the chair, Mr. John Burrell was elected fellow, and Mr. Alan Bailey, and Mr. G. S. Clarke, associates.

Donaldson presented from Mr. W. Mr. Hamilton, F.R.S., part of a wooden pin, which formerly held together, as a dowell, the *frusta* of one of the columns of an Athenian temple. It was at first said to be from the Parthenon, but Mr. Geering, who had been written to on the subject, said there were no wooden pins in this latter building, and that it was probably from the Propylæum. A letter was read from Monr. L. Serrure, of Antwerp, announcing the death of his father, who was a corresponding member, and offering his services to such mem bers of the institute as might visit Antwerp. The late M. Serrure is best known in this country by a drawing of the Antwerp Spire on a very large scale, which is engraved. Mr. Foxhall, the excellent district surveyor

Mr. Foxnall, the excentent district surveyor of St. George's, Hanover-square, read a com-munication from Mr. Thomas Cubitt, illus-trated by a model, descriptive of the chimney recently erected on Mr. Cubitt's premises at Thames Bank, and some observations on the expansion of the brickwork by heat. A the expansion of the brickwork by heat. A description of the chimney will be found in page 62 of our present volume. The paper led to an interesting conversation. Mr. Godwin reminded the meeting that pure clay, the staple of bricks, was understood to be the exception to the general rule that heat expands all bodies, and was contracted by heat, so that he was much puzzled to find this shaft expanded when the fire was in operation, §ths of an inch.

Mr. Hosking and Mr. Donaldson considered that when clay was made brick its properties were changed, and that it became amenable to the general law. Mr. Hosking remarked that the stone coping of Waterloo-bridge was expanded and contracted by change of temperature so considerably, as constantly to require pointing. Relative to brickwork, Mr. Scoles said, coke-ovens expanded considerably by heat.

Mr. Edward I'Anson, jun., then read a paper "On the Architecture of the Renaissance, in France," in the course of which he described at considerable length the Chateau of Fontainbleau, that "rendezvous of palaces," as it has been termed, and traced the progress of the style from the commencement to the end.

INSTITUTION OF CIVIL ENGINEERS.

APRIL 1st, 1845 .- Sir John Rennie, president, in the chair.

The paper read was by Mr. A. A. Croll, Assoc. Inst. C. E., "On the construction and use of Gas Meters." It first noticed the necessity for a means of accurately measuring the consumption of gas, in order that the honest consumer might not be obliged to pay for the frauds of the dishonest, as was actually the case at present, for the gas companies were obliged to charge such a price for their produce as should cover all contingencies. Then after relating many flagrant instances of frauds on the gas companies and the methods by which they were practised, the author attributed the loss of 30 per cent. of the gas produced, which was not accounted for in the consumption, rather to the fraudulent consumption than to the leakage, either from bad joints or through the pores of the iron pipes, as had been sought author's own practical observations induced him to limit the amount of leakage to under 5 per cent. If from the 2,700,000 cubic feet of gas which was distributed daily from the works of which was distributed daily from the works of the Chartered Gas Company alone, there was a leakage of 30 per cent, 810,000 cubic feed of carburetted hydrogen gas would be let free daily in a comparatively limited district of the streets of London, which would render the at-mosphere unbearable. This calculation was exclusive of the nine other large companies whose first provided the other district. The whose pipes pervaded the other districts. The paper also contended that the theory of the decomposition of the gas in the earth was inadmissible, as in that case the hydrogen would be converted into water, and the carbon, which would amount to nearly 3,000 tons annually, would be deposited in the soil.

The author then described the water-meter. as invented by Clegg and improved by Crossley, shewing its defects and liability to Crossley, shewing its defects and liability to be tampered with in dishonest hands, and the facility with which it could be made subobsolete meters of the dry-meter company, and of Sullivan, and then explained the action of Defrie's three-chambered meter, which has obtained such extensive employment, a good specimen of which, working very steadily, was on the table before the meeting. The pa closed with a description and illustration The paper Croll and Richards' dry-meter, which, in the opinion of the author, possessed superior qua-lities, being more accurate in its measurement, on account of the chambers opening by the direct action of the discs, there being no action upon the disphragm, and each chamber being completely filled and emptied at each interval.

In the discussion, these merits were con-tended for by the advocates of Croll and Richards' meters; while the partisans of Defrie's meters argued that his possessed every requisite quality, and that they had been in use for upwards of seven years with in-creasing reputation. It was admitted that the use of the leather in both meters was objectionable, but hitherto no better material had been discovered, and the attention of the makers had chiefly been directed towards diminishing the extent of leather exposed to of the gas; that either of them the action were preferable to the water-meter in its present state, and it was desirable both for the consumer and the gas-maker that accurate meters should be used, to prevent the present flagrant system of fraudulent measurement.

SONNET ON STONE HENGE.

I stoop beside the blue Tyrrhenian se And saw three wondrous monuments upre

And saw three wondrous monuments upress. Their column'd aisles 'mid desolation drear, For some forgotten cult's strange ministry— Type of man's wants and God's high majesty. Years pass'd. And now, more wondrous ous far.

appear The mighty unhewn stones that circle here

On the lone down 'mid countless tumuli. Whence came these stones? What unknown power

has riven And mov'd and rais'd them? Was it love or

dread Of God they testify? Reply, ye dead ! They do: and still the same response is given For ages have Stone Henge and Pæstum said, "Man's noblest works are consecrate to heaven." Dolman's Mayasine.

STONE ALTAR CASE. - The costs in the case have been taxed at 100%. 11s. 10d. in the Arches Court.

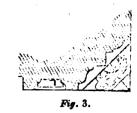

DOORWAY FROM FOULSHURST, CHESHIRE.

The ancient seat of the Foulshursts, formerly standing at Crewe, in Cheshire, was purchased by Sir Christopher Hatton in 1578, who was one of the most considerable patrons of architecture of the time, as is proved by the beautiful structures of Kirby (still standing), Holdenby, Stoke Poggis, &c. He added to or adorned the old structure of the Foulshursts ; and in 1610 he sold the estate to Sir Randulph Crewe, who was anxious to settle himself on the spot (being a descendant or connection of the Foulshursts) during the erection of his splendid structure of Crewe Hall, which was considered at the time, as it certainly remains, the model building of the style of James I. The old manor-house of Foulshurst remained standing, and was probably occupied by Sir Bandulph. In King's Vale Royal of the County Palatine of Cheshire a plate is given of Crewe Hall, shewing Foulshurst old manor-house in the distance. Several of the ornamental portions of the old building were removed by Sir Randulph to his new structure, among them the entrance doorway, represented above, which he placed leading into the carved parlour; but during the recent alterations it has been removed, and is now in

Fig. 2.

the great hall, or dibbg-room, near the staircase, a small portion of which is seen in the sketch. Fig. 2 represents the ornament at foot of jamb, enlarged; and fig. 3 gives the plan of the jamb.

A close resemblance between this doorway and those of the cinque-cento architecture of Italy, and the Renaissance of France, may be observed.

The fire-place seen through the opening forms part of the reparations made to Crewe Hall at the Restoration, the building having sustained two severe assaults during the civil wars. C. J. RIGHARDSON.

PROPOSED RESTORATION OF ST. JOHN'S GATE, CLERKENWELL.

Our readers are aware of the dangerous state into which this remnant of old London has fallen, and of the appointment of a commmittee to effect its restoration, if possible. With this end in view, the committee are about to issue the following appeal to all who are interested in preserving the arts and monuments of the middle ages :--

Architecture has its political use, public buildings being the oreament of a country; it establishes a nation; draws people and commerce; makes the people love their native country, which passion is the origin of all great actions in a commonwealth."--Waga.

ON the first of January last, the New Metropolitan Buildings Act came into operation; and in socordance with clause 40 (which requires that the district surveyor shall apply forthwith to the official referees to authorise a survey to be made of all buildings within the limits of the Act, which through neglect or other causes are in so ruinous a condition that passengers are endangered thereby), a survey was made, and a notice given to the owner of St. John's Gate to repair it. The decomposition of the stonecasing to the several sides of the building has rendered it dangerous to passers-by; and it appears that the substantial repairs alone are of so expensive a character as to prevent the present occupant from devoting any attention to a careful reparation of the exterior; in fact, the covering of the gateway with compo has been suggested. The knowledge of these facts was laid before the FREEMASONS OF THE CHURCH, a society for the recovery, maintenance, and furtherance of the true principles and practice of architecture, when a committee was immediately appointed to prevent the spuliation of the building by coment, and to adopt measures for its careful reparation. This committee consists of the Rev, Hugh Hughes, B.D., rector of St. John's, Clerkenwell; the Rev. G. Pocock, LL,B.; Messrs. Thomas Dighton (Architectural Modeller to Prince Albert); C. H. Smith (one of the examiners of the stone for the new Houses of Parliament); W. G. Rogers; James Finn; and W. P. Griffith, F.S.A., honorary secretary. Several meetings have been held, and a design prepared for the restoration of the gate.

