In Bristol alone, where the annual accumulation of money is enormous, much more ought to be subscribed than is yet announced; in fact, we have little doubt that the moment the works are commenced in earnest, additional assistance will be afforded. St. Mary Redcliffe does not simply belong to Bristol, but to the whole world,—it is one of those records of the past that all have an interest in preserving, and from which all may derive advantage. It belongs to history, it belongs to poetry, it belongs to art; and it will be a national digrace if it be not immediately rescued from its present dangerous condition, and restored in the minutest respect.

We will not believe for a moment that funds can be wanting for such a purpose, but we call on the wealthy inhabitants of Bristol themselves, if they are not disposed to keep the whole credit of the restoration in their own hands, at all events to set a good example. If there had been any public board for the conservation of national monuments, this building would not have been *suffered* to fall into its present state.

A desire for restoration is at this time general in Europe, — Germany, Belgium, France, all are actively engaged in this important task. The last project of the sort in France, and one of great extent, is the restoration of the Metropolitan Church of Paris, Notre Dame,-which is found to require thorough repair and reinstatement, a repair that is to extend to all the works of art contained in it; monuments, cenotaphs, carvings, and coloured decorations. Messrs. Lassus and Viollet le Duc, the architects engaged to effect the restoration, have been empowered forthwith to direct such works to be done as may be necessary to preserve the structure from ruin, and application has been made to the chamber for a grant of 2,650,000 france or 106,000/. sterling, with a statement that the repairs are not merely necessary, but most urgent. A commission was appointed to examine the nature of the works proposed, and there is very little doubt that when they send up their report, the required grant will be made.

At Cologne, the money required for the restoration of the cathedral is immense, still no one despairs; subscriptions daily come in, and the works progress. The town-halls throughout Belgium were in a dreadful state of dilapidation and called for a large expenditure; yet the money has been raised, and in several cases they are now satisfactorily completed. Surely then, as we before said, there can be no cause to fear for St. Mary Redcliffe. Once let the inhabitants of Bristol be convinced, that without interference on their part, restoration will be soon impossible, and we are quite satisfied they will come in munifi-cently to the rescue. We appeal, however, in its favour to every lover of our ancient architecture in the United Kingdom.

ILLUSTRATIONS OF ARCHITECTURE FROM THE BRITISH MUSEUM.

AMONG the most interesting remains of Grecian architecture, the marbles from the temple of Apollo Epicurius, at Bassæ, near Phigalia, hold a high place. They are not only interesting from their character and style of art, but as fragments of a singular edifice, contemporary with the Parthenon at Athens, and the work of the same architect. It is not an uncommon supposition, that the Grecian architects adopted one model, from which they made no very sensible deviations. But, although modern imitators have contributed to the prevalence of this opinion by adopting the same Ionic capital, or the same victor's wreath in all buildings, sacred or profane, the Greeks were an originating people, and did not restrict themselves to imitation in their architecture. It is true, that instead of trying a new experiment in every fresh building, they made use of the principles of their prede-cessors, which the voice of public taste had applauded; but they were not less strong in the endeavour to give each building the appearance of an original work ; so that we find in all Grecian buildings, that general character of resemblance which is sufficient to mark them all of one style, a scrupulous attention detail in points, many of which have only lately been discovered, and a marked difference in those details. In the temple under notice, we find some peculiarities, which are the more singular, as existing in a work of the architect Ictinus.

The notice which Pausanius gives of this temple in his "Description of Greece" adds greatly to its interest, as it leaves no doubt that it belonged to the age of Pericles. His words are "Phigalia too is surrounded with mountains; on the left hand by Cotylion, and on the right by the mountain Elaion. The mountain Cotylion is about forty stadia distant from the city. In it there is a place called Bassæ, and a temple of Apollo the Helper, the roof of which is of stone. This temple surpasses all the temples in Peloponesus except that which is in Tegea, for the beauty of the stone from which the roof is built, and the symmetry of its construction."—" Ictinus, the architect of the temple of Phigalia, was coptemporary with Pericles, and built the Parthenon for the Athenians." The temple had

been visited by Sir W. Gell, when subsequently it was examined by Mr. Cockerell, quenuy it was examined by Mr. Cockerell, along with Baron, Heller and with Mr. J. Foster, now of Liverpool. These gestlemendis-covered the existence of the aculpture, now preserved in the British Museum, and in 1812, a party was formed at Athens for the purpose of accurating, and delineating the purpose of excavating, and delineating the previous works of art. The temple was found to consist of six columns in front, with a range of fifteen columns on each side, two more than in the temple of Theseus, and was 125 feet in length, and nearly 47 feet in breadth. It is considered to have been hypethral. The external order is elevated upon three steps. The temple is peripteral, consisting of a peristyle, pronsos nace or cells, a space between the nace and the opisthodomus, and the opisthodomus itself. The space is separated from the opistbodomus by a wall, which has no opening ; but in the side wall there is a door into the peristyle, the use of which has occasioned some discus similar door is found in the Temple of Theseus at Athens. The structure does not stand cost and west, as most temples de, but nearly north and south. The Dorig columns of the peri-style were 3 fact 7 inches in diameter, and 19 feet 6 inches in height. In the interior of the cells were very curious celumns of the Ionia order, together with a single column of the Corinthian order, which, as it has been supposed, occupied the position opposite the en-trance, being an almost isolated instance of a central column in Grecian architecture. There is one other example at Poetun. This idea of the position of the column is, however, formed upon the assumption that the temple was hypethral, which may not have been the case, and upon the fact that the space would scarcely allow of two columns. The frieze would thus range round the four sides of the cells, being common to both orders, and it is an argument for the temple's being hyperbral, that otherwise the sculpture, would receive no light. The lanic columns project from the walls in a very singular manner, being at-tached to the eads of short walls, and are three walls, at the further ead, join the wall of the cells obliquely, for what reason does not seem clear. Engaged columns were not usually employed in Grecian architecture, but are found in the Erectheum, and the Temple of the Giants, at Agrigentum. The capitals and bases of the columns are very singular, so much so as to have led many to suppose, that they were of a later date than other parts of the fabric. 11 to is rather difficult to describe them, but a fragment of one of the capitals is in the collection, showing that the volutes were joined at a right angle, the capital facing all ways; an extension of the idea of the angular capital in the temple on the Llisaus, and in those of Minerva Polias, and Erectheus. The con-tinuous moulding of the volutes rose in a slight curvature from one volute to the other, and had not the usual abacus. The eye of the volute was a separate piece, it was, however, of any other material, as might not of stone, and be supposed, and was fastened into the socket by a plug. In the fragment, one of these balls is wanting. The base is not less singular. The small segment, forming the union between the shaft and base, is here expanded into a large curve, so that the bases have great projection. The bases hemselves have for their principal moulding a large scotia, the section of the whole being not unlike that of the moulding, immediately below the base of the order in the monument of Lysicrates. The flutes are more like those of the Doric than of the Lonic order, being of slight dents that for the long order, being of slight dents, they have narrow fillets between, as sometimes seen in the Doric. It is to be regretted, that the museum possesses no other fragment of this singular order than the small one above alluded to, which includes a portion of the flutes. The Corinthian capital is a still greater loss, as the examples of that order of Grecian origin are few :- it has now disappeared from the ruins, but a capital bearing close resemblance to this one, was found on the Acropolis of Athens by Mr. Inwood, and is now in the collection of that gentleman. The discovery of two capitals of similar description in these particular localities, is a circumstance of some interest, leading us to the inference, that they were both designed by Ictinus. That at Phigalia was much mutilated, but shewed a lower range of caulicoli, as in the monument of

Lysicrates. The other architectural fragments Lysicrates. The other architectural fragments are, one of a Dorie capital of one of the columns of the peristyle, fragments of tiles, an antefixa of beautiful design, and the cor-responding ornament at the ridge, besides fragments of the metopes, from the porticos of the pronaos and posticus. These parts of the of the pronaos and posticus. These parts of the building were not usually ornamented with tri-glyphs, but were so in the building under notice. It seems to us, that Pausanius, in speaking of the beauty of the roof of this temple, referred to the lacunaria, of which six different varieties were discovered, and figured in the description of the temple by Mr. Donaldson, which forms part of the supplementary volume which forms part of the supplementary volume of Stuart's "Athens." They were all beautiful, and two varieties were arranged in diamond forms. The ornament of the crowning cyma of the pediment is engraved in the title-page of the, fourth part of the description of the Museum marbles; it was of beautiful design, similar to that of the Erectheum, and may be considered to shew an advance upon painted ornament of the Parthenon. In the In accordance with the Grecian principle, the cyma was not continued along the flanks, its position being occupied by the antefixæ. The really valuable portion of the Phigalian

marbles is the frieze. When discovered, it was much broken, and the uniting of the several pieces was a work of extreme dif-ficulty, at last accomplished by Mr., now Sir Richard Westmacott. It occupied the position, above the Ionic columns of the interior. about 221 feet from the floor, and was attached to the wall by pins, the holes of which may still be observed. These pins are considered by Mr. Taylor Combe, the author of the deiption of the Museum marbles, to have been of lead, similar pins being used in the fixing of friezes of terra cotta. The positions of the slabs are almost a matter of conjecture, though evidently some of them followed in the order, in which they are now ranged. The subject of eleven of the slabs is, that which was so fertile a theme for Grecian sculptors, the combat of the Centaurs and Lapithæ; and that on twelve of the slabs, is the battle of the Greeks and Amazons. The direcbattle of the Greeks and Amazons. I he direc-tion of the slabs, belonging to the former sub-ject, was from right to left; that of the latter, from left to right. The frieze of the Parthe-non is in low relief, representing the Pana-thenaic procession in honour of Minerva, and is wonderfully accurate in anatomy, and the proportions of parts. But the Phigalian proportions of parts. But the Phigalian frieze, though not in every respect correct, as to the several parts of legs and arms, exhibits a marvellous spirit and energy. Some of the figures are almost detached from the background, and the whole are in violent action; the Centaurs are hurling rocks at their op-ponents, and everywhere the ardour of strife

prevails amidst the dead and dying. The marbles were purchased at Zante, in 1814, for the sum of 60,000 dollars, rather above 15,000*l*., which had been previously of-fered for them by Mr. Legh, one of the discoverers, and they are now hardly inferior in value to those other works of the age of Pericles with which they were in origin so intimately connected, and along with which, they are now united under one roof. E. H.

THE FUTURE ARRANGEMENT OF THE XANTHIAN MARBLES.

Since our former notice of these interesting fragments,* the question of their future ar-rangement, in the building now in progress, has become a ambiect of consideration. In consequence, is model has been prepared, we beproposed artangement, and we have heard, that Sir Charles Fellowes is about to prepare another. The former model is now in the another. The former model is now in the central saloon of the Mascum. Taking the door to be the same size as that of the Elgin room, 7 feet wide, we may venture to consider the scale of the model, one inch to the foot. This makes the proposed room 73 feet long, 40 feet wide, and 30 feet high. It is lighted by a range of long windows, immediately under the celling; the wells are shewn of a light red granite, about three feet in height from the floor, being left for scsgliola in imita-tion of Sienna marble. This leaves the lower This leaves the lower part of the wall entirely free, except at the ends of the room.

* Vide p. 301, ante.

On the walls are various has reliefs, many of them not yet unpacked; and the end of the room oppoalte the entrance is occupied by the fragments of the monument, erected to com-memorate the conquest of Xanthus by flar-pagus, previously described. They are arranged in the same positions, as they, occupied in the building, with the exception of the pedi-ments, and some of the figures from the inter-columns, which are necessarily placed on the ments, and some of the figures from the inter-columns, which are necessarily placed on the floor of the room. The lower range of bas-reliefs also, is placed too high, and we would much rather see it occupying its original posi-tion. The centre of the room is occupied by two immense tombs of the kind, which Str. Charles Fellowes has likened to Gotoic works. Charles Fellowes has likened to Gothic works. They precisely resemble each other, being only turned different ways, so that we don't under-stand why there should be two of them. They stand on pedestals having a pannel at the end, and a simple cornice of fascia, enriched ovolo, and fillet. Above this pedestal are bas-relief, apparently of good character, and above this is curious arrangement of pannels and more apparently of good character, and above ture a curious arrangement of pannels, and pro-jections very much resembling timber con-struction, and the projections much remind, ing us of the halving of the wall plates at the angles of a root. There are sign array projections in the form of books, or rather like the catch which receives the latch of a conprojections in the form of books, or rether fike the catch which receives the latch of a com-mon door." The roof is in the form of a coth-arch, and with its ridge, resembles the bottom of a vessel upset. The "pediment" all the ends has mutules, which are not found in the pediments of Grecian buildings. Two long heads project on each side from the curve of the roof. Nearer to the door of the mooth is the roof. Nearer to the door of the room, is the "Harpy Tomb," and on each side the door are examples of the two other varieties, of of monuments, which bear so strong resemblance to the dwellings of the present inhabitants of

Asia Minor. We trust, that the increased accommediation in the new buildings will allow of the better arrangement of many parts of the collection, which have long needed it—the architectural casts for example. We wish we could see any reason to hope for some provision for *inational* antiquities, which are as deserving of attention as those of Greece or Rome, and are to be had for a small fraction of the appoint for a small fraction of the expense. Έ.Ή.

THE (LINNEAN) SYSTEMATISING OF THE STREETS OF LONDON

5

"It leads us to look onward, through the long vists of think, with chatched but confident assirtance, this works has still other (1) and nobler work (11) to do, than any the has yet attempted." - Sir John Herseld's address to Private Association, 1843.

twochton 1842. IF the men of the present and the state of the state of the state of the present and the state of the stat our streets is remaining, leaves ample room for an analogous conclusion as to the whole of our an analogous conclusion as to the whole of our civic arrangements. It is, however, one of the standing and periodically reducing *Rena* of our periodicals, to dilate on the numeric of streets, going by the generic of Rings' or Queen's, the scores which are named after Charles (either I, or II), and so on. "There our perodicals have stopped spid. therefore, rather deserve the stygma, which has been cast, at least, opon one of then, vizlet filling cast, at least, upon one of then, viz. "mining fault with every thing, with dit stating dray thing to be done in fifely therefore." Bedder a most confusing and perplex "Systemme, the very nomenclature of many streets is errored as and anystematical in as much as que to any lst. Two opposite rows of boase of the

Cambridge terrace and Oxford terrace, and many other (even better) examples.

• A poculiar projection of similar description was noticed by Mr. Stephens in the buildings of México. May it not have assisted to support an awning, stretched at the side of the tomb, when the relatives visited the grave of the de-ceased? The blocks which we sometimes find projecting im-mediately below the caves of a Gothic church, those which ovidestly missered a constructive purpose, we might have a some difficulty in understanding, chd, we not know how for-quently a chapel was attached to the church, of which have are the only widenes, just a centain and of the reof, which reated upon them,

2nd. Streets of an immense extent have no sub-division into upper (middle) and lower for instance Oxford-street; while many others much minor have.

3rd. Streets quite contiguous and straight, are broken up by names different; so for instance John-street may end into Prince-street, and the like.

and the like. 4th. The labelling of squares, streets &c., is most defective, and there are some large squares which are not labelled at all.

5th. The numbering of the houses is at a par with the above, as many houses have no numbers at all, the same number occurring twice in the same street.

It would be matter of supererogation to dilate on the inconvenience, confusion, and unbusiness-like aspect, which result from this state of things. Besides, any such (palpable) momaly augurs bad for every other civic or social item of our huge metropolitan system; and what we wish is, that men should arrive (by-and-by—but not too slow) at a certain tidy, reasonable, business-like condition in this apd every other respect. It cannot be denied, however, that since our present reign, things are beginning to look very differently, from what they did at any period of English (or other) history; and as we are just in a numerative mood, we will resume by stating, that

Ist. Now-a-days there is scarcely a man of eminence in any department of science or art (or even literature), who is not consulted, employed and paid by Government; for instance, H. Hallam, Dr. Owen, Faraday, &c. 2nd. That last year only, Government have

2nd. That last year only, Government have expended 5,839% in experiments, scientific and otherwise.

otherwise. What is not to be expected under similar propitious circumstances! But we shall vary the point of a mere encomiast, by saying, that whilat it is very laudable to drag for instance "the depth of the Ægean sea," still the old homely proverb: "charity (justice) begins at home," should not be left unheeded. We consequently hope, that our Governmental or eivic authorities should not begrudge the granting a commission, or an adequate prize, for the systematising and regulating the nomenclature, and the proper labelling of the streets of London (and other large cities). In Paris it required a revolution to do all that, at least to a certain degree ---- but we hope that John Bull will do the same, without requiring such a strong extraneous excitement. This is our hope and trust, throughout: "that we shall have a revolution of allisirs without a revolution."

This, however, is after all not the report of a commission, way even a prize essay. We may, therefore merely throw out the following brief, remarks; and the following brief remarks;

Ist. It would be required, that all (what we rall) generic street appellations of King, Queen, Charles, Jöhn, &c., should disappear. They mean absolutely, nothing, as they apply, at present, to nobody at all. If their be any historical incident, which might have given to a certain (say Charles or other) street its name, this might be preserved, but no more. In so doing, a great number of vacancies would occur, for which there are, indeed, a great many candidates. Should any one believe, that while the Parisians have still a street of Jean Jacques Bousseau, Condorcet, Chaptal, &c. — we have none called after Jenner, Cabot, Chaucer, Herachel, Handel, &c. National recognition, even in that way, would excite national emulation and thus, the material result would cease as it were, to make, room for one of a more exalted character. We need hardly to add, that such an undartaking would require not only the aid of historical, but far more the surveyor's knowledge, as in many streets (especially the small and crooked open) there is at present no system of sppellation—none knows or can know, where a street begins or ceases, which all ought to be determined after certain laid-down rules and system. In fact, we have in our mind's eye, a certain tidy, complete, businesslike ooneummation of this undertaking—as we are a great enemy of all cobbling and botching.

Nomenclature, however, is only part of that metropolitan systematization which we propose, and which would avail but little, if the present wretched, beggarly, and jobbing way of *labelling* the streets were to be persevered in. **These tabels are really** a disgrace to the (materially) first city of the world. Some are large,

others small, some in one sort of type, and others in another, some at such a height, and some at another, and there is a new-fangled sort with moveable letters, of which, however, many have faded or fallen out, and look like the defective teeth-work of an old woman. We, however, propose (as we always do), that a uniform, solid, sterling, decorous, and or-namentive way of labelling the streets should be adopted. Having (albeit timidly) alluded to *jobbing*, we believe, that in most of our civic expenditure, there is too little regard paid to the humble and poor rate-payer. Paving is done most *futilely* and wretchedly, labelling in the Paving is done same way because such expenses increase the rate only by one penny or so in the pound; while none seems to think, that it is the last half ounce which breaks the back of the camel, and that that job which gives A, B, C, some employment, sends D, E, F, to the poorhousein fact, a mere repetition of our seven and a half per cent. parable, mentioned in previous essays. Solid, sterling, business-like work is, therefore—as every honest and candid man knows—always the most economical. And thus we propose a labelling of the streets which may last a century, or a couple of cen-turies-and we also, like Lord Stanley, say, that we don't want to legislate for any longer time.

Having, however, called our systematization, a Linnean one, we have to apply this principle to our present purpose. The labelling, as well as the proper naming of streets, will require a division of the metropolis—

division of the metropolis— 1st. Into certain localities according to their architectural and other respectability—say divisions A. B. C.—"Belgrave-square" and such like—"Soho-square" and such like— "St. Giles," and other such crowded and poor localities. This would form, say, the generics. But it is to be borne in mind, that in any, say A. (Belgrave-square) locality, there are streets of different size and architectural or other importance. We, therefore, distinguish in every of our A. B. C. localities, three species of streets (or better, aggregates of houses), which we shall mark 1, 2, 3. Thus, for instance, Belgravesquare would stand A. 1. in our proposed systematisation—meaning that it is a firstrate street (aggregate), in a first-rate locality; West-street, Petticoat-lane would be C. 3, meaning a third-rate aggregate in a third-rate locality, etc. And now we have to state, that this (simple be it) systematization will materially assist, as well the nomenclature as the proper labelling of the aggregates. For instance, the following rule (law) would result therefrom: If any No. 1. street is transected by another No. 1. street (no matter which locality), both retain the same name after having crossed each other. Such is the case with Regent and Oxford-streets. But if any (1. 2. 3.) street is transected by one which changes its character after the transsection—becomes 2. or 3., from having been 1.; then the name ought to be necessarily changed, and the major to retain its name, if other causes should not militate against it (for instance it being a generic name). A further detail and exemplification would be displaced here.

The above systematization would also greatly assist the labelling of the streets. This, we propose, should be done in a solid, sterling, showy manner. We propose it to be of the hardest and toughest China or the like possible—azure letters on white ground. But it would be wrong (in many respects), to have the same sized labels in an A. J. aggregate, as in one C. 3., vis.; in Belgrave-square and in West-street, Leather-lane. We propose, therefore three different sizes" of labels—thus. The names of the aggregates should be composed of oblong movable type (letters) of the above material, which could be manufactured wholesale, and them composed accordingly, encased in a (solid) brass frame, and then the back part filled out with some imperishable (hard and tough) cement; so much so, that every label should present a solid block of a certain size (according to the A. B. C. localities); most solid, we repeat, and not to be injured but by the mainest force. But it would be very wrong to charge the C.3. ratepayers with the same amount as those of A. 1. or the like. We, therefore, further propose, that the price, which a C. 3. label would cost,

• The shape of the labels would be either uniformly oblong, or, in some cases, orai-1/, viz., the names could not be well arranged in any other way.;

should be first ascertained, which we think would be 2*l*., made in such considerable quantities. A label of **B**. should be charged 4*l*. — and an *A*. one 6*l*. This were to be the general calculation. But, as a *B*. label would not cost the double of a *C*. one, and an *A*. label for less, the triple of a *C*. label the *C*. label prices of 2*l*., would be only a fictitious one, resembling (somewhat) the l49*l*. item of the income tax. In fact, it would then be, as it ought to be, everywhere the same "public" accommodation would be afforded to the public; but the man who has 7s. a week and he who has 7,000*l*. a week, would pay differently for it. Without the application of such a principle, nothing of any sterling nature can be accomplished; for which stating we have the high authority of the *Premier*, who said in the debate on the income tax: " the humbler classes cannot be taxed to any further extent."

No sterting work, however, of any kind can be ever effected, if it is made a job for any one. Thus, if our (Linnean) labels were to fade, break, split, exfoliate, melt (!), and all the like —it would only lead to the (accessory) conviction, that now-u-days no public work can ever be 'done workmanlike, and that all and every thing of the kind is merely done to put money in the pockets of a few favoured persons. It behoves us, therefore, to state briefly, how a (sad) repetition of that drama or farce is to be avoided. Our favourite system of super-revision (a system of revision) would have again to come into play. The patterns of the type or letters ought to be first produced by the persons tendering for the contract, and be subjected to a commission, of which men beyond all suspicion should be members—for instance Prof. Faraday, Brande, Dr. Ure, &c., &c. The ultimate contract of the accepted tender should be drawn out by a legal person, also beyond suspicion—and the material then received not in a whole lump, but in such quantities as they can be most conveniently fabricated.

In fact, every precaution ought to be taken, that the letters do not turn out to be made of gingerbread or pipeclay. Similar deep precautions ought to be taken with respect of the brass (or other) cases, forms; the cement, the filling-up—the placing in the walls.*

We are perhaps over-rating the importance of public tidingness and sterlingness--in saying, that the consummation of our plan would, and could not but, be of great influence on the morals, the behaviour, and (proportionately) on the whole social condition of the people of this metropolis. It is all idle to preach to the people a regulated and business-like behaviour-if the very labels of our streets (those pilot-marks on the estuary of the metropolis), proclaim in their dilapidated and fulle appearance the fact, that those above are hardly better than that people, who ex-hibit (in the three kingdome) the astoanding figure of 1,500,000 paapers. Do our respected readers doubt, that such a beginning even, of making all our streets looking tidy, nay ornamented, would not act like a constant memento on the idle, the disorderly, the filthy! Do our readers doubt, that the cobbler, the scavenger living in a C. 3 locality, would not be induced to some thought on seeing such a tidy ornamented plate inserted in his house- can their be any doubt that many might be induced to speak thus to their wives :- " why, missus, as how they have stock sich a snuggy thing in our street, I thinks we must keep the ouse somewhat more clean ourselves, and I shall send down Bobby to sweep the passage and clean the windows oftener as he did hitherto." And such and similar is the falcrum of Archimedes, with which to move the lumber of our present social condition. There is no use of sciling theories (books) on that score any more -business (John Bull-like business) is to be done henceforth.

CLAREMONT.—An extensive and convenient range of stabling and coach-houses has been completed at Claremont, for the accommodation of the horses and carriages belonging to her Majesty when the court is stationed there.

[•] If it were possible, I would propose that an additional slip (space) should be inserted at the bottom of each label, bearing the names of the manufacturers of the china letters, the brass forms, the coment, the builder who has placed them. Such an advertisement might somewhat deter the fraudulently inclined.

STIR IN THE SCHOOL OF DESIGN.

-As you have been pleased to give SIR.publicity in your journal of the 5th to letters containing statements on matters connected with the Government School of Design, and which represent that institution as in a state which represent that institution as in a state discreditable to all connected with it, whether as teachers or scholars, it is hoped that you will in like manner be pleased to insert at your earliest convenience a few short matter-of-fact statements, tending to shew that there is much misrepresentation afloat about the present state and future prospects of that establishment.

In your number of the 5th there is a brief In your number of the 5th there is a brief report of a conversation that took place lately in the House of Commons, in the course of which it was stated by Mr. Ewart, that the dis-pute in the School of Design had resulted in the withdrawal of the pupils almost without ex-ception. That this is very far from being the case is easily proved, by giving the number of scholars that composed the school prior to the drawing up of the remonstrance, the num-ber of those who were compelled to withdraw consecuent upon their airwing that document. consequent upon their signing that document, consequent upon their signing that document, and the number at present composing the school. (See postscript No. 1). But it is asserted that those remonstrators were the only persons in the school possessed of talent, and that, to use the words of your correspondent H. J. L., "in fact the only students of promise the school fact, the only students of promise the school could boast have been expelled." Our main could boast have been expelled." Our main answer to that will be made public about the 24th of the month, the time when the annual exhibition of designs and drawings will take place in the School. But it may be as well to answer this as the former assertion by a few simple facts. Before entering upon them you will perhaps pardon a short digression while we allude to the circumstances which have in a degree compelled us to come in this manner degree compelled us to come in this manner before the public. The thirty-seven remonstratbefore the public. The thirty-seven remonstrat-ing students have, in a pamphlet published by them, made a statement to this effect, that the students remaining in the upper classes of the school, are secretly as much disatisfied with the present management as themselves, and as anxious to see a change in existing arrangements; this, an as-sertion totally at variance with truth, as far as the Class of Design for Manufactures is con-carned, was circulated in such a manner, that while it might have heap working an injurious while it might have been working an injurious effect in influential quarters, we who were thus unwarrantably spoken of could not know of it, as they had never in any way communi-cated with us, neither personally nor by send-ing us a copy of the pamphlet, in which we were so dishonestly made use of. As the au-thorities of the school have apparently disdained making reply to the calumnies so plenti-fully heaped on them, and as the pupils have hitherto forborne answering, the expelled have become bolder and bolder in their assertions till they have reached a climax. In the first of the letters before alluded to, it is said, that the only students of promise having been expelled, "there is none at present designing, nor even attempting to design;" if the letter containing this statement be indeed the production of one of the thirty-seven, the the production of one of the thirty-seven, the only conclusion we can come to is, that he is guilty of wilful falsehood, because many of the designs about to be presented before the council were in progress before the outbreak, and the majority of the remonstraters having viaited frequently on the public days, they have seen many of our designs at their different stages towards completion. Surely a cause re-quiring the use of such disreputable means must be a bad one ! To the general assertion of in-competence in those of us who remain attached to the school, we will apply a test that the re-monstrators themselves must allow to be a fair one; we will take the list of prizes for original one; we will take the list of prizes for original designs awarded at the competition in June, 1844, and shew who of the successful compe-titors are now in the school, who of them have been expelled, and who have been promoted to masterships of provincial and district schools --(See No. 2). This is the most sure test that can be applied, because original designing is the end and object of the institution, the point to which all our studies tend, and there-fore the best criterion of talent; unless then it can be proved that they who were beaten are superior to those who beat them, it is incon-trovertible that the great majority of those who

last year distinguished themselves are still in the school, or have left it with credit to themselves

We think enough has now been said to shew the unfounded nature of the statements shew the unfounded nature of the statements contained in your paper of the 5th; for further proofs of the efficiency of the school, we again refer you to our coming exhibition, which we hope will exceed in quality as much as it will in quantity, all the former competitions at the School of Design.

It is necessary to state that there is always smaller number of scholars in the summer • smaller number of scholars in the summer than in the winter and spring months, which may be accounted for by the fact that many of the scholars being artisans and apprentices, they cannot be spared from their employments in the summer, or busy season, as they can in the winter months the winter months.

NEW CHURCHES .- There are now in proress, in the diocese of Chester, no fewer than

EXAMINATION IN LINES AND CURVES.

Sin, - The accompanying are a few questions, which may be put to students to accertain their knowledge of lines. Doubters their answers would suggest many other questions, and such questions may be greatly extended both in reference to the different characters of curves and their spplications, as well as to the simple methods of tracing them. What is a right live

2. How is an original right line formed and proved to be such ?

3. Describe the various means of producing right lines in different positions, in the execution of architectural works. 4. What is a circle, or circular line ? 5. Describe the various means of forming

circular lines or circles in the office and in th setting out or execution of large works, both by continuous motion and otherwise.

6. What is an ellipse, or an elliptical line, and what are the varieties of its form?
7. What solid is an ellipse a section of ?
8. What is an elliptical line the perspective

entation or projection of ? repre

9. Describe the various means by which an elliptical line can be traced—distinguish those most applicable for the smallest or largest practical example required.

10. Are there any patchwork imitations of the ellipse, and in what do they differ from the true ellipse !

11. By whom and for what reason are such imperfect imitations of the ellipse used ? 12. Point out instances of the application of

the whole or part of an ellipse in architecture,

and give the proof that the examples are such. 13. By whom was the ellipse discovered P and point out the earliest known applications

of it in architecture or the arts. 14. What is the difference between an ellipse and an oval? and shew how the latter cad be drawn by continuous motion.

15. Describe the various kinds of ovals, and point out instances of the whole or parts of

such curves being applied in architecture. 16. What is the hyperbola, how traced, and where applicable in architecture? 29, Wimpole-street. Jos. Jopling.

THE MESSRS. BAKER'S DINNER TO

THEIR WORKMEN.

-Whatever is calculated to increase SIR, the happiness of the community is well worthy the happiness of the community is well worthy of general attention; and among the various means tending to that end I will venture to place the occasional meeting of large numbers of men who are engaged in the same occupa-tion. The good to be anticipated is an im-provement of the social qualities by an exer-cise of mutual good and friendly feeling, and

cise of mutual good and friendly feeling, and by affording an opportunity for each to leara the good points of his fellow-workman. On Saturday, July 5, the annual recreation of Messrs. Baker and Sons, builders, Stan-gate, was held at the Greyhound, Dulwich. Many of the men availed themselves of the opportunity to visit the picture gallery be-longing to the college, and manifested great interest in the inspection of this splendid col-lection; others occupied themselves with the various exercises for which the place is adapted, while the more quiet were satisfied to adapted, while the more quiet were satisfied to look on, and breathe the fresh air. It was look on, and breathe the fresh air. It was pleasing to see the unanimity which pervaded the whole party. At seven o'clock about 120 sat down to dinner, for which they were well prepared by the various exercises of the after-noon, Mr. T. Fielder in the chair; after which the party were served with punch. The custo-mary healths and toasts were drank with the usual formalities, and songs, recitations, and addresses were given. Thanks were voted to the chairman, and being duly acknowledged, the party separated in hope of seeing another July. It is thought that the example of Messrs. Baker and Sons is worthy of publicity and Baker and Sons is worthy of publicity and imitation from their cheerful liberality to this annual dinner. It is one proof among others of the interest entertained by them for their workmen, and no doubt can exist of its producing reciprocal respect and esteem. The inter-est of this annual dinner is also increased to the workmen by the kind and friendly manner in which the foremen and others meet and distinction when in the workshop. I am, Sir, &c., J. O.

THE GAUGE QUESTION AND THE DE-FUNCT RAILWAY BOARD.

WE mentioned in our last impression, that Government had appointed a commission to inquire into the expediency and practicability of securing a uniform gauge in the construc-tion of railroads. The subject at the first glance will, with many persons, appear to be a difficult one, the bearings of the question however, are within extremely narrow limits. The gauge or breadth between the rails is upon American railways 4 feet 6 inches; upon Jrish, 5 feet 3 inches. The Liverpool and Manchester Railway Company fixed their gauge at 4 feet 84 inches. Other railways adopted the same breadth. Mr. Brunel in-troduced the first exception. Upon the line of the Court Worth Ford for the prove the for the Great Western, 7 feet 6 inches were left be-tween the rails. With this single exception, the narrow gauge was universal. In process of time, the rival lines were united by other railways, and then the evil resulting from a want of uniformity in the gauge was ex-perienced. Trains constructed to ply the nar-row gauge could not run right on along the row gauge could not start this rendered ne-broad, and vice versa. This rendered ne-cessary the frequent shifting and transferring row and luggage. The question now arises, is it expedient to avoid this evil by enforcing uniformity of gauge, and if so, what gauge must yield?

If the narrow gauge be finally adopted, it is pleaded that great risk of life and limb will be incurred. A certain speed of train is alleged to require a certain breadth of rail. If, to abun this evil, the parrow gauge be sacrifieed to the broad, a vast expenditure of capital and labour is indispensably demanded. The narrow gauge extends over 2,000 miles of way the broad gauge over 300 miles only; 2,000 miles, therefore, must be altered to suffer 300 miles to remain unaltered.

If the broad gauge be compelled to conform to the narrow, only the rails require to be lifted, and the carriages slightly altered. In the other case, embankments must be reformed, tunnels widened, bridges broadened, and carriages made anew. It is also strongly denied that experience demonstrates higher risk of life and limb upon the narrow gauge.

Such is the nature and bearings of the question which the Royal Commissioners have to investigate and decide upon. Much speculation and uncasiness prevail with respect to the issue.

Since our last number went to press, Lord Dalbousie has delivered himself of the painful duty of pronouncing an *éloge* on the defunct railway board over which it has been his misfortune to preside. His Lordship stated, that "the Government having maturely considered the question, and having due regard to the constitution and operations of the committees of the House of Commons, and to the feeling which had been evinced by Parliament in the course of the present session, had come to the conclusion, that the Board of Trade should not in future prepare or submit to Parliament any report upon the merits of railway projects." He further said, that "the same preliminary steps on the part of railway companies which were now required, such as depositing with the Board of Trade a copy of the plan and a statement of the objects of the bill, would continue to be required. They would also be expected to deliver a copy of the bill when prepared; and if upon the examination of its provisions it should appear to the Board of Trade to be desirable, on public grounds, to direct the attention of Parliament to the nature of those provisions, the Board of Trade would be at liberty to submit to Parliament a report upon the subject, but in no case to pronounce any opinion upon the merits of the bill."

The determination of Government on this subject appears to have given universal satisfaction.

COGHLAN'S GUIDE BOOK FOR TRAVEL-LRES.—Now that our friends in "populous cities pent," town-wearied, are about to fly hastily to various parts of the world to get fresh ideas and health, we cannot do better than introduce to their notice Mr. Coghlan's extended guide book. Whether they propose examining the modern buildings of France, the town walls of Belgium, the cathedrals of Germany, or, later in the season, the glories of old Rome, they will find it a most serviceable companion.

NATIONAL EXHIBITION OF MANU-FACTURES.

WE mentioned some time ago that the committee of the Society of Arts, Adelphi, proposed to establish an exhibition of the products of British industry. They have now issued a preliminary prospectus soliciting promises of assistance from artists, engineers, manufac-turers and others. The prospectus says turers and others. The prospectus says justly: — Besides the delight and instruction which would certainly be afforded, it may fairly be expected that a periodical competition of this nature will exert some beneficial effect on the progress of the arts; not only by exciting honourable rivalry in the producers, but by enabling the consumers better to appreciate real excellence. The present moment seems particularly auspicious for making such an attempt. The triumphant success of two attempt. The triumphant success of two especially British products, the railway and the locomotive, has so united the remotest parts of these islands, that the exhibition, though taking place in the metropolis, would be rendered available to all persons, in all places; and would therefore be divested of much of that exclusiveness which might otherwise be objected to such a scheme.

Without entering into details, it may be stated, that the plan embraces the exhibition not merely of products, but of the instruments of production in actual work— the facility, rapidity, precision, and economy of the act of fabrication, being often much more wonderful than the fabric itself. In carrying out these ideas, it is intended entirely to exclude all private, personal, and political objects. It is hoped that the plan may be preserved so free from objection on these points, as to command the approbation of all ranks, and justify its promoters in anticipating the highest patronage.

Parties willing to assist in carrying out the proposition are invited to communicate with Mr. Whishaw, the secretary.

FREEMASONS OF THE CHURCH.

JULY 8.—The Rev. G. Pocock, L.L.B., in the chair. The minutes of the last meeting were read and confirmed. Mr. William J. Short, architect, and the Rev. F. Wrench, rector of Stowting, were elected members. The Right Hon. the Esrl Cadogan exhibited one of the columns of the bedstead of Pope Leo X.; an Italian carving of Arlimisia, and a carving of Rubens' Battle of the Bridge. Mr. G. Field exhibited the four seasons carved in boxwood by a Flemish artist of the seventeenth century, also a medal in carved wood of the sixteenth century, containing Greek and Latin inscriptions. Mr. B. Hertz exhibited a carved spoon of ancient Egyptian workmanship, a ram's head in ebony, a deer's leg in cedar wood, &c. Mr. J. W. Archer exhibited a monumental brass, enriched with enamelling of various colours, now being executed by him, and dedicated to the memory of Lieut. Colonel White by the officers of the Inniskilling dragoons. Mr. W. H. Rogers presented some impressions of seals of the middle ages from the seal of Boxgrove priory, Nutley Abbey, Bucks, and from the seal of the vicarage of Salisbury.

Mr. W. G. Rogers then delivered a lecture on wood-carving, and illustrated it with carv-ings of all ages He commenced by referring ings of all ages He commenced by referring to the neglect of the study of the art, and explained the difference between carving in wood and in stone. There is no branch of art which offers a larger field for investigation than the neglected subject of wood-carving. Disre-garded to too great an extent by the architects and sculptors of our own country, and scarcely considered worthy a place in its literature, its history contains facts of the greatest interest. The high antiquity of the art of carving in timber was referred to, and a glance given at its history from the earliest ages, tracing its progress among the Egyptians, Syrians, Jews, and its cultivation amongst the Greeks and Romans. Mr. Rogers endeavoured to account for the absence of Etruscan carvings, and enu-merated a few works of Oriental character. The impulse given to the art by christianity was noticed, and great stress laid on the extent to which carving in wood had been carried by the Norman and gothic architects. He no ticed a remarkable work of the former period in box-wood, in the cabinet of Mr. Cavan. The advantages and disadvantages of the

"Renaissance" were fully explained, and the pagan character of the wood-carvings of the period alluded to. After a few remarks on the loss of style, followed a catalogue of the principal carvings of antiquity, and those which in more modern times have gained the greatest celebrity. For instance, the lives of Demontrieul, the great wood-carver to the court of Marie Antoinette, Birbeck, the English, French, and Dutch carvers employed on the decorations of St. Paul's Cathedral, were severally noticed, and their works reviewed, not forgetting Grinling Gibbons, his works, his merits, his hoxwood portrait of Charles JI. in the Earl of Orford's cabinet, &c. The concluding remarks were on wood-carving at the present day, giving reasons for its decline, noticing carvings by machinery, and referring to the inventions and patents relating to the art.

After the lecture, Mr. Payne explained his process of injecting timber with a solution of iron, and exhibited numerous specimens which occasioned much discussion.

SAVINGS BANKS.

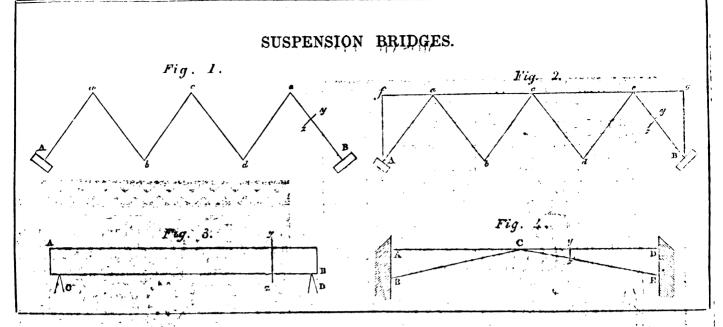

THE following comparative statement of progress, at specified periods, during the last seven years, has been forwarded to us by the secretary of the St. Marylebone Bank for Savings:

| | | | Open Deposit Account. | Sums invested with National D-bt Com- missioners. |

| | | | | |

Mr. G. R. Porter, in a sketch of the progress and present extent of Savings Banks in the United Kingdom, read at Cambridge, stated that these institutions owed their origin to Miss Priscilla Wakefield, who in 1804 induced siz gentlemen residing at Tottenham to receive deposits from labourers and servants, paying 5 per cent as interest. Four years later eight persons, four of whom were ladies, took upon themselves the same responsibility at Bath. The first savings bank regularly organized was formed at Ruthwell, Dumfriesshire; its success led to many imitations, so that before any legislative provision had been made for their management, there were seventy savings banks in England, four in Wales, and four in Ireland. In 1817 an act was passed to encourage banks of savings in England and Ireland, but it was not extended to Scotland until 1835. Of the value of these institutions there can hardly be two opinions.

TERRA COTTA CHURCH, BOLTON-LE-MOORS.

THE church of St. Stephen and All Martyre, in the new parish of Leverbridge, Boltonle-Moors, which is built entirely of *terra cetta*, from designs by Mr. E. Sharpe, as already mentioned in our pages, was consecrated on the 26th ultimo, by the Lord Bishop of Chester. The ground plan is cruciform, and at the west end is a tower, surmounted by an octagon, and a beautiful spire of open tracery, after the manner of Friburgh cathedral. The church has two entrances, the principal one at the west, and a small south one under the window of the south transept. The nave is paved with unglazed, and the chancel with encaustic, tiles. The font is a large basin of stone, enclose l in solid panels of *terra cotta*. The pulpit is at the angle of the chancel and north transept. The pews are low and open, with bench-ends and poppy-beads moulded in *terra cotta*, and painted. The north and south walls of the chancel are ornamented by an arcade below, with seats used as sedilia, and above by recesses with canopies. The east and west windows, and the tracery of all the windows, are filled with rich stained glass. The east window is by Willement, and the west (a memorial window to the Rev. George Langshaw, late Fellow of St. John's College), by Wailes, and is seen through a tower arch. The cornices and mouldings are enriched with texts; the chief of which are John vi. 53; Rev. xix., 9; Isa. lxiii., 5, 6; Wis. iii. 1—5; Rev. xx. 12; Matt. xi. 28-

SUSPENSION BRIDGES.

Siz, —I perfectly understood the nature of my communication to you the other day, but since I have to explain some part of it, let us quote the whole sentence to which your correspondent B. B. refers: —'I must differ from you in supposing that suspension is more likely suddenly to give way than compression bridges - IN proof of the contrary, I will instance the fall of the bridge across the Mill Fleam at Derby, those at Ashton-under-Lyne, and several others that have occurred lately, by which lives have been lost."

Here the failures at Derby and Ashtonunder-Lyne are merely brought forward to shew that compression bridges are as liable suddenly to give way as suspension bridges are; and in the following sentence, when I peak of the the following sentence, when I both suspension and compression bridges are built, none are particularized, though it alludes to all (that is all the bridges in which the horizontal forware apprenticularized, though it alludes to all (that is all the bridges in which the horizontal forware apprenticularized, though it alludes to sens, gute way, from the trivial cause of the mortan not being sufficiently dry at the time the centres were strack, and which was as effectually destroyed as when, in the other case, the workmanship in the pier was defective. This shews the truth of my position by supplying an illustration omitted in my letter.

The most orthodox way of discussing the question of a principle is by reasoning mathematically upon the subject, which would directly shew my statement to be correct, but as many of your readers may parhaps prefer a simple common-sense, though rough illustra-tion, to following me through the intricacies of the calculus, we will dispense, in this instance, with mathematics altogether. Suppose A a b c d e B, fig. 1, to be a viaduct consisting of three arches, and A and B the ex-treme abutment. Now, if from defective workmanship, or any other cause, either of these piers were to yield, all the arches would of course be levelled with the ground: or, suppose from the mortar not being sufficiently dy at any part, as y z, that part was to yield, the whole viaduct would be as effectually destroyed as in the former case, when one of the pters gave way. But if tension lines f a a c &c., be introduced, as in fig. 2, to the aper of each article, so as to prevent any concentration of high zonal force, then if either of the preve, as B, were removed, not all the structure would be destroyed, but only that portion $B \cdot g$: or if a failure were to take place at any section, $y \perp$, only a similar portion would be destroyed; the rest would remain as firm as ever. Again, let A B fig. 3, be a beam resting on fulcra C and D, either of which taken away, or a section z made, would cause the beam to fall. Bat if on the other hand the beam be of the form as fig. 4, one of the piers, as D E, may be re-moved, whilst the other would still stand, or a section z y may be made, and only that porz y E would fall, the rest would stand as firm as ever. Figs. 1 and 3 illustrate that principle

which I say is erroneous, and will leave your readers to judge if I am not right.

If the piers of my bridge were to give way, the bridge of course would fall, but if only one was to yield, that part which rested upon that pier only would fall, the rest would stand as exemplified in fig 4.

The reason why suspension bridges have not been employed for railways is because in the common catenary principle the roadway hangs by vertical rods, and is therefore subject to the same motion as the chains, which would endanger the passing train. This, however, ceases to be the case when the suspending rods are arranged obliquely, for then the borizontal force is taken from the chains and resisted by the roadway, which renders it rigid, and over which railway trains may pass with safety.

ON MOSAIC FLOORS AND TESSELLATED PAVEMENTS.*

LET us now glance at the modes in which the decorative arts have been brought into requisition for covering the floors and pavements of buildings, or of forming the pavements themselves. Here, as in other matters, the usages of different ages and of different countries mutually illustrate each other, by shewing that in many instances a fashion after dying away for centuries revives again into new life.

That variety of pavement or flooring which consists of mosaic or tessellated work was very extensively employed by the Romans, as is evidenced not only by the pavements of stillexisting buildings, but in the excavated ruins of Pompeli. The specimens of this art there brought to light are chiefly composed of black frets, or meandering patterns, on a white ground, or white ones on a black ground. The materials of which they are chiefly composed are small pieces of black and white mumble, and red tile, some larger than others, so as to take a deeper hold in the mortar than the gress, and thus form a sort of bondingcourse which gave stability to the whole. These pieces were set in a very fine cement, level as a base.

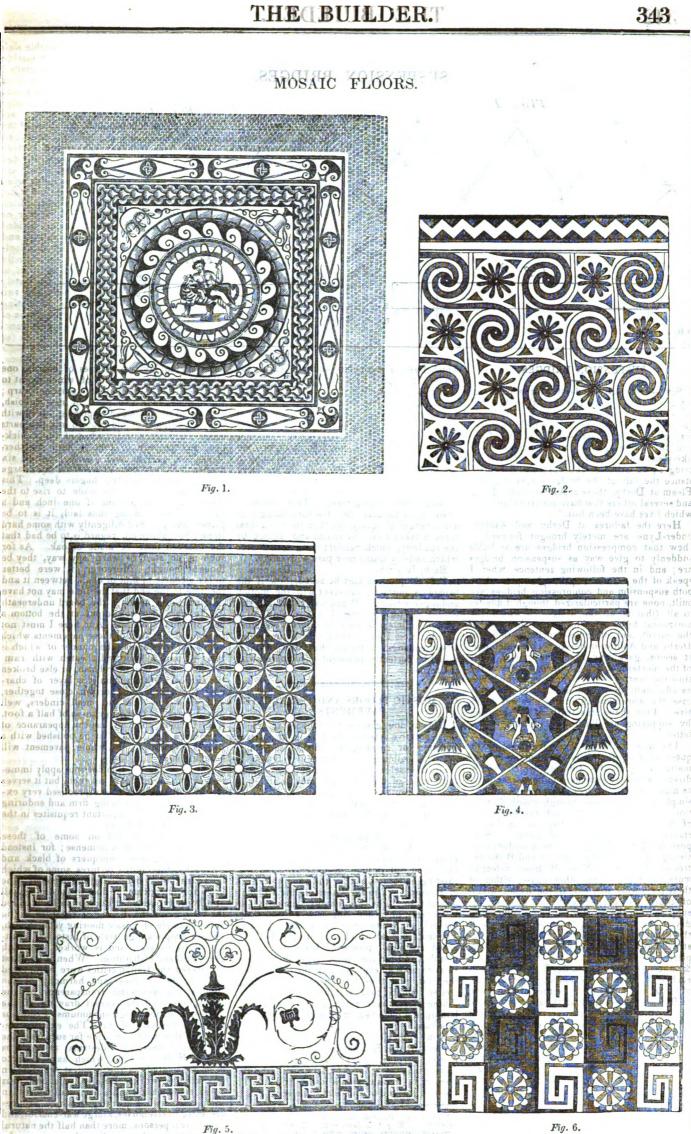

Pliny describes very minutely the plan adopted by the Romans in making cement or plaster terraces, which may have been the foundation or groundwork on which the tesseres or mosaic pieces were laid. "To make a terrace of this sort," he says, "it is

• From the "Pictorial Gallery of Arts," part vi., published by C. Knight, Ludgate-street. This work presents a mass of instructive matter profusely illustrated by woodcuts, at a cost singularly small. We cordially recommend it to our readers.

necessary to lay two courses of boards, one athwart the other, the ends of / which ought to be nailed, that they should not twist nor warp ; which done, take two parts of new rubbish, and one of tiles stamped to powder; then with other three parts of old rubbish mix two parts of lime, and herewith lay a bed of a foot thickness, taking care to ram it hard together. Over this must be laid a bed of mortur, six fingers thick, and upon this middle layer large paving-tiles, at least two fingers deep. This sort of pavement is to be made to rise to the centre in the proportion of one inch and a half to 10 feet. Being thus laid, it is to be planed and polished diligently with some hard stone; but, above all, regard is to be had that the boarded floor be made of oak. As for such as do start or warp any way, they be thought nought. Moreover, it were better to lay a course of flint or chalk between it and the lime, to the end that the lime may not have so much force to hurt the board underneath it. It were also well to put at the bottom a bed of round pebbles. And here I must not forget another kind of those pagements which are called Græcanica, the manner of which is this :--- Upon a floor well heaten with ram-mers is haid a bed of rubbish, or else broken tile-shards, and then upon it a layer of charcoal, well beaten, and driven dose together, with sand and lime and small cinders, well mixed together, to the thickness of half a foot, well levelled; and this has the appearance of an earthen floor; but if it be polished with a hard smooth stone, the whole pavement will seem all black."

The above description does not apply immediately to mosaic floors as such, but it serves to show that the Romans practised very extensively the art of forming firm and enduring plaster, one of the important requisites in the production of such floors.

The labour bestowed on some of these mosaics must have been immense; for instead of representing mere checquers of black and white, they form entire pictures, some of which have great beauty of drawing and of colour. The large specimen from the floor of the dining-hall of a house excavated at Pompen in 1829, called the "House of the Faun," is regarded as the finest example of mosaic flooring yet met wish, since it adopts a figh style of historical printing as its subject, and is worked out with great skill and elaboration. When it was first discovered the Italian critics were eproptured with it; the vividness and harmony of the colours, the wonderful transparency of the atmosphere, and the correct drawing of the figures, called forth pigh encomiums. Professor Quaranta has said of it: "The extreme delicacy of this work in marble far surpasses the celebrated mosaic of Palestrina, as well as that of Hadrian's villa, which have hitleerto been considered as the greatest wonders in this kind of work. Besides, what are four doves, some masks, and a few small figures, in comparison with a painting in which are represented twelve horses, a large war-chariot, and twenty-two persons, more than half the natural size, without reckoning those that were on the left side, which is almost wholly destroyed?

5. yill be persons, more than half the natu toout reckould those that were on t itsout reckould the almost wholly destroyed. It is impossible to describe the consummate skill with which so many figures are arranged and grouped in this confined space, or the truth and correctness of the drawing, the distribution of light and shade, the effect of the colours, and scrupulous attention to the minutest accessories. Michael Angelo and Raffaelle might have been proud of the dying horseman; and Alexander's Bucephalus, the horses of the quadriga, the others that lie on the ground wounded, and especially the one rearing and fore-shortened, are drawn with a boldness and truth in their motions and positions which the greatest modern painters, Raffaelle not excepted, might envy." This praise is perhaps injudiciously glowing; but there can be no doubt that this mosaic must be a wonderful specimen of the art. The subject is supposed to represent one of the battles between the Persians and the Greeks. The odd conceits at the bottom seem of a far inferior stamp, and are probably the work of another hand.

Various other very remarkable specimens of mosaic have been from time to time brought to light in different countries. At the end of the last ceutury a mosaic pavement was discovered near Seville, in Spain, at a small depth below the surface of the ground. It was forty feet long by thirty wide, and contained in the centre a representation of the circus-games of the ancients, while on three sides were circular compartments containing figures of the Muses, &c. In the race-course a busy medley of events was depicted, such as a chariot overturned, the charioteer thrown, horses in confusion, and horsemen dismounted; while several apectators are looking on at the sports. In the compartments, besides the representations of the Muses, were centaurs, children in variously-coloured tunics, and animals of various kinds. The floor between the different compartments also exhibited various birds, fruits, and flowers, and great diversity of colour was exhibited throughout the whole.

Another specimen, dug up near Lyons, was composed of small cubes of marble, interspersed in some places with pastes of different colours. In this, as in the specimen just alluded to, the whole details of the circusgames were represented; it comprised no fewer than eight chariots, which appeared as if they had started at once, some of which had fallen, and the horses and charioteers fallen. Spectators surrounded the scene, and seemed to regard it with eager interest.

The representation of pictures by means of mosaic for flooring or pavement was not the only variety known to the Romans. That ingenious people also formed patterns of a more or less elegant kind by the arrangement of small cubes of marble, or stone, or plaster previously coloured. The six cuts annexed give specimens executed apparently either by the Romans or while the Romans were in power. It is frequently the practice to denominate as "mosaic pictures nominate as "mosaic pictures" those which represent scenes or events, and as "tessel-lated pavements" those which exhibit simpler designs, generally in two or three colours only. The most beautiful specimen of Roman pave ment yet discovered in London is that represented in fig. 1. It was dug up in the year 1803, in Leadenhall-street, immediately in front of the eastern column of the portico of the the East India House. It lay at the depth of only nine feet and a half below the street; a sewer had cut away a considerable portion of it, but the central compartment, about eleven feet square, was nearly perfect. The whole is supposed was nearly perfect. The whole is supposed to have formed the flooring of a room about twenty feet square. "The device occupying the centre was a figure of Bacchus reclining on the back of a tiger, holding his thyrsus erect in his left hand, while a small two-handled drinking-cup hung from his right; a wreath of vine-leaves circling his forehead, a purple and green mantle falling from his right shoulder and gathered round his waist, with a shoulder and gathered round his waist, with a sandal on his extended left foot, the lacing of which reached to the calf of the leg. This design was surrounded by three circular borders, the first exhibiting on a party-coloured field, composed of dark grey, light grey, and red ribands, a serpent with a black back and white belly; the second, a series of white cornucopiæ indented in black; the third and innermost, a succession of concave sources and innermost, a succession of concave squares.

In two of the angular spaces between this last circle and the circumscribing rectangular border were double-handled drinking-cups; in the other two, delineations of some unknown plant; both figures wrought in dark grey, red, and black, on a white ground. The square border surrounding the whole consisted of two distinct belts, one described as bearing some resemblance to a bandeau of oak in dark and light grey, red, and white, on a black ground; the other exhibiting eight lozenge figures, with ends in the form of hatchets, in black, on a white ground, enclosing circles of black, on each of which was the common ornament, a true lover's knot. Beyond this was a margin, at least five feet broad, formed of plain red tiles each an inch square."—London, No. xvi.

Many other specimens of Roman pavement have been dug up in the various alterations which London has undergone within the last half century. Thus in the course of digging the foundation for an extension of the Bank of England, in 1804, a tessellated pavement was found at a depth of about eleven feet below the surface, and is now deposited in the British Museum; its dimensions are only about four feet each way, and it occupied the centre of a floor about eleven feet square. In Cannon-street, in Holborn-hill, in Crutched-friars, in Broad-street, in Fenchurch-street, in Longlane, in Eastcheap, in Lothbury, in Crosby square, and in Threadneedle-street, specimens of these pavements have been brought to light : thereby shewing that the use of such flooring was very common among the Romans. No longer ago than the year 1841, a specimen was found in the course of pulling down the French Protestant Church, in Threadneedle-street, still glowing with wonderfully fresh and vivid colours.

The Modes of producing Mosaic Floors.

The manufacture of all these varieties of inlaid floors or pavements, whether we call them mosaic or tessellated, depends on the arrangement of small coloured pieces in a definite pattern, the shapes being adapted to each other, and the whole brought to a uniform level. The mode of proceeding, however, differs considerably, according as a mosaic picture or pavement of tessellated tiles be the object in view. We will speak therefore of the former of these two, and then of the latter.

Where a picture rather than a pavement is required, enamel rather than stone is the material employed, as presenting greater facilities for adjustment in a delicate manner. There is first prepared a frame-work or foundation; then a layer of cement into which the mosaic may be imbedded; and lastly the mosaic pieces themselves. The frame-work, formed either of marble or of a volcanic stone called "piperino," is hollowed out to the depth of three or four inches, over the whole surface, except a portion to form a border at the edges. Grooves or channels, about one inch and a half in depth, are cut in the excavated hollow of the marble, somewhat wider at the bottom than the top, as a means of retaining the cement afterwards applied. The subsequent mode of proceeding is described somewbat minutely by Mr. Cadell, who witnessed the operations in Italy a few years ago; and to his account we will have recourse.

The early mosaic-workers used, as a cement in which to imbed the mosaic pieces, a mixture of one part of slaked lime with three parts of pounded marble, made into a paste with water and white of egg. But this paste is considered by the modern artists to barden too quickly, so that it solidifies before the workman has time to insert the pieces. It is therefore superseded by a mixture of one part of slaked lime with three of powdered travertine stone, mixed up with linseed-oil, and stirred and worked every day with a trowel; the mass is at first level on the surface, but afterwards swells up; each day more oil is added, to prevent it from becoming dry and intractable; and the mass, bearing some resemblance to a smooth ointment, is ready for use in a period varying from twenty to thirty days, according to the season of the year. The next point is the preparation of the

The next point is the preparation of the enamel pieces to form the mosaic. The materials, consisting of glass mixed with metallic colouring-matter, are heated for eight days in a glasshouse, each colour in a separate vessel. The melted enamel is taken out with an iron

spoon, and poured on a polished marble slab placed horizontally, and another flat marble slab is laid upon the surface of the melted enamel, so that the enamel cools into the form. of a round cake three-tenths of an inch thick. In order to divide these cakes into smaller pieces, each one is placed on a sharp steel anvil, called a "tagliuolo," which has the edge uppermost, and a stroke of an edged hammer is given on the upper surface of the cake: the enamel is thus divided into long square strips or prisms, which are cut to a length of nearly an inch. For small cut to a length of nearly an inch. For small pictures the enamel, while in a melted state, is drawn into long quadrangular sticks, which are divided across by the anvil and hammer, or by a file. Sometimes these pieces are divided by a saw without teeth, used with emery, and the pieces are sometimes polished on a lapi-dary's wheel. Gilt enamel is occasionally used : this is formed by applying gold-leaf to the hot surface of a brown enamel immediately after it is taken from the furnace, the two being made to adhere by a subsequent heating in the furnace. The colours of the pieces of enamels for producing a picture are extraor-dinarily numerous and varied. There is (or dinarily numerous and varied. There is (or was twenty years ago) a manufactory of mosaic pictures belonging to the Pope at Rome, situated in a large building southward of St. Peter's. In this building, the enamela, in the form of sticks about an inch in length, are arranged in a suite of rooms accord-ing to their tints; these tints are seven-tern thousand in number, all arranged in labelled drawers, boxes, and cases, from which they are withdrawn to be used by the artist very much in the same way as a compositor uses type for printing, the colours in the one case being somewhat analogous to the letters in the other.

The frame-work, the cement, and the enamels being thus all prepared, the artist pro-ceeds as follows :- The cement is laid on in small and convenient portions at a time, to the required thickness, and brought very smooth and level at the surface. The artist then, with the picture which he is to copy before him, selects one after another sticks of enamel of the proper colours, and imbeds them in the cement, taking them up and inserting them with forceps, and fixing them into the cement with a small flat wooden mallet, until their surfaces are level. If the effect does not please the artist, he takes them out and re-arranges them. The cement remains suffiarranges them. The cement remains suffi-ciently soft for a fortnight or three weeks, so that the workmen takes care to lay on no more cement at once than he can cover with enamel before it hardens. When one part of the picture is thus represented, more cement is laid on, and another part is done in a similar manner until all is enamelled. As there are likely to be minute crevices between the bits of enamels, they are filled up with powdered marble or enamel mixed with wax, which pe-netrates by having a heated iron passed over When the enamel has remained in its position two months, so as to allow the cement to harden, the upper surface is ground down and polished by means of a flat stone and emery—an exceedingly laborious process. Such is the mode in which the delicate

Italian pictures of mosaic enamel are produced, a mode necessarily involving a large expendi-ture of time and money. At the manufactory at Rome, to which allusion has been made above, mosaic-work is conducted on a large scale; the different materials are arranged in numerous apartments, from whence they are removed by the artists as occasion requires. Besides this establishment, there are many artists in Rome occupied in smaller works, such as pictures of birds, insects, flowers, and other objects not exceeding 2 or 3 inches scross; for such small specimens a frame-work or foundation of hardened copper is used instead of one of marble. As an example of the ex-traordinary minuteness of the work in some of these mosaics, we may state that there is one specimen, a portrait of Pope Paul V., in which the face alone consists of more than a million and a half of fragments, each no larger than a millet seed! and from this size up to 2 inches square, pieces are employed in various ways. celebrated specimen was one which nother Napoleon ordered to be made when his power was paramount in Italy. It was to be mosaic copy of the celebrated "Last Supper, be 🛔 by Leonardo da Vinci, and to be of the same

size as the original, viz., 24 feet by 12. The artist to whom the task was intrusted was Giacomo Raffaelle, and the men under his direction, eight or ten in number, were engaged for eight years on it. The mosaic cost more than seven thousand pounds, and afterwards came into the possession of the Emperor of Austria.

Such, then, is the mode of producing the delicate specimients of mosaic which are adapted rather for pictures than for floors or pavements. The latter are produced in a rougher way, with less costly materials, and in pieces of larger size. In most cases the separate pieces are called "tiles," and are made of prepared elay, though in other instances pieces of marble or stone are employed. Of the pavement before alluded to, as having been dug up near the East-India House, in Leadenhall-street, Mr. Fisher remarks:--"In this beautiful specimen of Roman mosaic, the drawing, colouring, and shadows are all effected with considerable skill and ingenuity by the use of about twenty separate tints, compowed of tesselike (cubical pieces) of different misterials, the more brilliant colours of green and purple, which form the drapery, are glass. These tesselike are of different sizes and figures, adapted to the situations they occupy in the design. They are placed in rows, either straight or curved, as occasion demanded, each tesselia presenting to those around it a flat side: the interstices of mortar being thus very narrow, and the bearing of the pieces against each other uniform, the work in general possessed great strength, and was very probably, when uninjured by damp, nearly as firm to the foot as solid stone. The tesselike used in forming the ornamented borders were in general somewhat larger than those in the figures, being cubes of half an inch."

The ecclesiastical architecture of the middle ages was one of the means of reviving the use of tessellated pavements; for many specimens of tiles, once used for this purpose, are from time to thme discovered in such buildings. A chequered flooring of black and white marble might be deemed a sort of mossic; but the specimens here alluded to were tiles, each of which had its own pattern, independent of the combined pattern which all might have presented when laid side by side. In the Norman churches it was a frequent custom to lay down such tiles as a flooring for the high altar, and before shrines: at first these tiles were irregularly shaped, and were formed of glazed brick or pottery, painted with some Scripture device on the surface; but afterwards the plan was adopted of using carefully squared pieces, so as to produce greater neatness of joint. Wreaths, circles, heraidle ornaments, and various other devices, were painted upon the tiles, together with griffins, spread-eagles, fleur-de-lis, &c. Various animals, such as the fox, the cock, and others, supposed to have had a symbolic meaning, were also adopted. It was long known to antiquaries that a mossic pavement existed in the Chapter-House at Westminster, and this was laid open to

It was long known to antiquaries that a mossic pavement existed in the Chapter-House at Westminster, and this was laid open to view a few years ago, when the tiles, each of which bore a particular device, were found to exhibit as brilliant colours as when first laid down, the sizes varying from about 6 to 10 inches square. At Little Marlow Priory, at Lewes Priory, and at Great and Little Malvern, other specimens have been met with. Towards the close of the last century the attention of antiquaries was directed towards a mosaic pavement found at Caen in Normandy, the separate tiles of which were supposed to be embliszoned with the heraldic bearings of the barons who accompanied William of Normandy to England. The pavement is supposed to have belonged to a building forming part of a convent or abbey built by William and to have covered the floor of a ball measuring 150 feet by 90. The tiles were about 5 inches square, made of baked earth. Eight rows of the tiles, running from east to west, bore the arms of William's followers, and between these were ornamental compartments of tiles, formed so curiously into a maze or labyrinth, that it is said the windings of the lines forming the figure or device in each compartment extended to a mile in length. Of the state of this pavement at the time of the French Revolution, Dr. Ducarel said, "Not-

withstanding these rooms have been used as granaries upwards of four hundred years, neither the damps of the wheat, the turning and shifting of the grain, nor the wooden shoes and spades of the peasants, constantly employed in bringing in and cleansing the wheat, have in the least damaged the floor, or worn off the painting from the tiles. The only injury this floor has received is the taking up some few of the tiles in order to open funnels through the floor for the more ready conveyance of the corn into the rooms beneath."

Tessellated pavements, like stained glass, have recently come again into fashion, in giving to ecclesiastical buildings a richness of decoration which has not been customery decoration which has not been customary during the last few centuries. Many such pavements have been laid down in churches within a recent period, of which one of the most notable specimens is in the Temple Church at London. This pavement was made Church at London. This pavement was made because, on renovating this ancient and beauti-ful building, it was found that a tessellated pavement had formerly existed there, which had for ages been buried beneath a pavement of another kind. The following is a description of the new tessellated flooring which has attracted so much the attention of the visitors to the Temple Church within the last two or three years :-- " The ground is a dark-red or chocolate, but so elaborately covered with the amber or yellowish ornaments as to make the latter the prevailing hue. The patterns form first, divisions of various breadth (the widest in the centre of the central avenue), extending side by side, from the entrance-door to the farthest end of the chancel. Within each division there is no alteration of pattern, but the divisions themselves, as compared with each other, present considerable differences. The two most striking are those next to the broad central one, where, as we pace along, we have the lamb on one side of us and the winged horse on the other, the emblems of the two societies ('Middle Temple' and 'Inner Temple') to which the church belongs. The former is founded on the device of St. John; the latter, it is supposed, on the poverty of the Knights Templars at the outset of their the Knights Tempiars at the outset of their career, when two knights rode one horse. Among the other ornaments of the pavement are a profusion of linked-tailed animals in heraldic postures; lions, cocks, and foxes; tigers, with something very like mail upon their shoulders; basilisks and other grotesques. There are also copies of designs of Anglo-Saxon origin, as figures playing musical instruments; and one illustrative of the story of Edward the Confessor, the evangelist John and the ring, a design which at once tells us from whence the materials for the pavement have been borrowed, viz., the Chapter-House, Westminster Abbey. The pavement formed by the tiles is as strong and imperishable as it is beautiful. The tiles are perforated all over with small holes in the under side; consequently, when they are laid in the cement pre-pared to receive them, and pressed down, the latter rises into these perforations, and harden-

latter rises into these perforations, and hardening there, binds the whole indissolubly together."-London, No. 102. The tessellated tiles of past ages were frequently, if not generally, called "encaustic" tiles, by which we are to understand (if the name be correctly applied) a kind of tile in which the device is in some way or other "burnt in," such being the meaning of the word "encaustic." Now, if the pattern were merely painted on the surface, and then burnt in or virified by the action of a furnace, the tiles would scarcely come under the denomination of mosuic or tessellated; and such seems to have been the case in many instances, so far as can be gathered from the descriptions. There was discovered, some years ago, near Malvern, an ancient Roman kiln, in which it is supposed encaustic tiles were baked. It consisted of two parallel arches about 35 feet in length, each 2 feet 3 inches wide by 15 inches high. These arches were composed of layers of brick and tile, and had a flooring composed of a less vitrifiable kind of clay than themselves. Below the floor was the fire-place, about 15 inches in height, and there was a flue at each end of the arches. Near the kiln were found several tiles similar to those in Malvern Church; and from this circumstance the purpose of the kiln itself has been inferred,

Whatever may have been the process followed by the early artists, the tessellated tiles now coming into use for pavements and floors are made by moulding and burning, but without any painting, properly so called. At the large porcelain-works in Staffordshire, Worcester, and elsewhere, this is becoming a regular branch of manufacture, and is conducted (in one of its forms at least) in a manner which we will now briefly describe.

The tessellated tiles are made of two differently coloured clays, one embedded in the other, and disposed so as to form an ornamental device. Three or more colours may be used by somewhat varying the process, but two is the usual number; and whatever may be the colours, the tile is first made entire in one colours, with a depression to be afterwards filled up with clay of one or more other colours. We will suppose the tile to present two colours, a yellow device on a brown ground. In the first place the modeller forms in stiff clay on evert model or repreforms in stiff clay an exact model or repre-sentative of one of the tiles, about an inch thick, cutting out to the depth of a quarter of an inch the depression which constitutes the device. When this is properly dried, a mould device. When this is property drive, a mean is made from it in plaster of Paris, and from this mould all the tiles are produced one by one. The ground-colour of the tile is that This This, which is adopted to cast in this mould. which is adopted to east in this mould. This, which we suppose to be brown, is mixed with water to a stiff consistency, and pressed into the mould by the aid of the press. On leaving the press it presents the form of a damp, heavy, square tile of clay, with an or-namental device formed by a depression below namental device formed by a depression below the common level of the surface, as in the ori-ginal model. The next stage is to fill up this depression with the yellow-coloured clay, so as to bring both colours to a common level. To effect this the yellow clay, so far from being made stiff like the first, has a much more fluid consistency. The tile being laid on a bench, the workman plasters the y llow clay on it by means of a kind of trowel, filling up every part of the depressed device. When this is completed, the tile is allowed to remain six or eight weeks, to dry gradually, as a displacement at the joints would occur if the outer surface became quite dry when the interior was yet wet. Each tile is next scraped all over the surface with an edge-tool, till the superfluous portion of the second clay is re-moved, and the two clays be rendered properly visible, one forming the ground and the other the device. In this state the tiles are put into a kiln or oven, where they are baked in a manner nearly resembling the baking of earthenware or porcelain, the degree and duration of the process having especial reference to the kinds of clay used. Here a point is involved which calls for much attention on the part of the maker. As one of the clays is used in a more fluid state than the other, it would, under most circumstances, contract to a greater degree by heating; but the selection so made that, notwithstanding the difference of consistency in the two clays, they may con-tract equally, and leave no unsightly gaps at the joinings. When the tiles are sufficiently baked, they are cooled gradually, and then dipped into a vessel of liquid "glaze," in the same manner as articles of porcelain. After this they are exposed for twenty-four hours to the heat of a "glazing-oven," by which the gluze is made to adhere to surface, and the tiles then appear with whatever ornamental device may have been designedly given to them them.

HOLBORN AND FINSBURY SEWERS.

THE result of the last meeting of the commissioners for Holborn and Finsbury was rather unusual. All the tenders sent in for the Gray's-inn-lane sewer exceeded the surveyor's estimate very largely, and neither was accepted; and for the Charlotte-street sewer, (Bedford-square) 3,400 feet long, estimated at nearly 4,000*l*., only one tender was sent in and this was returned unopened. The following is a list of the tenders for the Gray's-inn-lane and Liquorpond-street sewer, 800 feet in length :--

CONSTRUCTION OF ICE-HOUSES.

Sin, Will you allow me to ask a question, through the medium of your year, useful paper, in which questions and answers from time to in which questions and answers from time to time from verious subscribers, form Argincon-siderable part? In the month of January last I built on joe-house at the back of mycellar, which is under ground, huilt and arebad over with 14-inch brickwork, the door opening into an area. On extravating for the ica-house to about the depth of 19 feet, I found a spring of water, which I thought would be available for the house. I carried the excavation down to the depth of 30 feet, steined the well with Sisch brick-work, and formed a door of feet up from the work, and formed a lieosolisident up framithe bottom (the height of the water being 9 feet); the floar was of la inch plank, perforsted with holes to lead any water from the ice into the well. Before filling, A with thick is, 1 put on a layer of straw ever the floor of the house was built and domed over with 9 ight bricks. was built and domed over with 9-inch brick, work, and well compo'd inside and outside, with 3 feet of earth on the top. Six feet under the dome, a little above the sellar floor, I inserted a cover of 13 inch mank, with man-hole, and had an inner, and patters down, heading into it from the cellar, also, an outer cellar-door: but notwithstanding all these precau-tions the ice has disappeared. If should feel much indebted to say of your readers by their informing me in what yay I have erred, and what remedy I can adopt to prevent a recurwhat remedy I can adopt to prevent a recu rence.—I am, Sir, &c., A SUBSCRIBER. Paddington, July 3, 1845. ecur-Tence.

• No ice could possibly remain in such a

receptacle, as the water in the well would speedily reduce the ice to its own temperature. Our correspondent must get rid of the water-well, - introduce an additional wall all round the inskin of the house and over the floor (keeping a spara between), and provide means for carrying off such water as may be produced by the melting of the ice, without the risk of intro-ducing air. There should be at least three ducing air. I here should be at least three doors, and the space between two of them should be alled with straw. The greatest care is requisite in the construction of ice houses to prevent the access of heat.

008.9 INON AND THE IRON TRADE.

THE were held last week at Wilsell on Tuesday ; Wolverhampton on Wednesday ;

Birminghara, op. Thyreday; Stourbridge on Friday, and Dudley on Saturday. During the dast quarter some houses had re-threed the price of har iron from 101. to 81. per tan, and k size arranged at the Birming the meeting that a general reduction to the last quoted price should be made of a way, hawaver, weeved; is accordinct with the trust practice; that the final confirmation of the reduction should emanate from the Budley meeting, and at the close of the basiness hast Saturday, the prices were declared as follows - bar iton St. per ton; pigs from Bl"POs."ta'4."per ton; How long they will remain at the reduction is uncertain, but there is no great danger of a sudden advance. The fluctuations which a sudden advance. The fluctuations which have latterly taken place have been of considerable embarrassment to the trade, and rendered is very difficult for the manufacturer to know how to purchase. The general impression is that $\mathcal{B}(\kappa)$ is a remunerative price, and the masters being well aware, that the manufac-ture scannot compete with the foreign market vancing they pay a higher price for the inter-if they have to pay a higher price for the ing in the material will we the input in the input of a main ad-vancing the prices adless under some very extraordinary offermistances.

extraordinary bill combinades. "While on the subject of tron, we would men-tion that at the late meeting of the Britten Association," at Osmbridge, Dr. Lyon Playfahr reads report, prepared by Professor Bunsen, and himself, on the chemical changes occurring in iron furnaces. Buring meny years the atten-tion of scientific men on the Continent/had been directed to the employment as fael of the combustible gases that escape from the mouths of furnaces. Dr. Playfair and Professor Builfrom different heights of the furnace, and gave tabulated results of their analyses, the results of which were that for a depth of 24 feet down the body of iron hot-blast furnaces worked with coal there is no available heat for the melting of the metal, the

THE BUILDER

whole, of the heat for that extent of the furnace being employed in distilling the coal. The important fact which they established by their experiments is, that in common hottheir experiments is, that in common hot-blast furnaces, as at present employed, ninely-one per cent. of the heating power of the fuel is lost; that is, only nine parts out of one hundred are effective, the remaining portion being carried off in gases. It was proposed, therefore, to collect the gas as it issues from the furnace mouth, and to employ it usefully in various parts of the works, though they did not recommend the re-introduction of such not recommend the re-introduction of such gas, into, the, furnace, for, smelting the metal. Dr. Playfair said that these researches had led Dr. Playing said that these researches had led, them to the consideration of a new system of manufacturing, iron, which would produce a complete revolution, in the present mode, but they had not had aufficient, time to digest the plan to authorise them to recommend it to the sanciation; if would form the subject of their labours for the pert year.

NOTES FROM THE PROVINCES.

It is in contemplation, at Yarmouth, to en-large and restore St. Nicholas' Church, and to convert the remains of a priory on the south side of the churchyard into a national school. The estimated expense is between 4,000*l*, and 5,000*l*. St. Nicholus' Church, to an ordinary observer, appears little better than a dilapitated disproportioned and unsightly erection, but to the eye of the antiquary it presents beauties and attractions of no ordinary character. It is one of the oldest parochial edifices of the kind in England; a great peculiarity, and one in which it perhaps stands alone amongst the churches of Christendom, is in having its nave considerably smaller than the sisles, both in regard to length and breadth. The remains of the priory are now being used as a stable. They still contain two very beautiful windows and other specimens ancient ecclesiastical architecture. Many of the corbel beads have been removed only within a very few years. Mr. Hakewill is the architect. The principal difficulties con-nected with the Woodhouse tunnel, on the Sheffield, Ashton-under Lyne, and Man-chester Railway have been overcome. From Shemeld, Ashton-under Lyne, and Man-chester Railway have been overcome. From the mouth of the tunnel to a little beyond the first shaft there is upwards of 1,200 yards completed, being arched, having side drains and the rails laid. Between the first and second shafts the arching for a considerable distance is finished. The whole of the exca-vation is completed with the exception of about 300 yards. The depth of the first shaft is 183 yards, and of the second 193 yards. The highest point of ground under which the tunnel passes is situate between the third and fourth shafts, and is 536 yards above the level of the sea at low water. The York and Scarborough Railway was opened on the 7th instant. The directors and their friends started from York, after partaking of a splendid breakfast in the Town Hall, in 36 carriages, each containing 18 persons. Near to Castle Howard the train stopped to take up Lord Morpeth, who had provided refreshments for the occupants of the provided refreshments for the occupants of the train. After remaining a short time at Scarborough the company returned to York, and dined at the Town Hall. — During the past winter the beautiful grounds adjoining Alton Towers have been greatly im-proved under the direction of Mr. W. A. Nes-field. The upper terraces and slopes have been decorated with groups of marble statues and colorast marble vaces interpresed with an colossal marble vases interspersed with rose trees and beds of exotic flowers. The growth of the trees, particularly the evergreens, were beginning to hide the architecture. Many of these have been removed, and the beautiful these have been removed, and the beautiful stone work of the scalleped walls and vases are brought to light again, and stand out in bold relief, against the rich background of forest, trees. The Earl, and Countess of Shrewabury permit the bouse, with its gal-leries of paintings and works of art, as well as the gardens, to be shewn to respectable per-sona, who can obtain cords for admission on who can obtain cards for admission on sons. engaged in improving the senatory condition of their town. The sewerage has been disgracetheir town. The sewerage has been disgrace-fully neglected for many years. A capacious reservoir, 30 yards long and 4 feet in depth, has been found to be full of filth, it not having been cleared during the last 30 years.

Her Majesty and suite unexpectedly attended divine service at Whip-ning ham church during their last visit. האונגלי לימי לטיצט בנוצא איי

THE BUILDER

CITY IMPROVEMENTS. — At a Court of Common Council recently held, "Mr. R. L." Jones brought up the report of the London-bridge Approaches Committee, to whom it was referred to examine the allegations in the network of the tikehitteit of the courts data. was referred to examine the anegations in the petition of the inhabitants of the north side of the ward of Farringdon-without, for the com-pletion of the improvements at Farringdon New street and Holborn-bridge, with instructions to report their opinion upon the expe-diency of carrying out those proposed improve-ments. It stated that the committee had viewed the new line of street, and the projecting houses on the north side of Holborn-bridge, and directed the clerk of the works to report his opinion as to the estimated value of report his opinion as to the estimated value of those houses, and also to report the probable amount of the cost of the improvement, det ducting the value of the surplus ground which they had subsequently received reports from the clark of the works, from which it appeared that, exclusive of law charges, the probable cost of completing the line of improvement at Holborn-bridge, after deducting the value of The surplus ground, would amount to 14,500%. That the committee having dily considered all the circumstances, were of opinion that it was desirable for the City to complete the line of improvement at Holborn-bridge, by pur-chasing and setting back the said houses, pro-vided suitable means and powers could be obtained for that purpose; and they were further of opinion that an opportunity would at the same time he afforded for effecting an addi-tional improvement of Holborn-hill. The committee, therefore, felt it their duty to draw committee, therefore, felt it their duty to draw the particular attention of the court to the pro-priety of taking measures to carry out these objects, and they recommended the same ac-cordingly. That they had caused the vaults to be constructed on both sides of Farringdon-timest and had already lat elsewn of the late street, and had already let eleven of the lots street, and had already let eleven of the lots of ground in that street on building leases, and were taking measures which they trasted would ensure future lettings, so that the whole of the improvement, so far as the City was concerned, might be completed without delay, and that they were the more strengthened in that opinion in consequence of the measures in progress for carrying on the new line of street progress for carrying on the new line of street in the county of Middlesex.

Reputtion in the Paice of Gas. The Chelmsford Gas Company have resolved to reduce from Michaelmas next to those who burn with meter the price of gas from 10s. per 1,000 feet (the sum hitherto paid) to 8s. 4d. They have also determined to allow 10 per cent. to those whose consumption in the year is 40,000 feet and inswards thus in effort hower. cent. to those whose consumption in the year is 40,000 feet and upwards, thus in effect lower-ing, the price to 7s. 6d. per 1,000 feet. The Barnsley Gas Company have agreed to reduce the price of gas from 9s. to 7s. 6d. per thou-sand cubic feet from the 1st instant. The sand cubic feet from the lat instant. The Birmingham Old Gas Company have given notice, that from the present time the price of gas to consumers under 5,000 cubic feet per quarter, will be 6s. 8d. per 1,000; to those consuming upwards of 25,000 cubic feet per quarter, 5s. 8d., and to consumers above that quantity 4s. 6d. per thousand cubic feet. New Schools AND CHURCHES IN Science.

WARK .--- In consequence of the great want of schools and church accommodation in Southwark and the adjoining parishes of Bermondsev, Lambeth, and Newington, a committee has been formed for the purpose of raising funds by subscription to be applied towards the erec-tion and endowing of several additional schools and churches in those districts." Her Majesty and churches in mose districts." Her Majesty has contributed 2002., and Prince Albert 1002. The Archbishop of Canterbury Fives 1,0002, and the same annown is subscribed by the wealthy brewers, Messrs. Bardlay, Perking, and Co. The contributions stready amount to opwards of 11,0002, and 2005 stat south

POLONCEAU'S POLONCEAU'S BITUMEN PAVE-MENT for paving Foot walks, Terraces, Gandan walks, Stables, Coach Houses, Granaries, Corn Stores, and Salt Warehouses. For the exclusion of Damp and Vermin in Basements it is particularly adapted, and for Boofing Dwell-ing Houses, Porticos, Balconics, and Sheds. Price 33: 6d. per square yard. BITUMEN for covering the Arches of Bridges, Culverts, &c. &c. on Railways and other places (with instructions for laying it down), may be had at the rate of 45s. per ton, by applying to JOHN PILKINGTON, 16, Wharf-road, City-road. BITUMEN

BASTENNE ASPHALTE and BITU-MEN COMPANY, Offices, 31, Poultry. The Directors of this Company beg leave to call the atten-tion of ARCHITECTS, BUILDERS, and others, to the very beneficial results attendant on the use of BITU-MEN in the erection of buildings, &c. Its application as a FLOORING will be found eminently useful. It is also valuable for numerous other purposes, more par-ticularly where the object sought for is the EXCLUSION OF DAMP AND VERMIN. The Directors beg to refer to the works in Trafagar-square, which have given general satisfaction. Scale of prices per foot square :-- inch thick, sd.; § inch thick, 7.1; § inch thick, 6d. Works not mea-suring 400 feet, 1d. per foot extra. Roofing executed at 6d. and 7d. per foot square. Concrete is charged in addition according to the thickness when required. Carriage and men's time are charged extra when works are executed beyond three miles from the General Post-office. Bitumen 26 per ton, without grit. Bitumen 25 per ton, with grit. CHARLES F. TILSTONE, See.

TO ARCHITECTS.

TO ABCHITECTS. In consequence of many complaints having been made to the Company, by Architects, of a spurious material having been used in the execution of Works where the Savase Laspatters had been specified for, the Directors, with a view to ensure the fulfilment of any such specification, have authorized CERTIFICATES to be granted to Builders where the

SEYSSEL ASPHALTE

SEYSSEL ASPHALTE has been used. For the purpose of securing the use of the Genuine Article, Architects and others are recommended to insert in their specifications the "Seyssel Alphalte, Cla-ridge's Patent," and not merely "Asphalte," or "Bium-men," as in many cases where these terms have been used, gas-tar and other worthless and offensive compositions have been introduced. I. FARELL, Secretary, Stangate, near Westminater Bridge, Jan., 1845. Books of Instructions for Use may be had at the Office of "The Builder," and of all Booksellers in Town and Country, price 1s.

¹⁰ The builder, ¹⁰ and ut an Bootschristh Town and country, ⁹ a⁶ In proof of the necessity of the above advertisement, it may be mentioned, that it has soome to the knowledge of the Directors, that in certain works which have been executed by Messrs. Curtis, builders, of Stratford, a spurious material has been used by them, contrary to the specifications, which expressly mentioned, that "Claridge's Asphalte" was to be used.

Expressly mentioned, that Callings's Asplants was to be used. In the case of a work at Lewisham executed by MESSRS. ROBERT and DANIEL YOUNG, of 16, Crown-row, Walworth-road, where Seysel Asphalts was apecified for, a spurious article was neverth cleas laid down by them.

WESTERN PROVIDENT BUILD. WESTERN PROVIDENT BUILD-ING SOCIETY for enabling persons to Build or Purchase Freehold or Lesaschold Property on the security of such property. The next Monthly Sale of Shares will be held at the City of Westminster Literary. Scientific, and Mechanics' Institution, 7, Great Smith-street, Westminster, on Wednesday, July 30, at Eight o'Clock processery. The shares will be put up at 47% premium, and the termination of the Society is fixed by the laws to take place in 1664. Fall information may be obtained of Mr. G. DETHBIDGE, 1, Broad Sanctuary, Westminster (opposite the Hospital).

PATENT HANDRAILS. - J. MEL-DATENT HANDRAILS. — J. MEL-VILLE, after nowards of 20 years' experience in the manufacture of the above, can now, with confidence, recom-mend them to Architects and Bailders, combining beauty and durability; avoiding heading joints, and the grain of the wood continued theoughout the wreathed or otherwise circular parts. They are now patronised by the most emi-ment Architects, to whom reference can be given.—Speci-mens and prices sent to Architects of Builders, is Town of Country. Columns Vencered, Pew Capping, &c...No, 64, John-street, Fitzroy-square, London.

CAEN STONE

CAEN STONE. L UARD and BEEDHAM have a quantity of the above stone, of the best quality, direct from their Quarries at Allemange, which may be inspected at the Norway Sufferance Wharf, Greenwick.-Further putch-lars at Mis. G. GATES', 18, SOUTHWARE.SQUARE, SOUTHWARE.

SOUTHWARK. CUNDY'S MARBLE AND STONE WORKS, PIMLECO. SAMUEL CUNDY begs to inform Ar-chicacts, Builders, &c., that he is supplying VEIN MARBLE BOX CHIMMEY-PIECES, Opening 3 fast square, and 7 inch piers, for FORTY-FIVE SHILLINGS! STONE BOX CHIMNEY-PIECES, opening 3 fast square, and 7 inch piers, Tweire Shillings; do., do., with MOULDED CAPS, and 9 tach piers, FOURTEEN SHILLINGS. The above are manufactured in the best manner and of the best material. For CASH ONLY.-Address, SAMUEL CUNDY, Marble and Stone Works, Beignwe What; Fimilico.

Pimico. Masons' Work, Monuments, &c., &c., at equally Low Prices.

Full lists of prices may be had on application at the ing-house; if by letter, pre-paid, inclosing postage-A large stock of well-seasoned Doors always on h s st the

THE CAUSES of EXPLOSIONS in STEAM. ROLLED ----THE CAUSES of EXPLOSIONS in STEAM-BOILERS, and the prevention of those arising from incrustation, are now lectured upon by Dr. Byea daily at half-past Three, and on the Evenings of Memary, Wednesday, and Friday at Nine, at the ROYAL POUT-TECHNIC INSTITUTION. Professor Backhoffner, ke-tures daily at Ten o'clock, and on Tuesday and Theseday Evenings at Nine, on the ATMOSPHERIC BALLWAY, a Working Model of which, carrying visitors, is exhibited daily and in the Evenings. A curious MECHANICAL HAND; new and beautiful Objects in the Chromatrope, Physioscope, Proteoscope, and Dissolving Views. Work-ing Models described. Experiments by the Diver and Diving-Bell, &c., &c.-Admission, One Shilling; Schools, half-price. price.

IRONMONGERY. **B**UILDERS will find it greatly to their ad-vantage to purchase IRONMONGERY of CLUSE and BOSE, 35, City-road (corner of Tabernacle-sow, and near Old-street-road). Best Cut Clasp.

13

LL England has been railway mad,—perhaps it is so still; and the present session will be remembered by many members of the lower House as the session of "hard

lines." From the office-messenger at eighteen shillings a week (we speak what we know), to hereditary legislators, men of all grades have been dabbling in shares, and we might say, women too; for one distinguished peeress, until this time better known at Almacks' than in the share-market, made 30,000 good pounds by guessing cleverly, what lines would be favourably reported on by the Board of Trade. To put down the *roulette* tables at Epsom may be very desirable, but there are larger gambling-booths at home, where Home Secretaries intrude not.

Men without money, but with a friend in the "direction," have obtained large allotments, speculating on a rise, and generally with success; indeed, up to this time, it seems tolerably certain that all have benefitted. Let us hope that before "calls" are made, the shares generally may have passed into the hands of men who really have capital to invest, and that thus the difficulty and distress which must otherwise be anticipated may be avoided.

The excitement in which thousands have been kept for several months past, first by the reports of the Board of Trade, then by the discussion of the general questions (the advantage or otherwise of the atmospheric system, and the relative merits of the broad and narrow gange), and ultimately when reported on favourably by the special investigation of their own particular scheme before committees of both Houses of Parliament, - can hardly be described. The money spent in this latter stage must have been enormous (by some of the lines. it is said, as much as 1,000%. a day); and all but those personally advantaged by the expenditure must agree in wishing that some less wasteful mode of proceeding could be adopted.

In the course of a recent forced confinement in some of the committee-rooms, we have been led to cry shame on the undue advantage taken by landowners who possess influence, and have used that influence in opposition to projects of admitted utility, simply to extort an exorbitant sum of money as the price of their ultimate neutrality. In one case that we could name, 1,800% per acre is to be paid by special sgreement for land that the owner had contracted to sell only a short time ago for another purpose for 3001. per acre. If an owner is dispossessed of property against his will, he should unquestionably be paid handsomely for it, but surely the legislature should not allow him to use any accidental influence he may have, as, for example, being a member of their own body, to extort any unreasonable sum, which the company may be led to assent to rather than incur the enormous expense entailed by opposition.

The question of metropolitan railways is forcing itself on public attention, and several bold schemes have been propounded for connecting the principal lines in London. Amongst bese the Thames Embankment and City Rail-

way Company, of which the following is an outline, has been received with more than

THE BUILDER.

usual favour by the press :-"It is proposed to embank the river from Hungerford | Market to Blackfriars Bridge, forming, in the space recovered from the shallow parts of the stream, public gardens, terraces, and docks, and along the edge of the embankment a double line of road; the outer portion as an atmospheric railway, the inner as a macadamized road for ordinary vehicles, with a pavement for foot passengers, communicating with the streets and wharfs, and also, by short viaducts above and below the railway. with landing-places from the river. At Blackfriars Bridge, or about the site of Paul's Wharf, the proposed double road will leave the embankment, and be continued along a new street sixty-six feet wide, leading to the Blackwall Railway and Whitechapel, and, by a short branch at Southwark Bridge, direct to the Mansion House. The railroad portion of the line will join the Blackwall at Fenchurchstreet, or the Minories, and be carried along the middle of the new street, upon an open frame-work of iron girders, at the level of the first floor windows, leaving an under road of corresponding width for the usual street traffic. and opening throughout the whole line valuable frontages for building."

It thus presents two important and novel features,-the embankment of the Thames, as a money speculation (an achievement which seems too great for our Government), and the commencement of a system of railways through the public streets, out of the way of all ordinary traffic. Relative to these viaducts the Iron Times remarks :-- "After careful consideration, we can find no objection to urge against them, save that they are new. This is a fault we are satisfied will rapidly amend with the perception of their high importance-of the millions per annum that will accrue in savings by reason of their adoption. Have any of our readers watched the erection of the new Houses of Parliament? There may be beheld a railway viaduct set up for the purpose of constructing a building, to be removed when the building is finished. Surely it must be worth while to construct such viaducts for permanent purposes as well as for temporary ones! As an economical plan, these railway viaducts may probably be constructed for about 40,000% per mile. Of elegant construction they may amount to 80,0001, averaging 60,0001. Nor is it a mere speculation; the traffic exists-expensive horse traffic-where a saving of horses and a saving of time are both to be achieved."

The line will be in connection with the South-Western at Hungerford Bridge, and with the Great Western, and the London and Birmingham, either at the same point, or near Blackfriars Bridge, by a short extension of the City and Camden Town Junction, from their proposed terminus in Farringdon-street to the river.

Another project, instead of taking the railways over the ordinary course of traffic, takes them *under* it, and contemplates a series of tunnels, which would render London a huge warren and a perfect bore :---

They propose to establish their central terminus at or in the immediate neighbourhood of Hungerford Market, and upon a scale commensurate with the demands of an entire system of metropolitan railways. To proceed thus by tunnels of communication to the London and Birmingham Railway, to the Great Western Railway, the Eastern Counties, and, by subsidiary termini and approaches at the intersections of all the principal roads, to com-

plete the connection between all the northern lines and every part of the northern suburbs. To continue these lines across the river to a station on the south bank, and thence to the Dover, Brighton, and South-Western railways, "thus completing the access to and from every part of the kingdom and the continent." The suburbs are to have a company of their own, and are to be reached on the atmospheric principle. It would thus seem, that having driven the stage coaches off the roads, the rail will now compete with the omnibus, and take us from one end of town to the other, either through the air or through the earth, at "six-pence all all the way."