The committee trust that all those who feel a pleasure in preserving so interesting a remnant of former times, associated as it is with so many pleasing literary remembrances, will come forward and aid them by contributing their mite, however small, and thereby save the mortification of seeing the old gate compoed, if not ultimately destroyed. Perhaps a few words, by way of refreshing the memories of those who through the cares of mercantile and other pursuits may have forgotten its existence, as well as its claims upon us for our support, will not be thrown away. St. John's Gate stands at the southern en-

St. John's Gate stands at the southern entrance of St. John's square, and is the only ancient portal now remaining of those monastic buildings once so numerous in the metropolis and its vicinity; it formed the grand south entrance to the Hospital or Priory

of St John of Jerusalem," and was completed by Prior Docwra in 1504. This prior was the immediate predecessor of the last superior of the house, Sir William Weston, and retained his office from 1502 to 1523. In 1661 a view of the gate was taken by Hollar, shewing to advantage the effect produced by the battlements, then complete, but now entirely gone. In the reign of James I. it was inhabited by Sir Roger Wilbraham; but it has acquired much greater celebrity from having been the residence of Edward Cave, the printer, to whom the literary and antiquarian world owes so many obligations, and here emanated from the press the favourite and one of the oldest and most respectable of our monthly periodicals, the "Gentleman's Maganine," which was born in the gate in January, 1731, and is still flourishing. Among the numerous visitors at that time were Goldsmith ind Dr. Samuel Johnson (Cave being his friend and early patron). Dr. Johnson's pen was continually at work, and his pampilets, refaces, epitaphs, essays, and biographical memoirs were continually published in the old gate, either by themselves or in the "Genthan two years afterwards, he wrote the Parliamentary speeches in the same magazine, and these were followed by his "Life of Savage," "English Dictionary," "The Vanity of Human Wishes," the "Rambler," and many other popular literary productions. "St. John's Gate has been in a slate of decline for years : unfortunately, the disease has now

St. John's Gate has been in a state of decline for years : unfortunately, the disease has now assumed a serious aspect, but the committee rest assured that the public taste will never allow it to be disfigured or destroyed; that they will come forward and promote its recovery, if not to so good a state of health as formerly, aill, to give it a respectable appearance of old oge; and, for once; to nullify the old saying—

Owl-like, we blink at, and direct our search To furthest Inde in quest of novelties; Whilst here, at home, upon our year threshold

Whilst here, at home, upon our very thresholds, Ten thousand objects harite into view, Of interest wonderful.

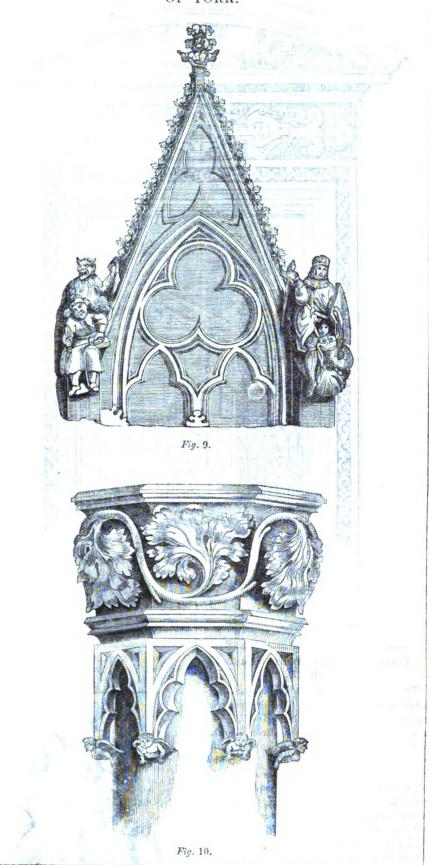

The subscriptions will be devoted to the reparation of the decorative portions of the Gate, much as tapping or testing each stone in the porth and south fronts, carefully rubbing those that are sound, and replacing those which are to much decomposed with new stone, not quared, but inserted so as to conform with the present appearance of the building. The committee recommend carrying up the embattlements in stone in front of the angular turrets and parapets to their original height, inserting new labels to the doors and windows, stringcourses and bands around, new and proper millions, with cinque-foil heads to the large windows in the north and south fronts, and removing the unsightly Roman doorway and shop-window on the south side, and placing a new window and doorway in keeping with the old gate ; and to point up the sides of the building with stone or slate set in good mortar, finished with blue ash mortar, to preserve an uniform colour.

thilorm colour. A design shewing the restoration of the gate will be presented to the subscribers to the repins, a list of whom will be printed, as well as a detailed statement of every expenditure, which it is presumed will require from 500/. to 600/. : in case of an overplus, a meeting of the subscribers will decide in what manner it is to be appropriated.

bescribers will decide in what manner it is to be appropriated. Subscriptions may be paid to Mr. W. P. Griffith, 9, St. John's square, Clerkenwell, hon, sec., and at the office of THE BUILDER, 2, York-street, Covent-garden.

Inon BEAMS. --Some of the largest plates that were ever made in Scotland were rolled at the Dundyran Iron Works a short time ago. The weight of the slab from which each plate was rolled was 1,700 lbs., and when finished, measured 16 feet in length, 3 feet two inches in width, and nearly an inch thick ; the weight of each plate varying from 131 to 14 cvrt. Nor is the weight and dimensions of these plates their greatest novelty, for they are intended to be used as walking-beams, and being lighter and more durable, will, it is likely, soon supersede the necessity of the present unwieldly cast-iron beams.

• Pounded in 1100; church dedicated in 1185; destroyed in 1561; and rebuilt about 1504. GOTHIC ORNAMENTS FROM THE CATHEDRAL CHURCH OF YORK.

GOTHIC ORNAMENTS

FROM THE CATHEDRAL CHURCH OF YORK.* On each side of the windows in the aisles of the nave an ornamented compartment is formed on the wall. Fig. 9 represents the pediment of one of these in the north aisle. The height of it from the springing of the arch to the top of the finial, as stated by Hulfpenny, is 8 feet 3 inches; from the floor to the top of it is 34 feet. The width is 3 feet 10 inches. There are fourteen of these compartments in the north aisle, fourteen in the south aisle; the figures of each are different.

Fig. 10 shews one of the capitals of the pillars in the choir, from which spring the groins of the roof. The arrangement of these capitals is peculiar and elegant; they are 2 feet 6 inches high, and 62 feet from the ground. They belong, to the end of, the fourteents, or beginning of the fifteenth century.

In connection with these illustrations of. York Minster we have given in a previous page the commencement of an article on the fires which have occurred there, and the recent restorations; and hereafter shall present to our readers accurate drawings of the new doors, designed by Mr. Sydney Smirke.

^{*} See page 139 ante.

TESTIMONIAL TO MR. JONES, R.A.

On Saturday last, the room usually al-lotted to sculpture in the exhibitions of the Royal Academy was crowded by the concourse of former and actual students of that institution, on the occasion of the presentation (by the hands of Mr. A. D. Cooper, on the part of the 100 subscribers) of a large silver Etruscan tazza, inscribed

TO GEORGE JONES, ESQ., R.A., KEEPER OF THE ROYAL ACADEMY, FROM THE STUDENTS OF THAT INSTITUTION, мавсы, 1845,

and offered in grateful remembrance of his kindly attention to their wishes, and his affectionate regard for their success and interests. Behaving as artists, the subscribers did not seek for something already manufactured, which they might purchase, but selected an antique and unusual though very excellent form; which, slightly modified, is much more orna-mental, as well as useful, than the upright vase,

the ordinary presentation cup. Mr. Jones's annual farewell to the students (this being the last night of the season) was displaced by a forcible and affecting speech, in which he mentioned that his anxiety to fulfil the duties of his post had always been so fully met by the assiduity and gentlemanlike con-duct of the students, that the gratification thence arising rendered the present token as unexpected as any support from the members of the Academy had been unnecessary. He mentioned that Mr. Mulready, who with Mr. Etty accompanied him, had been his earliest friend in that, "the antique school," and had been his competitor for the honourable office he now filled. He also expressed in words the interest he felt for the students, as brothers in the arts, and with great emotion proclaimed his hope that his senses might at the last still enable him to recall this manifestation of the feeling of the students that he had endeavoured to fulfil, and, indeed, had done his duty.

The presence of Mr. Mulready on this occasion, so creditable to his own feelings and gratifying to his friend, was marked with extreme applause by an audience much affected by the address of Mr. Jones.

INSTITUTION OF BUILDERS' FOREMEN.-We have received the rules of this Institution, established for mutual assistance in cases of emergency, and have read them with gratifi-cation. Its object is to maintain the respect-ability of the foremen in their different branches, to provide against accidents, and to obtain an asylum for decayed members. It seems to us that the masters would do well by encouraging such institutions, as tending to induce habits of prudence and forethought, and to increase the respectability of those en-gaged by them. By subscribing one guines per annum they become "honorary members, and take part in the government of the Institution.

THE BUILDER.

CAUTION TO RAILWAY SURVEYORS. LORD HARBOROUGH AND THE PETERBOROUGH RAILWAY SURVEYORS, &c.

THESE causes all came on for hearing before Lord Chief Justice Tindal and common juries,

at Leicester, last Tuesday week. Mr. Whitehurst, Q C., Mr. Mellor, and Mr. Flowers appeared for the prosecution; and Mr. Hill. Q.C., and Mr. Macaulay for the defendants. It appeared that after two previous unsuccessful attempts had been made to survey Lord Harborough's park for the railroad from Syston to Peterborough, early on a Saturday in November last, the defendants, with seventy or eighty people, came before daylight to the park with measuring chains flag staves, &c., and distinguished by white badges, with the evident determina-tion to proceed with their survey. They were resisted by a considerable number of Lord Harborough's people, and after a severe strug-

gle and fight, were compelled to retreat. The Lord Chief Justice summed up with great clearness, to the effect that parties so assembling in the manner and under circumstances given in evidence, were clearly guilty of a riot, and were of right resisted by Lord Harborough's people, who were justified in using

the necessary force to turn them out of the park. Mr. Hill addressed the jury, who, without much deliberation, returned a verdict against all of Guilty of an assault, and they were res-pectively sentenced to be imprisoned for one month, and to pay a fine of 1s.