When railways were first projected, the towns near which they came strove to keep them as far off as possible, and spent immense sums in effecting what has been most injurious to them. They have now found out their mistake, and would gladly pay as many thousands to bring a station near them as they before spent hundreds to drive it off. Every town now strives for its line, justly feeling that without it, its importance must sink; and before long every village will have one too, or must cease to be a village. How strangely and how rapidly opinions alter ! Before we find fault with others, still more, before we burn them for not thinking as we do, it would be well always to remember, that ere long we may actually think as they do.

THE QUEEN'S PAVILION IN BUCKING-HAM PALACE GARDENS.

HER Majesty's summer-house, concerning which so much has been said from time to time, is now completed, and will hereafter be regarded with interest, if not at this moment, as an early example in England of the use of fresco painting in decoration.

Within the last few years, owing to a number of concurrent circumstances, public number of concurrent circumstances, public attention has been directed to the combination of decorative painting with architecture, after the examples left to us by the great Italian The introduction, or rather the revival, of fresco painting in this country has become, in connection with a great national monument, a topic of general interest, an affair of national importance, and no longer merely a matter of private or artistic speculation. While curiosity and interest were thus strongly excited towards the subject, and our artists were occupied in the subject, and our artists were occupied in considering its feasibility and the particular management of a vehicle almost unknown to them, it occurred to Her Majesty and His Royal Highness Prince Albert, that it would be well to have the experiment made on a small scale, yet under circumstances which might lend it a more than common interest, and at the same time offer to some of our first and at the same time oner to some a fair oppor-artists at once a high motive and a fair opportunity to try their powers in this new old method. The idea was surely a happy one; and not the less seasonable that every one who had considered the subject (at least every one who understood it), felt that it was a method which presented particular difficulties to some of the ablest and most distinguished of our painters, whose habitual style of execution, whose aim in point of treatment of their sub-ject and effect, had been precisely the reverse of what is required in fresco.

The application of fresco painting to the decoration of architecture demands the adaptation of parts to a whole; a preconcerted mode of treatment, in which the painting shall seem to be in unison with the original design of the edifice; the harmonious combination of many minds, working under the direction of one mind, to one purpose: and, with regard to the mechanical part of the process, it requires much thought and study in the preparation of the materials, and great care and precision, as well as great rapidity, in the execution.

The advantage of mingling in the interior decoration of a building isolated figures and bistorical subjects with anabesque ornaments,

has been proved to be twofold. If the locality be small, the space appears to be enlarged to the eye by the involution and continuation of multiplied and varied forms and colours; while, if the dimensions be large, the interest is concentrated by the presence of a leading ides, connecting all these separate compart-ments and all this maze of variety into one harmonious whole. The wild and dream-like arabesques are like vague, delicious music; the historical subjects form resting-places for the fancy; and the two in combination are like the lyrical drama, — action, sentiment, and melody woven together.

The building in question is very small, -quite a toy, and is situated on an artificial mount in the gardens, and overlooking the ornamental The view from the terrace in front of waters. it is beautiful, and will keep the stranger on his first visit, for some time outside the object of his search. Nash understood well the art of landscape gardening, and displayed much skill in these grounds. It is almost impossible to believe the proximity of this spot to bustling town, it is so still and luxuriant; and the triumphal arch at Hyde-park-corner, seen above the trees, renders the effect of the whole almost

magnificent. The entrance to the pavilion opens into the principal apartment, an octagon 15 feet 9 inches from side to side, and 14 feet 11 inches in height to the centre of the vaulted ceiling. It is here, in eight lunettes at the foot of the vault, that the frescos from "Comus" appear, of which for the most part types have been exhibited in the rooms of the Royal Academy by the respective artists. Over the entrance door, an indifferent place, is Stan-field's, illustrative of the following passage :----

Yet some there be that by due steps aspire

To lay their just hands on that golden key, That opes the palace of Eternity. To such my errand is."—Comus, v. 12—17.

It is admirably transparent, and exhibits more power over the material than the ma-jority of the works. Passing round with the sun, Mr. Uwins' follows, having for motto,

"This is the place as well as I may guess, Whence even now the tumult of loud mirth Was rife."

Then comes Leslie: Ross follows. East-lake's is over the mantelpiece; Maclise, Edwin Landseer, and Dyce, complete the eight. A copy of Mr. Eastlake's work is now in the Academy exhibition, and will be remembered by all. The lines illustrated are,

" If virtue feeble were,

Heav'n itself would stoop to her."

Maclise shews the lady spell-bound in the marble chair, and displays much of his usual power. Mr. Landseer has found in the follow-ing lines an opportunity to exhibit his great skill in depicting the brute form :--

"Their human countenance, Th' express resemblance of the gods, is changed Into some brutish form of wolf or bear, Or ounce or tiger, hog or bearded goat." Comus, v. 68-71.

Comus, surrounded by his crew, is terrified by the approach of the brothers, who appear by the approach of the brothers, who appear behind in the act of rushing upon them. A bacchante, with a beautiful temale form, and the head of a hound, has thrown herself in affright upon the arm of Comus. Other monsters, half brute, half human, in various attitudes of mad revelry — grovelling, bestial insensibility— confusion and terror — are seen around him; the pathetic, the poetical, the horrible, the grotesque, all wildly, strangely mingled. In the spandrils are two heads — a grinning ape, and a bear drinking. Mr. Dyce winds up the illustrations with the presentation of the lady and her two bro-thers to their parents, who come forth to re-ceive them, and he bas produced what must be considered the best fresco, although wanting in the right sentiment.

in the right sentiment.

The *lunette* in which this is placed was for-merly occupied by Mr. Etty, and as many ill-natured comments have been made on the renoval of the fresco executed by him, it is but just to say that the step was unavoidable. We are much pained that so distinguished an artist —the first colourist of the day,—should have his work superseded, but truth compels us to say after excell commission of the removed say, after careful examination of the removed panel, that the fame of Mr. Etty would have

suffered materially if it had been allowed to

suffered materially if it had been allowed to remain. Two other rooms open out of the octagon apartment: one to the left, which is purely *Romantic*, the subjects being all taken from the novels and poems of Sir Walter Scott, and the other to the right, which may be termed *classical*, having all the ornaments Pompeian. The walls of the first room are painted in imitation of grey marble by Moxon, and form decidedly the best specimen we ever saw. The perfection of the face was attained by varish-

perfection of the face was attained by varnishing it ten times, and rubbing it down after each coat.

each coat. The subjects from the novels were painted by H. J. Townsend, C. Stonbouse, J. Severn, R. Doyle, and J. Doyle. The small land-scapes are by E. W. Dallas, and the bas-reliefs were executed by J. Bell and H. Timbrell. The ceiling of the Pompeian room was de-signed by A. Aglio. The arabesques in the panels of the octagon room were painted by S. Rice, of the School of Design: the carving of the doors in the same room were by G. B. of the doors in the same room were by G. B. Lovati; the ceiling was painted by E. Mor-ley; all the stuccoes were by G. W. Nicholl, and the plaster work of Walter Scott's room by Bermasconi.

In concluding our notice, it is right to men-In concluding our notice, it is right to men-tion that the whole arrangement of the deco-rations, after the completion of the eight frescos, was confided to Mr. Lewis Gruner, the author of a fine work on "Fresco decorations in Italy during the 15th and 16th centuries," with the arrange attivulation that all the centuries with the express stipulation that all the artists employed should be English. The Prince is said to have taken considerable interest in the works, and Her Majesty has been pleased to order that they should be engraved and published.

ROYAL INSTITUTE OF BRITISH ARCHITECTS. CLOSING MEETING.

THE meeting held on Monday last was one of more than ordinary interest. The chair was taken by Mr. Papworth, and Mr. Donaldson introduced the Duke of Serradifulco, with a well-deserved eulogy on his researches into Sicilian antiquities, and his uniform kindness to members of the Institute. His grace was not merely an honorary member, but he had contributed five volumes, the fruits of his labours. The antiquities of Sicily were pe-valiable interactions, the factor was culiarly interesting : the Doric order was essentially different from the Doric of continental Greece, the Temple of Corinth being the only example, which at all resembled in pro-portions the Sicilian order. The island had been favoured not only in art, in architecture, in bronzes, in statuary, but was a country of great natural beauty and productiveness. Its rivers abounded with fish, its caverns with sulphur, and a deep veneration for art had possessed the people. The work of the Duke of Serradifulco consisted not merely of measurements, but in the 5th volume were the deductions from his observations, matter tending to elucidate the principles of art. His grace was then formally admitted a corresponding member, and returned thanks in suitable terms. Mr. Donaldson, in announcing the contributions from foreign members, commented upon the peculiar satis-faction which must be felt at this, the closing meeting of the session, in receiving the com-pletion of two great works on architecture, the one on Sicilian antiquities, and the other the work of the Cavaliere Luigi Canina. The latter was the most complete illustration of architecture, that had ever appeared, and as the production of an individual, was in the highest degree meritorious. It illustrated the Egyptian, Greek, and Roman styles, in all their variations, and was not a compilation, but the result of a most careful study of the monuments themselves. It consisted of nume-rous folio plates, with accompanying letterpress; one volume for each style, illustrating its history, and a second descriptive of the examples. Hitherto, a complete work on Grecian architecture had not appeared, but the want was now supplied. Another work, by the same author, on the temple at Jerusalem, was also unnounced, and though not so satis-factory as the other, had some novel views on this speculative subject. The secretary an-nounced the present of ten guineas to the library fund from Mr. Sydney Smirke, and of

Quatremère de Quincy's "Lives of Architects " from Mr. Bellamy, and read the report on the adjudication of the premiums. The committee aujuaication of the premiums. The committee found a decided superiority in the drawings furnished, and awarded a copy of Wilkins' "Vitruvius" to Mr. W. Wood Deane, for the best design for a portico to an assembly room. The design was praised for the effective treat-ment of the coefficient and coefficient for the conferment of the coffers, and ceiling of the portico, and it was noticed, that the modillions in the pediment had been omitted, as well as the antæ: but it was presumed, that the absence of the former was deemed essential to the proper effect of the sculpture in the pediment. The report also noticed, that the Greeks were in the habit of constructing the lower course of the wall in a portico, of blocks of great height, and that the Romans occupied a similar situation with a plinth, and surbase moulding, with a dado between; these points, it appeared, had not been availed of by the councilities. " Public Buildings of London" was presented, for the best series of sketches, to Mr. Jadge, who also received a copy of Wood's " Letters of an Architect," for notes of papers read at the Institute. The medal of the Institute was presented to Mr. S. J. Nicholl, for an essay on the various species and qualities of slates, Mr. Donaldson then read a letter from Vicenza, stating that one of the members of Vicenza, stating that one of the members of the academy there, was engaged in preparing a life of Palladio, and requesting the assistance of the Institute, in procuring access to the drawings and autograph of Palladio, in the possession of the Duke of Devonshire. A description of an antique portico at Da-mascus, communicated by W. R. Hamilton, Esq., honorary fellow, was read by the secre-tary. It was first described in 1838, at the Boyal Society of Literature, having bern dis-

Royal Society of Literature, having been dis-covered by him, a considerable time previous. His visit was made at a period, when travelling in the East was attended with great danger, and therefore he was unable to make a very careful examination. He observed, that there were six granite columns, supporting an en-tablature and pediment, and that in the centre intercolumn, the entablature was carried across in the form of an arch. The style was clearly that of Baalbec and Palmyra, and the date therefore referrable to the time of the Antonines. The cornice had great projection, but had less height than usual in works of like date. The ruin was covered with rubbish, up to a short space below the capitals, but the fect of the columns appeared in the bazaar below. It was the only known example of Roman architecture in Damascus, and might have been a part of the Temple of Serapis. It was seen by Col. Leake and others, and from was seen by Col. Leake and others, and from their observations, and those of Mr. Hamil-ton, all that had been known of fitup to'the present time was gained. In 1844, how-ever, it was seen by Sir Gardner Wilkinson under more favourable circumstances, and he succeeded in getting statutes of it and some succeeded in getting sketches of it, and some measurements. The columns were calculated to be 42 feet in height; they were set rather close, with a wider space for the centre inter-column. The whole entablature took the column. The whole entablature took the curve of the arch, the dentils radiating to the centre, and the dentils of the pediment were placed at right angles to the raking mouldings. At the spring of the arch, in the tympanum of the pediment, were square apertures, the use of which was not apparent. The The angular column was united to to vo pilastres in a curious manner, the mouldings of the pediment and entablature being broken, as observable in some caprices of Italian production. At this period, some remains of columns were found in other parts of the city.-Mr. Donaldson commented upon the extraordinary disappearance of architectural works in that part of Syria. The prejudices of the Jews long prevented the admission of the Roman style, but at a later period, it could not be doubted, that the country abounded in Roman works, which it was the system of the imworks, which it was the system of the imperial government to raise in the countries subjugated, and we were aware that in other subjugated, and we were aware that in other parts of Syria, as in the Decapolis, and in Arabia Petrzes, at Petra, were magnificent works. Mr. Scoles stated, that in his journey to Damascus, and in other parts of Syria, be had seen a great number of fragments of the Roman Corinthian order, of which there had been no mention by any traveller. When at Damascus, although he had examined every

part of the city, he was not aware of the existence of the portico described, which had not been mentioned to him by Mr. Hamilton, till subsequent to his visit.*

An account of the remains of the ancient city of Agrigentum was read by Mr. Angell, who said, that amongst the ruins of Magna Græcia, none were of greater interest than those he was about to describe. They had not the awful solitude of Selinus and Pæstum, but occupied a most picturesque site near the modern city of Girgenti. Their architectural character would afford much matter for ex-amination. To any one who might visit them, the Capuchin convent in the neighbourhood would afford comfortable lodging, and occa-sionally no bad cheer. Amongst the remains were those of several temples of the Doric order. The Temple of Juno Lucina was hexastyle, pe The Temple of Juno Lucina was hexastile, pe-ripteral, and formerly contained, the celebrated picture of Juno by Zeuxis. There were some remains of the peribolus. The Temple of Con-cord was similar in plan to the Temple of Yung. Of the Temple of Esculapius, the only remains were a part of the cella, and fragments of the staircases to the roof; but it had been ascer-tained, that it was a temple in *inuis*. The Temple of Hercules was the largest after the Temple of Jupiter Olympius; one column was standing, but a restoration had been published by the Duke of Serradifalco; who had found traces of polychromy. The Temple of Jupiter Olympius was the second in magnitude, of all Olympius was the second in magnitude, of all the temples of ancient Greece; it was never completed, not having had a roof. The Greeks had two modes of arrangement in the plans of temples; one was that of the naos, with columns in antis, or portico at the end, and the other, manus, or portico at the end, and the other, where the naos was surrounded by columns. The temple under notice partook of both modes; the columns being, as it were, built into the wall, appearing circular without, and square within. The structure was of vast size, each flute of the columns being, as described by Diodorus, wide enough for a man to stand in, or two feet at the lower diameter. Mr. Cockerell'a restoration in the fifth volume of Cockerell's restoration, in the fifth volume of Stuart's "Athens," has seven columns in the front, the telamones, or Persians, being placed within the naos for the support of the roof. These figures were twenty-five feet in height, and represented the giants conquered by Jupiter; in style of art they resemble the Eginetan scalpture, though the pediments were enriched with work of a better description. Sig. Raffaelle Politi, corresponding member of the In-stitute, had made a restoration entirely different to the one described, though he now admitted the greater probability of Mr. Cockerell's. The restoration was not, however, entirely unwarranted, as fragments of but three telamones had been found, and there was a passage in an and other, describing a building with three giants forming the portico; which figures had been inserted in the arms of the modern city. As the figures remain in the arms, Sig. Politi considered he had sufficient authority for considering the temple, originally built with a Per-sian portico. Besides the above, there are remains of the temples of Castor and Pollux, of Vulcan, and in the modern city, which was anciently the Acropolis, of the Temple of Jupi-ter Polyaenus. There was also a Temple of Ceres and Proserpine, and, in the modern cathedral, a sarcophagus, enriched with sculp-ture. Other remains in the city were those of

• We may here mention, that letters, which we have re-ceived from a correspondent in Syria, quite corroborate the statement, as to the existence of many architectural frag-ments, yet undescribed. They are built into the walls of cottages, or bollowed into water-troughs, and the carved friese, on which the hand of genius revelled in ornament, is often turned into a receptacle for fills and ordure.

"Imperial Casar, dead, and turn'd to clay, Night stop shole, to keep the wind away : O, that that earth, which kept the world in awe, Should patch a wall to expel the winter's flaw !"

Should patch a wall to expel the where in awe, Should patch a wall to expel the where's flaw !" In a letter from Jerusalem, the writer's flaw !" In a letter from Jerusalem, the writer's flaw !" In some antiquities found in digging foundations here; they are of the Dorie order; the echinus is quite straight, and not curved in under the abacus, as we find it in the best Greeian examples; there are two of these; the others are the base and capital of a small column; the capital is, I biak, good. Jerusalem is not the place for an architect, or an architectural antiquary; there are few ruins, and the whole of the city is buried in filth to an immense depth. At Asealon, I found cornices, capitals, and other fragments, in-dicating something of interest there at a previous period. The fragment of a cornice was enriched with oves, and with the leaf ornament of the reversed cyma; it was in white marble, and fixed to mark the last resting-place of a Turk. There was also a capital of no decided character. I saw a good specimen of a Corinthian capital at Tyre, it was of white marble, hollowed out for the purpose of holding refuse water. I shall have much to tell you of other antiquities in Syria."

the oratory of Phalarides, and of the tomb of Theron. The latter was one of those singular monuments, which the Agrigentines were in the habit of raising to their horses, and was the only one not destroyed by Hannibal. That general, finding that the monuments round the walls gave shelter to the besieged in their sallies, ordered them all to be cleared away; but a flash of lightning deterred the soldiers from completing their work. The monument is a singular edifice; it has Ionic columns, but a Doric entablature, and stands upon a lofty basement. In the intercolumns are recesses basement. In the intercolumns are recesses or doorways, diminished upwards. The pis-cina was a large basin, nearly a mile in cir-cumference; it was used for the supply of the city with fish, and afterwards for bathing. Mr. Angell concluded his account with some interesting remarks on the former state of the city and cupting the words of Parialos said city, and, quoting the words of Pericles, said that "the Agrigentines built like men who expected to live for ever, and lived as if they expected to die to-morrow." Mr. Donaldson drew attention to the fact,

Ar. Donaldson drew attention to the fact, that in Great Britain we were reproached for our restricted pursuit of wealth, and for our assumed inability to execute great works of art, whilst the people of Agrigentum, with a small territory, as well as all the cities of ancient Greece, depended solely upon com-merce, and yet had produced works of un-equal magnitude and beauty. He also made some interesting remarks upon the "hcpta-style" arrangement of the columns, and said that there were other examples at Pœstum, and probably in the Temple of Hercules at Pompeii, and observed, that the Greeks often set at nought many of the rules, which we are set at nought many of the rules, which we are accustomed to observe, when they thought, that in so doing, other advantages might be gained. In large temples, if there had been a centre intercolumn, there would have been a doorway, but in this case they preferred to put a column in the middle, and place a door on each side. The Duke of Serradifalco said, that he considered this was not the principal entrance, and shewed, from his work, that he had given six columns and a central doorway in the other front. Mr. Donaldson exhorted the members to greater activity in contributing to the in-terest of the meetings; and after thanks to the chairman, the meetings were adjourned to November next.

THE HEIGHT OF CHIMNEY SHAFTS. AWARD UNDER THE BUILDINGS ACT

It is necessary builders should bear in mind that in schedule F. it is declared, that any chimney-shaft (except that of a steam-engine. chimney-shaft (except that of a steam-engine, brewery, distillery, or manufactory,—subject to special supervision) must not be built higher than 8 feet above the slope, flat, or gutter of the roof which it adjoins, measured from the highest point of junction, unless such chimney-shaft be built of increased thickness, or be wilt with and honded to appethe adjoint built with and bonded to another chimneyshaft, or be otherwise rendered secure. Messrs. Grissell and Peto recently carried

up the chimney-shafts of three houses in Grey-hound-place, Grange-road, to a height of 12 feet 7 inches above the adjoining building, without what the district surveyor (Mr. Hesketh) thought the necessary additional preceditors precautions.

The matter was sent to the referees, and the award was, that the chimney-shafts were con trary to the Act, and that the same must be made conformable thereto. The expenses of the award and 2*i*. 2s. for the district-surveyor's time were charged to the builders.

EFFECT OF NEW RAILWAYS ON THE PRICE of COALS IN LONDON.-Mr. Mahon, in giv-ing his evidence before the committee on the Cambridge and Lincoln line of railway, stated that he had had the management of coal-mines in Derbyshire for twenty years past; that the coal fields of Clay Cross, Wingerfield, and coal-helds of Ulay Gross, Wingerneid, and Staley, were capable of unlimited supply, and he believed that the Clay Cross and Staley coals were quite equal to the Durham. By the proposed new lines of railway these coals could be delivered in London at 14s. 10d. per ton; Erewash coals as low as 10s. 6d.; while the Wingerworth, which were not so good in quality, could not be delivered in London under 14s. 6d. per ton,

HOWDEN CHURCH, YORKSHIRE. YORKSHIRE ARCHITECTURAL SOCIETY.

THE quarterly meeting of this society was held in its rooms, Minster-yard, York, on Thursday, July17th, the Venerable Archdeacon Wilberforce in the chair.

After the election of several new members, the presentation of works of archæological and architectural interest, and other business connected with the society, the following report of the restorations going on in the parish church, Howden, Yorkshire, was read :--

" Howden, July 16th, 1845.

To the Secretaries and Committee of the York-

GENTLEMEN,—We beg leave to lay before you an account of the progress of the work of restoration of the parish church of Howden, towards which your society liberally granted us the sum of 40%.

1. As to the tower, the upper story has had all its louvering (lately composed of wood) re-stored. The wood has been removed, and blue slate, of the best and strongest quality, intro-duced in its stead. The second story has been partially reglazed. The stone work has been completely repaired, and the glazing done in a most substantial and workmanlike manner. The architect superintending the work has expressed his entire satisfaction in this departpressed his entire satisfaction in this depart-ment of the restoration. The work now ef-fected only shews more fully the necessity of opening and glazing the whole of the windows in this story, which can only be effected at an additional cost of 60%. A floor which origin-ally divided these windows in half has been removed, and the effect is truly imposing. 2. The east window is now in the course of

2. The east window is now in the course of insertion over the screen, which originally separated the choir from the transcepts; the stained glass to fill it has been contracted for, and is in the course of execution by Mr. Wailes, of Newcastle, and in a short time this department of the work will be available

department of the work will be complete. The screens to separate the new chancel from the transepts are of carved oak, and will be ready for fixing as soon as the masonry is perfect. When this is done, the new church will be thrown open to the nave; the pulpit removed from the centre aisle to the first pier of the nave, on the south, and the reading pew to the south pier of the church arch.

Other restorations have been effected, which, in the opinion of our architects, Messrs. Weightman and Hadfield, add much to the

beauty and character of our church. Having completed these restorations at a cost of 400%, in addition to what your society so liberally granted, we hope there will be no hesitation in allowing the payment of 40% to be now made to us on behalf of the object for

which that sum was specially granted. Whilst we feel deeply indebted to the York-shire Architectural Society for its past libe-rality, we trust we shall not be thought too encroaching if we ask a further donation to help croaching if we ask a further donation to help us in carrying out to perfection the whole of the masonry and glazing of the tower, wa pledging ourselves to make up the remaining money, and complete the work to the satisfac-tion of the society.—We beg leave to remain, your obedient and faithful servants, T. Guy, Vicar, W. Sucher, Churchwarden,

W. SUGDEN, Churobwarden."

After the reading of this report, one of the secretaries of the society, who had previously visited Howden, made his official statement, which was as follows :--

"Howden, July 16, 1845. To the Committee of the Yorkshire Architec-

GENTLEMEN, — I have this day visited Howden, in order to inspect and report upon the restorations now going on in its parish church. I have carefully examined every part, and can most conscientiously state that the work so far accomplished has been of the work so far accomplished has been of the most satisfactory kind. The zeal and skill displayed by the vicar, churchwarden, and architects are beyond any praise of mine; and whilst the Yorkshire Architectural Society cannot but feel gratified in having been the means of encouraging such a restoration by a liberal grant of 40*l*., it will do well to meot any future appeal for further help by such assistance as may be in its power. In a few words, the work is most creditable to all parties concerned, and has excited in the

THE BUILDER.

breasts of the parishioners of Howden an honest pride and desire to see their church restored to something of its original integrity. I remain, yours truly, JOSHUA FAWORT." The committee felt so perfectly satisfied with the work of restoration thus far advanced, that notice of a motion for an additional grant of meany towards completing the clearing of of money towards completing the glazing of the tower was given by the venerable chairman. The antiquary and archæologist cannot better bestow his mite than by assisting the vicar and churchwardens in this spirited undertaking. We hope very shortly to see their most anxious wishes fully realized.

At a meeting of the society, subsequently held the same day, a paper was read on "The History and present Condition of the Churches of York."

GLASS, Farmar 1, 1, 1977 Ar a meeting of the Decorative Art Booisty, held July 9th, "a general view of the history and application of glass" was read by Mr. Cooper, and afforded considerable sinterest. He remarked on the 18th were of the 37th chapter of Job, the trabelation of which has been rendered differently in some recent editions of the Bible, -on the construction of the Portland vase, as of layers of glass of different colours, cut away by drills in the man-ner of cameos; he exhibited drawings of Roman glass from examples in the British Museum, found at Recuivers, Canterbury, Hemel Hempstead, and elsewhere, and observed that the Romans were the first to introduce glass into this kingdom. He con-tended that plate glass was first made by the Venetians, and that they supplied Europe till nearly the end of the seventeenth century : and he noticed the manner in which Colbert he noticed the manner in which Colbert assisted in establishing a manufactory for plate glass at Oherburg, is 1664, and that in 1668 the French produced plates 24 by 50 inches. In 1673, Villiers, Duke of Buckingham, established some Vangtians in the manufacture

of plate glass at Lambeth, and this afterwards led to the formation of the British Plate Glass and other Companies. The injurious effects of different restrictive duties and excise regulations at the respective periods of change there-in were also explained.

The process of mamoling was illustrated, also a peculiar property in the coarse bottle-glass, by which when brought a second time to a red heat it will bear to be thrown into cold water, without change of form; a knowledge of this fact may possibly lead to a method of soldering joints in its application as water-pipes, which has been recently spoken of.

Malleable glass and glass produced from the bones of skeletons and formed into a commemorative statue were incidentally noticed. Specimens of some continental glass, not at present equalled or produced by our manu-facturers, were shewn, and conjectures offered as to the processes adopted in their formation.

The Mercure Segusien speaks of a marvellous invention which has come to light within the walls of Saint-Etienne-the production of a sort of glass as maileable when cold as while red-hot. The Monitour des Arts says,

more value than gold, and which the inventor has called Silicon, is of a white colour, very sonorous, and as brilliant and transparent as crystal. It can be obtained, with equal case, opaque or coloured; combines with various substances, and some of these combinations produce shades of extraordinary beauty. It is without smell-very ductile, very malleable; and neither air nor acids affect it. It can be blown like glass, melted, or stretched out into long threads of perfect regularity. It is very hard, very tough, and possesses the qualities of molten steel in the very highest degree, without requiring to be tempered by the exist-ing process, which, as is well known, offers no The process, which as is well known, others no certainty—while the result of the new method is sure." • • A variety of objects have been manufactured with this silicon; which are about to be submitted to public exhibition on the Place of the Hotel de Ville, at Saint-Etienne.

DECORATION OF THE NEW HOUSES .-_Mr Herbert, A.R.A., has received a commission for the Hall of Poets. Mr. Dyce has been commissioned to execute a work for the House of Lords.

RESTORATION OF ETON COLLEGE CHAPEL.

WE mentioned some time since that a limited competition was going on for the commission to restore and decorate this chapel. The roof, amongst other things, is understood to be conamongst other things, is understood to be con-structively so defective, as to render alteration absolutely necessary. The competitors were five in number, and Mr. Shaw, Mr. Benjamia Ferrey, and Mr. Nesfield were appointed to select and recommend the best plan. They met on Monday last, and after due consideration pronounced unanimously in favour of the design submitted by Mr. Deason.

Mr. Ferrey was originally included in the list of competitors, but declined sending in.

A second portion of stained glass has just been placed in the large altar window. The whole of the three compartments are now filled with the Crucifixion and Resurrection; the twelve apostles are to occupy the remaining lights. Painted glass is in progress for the two side windows next the altar. The whole of the interior of the chapel will no doubt be highly decorated.

THE PILE DRIVING MACHINE.

The Devonport Telegraph has the following notice of the application at Morice Town of the invention which we described in a recent number.

The application of steam power to the pur-poses of pile driving, which the extremely in-genious, but at the same time simple invention of Mr. J. Nasmyth has secured, renders what was the most tedious and laborious portion of works on the sea-shore the most commonplace; and, in its application at the new works at Morice Town, we understand effects a saving of time equal to nearly two years, and in the smount of expense no less a sum than fifty thousand pounds. But for this invention the great sea wall would have had to be built in several compartments, as with the power before used it was found impossible to erect a coffer-dam of the required length strong enough to resist the force and immense weight of water without. The fears of the Admiralty and their engineers on this point were so strong, that they were with some difficulty overcome; hence the length of the delay in proceeding with the works, which at one time gave rise to reports of the site being abandoned by the Government; and not until the con-tractors offered bonds of indemnity, such as could not fail to convince Government of their great confidence in the plan proposed, was consent given to the required deviation from the specifications. The length of the great coffer-dam or sea-wall now forming will be upwards of 1,600 feet, and will be composed of a double row of piles, varying from 55 to 66 feet in length, and from 14 to 16 inches square, driven as closely together as possible, so as to form two vast impervious walls of timber, form two vast impervious walls of timber, which will effectually exclude the sea during the period occupied in the excavation of the soil within, and the formation of the granite walls of the great steam dock. The dimensions of this coffer-dam are quite unprecedented, and its gigantic proportions have re-sulted from the bigh opinion of the powers and capabilities which Messrs. Baker and Son, the contractors, had formed of Mr. Nasmyth's invention before it had been put to the test of actual trial; and to these gentlemen too much praise cannot be given for the enterprising spirit which they exhibited in this matter, and we sincerely trust they will reap the most substantial advantages as their reward, in being the first to introduce so important a machine to the notice of the world. There are two features which most remarkably distinguish this important invention from all pile-driving machines. These consist, in the first place, in the direct manner in which the elastic power of the steam is employed to lift up the mass of iron by whose fall on the head of the pile it is driven into the ground; and, secondly, in the peculiar manner in which the block of iron and its guide, case, and cylinder, are made to sit, as it were, on the shoulders of the pile, so as to predispose and assist it in its descent into the ground. In this manner the entire dead weight of this part of the apparatus is rendered available, and made to act in a most important degree as a portion of the pile-driving agency; and as the entire part of the

appparatus follows the pile down, it never ceases for one instant to yield a most im-portant assistance towards the attainment of the desired object. The energy and rapidity. of the blows, which are dealt out on the head of the pile at the rate of upwards of seventy per minute! is such that, assisted by the dead weight. of the apparatus sitting on the shoulders of the pile, it is seen to sink into the ground in steps, varying from 6 feet to 3 inches per stroke, the whole operation of driving the pile, 60 feet in. length, occupying little more than from two and a half to four minutes; in fact, such, is the ease and rapidity with which these enormous, piles are driven into the ground by this power-ful machine when compared with the old system, that the spectator is as much inclined to laugh at the ridiculous contrast, as to be astonished at its vast powers and the perfect control under which it is placed. The whole movements are governed by one handle, regulating the supply of steam from the boiler to the cylinder and piston, which yields the re-quisite rising and falling motion of the monkey or hammer that drives the pile. We were particularly attracted by the simple and effi-cient contrivance which Mr. Nasmyth has cient contrivance which hir. its myth man adopted for carrying the steam from the boiler to the cylinder on the head of the pile, namely, by wrought-iron jointed pipes, which fold up, in the most beautiful manner in a succession of joints or lengths, so as to accommodate the length of steam at all the various heights of the apparatus, which having to descend, through a perpendicular space of upwards of 50 feet, in following down the sinking pile, double up or fold together in the most perfect, yet simple manner. The same boiler which supplies steam to the actual pile-driving appe-ratus, likewise affords steam to a small engine which is employed to give the requisite loco-motive action to the whole apparatus is sittler direction, so as to cause it to move from pile to pile. This same small engine "hoists and to pile. This same small engine " hoists and pitches" the piles in the most perfect manner, also raises the pile-driving apparatus to the head of the highest pile, some of which are 66 feet in height, and places it on the shoulders of the pile with the utmost ease and exactness. Some idea of the performance of this machine may be formed, when we state that it drives a pile of 66 feet in length in four minutes, while with the ordinary machines upwards of fifteen or twenty hours would be occupied in doing or twenty hours would be occupied in doing the same work; to say nothing of the entire absence of all damage to the head of the pile, which, in the case of the employment of Mr. Nasmyth's machine, is not in the slightest de-gree injured, while driving such a pile by the ordinary machine the head of the pile is so thatteend and entit by the prostition of its do shattered and split by the repetition of its destructive and ineffective blows, as to require to be cut off and reheaded several times during be cut off and reheaded several times during the operation. Practical pile drivers will have some idea of the remarkable superiority in the action of Mr. Nasmyth's machine, when we inform them that the iron hoop, hitherto em-ployed to preserve the head of the pile from being split into matches, in the steam pile-driver is antirely discussed with end the driver is entirely dispensed with, and the heads of the piles, after driving, bear scarcely, any evidence of force having been applied to them. It is almost impossible to form a ne-tion of the vast and important results which will issue from this new and powerful agent in the construction of great marine works, harbours of refuge, piers, embankments for the recovering of land, timber embankments for railways, and a vast number of other important works, which will now be as easy of èrecution as the most ordinary of undertakings; and the most extensive and tedious of pro-cesses be reduced to one of the most simple and rapid of operations.

BURNING GLASSES EXTRAORDINARY .--0n arrived. The skylight of the room is com-posed of panes of glass, the centres of some of which present that protuberance, technically denominated "bull's eyes;" these forming a focus, concentrated the rays of the sun, and the consequence was, that a large and unseemly hole was burned through the pile of shawls, whereby considerable damage was sustained;" fortunately the goods were insured. — Merlin.

EXAMINATION IN LINES AND CURVES.*

17. What is a parabola, and in what does it differ from the hyperbola? Give the descrip-tion of the difference in words that an artist can understand.

18. Point out examples of applications of the parabolic form in architecture. 19. How are the terms convex and concave

applied to lines ?
20. What is a point of contrary flexure in

a curve? and point out instances of different forms of inflected lines used in architecture.

21. What is a cusp of a curve or line, and what are their different varieties and modes of

what are their different varieties and modes of tracing them, or lines having them? 22. What is a node of a curve or line, and what are their different forms, and the simple means by which they may be traced? and shew also how parts or the whole of different nodes
may be applied in architecture.
23. What is a waved curve or line, and what

23. What is a waved curve or line, and what are their different varieties? Point out in-stances of their application in architecture. 24. Shew how by continuous motion a wave line may be drawn, having the quickest part of each convexity, and the quickest part of the concavity, of the same degree of curvature. 25. Shew how by continuous motion a gra-

dation of waved lines may be drawn between a given form of a deep wave and a shallow one, and shew when such means would be useful in architecture.

26. Shew another example of a wave line when the curvature of the quickest part of one convexity is large, the quickest part of the concavity is less, and the quickest part of the next convexity sill less. 27. What is a spiral line, and what are their different varieties? Jos. JOPLING.

STIMULANTS FOR ARCHITECTURAL STUDENTS.

THE Society of Arts offer their gold medallion for the best original design for a national edifice for the reception of monuments, statues, and busts of eminent public men deceased, with galleries to contain pictures commemora-tive of their deeds. The building to be de-signed in a classical style of architecture, and to be supposed to be placed on an eminence in the vicinity of London, as, for instance, Prim-rose Hill. The drawings to consist of a plan, elevation, and a transverse and longitudinal section to a scale of three-quarters of an inch to 10 feet, and a perspective view. Also a gold medallion for the best design for a hemis-pherical timber roof, circular base plan 100 feet diameter; framed to admit of an aperture for light, in the centre, of 25 feet diameter. The quantity of timber to be specified in cubic feet, and likewise the weight of wrought and cast iron respectively. The design to consist of a plan and section, with such parts shewn as large as may be necessary to fully explain the mode of construction, and to be accompanied by a model of one quarter of the roof to a scale of not less than three-eighths of an inch to a foot. The model and drawings to be sent in on or before the third Tuesday in January, 1846; and, if rewarded, to become the property of the society.

They further offer rewards for

1. Any improvement in the construction, drainage, or ventilation of barns, stables, and other farm-buildings, or in the arrangement of a farm-yard, or in the construction and hanging of gates. 2. For the best method of constructing

economical and durable fencing for agricultural paposes, particularly as relates to the preser-vation of posts and other timbers inserted in

the ground. 3. For any improvement in the method of building, heating, ventilating, and managing bot-houses, conservatories, or other construcions for similar purposes.

TENNIEL'S CARTOON. --- We are glad to learn that the coloured sketch exhibited by Mr. Tenniel in Westminster Hall, to which in our review of the cartoons much commendation was awarded, has been purchased for 100 guineas by Mr. Lewis Pocock, F.S.A., the able honorary secretary to the Art-Union of London.

DOMESTIC CHAPELS.

THE retention of domestic chapels was one THE retention of domestic chapters was one of the last vestiges of old piety to yield to mo-dern indifference. The custom of attaching chapels to mansions of commanding dignity survived even the shock of the outbreak of 1688: nay in the palaces of Blenheim and Chapter the bit her tree of the biof sature in Chatsworth, built by two of the chief actors in that scene, they are to be found; while, to quote a still later case, when during the last century a modern dwelling was reared within century a modern dwelling was reared within the walls of Warwick Castle, the chapel was not forgotten. Such chapels of course are quoted not as models, but as instances. It was reserved for another generation utterly to alienate private pomp from gratitude to The Giver of all good things. Now, as may be supposed, people are again beginning to require them, and we may be reasonably accused of neglect for not having sooner treated on the subject. subject.

Regarding the stile of the chapel, if the house be of any period of pointed architecture, or if it be of that no-stile so frequent in our rural abodes, there will, we trust, be little doubt that the only style in which it can pos-sibly be built is the middle pointed. If, how-ever, the chapel have to be attached to an Italian villa, there is less unreasonableness in questioning whether or not it should corre-spond with the style of the mansion to which it is to be adjoined. But we have no doubt as to what ought to be done. We should say to the proprietor: boldly acknowledge the former mistake, and let your chapel at least be in correct style, and the first fruits of your amended tasts. (?) It is no part of our office to recom-mend second-best courses, and therefore we shall say no more about style. Ancient canons forbid the placing of living apartments over a consecrated building, and reverence would equally counsel against their standing under them, when, as in the case of a country house, there is no lack of surrounding space to occupy. Therefore our chapel must be de-tached from the adjoining buildings, and if possible should be further separated from the rest of the house by a sort of cloister; and the chaplain's apartment too (which may be adapted to serve also as a sucristy) should rather range with the sacred building, than be merely one or two rooms of the secular portion of the house; if, that is, it be intended that he should not degenerate into a carpet-parson,— a risk very possible,—one which has innu-merable times occurred, and should in every legitimate way be avoided.

Domestic chapels form, just as much as cathedrais, parish cliurches, college chapels, cemetery chapels, a distinct genus of places of worship, and like other genera, have their own peculiar rules, to be deduced from the nature of the case, to govern their construction and arrangement. At first sight it might be imagined that the college chapels would be a safe guide to follow in their arrangement: there is, however, this cardinal difference between the two, that college chapels are for the use of a community in its nature religious, --domestic, for one in its nature lay. Thence it arises that the internal disposition of the one will be totally different from that of the other. College chapels, being for the sole use of a religious body, are all choir, the nave being reduced to the functions and dimensions of a mere ante-chapel. Domestic chapels, on the other hand, only require, as a general rule, the chancel of one priest, the congregation being disposed in the nave, and therefore the chancel should not bear a greater propor-tion to the nave than the one does to the other in a parish church. We do not here refer to episcopal chapels, which should be treated separately, but of which we may venture to assert that they bear, or should bear, considerable affinity to college chapels, and that there-fore while accommodation is provided for the lay members of the household in the nave, ample room should be afforded in the stalls for the bishop and his clerks. Again, from the limited dimensions of the domestic chapel, coupled with the privacy which invests it as a place of family worship, it is unnecessary for the distinction between the nave and the chancel to be indicated by any external difference of size.

must be especially careful not to make the building toy-like, and a Lilliputian imitation of more vast religious structures. The de-sire of giving the greatest satisfaction to his patron, may not improbably make him incur the risk of doing this. For instance, the roof need not always be groined. On the other hand, he should be still more careful to admit nothing that was not in proportion to other hand, he should be still more careful to admit nothing that was not, in proportion to the means of the householder, very costly. The chapel should always be the richest apart-ment in the house, and this in these days of exceeding luxury is not saying a little. The chancel, which should be raised at least a step, will of course be screened off from the nave, and contain all the requisite uranity in the for which should be raised at

furniture, including stalls for such clerks as may from time to time be inmates of the house.

The ancient distinction of the sexes should be invariably maintained in the arrangement of the nave, the men occupying the south, and the women the north side. The chapel and the women the north side. The chapel of Haddon Hall has aisles to the nave, of which the north is very parrow and unoc-cupied, but the south still retains its open seats. This chapel is in itself very picturesque, but we should not recommend it as a model; it is far too like a parish church in miniature. Aisles are both cumbersome and unnecessary in domestic chapels.

The nave will contain both lettern and litany-stool; on no account however a font. As an article of general use a font is unnecessary in a private chapel, as an ornament worse than meaningless, as a provision for cases of emergency a dangerous temptation.

The entrance, if possible, should be either on the north or south side, and as we have before said, from a sort of cloister. The arrangement of the belfry, and its nature, must depend upon circumstances. We need not say that orientation must be attended to Ecclesiologist, New Scries.

IRON AND THE IRON TRADE.

A VERY important improvement in the manufacture of iron has been made by a Mr. Green, of New Jersey, effecting a saving in labour and ma-terial of 33 per cent. The process is a modifica-tion of Mr. Clay's patent for the production of iron direct from the ore by the use of anthracite, and is as follows :- six tons of pulverised iron ore are mixed with two tons of anthracite coal dust, and the whole poured in at the top of a dust, and the whole pourse in at the top of a reverberatory furnace upon the slag bed-low; it is then to be worked into a loose granulated mass, and pushed to the furthest end of the hearth: four tons of cast pig-iron are then to be introduced, and, when at a white heat, it is to be heaped on the already half fused ore, and worked up into balls, to be treated in the same way as if the whole were pig metal. It is expected the process will en-able every furnace to double its make, and, of course to render the metal much cheaper.

At the late meeting of the British Asso-ciation, at Cambridge, Mr. Watt read a report on the Iron Trade in Scotland, from which it appears that at the present moment there are extensive new iron-works erecting in Scotland, especially in Ayrshire and in Renfrewshire. At several of the old works considerable addi-At several of the old works considerable addi-tions are being made to the number of fur-naces now at work. The increase in the annual quantity of pig iron smelted in that country in April, 1845, smounts to 37.4 per cent. And there is every appearance that before another year expires, a similar in-crease will be made in the amount of iron pro-duced in Socilard. duced in Scotland.

Sir J. Guest, of Dowlar's Works, in evidence before the Import Duties Committee, 1840, stated that-

Mr. Jessop, of the Butterley Works, esti-mated the annual produce in Great Britain, ex-clusive of Ireland in 1840, at 1,396.400 tons, Externally the lofty roof should be crowned with a cross, and the whole architecture should be of an ornate cast. Internally the architect

CARVED STAIRCASE, BELSIZE HOUSE, HAMPSTEAD.

THE richly-carved staircase still remaining in the old portion of Belsize House, Hamp-stead, is well deserving a pareful inspection; it is a more elaborate, but certainly not so elegant a specimen us the one by Intgo Jones, given in a former number of the BUILDER; but this staircase is of late date, either that of the reign of James II. 'or the one following, when the architecture of the day was overflowing with heavy and senseless ornament. Belsize House heavy and senseless ornament. Belize House was at the time in the possession of the Earl of Ohesterfield,' and we can imagine that the greater portion of the old building having been pulled down, some new parts and rich deco-rations were added to it by that nobleman. The staircase is of crossiderable size; there are four large compartments, of which the print shows the first on the word of the size of four shews the first on the ground floor, and four smaller ones the whole of these are varied in design, and the carring perfect on both sides. The effect of it at present is rather injured by being painted to imitate bronze. Belsize House was, a century back, a cele-brated and rather depressed place of amuse-

brated and rather depraved place of amuse-ment; the accounts respecting it are very curious. It was necessary for the protection of its visitors, to have first twelve and afterwards twenty "stout fellows compleatly arm'd, to patrole betwixt London and Belsize, to pre-"stout fellows compleatly arm'd, to

vent the insults of highwaymen or footpads, which may infest the road." of the date 1722 declares-A comic poem

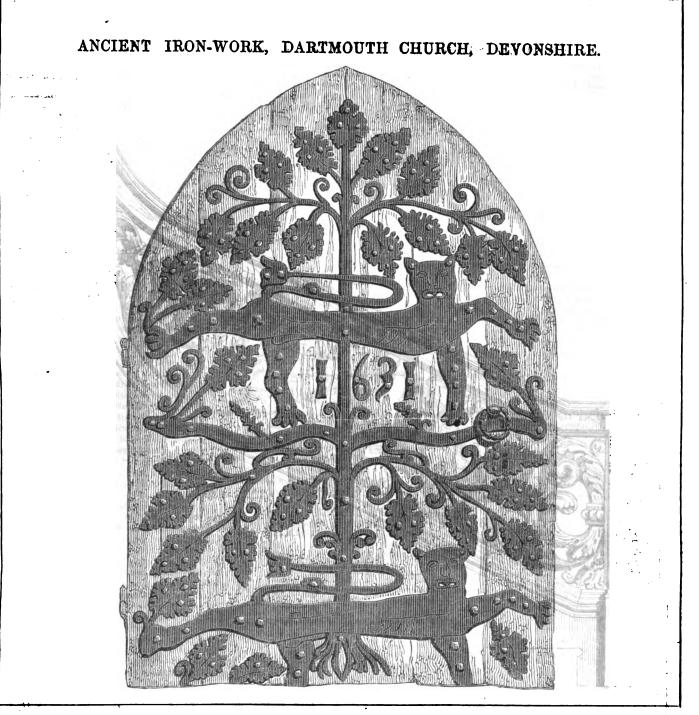

" that thirty men shall be Upon the road for their security : But whether one-half of this rabble-guard, (Whilst t'other half 's sales pon watch and ward,) Dont rob the people they pretend to save, I to the opinion of the reader leave."

Full accounts of this place will be found in Lyson's 4 Environs." second volume, in Park's "Topography of Hampstead," or in the fourth volume of the "Pictorial History of England;" the latter work gives a represen-tation of the front of the house, copied from a very rare print. C. J. RICHARDSON.

ornamental to the first city of the empire, worthy of the age in which we live, and suita-ble to the present and future wants of a Metropolitan University. The editor of the Morning Chronicle has recently peaned a few remarks on the subject. He says : "The present apartments ' have become ludierously insufficient for the purposes for which they are re-quired. What must be the impression on the mind of a stranger (drawing his idea of the ap-pearance of an English university from the noble piles of building which adorn our ancient sents of learning) when he asks for the University of London, and is directed to a staircase (which he of course takes for the porter's lodge)-and, on entering, sees written up in large characters, 'University of London on the A second floar l' The second floar might indeed do well enough for the really of the second floar l' The second floar might indeed do well enough for the creating of the University of Loodon of the great increase in the number of candidates for matriculation in the University of London this year, the chambers of the University at Somerset House not being sufficiently spacious to accommodate the whole of them, the principal of King's College, on being applied to, placed one of the lecture-rooms of that institution at the disposal of the senate during the examination. This want of room shews the necessity, and suggests the propriety, of erecting a structure, that shall be

IRON-WORK TO DOOR OF DARTMOUTH CHURCH, DEVONSHIRE.