WARD V. LORD HARBOROUGH AND OTHERS. This was an action for trespass and false im-

prisonment, and damaging a theodolite. Mr. Hill and Mr. Macauley appeared for the plaintiff, and Mr. Mellor and Mr. Flowers for the defendants. This action arose out of the attempts to survey the park of Lord Harborough on a previous day. The servants of Lord Harborough, without any violence, after warning the plaintiff and his followers after warning the plaintiff and his followers off the towing-path of the canal running through the park, took him into custody. They permitted the plaintiff to go away in his own carriage, and used no violence; but the theodolite was pitched out of a cart and broken broken.

Mr. Mellor addressed the jury, admitting that there must be a verdict against all the defendants, except Lord Harborough, as to whom the Lord Chief Justice had already intimated that there was no evidence; but he contended that it had been proved by the witnesses for the plaintiff that the damage to the theodolite might be repaired at an expense of from 71. to 121., and that, as for damages beyond, a half-farthing would be enough. The jury found a verdict for the plaintiff, with 81. damages.

LORD HARBOROUGH V. WARD AND COPE.

This action was for a trespass on the occasion of the rigt; and after Mr. Mellor had addressed the jury for the plaintiff, the Lord Chief Justice suggested that a juror should be withdrawn, which was immediately consented to by Mr. Mellor on Lord Harborough's part. The Lord Chief Justice then sentenced the

defendants on the conviction for an assault, and stated his regret that persons of their education and profession should have permitted themselves to be engaged in a transaction which was quite unjustifiable in law, and which it was his bounden duty to visit with punishment. The sentence was, as before stated, that they and each of them should be imprisoned for one calendar month in her Majesty's gaol, but should be placed in ward No. I, and subjected to no unnecessary hardship, and should be each fined one shilling.

SOCIETY OF BRITISH ARTISTS .- The 22nd exhibition of this society, now open to the public, cannot be regarded as satisfactory. Pyne, Holland, Allen, Woolmer, Baxter, Herring, Clint, and some others, have each one or more charming pictures; but the majority of the works are, we grieve to say it, of

very indifferent character. DISTRICT SURVEYORS' FEES.—A corre-spondent informs us that a builder about to put in some putlogs, in order to point the front of a house in Lewisham, was required by the district surveyor to give him notice, and to agree to pay him a fee, on the ground that the builder was about to *cut into* an external wall!!

PROJECTING BUILDINGS-PARTY WALLS.

JURISDICTION OF OFFICIAL REFEREES.

SIR,-I would close my remarks upon the Building Act by stating, it appears to me that the referees in their official capacity become public property, and that their acts, expressed through the medium of the authority with which they are clothed, may be cour-teously open to animadversion and comment. Perchance the Act itself is not explicit; if so held, my opinions would be against the complexity of the Act, and not against the mode of carrying it into effect. Leaving, therefore, this issue to be settled, I regret to state, from what has come to my knowledge, that a more oppressive, vexatious, and arbitrary piece of legislation never emanated from our Houses of Parliament. All will agree that the portion respecting the comforts of the humbler class, as to light, air, and accommodation to dwellings in densely-populated neighbourhoods, is un-exceptionable. The remaining broad feature for public benefit was protection (as by the former Act) against accidents by fire. In the large suburban district where I live I recollect no fire in a private house for the last twenty years, and but very rarely in shops; yet now even in rural districts within the operation of the Act (except in the case of isolated buildings), adieu to ornamental barge boards, decorated eaves, Italian roofs, &c., we must now all assume the rigidity of parapets and projecting party-walls, except by adopting the prescribed egulations that all such projections shall be of the same material as the walls.

In fulfilment of my promise, I will set out some portions of the award in the case alluded to in my last letter, respecting a building commenced before 1st January, and carried up 6 feet, and this doctrine is held to be good even with such buildings roofed in. "Now we, the said official referees, do hereby find, determine, and award, that the said works are a rebuilding, enlarging, and altering of a building within the meaning of the terms of an 'already built' building, as mentioned in the said Act, and that on and from 1st January, 1845, the same came within and were subject to the suspervision of the said --, the surveyor of the said district, and that he was and is bound to see the rules and directions of the said Act strictly observed with respect thereto; and that the said works or building, if carried up on the line of the external wall now building, would be beyond the general line of the buildings on that side of such road." It then directs, "that the said — do pay the sum of 151. 11s. 8d., as and for the fees of office," being the costs for seeking an explanation of an obscure clause; my objections to the interpretation of which will be found in the subjoined

letter sent to the registrar. My reason for suggesting in the last letter that the award is "insufficient for uncertainty" is, that instead of the referees exercising their authority by ordering the alleged nuisance to be abared it is alleged nuisance to be abated, it is merely referred back to the district surveyor. Should the party be contumacious and proceed (which I hold he is quite justified in doing), the district surveyor must then commence new proceedings, and from another portion of the award he will find bimself in a difficulty. This "commencement is to a house at the corner of a street, which par-taking (as relates to the road in front) of a taking the houses beyond such street circular form, the houses beyond such street assume another "general line," the architect assume another "general line, sent down by the referees has by a dotted line elongated each of these "general lines," in-tersecting each other on the building in progress,—the result being, that if one line is adopted it would condemn only about one movely in extent to what the other would; and the referees are silent in the instructions to the district surveyor which is to be deemed the "general line." It may also be well to mention that the house to which this addition has been made, recedes from the general line 22 feet, the new building being 25 feet deep; it consequently is only 6 feet, or 3 feet (as the above dotted lines may be adopted), that is sought to be condemned.

With respect to the decision in the case of "want of consent" as to party-walls, I would refer to the subjoined letter, having expunged such portions as were touched upon in my last letter, and referring your readers to my pre-

vious letters to the referees thereon in your journal of the 8th of March.

To Arthur Symonds, Esq. Registrar of Metropolitan Buildings. Sir, -I beg leave to address you, and through you the official referees, upon the subject of the award as to alleged irregularities in the count but on behalf of the public; as it is quite clear I was not bound to seek your decision, but having taken up the subject con amore, and being in that way a rara avis, willing to devote time and cost to develope the truth in any large question of public rights, I was anxious to argue upon facts. I feel, that perhaps I have no right to intrude on you, after having come to a solemn decision upon a case heard before you, nor am I at all desirous to excite a dis-Cussion in the shape of a correspondence, as (I say it not ironically, but in sober sadness) I cannot afford to write letters to be re-ceived and read at a cost of 5s, each, which leade me to the discussion of what I had im-agined to be the intention of public officers, liberally remunerated through the medium of a county-rate collected from each inhabitant householder of the districts within the jurisdiction of the Act, viz.: It being an Act ex-presely for the protection of public rights and benefits, I imagined the court thus appointed to be paid by popular contribution, was in-tended as an easy mode of carrying out its operations without in costs pressing hardly upon an individual who is in doubt as to the mode of proceeding under a complicated Act and was compelled to appeal for advice to this court. That the contrary is the fact, I would appeal to the costs in my own case of 51. 43,8d. for literally reading three letters and a confor literally reading three letters and a con-ference of one hour and a half. To the award itself I object, upon these grounds, and also to the whole proceedings. In your award, you set out the positions in which consent could not be obtained, and then you say, "or that the ad-joining owner to whom notice had been given, and the to consent but willing and was not only able to consent, but willing, and did, in fact, consent, or that in fact there was no differences between the parties concerned;" your decision being, "Then it will be the duty of the district surveyor to offer either to proceed to the survey in the presence of the parties, if they be present, without prejudice to the matter in question; or to defer making such survey until such matters shall have been determined by the official referees on a refer-ence thereof seconding to the unpublicance of ence thereof, according to the provisions of the Metropolitan Buildings Act in that behalf." In your award, you also state, " Yet the district surveyor was not bound to inquire into such matters, but on receipt of the notice of the buildings owner, he was bound to proceed mi-nisterially so far as the said Metropolitan Buildings Act has specifically prescribed on that behalf." This at once raises the question whether the district surveyor is, or is not, under the direction of the official referces, or if for any, for all purposes. The notice of survey was served late on the Saturday aftersurvey was served late on the Saturday after-noon, to meet on the Tuesday following at twelve. On the Monday, I served notices on the referees, the district surveyor, and the building owner, that we had been, and were consenting parties. We not on the Tuesday, and my reasoning sufficed to restrain the "building owner" and his surveyor from taking any part in the matter; the district surveyor remarking that, whatever his views of my arguments were, he was bound to proof my arguments were, he was bound to pro-ceed in obedience to the directions of the official referees. In lieu of exercising the discretion pointed out in your award, he for-wards plaus and statements of facts (profes-media he are available to the source would have edy, but so erroneous that a tyro would have disowned them) with knowledge of alleged irregularity. Copies of these are transmitted from you to us, headed "in absence of consent of the adjoining owner, sec. 24." I distinctly hold that the district surveyor,

se our appointed public officer in respect of the fee to be received for superintending the work, is bound to see the Act fairly carried out, and to advise as to the mode. In this particular once it appears to me he was the sole cause of all the ultimate difficulty. I contend it is his duty before sanctioning process to insist upon a declaration that "consent of adjoining owner" cannot be obtained. Thus, your

office was moved by the express direction of the district surveyor, and progressed with railroad speed in the face of our objections, distinctly stating we were consenting parties; and, I presume, in accordance with your table of fees, liable to the fee for "supplying want of consent of owners," all the mass of papers received being so headed.