CONSIDERABLE taste and skill in ancient times were displayed in all kinds of iron-work ; times were displayed in all kinds of iron-work ; this has been already most efficiently pointed out in these pages. The subject represented above, is a striking example of the boldness of ancient designers and workmen, and such that is indeed calculated to make their modern representatives stare. The style of the iron-work on the door at Dartmouth Church, is that of the reign of Edward III. The date, which appears 1631, is a puzzle; it either proves that in some parts of the country the different styles lingered for a considerable period longer than we now please to allow, or it proves that the iron-work belonged to an older door, and was brought there in that year. This latter supposition is the more likely to be correct, as it appears imperfect towards the lower portion, as if it had been made for a tailer door; the style of the church is that of the reign of Edward III. C. J. RIGHABDSON.

SETTING OUT CURVES ON RAILWAYS.

Your correspondent, "Amateur," in a recent number (June 14) of THE BUILDER, requested number (June 14) of The BOILDER, requested to be furnished with a method for setting out curves on railways. In the absence of any answer being yet afforded to his inquiry, I venture to give the one I have usually adopted, and which in practice I have found to be simple and expeditious.

It is obvious that from the great radii of railway curves in general it would be impossible to strike them as in the usual manner, from a fixed centre. But the known relation between the sine and versed sine of an arc

affords a ready means of effecting the same

affords a ready means or energing and object. For instance, in the annexed diagram, let A be the point whence the curve is proposed to commence with a radius, A C, of 60 or 80 chains, as the case may be. From the point A set off on the ground any convenient distance A T, of say 10 chains, marking each chain in its length. Then at the point B, the end of the first chain, set off B D at right angles to A B. Now if the ordinate B D be taken equal to the versed sine of an are of a circle of the given radius, with a sine of one chain D, is the locus. of the curve to be described at that point. The formula for calculating the value of B D is of easy application, being always equal to radius - Vrad.º - sin.º; and the same process will spply to any other re-quired point in the curve, merely substituting the value of sin⁴ in the expression, as the distances in the expression, as the distances in the tangent, A.T, increase from the point A. It is advisable, more particu-larly in uneven ground or where the space is confined, to recommence the operation at about every 8 or 10 chains which is afforded by satiring chains, which is effected by setting out a new tangent to the curve. This may be done by joining the last ascertained point to the next but one from it in the curve, viz., that cor-

Digitized by GOOGLE

responding to the ordinate on the tangent at two chains back. Then a line ranged forward parallel to this chord, and touching the curve at the middle point, will be the tangent required. The above method will be found convenient,

The above method will be found convenient, as it affords a facility for calculating tables for the versed sine of an arc of any radius from the one already obtained; for since the curvatures of circles vary inversely as their radii, a simple proportion will give the value of the versed sine of any other required. There is another method which is sometimes adopted by engineers, and recommended by its apparent simplicity, it is as follows: —Upon the tangent, A T, is taken any length, A D, as before; and from B is set off B D $\left(=\frac{AB^2}{diameter}\right)$ perpendicular to A T, then the chord A D is produced to G, making D G equal to A B; and from G is drawn the perpendicular G E equal to 2 B D, whence the points AD E are assumed to be in the circumference of the same circle, and other consecutive points are found by producing the chord D E as before, and setting off perpendiculars each equal to 2 B D.

It is scarcely necessary to observe that this method is not only erroneous in principle, but the curve so obtained is not a segment of a circular arc, but, on the contrary, one where the radius of curvature is continually increasing.

circular arc, but, on the contrary, one where the radius of cirvature is continually increasing. In the *Mechanics' Magazine*, No. 801, for December 15th, 1838, I gave an investigation of the principle, wherein it was shewn that in arcs of small radii the error would be serious. G. HAWEINS.

G. HAWKIN

IMPROVEMENT OF THE KING'S SCHOLARS' POND SEWER.

HAVING frequently observed considerable quantities of sewerage matter, as also silt, said, stones, and other substances, lying upon the channel of the King's Scholars' Pond Sewer, between the outlet next the Thames, and Elliott's Brewery, at Pimlico, and as this accumulation creates not only an abominable nuisance to this improving neighbourhood, but also cost a considerable sum of money during each year in removing it, I beg to suggest a simple method by which very much of the nuisance so frequently complained of may be obviated, and at the same time the great expense which now attends its removal may be entirely done away with. But in the first place I will explain how these deposits and accumulations are produced.

plained of may be obviated, and at the same time the great expense which now attends its removal may be entirely done away with. But in the first place I will explain how these deposits and accumulations are produced. There are two pairs of flood-gates at the outlet, which is 18 feet wide, one pair being scarcely or never used, but is intended to supply the place of the other should this ever get out of order. At every flux of the tide, and when it rises to the sill of the outlet, one pair of these gates is closed for the purpose of preventing the river-water from flowing into the sewer, which is by this means formed into a simple reservoir, and retains the whole of the sewerage matter, &c., that flows into it, from the time the gates are shut, till they are again opened, this being from four to five hours during every tide. Now as the sewerage-water accumulates or rises in the reservoir, the animal and vegetable refuse, and other substances, which are carried along in suspension by the velocity and action of the descending water, are thrown down, and thus become deposited and accumulated upon the channel; these substances being for the most part of greater specific gravity than that of the water; and, therefore, when it is still they settle and subside to the bottom. The gradient all along this portion of the sewer being very little, the water flowing down it here soon increases in height, and thus the action and force of the stream becomes very much expended at a considerable distance up the sewer; the lighter particles of matter being carried forward, while the more bulky and heavier, become deposited where the water loses its principal velocity.

Had scientific and proper principles of drainage been observed when this portion of the sewer was arranged and constructed, at least 5 feet more fall could have been given to it, so as to have brought the discharging sill of the outlet somewhat under low-water mark in the river, and which would not only have greatly improved the drainage of the lower portion of Westminster, by allowing the collateral sewers a greater gradient than they now have, but the increased fall would have

imparted such an amount of velocity and action to the descending stream at this part as would have prevented the deposition of matter, and consequently would have carried it direct into the Thames. The height of the water at each pent in the reservoir varies considerably, it rising higher on those days when the water companies' mains are charged for the service of the public, and also during rains and storms. But it scarcely or never rises so high as highwater mark outside the flood-gates, and when the tide recedes to, or a little below, the level of the accumulated water in the reservoir or sewer, the gates are forced open by the superior pressure inside, and thus the water gradually and slowly sinks and flows out with the ebb tide, leaving the deposited matter upon the bed of the sewer.

bed of the sever. Now what I propose in order to prevent these accumulations for the future is this : that the gates at the outlet be kept closed during each ebb tide, *until it leaves the sill* of the outlet. Then they should be opened and the descent of the current not having any thing opposed to it, such a high degree of velocity and scouring action would be by this means imparted to the stream, that it would raise up and carry along with it the substances which were deposited during the time the water was accumulating in the reservoir, and thus much of the stench which now infects this locality would be done away with, and great expense to the public saved also. An OBSERVER.

THE GILLESPIE MONUMENT IN COMBER.

On the 24th ultimo the monument recently erected to the memory of Major-General Sir Robert Gillespie, was publicly opened, up-wards of 25,000 persons being present, includ-ing the members of 119 masonic lodges, many of whom had travelled miles to attend the ceremony. The monument consists of a well-pro-portioned square pillar and pedestal 55 feet high, divided into compartments on the four faces, on each of which is sculptured a representation of one of the principal scenes of Gillespie's career; and it is terminated by a statue of the General himself, holding his sword in his right hand. Gillespie having been distinguished as a freemason, the south side of the pedestal is sculptured with masonic devices. "Brother" Johnston, the architect, received much praise for the manner in which he had carried out the intention of the committee. The proceedings took a masonic character, and one of the speakers, Alexander Grant, Esq., of Derry, made some lengthened observa-tions on the value and purpose of the institu-tion. He remarked especially on the manner in which it had withstood the destroying hand of time, and that its tendency was to effect good. "As Masons," said he, " we consider the entrance of a candidate into our order as typical of the entrance of all men on this their mortal existence. It inculcates the useful lesson of natural equality and mutual depen-dence—it instructs us in the universal principles of beneficence and charity, to seek solace of our own distress, by affording relief and consolatiou to our fellow-creatures in the hour of distress and affliction. Above all, it teaches us to bend with resignation and humility beneath the chastening hand of the Almighty, at the same time to engraft his law in our hearts. Further, it instructs us to cultivate the intellectual faculties, and to trace it through the paths of heavenly science, even to the throne of Omnipotence. To our minds, thus modelled by virtue and science, masonry, however, teaches one great and useful lesson more; she leads us, by contemplation, to the closing hour of our existence. Masonry has been not only mental wealth to the poor man, but softened the asperities of life and lightened the derive shalows of adversity with a smile." the dark shadows of adversity with a smile."

OLD GREYFRIARS' CHURCH, EDINBURGH. —On the 10th instant, the preliminary operations for the demolition of this church were undertaken in the presence of the lord provost, and several other of the city authorities. By means of a large beam which was employed as a battering-ram, the large pillars which separated the southern aisle from the main one were levelled with the ground, bringing with them the whole of the roof which they supported, and leaving only the small portion covering the northern aisle standing.

ST. WILFRID'S ROMAN CATHOLIC CHAPEL, HULME.

L

A FORTNIGHT ago, the anniversary of St. Peter and St. Paul, the chancel of St. Wil-frid's, Bedford-street, Hulme-which had been for some time closed for decoration-was reopened. According to a local paper the eastern end of the church has a spacious chancel, and two lateral chapels, one dedicated to the Virgin, and the other to St. Thomas of Canterbury. The chancel is between these; Canterbury. The chancel is between these; and it is to the decoration of this portion of the church that the congregation has been directing its efforts; and to aid in defraying the expenses of which, the collections of the day were made. The chancel is divided from the nave and lateral chapels by open screenwork of oak, the cusps and mouldings gilded and picked out with crimson. The screen next the nave is surrounded with a large rood or crucifix, with figures of the Virgin-mother on one side, and St. John the Evangelist on the other, and on either side of these, three massive gilt standards bearing large wax lights. The chancel is of large dimensions, about 25 feet square, with an open tim-bered roof. To ensure the stability of the work, this, from rooftree to floor, has received five or six coats of oil-paint, upon which the decorative work has been done, forming one glowing mass of gold and colour; and in de-sign and execution it is described as being, for its extent, the richest specimen of polychromic painting in England. The eastern end is adorned with four windows of stained glass, and the south side with one, all exe-cuted by Mr. Wailes, of Newcastle-upon-Tyne. The roof of the chancel is of azure, thickly sprinkled with gold stars; the rafers of crimson and gold, with rosettes and scrolls. The walls are covered with a simple dispering of blue, white, and red, down to the level of the rere-dos (or screen at the back of the altar), when the pattern increases in intriacy of design, richness of colour, and the more profuse use of gold. At the extreme height of the eastern gable, on a gold groundenelosed in the mystical vesica piscis, is the figure of the Lamb, and below, in round medallions, are two angels in attitudes of adoration, clad in white angels in attitudes of adoration, clad in white robes, and hearing tapers. At the same level, along the side walls, are five other angels in-scribed with sentences from the bymn, "*Cloring* in *Excelsis Deo.*" On either side of the eastern window is a large full-length figure, one of St. Wilfrid, in whose honour the church is dedicated; and the other of St. Edward the Confessor. The upper part of the rere-dos has shields alternately bearing the fa-mily cognizance of St. Wilfrid, and the arms of mily cognizance of St. Wilfrid, and the arms of the diocese of York, of which he was bishop. Beneath these again are seven medallions containing the heads of as many Angle-Senoa bishops. The corbeils are of crimson, with the emblem of our Lord's passion and desth blazoned in gold; the reveals of the windows and arches are of a rich pattern; the moald-ings of the arches, piscina and sodilia, the piings of the arcnes, piscina and seemin, the pit-lars of the reredos, and of the altar; are of bur-nished gold, which, mingling with, beighten-ing, and relieving the rich profusion of colour with which the whole abounds, produces a gorwith which the whole abounds, produces a ger-geous coup d'æil. The design was furaished by Mr. Welby Pugin, and excouted by Mr. William Boardman, of Manchester; the heads and figures being painted by Mr. Keeling, of Manchester. No cost appears to have been energy upon the work spared upon the work.

ST. JAMES'S CHURCH, NOBLAND, NOT-TING-HILL.—This edifice was consecreted last week by the Bishop of London, but at present it is minue the steeple, a deficiency which necessarily detracts from inte appearance. A subscription is, howev er on foot, to enable the trustees to erect the steeple; and as the sum of only 2501. is wanting, it is expected that the object will be speedily accomplished. The seats, which are constructed very low, will accommodate 750 persons, and one half of them are free.

FINE ARTS IN EGYPT.—We learn from Paris, that the Pacha of Egypt proposes to establish an academy of the fine arts in Cairo, and that a number of young men have been sent at his cost to Rome to study painting and sculpture there, with the view of acting as the first professors.

HUDP LONDON STONE.

- "It is so sure a Stone that that is upon sette, For though some have it thrette (Wish Menaces grym and grette, Yet Hurte had it none: "That the Oitie is set uppon, Which from al his Foone Hath ever preserved yt."

So singeth Master Fabian, with more good will, belike, than harmony, and possibly among the several characters ascribed to this mysterious stone, whereof many have conjectured, but none professed to state precisely, the origin, that of a Christian monument, according to the old City chronicler, may have likewise appertained to it.

But it is to an earlier period that we are to carry our inquiries as to its original use and destination.

Wren, who had opportunities for practical investigation, which might have done much toward the knowledge of ancient London, in the hands of a better antiquary, found, in the immediate neighbourhood of this stone, such extensive remains of buildings, evidently Roman, as led him to assert, supposing it to be the milliarium or standard milestone, similar to that in the Forum at Rome, that it partook of a more extensive form, and appeared, in some degree, to have imitated the Milliarium Aurem, at Constantinople, which was not merely a pillar like that at Rome, but a roofed build-

ing. Now, granting the roof, which is, indeed, a thing quite probable, we may suppose an edigoodly stone, of which but a morsel now sur-vives, would form the central pillar; conceive this, surrounded by a platform with steps, and having a pent or roof, supported by a series of inferior columns, and you have a building of a Roman character, and withal the model, per-chance, of those central crosses which date from a period as early, for aught that is known, as that of the Saxons, who learned the forms of sreditesture from their Roman predecessors. And now, good reader, you may set up statues of Fortuge and Mercury, for we will conclude this not only to have been the point whence branched off the principal highways, but that it was likewise the place of eloquence, where proclamations were addressed to the populace. You may add, likewise, if it seemeth so to be-hore you, the statue of the Emperor Theodosius, in whose honour the name of the ancient city, Latinised into Longidinium, according to Autininous, or otherwise Londinum and Londinium, from the elements of its Celtic denomination, was for a time suspended, and that of Augusta bestowed upon it instead.

But m for we have begun somewhat before the beginning, so far as matter of surmise is concarned-let us now take an earlier view of this renewed city. Imagine we, then, a space cleared from the primeval forest. The various tribes of the early inhabitants living in a state of a predatory warfare, some natural defence was necessary to a people who had not learned the art of building walls, or constructing artificial bulwarks much more efficient than the stockade or fence of felled trees surrounding the village. The site of this primitive city is accordingly chosen so as to be protected on all sides: the Thames on the south, and on the north the manshes, afterwards known as Fensbury, were traversed by certain rivers running into the former, and forming the boundaries of the settlement.

A street of hovels runs east and west, leaving a space in the centre, and in this space stands a perpendicular mass of unhewn stone, even such as they of yore set up for worship and secrifice in the East, and similar to the grey and solitary pillars which appear inthose waste moors of Cumberland and other parts of England, and furnish the untaught peasant with the theme of many a wild tale and fabulous legend. This particular stone, standing in the midst of Lon-dun or Llwn-thun, the unhewn altar of the Druidic hierarch, was then, gentle reader, upon the authority of, "it has been supposed," no other than the identical London Stone.

And, verily, it is a pleasant supposition; and let us only adopt it as such, and belike it will soon amount to a belief; and why should not the judicious antiquary have his pet weakness to cherish like a founding, hugged all the more vlosely the more it is rejected of others? Marry, good friend, the thing is wholesome,

and in this shrine will we lock up all our credulity. The Romans took, then, this venerated monument, and dedicated it to those tutelary deities who presided over the destinies of way farers, and all such as would propitiate the goddess Fortune.

Having made this declaration of faith, it now behaves us to descend from our altitudes, and betake us to some inquiry concerning what history sayeth touching this, our subject, and eke what tradition, which latter is but an un-written history, and therefore unsophisticated, and off times mears to the naked truth Baand oft-times nearer to the naked truth. Before the time of the Conquest, then, and that is whereof one parcell is described to lye neere unto London Stone."

London Stone, be it said, stood not, of yore, in its present place, but on the other side of Watling-street, which was formerly one of the three great thoroughfares running east of Roman London. There was an open space where several streets met, and surrounding which were the markets which supplied the which were the markets which supplied the city with provision, such being the only legal markets according to a decree of Hammond Chickwell, in the reign of Edward II., which sets forth that "none should sell fish or flesh out of the following places, vis., Bridge-street, Eastcheap, Old Fish-street, St. Nicholas Shambles, and the Stocks-market," the latter so designated by virtue of the provision made there in order to chastise and expose all chesting huxters, and such cozening knaves as dealt not honestly in their wares, according to the law of the Pied Poudre Court. This was the region of good cheer, for here, said Lydgate,

"Pewter pots they clattered on a heap ; There was harp, pipe, and minstrelsy

There were ribbes of beef rosted, and pies well baked, and, while the substantial and strongflavoured meats were ever ready to appease the hunger of the churl, the more dainty and appetising vivers, such as spiced frumetye, carpe in foile, larks ingraylede, and many other toothsome refections, were forthcoming at the call of gallants from the patrician purlieus of St. Catherine's Tower Royal, and Baynard's Castle.

Nor was good sack lacking to boot, be thou Nor was good sack lacking to boot, be thou witness, shade of fat Jack 1 but thou never could'st become a shade. Here revelled, if Will Shakspere speaketh sooth, hotheaded Prince Hal and his frolicksome playfellows. The atmosphere is still redolent of canaries, and the nose of Bardolph sheds a fiery splendour over the spot like the livid efful-rence of a stormy supset gence of a stormy sunset.

But the glory of Eastcheap is departed, the Boar's Head is no more, and they who would behold its former site may seek it well nigh, even at the feet of King William's statue.

In the Saxon times and downwards, ere London had a Bourse, or Exchange, the font of St. Paul's and London Stone seem to have been resorted to for the ratification of various transactions; and a promise to pay a debt upon London Stone appears to have imparted an additional solemnity to the obligation, by the nomination of the locality where it was to be fulfilled, the shadow of its early canctity probably taking the colour of the successive religious changes it had witnessed, until it was finally invested with a degree of Christian reverence, according to the spirit of the times.

Moreover, its great antiquity, for few men are without something of the spirit of anti-quarian veneration, however little they may be conscious of it, may have given to it, in the minds of the citizens, something of that importance which is supported by an indefinite superstition.

It had thus become in the eyes of men, as it were, in some sort, the foundation-stone of the city, even as Fabian suggests, being the oldest visible object there existing—a thing by which the city and its greatness were to stand or fall, wherefore, as it hath been recited, treaties were there ratified in good faith between man and man, proclamations made, and all matters relating to boundaries begun and ended there.

In the same spirit, that arch rebel, Jack Cade, when he entered London at the head of the Kentish insurrection, marched to this place, and, in the presence of a great concourse of people, struck his staff on London Stone, exclaiming, "Now is Mortimer lord of this city !" "And here, sitting upon this stone," &c., adds Shakspere, who wist somewhat of the gnostic meanings of things, thereby implying, that, although a more dignified orator would have stood upon the stone or the platform thereof, if such existed, the would-be Mortimer, inspired, forsooth, with the putting down kings and princes, must loll at his ease, while he addresses a swaggering oration to his quaking worship, the mayor, and issues this lordly ordinance,

"I will make it felony to drink small beer."

The last notices of this ancient and solemn monument appear in this wise: — "On the south side of this high street, near unto the Channell, is pitched upright a great stone, called London Stone, fixed in the ground called London Stone, fixed in the ground very deepe, fastned with barres of iron, and otherwise so strongly set, that, if Cartea doe runne against it through negligence, the wheels be broken, and the stone itselfe un-shaken." This is its appearance according to Stowe.

And now the latter days fell heavily upon the venerable relique, which was at length overthrown, and in a dark age, and by the sentence of wicked men, without awe or veneration, doomed to destruction, as a nuisance !

But at this crisis there arose a bold and goodly hero (upon whose memory be every honest antiquary's benieon), by name Thomas honest antiquary Maiden, of Sherbourne-lane, printer. This worthy moved the authorities, even the parish officers, to its preservation, which act of P righteousness was fulfilled in the year 1798, whereby London may be said, in a figurative sense, to continue standing upon its ancient foundation.

And now, worthy reader, having detailed' for your instruction as much as is chronicled of London Stone, and, perchance, somewhat more, in the process of this discourse, behold it shifted, and degraded from its dignity and uses, even where it hides its diminished head, curiously enshrined in a case of freestone. It seemeth but a little bit of what would appear to have been of a goodly bulk formerly; but remember that the unsparing wheels of fifteen centuries, if not many more, wheels of inteen centuries, in hot many more, have passed over it, and even still it may be bigger than you wot of, for though we peep thus at its venerable crown, which is somewhat greater than your head though by no means as large as the dome of St. Paul's, yet may there be much more below ground, and enough, perchance, to serve as a goodly bulwark to that part of the church wall against which it standeth.

In curiously surveying the site there will, likewise, be seen another object which partaketh somewhat of the spirit of the earlier time, yea, the days when labouring men might rest awhile on their wayfaring, under heavy burdens, ere it had been ordained that all things had to be done in breathless speed and haste. This is a porter's shelf, many of which are now removed, but which presented formerly numerous invi-tations to the weary, accompanied by certain sage admonitions to boot, daintily imprinted to this effect, "Don't forget your parcels." Underneath we may find, lazily prolonging his rest even unto the pitch of snoring, an unthrifty member of the fraternity of London porters, who has, mayhap, essayed to carry too much of his namesake, over and above the sufficient load upon the shelf, and now wots but little of things ancient and modern, nor even of the preservation of his shins in a populous thoroughfare.— Illuminated Mayazine.

STIR IN THE SCHOOL OF DESIGN .papers which have appeared in our columns on the state of the School of Design have excited very lively interest, serving to shew that a large number of our readers consider it as it really is, a subject of considerable import-ance. We have now before us statements of an extraordinary character bearing upon it, but feeling the possibility of committing injustice, both correspondents and readers must pardon us for postponing the consideration of them for another week.

THE BUILDER.

357

INFLUENCE OF NEWLY-BUILT HOUSES ON THE HEALTH OF THEIR OCCUPIERS.

DR. SUTRO, in a recent number of the Medical Times, draws attention to the intimate connection kept up between the external air and the human organization, through the medium of theskin and lungs, and then he refers to experience to shew the slow and dangerous diseases to which inhabitants of newly-built houses are exposed, and he considers it, therefore, to be the duty of the sanatory police to remove or check these evils, by means of de-cisive prohibitory measures. The normal composition of the air is changed in newly-built houses, and thus diseases are created :--lst. by an increased proportion of water in the atmo-sphere; (a) from the wooden materials, which may be too new and damp, and which, there-pared from dried clay, most; (c) from the ma-terials used for cementing the stones, and for terials used for cementing the stones, and for colouring and varnishing the stones, and for mortar used for cementing the stones, consists of hydrate of lime, which gradually loses its water, and hardens by attracting carbonic acid from the atmosphere. "The walls of those houses remain damp longest which have been plastered immediately after their completion, because the dried lime forms an external layer very difficult of penetration. As accidental causes, which may render houses damp, it is necessary to mention wet weather when building, damp situations, large cellars, and enclo-isome by other high edifices, which prevent the free lagests of son and wind. Ind. The provoorsion of varbonio acid in the air is diminished by the mortar which attracts it from the air. as before mentioned ; it may also be attracted by: wilburs; containing scotate of copper, in which case the actic acid escapes. No direct injury would; however, be caused by the dimiweition of darbonic acid, as it belongs to the matheme encodeted by the skin and lungs. 3rd. The following foreign substances are miaed with the dr :--- (a) particles of line, which have been proved beyond doubt to exist in the atmosphere of new habitations, being suspelided by the susperation of the moisture ; (6) evaporation of oil and metallic colours. Combinetions of lead, copper, and arsenic are employed in the preparation of painter's colours. ead volatilizes at the increased temperature of the rooms, copper does not, but wherever assenical colours have been used, the air may absorb assenious acid, and asseniurettad hydrogen gas may be formed by combination (with hydrogen; (c) different chemical evapo-rations of damp new wood, mould, fungi, and rations of namp new wood, indud, langt, and grasses, which arise and putrify in damp habi-tations. P. Frank has already directed atten-tion to the mould with which the furniture of newly-built houses is covered, and to the constant moisture of the clothes and linen, from which circumstance alone influences injurious to the inhabitants may be expected; for on account of theinstrained indiate ity of the surrounding atmosphere, not only is the skin prevented from free transpiration ; but it is even induced to attract more moisture. This is also the case with the lungs, and thus the composition of the blood is rendered abnormal, , and hydræmia of the whole body is produced this is: shown by a pale anormic face, sweated muscles, decrease of strength, sluggishness of all the functions, difficult respiration, and soft nall pulse, which symptoms frequently termi-180 nate in external or internal dropsy. In other cases, protracted theumstisms, articular inflammations, contractions or paralyses, are produced. In addition, the sojourn in a damp atmosphere is a frequent cause of the develop-ment of supplie intermittent and the development of scrofuls, intermittent and typhoid fevers, scurvy, quinsy, croup, pulmonary gen-grene, puerperal fever, &c. Wounds and grene, puerperal fever, &c. ulcers easily assume an unhealthy appearance, and have a tendency to take on gangrenous inflammation. The evaporation from organic substances favours the production of miasmata and contagions, for in no situations did the cholera occur more frequently, than in new, damp habitations. The inspiration of lime damp habitations. The inspiration of fille particles may predispose to diseases of the chest, or apoplexy. There can be no doubt, that the lead employed in painting the walls, evaporating at a higher temperature, may pro-

duce in those who are constantly exposed to its injurious exhalations, symptoms of chronic poisoning, disturbed digestion, colic, or pa-ralysis, but this may be less feared from paints coloured by acetate of copper, inasmuch as it does not volatilize, and could, perhaps, at most by attracting carbonic acid, allow its acetic by Mitratung Carbonic Patro, and the action acid to escape. Chronic poisoning by arsenic may be produced by being exposed to the eva-poration of Scheele's or Schweinfurt's green, from which arseniuretted hydrogen and arsenious acid often escape for a long time. Lastly, the constant meisture of the clothes and beds, and the frequent effect on the food causes certain injurious consequences on the constitutions of the inhabitants. Since then the early occupation nof inawly-built houses and recently plastered mome cause as many discusses, and impart to oblide the series of prolonged soluces and minery, it becomes the duty of the state to prevent these evils by all possible means. In order to guard against the perils and injuries enumerated, the author considers the following measures to be necessary. Official examination of the materials before the commencement of the building, the enforcement of proper arrangements as regards the building itself. Thus, in public contracts for any building, to be erected in summer, the condition ought to be made, that the materials should be procured and dried during the preceding winter, and the term of completing any edifice should always be regulated according to the weather. Lead and arsenical colours for painting the walls should be entirely for-bidden. 2° A house should not be inhabited before a fixed time after its completion had elapsed. Some authors think a year should be the period fixed. Considering the different effects of different localities, a house in town should remain uninhabited for a year, and in the country, where sun and air have free access, for half a year, after it has been finished. Should any house be dried before the time appointed, the proprietor might re-quest the sanatory commission to examine it, when, if sufficiently dry, it might be inhabited. 3° A commission should be appointed for the purpose of examining every newly-built house, and testifying to its soundness before it is inhabited. Austria presents evidence of the feasibility of such an arrangement. 4º Instruction of the people as regards the injuries caused by inhabiting newly-built houses, &c., and as regards the means to be taken for the purpose of counteracting these injuries. The above commission not being generally intro-duced, wor put in force in cases of repairing, painting, &c., people ought to know to what diseases they are liable by exposing themselves to such injurious evaporation, and if compelled by circumstances to submit, they ought to use the following precautions : -- first, drying should not be confined to one room, but to all the adjoining rooms. Mould, fungi, &c., should be rubbed and washed off with the be frequently lighted, and the windows should be frequently lighted, and the windows should be opened. Muriate of lime or sulphuric acid be opened. Muriate of time of supports acid should be put in different places to attract the moisture. To parify the air from other inju-rious matters, the following substances are re-commended, chlorine, nitric acid vapours, furnes of sulphur, evaporation of vinegar, coarsely powdered and moistened charcoal put indifferent places, fumigations with the vapours of elder berries. For rooms already inhabited a solution of chloride of lime is the most proper substance. Drawers and other furniture ought not to be placed too near the damp walls, and if the latter should be covered with mould, they ought to be touched with a solu-tion of chloride of lime. In addition, warm and dry clothes must be provided, and the bed must not stand too near the walls. Straw or feather-beds must be changed frequently, or exposed to the sun.

BIRKENHEAD MARKET.-The new markethouse at Birkenhead was opened on Saturday week for the first time. The building is one of the largest in the kingdom, and is said to be superior to any thing in its admirable arrangements and accommodations. Large quantities of eatables of all sorts were displayed at the various stalls, and the purchases made were such as to ensure success to the renters of the shops and stalls. The entire cost of the build-ing is about 24,000/.

PURIFTING WELLS, &c.

SIR, - Seeing an extract from THE BUILDER respecting a suggestion of mine for purifying wells, cesspools, &c., I beg to state that the method communicated by me to the Society of Arts and Sciences, and rewarded by Society of Arts and Sciences, and rewarded by them by an honorary testimonial, was quite different to throwing a quantity of lime into the well. If there is a depth of water in the well the lime will be absorbed by it; if thrown into a dry well, it will be of no use whatever. The process is simply this :--On finding a well contaminated with carbonic acid gas (and no man ever ought to descend a well before this is ascertained, by lowering a lighted candle, which will be extinguished, if there be foul air, on coming in contact with the vapour), take on coming in contact with the vapour), take about half a bushel of fresh burnt lime, put it in a bucket or kettle, pour water on it sufficient to slake it, but no more. When the lime has steamed a short time, lower it down in a steaming state, so that the bottom of the bucket is close to or rests upon the surface of the water in the well. By lowering it to this depth, if the well is foul near the bottom, it will be the more effective. It is by the affinity existing between the lime and the carbonic acid gas that the vapour is destroyed; by that affinity the carbonic acid gas seizes upon the lime, and is incorporated with it, and forms a carbonste of lime, which is perfectly harmless. In minutes the well will be in a pare state. In ten J might add much more upon the effects of lime, used similarly, in vaults, graves, and vats, but, fearing to be too prolix, I conclude for the present. I am, Sir, &c., A. J. GREEN, Bricklayer.

Sudbury, July 19th, 1845.

SUSPENSION PIER AT WESTON-SUPER-MARE, BRISTOL.

It is proposed to annex the Island of Birabeck to the main land, by means of a suspension-bridge on the principle invented by Mr. Dredge, of Bath. In opposition to this, it has also been proposed to approach the island by means of a roadway, formed of loose stones at the base, with a crown on the top of solid ma-sonry; but as the difference in the cost will only be a few hundred pounds, it is not likely that the latter will find much favour.

Mr. Dredge has furnished the committee with several designs for the suspension-bridge. The whole length to be crossed is about 1,400 feet; of this he proposes that about 1,100 should be accomplished by means of the bridge to be composed of iron, the central span of which would be 545 feet, and the outside openings 272 feet. The remaining 300 feet he proposes should be solid masonry. The height of the towers above the vosdway is intended to be 42 feet. The platform is designed to be hung on two main suspending chains.

PRESIDENT OF THE ROYAL ACADEMY .-The academicians find the selection of a new president so difficult a task, that they are un-willing to accept Bir Martin Shee's resigna-tion, although it is certain that the state of his health even if he accede to their request that he should retain the office, will prevent him from performing its duties. An address was presented to Sir Martin a few days since, soliciting him to retain the presidentship, but we have not yet heard his reply. THE ASSOCIATION OF ABCHITEOTURAL

DRAUGHTSMEN,—This ussociation seems now to be very satisfactorily organized, and pro-mises to be useful amongst other ways, in faci-litating communication between its members and the profession generally. Architects may here at once learn the addresses of draughtsmen who are unemployed, and see their works. The place of meeting is 33, Southamptonstreet. Strand.

REDUCTION IN THE PRICE OF GAS. addition to the cases we gave last week of provincial companies having resolved to reduce the price of gas, we have heard that at Bristol both companies have lowered their prices to 7s. per 1,000 cubic feet; at Aberdeen 4s. satisfies the rival companies; and at Doncaster a reduction of 10d. on the same quantity has been effected during the past fortnight. With respect to the reduction at Aberdeen it is worthy of remark that the far more extensive companies of Edinburgh, Leith, and Glasgow, having the coal at their very doors, charge six shillings and sixpence.

The Nutural System of Architecture, as opposed to the Artificial System of the present Day. By W. P. GRIFFITH, Architect, F.S.A. Published by the Author, 9, St. John's-Square.

The principal object of the ingenious work before us is to establish, or rather re-introduce, those laws relating to proportion which the author maintains were acted on by the early and middle-age architects. Ancient edi-fices, he asserts, were the result of pure geo-metry, and he gives the following table to shew that the most perfect examples of Greek art were produced at a time coeval with the most celebrated Greek geometricians :---

| Geometricians. | Eras. | Temples. 1920 | Bras. |
|----------------|-------|--------------------------|-------|
| | B. C. | | B. Ć. |
| Theles | 600 | Delphos-Apello | 600 |
| Pythagoras | 550 | (Thesewh | |
| Eutocius | 540 | Athens Parthenon | 448 |
| Hippocrates | | Athens Parthenon, | 435 |
| Procine | | Olympia-Jupiter Olympius | 436 |
| Propus | | Athens-Erectheum | 300 |
| Serenus | 390 | Priene-Minerva Polias | 840 |
| Aristonus | 350 | Ephesus-Diana | 840 |
| Plato | 810 | Elousis | .915 |

"To teach weak mortals properly to scan, Down came geometry and formed a plan."

Another portion of the work treats of the connection between architecture and music, and is to the effect that the laws which regulated a measured musical production regulated in like manner just proportion in architec-ture. On both these points much has been written and thought since Archimedes, who written and thought since Archimedes, who demonstrated that the proportions of certain solid hodies are the same as those of the musical consonances. René Ouvrard, a learned French ecclesiastic of the sevententh century, published a work entitled Architecture Har-monique, ou application de la doctrine des pro-portions de la Musique à l'architecture (Paris, 1679, 4to.), and afterwards a supplement (1682) called Calendarium novum perpatuum et irre-vocabile, but this he was prevailed on by M.

Argauld to suppress. Lyos the forms of the five platonic bodies, viz.:—the *Tetrahedron*, or regular pyramid, which has *four squal* triangular faces; the *Harahedron*, or cube, which has *six equal* square faces; the Octohedron, which has *eight* equal triangular faces; the Dodecahedron, which has locales equal pentagonal faces; the locade-dron, which has twenty equal triangular faces, Mr. Griffith endeavours to shew that the arand or inthe endewoors to snew that the ar-rangement of all the Grecian buildings was based; and some of the plans do certainly pre-sent very singular coincidences if nothing more. The subject however is still obscure to those who now give their attention to it for the first time, although we dare say to our author first time, although we dare say to our author, who has long <u>dwelt upon</u> it, the whole is so clear, that he will be surprised to hear us say so. We suggest that he should in the next edition of the book describe in words the construction of the various diagrams, step by step, and shew how the plan of the building is produced by them.

The Art of Land Surveying, explained by short and easy rules. By JOHN QUESTED, Sur-veyor. Relfe and Fletcher, Cornhill.

This little volume, the author modestly ays, is arranged for the use of schools, says, is arranged for the use of schools, farmers, stewards and others, who may want just such a knowledge of surveying as will enable them to do all that is needful in that art on the farm. There are many others, however, to whom it would be more useful than some larger and more pretending works; and werecommend it to all who wish to obtain a knowledge of surveying and plotting land with knowledge of surveying and plotting land with the chain or cross-staff. The language is plain, and the direct ions clear.

HUNT'S IMPROVED PATENT URINALS. — Mr. Hunt, of Qucern's-row, Pimlico, has in-vented a basin of h ighly vitrified porcelain, which is admirably adapted for its purpose, railway stations an d other public places. Water is admitted to cleanse it through a series of small holds will round the rim. It is superior to any thing soft the kind we have seen, and deserves to be germerally known. HUNT'S IMPROVED PATENT URINALS.

Correspondence.

THE BOUND TOWERS OF IRELAND.

Siz, --- In my observations on the round Siz,..... In my observations on the round towers the principal point aimed at was to assign the tower to the same date as the ad-joining church. In this opinion your corre-spondent, "Veritas," seems to agree, but states that "he found them near the castle quite as often as the church." This statement is correct, but "Veritas" ought to have men-tioned hose many he did find. Now out of 118 round towers upwards of 100 still exist: and this no proposition has

100 still exist; and it is no proof of the point be endeavours to establish; "that they are found near the castle quite as often as the church," because he happens to find a round tower and an old eastle adjoining, minas the church; such a fact at the present day is no proof, far from it, that there never was a church in the vicinity. Sugar int state ad

It so happens the old tower I particularly referred to (Aghadoe) stands within 57 feet of the dilapitated church, and at a distance of about 200 feet stands an old castle.

Again, we have Ferns, once an eculesisatical eity of great note, having at the present day the ruins of an ancient abbey, the remains of a fine cathedral, and the mouldering walls of the once proud castle of the Kings of Leinster, whilst not a vestige of its former lofty round whilst not a vestige of its former lofty round tower can be traced.

One thing I candidly admit, my powers of vision are not equal to that of "Veritas;" rocks, hills, or mountains, in nine cases out of ten, form a complete screen to their being "within sight of others." Parties taking a trip in an air balloon, or the "aerial machine," would at once contradict this assertion.

There are no examples of these towers in any part of Europe at the present day except one at Aix la Chapelle, close by the celebrated cathedral (built by an Irish architect at the close of the eighth century), and two in Scotland.—I am, Sir, &c., J. K. Gorey, July 16th, 1845.

THE COLOSSAL STATUE AND THE UN- COLOSSAL TRIUMPHAL ARCH.

Although we entertain for H. G. the Dake of Wellington every respect due to his bigh position, we cannot help remarking, that our forefathers hardly ever erected monuments to living men. Joseph II. and Goethe declined it most peremptorily. Besides, there is some anomalous inconsistency in placing the inunge of any one in the public streets, whom every one may see in propria persond. In fine, every monument implies something sepulchraf, as it were; viz. the preserving of some one's memory, which is incongruous with a person who does yet exist. However this may all be-monuments have been erected to the living now-a-days.

Turning our attention to the coloasal statue to be placed on the triumpbal arch in Hyde-park—we perfectly coincide with what has been said in the last number of this journal; intending merely to throw out another remark, which, we trust, will have some *weight*. The statue, namely, is colossal (15? tona), but the arch does not seem to us of a solidity to bear any thing colossal—in fact, the architect never intended it for such purpose. The consequence, therefore, may or will be, that the such will not be able to stand such a burthen. And then, somewhat in the year 1860 or 1870, the colossal statue will out-wear, the arch-and on some fine day this will give way, and the statue come down, and of course, break. to pieces. Then, both will have to be re-built and re-cast; in which way, however, this is to be done, will depend on the cast of character of the men of those latter days. . . i Ja Lammer, Ya

ARCHITECTURAL COMPETITIONS CHURCH AT CAMDEN TOWN.

SIR,—Knowing that the columns of your valuable journal are always open for advocat-ing the cause of justice, I take the liberty of troubling you with a few remarks respecting the late competition for the church at Camden Town. Some time since, a committee was formed who invited a limited number of architects to furnish designs for the church, the cost of which was not to exceed 6,000*l*. A design was at length fixed noon prepared with the usual showily-tinted foreground of com-

petition drawings; but on deliberation it was found that it would cost a very much larger sum to carry it out, and therefore I contend the decision should have been set aside, and

the decision should have been set aside, and the church submitted to a fresh competition, instead of which, the successful architects were desired to prepare a new design which could be executed for the stipulated amount. Now, as any of the other competitors could have prepared designs of much more magni-ficent appearance than those they sent in (sup-posing no regard were paid to the cost of erection), and could afterwards very easily have made another which could be carried out for 6,000L, I think it was giving the successful competitors a most undue advantage, and I truet you will consider the subject of sufficient impertance to occupy a corner of your journal.

trust you will consider the subject of sufficient impertance to occupy a corner of your journal. I am, Sir, &c. ONB OF THE COMPETITORS. London, July 19th, 1845. •• If, the fact, be, as stated by our cor-respondent, it was a fraud, and nothing better; a robbery of the time, skill, and money of those competitors, who adhered conscientiously to the anstructions of the committee. How long will architects, subject, themselves to these in-sults? Professor, Hosking, in a lecture deli-vered at King's. College some time ago, and afterwards, published, exposed, the degrading tendency of the system : we shall take an oppor-tunity to bring it again before our readers.

ANNUAL DINNER OF MESSBS. BUNNETT AND CORPE'S WORKMEN.

SIR,....Coinciding most entirely as I do with your correspondent J. O., in last week's BUILDER, as to the highly beneficial results of occasional social meetings of large numbers of occasional social meetings of inrge numbers of men engaged in the same occupation, if some the liberty of stating, that the same locality (the Greybound, Dulwich), was on Baterday last, the resort of the workmen in the samploy of Mesers. Bunnett and Gerpe, patentees of the revolving iron shutters, Sec. (1) he ment to the number of sider, and denot the new libert the revolving iron shutters, see (1) he men, to the number of eighty, as down to an excellent dinner at 2 o'check, Mir. Stuart, the dorsman, in the chair, several master its dean an doing business with the firm boing also of the own-pany. The afternoon, was speak in various muly sports; for which that place, in so, ad-mirably adapted, and in the evening, the com-pany were gladdened by the streadenees of their respected employersmer han the he week.

and Whose easy presence cheeked no Becent joy;14 and whose substantial addition 'to the nieaus

of convivial enjoyment was fluty appreciated. The respectable and intelligent appearance of the men, who started from the works at Deptford in four vans, the rational churacter of their recreations, and their orderly conduct of their recreations, and their ordering conduct throughout, impressed all who saw them with a very high opinion of their worth, and fur-nished incontestible evidence of the great moral improvement that has taken place in the habits and characters of this class of men. I am, Sir, &c.,

A VISITOR ON THE OCCASION.

Miscellanea.

LEAMINGTON CEMETERY. - At a preliminary meeting held at the Regent's Hotel; Leamingmeeting held at the Regent's Hotel; Leaning-ton, last week, a resolution approving of the establishment of a public cemetery under the power and authority of a legislative enactment, with a chapel and all necessary vanits; enta-combis; &c., was unanimously adopted; and a committee formed. for requirement of the PREVENTION OF DAAP due in reply(d) some inquiries under this head; which have ap-peared in our pages, at correspondent has directed our attention to the appendix to the 2nd report of the commissioners on the fine-ents, containing evidence of the efficacy in

arts, containing evidence of the efficacy in keeping down damps, of a layer of Seyssel Asphalte spread on the horizontal surface of the walls above the ground level. PROPOSED CARLYON CLUB HOUSE.—There

is a strong party in the club opposed to build-ing, and they have succeeded in obtaining the postponement of the project till next year.

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our readers, however, they are entered in a book, and may be seen on application at the office of "The Builder," S. York-street, Covent-garden.]

For Lighting the town of Woodbridge in Saffolk with Gas

For certain alterations of the premises (formerly the Post-Office), in Crown-street, Bury St. Edmunds, and for a New Building.

For supplying the Majesty's several Dockyards with Canada Red and Yellow Pine Timber, Rock Elm Timbers, Spruce Deals, and Ash Oar Rafters. For the restoration of the Norman Tower, Bury St. Edmunds.

For the erection of three additional wards at the Bedminster Union Workhouse, situate at Long Ashton.

For the executing the skeleton of Glenorthy Castle, County of Limerick, Ireland.

For building sewers in Gray's-Inn Lane, from the and of Elm-street to Liquorpond-street, and along Liquorpond-street to Crown-court, being about 800 fret in length : also, for a sewer in Red Lion-

Foret, Clerkenwell, being about 480 feet. For supplying her Majesty's several Dockyards rith Dantzic Oak, Thickstuff, and Plank.

For Building a Sewer in Fleet-street, from Temple-bar to Water-lane.

For Lighting the Parish of St. Mary, Rother-hithe, with the Essential Oil of Tar, for One Year,

from the 24th of August next. For Building a New Union Workhouse, to con-tain 1180 Persons, for the Guardians of the Clifton Union.

For supplying her Majesty's Dockyard with Honduras Mahogany Timber and Polish and Italian Larch.

For the complete restoration of two Windows on the south-side of St. Thomas's Church, Salisbury ; also, for Cleaning and Whitewashing the interior of the same Church. For certain alterations at the Workhouse of St.

Mary's Parish, Islington.

Thirak Railway. For Coupled Locomotive Engine and four-wheeled Tender, to contain 700 gallons, for the Manchéster and Birmingham Railway Company. For the execution of Works on the Newcastle and Berwick Railway.

• • , COMPETITIONS. < 'x

Plans are required for Laying out and covering with Vilarosidenous abent 90 Acres of land having a frontge of about helf a mile to the Queen's-road, Richmond, Surrey, extending from Spring-grove towards Bichmond-hill. Premiums will be given of 25 guineas for the most approved plan, and 15 guineas for the second.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

At the Crewn and Anchor Ian, Ipswich: the Martello Tower (V), situate on the point at Bawdry, Suffolk, near the ferry, and within 100 s of the sea.

yinds of the sea. At Ossington Woods, near Newark : a large quantity of superior Oak, Elm, Larch, Spruce, and Sootch Timber. At Messrs. Westlake's 'Timber 'Ponds Wharf, Southampton : the entire and selected cargo of Red and Yellow Pine Timber and Deals ; ex. '' William'' Hascroft, from Quebec.

At the Crown Inn, Frome: 307 Oak and Ash Timber Trees; the whole of large dimensions

and superior guality. At Little Bentley Hall, Essex: 200 particularly straight and good Larch Fir Trees.

BY TENDER.

In the Hantations of the Duke of Montrose, situate in the Parishes of Drymen and Buchanan, Stirlingshire: many Thousands of Larch Trees of some size, adapted for Railway Sleepers, Roof-ing and Joisting, and other purposes.

TO CORRESPONDENTS.

"St. Mary's Church, Nottingham." -- Havina little authorized information on the matter, we cannot insert the anonymous communications we have received. We shall be glad to see the account in the Nottingham Journal referred to by one of our correspondents. "Q. Q."— As the letter did not arrive in time

for us to reply as desired, it would probably be useless now to do so. "P. C. A." — We are obliged to our corre-spondent, but cannot promise at this moment to en-

grave the diagram.