The point for the public to ascertain, there-fore, is, upon ground of complaint, whether the referees have any authority over the district surveyors in this case upon my ground of com-plaint of the short notice given of the meeting. The district surveyor denied your authority to control him; but an authority has been assumed over them in the circular issued as to the course to be taken in respect of matters commenced before the 1st of January, to which authority, with all respect and submission, I demur; as I cannot find even by implication one word in the Act permitting any one to control me in reading a public Act in its common sense; and I quite agree with Mr. Jeremy, the magistrate, that if he had built a mansion before the 1st of January, but had not commenced detached out-buildings and stables necessary to complete for occupation, he would insist upon building them irrespective of the new Act. The frivolous and vexatious cases I now have in hand upon notices from district surveyors, I have advised the parties to resist, and take them into a court of law, most of them being founded on the perversion of the reading of sec. 5, a section that by the greatest ingenuity cannot be strained to apply to works commenced (being buildings erected before the general line of houses, but roofed and covered in) before lat January. The reason assigned by the district surveyors in the cases alluded to (and as, I understand, sanctioned by your authority) is that sec. 5 states " with regard to every such building hereafter to be built, so far as relates to building the same, and with regard to every such building, either already or hereafter built, so far as relates to the rebuilding or altering the same :---" this can apply only to any such operations com-menced after 1st January, as what is termed "enlarging or altering" was a building commenced before 1st Junuary, restrained by no

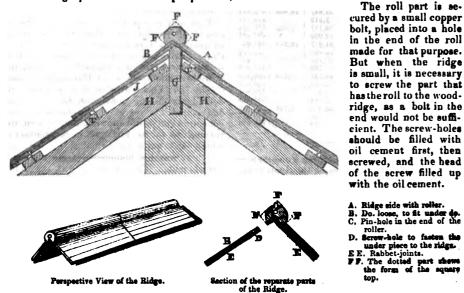

existing law. If the permissive sec. 2, is ont to be taken as defining what is "already built,"

WILLIAMS'S PATENT SLATE RIDGES AND HIPS.

THE annexed engravings will serve to explain the construction of a very efficient slate ridge, the cost of which will be found in our advertizing columns.

In order to put on the patent ridge properly, the wood ridge piece should be kept up about

an inch clear of the slating, and bevelled off on each side, so that the upper edge of the under part of the slate-ridge should bear solid on the bevel of the wood ridge, the lower end will then bear tight on the slating when screwed on. The part of the slate-ridge which has the roll should be bedded on the other in oil cement. The roll part is se-

ABSTRACTION AND SALE OF A FONT COVER.—A report having been generally cir-culated throughout the parish of St. Martin's-in-the-fields, that the curiously carved ma-hogany cover of the font, which had been for some time missed from the edifice, had been traced to a broker's shop in Drury lane, where it was exposed for sale for 30s., an investiga-

tion took place, when, at a vestry meeting held a few days since, one of the churchwardens admitted that he had sold it, as he considered it to be a piece of useless lumber, which had been lying for years in the value of the church, and its use unknown or disregarded until it had been seen at the broker's to whom it had been sold.

Digitized by Google

I would quote another portion of sec. 5, as against the above reading "subject, never-theless, to any other rules and directions in this Act, contained in the same behalf." And it must be borne in mind that sec. 5 is merely declaratory; the enactments in each case being referred to the various schedules, when it will be found that such terms as "enlarging it will be found that such terms as "enlarging or altering" are nowhere to be met with. Every such erection to an existing building (which in common *parkance* would be termed "enlarging or altering)," is treated of in the Act as a building *per se*, regulated in its con-struction according to its rate by area and height; if such an erection be therefore for the future deemed a building, it follows that a similar erection commenced before 1st January must also be a "building already built," pro-tected by sec. 2. tected by sec. 2.

I have the honour to be, &c., GREENWAY ROBINS.

Relative to the sum of 151. 11s. 8d. charged by the referees for an award, referred to by our correspondent, we felt bound to make injunction and are in a position to state, that the largeness of the amount in this case was caused by the indiana of the parties themselves. The correspondent, we felt bound to make inquiries, proceedings of the parties themselves. The referees profess themselves to be, and we believe them, anxious to keep down the ex-

pense of application to them. We have already (page 133) stated our opinion at some length, that necessary parts of buildings commenced before the lst of last January, such as shop-fronts, bows, porches, being part of the original design, although these may be still undone, are not within the control of the Act, and do not authorize the demand of a notice by the district surveyor, if completed before January next. In a case now before us professionally, the district sur-veyor has called on the builder of a house veyor has called on the builder of a house which was roofed in before last January, to give him notice (in other words a fee), before he completes the porch, although this is as much a part of the original design as the chimney-stacks, and, in the eyes of the law, as we said of shop-fronts, is *already up*,—part of it indeed actually was carried up with the front wall of the house last year. The demand is so preposterous, that we cannot think it will is so preposterous, that we cannot think it will be persevered in : if it be, we shall of course resist it to the utmost, and have no doubt as to the result.—ED.]

THE BUILDER.

Correspondence.

MISTARBS IN ESTIMATES-HERNE-HILL CHURCH.

SIR, -As one of your numerous readers, allow me to express my satisfaction as regards the talented manner in which your various correspondents are treating the question of archi-tectural competition, with the view of purifying future decisions, so that real merit may ultimately find its proper level. However desirable this object may be to accomplish, it should be borne in mind there are serious mismanagements in building competitions, which appear to me to have equal claim on the pages of THE BUILDER, and, in support of my assertion, refer you to that unfortunate affair at Hernehill Church.

We take for granted the matter went through a business form, and the quantities were supposed to be taken out by competent persons ; of course the builders, satisfied of the abilities of the parties so employed, proceed to prize the various items in full confidence that all are correct. Imagine the contractor's surprise when he finds out that the actual quantity of stone regained for the completion of his works exceeds the quantities furnished, by some 2,000 cubic feet or upwards. Then comes the question, what is to be done? Not allowed to throw up his contract, he is told he can fall back on the parties who supplied the quantities to make up his loss. We then have the name of Mr. Broomfield introduced to us as the person who made so serious an error. Mr. Broomfield then tells us he did not take out the quantities at all, as the time allowed was too short, but that he copied them by permistoo short, but that he copied them by permis-sion of the architect from his private quantities. The architect next introduces himself, and very politely gives Mr. Broomfield the lie direct. The principal clerk next approaches the arena of discord, and after quoting a pre-cedent io point of allowing an inspection of private. quantities on the Great Western Railway, admits that on the second application of Mr. Broomfield he was allowed to copy the privateoquantities of the architect, but at the same time was cautioned they could not be depended time was cautioned they could not be depended on as correct.

Thus it appears, if this statement be true, Mr. Broomfield supplied copies he was in-formed could not be depended on, and the architect allowed builders to tender for building this church, from quantities he knew were copies of his own, which he could not say were correct.

Yet after all these statements, we are still in the same position as regards being informed where the blame lies : neither seems inclined to own the fault, but makes vain attempts to throw

it back from one to the other. I trust, Sir, you will consider this Herne-hill Church affair to be of a serious character, as affecting builders generally, and that it demands a further notice in the columns of your journal, as the architect and builders' organ, for it is self-evident, if the truth is before us, that Mr. Sugden has encountered a heavy loss by such a system of conducting competition, and it may prevent respect-able bailders in future from engaging in competition from quantities furnished in such loose, and, to say the least, disgraceful inner. I am, Sir, &c., Lambeth. March 25th. W. A. เพิ่มที่กอา.

We have carefully considered a number of letters forwarded to us on this subject, including one from Mr. Broomfield, and one cluding one from Mr. Broomfield, and one (accidentally) unsigned, purporting to be from Mr. Sugden. None of them, however, seem to disprove the statement made by Mr. Alex-ander's clerk (p. 130, ante), that when he allowed Mr. Broomfield to inspect the ab-structs and dimension books, Mr. B. was distinctly told that Mr. Alexander would not be responsible for their correctness ; further, that at duplicate specification was lodged with the Church Commissioners, and would serve to prove that no alteration was made in it after the estimates were prepared, The architect's es-timate was probably what architects' estimates often are (and are required only to be), namely, a general one to get at the prohable cost and the mistake seems to have been, adopting the quantities, taken out perhaps roughly for that purpose, without comparing them with his specifications and drawings. We trust what has been said on this occurrence may have

the effect of inducing greater caution in future on the part of those deputed to take out the quantities for builders, and may prevent architects from allowing their quantities to be seen, unless they are quite satisfied that they are correct.-ED.]

HOLLOWAY CONGREGATIONAL CHAPEL.

SIR,-Your correspondent of last week who desires some information respecting the late competition for a new Independent Chapel at Holloway, appears (like many others) to be surprised at the mystery with which the whole affair was conducted. Secrecy in such matters never looks well, and generally defeats its own intentions, since it arouses suspicion, and, as

in the present instance, prompts inquiries. From hints unwittingly dropped in different quarters (and those versed in architectural competitions know too well how to put such together), I was led to conclude that the studied reserve, which your correspondent has salso noticed, was not casual, but a matter of prudence, inasmuch as the Holloway In-dependent Chapel Committee had not shewn themselves proof against the influence of party interest.

But now for more tangible evidence :---when I had received back my drawings, I naturally wished to know who was the fortunate candi-date, and was informed Messrs. Emmett and Chadwick, and, on further inquiry, learnt that Mr. E. was "one of the congregation." This looked very doubtful. It has since got whispered about that the above parties have not adhered to the conditions of the furnished This instructions, and that the committee have winked at the discrepancies.

That a portion of the required accommodation is provided in a gallery notwithstanding the express direction "No galleries to be erected at present," a gross unfairness towards the other competitors, who, I doubt not, to a man,

obeyed its obvious meaning. That before any of the unsuccessful draw ings were returned, it was decided entirely to alter the character of the APPROVED elevation and - That before the business was finally achieved, to make assurance certain, the plan was revised, and no time lost in setting it out on the ground.

Now, Six, there is an old saying, that truth will out, and if corroborated runiours become facts, these charges must be true; at any rate, I see no reason for disbelieving them till they are severally and officially contradicted. I am not going to querrel with the committee for wishing "one of the congregation," in the first instance a committee-man himself, to build their chapel if they can trust to his taste and abilities, but I do complain, that in conse-quence of a public advertisement so many arabilities, chitecte have been induced to expend time and labour in preparing designs, with the hope that their respective merits would be honestly weighed, when the result (if what is above stated be correct) seems to force upon us the not very palatable notion, that the real design after all was to collect a few suggestions gratis, and then make such use of them as might be con-venient in the improvement of a "cut and venient in the improvement of a dried " plan. I am, Sir, &c...

FAIRPLAY.

P.S.-I quite fall in with the idea of exhibiting the different designs, and am ready to contribute mine."

THE FOUNTAINS IN TRAFALGAR-SQUARE. Several experimental trials have lately been made to test these works, which at last have been pronounced to be complete, and ready for constant use. The fountains will be put in daily operation as soon as the basins are repaired, they having got out of order, and the cement being cracked in many places from imperfect workmanship. The fountains are to play for ten hours each day, such being the contract with the engineers of the works. The cistern from which they are supplied at the top of the engine-house in Orange-street holds 37,000 gallons of water, and the higher main at the top of the tower for the supply of the Government-offices about 20,000 gallons. The water will ascend to a height of 40 feet; but at the recent trials the jets were only suffered to play to a height of from 6 to 8 feet, as with a greater ascent the water is liable to be driven by the wind to a considerable distance across the square.

Aliscellanea.

GLASS FOR OPTICAL PURPOSES .--At a recent meeting of the Society of Arts, Mr. Claudet submitted a communication on the improvements recently introduced into the manufacture of glass for optical purposes. The importance of this invention will be clearly understood if we reflect that upon the perfection of glass depends entirely the power and utility of the telescope, and hitherto the manufacture of a material possessing the requi-site properties in a sufficiently high degree has been a matter of infinite difficulty and uncertainty. The defects most injurious to glass employed in the construction of philosophical instruments were, the numerous filaments and lines, called by opticians " strike," and also the spots produced by the bubbles of confined These defects arose from the almost imair. These defects arose from the almost im-possibility of obtaining an intimate mixture during the fusion of the different materials composing the glass. A means has, however, been discovered by M. Bontemps, a French gentleman, founded upon an old process in-vented by a Swiss, of the name of Guinand, and it is this invention that formed the subject of Mr. Claudet's communication. By an incenious contrivance a complete mixture air. an ingenious contrivance a complete mixture of the materials, when molten, is obtained, so as to produce perfect homogeneousness and the entire destruction of all the defects in the glass. Lenses, with scarcely any blemishes, may be made of two or even three feet in diameter; and it was stated in Mr. Claudet's paper that the inventor has undertaken to furnish to the Royal Observatory at Paris the lenses for an achromatic object glass of a metre (ubout 40 inches) in diameter.

DECORATIVE ART SOCIETY .- On Wednesday, 26th ult., a paper "On the physiology of timber trees, considered with reference to manufacturing purposes" (second notice) was read by Mr. Vicary. He passed in review various theories concerning the growth and formation of pith, annular rings, medullary rays, bark, &c., the influence of soil, light, winds, and pruning; and also the evidences of health and maturity in the living tree. The tubular construction of timber, its medallary rays, &c., were illustrated by the oxy-hydrogen microscope, with transverse, oblique, and longitudinal sections of various woods pre-pared for this occasion. Sir W. Symonds, in the course of his observations, expressed his willingness to afford to inquirers the facility and advantage of examining the Government collection of woods, &c., at present under his control. Papers "On stuined glass," and "On the application of colours to manu-factures," were announced to be read at the next meeting of the society.

INSTITUTE OF THE FINE ARTS.— The monthly meeting of this body was held on Saturday evening last in the great room of the Society of Arts, 'Adelphi. The chair was taken by Mr. Wyse, M.P. A great number of members and their friends was present, the room being literally filled. The chairman addressed the meeting in a very eloquent speech, in which he took a view of the rise and pro-gress of art, and its present state and prospects. He insisted on the necessity which called upon the artists of this country to be-come the teachers of the principles of art to the people generally, and to caltivate and direct properly the taste of their fellow-countrymen. Mr. James Foggo then read a paper, in which he set forth the advantages paper, in which he set forth the advantages which would accrue to the fine arts if a national exhibition of engravings were established, and proposed that the government should be called upon to establish a gallery for that pur-pose. Mr. Park read a paper on modern sculpture, in which he made some severe strictares on the statue of the Dake of Wellington lately erected at Glasgow: after which a vote of thanks was passed to the chairman, and the meeting broke up.

BBISTOL ACADEMY OF THE FINE ARTS. —The first annual exhibition of works of living artists will be opened on or about the 14th instant. In sid of the fund now collecting for the establishment of the academy, a bazaar has been proposed, to which many who are unable to give money may be disposed to send prints, drawings, duplicate copies of books, &c. It is thought that a large sum might thus be raised.

NOVEL LOCOMOTIVE POWEB .--- A very ingenious application of the screw principle to the common locomotive has been suggested by an American. It professes to overcome inclined planes of any steepness, even though the greatest load be attached, with perfect ease and certainty. By a very simple apparatos the driving-wheels are lifted from the track on approaching the plane. A cogged-wheel of small diameter is attached to, and derives motion from, the axle. This wheel plays into another cogged-wheel of greater diameter, and that in its turn gives motion to an ever-lasting screw placed longitudinally beneath the engine. Along the centre of the track, on the inclined pluve, a series of strong wheels, moving freely on their pivots, and inclined to the horizon at the same angle with the plane, are so placed that they correspond with the threads of the everlasting screw beneath the eogine. When the engine reaches the plane, motion is given to the screw from the engine itself; and its power is capable of being increased to any point by increasing the ratio of the diameter of the cogged-wheels, turning the screw to the diameter of the wheel deriving motion from the driving axle of the engine. The inventor anticipates very great advantages from this adaptation : among others, a great saving in expense, additional safety to pas-sengers, and facilities of constructing lines in positions hitherto considered wholly unadapted for such purposes.

INPBOVED MANUFACTURE OF CAST STEEL. -The solution of the problem of producing cast-steel direct from cast-iron, without in-carring the enormous expense hitherto inseparable from the old process, has engaged the stiention of scientifio mcn, since the time of Reaumur, whose work appeared nearly a century ago, to the present time, without having produced any result of the least value. At length, however, this object is announced as having been accomplished by a gentleman, who states the apparent paradox, that he is able to produce cust-steel at a cost not exceeding that of pig iron, of a quality suitable for the manufacture of steel. Of the importance of such a discovery, supposing it brought into practical operation, some opinion may be formed, from considering that steel made in this manner may be sold at half the present selling price of that of medium quality, mad-in the usual way, at a profit of 100 per cent; and that the quality of it, according to the statement of the discoverer of the process, will be const to that now made from the most be equal to that now made from the most expensive foreign iron; it is also stated that the steel is suitable for every purpose for which steel is now used—from coach-springs to surgical instruments-and that, consequently, this process must entirely supersede all those at present in use for making the various descriptions of steel now used in the arts.

RAILWAY RESTAURANT .- A plan has been promulgated which promises to administer largely to the luxury and comfort of those who are compelled to undertake long journeys by railway. It consists in the construction of some newly-formed carriages, so as to consti-tute a sort of travelling café, or railway res-taurant, to be placed in the rear of the other carriages, which are to be so constructed as to open into one another thereby exclusion open into one another, thereby enabling waiters to travel along the train *ad libitum*. A bill of fare, shewing what the refectory contains, is to be posted in each carriage. Bells are to be at the command of the passengers to apnounce their wants to the waiter, who will travel to them along a narrow passage alongside the in-terior of the carriages constructed for the

PUTPOSE. RESTORATION OF ST. MARY'S CHURCH, BURY ST. EDMUNDS,-A detailed account of the receipts and payments connected with this restoration has just been published. It appears restoration has just been published. It appears that the receipts up to the present time amount to 2,056/. 4s. 7d., and the payments to 3,417/. 6s. 8d., shewing a deficiency of 1,361/. 2s. 1d. A public appeal for further donations has been made by the minister and churchwardens, who, for the present, have paid the deficiency. It may be mentioned, in con-nection with this restoration, that in addition to the very handsome subscriptions of Henry James Porteus Oakes, Esq., and John Fitz-gerald, Esq., the former gentleman presented astained window at the east end of the nave, and the latter, a new font.

PROGRESS OF RAILWAYS .-- Railways are messengers of civilization, peaceful locks tend-ing to bind countries in ties of closer intering to bind countries in ties of closer inter-course; as a guarantee of peace they protect from war. They are now covering the Con-tinent—extending across the Desert—about to span India from Calcutta to Bombay. Where will they stop? There is a railway now on its way from St. Petersburg towards Moscow—will it stop there? The direction of that line, if pro-longed, leads to China. Between St. Peters-burg and Pekin, there is scarcely a hill; Moscow is, therefore, but a first-class station on Moscow is, therefore, but a first-class station on the way to Pekin. We will not speculate on the date of completion of such a line yet, but return to what is imminent and in sight. From London to Southampton there is now an elec-tric telegraph. Mr. Wheatstone is on his way to Paris for the arrangement of a telegraph in France. It may soon be completed from Havre to Paris; from Paris to Marseilles there will be a continuous line of railway, and a tele-graph on it; thus we reach the Mediterranean; thence Egypt, across the Desert, and so to Bombay and Calcutta. We may cross to Bel-gium, where an electric telegraph already exists. We shall soon have one continuous line to Venice; and then across the Desert, and finally from Calcutta to Bombay as before. Does such a prospect, so clear, so certain of bringing so near home our many friends and brothers now in the other hemisphere, not bring home to our hearts the conviction that we are just entering a career of social improvement, based on scientific discovery, the beneficial effects of which it is difficult to foretel, but impossible to over-estimate? - Athenaum.