"Amicus." — We are obliged by his communi-cation, and have availed ourselves of the informa-tion contained in it. Opinions, however, we do not insert but on good ground.

"Mr. B."- The cords for Mr. Fraser's enter-

"Mr. B."— The cords for Mr. Eraser's enter-tainment, at which the Spitalfields' School of Design attended, did not reach us in time. "W. B." (Guernsey.)— General Pasley's work on limes, &c., is out of print, but a new edition will be published shortly. Vicat's work on the same subject, translated by Captain Smith, may be

had at Weale's, High Holborn. "F. T." — We regret that we have not time to enter into the question asked. "B. Green." — The diagram is in the hands of

our engraver.

" Patent Glass Tiles." - We have had several inquiries as to where these are to be procured : can

infairries as to where these are to be procured : can any of our readers tell us? "J. G." (Oxford.) — Gwilt's Encyclopædia of Architecture, published by Longman. Nicholson's Architectural Dictionary, 2 vols., 4to. "Hoisting Building Material." — A builder wishes to know where the machine for hoisting materials by means of an endlase their may be ob

waterials by means of an endless chain may be ob-tained on hire. "W. S." — We regret we have not space for the letter. Our correspondent is hardly correct in his deter. kis dates. "B. B.,"-Next week. Received : "M. R." "P. A. T. H." "T."

"A constant contributor."

ADVERTISEMENTS.

PUBLICATIONS.

Just published, price 5s., neatly bound in roan, with tuck, gilt edges, and lettered, a Pocket Edition of A CYCLOPÆDIA of the 'NEW ME-TROPOLITAN BUILDINGS ACT, together with the Act itself, a Folio Table of the Metropolitan Districts (old and new), a List of the Surveyors, with their Residences and Offices, and a Table of Fees to be paid to the Registrar for services performed. In the Cyclopeedia all the details of the Statute are arranged Alphabetically, so as to be instantly found, and accompanied by extensive references and counter-references to the sections of the Act itself and its minute provisions. By the late A. BARTHOLOMEW, Esq., P.S.A., Architect, Surveyer of the Horasey District. Published at the Office of "The Builder," 2, York-treet, Covent-garden; and to be had of all Booksellers.

New Edition, Just Published, Price 4

AXTON'S BUILDERS' PRICES, con-taining nearly 11,000 PRICES and MEMORANDA connected with Building, together with the whole of the NEW METROPOLITAN BUILDINGS ACT. The New GLAZIER, and the Alterations in the prices of the GLAZIER, and the New Tariff of PLATE GLASS, showing the prices of plates from 12 by 12 up to 84 by 140. Weale, High Holborn: Simpkin, Marshall, and Co., Paternoster-row.

A TKINSON'S ORMENT. - The pupile is respectfully informed, that the price of this very ex-culent Cement, which has now been in use for Architecture and Engineering works upwards of thirty years, is reduced to \$3, \$40 per busbel, and may be had in any quantity at Wyatt, Parker, and Co.'s Wharf, Holland-street, Surrey side of Blackfriars-bridge. N.B. - This Cement being of a light colour, requires no arti-ficial colouring or painting, and may be used for stucco with three parts its own quantity of sand. TKINSON'S OBMENT .-- The public is

O ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MER-CHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL. TO OHNS and CO.'S PATENT STUCCO

GENERAL. JOHNS and CO.'S PATENT STUCCO CEMENT.—The following are the positive advantages possessed by this Invention ever every Consant hitherto in-troduced.—It will effectually resist Damp. It will never vegetate nor turn green, nor otherwise discolour. It will never crack, blister, nor posl off. It will form a complete Stone casing to say Building covered with it. It so closely resembles Stone that it is impossible to detect it. It never requires either to be painted or coloured. It will keep fresh and good in the cask in any Climate for any number of years. It is the only Cement that can be depended upon for export. It is the only Cement that can be used with confidence by the Sea-side. It may be used in the hottest or coldest Climates st any seasos. It will earry a larger Proportion of Sead than any other Cements begin to periah. It may be worked through the Winter, as frost has no effect upon it. It may be used on the Inner Walls of new Houses, which may be papered over or painted directly. Roofs laid or pointed with this Cement mid iteration. The first cost of this material does not exceed that of the chappest by the serverest Storm. Any Plasterr may apply it, the Instru-tions for use being very clear and distinct. The first cost of this material does not exceed that of the chappest Cement now in use, but with all the above-named extraordinary and valuable advantages, nothing can approach it in point of economy. Architects and Builders who have used this Cement have

Interesting the second state of t

TO ENGINEERS, ARCHITECTS, AND CON-TRACTORS. GREAVES'S LIAS CEMENT and GROUND BLUE LIAS LIME, at 2, South Wherf, Paddington, London, and Works, Southans, Warwichshim, Agent for Liverpool, Mr. WYLIE, 56, Gloster street; ditto for Manchester, Mr. J. THOMPSON, Back Eing-Mitretp ditto for Chester, Mr. J. HARRISON, Linen Hell-street.

MARTIN'S PATENT CEMENT. TO ARCHITECTS, BUILDERS, AND PAINTEES IN FRESCO. STEVENS and SON, PATENTEES and SOLE MANUFACTUREPS

STEVENS and SON, PATENTEES and SOLE MANUFACTUBERS, begrespectfully se announce that this beautiful cement has now arrived at a degree of excellence far surpassing their most same expectations. For all internal work it possesses a great superiority over every article hitherto in use; It is now their used extensively by Government in the Britch Museum and other public buildings. IT DOES NOT THHOW OUT ANY SALT, but presents a beautifully plain and perfect surface, which may be painted upon dry work within four days without pecling. It is equally applicable for walls er lath, for mouldings, architraves, skirting, or flooring; and is admitted to form the best ground for fresco painting, having been used for many of the prise frescos lately exhibiting in Westminater Hall. It will bear an intense beat visito racking, and for hardness, durability, and economy, cannet be equaled. 186, DRURY-LANE, LONDON.

be equalise. 186, DRURY-LANE, LONDON. Agent for Liverpool and Manchester, Mr. E. Past, 11, Atherton's-buildings, Dale-street, Liverpool.

TO ENGINEERS, ARCHITECTS, AND BUILDERS, ATENT METALLIC SAND CEMENT. TO ENGINEERS, ARCHITECTS, AND BUILDESSE, DATENT METALLICSAND CEMENT, The Mstallic Sand, from its chemical qualities, forms, when mixed with blue liss lime, a metallic center of great strength and denaity; the iron, which is one of its principal constituents, combining with the bed in which it is deposited, and communicating to it a greater degree of hardness than can be obtained by admixture with any other known material. Concrete and mastra: is which the metallic sand has been used are more durable than affected by damp, otherwise than by increasing its hard-meas from the arydation which is thereby occasioned. Employed as a cement to turn water from brickwork is ton-nels, sewers, and other underground works, the Motallie Sand is found cheaper, and from its eminent altheave qualities to form a more solid and hydrawlic body, in cema-nination with the brickwork, than any other connect is the in-sination with the brickwork, than any other connect and the bort substitute for possolano that has ever been presented to the public. As an external stucco, the Motallic Cement any bisters, and continue to improve both in appearance and durability by exposure to the weather. The Proprietors and bisters, and continue to improve both in appearance and may bisters, and on the water, and is found due bore rences to very extensive erections which have been staccool with chefallic Cement. Further information will be given, and specimens also an application to Mr. C. K. Dyre, 4, New Bread-street; and at the Metallic Cement. Further information will be given, opposite traits street, Camden New Town. K E E N E'S PATENT MARBLE

KEENE'S PATENT MARBLE KEENE'S PATENT MARBLE CEMENT.-The Patentees of this tomposition beg to refer to the British Museum, the Boyal Exchange, the sev works at Bethlem Hospital, Greenwich Hyspital, and the Co-liseum in the Regent's-park, as buildings finished of in pe-greas, in which Keene's Cement has been toxed as an thermal stucco. Its superiority to common plastering coexists hat sutreme hardness, and the rapidity with which it dries, which qualities fit it to receive paint or other finishing some than other water Cement. When employed for akirtings, architrave, and other mouldings, in place of wood, it checks dry-rot, is impervious to vermin, prevents the spread of fire, and is anote eco-nomical in its application than the material for which it thus becomes the substitute. Confirmation of these statements is to be found in the almost universal adoption of Keene's Cement for thirthy and Hall flooring in the new bouses on the Hyde Fark Rawns, tage.

where its application in to be seen to the indicate area. In Liverpool and Manchester, Kethe's Commas has be several cases been used for the covering of the first-press warchouse floors, where its lightness and hardness give is the preference over tills and flagging, which are much hardness and necessarily leave the floor intersected with auxietious joints, whilst Keene's Cement is laid down in one unbroken surface.

Sounds, which access a content is had down in our entropeen surface. The high polish and marble-like hurdness of which this Cement is susceptible resulter it they mest suitable material for the manufacture of Scagliola. Patentees, J. B. toilet, on an entirely new principle, of great elegance, and free from all the practical inconvenience of ordinary Glass-stands.

SATURDAY, AUGUST 2, 1845.

HE importance of proper VENTILATION is more generally felt at this time than it was a dozen years ago; that is, larger numbers of persons have become con-

vinced that bad air will kill as certainly as prussic acid, though not so quickly. Individuals have always understood this, - have always laboured to convince the multitudes of the trath of the assertion, and to induce the adoption of means to obtain the fullest supply of pure air; but it is only recently that the massee have been impressed with the fact, and have thought it worth while to employ the means suggested. The evidence that has been brought forward is most conclusive, and abundant : books of all sizes have been written upon it; commissioners to inquire into the state of large towns have recommended " that measures be adopted for promoting a proper system of ventilation in all edifices for public assemblage and resort ;" and so, by repeated striking, the impression has been at last communicated to the general tympanum.

The great question now is, how can ventilation be best effected,-in what manner can the vitiated air be removed and fresh air supplied, without producing currents injurious or offensive to the human frame? And to tell the truth, notwithstanding the numerous experiments made within the last thirty or forty years, and the tomes that convey their results to the world, it is not easy to reply to the question. The same means cannot be uniformly adopted in all cases, but require to be adapted to varying circumstances. No exact rules can be laid down; much must depend on the intelligence of the persons to whom the structure is entrusted. A change in the temperature of the external atmosphere, or of the direction of the wind, may alter entirely the effect of a mechanical arrangement; and the presence of a larger or smaller number of persons than was expected, would require corresponding changes in the supply of air, and the temperature to be artificially given to it.

We have recently, on more than one occasion, directed attention to this subject, and our columns have been open for the particulars of every invention bearing on it, and for every suggestion likely to prove of value in the investigation of principles. We are forced, however, to recur to it by the letters of influential correspondents, pointing out the magnitude of the experiments which have been made, and are now being made, in the temporary Houses of Parliament, asserting the positive failure of them, and urging the necessity for other and totally different arrangements in the new Houses. Our inquiries amongst the members of the House confirm, we are sorry to say, these assertions, and lead us to regard with fear and trembling the extravagantly expensive, and architecturally destructive, preparations for ventilating, which have been made by Dr. Reid. According to the "Brief outlines illustrative of the alterations in the House of Commons, in reference to the acoustic and ventilating arrangements," which Dr. Reid presented to Mr. Hawes' committee in 1837,

BUILDER. THE

the principal object which he endeavoured to attain was,-" To introduce air equally over the whole floor, both in the galleries and in the body of the house; to sustain an equal flow at all times proportional to the number present, and to admit air either at natural temperatures or after passing through the heating apparatus, as might be required." This, one would suppose, with no limits as to expenditure, and no personal scruples about cutting and hacking a building whether old or new, was not a very difficult task; and when the enormous machinery by which it was to be effected was seen, including a huge shaft 120 feet high, the object was considered to be as good as effected. Alas! for the vanity of human expectations.

The present House of Commons, lobbies, committee-rooms, and galleries, with the three hundred thousand little holes in the floor, are no better than the old House,-rather worse, -the currents are most offensive and hurtful. and the escape of the vitisted air slow and uncertain. Members say their feet are in an icepail, and their heads in a vapour-bath, in direct contravention of the old advice, to keep the feet warm and the head cool. But so it is, and members get soon fatigued, and some fall ill; while in all, according to Mr. Wakley, the seeds of bronchial disorders are implanted. Things therefore look serious, and when we find the works at the new Houses stopped and interfered with, architect's plans altered, and supports cut away with the simple direction that some other means must be found (whether there be any or none) to carry superincumbent weight, it is surely time for the public, if not the members, to look about them. We have watched the mode of proceeding both at the Liverpool Hall and Assize Courts, where the architect's plans seemed to us sadly treated, and at the new Houses of Parliament, and to speak the truth, are satisfied at neither place.

A short time since a letter on this subject appeared in the Times reminding the honourable persons whose duty it is to superintend the arrangement of the new Houses, that a contrivance was in operation for many years by which the atmosphere of the House of Lords was kept in a pure state, and at an agreeable and uniform temperature. The writer said of the apparatus that "it was planned, without any charge, by the ingenious Adam Walker, the philosopher, and laid down by the late Mr. Moser, of Soho, and it was, and I believe still is, used in her Majesty's Theatre. Surely, Sir, it is the duty of hon. members at length to free themselves from the deluding trammels with which Dr. Reid finds it his interest to surround them. If a plan of known efficiency exists, is its adoption to be prevented because the pecuniary interests of a bungling experimentalist are in a different direction?'

In consequence of this letter, several requests were forwarded to us, that we should examine Her Majesty's Theatre, where lately great improvement in the state of the air had been found, and lay before the public some particulars of the mode of ventilation pursued there. We accordingly applied to Mr. Lumley, the present proprietor, and received from that gentleman every facility desired. We went over the building with Mr. Charles Marshall, in whose hands the arrangements for ventilating the theatre are placed, and were compelled to arrive at the conclusion that the improvements in the ventilation alluded to, were chiefly owing to the increased attention paid to the means under their control, whereby they are adapted hour by hour to the varying circumstances to which such a structure is liable.

Between the ceiling of the pit and the roof there is a very large space appropriated as the painting-room, and in the sides of the roof there are a dozen or more skylights, made to open, by means of which much of the heated air that accumulates in the roof, brought up amongst other causes by the chandelier, is got rid of. Now, as an instance of the necessity of constant attention, and of the difficulty of laying down rules to be followed without discretion, it may be mentioned that if when the wind is in a particular quarter some of these lights be opened, the hot air, instead of escaping, is kept down upon the audience.

Three or four years ago, the ventilation being considered defective, Dr. Reid was called in to improve it; which he attempted to do by forming a large louvre about 10 feet square, in the roof, with a cowl to close it at the side from which the wind blows; the object being, not to bring cold air in, but to allow the heated air to escape. The single advantage that could be expected of this over the windows already mentioned is, that it should be self-acting,that, instead of having on a change of wind to close the windows exposed to it and open those on the other side, the wind should itself effect the same operation. This, however, is not found always to be the case, and the cowl is not considered of great value by those who are engaged in the house. Another of Dr. Reid's operations was to convey fresh air to her Majesty's box. Here he employed a "blower," -ill-constructed as it seems to us,--in an aperture connected with the external atmosphere, and opening into the box behind the silk with which it is lined. This employed two men the whole evening, but so entirely failed to produce a good effect, that it is now no longer need.

With this exception, there is no mechanical arrangement throughout the house to bring in air, and of the system "invented by Mr. Adam Walker, and laid down by the late Mr. Moser, of Soho," there is no trace. Windows have been opened in every available position, and it is by constant attention to these, under the direction of the gentleman before named (Mr. Marshall), who has found pleasure in the subject, and is pursuing it oon amore, that the frequenters of the Opera House owe much of the comfort which has been found there, notwithstanding the unexampled crowds which fill it.

What is now wanted there, is a controllable arrangement to bring in air at the bottom, independently of the doors, the means of getting rid of it at the top being ample." To avoid unpleasant and dangerous drafts is of course the difficulty, as in all similar cases; but this would be lessened if it were oftener remembered that it is not so much cold air that is required as PURE AIR, and that by slightly raising the temperature of that which is introduced, even in summer, and bringing it in through numerous apertures, the chief end might be attained without the inconvenience described. In concluding this allusion to the Opera House, we cannot omit bearing testimony to the desire manifested by the present proprietor, Mr. Lumley, to increase the excellence of his theatre, as well in the particular to which our attention has been directed as in all others.[†] We shall return to the general question of ventilation before long.

^{*} Double doors might then be placed in the pit corridor, so as to lessen the dangerous draft now found by those who ait near the entrances.

⁺ Our thanks are further due to Mr. Marshall for the dness with which he assisted us in examining the building.

MR. CHADWICK ON WANT OF SCIENCE IN OUR PUBLIC WORKS.

The week before last we mentioned the annual meeting for the distribution of prizes at the College for Civil Engineers, Putney, but from pressure of matter, were unable to do more than allude to the address of the Principal. We now return to it, and have the pleasure of placing before our readers a correct and, we believe, exclusive report of a speech made by Mr. Edwin Chadwick on that occasion, touching many points of much interest. MR. CHADWICK said he had not been led to

expect that he should be more than a silent witness of their proceedings, yet he could not hesitate to offer testimony to the great public importance of the promotion of the studies in practical science, for which the college was specially instituted. This country was pre-eminant for its great expenditure in public works, for its stores of practical science avail-able for their direction, yet whenever a large proportion of those works were examined in their conception, their execution and the effects realised in comparison with the expenditure upon them, they too frequently failed to justify any claims to pre-eminence in the application of that science. In respect to one important class of works, the condition and effects of which it had been his duty to examine—the works for the sewerage and drainage of the metropolis and of other of our large towns, which had been frequently pointed out as a subject of public boast, but on irrefragable proof he had been compelled to pronounce them to be a vast monument of mal-administration, of lavish expenditure, and of defective execution, and this conclusion further inquiry had only served to confirm in every particular. That very form of sewers which had been presented to a com-mittee of the House of Commons by a gentlethis of high professional standing, as the most perfect in its form and connected arrange-ments that had been or could be attained in practice (the form with upright sides, nearly flat segmental bottoms, and spreading foot-ings), was found to accumulate deposits of decomposing matter, and pollute the air of their houses and the streets with offensive and pes-tilential emanations. That form he had adduced as an example of weak, unscientific, and most expensive construction. Line after line most expensive construction. Line after line of the sewers of this expensive construction had since fallen in in one large district, and its use was therefore silently abandoned. Now in the second volume of first report of the commissioners for inquiry into the health of large towns they would see in the admirably clear evidence of their professor of geodesy, Mr. Butler Williams (which he next red to com Butler Williams (which he ventured to commend as a most important subject of their profes-sional study), the demonstration that by a sewer of another and scientific construction, the egg shape, with precisely the same number of bricks three districts might have been sewered perfectly for the money lavished in sewering one, and that one imperfectly and injuriously. Their professor had demonstrated that all this waste of money, which though no less than 60,000/., was levied in excess during ten years on the retanagence in that one direct was of on the 'ratepayers in that one district, was of secondary importance to the noxious effects on the health of the population, must have been avoided had the works been planned and exe-cuted by persons who had gone through a proper course of study, and duly consulted such works as these of Young and Tredgold and others, con-taining the existing knowledge, to be found on taining the existing knowledge, to be found on the shelves of their college library. On inquiry into the history of a large proportion of these wasteful and deplorably inefficient works of our towns, it appeared that they had been superintended by ignorant authorities, and designed and executed piece-meal by common tradesmen, who did not understand the use of the anist level and not being more fully invested. the spirit-level, and nothing more fully proved the ignorant reckless temerity with which such works were conducted than the defective nature of their plans, and often the entire absence of any plans or survey whatever. In one dis-trict, where a commissioner happened to deem it a qualification for the office of surveyor and succeeded in getting it recognised, and where, as a consequence, a properly qualified person hap-pened to obtain the appointment, it was proved in a recent report of that same engineer that no less than one-quarter of a million of money must be expended for setting right the outfalls of the sewers of that one division (the Holborn

and Finsbury) of the several divisions into

which the general sewerage and drainage of

the metropolis had been capriciously, igno-rantly, and mischievously divided. Now he, Mr. Chadwick, ventured to assert without fear of disproof, that had the district which he had named or others, been originally placed under the guidance of any person who had gone through such a course of studies as the course provided in that college, with competent attention to their duties, it was impossible that such misery and waste could have been inflicted; a waste of capital in respect to levels only in that one district, which would, under proper direction, have sufficed for the complete drainage of upwards of 50,000 of the houses in the metropolis that are still left without any proper drainage. As a convincing proof in itself of the reckless or ignorant temerity with which such large expenditure in such important public works had been, and still continued to be made, it might suffice to state that neither in the metropolis, nor in any of the towns examined, was any accurate map with proper system of levels found to exist. Hence they saw large sewers which after all that had been expended on them were found with accumulations of stagnant refuse, acting as extended cesspools. To shew what might be done for amendment, he had asked and had obtained the aid of a detachment of the pupils of that col-lege, and under the superintendence of their professor of geodesy, they had executed as a specimen the first plan of the city of London, and he believed of any town in Great Britain in which contour lines of equal altitude were laid down. That map (which had been fol-lowed by another specimen map of Windsor, executed under the direction of the Board of Ordnance) he displayed before the noble chairman, and stated that he had been assured by competent engineers, that if similar maps ith contour lines had been executed for the whole country, that out of the two hundred and forty millions of probable expenditure for the railways to be constructed in this country, full twenty millions would be saved by the better direction which it must have given to the works. Lord Devon observed that he was fully impressed with the great importance of such well-constructed maps, with levels so ex-hibited, for the guidance of all such works, and he had used great exertions to obtain a map of Ireland with the contour lines, which would be found appended to the recent report of the commission of inquiry into the tenure of land in that country. With such a map, any one in that country. With such a map, any one sitting in his own room might see what would be the best lines of drainage. Whilst the sewers and the general drainage works of large districts were found to have been executed without the rudimentary knowledge available for the efficient construction of such works, large masses of capital were expended in works for the distribution of water into our towns without such a competent knowledge of hydraulics, and other branches of science ap-plicable to the collection, storage, purifica-tion and distribution of water, as a good scientific course of instruction must afford. Some of the consequences of this empiricism were, that after all the ill-advised and lavish expenditure of the companies' capital, the adoption and maintenance of intermittent supplies of water necessitating a double and treble expenditure on the part of tenants; the retention of water in butts and tanks in which it stagnates until it is wanted, and absorbs the dust and soot, and vitiated atmosphere, preventing improvements in the application of water to an effi-cient system of house drainage and cleansing, and the immediate extinction of fires, and The course of the sanatory inquiry, and the examination of schools, and workshops, and large public as well as private buildings, shewed that they had been constructed by professional mere who from the condition of professional men, who from the condition of those buildings when occupied, and the sufferings of those who were kept in them, were demonstratably ignorant of such a practical knowledge of the settled principles of pneumatics, and the existing practical science ap-plicable to warming and ventilation, as must have led to relief by arrangements for the properly regulated ingress of air, that was warmed as well as pure, and for its egress when vitiated. He might occupy the whole day, and fail to adduce all the proofs which

indeed filled the volumes of reports now before the legislature and the public. In them were to be seen the grounds on which the commissioners of inquiry, at the head of which was the noble duke, the president of the college, came to the concurrent and unanimous conclusion, in solemnly recommending to the legislature that securities should be taken for the public safety, that all such works should be superintended as well as planned by men of tried competency as engineers, from the possession of such science as the founders of that institution were anxious for the public educations to impact. But it was not in these advantage to impart. But it was not in those volumes that the public need seek proof, in waste of life and property, of the deplorable deficiences of practical science for which public provision and securities were requisite. public provision and securities were requisite. The proofs were displayed to them in spec-tacle after spectacle of the ruins of fallen bridges, factories, and large buildings, in horrible deaths, and shocking mutilations oc-curring again and again from the like pre-ventible causes. From the direct information of competent inquirers, as well as from the published evidence, he might confidently assert, that where full inquiry was made, assent, that where full inquiry was made, there was not one recent instance of such destruction in which the cause was not assign-able and distinctly assigned to a culpable omission of the application of existing knowledge or science. In the instance of the failure of one edifice, he was assured upon competent authority, that the cause of the de-struction, attended by loss of life, was occajust of the size at which the architect, if he had consulted the works of Tredgold, would have found it shewn on actual experiment that such a bar would break under such a weight such a bar would break under such a weight as had been ignorantly placed upon it. In another instance, of the destruction of life from the falling of a factory, the cause was clearly proved to be the unskilful disposition of some eleven tons of weight on iron beams, which evicting data with respect to the strength or some eleven tons of weight on iron beams, which existing data with respect to the strength of materials, imperfect as those data were acknowledged to be, if they had been duly consulted in the plans and in the construction of the works, would have shewn could only have been safely intrusted with a much less weight skilfully adjusted. Another instance of destruction was displayed in the brackers of a cast-iron beam, the crushing of brick, or a cast-mon beam, the crushing of brick, stone, and iron successively; in the order in which it was laid down in existing works, such materials of such dimensions must be crushed when charged with such weights. On the other hand, reckless empiricism and ignorance of the strength of materials found active the westful contents. materials found safety in the wasteful application of them and massive deformity, which was the subject of complaint as well as the consequent excessive expense of our public works. Again he ventured to repeat, that the task of re-trieving these and the like proved errors, the effectual drainage of towns, of habitations, and agricultural districts, the most effectual prevention of those atmospheric impurities, the CARAC of epidemics and of premature mortality, was only to be achieved when such practical science as it was the object of this institution to promote and diffuse, was duly appreciated and re-ceived by the public, and properly applied.---

(Applause.) DR. LYON PLAYFAIR stated from his own observations, as a commissioner of inquiry, he could corroborate the statements of Mr. Chadwick in respect to the deplorable absence of competent scientific knowledge displayed in our public works, especially in his observations on the want of knowledge of science displayed by builders and architects in their arrangements for ventilation. In the schools which he examined in Lancashire he found that from the space allowed for air to breathe (and the absence of any arrangements for changing it) was only one-balf that in which they could breathe it without change, and were compelled to breathe repeatedly the same vitiated air, and that hence arose various forms of disease, and that their constitutions were impaired for life.

MR. BABBAGE addressed to the students instances to shew that what was set down as intuitive genius was commonly the result of greater mental application, and that labour was the best foundation for professional eminence.

MR. BINNELL bore his testimony to the practical utility of such studies as those promoted, and that though they might put aside abstract formulæ in daily practice, yet mathe-matical studies would, in training the mind, be of very high value.

HEALTH OF TOWNS.

AMIDST much that is otherwise thoroughly inspiritual and self-seeking in the tendencies of the present day, there is this great and re-deeming feature, and one which every philan-thropist must hail as the certain advent of that wide and embracing sympathy which is the real and essential spirit of practical re-ligion,—we allude to the universal and gradually awakening interest now felt in the social condition of our poorer brethren. To the efforts of such men as Bentham, Charging Conductor and the lett Dr. Arable

Channing, Carlyle, and the late Dr. Arnold, the active apostles of a newer and more en-lightened philosophy, much of the better feeling of the day is perhaps to be attributed; and if late, not the less certain we feel will be and it late, not the less certain we feel will be the evolution of that great principle long since enunciated though ignorantly decried, that the only legitimate aim and object of govern-ment, and all social polity, is the greatest hap-piness of the greatest number. As evidence of this improved feeling, we need only point to the fact that now comparement are incuried. to the fact that now everywhere inquiries are set on foot, and information eagerly sought, as to the actual condition of the people. The press abounds with investigations of the cruses and suggestions for the remedy of our social evils. Recently in this country, what a vast mass of appalling facts has been brought to light by our factory commissions, our mines commissions, our sanatory reports, and in those details upon the state of our labouring population, urban and rural, so clearly eluci-dated in the valuable reports of Mr. Chadwick and the Poor Law Commissioners. All these have developed a fearful aggregation of evils, before undreamt of by the great mass of the community # community.#

To the zealous exertions of such men as Lord Ashley in the cause of active benevolence, we may trace the source of much of the recent we may trace the source of much of the recent public interest in the moral and physical state of the poorer classes, and it is indeed a sub-ject of sincere gratulation that, aided by a more enlightened policy among those in power, this mobleman's labours have tended already to effect much towards ameliorating the actual condition of our labouring population; but we must not disguise from ourselves the fact—a yeat deal yet remains to be done : and it is hy west deal yet remains to be done; and it is by constant and strenuous individual efforts alone that a total and permanent benefit is to be hoped for. The broad and full tide of human progression is but the aggregate of every scat-tered rill of individual endeavours. Each step is aignificant and conducive to the great end.

As bearing more immediately upon the above views, we would now call especial atten-tion to the late important and valuable report furnished by the royal commission on the health of towns, the result of two years arduous and unremitting investigation into the causes affecting the general sanatory condition of the community. It would be out of the of the community. It would be out of the question, within the limits of the present notice, question, within the limits of the present notice, attempting to offer any thing approaching to a detailed analysis of the accumulated mass of evidence (comprised in two thick folios), bearing upon a subject of so comprehensive a character as this must necessarily be, nor shall we attempt to follow the commissioners through the whole of the yeat and waried fold

shall we attempt to follow the commissioners through the whole of the vast and varied field included in their inquiry. Suffice it to observe, that to those who feel an interest in the subject these reports will amply repay perusal. Before adverting to the principal topics investigated by the commis-sioners, or to the general conclusions arrived at in the reports in connection with the recomat in the reports in connection with the recommendations for a more efficient system of sana-tory jurisprudence and police throughout the kingdom, we shall take the opportunity of briefly alluding to the history of these investi-gations, and recapitulate the circumstances which induced the present inquiry. which induced the present inquiry. It will perhaps be remembered that the pre-

⁹ The interest in such statistical inquiries is not confined to England. On the continent investigations on the social and paytical condition of the masses have been ably de-raloped in the researches of such men as Velliriné, Presier, De Gerando Arrivahene Mohl, and Parent du

dowed with an extreme power of vitality, or else some wonderful faculty of reproduction at all events, they certainly possess the happy method of just arriving at that incompletion of result, which entails the necessity for some farther investigation, making invariably, like jealousy, "The meat they feed on." That the physical condition of the poorer classes was most deplorable, that they were badly housed, with an insufficiency of every bodily aliment and comfort, were axioms which unbappily it did not require another royal commission under the sign manual, to demonstrate : mission under the sign manual, to demonstrate : these facts, which ever way we turn are pain-fully self-evident; but there was, we presume, no reason why commissionerships with their comfortable amenities, should be left entirely at the disposal of Whig governments; accord-ingly another including his Grace the Duke of Buccleugh, as chairman, was forthwith con-stituted for farther inquiry into the *state of large towns and* populous districts. The re-sult is that now before us, and however much we may feel onnosed to the period. we may feel opposed to the pernicious system of jobbing displayed in the perpetuation of these commissions, we are bound to concede all praise to the exertions and perseverance as well as to the full and comprehensive data furnished by this last inquiry. The chief causes proved by the concurrent testimony of medical men, and other intelligent witnesses examined, as more strongly affecting the phy-sical condition of our labouring population, are (what had been before stated), viz. defective drainage and bad ventilation; to these, therefore, the attention of the commissioners was more specially directed. But the general subject included in the inquiry may be reduced

of the inhabitants.

2. The paving of public streets, courts, and alley

3. Cleansing; comprising the removal of all refuse matter not carried off by drainage, and the removal of nuisances.

4. Supply of water for public purposes and private use.

5. The construction and ventilation of buildings for promoting and securing the health of the inhabitants.

The conclusions arrived at from an examination of the above important matters are embodied in thirty distinct recommendations, already given in THE BUILDER,* necessary, in the opinion of the commissioners, for the construction of whatever remedial measures may be subsequently adopted. These may be shortly summed up under the following general propositions

1. That the crown should have the control and supervision of all sanatory measures,

2. That the local authorities entrusted with the execution of such measures be armed with additional powers, and the districts placed under their jurisdiction should in many cases be enlarged, and made co-extensive with the natural areas for drainage.

3. That the necessary arrangements for drainage, paving, cleansing, and an ample supply of water, be placed under one adminis-

trative body. 4. That general sanatory regulations rela-tive to buildings and the width of streets; and that low lodging-houses be under the same in-

These it must be confessed are sufficiently comprehensive, and it only remains to be proved how far the wide field of operations here sugnow far the wide field of operations here sug-gested would under existing circumstances be compatible with the legitimate functions of any one public body, and whether such an ab-solute system of central control amid the variety of adverse interests—both local and private, at present existing, would be practi-cally attainable. In either case it behoves us to receive with extreme diffidence and existing to receive with extreme diffidence and cantion a scheme of centralization which would go to place in the hands of any home secretary for the time being, so direct and extensive a power over the executive administration of the whole country. We shall, however, defer to a future occasion our examination of the mode in which the above objects are proposed to be carried out, more particularly as a bill embodying the suggestions of the commissioners is now before Parliament; to a simple abstract of which we now ask the attention of our readers.

LORD LINCOLN'S BILL FOR THE IMPROVEMENT OF DRAINAGE AND SUPPLY OF WATER.

A copy of the Bill brought in by Lord Lin-coln, and printed for the consideration of the coln, and printed for the consideration of the members during the ensuing recess, is now before us. It has 325 clauses, occupies 118 pages, and contains many very important pro-visions. It extends to the whole of England and Wales, except the city of London and its libertics, and any place situate within a radius of five miles from Charing Cross, in the city of Westminster. The preamble is as follows: "Whereas it has of late been made appa-rent that the sewerage and drainage of the

rent, that the sewerage and drainage of the towns and populous districts of this realm, and the supply of water for the domestic use of the inhabitants, and for the due cleansing of drains, are extremely defective or utterly neglected, especially in the districts chiefly inha-bited by the poorer classes of her Majesty's subjects, whereby excessive disease and great mortality have been occasioned : And whereas mortality nave been occasioned : And whereas the general laws in force are wholly insufficient for the remedy of so great a mischief, and the like defects, for the most part, exist in the powers of trustees, acting under the authority of divers local Acts: And whereas it is expedient that remedy should be had therein, and that the arrangement of the supply of water for domestic use, and for the cleansing of scwers, drains, houses, courts, alleys, and streets, should be combined, as often as may be practicable, with the management of the paving and cleansing of the surface of courts, al-leys, and streets, and of the construction and maintenance of the drains and sewers, and other works subservient to the preservation of

> * See p. 118 ante, . . Digitized by Google

valence of severe fever in the poorer districts

of the metropolis, more particularly in Spital-fields, during the winter of 1837, having excited an alarm of a visitation of the cholera, induced

the Poor Law Commissioners to institute im-

mediate and strict inquiry into the sanatory condition of the districts affected; and espe-cially with reference to the removable causes

of disease. For these objects the able assist-

ance of Drs. Arnott, Southwood Smith, and Kay were called into requisition, and the

result of an investigation by these gentlemen was embodied in a valuable report dated May 12th, 1838. This report declared that the chief and constantly acting causes of destruc-

tion and death were comprised in the ex-istence of bad ventilation and defective drainage. These facts, without loss of time

were strongly represented by the commis-sioners to Lord John Russell, with urgent recommendations for the immediate adoption

of some legislative measures for their removal. Although much public discussion at the time took place on the subject, little was done re-lative to this important matter until the close

of the following session, when the Bishop of London, in his place in the House of Lords, called the attention of the Government to the

report, and moved an address to her Majesty, aying for an inquiry as to the extent to

which the causes of disease stated by the Poor

Law Commissioners, to prevail among the labouring classes of the metropolis, prevail

also among similar classes in other parts of the kingdom. This address being carried, Lord John Russell directed the Poor Law

Board to institute the inquiry; and the com-missioners having accordingly in the November following given the requisite instructions to their assistants, the results of the consequent

investigations were embodied in the lucid and voluminous report of Mr. Chadwick, presented in July, 1842. In the meantime, in 1840, also

in July, 1842. In the meantime, in 1840, also appeared the report of the select committee of the House of Commons "On the health of large towns and populous districts." From all these it would appear that there had been no lack of investigation into the sub-ject, and it might naturally be supposed that the result of these different inquiries, em-bodied in the published reports with folios of appended evidence from all imaginable quarters, would have been deemed sufficient to indicate would have been deemed sufficient to indicate the sources of the evils, and to have suggested a plain, straightforward course for some legislative remedy. It would seen, however, that these boards of inquiry are either en-

the streets and other public places, in a good and proper condition, and that further provision should be made for promoting the health and convenience of the inhabitants of towns and populous districts.

Inspectors are to be nominated by one of the Secretaries of State at salaries to be determined on, to assist in carrying the Act into execution; and commissioners are to be elected by the rate-payers for every town and district. That is to eay, "Nine commissioners for every town or district in which the number of inhabitants specified in such order in council shall not exceed ten thousand; twelve commissioners for every town or district in which the number of inhabitants so specified shall not exceed itenty thousand, and so on at the proportion of three additional commissioners for every additional ten thousand inhabitants specified in such order in Council: provided always, that in no case shall the number of commissioners elected by the occupiers and owners of property as aforesaid exceed twenty seven."

Gommissioners are to provide a map of the district within their jurisdiction. "And be it enacted, that the said commissioners shall cause to be inscribed on such map and plan a series of marks or figures denoting a complete system of levelling, exhibiting the true form or relief of the ground in the area or district, and shall also cause to be drawn, wherever practicable, lines of equal altitude, commonly called centour lines, at every four feet of elevation, or at such other intervals as may appear, upon due inquiry, to be the best adapted for the guidance of works of sewerage and drainage, for the collection and distribution of water, and for other public and private purposes within such district."

Clause 113 gives commissioners power to pave streets; 117, to fix levels of all new streets.

Then, as to the width of streets-"Be it enacted, That it shall not be lawful to form, lay out, or build any new street within any town or district, unless the same, being a car-riage-road, shall be at least thirty feet wide, or being a foot-way only, shall be at least twenty feet wide, but if the buildings, or any of them not being a public building fronting any street being a carriage-way be more than thirty feet high from the level of the street, or being a foot-way only, shall be more than twenty feet high from the level of the street, then such st must be of a width equal at the least to the height of such buildings above such level, and every such street being a foot-way only, shall have an entrance thereto, being at the least the full width of such street, and open from the ground upwards: Provided always, That these provisions shall not extend or apply to any street which shall be proved to the satisfaction of the commissioners to have been agreed to have been formed or set out in the disposition of any estate for sale in lots, and of which a sale plan shall have been so proved to have been prepared previous to the issuing of any Order in Council for enforcing the provisions of this Act within such town or dis-trict."

Commissioners are to provide for draining all towns not already sewered, and to build such main and other sewers as may be necessary.

sary. House drains are to be formed. —"And whereas numerous houses and buildings have from time to time been erected and built without having proper drains communicating therefrom with any sewer, which proceedings are highly prejudicial to the public good; Be it enacted, That in all cases where any house or building, situate within any town or distriet, shall at any time be found not to be drained by a sufficient drain or pipe communicating with some sewer, and emptying itself into the same, to the satisfaction of the said commissioners, and if a sewer of sufficient size, under the jurisdiction of the said commissioners, shall pass along any street, and within thirty feet of any part of such house or building on a lower level than such house or building, it shall be lawful for the said commissioners, by notice in writing, to require the owner of such house or building forthwith, or within such reasonable time as shall be appointed by the said commissioners, to construct and make from such house or building, into the nearest common sewer, a covered drain or pipe of such materials, of such size, at such level, and with such fall, as shall be adequate

for the drainage of such house or building, and also, if practicable, of its areas, water-closets, privies and offices, if any, and to carry and convey the soil, drain and wash therefrom into the said sewer; and if the owner of such house or building shall refuse or neglect, during *twenty-eight* days next after the said notice shall have been delivered to such owner, or left at such house or building, to begin to construct such drain, or shall thereafter fail to carry it on, and complete, it with all reasonable despatch, it shall be lawful for the said commissioners, and they are hereby required, to cause the same to be constructed and made, and to recover the expenses to be incurred thereby in the manner hereinafter provided."

Before erecting new buildings, or rebuilding old ones, levels are to be settled by the commissioners.

Gully holes are to be trapped, to prevent the escape of effluvia.

Persons allowing stagnant water to remain within any house, or the contents of any cesspool to overflow or soak to the annoyance of adjoining occupiers, may be fined. They may require owners to provide privies and ashpits.

No. 175 is an important clause :--- "And whereas the health of the population, especially of the porer classes, is frequently in-jured by the prevalence of epidemical and other disorders, and the virulence and extent of such disorders is frequently due and owing to the existence of local causes which are capa ble of removal, but which have hitherto fre-quently escaped detection from the want of some experienced person to examine into and report upon them, it is expedient that power should be given to appoint a duly qualified medical practitioner for that purpose; Be it therefore enacted, That it shall be lawful for therefore enacted, That it shall be lawful for the said commissioners to appoint, subject to the approval of one of her Majesty's principal secretaries of state, a legally-qualified medical practitioner, of skill and experience, to inspect and report periodically on the sanatory condi-tion of any town or district, to ascertain the existence of diseases, more especially epide-miss increasing the mits of mortality and to mics increasing the rates of mortality, and to point out the existence of any nuisances or other local causes which are likely to originate and maintain such diseases and injuriously affect the health of the inhabitants of such town or district, and to take cognizance of the fact of the existence of any contagious disease, and to point out the most efficacious modes for checking or preventing the spread of such dis-eases, and also to point out the most efficient means for the ventilation of churches, chapels, schools, registered lodging-houses, and other public edifices within the said town or district, and to perform any other duties of a like nature which may be required of him; and such person shall be called the medical officer of health for the town or district for which he shall be appointed; and it shall be lawful for the said commissioners to pay to such officer such salary as shall be approved of by one of ber Majesty's principal secretaries of state."

Commissioners may order owners and occupiers to cleanse, purify, and whitewash premises; and are to nominate inspectors of nuisances. Certain underground rooms are not to be let for dwellings.

Clause 191 directs commissioners to obtain reports on the best mode of supplying water; and to this part of the bill we shall return next week.

COST OF TIMBER VIADUCTS.

A CORRESPONDENT of the Railway Chronicle supplies the cost of the following timber viaducts on the Newcastle and Darlington railway.

Sherburn Viaduct.—Length 220 yards, breadth within railway 24 feet, average depth 45 feet: total cost $6,340\ell$.—220 yds. \times 45 ft. \times 26 ft. = 28,600 cubic yards; cost $6,340\ell$. or 4s. 5d. per cubic yard.

Cassop Viaduct.—Length 153 yards, breadth 24 feet, average depth 34 feet: cost 4,069/.— 153 yds. × 34 ft. × 26 ft. = 15,028 cubic yards; cost 4,069/. or 5s. 5d. per cubic yard. Shinchiffe Viaduct.—Length 220 yards,

Shincliffe Viaduct.—Length 220 yards, breadth 24 feet, average depth 48 feet: total cost 6,417*l*.—220 yds. × 48 ft. × 26 ft. = 30,507 cubic yards; cost 6,417*l*. or 4s. 3d. per cubic yard.

STIR IN THE SCHOOL OF DESIGN.

SINCE the appearance of the last communinication on this subject in our pages, the annual meeting to distribute prizes to the successful students in the school has been held, and the disorganized state of the establishment has been brought under the notice of the House of Commons. Before alluding to these events, however, we insert the following letter, which reached us previously.

Sin,—As a letter has appeared in your journal signed by twelve students of the School of Design, and in which they attempt to prove that those students suspended by the council have misrepresented the state of the school, I trust you will permit me to answer such letter on behalf of my fellow students. Whatever might be reported as the words of Mr. Ewart, I do not for a moment believe that the expression there complained of was over used by him. That the dispute had resulted in the withdrawal of the *senior* students or pupils almost without exception, was, I have no doubt, the term made use of; and which is the perfect truth.

The berfect truth. Whether a letter which appeared in your paper of the 5th inst., signed H. J. L., was or was not the production of one of the suspended students I cannot say, my opinion certainly is that such is not the case, I therefore expost feel that we are answerable for its assertions; but if your correspondent had written the following, he would certainly not have gives those twelve any right to dispute the truth of his statement. (I will underscore the three additional words which I have placed in his sentence.) "In fact, the only students of promise the school could boast of having educated have been expelled." With the so much boasted answer that they will give on the 24th instant, I will have to do presently.

I will have to do presently. The letter then goes on to say that our assertion of the general discontent in the school was a falsehood; now the fact is, that at one of the meetings held by the suspended students, twelve or fourteen of the senior students of the large room attended, and there discussed the propriety of joining with us in petitioning the council. Those students were then advised by me, a suspended student, not to join with us; for this reason, that by far the larger portion of that room being filled with elementary students, the council would not know whether they were boys or men, and consequently they would only share in the difficulties without benefiting the cause advocated by us. Now of all those so attending there was not one that denied the truth of our assertions, but on the contrary, approved of them.

That twelve students can be found in the school (immediately previous to the awarding of the prizes) willing to purchase the good will of the director ought not perhaps to be a matter of surprise; but that any number, however small, could have the hardihood to string together such a mass of misrepresentation, and print it, and, moreover, to boast (as by them is done) that the precious production is unanswerable, is certainly astonishing. Now to the proof; and I willingly accept the test (of the past exhibitions) which they so boldly offer.

I must first premise that the present director has been two years and two months in the school; and also that one rule (No. 7, page 10) of the school says, "students who do not attend constantly, and regularly not to be allowed to compete for any of the prizes." Speaking of the last exhibition, they say that "unless then it can be proved that they who were beaten are superior to those who beat them." &c., &c. Now the facts are these: five prizes were last year taken by exhibitioners; four by students who have signed the letter in your paper (one of whom had not been a student the twelve months previous, and another has never studied in the echool since till he came to compete for the present prizes), and thirteen by students signing the remonstrance.

Out of the twelve students signing the article in your paper eight have never before obtained a prize in the school, and therefore are strangers in it, or if they have before competed have been beaten, namely, Messrs. G. M'Kenzie, J. Woods, D. Pearse, R. Jefferson, C. Worrall, W. E. Cadman, C. Hairs, and P. Holland. W. C. Wild has not been a regular student in the school for two years (only com-

364

ing to compete for the annual prizes, which, in direct contravention of the rule mentioned above, he is allowed to do), and therefore can owe but little to the present director. Mr. Strudwick has not been a student in the school for twelvemonths, and is, moreover, a designer regularly employed in the glass trade; leaving only Messrs. Walker and Wallace, who can be placed in competition with ourselves, or who have not been beaten by us.

In their postscript No. 1. they give the number of students in April, in the evening classes, as 189; in July, the present month, 111; thus evincing a falling off of 78, certainly not to be accounted for by the withdrawal of the complaining students, in number 37, still leaving 41, nor even by that bit of fiction con-tained in their note, as I think the following extract from the report of 1843 and 1844 will prove; and since which time it is wished to be thought the school has increased in numbers.

In April, 1844, the number attending the In April, 1844, the number attending the evening classes was 196; in July, 1843 (I have not the return of July, 1844, otherwise I doubt not that month would be more favourable), the number attending was 187, leaving only a difference is forty-one beside ourselves. Can those students have shared in our sentiments? The encuse which they make use of does not apply to April, but to the three or four winter months in 1843. The evening attendance in

noothe in 1845. Ine evening alleurance in November was 259; in December, 234; in January, 1844, 193; in February, 228. Ishahi now proceed to remark on the second postcript. In the spring of 1843, six exhi-bitioners were chosen from among the students; this was just at the time of the appointment of the present director, and they were of course stud ints who had been taught by the previous director; now what right have those twelve students to place the names of those exhibi-tioners is justaposition with ours, and what can they know (or what could be the weight if known) of the opinions of those who left the school twelve months ago? Or does it arghe for the competence of the director, that these who ought to have been taught by him have been beaten by those taught by his predecessor? That it is not our fault, is, I think, fully shewn by the fact, that under the That it is not our fault, is, I same teaching we have carried off every prize even from the exhibitioners themselves (I allude to class drawings). But there is another strange fact; there are at present in the school two exhibitioners, their names are not down amongst those signing the letter. How is this? they must know something of the state of the school.

As a proof of the spirit in which their letter was written, I will morely state, that a remark is made on a design executed by Mr. Philip, one of the suspended students. After stating that the prize was one of three guineas, they go on to say that "Two guineas only were given because the council did not consider the design deserving of more." Previous to this, there is a design for paper mentioned, the prize for which was taken by Mr. Walker, one who has signed their paper; now the prize is mentioned as two guineas, and no remarks made; the truth is, the prize offered was three guineas, but the council said they gave him two guineas as a reward for his industry, but as, but the council said they gave him considered his design as not at all applicable to the purpose for which it was designed.

And now, Sir, a few words on the so-muchvaunted coming exhibition, and the means that have been had recourse to in order to produce it. The three assistant masters have been employed to execute specimens of ornamental painting instead of teaching the junior stu-dents. By far the larger portion of the other principal competitors have not the slightest right to be considered as students who have been taught in, and by the school, being in fact practical designers (some of many years standing) who have been procured to make a show, and whose productions will be attempted to be passed off as those of students taught by Mr. Wilson. This is precisely the case with six out of the twelve signing the letter, half of them not having been in the school more than four months (though there is a rule which says that no one shall compete until he has been a student three months), when they almost immediately commenced competing.

In conclusion, I think I have proved that almost without exception the senior students have complained, and been suspended; that

the only students the school could boast of having educated have been expelled ; that eight out of the twelve signing the letter have no right to be considered as competitors with ourselves, or as the production of the school ; that two others have no right to be allowed to compete at all; and that the present show, whatever it may be, has been produced by unworthy means, and I shall conclude by asking in the words of your correspondents,-whether a cause requiring the use of such disreputable means can be a good one ?-I remain, Sir, &c., R. BURCHETT. 17, Bond-street, Cammercial-road, July 21, 1845.

The annual meeting was held on the 24th, when Lord Colborne presided. According to the report of the committee, the designs were more numerous, better executed, and displayed more knowledge of urnament, and greater range of taste and composition, than those exhibited on any similar occasion, holding out a cheering prospect of continued improvement on the part of the pupils. Unfortunately, however, for the present reputation of the school, it seems from verified documents sent to us, that several of those who were rewarded are practical designers, who have been in the school only a few months, while others are ex-hibitioners appointed in Mr. Dyce's time. Mr. W. Williams when he brought the matter before the House of Commons dwelt strongly on this point, and asserted that it proved that the expelled students were the most able young men in the school. Mr. W. moved for a select committee to inquire into the allegations contained in the petition of the senior students of the School of Design in Somerset House, and into the general management and present state of that school.

Sir G. Clerk, on the part of the Government. would not listen to the proposition, spoke highly of the qualifications of Mr. Wilson as director, and referred with sonfidence to the works last rewarded. He said, the attack on Mr. Wilson had been prompted "by a bad heart (whose, we did not learn), and trasted the House would refuse the committee.

Mr. Ewart thought very differently. The school was disorderly — thirty-seven of the pupils had seceded — it was, in fact, in a state of disorganization (vo, no). Manustate of disorganization (no, no). Manu-facturers were complaining that they could not obtain good designs from the school, and Mr. Pugin, the architect, stated that the condition of the school was highly unsatisfactory, and that he was obliged to have recourse to con-tinental workmen to execute his architectural He put it to the House, then, decorations.* whether they had not a right to ask for some inquiry (hear, hear). He found that the right honourable baronet opposite was inclined to put the school upon too mechanical a footing -to look upon the pupils rather as workmen than artists. Now, there lay the error which prevailed in the present system of management. Every eminent artist would tell them that the studies pursued at a School of Design should rest upon two main points-drawing from the human figure, and from na-ture. Upon these principles the most celeschools for design had brated continental been constructed (hear, hear). He agreed that the master should be an eminent artist. He also agreed with the opinion that this school should not be under the superintendence of a board. He should prefer to see some person out of that House at the head of it, who should still be responsible to the House for the manner in which the duties were per-But the board now consisted of a formed. number of persons, many of whom remained away from sheer idleness; and five or six converted the business into what (though it was considered a very unpleasant word in that House) he must then designate as a job. He was satisfied there ought, at all events, to be

inquiry. Mr. Wakley said, the report which had been made to the House was an attempt to deceive it. Mr. Herbert, the late master, was not even mentioned in it. He contended that Mr. Herbert was most unjustly treated—he was a man of great intellectual capabilities and great accomplishment in his art. It was acknowledged he was universally respected in the school. He was dismissed for some slight difference by a meeting of four councillors out

* The letter from which this is quoted will be found in our present number.

of twenty-four, one of whom said, "We must stop the reconciliation between Mr. Wilson and Mr. Herbert. It must not take place." Young men, such as these students, would not have ventured to have proclaimed the incom-petency of Mr. Wilson if it were not palpable.

Mr. Hawes defended the council, and said that Mr. Herbert's feelings had been studied, and every endeavour made to retain his ser-vices, but finding no hope of re-establish-ing harmony, they were compelled to discontinue the services either of that gentlemen or Mr. Wilson, and chose the former. Inquiry asked for on public grounds he should say by all means grant, but inquiry on the condition of being held up as jobbers he could not approve

Mr. Wyse said the defect of the present school was, that the whole system as at first laid down was not acted upon.

Mr. Hume thought there had been some suppression of important facts in the report, and that further representations should be laid on the table. The motion was then argatived without a division.

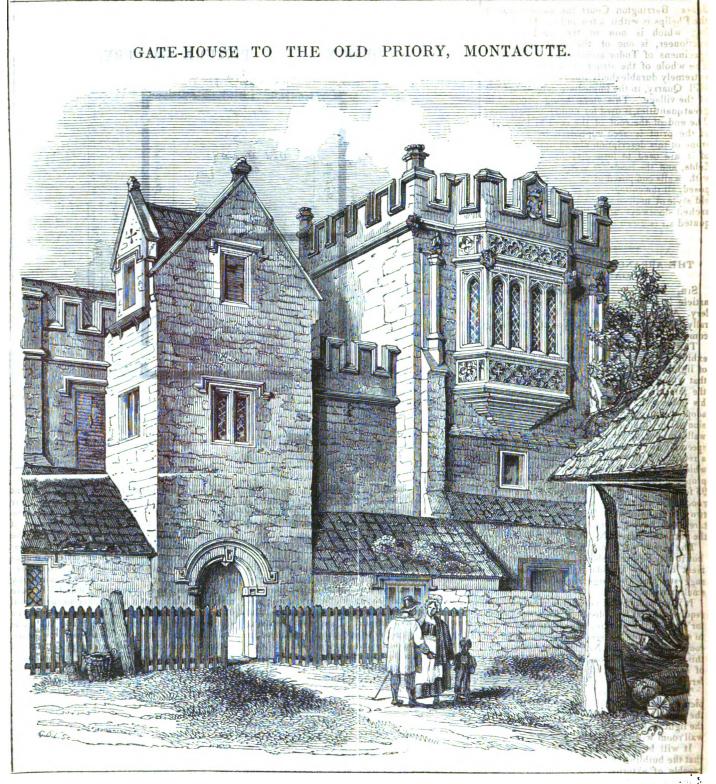

While we earnestly desire to see the school efficiently conducted, we are most anxious not to commit injustice towards the present director. Impelled, however, by sense of duty, we cannot avoid asking a question, to which we trust a satisfactory answer will be afforded. A large sum of money, some say 1,000*l*., has been expended in the production of a drawing-book; why is it that this work is withheld? and is it true that the 5,000 copies printed are consigned to the cellars of Somerest House ?

NEW CHURCH AT GRAVESEND.

A anunant is now in course of completion at Milton-next-Gravesend, which calls for favourable notice. It is a cross church, without aisles, and the tower stands at the south-west Unfortunately, it has not a favourable angle. situation, being built on ground below the level of the neighbouring roads. A church is one of those buildings, which should always stand in a prominent position, meeting the eye from many miles distant, but this is so hid at the bucks of houses, that its existence is not easily discovered. The erection of the spire will partly obviate the mistake: at present, only the tower is completed. It would not be right to cast any portion of blame upon the able architect, Mr. Wilson, of Bath, and the church is on the whole highly commendable. The omission of aisles, we are inclined to think an advantage in a modern church, but we do not think that the same number of people can be arranged with greater convenience in transepts, though these improve the external effect. The buttresses are set rather close, the roof is of good pitch, and the tracery of the windows well designed. The style is deco-rated. The church is built of rough stone with tooled dressings, and there is no want of ornament. The western door and window are set in a large arch. The pinnacles of the tower, which now appear too small, can hardly be judged of till the spire is completed. interior of the church is very effective from the good design of the roof, which is framed without a tie-beam, and stained a dark colour. without a tie-oeam, and stained a dark colour. We are sorry to say, that there are galleries in the transepts, and at the west end, but they have been well managed. The pews have low doors, so that they do not differ much from open benches. The arrangement of the roof timbers, at the intersection of the nave and transept is educively. The fort is a sum transepts, is admirable. The font is a very beautiful one — octagonal — on steps, with a kneeling stone. The pulpit is of stone. The reading desk and all the minor accessories shew much thoughtful consideration.

THE CHELSEA EMBANKMENT .--- The entire cost of the embankments about Cheyne-walk will be 75,4251. 4s. 11d.; of which Earl Cado-gan contributes 6,7451. 0s. 10d.; Lord Calthorpe, 1,706/. 15s. 41d.; her Majesty, 1,903/. 1s. 61d.; the Chelsea Water Company, 10,403/. 6s. 21d.; the Chelsea water Company, 10,403/. 6s. 21d.; the Marquis of Westmin-ster, 8,123/. 19s. 7d.; Mr. Sloane Stanley, 3,111/. 5s. 61d.; Miss Howe, 1,648/. 1s. 61d.; and Colonel Talbot, 545/. 18s. 11d. Some of these parties, however, have not yet given their consent to this allotment.—Globe.

THE BUILDER.

GATE-HOUSE TO THE OLD PRIORY, AT MONTACUTE, IN SOMERSETSHIRE.

MONTACUTE is one of the most picturesque villages in the county of Somerset ; and, in ad-dition to its natural beauties, it possesses those dition to its natural beauties, it possesses those of particular interest to the architect. It con-tains, and its immediate vicinity affords, several ancient edifices of great architectural merit. The building here represented, com-pared with some others, is perhaps of lesser in-terest, but still has much value both to the artist and to the antiquary. It is the gate-house of the old priory, whose history shall shortly be touched upon. The chief attraction of the village is the princely residence of the Phelips', Montacute House; but of this noble pile detailed represen-tations of every part have been published, ex-cept, strange to say, its finest portion, the north front, which originally belonged to Clifden-

cept, strange to say, its finest portion, the north front, which originally belonged to Clifden-hall, one of those fine old Tador gothic struc-tures, similar to Hengrave, in Suffolk, and to which it is nearly equal. Of the old priory at Montacute, the gate-house and a small building on each side are the only remains. The view represents the back-front end the prosphedded to it in the reign of

front and the porch added to it in the reign of Henry VIII. With the exception of this porch the building is of late perpendicular

character, in the same style as the noble vil-lage church, which immediately adjoins it,--so much alike are the details of these two struc tures that we may consider they were built about the same time. The entrance front of about the same time. The entrance front of the gate-house is very picturesque, and is greatly superior to the front represented in the print; it has at each angle two bold octa-gon towers, one of which reaches above the battlements. The bow-window in the first floor is repeated in both fronts, and under them are the arched entrances, the sides of which here eluments and the pointed which have clustered columns, and the pointed arches over them are richly moulded; they are hidden by the mean sheds erected before them. The centre battlement contains in one side, a bas-relief of the royal arms, and in the other are two letters (which appear to be \mathbb{C} . \mathbb{C} .) under a mitre; these probably were the initials of the abbot by whom the building was There is one room which still retains erected. its ancient appearance internally; the ceiling is formed of the open joists and girders of the

the rormed of the open joists and griders of the floor above: they are in oak, richly moulded. In the *Gentleman's Magazine* of May 1817, there is an account of the priory; it was founded about the year 1091, by William, Earl of Morton, as a priory for black cluniac monks, it was surrendered to Henry VIII: in 1520 the law in surrendered to Henry VIII: in Earl of Morton, so a priory for black cluniac monks, it was surrendered to Henry VIII: in 1539, the site was granted to Sir William Petre, garden front of great size, built by Inige

and sold by him to Mr. Robert Freke; it was soon after purchased by the family of Phelips, in whose possession it still remains.

Ъ.

I cannot quit the description of the building without pointing out a barbarous tree which threatens its destruction. This tree, suffered threatens its destruction. This tree, suffered to take root within the gateway, has mounted up, till having combinato contact with the stone-work of the valt, it has forced its way through the walt at the angle, and appears on the outside. As its bulk increases year by year, it threatens to upheave the arch-stond, and, if so, the whole waulting will fall in, and probably bring the beautiful fabric in one ple of ruin to the ground. Now, on a former occasion, Mr. Editor, the insertion in your valuable paper of a view of the turret of Leigh de h. Mere Church, in Wilts, and of an account pointing out the insecure state of that inter-esting structure, caused immediate attention to esting structure, caused immediate attention to be paid to it, and the restoration of the entire building under experienced hands is soon to take place. I do hope that this number will be equally efficacious in saving from destruc-tion by such values, the alugnate stem. tion by such valgar means, the elegant struc-ture at Montacute.

In the vicinity of the village is Brympton

Jones; Barrington Court the ancient seat of Jones; Barrington Court the ancient seat of the Phelips is within a few miles. This build-ing, which is now in the hands of the adcioneer, is one of the most interesting specimens of Tudor architecture in England. The whole of the structures are built with an extremely durable shelly lime-stone from Ham Hill Quarry, in the immediate neighbourhood of the village. This stone being obtained in great quantities, is used for numerous purposes. The end of the roof of the shed to the right of the print is seen supported by one large The end of the roof of the shed to the right of the print is seen supported by one large stone of this description placed upright; slabs of it are used to form divisions between the fields, and the roads for many miles are lined, with walls composed of it. As may be sup-posed, all the cottages are of stone, and as the old style of mullioned windows, and flat tudor arched doorways are still in use, a very anti-constat doir is given to the village. quated air is given to the village. C. J. RICHARDSON.

THE ARRANGEMENT OF PICTURE GALLERIES.

SIR, — HAVING read with some attention the article in your work "On the National Gal-lery. Arrangement of Picture Galleries gene-rally," I beg leave to offer to you the following companiestion: —

The scompanying sketch is intended to exhibit a gallery for pictures upon a principle of lighting the walls in a similar manner to that which I had the honour of suggesting to the late. Mr. President West when he altered his gallery in Newman-street, and which be adopted with great success. It was the admis-sion of the light perpendicularly, close to the walls, producing from them no reflection to the spectator's eye, that by lighting the floor gave a returned light to the pictures on the walls, which was, way beneficial. It is by this plan proposed that a boilding should be constructed 95 fort by 90 feet, without fire-places in the room, having two divisions for large pictures, two side divisions for Dutch and cabinet pic-

A BULLIN

TOPSERSERVER STRATE

95 feat by 90 feet, without fire-places in the room, having two divisions for large pictures, two nide divisions for Dutch and cubinet pictures, and having a staircase in the middle of the entrance room. No. 1. The lower part may be used for statues, but it may be preferable to have a low basement only for attendants, &c. The height suggested for the large room is 24 feet, the smaller room 12 feet. It is presumed that very large paintings will require, full 30 feet distance from the spectator's size the woole design of the master at one coup of and. Room No. 1. will not admit of much an inferval, as the stairs will interfere.
The side galleries are adapted for small pictures, will be near enough; and by having the light as described, almost the whole of the works will be near enough; and by having the light as described, almost the whole of the wall room will be occupiable.

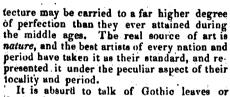

wall room will be occupiable. It will be evident from inspecting the plan

that the building will be very economical, and capable of external embellishment. If iron doors are placed at the openings, only one divi-sion meed be burned from one accident: the streams of people can flow without much in-terruption, which must ensue where the aper-surces are in the middle of the apartments. Judy 18, 1845. JOHN WHITE.

MR. PUGIN ON CHRISTIAN ART.

Tux following is the communication ad-arcseed by Mr. Welby Pugin to Mr. Herbert, which was referred to in the recent debate mcerning the School of Design.

My DEAR HERBERT,-I have almost given which (I feel assured) might be made the most powerful and effective means of creating a school of network and the a school of *mational artists*, not mere imitators of any style, but mea imbued with a thorough knowledge of the history, wants, climate, and customs of our country; who would combine all the spirit of the medieval architects and the beauties of the old Christian artists, with the Practical improvements of our times and our practical improvements of our times and our increased anatomical knowledge; we should then create a school founded on the old prin-These and yet a trace expression of our period. must own I have long entertained a most sugaine hope that Christian art and archi-

Gothic figures; the types of the foliage introduced in the decoration of the foliage miro-duced in the decoration of the first medieval buildings are all to be found in nature; and any garden and field can supply beautiful models for the sculptor. I am now preparing a work on vegetable and floral ornament, in which, by disposing nutural leaves and flowers in geométrical forms, the most exquisite combinations are produced, and of precisely the same character as those found in the illuminations-stained glass, incised plates, &c., of the thirteenth and fourteenth centuries. As regards images, no reasonable man would think of altering the proportions of the human frame, so beautifully and wisely ordaned by the Creator; but it is by the disposition and drap-ing of the figure that the Christian artist ob-tains his effect. The sublime repose of the ancient statues, and the majestic simplicity of the folds of their drapery, are the true cha-racteristics of the old sculptors, and not any affected quaintness of outline. By draping a lay figure of natural proportions in stuff and vestments which were in use during the middle vestments which were in use during the middle ages, the identical folds and forms are pro-duced in reality which we see represented in a greater or less degree of perfection in the ancient works. The first productions of Christian art are the closest approximations to nature, and when they failed in proportion and anatomy, it was not a defect of principle, but of execution. If the students of the School of Design were trained in this manner, we should Design were trained in this manner, we should Design were trained in this manner, we should get splendid designers for stained glass, frescos, and brassee; and sculptors who would not represent departed Christians under the guise of dying gladiators, nor statesmen and ecclesiastics as half depuded maniacs.

and ecclesiastics as half denuded maniacs., But the school should be also a place for the formation of operative as well as designing artists: we want artist smiths in silver and iron, artist chasers in metals, artist glass painters, artist engravers for enriched plates, artists for the manufacture of stuffs and the production of embroidery; and these should be well grounded in the fundamental principle of adapting the style and working of its orna-ment, not only to the purpose, but the material in which it is to be produced. Wood, stone,

glass, silk, and metal, require totally different treatment in their enrichment, suited to their, separate properties : the sime, losf woold be produced in a totally different manner if wrought in metal or carved in wood, and the practical knowledge of these matters is indis-pensable for the revival of true taste in manu-factures. Now the School of Design in its pre-sent form, so far from tending to promote any of the ends and principles which I have mentioned, is in fact a hinderance to the revival of true taste and feeling, for the minds of the students are perverted, by copying the same stale models that have been used for years. stale models that have been used for years, without producing a single artist capable of designing any thing original or appropriate. I see nothing but Pompeian arabesques, Greek friezes, and capitals—works certainly good in their kind—excellent illustrations of the opinions and principles of the nation which produced them, but more than useless when employed to form a school of English artists; they lead to a miserable system of adaptation of obsolete aymbols and designs, appropriate only they lead to a miserable system of adaptation of obsolete symbols and designs, appropriate only to times and people from whom they origi-nated; and while this system is pursued, the school cannot produce one man fit to be em-ployed in our national works, and at the present time I am actually driven to seek efficient assistance from the Flemish and German operatives.

ratives. It is misnamed a School of Design; it is a mere drawing school, and a drawing school for bad models; that is to say, models which must fail in generating original artists, and which can only form bad copyists and adapters. Now, I do feel anxious that this period and this country should be distinguished by a new achool of art, which should combine all the axcellencies of the old men with the greatest purity of drawing and proportion, and the ad-mirable execution of the ancient operatives, with any improvement of science and mecha-sical skill; then, indeed, we might produce a class of artists that would be capable of deco-rating our churches and public buildings, and rating our churches and public buildings, and skilful operatives for manufactures. England might then be distinguished by a national school of art, which would illustrate its bistory, school of art, which would Hustrate it bistory, and produce objects suited to our present wants and circumstances. This is merely a rough ontline of my views on the subject, but it is one of such importance, and things are going on so badly, that I could no longer refrain from sending them to you even in this crude and im-perfect state.—My dear Herbert, yours, &c., A. WELBY PUGIN,

INFLUENCE OF NEWLY-BUILT HOUSES ON THE HEALTH OF THEIR OCCUPIERS.

-In your journal of to-day, I find an Sin.article headed as above. Respecting science as I do, I fear we are upon the eve of running riot upon theory, in lieu of attaching due value to the importance of experience. I beg to differ from the propositions of Dr. Sutro, and also not only from these propositions, but from the propriety of the frightful outlay consequent upon the experiments of another doctor touching the ventilation of public buildings. Is the profession to be silent, and trust to mere theorists to alarm the public as to the occupation of newly-erected residences? From twenty-five years' experience in my profession, I will endeavour to grapple with the doctor's objections, without harassing the minds of your readers with the scientific terms used in his argument, never having met with the "pale anœmic face, wasted muscles, decrease of strength, sluggishness of small pulse, which symptoms frequently terminate in external or internal dropsy." And then follows a vo-cabulary of nearly all the ills that human nature is heir to; of course, intended as con-sequent upon inhabiting a newly-erected re-sidence. Without attempting to controvert sidence. the learned doctor's scientific terms, I will appeal to the experience of your practical readers whether I have upon me the charge of homicide, for having constantly placed parties in the occupation of their dwellings within six months from the commencement thereof? Admitting the doctor's correctness as to the me-dium of exhalation, evaporation, &c., the practicalquestion will be, what is the result in newly-erected dwellings ? My test, without any scientific reasoning is this, pass the nail of digit over the plastering, if not the dightest impression remains, proceed topaper-ing; which involves the fact, that you are about b append an article partaking so much in its construction and in that by which you attach it of the medium for exhibition, that the evidence would be immediate. I do not deny the doctor's proposition that dampness may exist, doctor's proposition that dampness may exist, but assert from practical experience, that ex-heilation goes on (if at all) in connection with the external fighter atmosphere. I challenge the doctor to hang up a blanket or woollen cloth in a room so circumstanced. Then as to the effects of evaporation from the accredited baneful influences of the component parts used in painting; by the common practice of the painter to put a pail of water in a room newly painted (the colour not being hardened) a de-posit is the result; try it again when the paint is hardened, and no smell remains to offend the olfactory nerves, --- no deposit is the result. I would refer the doctor to the evidence we

I would refer the doctor to the evidence we all have of the operation of nature upon freestone—which, in the quarry may be cut with a knife—exposed to the atmosphere becomes hardened; so I hold it with plastering or paint; offensive and deleterious in their component parts, when amalgamated and with this operation of nature's incrustation who will limit its commencement of resistance to exhalations? In a well-cleansed house (before occupation) I am at a loss to imagine where the baneful influence can arise from *floating* particles of lime.

With respect to ventilation, it has been my privilege very recently to discuss the question with two members of our profession, one of accredited, high, and long standing, who tells me some twenty years since he was called in to ventilate a large public building, that the system he adopted had been most successful, and I only waited (and still only wait) his offer to take me over the building to trouble your readers with the mode. The same modesty that has prevented him intruding on the public, induced the remark in our discussion, that having no title (doctor or otherwise), as an humble individual he was passed over. My younger friend has a scheme for ventilating houses in their construction, nolens volens, as to the occupier. I trust his modesty will not interfere with giving the result (through your columns) of his inquiry to the public.

Other personal occupations have prevented my intention of sending you counsel's opinion upon the construction to be put upon the clause in the new Buildings Act, touching "finishing fit for occupation" houses "already built," which the dictum of the referees in their circular rendered imperative; suffice it

for the moment to state that counsel's opinion is thoroughly with my case, viz. the clause is permissive without penalty, ergo, "cover in, finish when you please," as in respect of works commenced since 1st January last there is no controlment of period for finishing, the contrary in respect of works commenced previously (intended as of benefit) would be an absurdity. I am, Sir, &c.

GREENWAY ROBINS. Peckham, 26th July, 1845.

IMPROVEMENT OF DWELLING-HOUSES.

SIR. -In the hundredth number of your journal you state that one great object of "THE BUILDER" is to disseminate practical "THE BUILDER" is to disseminate practical knowledge, and to introduce sound principles in building. "The improvement of dwelling-places is a subject of national importance." Every one must admit the necessity of the former remark, which stands in need of your powerful aid, and with the latter I perfectly coincide. I had hoped that during the present session of Parliament some general measure would have been introduced by the Government for the purpose of improving the con-struction of buildings, and the general sanatory condition of towns. Although notice has been given of some such a measure by Lord Lincoln,* I fear the bill will have to be delayed another session, as the early part of the present has been lost in fruitless discussion, and now important measures that effect the vital energies and well being of every member of the com-munity are postponed in consequence, forsooth, of that great pressure of business which ought to have been transacted in the early part of the session. With such a mass of strong and unconfutable evidence before them, collected by the useful and laudable exertions of that eminent body of men, the Health of Towns' Commissioners, containing such startling and astounding facts, our legislators, with all due deference, I conceive are not discharging their duty either to themselves or to the country, by allowing a session to pass without an effort to remedy the evil which undoubtedly presses equally on all, both high and low, rich and poor. As the lives of many thousands of our fellow-creatures are annually sacrificed from the unhealthiness of our towns, and as the average duration of life of many thousands more is materially shortened from the same cause, which is capable of remedial measures, surely we have as great a right to expect the attention of the legislature drawn to the subject as to that of the protec-tion of dogs, and others of the brute creation. A general building and improvement act for towns is much required, as the want of it must be evident to every one at all acquainted with the state of the towns of this country. In most of them you find the streets nar-row, crooked, and inconvenient; the houses shops inefficiently and irregularly built, and without taste or architectural pretensions, or the slightest attempt at uniformity in design. A building and improvement act would enable us to lay out and improve our streets with science, taste, and convenience, our dwellings might be constructed substantially, and with some degree of architectural style and embellishment, and so arranged and classified, as to suit every grade of the community. The buildings ought to be erected under the supervision of a qualified architect, who should be appointed for that purpose (similar to your district surveyors); they would then be well and substantially constructed, and present a striking con-trast to the faulty, cracked, and distorted appearance of many of our modern buildings, that are erected to suit the whim or caprice of some speculative individual or adventurous Much difference of opinion appears builder. to exist relative to the nature and operations of the Metropolitan Buildings Act, but I think every right-minded and unprejudiced person must acknowledge that it is an exceedingly useful measure, and one that is calculated to effect great public benefit. An extension of its principles throughout the country is ardenly to be hoped for. At present, little attention is paid to the ventilation and drainage of houses; these are most essential elements in the salubrity of a town, and the preservation of health. There are but few towns that have any system of drainage; some are drained partially and

* A notice of this bill, since brought in, will be found the another page.

imperfectly, and others not at all: this arises in consequence of having no general measure for that purpose; and if it is to be left to the wish of the inhabitants at large, it would never be carried into effect at all, because the great majority of persons are unwilling to add to their local burdens; and as a town caunot be healthy without an efficient system of sewerage, constructed on correct and scientific principles, the expense, I consider, should be borne by the owners of the property, as they should be required to render their houses not only habitable, but healthy also.

habitable, but healthy also. A good supply of water to towns is of the utmost importance; for next to the air we breathe, water is the most indispensable agent in vital economy. There are but few towns in this country that have water-works established, and many have to depend upon the precarious supply to be obtained from rivers, brooks, or wells; the former being surface water, is rendered unfit for consumption by the impure matter it contains in solution, the latter from pernicious matter that percolates through the earth, more particularly if the system of drainage is bad. The expense of water-works even to small towns, in the shape of rates, would fall comparatively light upon the inha-bitants, and the sums annually paid in sickness for medicine, &c., required in consequence of the impure and deficient state of the supply of this necessary of life, would amply compensate for the first cost of the works and the supply, as well as filter the water, and rendering it pure and fit for human consumption. More diseases are engendered from this cause than we are generally disposed to admit of, or than we dream of in our philosophy. In the event of fire, water-works are essential, as the means of checking the ravages of that devouring element, as it is rarely convenient to obtain an immediate and sufficient supply from any other source; and when we contemplate the awfal destruction of property that has taken place lately both in this country and abroad, I think every precantion should be used, and every effort made, if not to remove the cause, at least to lessen the disastrous effect. Too much timber is used in our modern buildings. I think the day is not far distant, when the nature and properties of iron will be better understood, and it will, in a great measure, supersede the only perishable material used in building construc-Much of the unhealthiness of towns tions. arises from the dirty and filthy habits of the lower orders of the inhabitants, who are allowed either to accumulate their filth and refuse matter on their own confined premises, or to deposit it in the streets, to the great annoyance of their neighbours, and to the unhealthiness of the district they reside in.

In every town, provision should be made for the collection and deposition of this refase matter, and every means should be taken to instil into the minds of the lower orders babits of order, cleanliness, and decency I think health officers, or inspectors of nuisances, should be appointed in every town for the purpose of aiding in the suppression of these abominable practices, and power should be given by the Legislature to inflict penalties on all who do not conform to regulations of cleanliness and decency. Slaughter-houses are oftentimes great nuisances in towns, the stench arising from them being intolerable. These I think should be built on a plan and site favourable for drainage, and detached from dwelling-houses, which is very rarely the case.

Macadamized roads in towns I think are not desirable on the score of health, because in dry seasons every one must have suffered from the inconvenience arising from the dust, and in wet weather mud and dirt predominate. The same objection applies as to dust, to road surfaces formed of broken stone, profusely intermixed with asphaltum, alluded to in your journal (p. 263, ante), which has been extensively used at Nottingham. This material, moreover, is readily operated on by the rays of the sun, which render it soft and elastic, and thereby increase the force of traction, and consequently the labour of horses in draught.

Streets cannot be too frequently swept, and I think Whitworth's machine is a decided improvement on the old system, inasmuch as the dust is swept up and carted away immediately, whereas formerly the dust and filth was allowed to remain in the streets a considerable time, giving off offensive and noxious gases. In dry seasons the streets should be invariably

watered before they are swept, whether the surface is macadamized or paved, because the dust is not only detrimental to health, but injurious to the goods of tradesmen and the furniture in houses.

I could extend these remarks to an almost indefinite length, so numerous and so crying are the evils and abuses we are suffering under; but I fear even now I have trespassed too much or your valuable space, which might have been occupied by an abler pen than mine, and must plead for your kind indulgence. I am, Sir, &c. B. B. Brecon, South Wales, July 21, 1845.

GONTHE ON ARCHITECTURE AND ART.

TRANSLATED BY J. LHOTSKY. "Genius-is universally genial."

ALTHOUGH the great German poet extended his research and activity over almost every branch of human ken—it was to art, after all, to which his external position, as well as in-ternal vocation pointed most prominently. As the adviser of the great building operations carried on at Weimar; the creator and arranger of the well-selected grand ducal collec-tions, and the companion of the duchess dowager in her peregrinations in Italy-art was his constant occupation; and when, ultimately, he lived two years in Italy, ancient and modern architecture attracted much of his attention. While, however, so much of the most futile While, however, so much of the most futile and unmeaning trash of German novels and goblin stories have been reverentially trans-lated into English —, Goethe's "Auch ich in Arkadien" has not participated in the same distinction. Besides these two volumes of Italian travels, the German poet has scattered a variety of the most vivid and pregnant obser-vations on architecture and art over his autovations on architecture and art, over his auto-biography, his papers "Für Kunst und Alter-thum;" all which has been laid aside by our translators as no good. We therefore intend, as space and occasion may allow, to supply this desideratum by presenting our readers with the first translation of Goethe's architec-tural and artistic remarks, ever made —which, after all, may have that additional merit of fix-ing public attention to the ensemble of the e works.

We have, however, still to remark, that we feel no inclination for acting the part of a censor with Goethe's writings. This great man knew full well, that nothing whatever has gray values but in relation to, and in connection with the social condition, and the consider with, the social condition, and the social im-provement of men. He knew full well, that men may amuse themselves (waste time) with counting the hairs on the body of spiders, or discuss whether Cæsar had any corns or not, and the like - but he knew full well, we say, and the like — but he knew run wen, we say, that this, really, was no good. Hence his con-stant and deep allusions, to the bearing of ar-chitecture and art on the *total* condition of men. Such remarks, if interwoven with our topics, we shall not curtail-as they give zest and pregnancy to his beautiful sayings. We know, in fine, that Goethe's writings will not instruct our readers in the materiale of building (the theory of beams, &c.); for this, other space is extant. They will, however, afford ample scope for thinking and feeling-and from this to reasonable and seasonable action, is but one step.

THEORY OF AMPHITHBATBES (THEATERS). Verona, Sept. 16, 1786.*

The amphitheatre is, then, the first important monument of ancient times, which I was destined to see; and how well is it pre-served! When I went in, still more when I walked around on the brin of the building, it appeared strange to me, that I saw something grand, and still *nothing* in reality. Because, it is not intended to be seen empty, but quite filled is not intended to be seen empty, but quite filled with people, as it has been shewn of late to emperors and popes. Joseph I., accustomed as he was to see masses of people, is said to have been seized with astonishment. It was, however, but in the earliest period, that it produced its full effect, when the people were yet more really "the people," than they are now (!) Because such an amphitheatre is indeed made for the sake of imposing upon the people with their own importance—to gammon people with their own importance-to gammon the people with the presumed idea of themselves.

* Italienische Reise, vol. 1.

If any thing see-worthy occurs on even ground, and every one runs to it, the backstanders endeavour, by every possible means, to raise themselves above the foremost : some step on benches, casks are rolled hither, carts dragged to, boards are laid to and fro, neighbouring heights are occupied-and a sort of living crater is quickly formed. If the spectacle occurs oftener at the same

place, slight scaffolding is erected for those who can pay, and the other mass shift for themselves as they best may. To satisfy that general want, is here the architect's task. He constructs a similar crater by art-as simple as constructs a similar crater by art—as simple as possible, for the people themselves becoming the ornament thereof. If they thus saw themselves together, they must needs have wondered— because, being merely accustomed to see themselves, hitherto, running about promis-cuously, to find themselves crowded together without order and rule; this many-headed, many-minded, tossed-about animal, erring to and fro—sees itself then united into a noble whole, combined into a unity, congregated and whole, combined into a unity, congregated and fixed into one mass, as one body, ruled by one mind. The simplicity of the oval is visible to every eye in the most pleasing way, and every head serves as a scale, indicating how immense the whole be. Now, as we see it empty, we are left without a standard of comparison, and cannot judge whether it be large or small.

The Veronese deserve much credit for the way in which they preserve this monu-ment. It is built of a reddish sort of marble, ment. which is affected by the air and rain : on which account the corroded steps are replaced by others, and they appear almost all new. An inscription records the name of one Hieronymus Maurigenus, and the nearly incredible pains he has taken with this monument. Of the outer wall there is but a part remaining, and I doubt whether it has been ever wholly finished. The lower vaults, which are situated towards the great square called *il Bra*, are let to artisans, and it looks funny to see these dens again tenanted. (Verona 16 Sept. 1786.) The finest arch

gate which, however, is constantly shut—is called *Porta stupa* or *dell Pallio*. Considering it as an arch, and the great distance from

It as an arch, and the great distance from which it is seen, it is not a well-conceived work; as it is only in nearing it that the merits of the building are appreciated. They state different reasons, why it is shut. Still, I have my own conjecture. The in-tention of the artists went, undoubtedly, towards causing by it a new laying out of the Corso, because it does not correspond at all with the line of the actual street. The left with the line of the actual street. The left side consists of low tenements, and the rectangular line of the middle of the arch points towards a convent of nuns, which would have been to be laid down, as a matter of necessity. This all was evident; besides the rich did not like to establish themselves in this distant quarter. The artist died, perhaps, in the mean time, and the arch was shut, by which, matters

were brought to an issue at once. The portal of the theatre, consisting of six large Doric columns, is respectable enough. The meaner, nevertheless, appears over the two Corinthian columns, the life-size bust of Marchese *Maffei* in a large wig. The place is honourable, but for the sake of being somewhat at a par with the size and sterlingness of the columns, the bust ought to have been colos-sal. Now, it appears puny, on a miserable pedestal, unharmonical with the whole. The gallery also, which surrounds the vestibule, is mean sud the fluid Dorig dwarfs appear poor mean, and the fluted Doric dwarfs appear poor aside the smooth Ionic giants. Still, we shall pardon this, in consideration of the fine collection which is placed under these arcades. Here, the antiquities, mostly dug up in, and near Verona are jointedly exhibited. Some near verons are jointedly exhibited.[•] Some are said to have been found even in the am-phitheatre. They are Etruscan, Greek, and Roman, down to the later periods, and also some of modern times. The basso-relievos are encased in the walls, and bear the numbers given to them by Maffei in his work: Verona Illustrata. Altare frequencies of column Illustratia. Altars, fragments of columns and such like; also a most exquisite triped of white marble, on which genii are represented playing with the attributes of gods. Ra-

* Thus the commonwealth of Verona possessed a museum of national antiquities in 1796—denied to this country in 1845,

phael has imitated and idealized such in the

The breeze blowing from the graves of an tiquity, replete with fragrancy, is, as if it came over a bosquet of roses. These sepalchraf monuments are hearty, sentimental, and repre-sent always life. There is a man, who, in \leq niche, aside his wife, looks as if out of awindow. There stand father and mother, their son between them, looking at each other with un-speakable simplicity. Here again, a couple seize each other's hand. A father, reclining on speakauto since is hand. A father, recturing on his sofa, seems to be amused by his family. I, indeed, was very much moved by the deep I, indeed, was very much moved by the deep meaning of actuality in these stones. They are of a later period of art, but are simple, natural, and speaking to every one. The artists have (with more or less skill), placed merely the simple existence of man before us, but by so doing here presented is not make it but by so doing, have preserved it and made it something stable. They do not fold their hands, do not look to heaven, but they are here what they have been and still are. They stand aside each other, take interest in each other, love each other—and this is most lovely, albeit somewhat unworkmanlike, represented in these stones. A very ornamented marble pil-

lar afforded me also some new ideas. However praiseworthy this institution be, still, it is apparent, that the noble spirit of conservatism, which caused its foundation, has outlived itself. The splendid tripod will soon be injured, because it stands unprotected exposed to the weather on the west side.

Provided with a wooden case, this treasure might be easily preserved. The new palace of the Proveditore, if finished, would have been a fine piece of archi-tecture. Besides, the Nobile still build a great tecture. Besides, the Nobile suit build a great deal, but it is a pity, everyone at the place where his former dwelling stood—consequently, aften in narrow streets. Thus a splendid front of a seminary is erected in a small street of the most distant part of the fauxbourgs.

RESTORATION OF NETHER WALLOF CHURCH.

THE church of St. Andrew, Nether Wallop, like too many of the Hampshire churches, was formerly remarkable for little beyond a " sing formerly remarkable for little beyond a " sing-ing gallery " of goodly proportions and an no-sightly array of pews of every size, shape, and height. It has lately undergone a thorough restoration, the gallery having been removed, a beautiful belfry arch having been opened to view and a two light window with stand view, and a two-light window with stained glass having been inserted at the west end. The centre of the nave has been repewed with seats of a uniform height of two feet eleven inches, corresponding with the original oaken seats in the north and south aisles; the whole of the nave has been refloored and repewed throughout, the windows reglazed, and a space enclosed by an oaken parclose at the east end of the south aisle, to serve as a vestry. A per-pendicular font, from a design by Mr. Os-mond, of Salisbury, has been likwise substi-tuted for the old broken one, which was ingeniously hidden in one of the high pews

ingeniously hidden in one of the night power under the gallery. The chancel has been wholly rebuilt, at the expense of the impropriator, the Rev. Walter Blunt, who has retained its original propor-tions, viz., 38 feet in length, by 15 feet in breadth. On taking it down, the remains of a beautiful old oak roof were discovered, which was adopted as an exact model for the new one, It is of a good pitch, and is remarkable for the peculiar curves of the tie-beams, and prin-cipals, and the lateral brackets for the support of the purlins. The seats, extending longitu-dinally and alternatic are of foreign and the dinally, and altar-rails, are of foreign oak; and dinally, and altar-rails, are of foreign oak; and the space within the altar-rails is paved with encaustic tiles, interspersed with medallions; containing emblems of the Evangelists, the Queen's and Prince Albert's arms, and a mitre. The whole is surrounded with a figured border. A new perpendicular window has been placed in the east end, and there are two two-light windows of rather earlier data on the porth and south aides: the whole of on the north and south sides; the whole of which have been filled with stained glass, the former from a design by Mr. Fisher, of Salis-bury, and the latter with quarries of tinted glass (covered with oak and ivy leaves), which were made after the pattern of an original quarry found in the old chancel.

The restorations of the nave have been ef-fected by a voluntary subscription.

EXAMINATION IN LINES AND CURVES.*

28. Describe the different characters of spiral lines used in architecture, and shew how they can be traced by continuous motion.

spiral times used in architecture, and shew how they can be traced by continuous motion. 29. Is there any example of the logarithmic spiral being applied in ancient architecture? If so, state where and when, and how it is proved to be such.

30. What are the characters of the curves forming the vertical contour of Egyptian, Greek, or other columns? and shew how they can be described full size by the workmen. 31. Shew how the various characters of

31. Shew how the various characters of Gothic arches, from the most pointed lancet to the flattest Tudor, may be traced by continuous motion by a workman, to the full size required.

32. Point out the difference in the characters of lines applicable, or supposed to be applicable for these purposes, and why one description is preferable to another.

33. What is a cardioid, what are its different characters, and by what means can the whole, or any part of such lines be drawn?

34. Shew any instance of the application of a part or the whole of any description of cardioid in architecture.

35. Shew how a varying curyed line can be traced (always concave on the same side) commencing at a point at any gives distance from one side of a right line, then crossing the right line at a point at any distance from the first point, then returning on the other side of the right line to the same distance from it as from the first point on the other side; and, if necessary, produce both the right line and both branches of the curve to any extent, continually receding from the given right line on both sides, but never to exceed a given distance from each other. 36. Draw a portion of another line with two

36. Draw a portion of another line with two infinite branches — both branches continually approaching a right line on the same side and in the same direction.

37. Draw Hogarth's line of beauty by simple continuous motion, of several different dimensions, but exactly in the same proportions, a subject of the JOSEPH JOPLING.

NEW HALL OF COMMERCE, IPSWICH.

On Monday, the Stat ult., the new building at Ipswich, appropriated to the customs and excise, was publicly opened. It is said to be a good instance of what may be done with small funds by clever distribution and just proportion of parts. A local paper says :--"The Hall of Commerce occupies the centre of the building on the principal floor, the same width as the portion, being about 35 feet square, and 18 feet high; some little decora-tion has been given to this room, the walls being surrounded with an order of the Corinthian proportion, the capitals of which are of original design and display considerable merit-from the cornice springs a cove abutting against an enriched guilloche flatband which surrounds the ceiling, and groined on the south and west sides. This portion of the building, together with two private offices in the rear, is to be devoted to the convenience of merchants, ship owners, &c., for business purposes. The department of the customs is he west side of the building, and that of the excise on the east, each consisting of a long room or public office, with private apartments for the collector and controller of each establishment, together with rooms for samples and stores. A separate entrance and staircase is provided for each department, communicat-ing with the arcades at each end of the building; while there is another staircase at the back for the Hall of Commerce, and the offices on the Mercantile Floor, which are occupied by the Dock and River Commissioners and private merchants. Extensive corn cham-bers are obtained over the whole of the building, and the lower story throughout is appropriated to stores and warehouses. The con-tract for the whole of the works was completed at 4,250% and the work has been executed in a sound and substantial manner-no settlement

in any part having occurred. The length of the building from west to east is 125 feet, and the depth from north to south 44 feet—the portico and staircase projecting

* See page 853 mic.

about 23 feet. The height to the apex of the pediment is 55 feet, and to the cornice, 45 feet; and the tower, 76 feet." At the north-west corner of the building,

At the north-west corner of the building, there is a campanile. An entertainment was afterwards given in the ball, and the health of the architect, Mr. Clark, was proposed amongst others by the mayor in flattering terms. It is so much the custom to forget the architect altogether at these ceremonies, and still more so in any account of them afterwards given by the press, that we cannot omit mentioning the circumstance.

Mr. Pettit, the contractor, was also complimented, and said in reply what it is always most satisfactory for an architect and employer to hear, "That while he had endeavoured to do justice to others he had paid himself."

MONUMENTS TO EMINENT MEN.

Our readers are probably aware that steps were taken some little time ago to obtain a monument to our illustrious countryman, Flaxman. The committee rightly remark in their appeal on the subject, " It has long been a subject of general regret and national reproach that in this country so little has as yet been done to testify a nation's gratitude to the great masters in British art. The persevering exertions of private individuals erected a monument in St. Paul's to the memory of Sir Joshua Reynolds, and the admiration of friends and countrymen a statue in the National Gallery to the memory of Sir David Wilkie. But the history of British gratitude to British art begins and ends with these two statues. While public memorials to our warriors and statesmen are of common occurrence, Sir Christopher Wren has only a slab, Hogarth is with-out a bust, and Flaxman without a statue." We are glad to find that the latter stigma will be removed; a sum of money has been already subscribed, and Mr. M. L. Watson has com-pleted the clay-model of the statue to the perfect satisfaction of the committee: further subscriptions, however, are required, and we gladly make known the want in the hope of inducing assistance. Mr. Peter Cunningham is acting as honorary secretary. The subscriptions in aid of the memorial to the memory of his late Royal Highness the

Duke of Sussex are to be appropriated to the building another wing to the Royal Free Hospital, with the addition of a marble statue and a suitable inscription, to be erected at a cost exceeding 1,000 guineas. The new wing not will be called the Sussex wing, and is to be large enough to contain 100 beds.—A statue of the late Lord Rolle, in the robes worn by him at the coronation, executed in white Carrara marble, at a cost of one thousand guineas, is being erected at Buton, the seat of Lady Rolle.——We understand that Mr. Butler, the sculptor, has been selected by the committee to execute the bust of the late Professor Daniel. of King's College, London. — The Queen has subscribed 200 guineas to the fund for the erection of a monument to the late General Sir William Nott. — Gibson's statue of Mr. Huskisson, for the town of Liverpool, is casting in bronze, at the royal foundry of Munich. ——The Picton Monument in Wales is about to undergo the work of restoration. It is gra-tifying to learn that public sympathy has not been permitted to flag on this subject, and that subscriptions are daily increasing. — The statue of Beethoven, modelled by the Dresden statue of Beethoven, mourieu of the Director sculptor Hähnel, for the town of Bonn, has just been cast in bronze at Nuremberg. — The site for the Weber monument, to be erected in Dresden, has been selected by the king of Saxony, in front of the theatre royal of that city. The committee have decided that the monument in question shall be the counterpart of that about to be erected to the memory of Beethoven,-that is, that it shall con-sist of a colossal statue, in bronze, of the illustrious deceased, on a quadrangular pedestal enriched with bas-reliefs on the four sides. The cost of the work is more than covered by the performances given in its behalf at the several theatres of Dresden, Berlin, Munich, Vienna and Hamburg. — A monument in the shape of a mausoleum was inaugurated at Leipsic on the 5th instant in one of the principal squares, in commemoration of the great battle of Leipsic.

SMOKE PROHIBITION BILL.