A COURT IN THE GREAT METROPOLIS .-Orchard-place is a broad court leading out of Orchard-street, Oxford-street, and close to Portman-square, Manchester-square, Grosvenor-square, and some of the first streets in the metropolis. Including two nooks, Orchard-place is less than 45 yards long and 8 broad, and contains twenty seven houses. Its inhabitants amount to 882 persons, of whom 582 are about fourteen years of age! The population of a large village or small town is here compressed into one court. Amongst these are found 222 adults who could not read; whilst most of the other adults could only read imperfectly. Only seventeen persons had copies of the Scriptures. Ten persons professed to attend Protestant worship; while the great mass of those who attend Romish worship only did so early on the morning of the Lord's-day. The parties employed in taking the statistics of the place witnessed two fights, and one woman was nearly beaten to death. The court was once supplied with copies of the Scriptures, but such was the desperate character of the inhabitants, that every copy was destroyed. Such is a brief outline of one of the heathen spots which stud the metropolis of Christian England. ON FIXING BLOWING SANDS.—I have had

occasion to try experiments upon the practibility of fixing blowing sands on the sea coast, by planting grasses and trees upon them. The experiments were made upon a tract of blowing sand of between 500 and 600 acres, on the ing sand of between 500 and 600 acres, on the sea coast, upon my property in the county of Sligo, in Ireland, and with great success; and if you should wish for any detailed informa-tion on the subject, you would obtain it by addressing my local managing agent, Mr. Lynch, Rundale Cottage, Chiffony, Sligo. I found a small quantity of bent growing upon the sands; and by transplanting annually, for many very inst. a sufficient quantity of many years past, a sufficient quantity of the younger plants, I have covered with a close coating of bent the whole surface of the formerly blowing, but now fixed and stationary sand; and the result is, that the bent affords shelter and food for young cattle, while trefoil begins to grow spontaneously on the sand be-tween the tussocks of the bent. I have for the last three or four years sown seeds of the pinus maritima, from Bordeaux, among the bent on some portion of the sand, and the young plants are growing well, though hitherto they have been more occupied in striking their roots deep into the sand than in throwing shoots I have also tried young oaks in the upwards. sand, and they seem as yet to thrive in it even better than the pine. The sand is the broken downruck of the old or lower sand-stone formation — PALMERSTON, Carlton-terrace, Fcb. 17. [This mode is adopted to a considerable extent in Holland, where the soundness of the dykes is a matter of vital importance.-Eo.]

NOTICES OF CONTRACTS.

We are compelled by the interference of the Stamp, Office to omit the names of the parties to whom tenders, &c., are to be addressed. For the coareciones of wir receiver however, they are entered in a book, and may be easily on application at the office of "The Builder," 2, Yorky, street, Covent-garden.]

For cutting, forming, and completing a new line of Private Carriage-road, one mile in length, from Whitehaven Castle, Camberland, the seat of the Earl of Lonsdale, 'to' the Turnpike-road,' between Bransty toll-bar and Lonsdale-place, near the town of Whitehaven. April 7. and bradescond. 16 t

For constructing the fourth division of the Great, Southern and Western Railway. April 8. For supplying the Gaol, now in the course of

ror supplying the Gaol, now in the coarse of erection at Aylesbury, Bucks, with gas-pipes, fittings, shades, and burners; locks, and other fittings; iron tanks, pumps, and piping necessary for the supply of water. April 8. For about 250,000 Railway Sleepers not less than 9 feet long, for the Chester and Holyhead Railway.

April 9. For erecting at Alresford, Hants, between five

and six thousand feet superficial of new Brickwork, to be either neat flat, joint-pointed with white mortar, or neatly tuck-pointed. The parties to find labour and the erection of scaffolding only. April 10.

For the restoration of the Parish Church of Grays Thurrock, Essex. April 12.

For the erection of a Church in the parish of St. Thomas, Winchester, April 12. For the erection and building of a Farm-house,

Barn, Stable, and other offices, at Hepworth, Suffolk. April 16.

Suffolk. April 16. For keeping Battle-bridge and Holleway-road in repair for one or more years. April 17. For submitting a plan of a Tread-wheel, and com-structing the same in the Common Gaol of Great-Yarmouth, Norfolk. April 24. For all the Works to be done in the erection-and completion of the new cast-iron Bridge over

the Haven of Great Yarmouth, including the find-ing of labour, certain materials, &c. April 26. For the construction of the third and fourth divisions of the Chester and Helyhead Railway. April 28.

For laying out the Grounds of the Victoria-park Cemetery, and for draining the same, making the roads, paths, and finding all necessary trees, shrubs, the materials. &c.

For performing the several works in building a new Workhouse at Tenterden. . May 2. For the formation and completion of a new.

Drain, being about eleven miles long, twenty yards wide, and five yards deep, for the Middle Level Drainage Commissioners. Also for the erection of a Staunch, several Bridges of wood with brick abutments, together with the necessary culverts, and other works. May 8.

COMPETITIONS.

Plans, sections, and elevations for a Terminus, rians, sections, and elevations for a terminus, and other requisite accompanying offices, for the Great Southern and Western Railway, Ireland. Plans for a Church to be erected within the Borough of Kingston-upon-Hull. May 8.

THE BUILDER.

APPROACHING SALES OF WOOD, 800. BT AUCTION.

-At the Spulk House, in Dean Forest, April 2.-Gloucestershire, by order of the Commissioners of her Majesty's Woods and Forests: 319 Oak Timber Trees.

April 5.—At Bower Hall, Steeple Bumpstead, Bases: 400 Fir, Oak, and Elm Trees. April 7.—At the Swan Inn, Alton, Hants: 270 fine Oak Timber Trees, now standing in Shaldenpark Coppics. The timber is of good size, and the greater part of unusual length and straightnes

April 8.—On the Glembam House Estate, Suffolk : upwards of thirty loads of Ash, Elm, and Poplar Timber, of good quality. Also 200 Oak Stands, and a considerable quantity of Pollard Trees, &c.

April 9.—At the Lamb Inn, Rainton, near Topcliffe, Yorkshire: 254 Oak Trees and 217 Ash, now standing at Rainton. The Wood is of large dimensions.

April 10 .- At the Devonshire Arms Inn. Martinle-Moor, near Ripon, Yorkshire: 276 Oak Trees and 12 Cyphers, new standing at Martin-le-Moor. Also 786 Oak Trees and 173 Cyphers, all standing in Martin-le-Moor Old Wood. Many of the out-

standing Trees are of large size. April 11.-On the Hoo Hall Estate, near Fram April 11.—On the Hoo Hall Estate, near Fram-lingham, Suffolk: a quantity of Ash and Oak Timbers; ditto Fir, Oak, and Ash Stands; ditto

Pollards; all recently felled. April 11.—At Wingerworth, Derbyshire: a large quantity of Oak, Ash, Beech, Alder, Elm, and Walnut Trees; in all 716 Trees and 911 Poles.

April 11.—At the Congreve Arms Inn, Alder-meston, Berks: 180 capital Oak Trees, now stand-ing in Wasing-wood; also 50 capital Oak Trees, standing in Hart's-hill Coppice. They are all sound plank Timber of large metings and of the very best quality, April 15.—At the Three Ashes, crossing near

Witham, Essex: 1185 Oak Trees, now growing in the woods and fields of Lanhams, and Crossing Lodge Farms. Many of the Trees are of large dimensions.

Some time during the present month. A large quantity of full-grown Coppice and Hedgerow Timber, now standing at Denby's, Derbyshire.

TO CORRESPONDENTS.

"J. P."-We shall be glad to see the sketches offered.

"Constant Reader and Purchaser" is thanked. Estimates of that sort do not require notice.

"W. W.," as a competing architect, offers his thanks to Mr. Allom, and Messrs. Lahee and Mabin, for their letters in our last number.

"A Subscriber " (Nottingham) wishes to know which is the best machine for crushing lime in large quantities for concreting. The ordinary crushing nill, a cylindrical store made to revolve round a fixed point, by horse or other power, on a grating fixed over a receptacle for the power, and material, answers perfectly well, we believe.

"A Country Carpenter" wishes to be told of a good stain to make deal look like old oak. As-phaltum ground in copal varnish produces a good appearance, but is not properly a stain.

"F. M."-There does not seem to be anything to prevent him "butting a timber erection against the gable end of a brick building," if the timber erection was up before the 1st of last January. The erection of such a shed as he speaks of would not be permitted now.

"W. Rowland."-The "canaliculated acqueduct" for preventing effluvia from sewers through the street gratings, does not seem to have any ad-vantage over the ordinary "trap" in use. The objection to trapping is, that by preventing the escape of the gases the sewers are rendered danger-ous. The model is left at the office in York-street for impression for inspection.

"E. M." (Pimlico).—The average (of last seven years) annual produce of the duty of 8d. per ton on coals is 87,8011. 7s. 5d.

on coals is 87,8011. 74. 5d. "The Reading Competition." — "Architectus non Competitor" effers praise to Mr. Blandy for the course he pursued, and considers with a little alteration in the details, it might be generally adopted with much advantage. "A Young Subscriber" will not find any one book to give him the knowledge he requires; it must be abtend from parious surveyse. — Could's Edition

be obtained from various sources.—Gwill's Edition of Chambers ; Stuart's Athens ; Parker's Glossary, &c. Shaw's Encyclopædia of Ornament would be Snaw's useful to him.

A Young Builder '' (Dublin) .- "The Students, Builders', and Architects' Instructor in the Students, and Practice of Measuring Artificers' Work," published by Weale, High Holborn, would pro-bably answer his purpose.