THIS Bill to which, in its progress through the House of Commons, we have more than once directed attention, was lost last week on Mr. Mackinnon moving that the report of the Committee be received. In the debate it was the general opinion that the Bill since its introduction had undergone so many and such extensive modifications, to suit the views and interests of certain classes of manufactures, that it would be partial and unjust in its operation. Upon these grounds Lord John Russell declined giving his support to its farther progress, and thought it would be advisable that some further inquiry should take place in order to accertain what branches of manufactures could be fairly brought within its provisions.

its provisions. Sir James Graham expressed himself as being most anxious to adopt this suggestion, and thought it might be advisable to have some scientific inquivy instituted during the recess, as to how far the provisions of the Bill might be applied to stationary engines employed in manufactures. He further stated that the labours of Mr. Mackimaon would not be lost, as his measure might be incorporated in Lord Lincoln's Bill affecting the Sewerage and Drainage of towns, ar introduced in a separate and more satisfactory form next session. In dismissing this subject for the present we cannot refrain from noticing the ill-success that attends Mr. Mackimnon's attempts at legislation. His powers, or his influence to grapple with subjects of so much importance as the health of towns, whether in getting rid of the smoke nuisance or of intramural interments, are no longer questionable. He has in both instances prevented more efficient members from taking in hand remedial measures and advocating them with decision and firmnees, without which success is impossible.

ST. AUGUSTINE'S ABBEY AT CANTERBURY.

ABOUT twelve months sgo, Mr. A. B. Hope, finding that the ancient abbey of St. Augustine, at Canterbury, was fast disappearing, purchased the rains with a view to their restoration, and proceeded to excavate the foundations. The munificent proprietor has since determined to devote the site to the establishment of a missionary college for the Church of England, the object of which will be to provide an education to qualify yoong men for the service of the church in foreign settlements, with such strict regard to economy and frugality of habits, as may fit them for the special duties to be discharged, the difficulties to be encomtered, and the hardships to be endured. Al considerable sum, nearly 40,000*l*, has been subscribed already, chiefly through the exertions of Mr. Hope, who has himself contributed a large proportion of it. - It is proposed, therefore, to commence immediately the principal quadrangle of the college, which includes the chapel, hall, library, and apartments for 50 students, with the requisite accommodation for the officers and servants of the establishment. The arrangments of the building will be so constructed, as to admit of subsequent enlargement.

We shall seek an opportunity to examine the works, and shall hope to find that the old buildings are to be restored.

YARMOUTH BRIDGE.—A further delay has occurred in the erection of the new bridge over the Haven at Great Yarmouth. It appears from the proceedings of a meeting of the commissioners, held last week, that tenders, for building an iron bridge were obtained from the Birtley Iron Company, at the sum of 32,000*l.*, and from Mr. W. Smith Simpson, of Tower Park, near Ely, at the sum of 18,479*L*, subject to conditions. A second tender was made by Mr. Simpson, at 19,070*l.*, subject to conditions. The conditions have reference to the amount of responsibility, and the commissioners not being disposed to agree with them, they have postponed further consideration of the subject for the present.

PARIS. — The eight magnificent blocks of Italian marble recently arrived at the Port d'Orsay, and intended for the construction of the tomb of the Emperor, have been safely removed to the Invalides. — Galignani.

LORD BROUGHAM AND THE NEW HOUSES OF PARLIAMENT.

LORD BROUGHAN, a few nights since, in moving an humble address to her Majesty praying thet she might be graciously pleased to give the necessary directions for preparing accommodation for their lordships in the new Houses, of Parliament by the beginning of next session, complained bitterly of the sufferings which the law lords at present had to endure in their morning sittings, sometimes from beat, and sometimes from cold. His lordship also took occasion to say that he *feared* there was a project a foot for making the new houses not only subservient to legislative pur-poses but also to pictorial ones; he had heard that the walls were to be decorated with frescos; and that statuary was also to be called in to aid in ornamenting them.

The motion was strongly opposed by the Duke of Wellington, Lord Wharncliffe, and Lord Sudely, the latter nobleman observing that he thought it would be more advisable and safer to wait for another year than to go into a new building before it could be sufficiently dry. Lord Brougham pressed his motion to a division, and it was lost by a majority of 24, there being 16 for and 40 sgainst it.

Correspondence.

FIRE-PROOF ROOPS.

1

Sig.-Some second and third-rate dwellinguses now in progress have been covered with fire-proof roofs, constructed of wroughtireo joints and plain tiles in cement, laid to a sufficient fall to carry off the rain. The adsufficient fall to carry off the rain. The ad-vantage of this mode of roofing, when com-pared with that of slates and lead gutters is pared with that of slates and lead gutters is obvious. It is stronger, more durable, less liable to repairs, more convenient in many situations, for views, &c., more adapted to ar-chitectural beauty, and, being fire-proof and flat, affords an easy escape from one house to the other. The size of the joists varies ac-cording to the width of the houses, but where the frontage is about 19 feet, the iron has been used 41 inches hy 14 inches, and placed from used 4, inches by 11 inches, and placed from centre to centre of party-walls, 4 feet apart, with structing of smaller-sized iron. The tiled work of three or four courses (executed by competent bricklayers) in fresh cement, well grouted, forms a flat all over, and is finished with a skirting all round the walls, which an-swers as flashing. It is plain these roofs have an equal bearing throughout the walls, without the utility in any direction or cruching in any thrusting in one direction, or crushing in anothrusting in one direction, or crushing in ano-ther, as is the case with timber roofs, an illus-tration of which was given in Vol. II. p. 344. The damage done so readily to slates by sweeps or other persons, and the constant an-noyance of repairing, as well as being robbed of lead gutters, &c. are entirely avoided.

CANDEN TOWN NEW CHURCH AND THE NEW HOLLOWAY INDEPENDENT CHAPEL.

Sin,-" One of the competitors" for Camden Town new church, in his letter inserted in your last number, has either omitted, or is ignorant of a glaring peculiarity in the late transactions, viz., that the selected design consisted only of two drawings, an exterior and interior perspective view, unaccompanied by geometrical draw-ings; so that the managing parties must either have shewn themselves unusually sagacious in making up for the necessary defectiveness of the drawings, or, which is more probable, judging by analogy, set to work in the first instance determined to push forward a favourite individual, regardless alike of honour or even justice. Now, Sir, if this be the case, it is really too bad, and seems to be a kind of second edition of the jobbing proceedings of a neigh-bouring "independent" committee, whose doings were so unmistakably shewn up in your journal some months since, and who, after having had the benefit of discussing some thirty sets of drawings sent in compeafter baving had the benefit of discussing some thirty sets of drawings sent in compe-tition, at last selected one of their own number, and are now (after five months' consultation) preparing to carry out a design unwarrantably at variance with the original drawings and esti-mate ;—an example which I am sorry the Camden Town people seem inclined to follow. I am glad to find you purpose keeping your eye upon them :—the persevering efforts of Tws BUILDER in the cause of competition de-serve the warmest thanks of the profession :

and it is hoped they will not be fruitless, but prove to have aided in establishing a system more in accordance with the undoubted rights of integrity and fair dealing .- I am, Sir, &c., London, July 29th, 1845. VIGILANS.

MOSAIC PAVEMENTS.

S18,-In the last number of your excellent paper, there is a good account of the above; but no notice is taken of the following, which if you think it useful to your readers, perhaps you can find a spare corner for. There are you can find a spare corner for. There are manufactured at Naples thick glazed tiles, upon which are figured fac-similes of many beautiful patterns, which together form the ce-lebrated mosaic pavements of Pompeii and Herculaneum. For instance, there is the, whole pavement which was found in the house of the tragic poet, the dog with cave canem; and besides, there are a host of borders of all patterns. As far as I remember, these tiles are very cheap, and their effect is very good; and at a little distance they look better than the originals. The shops in which they are to be bought are situated on the Mole, close to the sea, and I should wish very much to see them introduced into England, as they are well adapted for the floors and sides of halls, baths, dairies, &c.—I am, Sir, &c., London, July 23rd, 1845.

P. A. T. H.

Miscellanea.

NEW CHURCHES. — At a meeting of the Society for promoting the enlargement, build-ing, and repairing of Churches and Chapels, held last week, grants were voted towards the erection of new churches at Beggin, near Ash-bourne; Tetbury; Moxley, near Wednes-bury; Hereford, the parish of St. John the Baptist, in which there is no church; Clandown, a district near Bath; Cantley, in the parish of Sedburgh, York; Kingsholm, a district ad-joining Gloucester; Pembroke Dock; St. Paul's, a new district in Hull; West-street, Oxford-street, London; and Brighton. Grants were also voted towards the rebuilding of the churches at Eye, near Peterborough; Hinton, near Blandford; Standford near Hythe; St. Thomas, Winchester; Branston, near Cold-stream; Ripley, in Surrey; Badderley Ensor, near Atherstone; and towards the enlarging of the following churches, viz., Cilcain, near Mold; Wallingford, St. Leonard's; Hook Norton, near Chipping Norton; Wymerwold, near Loughborough; Shatton, near Swindon; Whitchurch, near Stratford-on-Avon; Upton, near Horsham; St. Philip, Birmingham; Crendall, near Farnham; Brightwell, near Woodbridge; and Llancynfelin, near Aberyst-with. Cost of GLASS FOR HORTICULTURE — NEW CHURCHES. — At a meeting of the

COST OF GLASS FOR HORTICULTURE COST OF GLASS FOR HORTICULTURE — Belgian glass is advertised, in lengths of 40 inches, at the price of something less than 14d. per foot, at Antwerp. At that price we ought to buy it, and eventually shall buy it, at home; for the English glass-makers can sell it as cheap as any body if they think proper to do so. Now, the cost of glass at 2d. a foot, to cover a bed 6 feet wide and 100 feet long, would be just five nounds and 100 feet long, would be just five pounds, and the squares might be long enough to render all laps unnecessary in a bed which shall be 6 feet wide. The English glass-dealers, in that modest tariff with which they favoured their countrymen immediately after the repeal of the glass duties, only demanded seventy-five pounds for the same quantity; or, supposing that the squares were not more than 40 inches long, they would then have vouchsafed to accept the small sum of thirty pounds. We do not say that a fall in the price of glass to 2d. per foot is to be expected immediately, or that a reduction of prices to such an amount could at present be accomplished by the English glass-trade; but would be just five pounds, and the squares might accomplished by the English glass trade; but the difference between what they have done, and could have done, and must do, is suffi-ciently significant of the course which those who have money to spend on glass should steadily pursue.—Gardeners' Chronicle.

who have money to spend on glass should steadily pursue.—Gardeners' Chronicle. WALLASEY DOCKS.—On Saturday last, about half-past five o'clock, the first stone of the Wallasey Docks, on the uorth side of the pool, was laid by Mr. Rendall, the en-gineer of the docks, on the Seacombe beach, and within about 20 yards of the Seacombe ferry. Between 200 and 300 of the inha-bitants of Seacombe were present. serve the warmest thanks of the profession; bitants of Seacombe were present.

building societies are conducted."-Temperance Intelligence. PRIZES IMPORTANT TO INVENTORS AND PATENTEES. A GOLD MEDAL, value 1007. and a SILVER MEDAL, value 501., will be given by Mr. M. JOSCELIN COOKE. The Gold medal for the best Patent, and the Silver medal for the best Design taken out or Registered at the OFFICE for PATENTS and DE-SIGNS, 30, Half-Moon-street, between the last of Novem-ber, 1844, and the 1st of June, 1846. The Prizes will be awarded by competent judges on the 10th June, 1846. The conditions to be observed, together with instructions, charges, and every information for obtaining Patents in England or Poreign Countries, or Registering Designs, will be forwarded gratis, on application to Mr. M. JOSCELIN COOKE, at the Office for Patents and Registration of Designs, 20, Half-Moon-street, Piceadilly, London.

PAINTING BRUSHES OF SUPERIOR QUALITY. TO PAINTERS, BUILDERS, &c. J. J. KENT AND CO.,

J. J. KENT AND CO., MARUPACTURES, 11, GREAT MARLBOROUGH.STREET, LONDON, Offer to Painters, Builders, &c., Painting Brushes of a quality far superior to those generally offered for sale, to which they beg to call the attention of all who prefer quality and durability to apparent cheapness. 000000.-7 in. Dusters. 000000.-7 in. Dusters. 00000.-7 cound Brushes. Distemper ditto. Ground and Unground. Bash Tools, and Common Tools. Tar Brushes and Masons' Brushes, and all other Brushes used by Painters and Artists. Lists of Prices of Painting Brushes, and of all other kinds of Brushes, forwardsd on application. Established 1777.

WARNISH.—It has long been a desideratum amongst the consumers of Varnish to obtain a good and genuine article ; brilliancy, facility of drying, hardness, and durability are the qualifications necessary, but these are seldom if ever found united. The experience of a life-time devoted exclusively to the manufacture of this article, the great and important discoveries of modern chemistry, and the daily improvements in machinery, have enabled Mesara. George and Thomas Wallis to produce Varnishes (both oil and apirit) unrivalled in every respect, and they confidently recommend them to the track, as deserving of notice both in price and quality.

recommend them to the trade, as deserving of notice both in price and quality. Builders, Coachmakers, Painters, and others may depend on being supplied with a genuine and unadulterated article. Fine Oil Varnish, from 10s. per gallon; best White Spirit Varnish, 21s. ditto; Best Spirit French Polish, 20s. ditto; White Lend, Oil, Turps, and Colours of every description at the very lowest prices.-WALLIS'S Varnish, Japan, and Colour Manufactory, 64, Long-acre, one door from Bow-street. Established 1780.

WALLIS'S PATENT LIQUID WOOD KNOTTING - This newly discovered limit WALLIS'S PATENT LIQUID WOOD KNOTTING. — This newly-discovered Liquid Composition which Messrs. Geo. and Thos. Wallis have the satisfaction of introducing to the trade, possesses the im-portant qualification of effectually stopping Knots in Wood, however bad, and preventing them eating through and dis-figuring the paint above. Many substances have been used and much time spent in endeavouring to find a cure for a bad Knot, but hitherto without success. Messrs. Wallis therefore feel much plea-sure in offering to the public an article so long and anxiously called for. In the application, skill is not required ; a boy can use it as well and effectually as the best workmen : it is put on to the work with a brush like common paint, can be used in all climates and situations, and does not require heat. Sold wholesale and retail, by Messrs. G. and T. Wallis, Varnish, Japan, and Colour Manufacturers, No, 66, Long Acre, Price 28s, per gallon.

G,'s TRACING-PAPER.—It is warranted to take Ink, Oil, or Water colour, and sold by MESSRS. ROBERSON AND CO., SOLE AGENTS, SI, LONG-ACRE, at the following eash pricesp-THIN TRACING-FAPER. 60 by 40, at 141. Os. per Learn, or 18s. ed. per Quire. 40 by 30, at 71. Os. This beautiful and unequalled article is allowed to be the cheapest and most useful Paper hitherto introduced to the public, as will be best proved by a trial.

TO RAILWAY SURVEYORS AND ENGINEERS.

TO RAILWAY SURVEYORS AND ENGINEERS. TRACING PAPER. — SAMPLES for-warded by Post, free. — WATERLOW and SONS, having devoted much attention to the manufacturing of the above article, have succeeded in producing a Paper superior to any yet introduced, combining the great requisits of elearness and a surface, warranted to work well with panell, ink, and colour.

and Lithographers, 66 and 67, London-wall. MONS, BOUTIGNY'S EXPERI-MENTS on the FREEZING of WATER in RED. HOT CRUCIBLES, &.c., will be separated by Dr. Byan. in his Lectures on the CAUSES of EXPLOSIONS in STEAM. BOILERS, daily at half-past Three, and in the Evenings of Mondays, Wednesdays, and Fridays, at Nina, at the ROYAL POLYTECHNIC INSTITUTION. The AT-MOSPHERIC BAILWAY, carrying from Six to Eight and exhibited daily, and in the Brenings. The art of SWIMING and DIVING illustrated by a Youth Eight and exhibited daily, and on the Brenings. The art of SWIMING and DIVING illustrated by a Youth Eight and Fridays at Two o'Clock, and on the Brenings of Tese-days and Thursdays, at half-past Eight. All the other popular Exhibitions and interesting Works as usual.—Ad-mission, One Shilling' Schools, half-price.

HOT WATER APPARATUS. -- The HOT WATER APPARATUS. — The attention of architecta, builders, and ethers, is respectfully requested to BENJAMIN FOWLER'S superior method of heating churches and chapels, halls, stair-case, conservatories, forcing and green-houses, unautifacturies, and warehouses, kilms, rooms for drying timber, de., and eway variety of purpose for which artificial heat is required. Withis the last twenty years some hundreds of buildings have been heated upon this plan, and the parties for whom they wer executed are constantly expressing their satisfaction, also their willingness to vouch for their efficiency. An improve wrought-iron boiler, which requires no brickwork, may be seen in action upon the premises. BENJAMIN FOWLER, 63, Doract-street, Fleet-street.

HOLBORN AND FINSBURY SEWERS, MIDDLESEE.

THE COMMISSIONERS of SEWERS THE COMMISSIONERS of SEWERS for the LIMITS give NOTICE, that their Office, Hatton Garden, is open daily between the hours of Ten and Four, where information can be obtained (gratis) by persens about to Purchase or Rent Houses or Property, or take Land for Building purposes, of the situation and level of the public Sewers, capable of affording sufficient Drainage, and which they recommend all such Persons to apply for at the above Office. By the Court, STABLE and LUSH, Clerks.

COURT OF SEWERS FOR WESTMINSTER, AND PART OF MIDDLESEX, No. 1, Greek-street, Some

<text><text><text><text><text><text><text>

SATURDAY, AUGUST 9, 1845.

HE architectural embellishment of a city is of much greater consequence in forming the character of the people than some hasty thinkers now-a-days recognize. The

constant contemplation of fine forms, or the reverse, has a powerful effect upon the mind; and it should be the duty of governments to aid in obtaining for the multitudes the advantages of the former to the extent of their power.

Plato says, in one of his Dialogues, "The plan we have been laying down for the education of youth was known long ago to the Egyptians, that nothing but beautiful forms and fine music should be permitted to enter into the assemblies of young people."

In England, this has been little thought of; the people have been rigorously excluded from the contemplation of works of art, although the enjoyment of it would have cost the nation nothing; and many of our public buildings, instead of advancing the standard of taste, have tended to lower it. That an anxious desire exists at this moment to remedy the mistake as quickly as possible is certain. And this no one will doubt who has watched the proceedings in Parliament during the present session. Although it is unfortunately too much the eustom of the daily press to omit reporting much of what is said in the House about art and monuments, it is obvious that these subjects have occupied more attention there than usual. In the debate as to whether the tax of ld. per ton on coals should be continued, and the money devoted to the purpose of improving the town, all agreed is the second ty for metropolitan improvement, however much they differed as to the propriety of raising money by that particular tax." The vote of money for the repair of St. Margaret's church, Westminster, led on another occasion to a long conversation on Gothic buildings and taste; and Mr. Hume's annual motion for opening St. Paul's and Westminster Abbey, when brought forward on Monday night last, was received in a very different manner From What used to be the case, and fed to a more satisfactory result.

When the vote for St. Margaret's was proposed, Mr. P. Borthwick objected, on the ground that the money hitherto granted had been expended in the worst possible taste. He though the church ought to be pulled down and rebuilt, rather than to undergo the Georgian-Gothic alterations with which it was proposed to deface the building. He also objected to Westminster Abbey, as not fulfilling the perpose for which it was intended. It was neither a cathedral nor a place of public exhibition, hat rather a gross between both. (Latghter.) The monuments were a disgrace to the age and to the edifice. The Chancellor of the Exchequer said that archi-

tectural amateurs were quite insatiable in their demands for public money to be spent in carrying out their ideas. As to St. Margaret's church, as the House of Commons occupied it in some sort, it was but proper that some part of the public money should be appropriated to its expenses. If the church were pulled down, as wished by Mr. Borthwick, an expense of not less than 50,000% would be incurred. Mr. Osborne wished to know what was the use of the commission having brought in a report that the church ought to be pulled down, if parliament were to be required to vote 1,200% for repairs? He was satisfied if Government came forward boldly, and preposed a vote of 40,000/. for a new church, that it would not be disapproved of. Viscount Sandon said, he should regret to see 40,000/. granted for merely replacing the same aburch. It would be much better to expend the money in pulling down the two towers of Westminster Abbey, which were alike deficient in taste and architectural beauty. Mr. Sheil would ask hon. members if the Abbey was turned to as much account as it ought to be? (Hear, hear.) It was a noble building, and might be made much more available for religious worship. Let the House consider the immense difference between the use made of that church and the churches on the Continent. The congregation was crowded into a small space; but that portion of the edifice might be enlarged by the expenditure of a few hundred pounds, and sufficient accommodation would thus be afforded, in a most economical manner. He never beheld a more beautiful atructure than that now erecting by Mr. Barry. When the building should be completed, and the new street constructed, St. Margaret's church would be a complete eye-sore, although so much public money would have been laid out in improvements. Mr. Prothero was of opinion that St. Margaret's church was a very fair specimen of undecorated Gothic architecture (?) The only pure of the Abbey which was concealed by the church was the ugly portion between the north entrance and Henry the Seventh's chapel; and St. Margaret's church was far more sightly. Mr. Escott felt somewhat alarmed at the tone of the right hon. baronet the Secretary of State for the Home Department, who evidently intended that St. Margaret's church should remain permanently. If they consented to vote hundreds of thousands every year for the new palace at Westminster, and could not afford 20,000%, or 30,0007. for the removal of that church, it would be better to put a stop to the improvements altogether. He considered the church to be a complete disgrace to the neighbourhood. The money for the repairs was, however, ultimately voted.

The terms of Mr. Hume's motion were:-" That in the opinion of this House, the practice of exacting fees from the public, as the condition of their admittance to cathedrals, is highly improper, and ought to be discontinued."-Sir R. Peel said he had always expressed his opinion that there was great public advantage in giving as free and unrestrained admission to those noble edifices as could be, consistently with securing those works of art which they contained. He could not conceive any thing that would exercise a better influence on the public mind than free admissions of the kind. At the same time he thought they should be subjected to one restriction,namely, that precaution should be taken for the security of the monuments and other works of art erected in those edifices. Speaking generally, he believed nothing could be more ex-

emplary than the conduct of the great body of people when thus admitted. He spoke now of the working class, for their conduct had been quite as exemplary as that of persons in a higher condition of life. When a distinguished divine, the late Dean of Westminster, was appointed to another sacred office, he (Sir R. Peel) had an interview with him, and spoke to him on the subject, and he believed it was not only his wish but that of the whole chapter, to give the liberty of free admittance as far as was consistent with the security of the works of art. He was certain the present Bishop of Ely, in pursuance of the promise he had made, had given the fullest consideration to the subject, and that his exertions had been most constantly directed towards the object which the right hon. gentleman had in view. He (Sir R. Peel) had now the satisfaction of stating that, in consequence of a communication he had made 'to the present Dean of Westminster, Df. Wilberforce, when he took the opportunity of stating to him the opinions he had expressed to Dr. Turton, he mentioned how freely the public had been admitted to the exhibition of works of art, and how exemplary their conduct there had been; that there had been no instance of misconduct, and that they all retired with expressions of grateful acknowledgment for the opportunity that had been given them of inspecting those works, and that they felt an interest in them which it was most desirable to encourage; in consequence of that communication, he had, a few days since, received the following letter from the Very Reverend Dean of Westminster :-

"As I know your wishes respecting the admission of strangers, I trouble you with a few lines to say that I have just issued some new directions on that subject. Strangers are henceforth to be admitted into the south transept, the naves, and the north transept, that is, into the great body of the church. The only portion from which they will be excluded is from the choir, except at time of service, for obvious reasons, and the chapel behind the choir. These will be shewn to them at a charge of 6d. apiece, and this will be the only payment allowed in the abbey. Such a payment is universal on the continent. "S. WILBEBFORCE."

The admission then to the body of the abbey would be free, as was the practice in foreign countries; and if the parties visiting wished to see the choir and the chapel, he believed a small fee would be required.

On the occasion of taking the vote for 2,000/. towards the expense of statues of Hampden, Lord Falkland, and Lord Clarendon, the execution of which works is recommended by the Commissioners of Fine Arts to be given to William Galder Marshall, John Bell, and John Henry Foley, whose works in the last exhibition in Westminster Hall were considered by the commissioners to be entitled to special commendation, -- Mr. Williams expressed a hope that when monuments were being built to commemorate the achievements of the former monarchs and rulers of this country, the claims of the Protector Cromwell would not be overlooked. Not one of those rulers had been more distinguished as a soldier and a statesman; and he was as much entitled to a monument to be raised by the people of this country as Napoleon was to one from the people of France. He hoped that Cromwell would not be denied a niche in the palace of Westminster .- Mr. Hutt believed that the protector would not be excluded. He had seen a list in which his claims to a niche were sub-

[•] In the course of the discussion on this measure in the Honse of Lords, the Marquis of Loadondary who has perasycringly exposed it, said, the tax would produce 300,000. For annum. This tax, he said, did not full on the consumer, but on the coal-owner. On the same occasion, the Marquis of Westminster called the attention of the Government to the way in which the communication from Oxford-street to Holborn had been carried ont; the opening had been made awarrow, that he found it would sume greater will than their vange circuitous route,

mitted to the Committee of Taste, who would no doubt duly consider them. What we wish to show by these memoranda is simply, that a desire for the improvement and adorament of the metropolis is manifesting itself extensively. A good spirit has been awakened, and we hope, will not be allowed to sleep again.

What may be achieved in a short time may be strikingly illustrated by reference to the extraordinary works executed in Munich through the genius, liberality, and energy of the present King of Bavaria, Within the last thirty years the aspect of the city has been changed; a crowd of wonderful buildings has been raised, and a new school of artists created. The Glyptotheca, commenced in 1816, and finished in 1830, is 220 feet square. The Pinacothecs, completed six years later, is above 500 feet long; and (not to speak of the Basilica of St. Bonifson, the church of All-Saints, and numerous other monuments), the Walhalla, near Ratisbon, just now finished, has sprung, "like an exhibition," from the rock on which it is reared, to immortalize its projector. Munich has become one of the most extraordinary capitals in Europe, and strangers from all countries annually flock there to admire its beauties, and wonder at the effect which may be produced by one powerful mind. Not satisfied with merely raising fine buildings, Lawis of Bavaria has sought to pationalize the fine arts, and bring them into the houses of his people for their enjoyment. Museums have been arranged to convey clearly a history of the arts, and each of his buildings is intended to illustrate some particular epoch. The means of education in art are afforded to all, and every endeavour is being made to develop to the utmost the national resources in this respect. The success with which the king's endeavours have been crowned is to be attributed greatly to the position which he has given to artists in his dominion, and the elevation of character, which it has caused, He has conferred prerogatives on genius; he has admitted that the man who is capable of affording instruction or wholesome delight to a nation, who expresses noble thoughts whether with the pen, the pencil, or the chisel, is fit society for the highest, and deserves all the rewards a country can bestow. This artist-king has shewn there is another road to the Temple of Fame besides that over dying bodies in the field of battle, and has earned for himself a niche in it next to those occupied by Pericles and Augustus.

THE BUILDER.

ASSERTED ABUSES IN THE WESTMIN-STEB SEWERS' COMMISSION.

MR. JOHN LESLIE, one of the Commis-sioners of Sewers for Westminster, has just now published a pamphlet in the shape of a letter to the representative vestries under Sir John Hobhouse's vestry Act, charging the commission of which he is a member with extravagant expenditure and misconduct. When it is remembered that the taxation of nearly three millions of property rests in the hands of the Westminster commissioners,* and further that public health is involved, the question is seen to be one of considerable importance.

The writer sets out with the assertion that "The active members comprehend a very considerable number of surveyors, district surveyors, and others engaged in building operations; and very frequently the painful exhi-bition is witnessed, of parties directly interested in the expenditure voting as commissioners on the questions."

Heremarks that the contracts for the works in Westminster have been in the hands of two families since the year 1810, namely, the Messrs. Bird and the Messrs. Bennett (both highly respectable parties be it observed), and asserts that others had offered, in reply to public advertisements, to do the work at considerably lower prices, but had not been permitted to do so.

The sewers of the Holborn and Fins-bury divisions the writer considers are under superior and more economical manage-

"About thirty years ago, a double rate was The present Mr. Sergeant Wilde and Mr. John Wilks of Finsbury headed the opposition to the then irresponsible commissioners, and certain clauses were framed in an Act of Parliament applicable to the Holborn and Finsbury commissioners, and of vast importance to the inhabitants. Similar clauses would save the rate-payers under the Westminster com-

missions thousands of pounds per annum. The Act is the 54 Geo. 3, c. 219, passed the 25th July, 1814; and the advantageous clauses for the rate-payers to which I allude are as follows:-

The 18th section provides, that every commissioner interested either as principal, trustee, steward, agent, attorney, or solicitor, shall withdraw from the court, under a penalty not

exceeding 100%. The 23rd section requires that before the commissioners come to any determination as to the making any new sewer, the clerk must give twenty-one days' notice to the vestryclerk of each parish, stating the place where it is intended to commence, pass, and terminate, and the time and place for holding the court, so that any party objecting may have the op-portunity either personally or by his solicitor or counsel of doing so.

Section 24 provides that all work amounting to more than 50*l*., including all materials used therein, shall be done by contract.

Section 26 requires fourteen days' notice of the meeting to make such contracts, to be twice inserted in three or more of the public newspapers, expressing the nature, objects, and

conditions of such contracts. Section 30 provides that the parochial au-thorities may peruse, make all extracts without fee or reward, from all books, papers, writings in the custody of the commissioners, or any person or persons holding office under them.

Section 31 requires the commissioners to make an annual account, to print the same, and send a copy, gratis, to every vestry-clerk; and every rate-payer to have a copy on pay-

ment of one shilling. Mr. Leslie then goes on to shew the fruits of these checks on public expenditure.

12,185 feet First-class sewers . Second-class sewers 12 1 1 1 1 Fotal - 27,716: 1.01-3

ามเวลีย์สี หมุ่ม Including the following, a run

31 Side entrances, and the generation of the second states of the second

181 Gullies. The private drains. Repaying all the displaced carriage and footways.

And the total cost to the ratepayers was 21,224L 6s, 9d.; now, dividing this sum by the 27,716 feet of sewer, including all artras, about

15s. 3id. per foot. Some of these works were of great importance. In the first class.

2,750 feet were 24 feet deep.

3,440 feet were 18 feet de 3,465 feet were tunnelled 26 feet deep.

This tunnelled work, including 5 side en-trances, 12 junctions with other sewers, and 20 gullies, cost the rate-payers of the Holborn and Finsbury divisions of the metrapelis, in-cluding every extra, 16s. 74d. per foot. I have a subsequent return, bringing down the works in the Holborn and Finsbury divi-ions to Midsummer 1845, which choice that

sions to Midsummer, 1845, which shews that additional lengths of second sized sewers were put in to the extent of 4,915 feet, including.

90 Private drains, 1 and 1 and 12 at

8 Side entrances, and _____

27 Guillies, 29 Junctions with other sewers

Repaying carriage and footways.

cost 3,681*l*. 3s. 5d., which divided by 4,915 feet of sewer gives 14s. 11d. per foot, including all the extras.

In the year ending Midsummer, 1845, there are two works of unusual expense. One is the main outlet of the drainage of 4,400 acres of surface, and which has been effected thus: at a depth of 23 feet 9 inches by a circle sewer 10 feet 3 inches in diameter in the clear, one and a half brick thick in blue has mortar, the inner invert in malm paviors in cement blocks, 570 feet in length, and 30 feet similarly done, 8 feet in diameter. The expense of this to the rate-payers of the Holborn and Finsbury divi-sions was 1,667*l*., or about 2*l*. 15s. 6d. per foot.

The other is a work of very great magni-tude, being 4,350 of the first-class sewer, 27 feet deep, passing under the Regent's Canal, the traffic on which was not allowed to be the traffic on which was not allowed to be stopped: there are 5 side entrances, 17 junc-tions to other sewers, 4,270 feet of private drains, 1,344 feet of gully drains, and the cost is 6,250!, about 28s. 9d. per foot. There will be a few extras of timber to be added, as the work is not finally closed. I have now, my Lowes and and the set

I have now, my Lords and gentlemen, placed before you the details of an expenditure in the Holborn and Finsbury sewers of upwards of 33,000/., under the very able management of that commission, and the economical checks which the rate-payers bave effected in the Act of Parliament, to which I have called your attention ; and now for the reverse of the picture, where no control has been obtained by the rate payers in Westminster.

In the Westminster commission in 1844, the abstract of sewers and drains built, and of bills for works done in the same year, shew the following lengths of sewer built :-

feet wide 152 feet 3 inches in length. 2 feet 6 inches wide . 1,792 feet 1 inches in length. 3 feet wide . 1,792 feet 2 inches in length. 4 feet 6 inches wide . 730 feet 5 inches in length.

Total . 5,359 11

The cost of which, as stated, was 7,718/. 10s. 8ad., equal to within a more fraction of a farthing of 29s, per foot; but there are no man-holes, or side-entrances, or repaying the carriage ways, and other items, in this large sum, equal at the most moderate calcalation to 3s. per foot lineal in addition, making the total expense more than double the rate of expenditure per foot lineal in the Holborn and Finsbury commission.

Now, my Lords and Gentlemen, I will cite a few cases in your respective parishes. In George-court, St. James's, Piccadilly, 171 feet of second-size sewer, 13 feet 9 inches deep,

^{1.} THE CORPORATION OF THE CITY OF LONpon---- The annual accounts of the Chamberhin of the city of London have been presented to Parliament, and ordered to be printed for the information of the public. It appears that the intotal amount of monies received by the chamberlain of the city between the 6th of January, 1844, and the 25th of January, 1845 (being the produce and application of the several duties and payments constituting the fund called the "London-bridge Approaches Improvement Fund," for effecting public works and improvements in the metropolis), was 104,073., and the total concurrent payments, 36,2791.; leaving a surplus balance of 67,7931. Of the sums received, 88,8171. were derived from the duty of 8d. per ton on coals brought into the Port of London for one year, pursuant to the Acts of the 10th of George IV. and the 1st and 2nd of William IV.; 3,824*l*. from the duty on wine; 11,500% from the annual charge on the revenue of the corporation; 219/. from the duties on admission to the freedom of the eity; 821. from the duties on the binding of apprentices; 190% from the profits of aqueducts; and 68% from a moiety of the profits of Far-ringdon-market for the year 1842.

cast 5194. 12s. 51d., equal to 31. 0s. 91d. per foot lineal, the whole court contributing 50s. every rate made on the division. In the greater portion of this property, the family of a deceased architect commissioner are interested; the late chairman at the time was surveyor ested; the take charman at the time was surveyor to the property: this fact I ascertained from an inquiry into the whole circumstances of this transaction, and from a comparison with the surveyor's original report, and the alterations and erasures I discovered had been made in it, compared with the entered copy on the records of the court. For this second-size sewer down a small paved court in your parish, the rate-payers of Westminster paid 5s. 3id. per foot more than the rate-pavers of the Holborn and Finsbury divisions have to pay for the 10 feet 3 inches circle-sewer, forming the main outlet of the drainage of 4,400 acres of surface.

My Lords and Gentlemen, in the represen-tative vestry of St. George, Hanover-square, a second-class sewer has been put in in your

a second-class sewer has been put in in your parish in Albemarle-street; it was, according to the accounts, 687 feet 2 inches long, 17 feet 4 inches deep, and the cost 1;2607. 4s. 41d., about 17. 16s. 8d. per foot. The Holborn and Finsbury commissioners put in 1,840 feet of their second-sized sewer in Collier-street, Pentonville, 17 feet deep, will two side entrances for 1,0237. 18s. 3d., or 13s. 10d. per foot lineal, the excess of expense being in St. George's under the Westminster irresponsible commission of sewers, 165 per cent. per foot lineal. cent. per foot lineal. In St. Martin's-in-the-Fields, in Castle-street

and Hemming's-row, the Westminster commission put in of their second-sized sewer 728 feet 5 inches, 14 feet 8 inches deep, the cost of which, as stated by the surveyors, was 1,1051. 16s. 5d., or 11. 10s. 44d. per foot lineal. 1,1057. 105. 5d., or 17. 105. 44d. per foot lineal. The Holborn and Finsbury commissioners put in in Parkfield-street, Islington, Battle-bridge, and Holloway-road, 870 feet of their second-size sewer, 15 feet deep, for, including two side entrances, 5967. 15s., or 12s. 2d. per foot lineal; the unfortunate rate-payers in St. Martin's in the Fields having to pay an excess

of 150 per cent, per foot. My Lords and Gentlemen, another case in St. Paul's Covent-garden, is worthy of your notice.

An estimate having been presented of the expense of making a new sewer along Wel-lington-street, Wellington-street North, and expense of manager, relington-street North, and lington-street, Wellington-street North, and Bow-street, 985 feet long first class, at a cost of 1,4004, 9s., it, was ultimately carried to do the work in July 1844, by the votes of the commissioners.

commissioners. Now, my Lords and Gentlemen, I bring this matter before you, because of the result. In-stead of .985 feet-of sewer being built, only 959 2 wars, executed, but the expense to the rate payers was 2.0121. 3s. 5d., exceeding the yole of the court above 40 per cent.; this sewer was at the depth of 24 feet, and the cost war was 2 1 a 1144. Let me submit a per foot was 21, 1s. 114d. Let me submit a work of the same depth of the first class in the Holborn and Finsbury commission, done in the New-road, St. Pancras, 2,750 feet of the first class; 600 of the second class, 3 side entrances, 8 junctions, 22 gullies, depth 24 feet, total 3,292%, equal to 193. 72d.; the excess in the Westminster division at the same depth

being 1/3 per cent. per foot lineal. Recently, in the Westminster Court of Sewers, the old form of sewer has been altered. The successful example of the Holborn and Finsbury divisions for efficiency and economy was lost sight of, The principle of the Hol-born divisions as to form of sewer is the egg-shape with the narrow end downwards, whereby the smallest quantity of water passing is operative in deansing that sewer: the shape requires a very small quantity of digging, and, when placed in the earth, forms a wedge not easily distorted by either lateral or vertical pressure.

Instead of adopting this simple, economical and efficient form, the Westminster Court of Sewers, after floundering about with various pluns, subpted one which turned the reverse end of the egg downwards, put a couple of wings to the sides, which in building requires, in every foot in length, that sixteen bricks shall

In every foot in length, that sixteen bricks shall be cut to particular shapes, to form the figure. The first work under this now form, and under a now contractor, Mr. Jay of London Wall (for the wedge is so far got in as to break up the forty years' monopoly), was done this present year, in the parish of St. Maryle-

bone, in Berners Street, and cost, as finally stated by the surveyors and the committee of accounts, for 1,125 feet 2 inches of second-size sewer, 16 feet 4 inches deep, 1,288/. 0s. 5d., about 14. 2s. 101d. per foot.

In the Holborn and Finsbury divisions, at Battle Bridge and the Holloway Road, I find 2,500 feet, viz. 300 feet of first, 2,200 feet of second class sowers, were put in 16 feet deep, including two side entrances, for 1,2461. 12s. 6d. equal to 9s. 11 d. per foot lineal, the excess in the Westminster commission against the ratepayers of Marylebone being above 152 per cent. per foot lineal. I will cite another comparison in a place of

equal importance to Berners-street, viz. Bedford-square, where the Holborn commission tord-square, where the Holborn commission put in 1,380 feet of second-size sewer, 16 feet 6 inches deep, with two side entrances, and every expense, for 8021, 19s. 2d.; rather less than 11s. 73d. per foot; the excess against the rate-payers under the Westminster comalthough the Holborn sewer was mission, deeper, and the two side entrances, not in the Berners-street sewer, nearly 97 per cent."

We are not to be understood as pledging ourselves to Mr. Leslie's charges, or admitting any want of confidence in the commissioners e insert them simply with a view to inquiry, and reserve to ourselves the right of investigating them hereafter. Since writing the above, we have received

the following communication from one who is well acquainted with the subject.

The conduct and proceedings of the West-minster Court of Sewers for some considerable time past have afforded fruitful subjects for grave and serious charges; those charges appear to amount to the following :--That the public money under this commission has been both uselessly, wantonly, and extravagantly squandered away; that it has ex-pended scores of thousands of pounds ob-tained by sewers rates, in the diversion and re-pair of old, and in the construction of new ewers, which, after all, are now found to have been formed and pat in upon improper, un-scientific, and entirely erroneous principles; that had recognized scientific principles been adopted in the construction of these sewers, the cost would not have been anything like what has been paid for them, and, therefore, con-siderable lengths of good and efficient sewers could have been carried up at the same time and with the surplus money, in very many filthy places where none now exist; and also of the old ones could have been repaired and highly improved ; that instead of affording facilities for carrying off the sewerage, the majority of these sewers are nothing better than elongated reservoirs, being more or less filled up with accumulations of decomposing filth, which choke up the house drains instead of accelerating the discharge of the refuse from them; that these sewers are, in consequence, ill-adapted and inefficient for affording good and proper facilities for rapidly carrying away to the Thames the refuse vegetable or animal matters which are discharged into them from the various dwelling houses and premises along which they pass. It would appear, therefore, that the enormous sums of money which have been expended in the erection of these abominable constructions have been almost entirely wasted; and that the whole, or nearly the whole of them, require to be recon-structed and re-arranged. Now, if the above charges be true, and we see no reason at present to doubt them; the sconer some legis-lative ensetment is unal the other to relieve lative enactment is made in order to relieve the present irresponsible and inefficient authority, and also the sooner the arrangement and construction of these sewers are based upon proper scientific principles and placed under some scientific and and placed under some scientific and properly qualified board, the better. Public economy, and above all, public health, cries loudly and earnestly for some extensive and heneficial character this important matter.

NEW CHURCH AT BYER'S GREEN, NEAR NEW CHURCH AT BYER'S GREEN, MEAR DURHAM.—A new district has lately been separated from the parish of Bishop Auck-land, including the villages of Byer's green and Kewfield, and a church, in the early English style, has been erected at the expense of the Bishop of Durham. The ceremony of consecration was performed by the bishop last week last week.

THE ARCHITECTURE OF GENOL' ILLUSTBATED'IN THE WORK OF GAUTHIER.

THE architecture of Italy, viewed in connection with political history, would afford a large field for inquity, into the causes of that, brilliant state in which the arts existed in every city of the country. Torn by civil strife, and its governments subverted by democratic insurrections, the penhaula yet con-tains an immense number of works of art, of which the most elaborate publications can give very partial illustration. Alike in the brightest days of a republic, in the most tyrannical government of a despote ruler, in the subversion of a so-called republican government, and the sway of a demagogue, whose power was more absolute and pernicious than the oligarchy he succeeded, in every variety of position, smid turmoil and contention, which the rest of Europe has not known, art continued to advance, as it were in spite of these antagonistic circumstances, in spite of these antagonistic circumstances, and to attain a position of splendour, which more consolidated government, and longer continuance of peace in other countries failed to acquire. We are not able, in this place, to do more than suggest a small amount of the matter of such an inquiry, but the work of Simonde de Sismondi, will give many im-portant materials in the historical part, and the architectural obaracteristics of the states cannot be better illustrated than in the works before us. The work of Cicognara on Venice has been previously noticed (vide ente, p. has been previously noticed (vide ante, p. 326), and it will be interesting to compare that city with its rival republic, Genca, the architecture of which is admirably illus-trated by Gauthier. This author remarks, that in Italy there is no town, no village, which does not possess models of architecture, yet all differing from each other in tasta and, manner of execution. Venice, Genoa, Flo, rence, and Rome, have each edifices of sin-gular beauty, yet having certain peculiarities: Circumstances of locality and convenience often suggested the most striking effects, and often suggested the most striking effects, and, in that day, even the irregularities of the ground could be turned to the advantage of the art. This observation is particularly applicable to the city of Genos, whose positions seems to bave called forth those fiber 904 ceptions, which strike every one who ap-proaches it. Situated on the shores of the Mediterranean, it forms is semicircle rising with the slope of the mountains, which sur round it, and has a magnificent appearahoed The palaces are an unerguing that one might The palaces are so numerous, that one might believe, that Genos had only princes for inha-bitants, and it was this that made Madame de Stall exclaim, when she visited the place, that the grand street seemed to have been built for a congress of kings. The vestibules, the courts, the porticos, and especially the staircases, are hardly to be equalled. The terraces and gardens are laid out with remarkable skill, and no better materials, than are ia this city, could be found for the study of the art of landscape gardening, and of other accessories, which the architects of Italy were well conversant with, but which those of our own country are accustomed to neglect. The arrangement of the steps at the entrance door, the grottos and fountains, are some of the points which attention may be profitably directed to: "It is evident; that effects the most remarkable are often obtained by means the most ingenious, yet the most simple. ... Each town of Italy has its particular description of architectural beauty, and Genes is most re-markable for the disposition of its plans. Consequently the icnographic form of illostration occupies a considerable part of the work, which will rendor it especially valuable to architects. It has also sections, and perspective views admirably drawn and engraved in outline. The views show the vestibule from which the staircase ascends to the loggis, on the first floor of the open court, various other portions of the building, and the ex-ternal appearance of the house and gardens. The first part of the work contains general views of the city, and plans, elevations, sec-tions, and views of the palace, with the walls, and the second part is devoted to the villas and palaces of the environs.

* "Les plus beaux édifices de la ville de Génes, et de ses environs ; recueil publié par M. P. Gauthier, Architecte du Gouvernement.—Paris, 1830-32," in two parts. † "Histoire des Républiques Italiennes du Moyen Age, par J. C. L. Simonde de Sismondi.—Paris, 1826."