"J. R. Croft," "E. H.," "H.W. Portses." and W. J. S."-Next week.

"Messrs. Poulton and Bland " are thanked for the information respecting Holloway Congrega-tional Chapel. They will find another letter on the subject in our present number. "Lavinia" states that the old church at Wilton

will be removed when the new structure is com-pleted, and offers to send some sketches of those parts which are worth preserving. We shall be very glad to receive them. We don't know the character of the old building, and hope it will be examined by qualified persons before it is taken

uown. Received.—" A Series of Letters on Agricul-tural Improvement," by J. J. Mechi (Longman)— "Old England," part 16 (Knight), containing various architectural notices to which we shall refer shortly; and "The Pictorial Gallery of Arts," part 3.—Archi—Bricks and Brickmaking rts," part 3.—Archi—Bricks and Brickmaking -G. M.

MEETINGS OF SCIENTIFIC BODIES

MEETINGS OF SCIENTIFIC DODIES During the ensuing week. MONDAY, April 7.—Entomological, 17, Old Bond-street, 8 P.M.; United Service Institution, Whitehall-yard, 9 P.M.; Chemical (Society of Arts), Adelphi, 8 P.M.; Medical, Bolt-court, Float street 8 P.M. t-street, 8 P.M.

TUESDAY, 8.—Medical and Chirurgical, 53, Berners-street, 81 P.M.; Civil Engineers, 25, Great George-street, 8 P.M.; Zoological, Hanover-square, 8 р.м.

WEDNESDAY, 9.—Society of Arts, Adelphi, 8 P.M.; London Institution, Finsbury-circus, 7 P.M; Graphic, Thatched-house Tavern, 8 P.M; Pharmaceutical, 17, Bloomsbury-square, 9 P.M. THURSDAY, 10. — Royal, Somerset-house, 84

P.M.; Anliquaries, Somerset-house, 8 P.M.; Royal Society of Literature, 4, St. Martin's-place, 4 P.M.; Medico Botanical, 32, Sackville-street, 8 P.M.

FRIDAY, 11. Astronomical, Somerset-h

 P.M.; Royal Institution, Albermarle-street, 8¹/₃
 P.M.; Philological, 49, Pall Mall, 8 P.M. SATURDAY, 12.—Royal Botanic, Regent's-park, 4 P.M.; Westminster Medical, 32, Sackville-street, 8 P.M.

ADVERTISEMENTS.

NOTICE TO INVENTORS.—OFFICE for PATENTS of INVENTIONS and REGIS-TRATION of DESIGNS, 20, Half-moon-street, Piccadily. Patents obtained for the United Kingdom and Foreign Countries; Designa registered; printed instructions, contain-ing the chargee, forwarded gratis; and every information given by application, if by letter pic-paid, to Mr. M. Joseel.m Cooke, 20, Half-moon-street, Piccadilly.

EMBARRASSED CIRCUMSTANCES **MBARRASSED** CIRCUMSTANCES. -PERSONS IN DIFFICULTIES being desirous of availing themselves of the Benefit of LORD BROUGHAN'S RUMANE ACT. are requested to apply to MESSRS. GRAND AND CO., of 54, Coleman-street. City. where every information may be obtained, FREE OF EX-PENSE, or arrangements can be made with Creditors, by which means the painful necessity of resorting to BANKRUPTCY or INSOLVENCY may in many cases be avoided.--N.B. Partnership accounts adjusted.

LUBUILDERS and Others.—A cheap substitute for high priced bricks, well worthy the attention of speculative gentlemen, and other capitalists who intend building this season. This article is stone, which may be worked with great advantage. It is in pieces from 3 to 5 inches in thickness, and averaging from 14 to 20 pounds in weight; it is about the same weight as bricks, and will be sold in London at 12s. 6d. per ton. Any quantity may be had from 100 to 200 tons per week; not more would be guaranteed per week, as it will come by railway. A fair sample of 16 or 12 tons may be seen at the proprietor's at any time.—Address, JAMES PERREN, 1, Vietoria-place, Surrey-square, Walworth. TO BUILDERS and Others .- A cheap

Surrey-square, Walworth. HIP TILES to suit slate roofs in colour; Ridges, with plain or rebated joints, roll tops, and vertical ornaments; draino, many sizes, with plain or socket joints; paving in squares, hexagone, octagons, &c., dif-ferent colours; roofing, in Grecian or Italian styles, other devices also, or plain; conduits, which do not injure pure water; fire-bricks and tiles; clinkers, and out-door paving; sundry wall-coping, garden-borders, chinney-tops; also tubular and other flues of peculiar material. No agent, but a depôt at WHITEFRIARS, and 23. WATER-LANE, FLEET-STREET, LONDON, under Mr. PEAKE'S per-sonal care, to supply genuine TERRO-METALLIC goods at fair prices as per quality. The TILERIES, TUNSTALL, STAFFORDSHIRE, are near the centre of England, whence boats are sent direct to any inland place; or to the Mersey for the coasts, the colo-nies and elsewhere.

mies and elsewhere. PAINTING BRUSHES OF SUPERIOR QUALITY. TO PAINTERS, BUILDERS, &c. J. J. K E N T A N D CO., MANUFACTURERS, 11, GREAT MARLBOROUGH-STREET, LONDON, Offer to Painters, Builders, &c., Painting Brushes of a quality far superior to those generally offered for sale, to which they beg to call the attention of all who prefer quality and durability to apparent cheapness. 000000.-7 in. Dusters. 000000.-7 in. ditto, extra. 00000.-7 in. ditto, extra. 00000.-7 in. ditto, extra. 00000... Plasterers' Brushes. Distemper ditto. Ground and Unground. Sash Tools, and Common Tools. Tar Brushes and Masons' Brushes, and all other Brashes used by Painters and Artists. Lists of Prices of Painting Brushes, and of all other kinds of Brushes, forwarded on application. Established 1777.

GEN STONE.

DEPOT at Freeman's Sufferance Wharf, St. George's Stairs, Rotherhithe. Cargoes shipped direct from the Quarries to any part of the coast. Counting-boure, 27, Millbank-street, Westminster

CAEN STONE. UARD and BEEDHAM have a quantity of the above atone, of the best quality, direct from their Quarries at Allemange, which may be inspected as the Norway Sufferance Wharf, Greenwich. - Further particep-lam at Ms. G. GATES', 18, SOUTHWARK-SQUARE, SOUTHWARK.

BEST FARLEIGH DOWN FREE. BEST FARLEIGH DOWN FREE. STONE, CHEAPER THAN EVER, at the Wharfs of Mr. Hanson, Kensington; Messrs. Druce, Chelses; Mr. Rogerson, Pimlico; Mr. Foot, Westminster; Messri-Brown and Runy, Bank-side; and Mr. Searle, Wapping. General Agent, T. E. Weiler, Steel-yard Wharf (late Drewe's), Thames-street.

ST. PANCRAS MARBLE and STONE WORKS, near St. Pancras Church, New Road-Gentlemen, Builders, and others, in want of Marble or Stone work, are respectfully requested to apply as above for an estimate, for which no charge will be made. N.B.-A Vein Marble Chinney Piece, opening 3 fost square, 8 inch Piers and Shelf, for 31. 7s. 6d.; a faill vise Head and Foot Stone with 100 letters, fixed within 4 miles of the above-named works, for 31. 5s. Monuments, Tombs, Pedestals, &c., proportionally low.

CUNDY'S MARBLE AND STONE WORKS, PIMLICO.

S chiect, Builders, &c., that he is supplying VEIN MARBLE BOX CHIMNEY-PIECES. Opening 3 feet square, and 7 inch piers, for

upening 3 meet square, and 7 inch piers, for FORTY-FIVE SHILLINGS! STONE BOX CHIMNEY-PIECES, opening 5 feet square, and 7 inch piers, Twelve Shillings; do., do., with MOULDED CAPS, and 8 inch piers, FOURTEEN SHILLINGS.

The above are manufactured in the best manner and of the best material. For CASH ONLY.-Address, SAMUEL CUNDY, Marble and Stone Works, Belgrave Wharf,

Masons' Work, Monuments, &c., &c., at equally Low Prices

JOHN KNOWLES, Jun. POLONCEAU'S BITUMEN PAVE-MENT for paving Foot walks, Terraces, Garden walks, Stables, Coach Houses, Granaries, Corn Stores, and Sait Warehouses. For the exclusion of Damp and Vermis in Basements it is particulary adapted, and for Roosing Dwell-ing Houses, Porticos, Balconics, and Sheds. Price 3s. 6d. per square 'ard. BITUMEN for covering the Arches of Bridges, Calverts, Re. Re. on Bailways and wher places (with instructions for laying it down), may be had at the rate of 45s. per ton, by applying to JOHN PILKINGTON, 15, Wharf-read, City-road.

City-read. BASTENNE ASPHALTE and BITU-MEN COMPANY, Ofices, 31, Poultry. The Directors of this Company beg 'eave to call the atten-tion of ARCHITECTS, BUILDERS, and others, to the very beneficial results attendant on the use of BITU-MEN in the erection of buildings, &c. Its application as a FLOORING will be found eminently useful. It is also valuable for numerous other purposes, more pap-ticularly where the object sought for is the EXCLUSION OF DAMP AND VERMIN. The Directors beg to refer to the works in Trafugar-square, which have given general satisfaction. Scale of prices per foot square: - 1 inch thick, and 7d. per foot square. Concrete is charged in addition according to the thickness when required. Carriage and men's time are charged extra when works are executed attere miles from the General Poat-office. Bitmems 26 per ton, without grit. Bitumen 25 per ton, wich grit. CHARLES F. TILNTONE, Sec.

TO ARCHITECTS.

TO ARCHITECTS. In consequence of many complaints having been made to the Company, by Architects, of a sperious material having heen used in the execution of Works where the SIYSSEL ASPHALTS had been specified for, the Directors, with a view to ensure the fulfilment of any such specification, have authorized CERTIFICATES to be granted to Builders where the where the

SEYSSEL ASPHALTE

SEVSSEL ASPHALTE has been used. For the purpose of securing the use of the Genuine Article, Architects and others are recommended to insert in their specifications the "Seyssel Alphalte, Cla-ridge's Patent," and not merely "Asphalte," or "Bits-men," as in many cases where these terms have been used, gas-tar and other worthless and offensive compositions have been introduced. I. PARELL, Secretary, Stangate, near Westminster Seyssel Asphalte Company. Bridge, Jan., 1845. Books of Instructions for Use may be had at the Office of "The Builder," and of all Booksellers in Town and Country, price 1s.

"Interstandor, and or an energy of the above advertisement, *.* In proof of the necessity of the above advertisement, it may be mentioned, that it has come to the knowledge of the Directors, that in certain works which have been escuted by Messrs. Curtis, builders, of Stratford, a spurious material has been used by them, contrary to the specifications, which expressly mentioned, that "Claridge's Asphalte" was to be used. expressi be used. SATURDAY, APRIL 12, 1845.

N the present Number we have the pleasure to lay before our readers a view of the Hungerford suspension bridge for foot passengers, constructed under the di-

rection of Mr. I. K. Brunel, which will be opened publicly on Friday, the 18th of this month. The engraving shews the bridge as it appears seen from the Middlesex side, a little to the west of the market, and gives an accurate notion of its general arrangement and It consists of three arches; the form. span of the centre is 676 feet 6 inches, and that of each of the side arches 333 feet. The height of the roadway from high-water mark at the abutments, is 22 feet 6 inches; at the piers, 28 feet, and in the centre, 32 feet; so that it cambers in the whole. 9 feet 6 inches. The clear width of the roadway is 14 feet, and the height of the two towers, or piers, which carry the chains, is 58 feet above the road. These towers, which are 22 feet square, consist each of four solid piers of brickwork in cement, 7 feet 6 inches square. connected by inverted arches at the bottom, and are built on the natural bed of the river without piles. They are Italian in style, and were designed by Mr. Bunning to accord with buildings appertaining to the market.

For the foundation of the abutments, piles 26 feet long were driven in an inclined direction. On the south side this was effected with much difficulty, the soil being formed by accidental causes into concrete of very great hardness. The platform, or roadway, is carried by four chains, in two lines, with single suspension-rods on each side, 12 feet apart. The chains pass over rollers in the upper part of the towers, so as to equalise the strain, and are secured in tunnels at the abutments to two iron girders, 44 feet long and 5 feet deep, solidly embedded in a mass of brickwork in cement, further strengthened and backed up with concrete. It is bardly necessary to say, that this is a most important part of the construction, and demanded the greatest care.

The suspension rods carry two longitudinal bearers of fir, 9 by 9, running from end to end on each side of the roadway, one above the other, and between these are placed the ends of cross-beams, which beams receive a flooring of three-inch deal. The cross-beams are double every 12 feet, that is, at the point where the suspension-rod comes through; (each of the two pieces is 11 by 3, and side by side): the intermediate beams, two in each space, are 11 by 51. There is a third longitudinal bearer under the crossbeams, down the centre, 10 by 6, and the whole is trussed disgonally, from side to side, with iron. To prevent undulation is of the utmost importance in the construction of suspension bridges, as they are peculiarly liable to damage from this cause; and it has been thought that the injuries to which suspension bridges are exposed from wind arise chiefly from its action beneath the platform : to stiffen this is therefore most essential.

General Pasley urges, in a paper published in the "Transactions of the Institution of Civil Engineers" (Vol. III.), that if the platform, THE BUILDER.

which presents a large surface to the wind acting from below, be kept from undulating, it can scarcely be supposed that the utmost force of the wind could move the chains at all, having comparatively so very little surface to oppose to it, and which must be held down by the great weight of the roadway, so long as that remains at rest. The trussing adopted at Hungerford bridge by Mr. Brunel will have the effect of stiffening the platform considerably, and will be further assisted by the castiron railing on each side of the roadway. The appearance of the under side of the roadway, viewed at one end, is very curious, from its narrowness, great length, and the effect of the trussing : it resembles, in some degree, the back bones of a fish, and exemplifies in a striking manner the theory of vanishing lines.

The span of the main arch of this bridge is much larger than any other in this country. The greatest span of Hammersmith suspension bridge is 422 feet; of the Union bridge across the Tweed, near Berwick, 449 feet, and of the Menai bridge, Beaumaris, 560 feet.[•] It is only second to the suspension bridge at Fribourg, in Switzerland, the span of which, from pier to pier, is nearly 900 feet.

The first stone of the Hungerford bridge was laid in 1841. The total cost, including the purchase of property, parliamentary, law, and other expenses, is 110,000%. The approaches on the south side of the river require improving, and for this purpose a Bill is now before Parliament. It is proposed to obtain a direct communication with the Yorkroad. On the Hungerford side the platform joins the centre of the terraced roof of the colonnade between the two taverns, whence the traffic will pass through the galleries over the colonnades of the fish-market, by the level of the general market, to Hungerford-street and the Strand. The toll is to be a halfpenny each person, and it was originally estimated that the annual return would be-ordinary traffic 8,000%. traffic from Lambeth to Hungerford Market, 2601.; for the sight of matches on the river, 250%; traffic to and from steam-boats, 300%; rent of unappropriated property, 200%; total 9,010%. As a point for embarking or debarking, there is a commodious flight of stairs in each pier, which will probably supersede the unsightly wood-piers now in use.

Mr. P. P. Baly, the author of the selected design for the London Baths and Washhouses, was the resident engineer; Mr. W. Chadwick the contractor for the brickwork, and Messrs. Sandys, Carne, and Vivian (Cornwall), the contractors for the ironwork.

When we view the comparative slightness of the piers, the great length and tenuity of the roadway, and the single suspension-rods, so wide apart, and remember the effect of a gale of wind even in the Thames, it is hardly possible to avoid a doubt as to the stability of the new bridge during any long period of time; the skill and high attainments of Mr. Brunel, however, forbid the entertainment of this doubt, and we willingly waive it, with perfect faith in his reputation.

We should have mentioned, that all the wood employed in the construction is Paynized, and that the quantity of iron consumed is between 10,000 and 11,000 tons.

The suspension bridge at Fribourg, to which we alluded, is, as most of our readers know, a wire bridge, and has been appealed to in support of the arguments of those who advocate the employment of wire for this purpose in preference to iron bars. The length of Fribourg bridge is, as we said, nearly 900 feet ; the height from the water, 175 feet, and the breadth 22 feet; that is, 16 feet for the carriage way, and 3 feet each for the footpaths. The versed sine is 65 feet; the length of the perpendicular suspension wires nearest the pier is about 57 feet, each one diminishing towards the centre of the bridge, where the shortest is only 12 inches. These perpendiculars are 4 feet 8 inches apart, and sustain the extremities of the beams which support the platform. Each of the four cables which form the arch consists of 1120 wires, and it is estimated that the four could sustain 2,678 tons! It was completed in two years and a half, and cost 24,000/.+

Although the use of wire offers some advantages, especially superior strength, bulk for bulk compared with bars, general opinion is not in favour of its adoption, on account of the impossibility, nearly, of adjusting the length of the wires, so that when the cable has assumed its proper curvature, each wire may bear its due proportion of strain, and because of the increased liability to oxidate, in consequence of the increased surface offered by wires to the action of the atmosphere. It has been proposed that each wire should be passed through a vessel of varnish immediately after the process of drawing, and that, after forming the wires into bundles of fifty or sixty each, they should be passed through a concave vessel of the oleaginous matter at a high temperature. By this process it is supposed every particle of moisture would be driven off in vapour, and its place occupied by the oleaginous substance in the interior of the cable, where it would be retained by its adhesive property, while it would harden over the exterior, and prevent oxidation, by removing the possibility of moisture coming into contact with the wire.

A suspension bridge of considerable importance is in progress at Clifton, near Bristol, but proceeds slowly; and one of very large size (three main arches of 1,200 feet span each) has been suggested to connect Liverpool with the Cheshire shore, by crossing the Mersey, but is at present "in the air."

SHOP-FRONTS, BOWS, AND OTHER PRO-JECTIONS TO HOUSES COMMENCED BEFORE LAST JANUARY. IMPORTANT DECISIONS.

In our leading article of March 22nd (p. 133), and elsewhere since, we asserted (in opposition to instructions said to have been forwarded to the district surveyors from the district surveyors in consequence) that intended shop-fronts, bows, and other projections, forming a necessary part of buildings duly commenced before the 1st of January last, did not come within the control of the new Act, although still unfinished, and that no notice to the district surveyor before completing such was necessary. Last week we mentioned a case in point, then before us professionally, where the district surveyor had called on the builder of a house, which was roofed in last year, to give him notice before he completed the porch, although that was as much part of the original design as the chimney-stacks; and we stated that we should, of course, resist to the utmost such a preposterous demand.

It is with much gratification we now inform our readers, that our view of the law has been fully confirmed by several awards made since the date of the article in which we argued it; and that if the instructions issued by the official referees did direct the district surveyors that all such projections, if not completed before the 1st of last January, must be conformable to the Metropolitan Buildings Act, they having very properly given due consideration to what has been since advanced, have now arrived at another conclusion.

† It was opened October 1834.

^{*} The Trinity suspension pier at Newhaven has three spans of 209 feet each; Brighton chain-pier has four spans of 255 feet each. The bridge over the South Esk, at Montrose, has a span of 433 feet.