The elevated position, which the artist held in Italy, was no where more apparent than in Genoa. By a special decree it was made known, that the pursuit of art did not exclude the professor from the rank and privileges of nobility, and no art had greater opportunities for display than that of architecture. Within the short period of a century arose churches and palaces, not inferior to any in Italy; in which the skill of the best artists of the time was exerted, and in which the most expensive materials were lavishly employed. The difficulties of the site were the origin of the most happy ideas. The declivity of the ground rendered an ascent from the vestibule necessary in most of the palaces; and this is often the most effective part of the building. The same circumstance was availed of in the construction of grottos and fountains, and of terraces at different heights, communicating with each other and the respective floors of the building. The perfect adaptation of the dwel-lings to the climate, shewn in the courts open to the sky, and in the staircases and loggias, in which we protection from the weather was which no protection from the weather was necessary, the admirable use made of running water, the treatment of breaks and coins, often varied in the different stories, and above all, the arrangement of entrances and approaches, are evidences of the skill and artistic feeling of the evidences of the skill and artistic feeling of the Genoese architects. Many of their names have not been preserved, but those of Galeasso Alessi, Bartolomeo Bianco, and Andrea Tag-liafico, were the most famous. It is worthy of notice, that in Genoa, as in greater degree at Venice, windows often bear a great proportion to the front, and in some cases they are placed so near to the angle as to leave what in the so near to the angle, as to leave what, in the absence of coins, might appear to be a very small pier for support. This extent of opening was probably for the same object, as we ob-served might have influenced the like pecu-liarity in the other city, for with so beautiful a prospect, as the Genoese palaces possessed, it is likely that its advantages were considered, and in the Church of the Assumption we find, that a balustraded way was carried along the ridge of each roof, with the purpose of obtaining

376

several points of view. The palace of the University consists of a vestibule next the street, a court open to the sky, arcaded in two stages, a staircase at the end furthest from the street, and rooms on each side the court and next the street. The ascent from the vestibule to the first arcade, is by a magnificent staircase. The balustrade commagnificent staircase. The balustrade com-mences nine or ten steps from the first ascent, and the space is here occupied by lions, which seem ready to spring upon the passer. The view from this point is equal to any thing in The the city; in front is the staircase ascending to the court, which is in two stages, with coupled columns and arches, and at the extremity is seen the open staircase to the upper floors. Single columns corresponding with the rest, are continued round the vestibule on the level of the court, the intercolumns being balus-traded. The ceiling of the vestibule is plain, as in most of the other buildings : it is arched as in most of the other buildings: it is arcnea over, the smaller arches groining into the larger. The numerous apertures in the cor-nices for the escape of the water, have a singular effect, and in many other buildings it is not pleasing. The façade has a low base-ment, in which are square windows and coins in excellent taste; above this are three heights of windows, the lower range being of singular design, and the two upper having singular design, and the two upper having alternately curved and pointed pediments. The front is divided into three parts, the centre compartment being set back about six inches by coins, which are varied in the different stories, and the whole is crowned by a bold cornice. The building was erected in 1642, and the architect was Bartolomeo Bianco. 1042, and the architect was Bartolomeo Bianco. The Ducal palace was originally built by Andrea Vannone, but having been in great part burnt, the façade was rebuilt in 1778 by Simone Cantone. At the same time were pro-duced the magnificent hall on the first floor, and the upper story of the building. The plan is of great extent, and has many points well worthy of notice. well worthy of notice, as in the arrangement of the columns, and the ascent to the door within the entrance court. The columns are placed four together, engaged in projecting piers, supporting the entablature, and similar ar-rangement of the order above. The ascent to the entrance might often be adopted with great convenience, and addition to the beauty, of

buildings in England; the steps in front afford a ready access to pedestrians, and by the inclined roads, carriages can reach the same level—the whole, though simple in itself, being highly conducive to the effect of the edifice In no particular can an imposing effect be aided by such small means, as in the arrangement of entrance-steps, and even of the flagging in front of a building; yet, to no other resources are we so wilfully blind. Such of our edifices as have a massive basement, or a fine ascent of steps, are so railled round, that the most important part of the structure is almost hid from view, whilst the National Gallery has for its basement a blank wall. Galeasso Alessi, also, would not have placed his ascent in the cor ners of the square, where for any purpose of effect they are useless, but by arranging staireffect they are useless, but by arranging stair-cases in the centre, would have made the build-ing tower above the spectator. To such an architect, the declivity of the ground would have been an advantage; but we have really "thrown away the most magnificent site in Europe." The palace above mentioned is richly decorated, and may be referred to, as affording valuable hints in fire-proof construc-tion. The Durazzo (Philippo) palace was built by Bianco, but enlarged by Tagliafico, who added the staircase, which is of great beauty. The court is square in plan, and the staircase is placed by the side of it. The ele-vation is of good proportions, though plain. The Durazzo (Marcello) palace is one of the few, in which there was no ascent from the vesfew, in which there was no ascent from the ves tibule; consequently, the court can be entered by carriages. It has two staircases of white marble, one on each side the corridor; they marble, one on each side the corridor; they were added to the building by Carlo Fontana. The architects of the original building were Pietro Francesco Cantone, and Giovann' An-giole Falcone. The Balbi palace, by Bartolo-meo Bianco, is one of the smallest in Genoa; but a striking instance of the ability to produce a fine work with small means. The plan is well errored though of an irregular plan is well arranged, though of an irregular shape, and the staircase admirably contrived: there is a descent, as well as ascent, from the vestibule. The façade is well designed. The Balbi (Piovera) palace is remarkable for its fine colonnades, and the beautiful grotto. This palace is a good example of the usual arrangement, where there was a garden. It is im mediately beyond the court. The staircase is ascended from the right hand side of the court. There being no ascent from the vestibule, the grotto in the garden could at every time be seen from the street-door. Bianco was the architect. The Mari palace is also small in size, but the plan and arrangement worthy of care-ful examination. The portions of the ground-floor, and entresol, on each side the entrance, project in front of the main building, having balustrade and terrace on the top; the vesti-bule, which also projects, is lower than these, o that there is more place of list and abad. In the upper story of the front, the interfenes-tral spaces are hardly the width of the open-ing, but the effect of the front is still pleasing. Above the windows are bas-reliefs, as at pre-sent in the Oxford and Cambridge Club-house, Pall-mall. The apertures for the rain-water in the parapet are here very unsightly.

THE - BUILDER.

The Tursi-Doria palace, built in 1551 by Rocco Luzago, is much to be admired for the general disposition of its plan, for its elegant outline, and the character of solidity observable in it. The gardens are arranged on each side, and the balustrades and loggias, which separate them from the street, are good features in the elevation. The Hall of the Bankers was commenced in 1570 and completed in 1596, and is a building of great beauty, and of singular construction. It is a hall, oblong in plan, inclosed on two sides by columns, coupled and supporting arches, and on the opposite sides respectively by a blank wall, and by door and windows. The coins at the angles, and the trophies on the front are very effective. The roof displays great boldness of construction—the small amount of the support being considered; it is framed without a tiebeam, to get height.* The Cambiaso palace has a front, rusticated horizontally the whole height, but the windows of the different floors are so united to each other, that the perpendicular line predominates. The Church of the Assumption is a magnificent edifice; it is square in plan, the dome occupying the centre, there-

* This roof is given in the supplement to the last edition of "Tregold's Carpentry," Edited by Barlow,

fore the nave and transept in plan are in the form of a Greek cross. There are two towars besides the main dome, and four small cupe it was intended to erect two other towers. The large dome is of great beauty. Abesi was the architect of the bailding which was commenced in 1552. The public granaries are welladapted to the object; they consist of four building united by a common vestibule. They are valled up to the top; and it is observable, that shert walls are built to keep the grain free from the humidity of the larger wall. The date is the number of the larger wall. The calls is 1625. The poor-house is said to be the largest in Italy; it is well planned, and the imposing effect of its façade hardly to be surpassed. The church occupies the centre of the building. It was built in 1654. It is well approached through a series client by a well and a set and and and and and a set of the building. an avenue of trees, lined by a wall and pedes-tals. The ascent to the entrance is here a feature worthy of notice. The Hall of St. Georges is only inferior in size to that of the Georges is only inferior in size to that or the Bankers, and is devoted to similar objects. The roof and ceiling are remarkable, but have hardly sufficient explanation in the work. In the Hospital for Incurable Patients we again see, that the art of architecture was not confined to private residences, but was equally exercised in charitable institutions. This building was commenced in 1420 by Andrea Oraslino; it has a fine vestibule and staircase, and a court surrounded by portices of white marble. In-stead of opening the windows for ventilation, apertures were left in the wall, and other openings made in the ceiling; the current from the lower story was carried up in the thickness of the wall. In the small Brignole palace, by Alessi, there is a staircase which deserves very attentive examination, and the facads is designed with skill. The Raggio palace has an excellent plan, and an entrance of great beauty. designed with SKIII. a ne reaggio parts are excellent plan, and an entrance of great beauty. The Caréga palace, by Alexsi, contains some ceil-ings splendidly decorated by Taddeo Carlone. The Serra palace is equally remarkable for the beauty of its decorations, which were exe-cuted by Carlone, and by a French artist named Callet. Andrea Tagliafico was the architect. The Lercari palace has a base-ment admirably designed, and adorned with rustice, and a loggis on the first floor. The architect was Alessi. The vault of the stair-case is beautifully decorated with arabesques. The Sauli palace is one of the most imag-nificent of Italy. In plan it consists of a court in front of the muin building; one order in height, and the building itself. The ele-vation towards the street has rusticated in height, and the building itself. A be ex-vation towards the street has rusticated doors and windows, and has in all respects greater originality of 'treatment than any before acticed; it is connected' by the co-lonnades of the court with the main building, which has a magnificent loggia on the first floor. The garden front is a fine fivede with coupled columns in two orders, and has beautiful friezes. Alessi was the architect. The Negroni palace is most remarkable for its beautiful grotto, which is of large size. The Church della S. S. Nunziata, by the architects Domenico Scorticone and Giacomo Porta, has a noble interior most richly decorated. It consists of nave, sisles, and side chapels, and the plan is oblong in form. The ceiling is semicircular, springing from an entablature-below which are arches springing from columns of the Corinthian order. The two Spinola palaces are remarkable for their decorations, one of them has paintings of portions in perspective, and contains a statue of Columbus. The gate of the old Mole, of which Alessi was the architect, has a good plan, and a fine fortress-like character in the front towards the sea. The Grimaldi palace has a façade, much resembling one of Venetian

has a lackde, inter resembling one of vescuan production; the different floors communicate with the adjoining terraces of the gardes. If the talents of the architects of Genon are evinced in the buildings of the city, they are probably shewn in a greater degree in those of the environs. The plans being less restricted by site, are arranged in the most admirable manner, and the gardens are so laid out, as to give within a small space much variety and picturesque effect. The Pallavieini palace, which was built in 1537 by Alessi, is one of the most celebrated; it has a good plan, and there is a beautiful grotto. The yilla Pallavicina hastwo orders of pilasters enriched with ornament, a style of decoration more suited to interiors. The villa Spinola,

are arranged in sinuous forms, which was not usual. There are many other villas, which we have not had space to notice, but which are well filustrated in sections and perspective views. But smongst the most magnificent, we should not omit to mention the imperial villa, in which the fountains and gardens are arranged in the best manner. Alessi was the architect. The palace of the Prince Doris, slao, was of wast extent, and though its exterior was comparatively plain, internally it was embellished in the most lavish degree. The foustains, the long vineries in which the trellis was supported by elegant fluted columns; its great extent, and the splendour of its decorations, must have rendered it a fit abode for the most influential family of the Republic. The volume before us is wound up with illustrations of the theatre built at Genoa, between the years 1826 and 1828, and betrays a immetable failing off from that high and palmy state, which earned for the maritime city the distinctive title of Genoa. "the Superb." E. H.

LORD LINCOLN'S BILL

FOR THE IMPROVEMENT OF DRAINAGE AND SUPPLY OF WATER.

Ws closed our notice of this bill last week (p. 363) at clause 191, which directs commissioners to obtain reports on the supply of water. The following are the words of the clause :---

"And whereas it is of essential importance that all the inhahitants of every town and dis-triet made subject to this Act should be supplied with good and wholesome water for do-mestic purposes, to the utmost extent that the local and other circumstances of such town or district will permit, and especially that the poorer inhabitants thereof should be so supplied with water; and whereas supplies of water are also required for the efficient and wholesome cleansing of the streets, and main and other sewers and drains which may be constructed or maintained under the provisions of this Act; be it enacted, That when any town or district shall be made subject to this Act, it shall be the duty of the inspector to make diligent inquiries, and report upon the sufficiency or insufficiency of the then existing ropplies of water, and, if necessary, he shall state his opinion as to the best mode or plan which can be adopted for increasing the supplies of water for the purposes aforesaid; and he shall in every such case state in such re-port how far any existing companies are able and willing to extend their supplies of water, or upon what terms they are willing to con-tract with the commissioners for supplies of water, and also the ability of such companies to supply such water; and, if necessary, he shall also state in such report what streams of water, or other water in the vicinity of such town or district, can be made available for supplying water by the construction of proper works, or by improving and enlarging the works of existing water companies, or any other water-works; and the inspector, after having drawn up such report, shall send a copy thereof to the commissioners, and also to the proprietors of any such existing water-works aforesaid as he shall see fit.'

The cammissioners may make contracts with existing water companies, purchase their works, or construct works themselves for the supply of water. But "whereas it is expedient that existing water companies and other persons affording a sufficient supply of water to the inhabitants of any town or

district should be protected in the enjoyment of the profit and advantages which may accrue to them by the sale of such water; be it enacted, that it shall not be lawful for the commissioners to lay down any pipes for the purpose of distributing water in any street within any town or district in which street or place any such water company or other person shall have previously to the day when this Act came into operation within such town or district, or within Six calendar months afterwards, laid down a main or pipe throughout such street in such manner as to enable all the inhabitants of such street to obtain a good supply of water, and so long as such water sompany or other person shall continue in manner aforesaid to supply the inhabitants of say street with water, it shall not be lawful for the commissioners to distribute water in such street or place."

Inasmuch as the houses of the poor are in many cases not supplied with water, on account of the inability of the owners and occupiers to lay down the communication-pipes, &c. " It shall be lawful for the said commissioners, " it shall be lawful for the said commissioners, and they are hereby required, upon the re-quest of the owner of any dwelling-house of an annual value not exceeding *Tew Pounds*, or upon the request of the occupier, with the consent in writing of the owner of any such house, to lay down communication-pipes, together with a cistern and other apparatus required for the supply of such house with required for the supply of such house with water for domestic purposes, and to keep the same in repair, and to charge for the same such reasonable annual rent or remuneration in money as shall be agreed upon, or, in case of any disagreement, as shall be settled by the said inspector; and such rent or remuneration shall thereafter be recoverable from the owner of such house at the same times and in the same manner as any water-rate due from such owner in respect of such premises may be recovered under the provisions of this Act; and such pipes and other apparatus shall not be subject to any distress for rent, nor to be taken in execution on any judgment of a court of law, or under any fiat in bankruptcy, any law or practice to the contrary notwithstand-ing."

Public baths, washhouses, &c. are to be supplied gratuitously:—" And be it enacted, that all existing public cisterns, pumps, conduits and other water-works used for the gratuitous supply of water to the inhabitants of any town or district, shall be continued, maintained and supplied with water by the said commissioners, and shall be vested in them and be under their management and control; and it shall be lawful for the said commissioners to erect and place any number of new cisterns, pumps, conduits or other water-works for the supply of water to the inhabitants of any street, court or alley, or of any number of houses as they shall see fit, or to erect the same in any public situation, for the gratuitous use of any persons who may choose to carry the same away for their own private use, but not for sale, and to supply with water any public baths or washhouses that may be established for the use of the poorer classes."

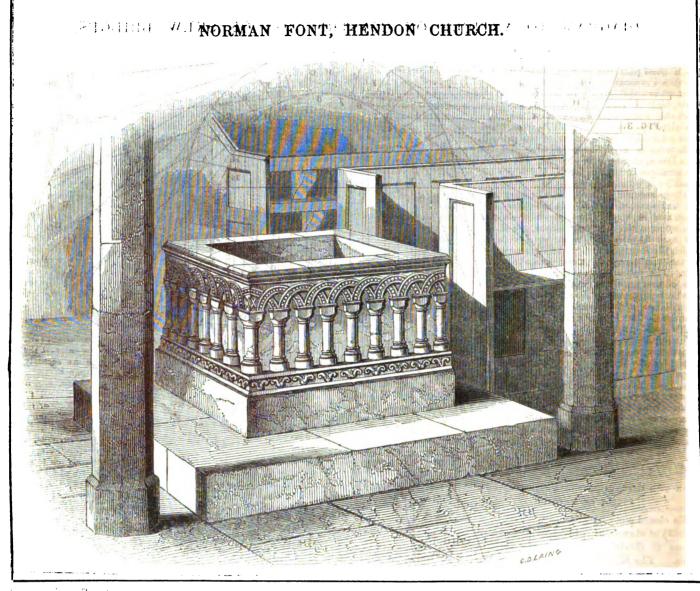

Commissioners are to provide engines for extinguishing fire, buckets, and fire-escapes. Proper fire-plugs are to be fixed into the main : and "all the main pipes to be laid down by the said commissioners, or used under and by virtue of the provisions of this Act, for supplying any town or district with water, or any part thereof, and all main pipes used for such purpose belonging to any water company or other person, shall at all times be kept charged to the full with water under pressure."

to the full with water under pressure." A penalty of five pounds is laid on—"1. Every person who shall bathe in any reservoir, aqueduct, or other water-works belonging to the said commissioners, or their lessees or contractors, or shall wash or cause to enter therein any dog or other animal. 2. Every person who shall throw, put or cast any gravel, stone, rubbish, dirt, filth, or other noisome or offensive matter or thing into any such reservoir, aqueduct, or other waterworks as aforesaid, or who shall wash or cleanse therein any cloth, wool, leather, or skin of any animal or other thing. 3. Every person who shall cause or permit the water of any sink, sewer or drain, or any other offensive liquid, matter or thing belonging to him, to run, drain or be conveyed into any of the springs, rivulets, reservoirs, aqueducts, pipes, or

other-water-works belonging to the said commissioners, or who shall commit or cause any other act whereby the water of the said commissioners shall be fouled or corrupted. And be it enacted, that if any person making or supplying any gas within any town or district shall at any time cause or suffer to be conveyed or to flow into any stream, reservoir, aqueduct, pond or place for water within such town or district, or belonging to the said commissioners, or into any drain, sewer, or ditch communicating therewith, any gas or any washing substance or thing which shall be produced in making or supplying gas, or shall do any act to the water contained in any such stream, reservoir, aqueduct, pond or place for water, whereby the water therein shall be fouled or corrupted, then such person shall forfeit and pay for every such offence any such acceeding *fifty rounds.*"

shall forfeit and pay for every such offence any sum not exceeding *fifty pounds.*" Then as to obtaining money to carry the several purposes of this Act into execution— "Be it enacted, that it shall be lawful for the commissioners for every town or district made subject to this Act, once in every year, or oftener if they shall think it necessary, to make one or more rate or rates, to be called the sewer rate, for the purpose of purchasing, constructing, and repairing sewers, for such town or dis-trict, and for otherwise maintaining effectually the wholesome sewerage and drainage of such town or district, and also for securing, raising, and paying any monies, and the interest there of, which may be borrowed on the security of the said sewer rate, in pursuance of the pro-visions of this Act; and in like manner, once in every year, or oftener if they shall think it necessary, to make one or more rate or rates, to be called the paving rate, for the purpose of forming, making, maintaining, and kceping in repair the carriage-ways and roads, and forming, making, paving, sweeping, cleansing and watering the streets, within such town or district, and for securing, raising and paying any monies, and the interest thereof, which may be borrowed on the security of the said paving rate, in pursuance of the provisions of this Act; and, in like manner, once in every year, or oftener if they shall think it necessary, to make one or more rate or rates, to be called the general rate, for defraying all sums specially made payable by this Act out of such rate, together with the salaries of all officers acting in the execution of this Act, unless otherwise provided, and all other incidental costs, payments, charges, and expenses attending the ecution of the powers, duties, and authorities hereby imposed and given to the commis-sioners, and which are not herein otherwise specially provided for. "And in order to raise a sum of money suf-

ficient to defray the costs, charges, and ex-penses of the water department; be it enacted, that it shall be lawful for the said commissioners, once in every year, to make a rate, to be called "the Water-rate," to be made and levied on every person who shall hold, use or occupy any dwelling-house situate within the limits of such portion or portions of any town district as shall be marked out in the plan or of the said inspector, to be supplied by the said commissioners, or by their lessees or con-tractors, with water, or by any other person on their account, according to the full net annual value thereof, and in like manner upon every warehouse, counting house, coach house, stable, cellar, vault, workshop, manufactory or other building, and all yards and all other places where goods or other property are deposited, or business carried on, except as hereinafter is excepted, according to one fourth part only of such net annual value thereof respectively; and the said rate shall from time to time be collected and paid by yearly, halfyearly or quarterly payments, or at shorter periods, as the said commissioners shall think proper, and shall commence from such time after this Act shall come into full force and operation in such town or district as shall be fixed by the said inspector : provided always, that no person who shall hold, use or occupy any dwelling-house, shall be liable to be rated in a greater proportion than according to one-fourth part only of such net annual value thereof, unless the mains or other pipes of the said commissioners, or their lesses or con-tractors, shall be laid down and properly supplied with water within thirty feet from the outer wall of such premises."

NORMAN FONT, HENDON CHURCH.

Тна above engraving, from a drawing by Mr. Francis T. Dollman, represents a very interesting stone font of the Norman period, in Hendon Church, Middlesex. It stands at the west end of the nave, under the organ gallery, and is 2ft. Ilin. square on plan, and 2ft. Sin. high, including the bottom step, 64in. high, which is modern. The bowl, lft. deep, is lined with lead, and has a water drain. The font was repaired about a year and a half

ago. We have in preparation a valuable collection of Norman fonts, which we shall give shortly.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

ASSOCIATION. THAT division of the association which have Lord Albert Conyngham for president, Mr. Pettigrew for treasurer, and Mr. Crofton 'Croker and Mr. C. R. Smith for secretaries, assembled in Winchester on Monday last, to hold their annual congress. The first meeting was held at three o'clock, when the president an able paper, explaining the objects of the association, and urging the importance of anti-quarian pursuits: it gave a history of the Society of Antiquaries and traced the Archæo-logical Association from its commencement in 1843. In the evening a conversazione was held, and Mr. Thomas Wright, the Rev. S. Isaacson, and others, read interesting papers. Since then, various excursions have been made. barrows opened, and a large number of papers read to very numerous audiences. The weather has not been propitions, but the meeting has nevertheless passed off well. Sir James Annesley, Mr. East, one of the members for the city, Sir W. Betham, Sir Francis Myers, Mr. Planché, are amongst

called away to Ireland by the death of a rela-

tive. The elucidation of the cathedral devolved on Mr. Creey; and the hospital of St. Cross was illustrated by the Rev. S. Jackson.

We shall probably give more particular information next week. We cannot avoid renewing our expressions of regret that no satisfactory arrangement has been made between the two committees, but that, on the contrary, unwise supporters of either side are seeking to make religious feelings fresh elements in the quarrel. Some admirers of the objects both societies have in view, consider that the dissensions will put both parties on their metal, and induce,

That hence the common object of both will be prosecuted with a keener spirit, and with greater industry; and that when the time arrives, each party will acknowledge its own errors, and a generous smile of satisfaction will welcome the harvest of good things their dif-ferences have partially been the means of bringing to light. For our own part, however, we cannot but consider the division an occur-rence of unmixed evil, and beseech all who ave any influence, to use it in calming the ill-feelings that have been engendered.

THE CONSTRUCTION OF SKEW BRIDGES.

Sin,-From the many catastrophes which have occurred by the tumbling down of railway and other bridges, particularly those that so recently have taken place on the Ashton railway near Manchester, and the two instances at Derby, I have been repeatedly requested and importuned by gentlemen of high scientific

the works in which I have been many years engaged. Those principles, I feel persuaded, are known to few, with the exception of those whom I have instructed. Under this impre-sion I beg leave to submit to you a plan and the description of a mode of obtaining the bevels of a bridge on the Grand Junction Railway, immediately adjoining Vauxbal Station, Birmingham. This bridge was con-tracted for by Mr. Brandson, builder, now of the firm of Brandson and Gwysher, the well-known railway contractors, who have been pre-eminently successful in all their undertakings. The workmanship of the bridge referred to was entirely left to my care. I have been much engaged in many extensive railway the works in which I have been many years much engaged in many extensive railway works, such as tunnels, bridges, viaducts, &c., and I never met with any difficulty but what I vas able to overcome.

If you should think my endeavours worthy of being laid before your readers, particularly those who are intrusted with extensive works, it is my intention to follow up the present with a series of drawings (accompanying them with working instructions) of difficult work, laying down a sure and certain method to construct such work with ease and safety. It is deeply to be regretted that much work on railways has been erected under such circumstances as it has been, namely, that of giving contracts to such an extent, that it was absolutely impossible for those individuals to complete the work under their own eye, however talented they might be; they were necessarily compelled to re-let part of it, and in many instances the second con-tract has been given to individuals totally in-competent for such responsible work, and hence the many fatal catastrophes which are continually taking place. It is with a view to give instruction to such individuals that I have been induced to lay my system before the public in your valuable paper. I could name bridges to an innumerable extent on railways those who have interested themselves in the attainments to lay down the theoretical prin-proceedings. Mr. C. Croker was unfortunately ciples on which I have uniformly acted in all those bridges having been constructed without

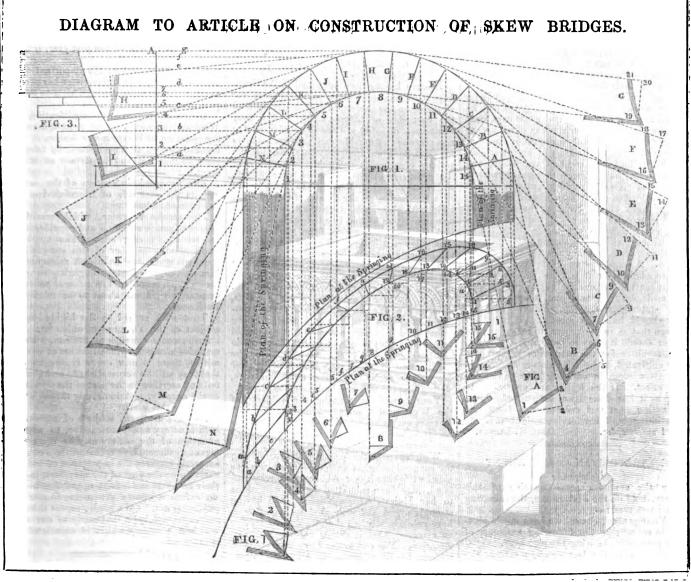

1

being laid down upon true theoretical and

In describing the plan on which the above arch was constructed, it will be necessary in the first place to shew the manner of drawing the first place to shew the manner of drawing the figures represented. Fig. 1 is a section cut square to the abutment of the arch; fig. 2 is the plan of the batter line; fig. 3 gives the intrados and extrados of the arch. From figure 2 are got all the bevels required for working the arch represented by the letters A, B, C, &c., and 1, 2, 3, &c. To draw figure 2, take each distance from the perpendicular line A, in figure 3, and set them from the plan line, 1, 2, 3, 4, &c., those distances set at 12, 13, 14, and 15 in figure 2, then trace those points from one to the other, it will complete the plan of the intrados; proceed in the same manner with the lines dotted from the extrados to the battering line in figure 2. Set those distances also from the other side of the arch, to the battering line in figure 2. Set those distances also from the other side of the arch, which will complete the plan the extrados gives. From these two plan lines are got the bevels, A, B, C, D, &c., on the right-hand side. The bevels at the bottom, 1, 2, 3, 4, &c., are got in the following manner: the angle 1, 2, 3, on figure 2 is equal to the angle 1, 2, 3, on figure 2 is equal to the angle 1, 2, 3, in figure 3; the dotted line from the point A, on the section figure 1, to the bevil figure A, represents the bed of the arch stone brought out, and the stock of the boxel angle angle and the stock of the boxel angle angle and the stock of the boxel angle angle and the stock of the boxel angle an presents the bed of the arch stone brought out, and the stock of the bevel applied on the soffit line of the arch stone, and lying on the line A or bed of the stone, will give one draft for making the face of the springer. The plan of the springer will give the draft of the face at the bottom bed, but before the bevel A is ap-plied, it will be necessary to apply the bevel 15 from the bottom bed of the springer, up the line of the intrados, and it will be seen that the three bevels will give the twist of the face of the springer required to get the bevel 15; it the period of the twist of the face of the springer required to get the bevel 15; it will be observed also that the line 15 is in the same parallel as line 15 on the section, figure 1. The stock of the bevel is drawn at right angles to the line 15. The angle 15 in figure 2 is

equal to the angle 15 on the bevel of figure 1 on the intrados of the plan line; all the other bevels are got in the same way. To work the second stone on the right hand side of the arch, second stone on the right hand side of the arch, after the beds and soffits are worked, to the section mould A on the arch, take the bevel A, and apply it from the soffit along the bottom bed, which will give the first draft for making the face; then take the bevel 14, and apply the stock to the bottom bed up the line of the in-trados, and it will give the second draft re-quired; then take the bevel B and it will give the twist required for working the face of the second stone. All the other bevels are to be found in the same manner. By a strict exami-nation of the figures and the dotted lines the system will be sufficiently clear to most pracsystem will be sufficiently clear to most prac-tical men.—I am, Sir, &c., BRN. GHEBN. Birmingham, 23rd June, 1845.

THE SCHOOL OF DESIGN.

MR. EDITOR,-Seeing in a late number MR. EDITOR, --- Seeing in a late number of THE BOILDER, that it was your intention to consider the matter you had before you re-specting the School of Design, and to lay it before your readers, I beg to make a few remarks upon the great importance of design. remarks upon the great importance of design. If I recollect right, one of your corres-pondents states, that the School of Design is a school for drawing, and not for learn-ing to design. There is no doubt about the truth of that statement. I have been much surprised from its commencement, that design should not have been taught, and I have stated this over and over again, but the anthorities have been satisfied with but the authorities have been satisfied with the name they have given their school, and that the students would, by studying there, become designers. In this point they have deceived themselves, and the students have been the sufferers to the extent of designing. It appears that teachers of design have not been appointed, but teachers of draw-

ing, and, so far so good. But they must go further, and carry out the full intention of their name, — The School of Design. And why should not this nation have a School of Design, requiring it so much as it does? That a school of drawing must be authlished monostituter to of drawing must be established preparatory to design is true enough; but we must not de-ceive ourselves upon that which is only preparatory. To learn our language, is only pre-paratory to our becoming poets. By reading Shakespear our minds will be improved, but we must not expect to become dramatic poets. we must not expect to become dramatic poeta. By copying the Parthenon, our minds will be improved on Grecian architecture, but by doing so, we must not expect to become designers of architecture for English people; the climate, the Tand, the convenience, the comfort, the peculiar wishes of the indi-viduals, must he first consulted before we venture to force a style of architecture upon viduals, must he first consulted before we venture to force a style of architecture upon the employer; the design must be made to con-form to the wants of the party, and to ac-complish which, a vast deal of philosophy will be required. A designer must be taught to become an active observer, and after that, as active a reasoner. But his observations must be made upon the wide field of Nature— throughout the works of creation, in order to fill his mind with the true materials, and with which design is only to be effected. The works of the great designers sufficiently testify this by their close imitation of the beauties of nature. The designers of our cathedrals, like great me, stuck to the subject for which they nature. The designers of our cathedrals, like great men, stuck to the subject for which they designed. They did not, like slavish copyists, go to the Parthenon, and make studies of that temple (which was designed for pagan pur-poses), to assist them in designing a temple for Christian worship! No, they invented such forms as would be in accordance with the Christian religion, and thus make an ap-peal to the flock that it was the house of prayer for all who wished to worship the living God. To design, is to invent such form as will tell its own tale, and apeak as it were to The designers of our cathedrals, like God. To design, is to invent such form as will tell its own tale, and speak as it were to

THE BUILDER.

the subject for which it was designed. Are the students then of the School of Design thus taught? It appears not. They are taught to draw, but then what are they taught to draw? Are their faculties for the arts legitimately exercised, and rightly directed for the purposes of design P If their faculties are exercised upon att only, they are not. They must have their faculties exercised first upon the works of creation, and then a due studying of the works of the great designers may be turned to good account. But great care must be taken in placing such works of art before the students that are not incongruous—such as those senseless productions of half man and half beast, balf man and half vegetables, and half man and half stone, with wooden cases to keep from view their lower extremities; all such deplorable absurdities should be turned to the right about, for they have outlived sensible people's likings. In point of true de-sign, every thing is yet to be done. The authorities have been changing their masters, but the students feel they are not at all nearer design. A sound system of instruction most be propounded, or it will be vain to expect the students to become designers; in fact, they are made draughtsmen, and, it appears from their statements, nothing further. This na-tion should have the most perfect School of Design that is in its power to make, and no longer should it delay so important a subject. The faculties for the arts were given to be duly cultivated, and the legislature should em-ploy its wisdom in carrying such cultivation into effect. If the legislature continues to sleep as it has done upon artistic education, this nation must rest content with being the mere imitators of her foreign neighbours.

I am, Sir, &c. GEO. R. LEWIS.

; ._j. . METROPOLITAN IMPROVEMENT SOCIETY.

Ar the annual general meeting of this society, held on the 31st ultimo, the following report was read :---

Your general committee have much pleasure in submitting the following summary of their proceedings during the past year.

Shortly after the last annual meeting, the committee addressed a letter to Sir Robert Peel, requesting to know if any progress had been made in the preparation of a map of the metropolis, founded on an ordnance survey, which had been promised to a deputation of this society in 1842, and arging the importance of such a map on various public grounds.

The committee also took that opportunity of expressing a hope that the important question of an embankment of the Thames, with a view both to the improved facilities of communication, as well as public health and recreation, would not be lost sight of during the then en-suing sessions of Parliament.

letter was also addressed to the Secretary of her Majesty's Commissioners for Metropolitan Improvements, on the subject of the proposed line of thoroughfares, connecting the Belgrave square district with Westminster Abbey and the New Houses of Parliament, strongly urging that good taste and public con-venience should not be sacrified to a narrow economy; but that by some modification, a view of Westminster Abbey as one of the moblest monuments of antiquity might be preserved, and an approach to that, and the seat of the legislature, rendered worthy of the metro-polis of the British pation.

In their last report the committee stated the steps which had been taken with regard to a modification of the window duties, or as they have been justly designated, taxes upon light and ventilation, in their effects, excluding mul-titudes of human beings from the light of the sun during a large portion of their existence, and compelling them to breathe pestilence. Your committee continuing to feel a revision of this tax essential to the sanatory existence and comfort of the community, as necessary also to avoid its resulting and injurious consequences in defective construction and architectural deformity; and, moreover, satisfied that an alteration might be effected with little or no sacrifice of revenue, resolved to persevere in such object. Mr. Hickson (who on this and many other occasions as the society have witnessed, has been most strenuous in his exertions), having prepared a paper on the subject, your committee resolved that a thousand copies of the same should be printed and circulated. Several petitions to Parliament on the same subject were also prepared and adopted, public meetings were promoted, and the committee have had much pleasure in recording their sense of the exertions of Viscount Dancan in this benevolent cause.

Notices having been published in the newspapers of an application to Parliament for stopping up the thoroughfare for carriages on the east side of Lincoln's-Inn Fields, your committee directed a letter to be addressed to the secretary of her Majesty's Commissioners for Metropolitan Improvements, urging the serious obstruction and public inconvenience that must ensue if such a project were effected, and referring the commissioners to the report of a committee of the House of Commons in 1838, with plans, approving of a direct carriage communication by that line between the Strand and Holborn; and which, from the evidence then submitted, it appeared would be effected at the inconsiderable outlay of 18,000%.

The committee represented, that there is at present no approach from the north of London to the Strand, between Endell-street, St. Giles's, and Holborn-bridge, except by courts, or narrow winding lanes; and that if the exist-ing obstructions could not immediately be removed, at least any increase of them should be prevented by the influence of the honourable commissioners. Your committee have the gratification to state, that they shortly after received a reply from the commissioners, stating that the measure had been abandoned.

Your committee, viewing the subjects of Westminster improvements and of the the Thames embankment as of great national importance, have devoted much time and anxious consideration thereto.

With regard to the former, plans, embodying With regard to the former, plans, embodying the suggestions of the society, with a bird's-eye view of Westminster Abbey as thereby iso-lated, have been submitted by the committee to her Majesty's commissioners, and having strongly urged and reiterated its importance, have subsequently had the pleasure to receive an assurance that it should receive their best attention. The committee have been enabled, through the liberality of Mr. Hickson, to prepare copies of the plan and view of Westminster Abbey, which will shortly be forwarded to every member of the society.

Modified plans of the Thumes embankment, embracing the suggestions of various members of the society, have also been prepared with the view of being submitted to the commis-sioners. Subsequently, your honorary sccretary, Mr. Henry Austin, has suggested a plan of a railway street, in continuation of the embank-ment, and by which a junction may be formed with the Blackwall railway, and by which means the improvement long since urged by the society to her Majesty's commissioners, may be effected; namely, that of a spacious street or roadway, adequate to the increased and increasing traffic between the western and eastern parts of the metropolis.

Your committee have the pleasure to state, that on these plans having been submitted to the directors of the Blackwall railway, they were highly approved, and readily adopted by them. A company is in course of formation to carry the same into effect; and with the fur-ther view of connecting the same with other railways, by which the present obstruction of the principal public streets will doubtless be much relieved.

The committee cannot but congratulate the members on the signal success which has hitherto attended the efforts of the society. Although their power is not great, and their means at present are small, it has become manifest that they may be rendered the nucleus of important benefits. The Government having so readily yielded to the re-presentations and suggestions of the society in advising her Majesty to appoint a com-mission for metropolitan improvements, this society for a time remained passive, consi-dering its province rather to watch the proceedings of that body, and to render from time to time such assistance in the way of suggestions, or otherwise, as might be their power; but observing how little has hitherto been effected, and satisfied by a review of the past year how much may be done by zealous and persevering efforts, and encou-raged by success, your committee would call on votes to 7.

the society, jointly and individually, to future exertion; and to devise some efficient steps to render its existence more generally known, and extend its sphere of influence and use fulness.

As to the results of the past year, it may be stated-

That with regard to the important subject of the window duties, the minister has promised. to consider the subject with a view to their reor modification. peal

That with respect to the modification of the Westminister new line or thoroughfare, and the isolation of Westminster Abbey, it is now earnestly hoped that means will be adopted to effect so manifest and important an improvement.

The proposed obstruction of the carriage-way on the east side of Lincoln's-Inn Fields has been abandoned.

The emoke nuisance, which was long a source of much attention and consideration the society, having been taken up by Mr. Mackinnon, a member of this society and of the legislature, hus only been relinquished by him on the Government engaging to provide for its suppression in the general measure of sanatory regulations about to be submitted to Parliament

That with regard to the highly impertant subject of the Thames embankment, and the improvements consequent thereon, which has occupied so much of the attention of your committee, there is now every reason to expect that they will be accomplished, and that without any sacrifice on the part of the Government or the country, and indirectly through the exertions of this society. As there are many subjects of improvement,

both sanatory and constructive, to which the attention of the society may be most advantageously directed, your committee would again earnestly impress the importance of individual exertion on the part of the members, to extend their numbers and influence, and thus to render their future efforts yet more conducive to public benefit." We gladly repeat this appeal, and express a hope that many of our re will join a society which is calculated to do much good.

ART-UNION OF LONDON.

THE annual exhibition of the works of art purchased by the prizeholders will be opened to the subscribers and their friends, at the Suffolk-street Gallery, on Monday, the 18th inst. The Art-Union indemnity bill has received the royal assent. We are glad to learn that the committee of the House of Commons, who were appointed to take evidence on the subject of art-unions last session, are about to publish their report and the minutes of evidence. The committee of the Art-Union of London have commissioned Mr. Calder Marshall to execute in marble his group, "the first whis-per of love," lately exhibited in the Royal Academy, for a prizeholder who had de-puted the committee to select a work of art for him.

ON THE PRINCIPLES OF GREEK ARCHITECTURE.*

Mr. WILKING has remarked, "that the Greeks adhered to established rules for determining the proportions of the several divisions of the naos, cannot be doubted. The great similarity which is discernable in the plans of mest of the temples with which we are acquainted, warrants the conclusion that they studiously followed some one great model, and deviated from it as little as circumstances would allow them. In order to ascertain the accuracy of this conclusion, we must have recourse to some of the earliest temples of which there is any authentic account, and consider what resemblance can be traced in the plans of such as were erected at periods not very distant, in countries remote from each other."

countries remote from each other." Our author, then, compares the plan and proportions of the temple at Jerusalem with the imple at Pæstum; those who may wish to secretain how far he has succeeded, must refer to his "Antiquities of Magna Græcia." If we were to admit that Mr. Wilkins had shewn that the temple at Pæstum was exactly the same as the temple at Jerusalem, and that the latter was a model from which emanated the temples of Greece, we should even then be very little bacefied, not more so than if it were to be proved that the form of one of our cathedrals ind been selected from one on the continent. We differ from Mr. Wilkins in endeavouring to find a model from which the temples were sopied :---our inquiry is ---What were the primciples which guided the formation of the Grecian temples? This is the very error of the followers of Mr. Wilkins's school, which has retarded the progress of architecture as an art of design for years; their aim being to imitate by copying, and continually discoursing of effects, instead of developing causes. Therefore, however correctly Messrs. Stunt and Revett, or Mr. Wilkins, may have delineated the existing remains of Grecian buildings, important as the acquisition may be---unless we can obtain the key by which we can detect the original source of their creation, we must never aspect to understand Grecian architecture, but continue to copy only the models, to be satisfied with their acknowledged beauty, and remain ignorant of the cause of that beauty. The deficiency of a correct knowledge of proportion is one of the reasons why architecture in modern times has seldom been successfully treated. Each part of a Greek temple was so regulated as to bear a just proportion to the whole : in this alone how deficient are our edifices !

"Though we excel in every separate part, Yet fail of just proportion in our art, In one grand whole unknowing to unite Those different parts."—Horace.

We have copied a portico, placed it against a house, a church, or a theatre; and however perfectly we have imitated it, and beautiful as it may be *per se*, it never has been adjusted to bear any proportion to the building to which it has been affixed.

Before, therefore, an architect can design an edifice in any style of architecture, he must become acquainted with that style which he proposes to adopt; and if he wishes to raise himself above the plagiarist, and add new features to existing styles, it is absolutely necessary he should first possess a knowledge of the principles which guided our ancestors; unless this be done, however cleverly he may imitate, it will be impossible for him to strike out new ideas with any certainty of success.

That the principles by which Grecian architecture has been moulded into beautiful forms have never been discovered is perfectly apparent, if we quote only a few remarks offered on this subject.

Mr. Gwilt observes, it may be objected to, that fitness alone will not account for the pleasure which arises in the contemplation of what are called the orders of architecture; and Alison seems very much "to doubt whether there be not some other cause of beauty." "If admiration of Grecian architecture," says Mr. Wilkins, "result from intellectual association it will be found to mirtellectual

"If admiration of Grecian architecture," says Mr. Wilkins, "result from intellectual association, it will be found to exist only among men of knowledge; and its just proportion will be determined by those whose taste is the most cultivated, and whose science is the most ex-

• From "The Natural System of Architecture," by W. P. Griffith, Esq., F.S.A.

tensive; but if there be some intrinsic charm, some peculiar grace, which is necessarily acknowledged and felt by all mankind, we then must look for some more general principle, which will accommodate itself to this more general feeling." "We can scarcely deny, then, that the pleasure which is derived from surveying the ancient models of Grecian architecture is heightened by ideas connected with learning, with science, and with art; accompanied, as they still must be, by all the nameless charms which imagination combines with the history of the Greeks, and which it throws over all their productions. It is probable, nevertheless, that their buildings possess certain qualities which affect us independently of all these associations, and which, even without them, fail not to produce sentiments of admiration, and feelings of delight." The same cause which operated so power-

The same cause which operated so powerfully during the middle ages, and to which we and our continental neighbours are alike indebted for our beautiful cathedrals, viz., religion,—influenced in like manner the contemplation and erection of the Grecian temples; in the ancient, as well as in the modern world, —in savage, as well as in civilized nations, we find that religious edifices are the largest in extent, the most elaborate in execution, and likewise the most costly of all the works of men.

If, therefore, we desire to seek the causes which operated so powerfully and so successfully in rearing edifices, acknowledged by all to be beautiful, our merely possessing accurate representations of those buildings is not sufficient for us to determine the reason of their being beautiful; to gain this desideratum, we must carefully inquire into, and examine the celebrated matured scientific systems of the earliest philosophers of Greece, and see if they will assist us by shedding any light upon so important and interesting a subject. To accomplish this, we will at once transport ourselves to Greece and the age of Thales and Pythagoras, who foun led the earliest schools of geometry; the latter of whom, according to Proclus, was the first who gave geometry the form of a science.

Thales was born at Miletus, a Greek colony in Asia Minor, in the first year of the thirtyfifth Olympiad. After receiving the usual learning of his own country, he travelled into Egypt, where he became eminent in astronomy, geometry, philosophy, &c. From him astronomy made a very considerable advance, and he is generally reputed to be the father of the Greek philosophy, being the first that made any researches into natural knowledge. IIe founded the Ionian school 600 years u.c.

From Thales we pass on to Pythagoras, a philosopher no less distinguished than the former for the variety and extent of his discoveries. The information which he derived from his countrymen not satisfying his inquiring mind, he travelled into various countries. He first visited Egypt, from which country he went to Asia, where he is said to have made himself acquainted with the science of the Chaldæans and the Magi. Although these traditions may have some historical foundation, it is considered that his philosophical system was not derived from any foreign source, or even materially influenced by any thing that he saw and learned in the countries which he visited ; his whole philosophy bears the impress of genuine Greek growth, and there is scarcely any thing in it which may not be traced to some native source.

Pythagoras finally settled at Crotona, in Southern Italy, and established a philosophical institution about B.C. 500, which in many repects hore great analogy to the Doric institutions which he had seen in Crete and Sparta. He instituted among his disciples a secret worship, or mysteries, which are sometimes called Pythagorean orgies; and the science of numbers, geometry, and music, were closely connected with the sacred rites.

The main purpose of philosophy, according to the system of Pythagoras, is to free the mind from incumbrances, and to raise it to the contemplation of immutable truth, and the knowledge of divine and spiritual objects. Mathematical science was with him the first step to wisdom, because it inures the mind to contemplation, and takes a middle course between corporeal and incorporeal beings. The whole science he divided into two parts, numbers and magnitude; and each of these he subdivided into two others; the former into arithmetic and music, and the latter into magnitude at rest, and magnitude in motion; the one comprehending geometry, and the other astronomy. Arithmetic he regarded as the noblest science, and an acquaintance with numbers as the highest good. He considered numbers as the principles of every thing, and divided them into scientific and intelligible. Scientific number is the production of the powers involved in unity, and its return to the same. Number is not infinite, but it is the source of that infinite divisibility into equal parts which is the property of all bodies.

In other, and its recent to the source of that infinite divisibility into equal parts which is the property of all bodies. Not any exposition having been handed down to us by Pythagoras of his scientific labours, it is undoubtedly no easy matter to separate, in the later traditions, what belongs to the old system, and what to the new. In modern times, great light has been thrown upon the subject by the careful examination and analysis of the fragments of Philolaus by Boeckh. Philollaus of Tarentum, a disciple of Pythagoras himself, was in all probability the first Pythagorean who wrote an exposition of the system of his master; and his fragments must therefore be considered as the most genuine source of information. The results at which Boeckh arrived are, on the whole, the same as those which Ritter subsequently reached, though by a different mode of inquiry.

IRON AND THE IRON TRADE.

SINOB the last quarterly meeting of ironmasters, the trade has acquired much firmness, and may be regarded as in a more fixed and healthy state than for many months pat. There is no disposition to form prices above their natural level, and the late rates agreed upon will we have no doubt be fully maintained. The tendency in the market is rather to advance than to recede. At a meeting of the masters at Glasgow, on the 30th utiling, prices were reduced from 80s. to 65s. net, four months, or 24 per cent. for prompt delivery. In rails, some large transactions have taken place during the past fortnight, at prices varying from 94. to 94. 10s. per ton.

It is well known, that iron made from one in France is of an inferior quality, and unfit for railway and other engineering works. This fact, in connection with the fears of the French government, of the entire disforesting of the kingdom if charcoal iron-works are carried on to any extent, has suggested the idea of forming an establishment at Boulogne-surmer for the make of iron and the manufacture of fire-brick and pottery, from ores, coal, and clay, to be imported from Walse. Mr. R. Hopkins, with whom the idea originated, and who possesses several mines of the necessary materials, proposes to raise a capital of 100,000/., to carry into execution his project. The following is a statement of the imports

The following is a statement of the imports and exports relating to iron, for the past year, 1844. Our imports of foreign iron-ware--chromate of iron, 2,355 tons; bloom iron, 524 tons; old broken and cast-iron, 97 tons; unwrought steel, 2,717 tons; wrought steel and iron, entered by weight, 153 tons---ditto, entered by value, 11,9054. Of foreign iron in bars, 21,598 tons were retained for home consumption, and 5,876 tone exported, of which 3,371 tone went to India, and 1,013 to our North American colonies.---Of British irofa we exported that year 99,960 tons of pig-iron; 230,835 tons bar-iron; 18,980 tons boli and rod-iron; 18,969 tons cast-iron; 1,963 tone iron wire; 2,490 tone of anchors, grapnels, &c.; 15,654 tons in hoops, &c.; 7,226 tone naile, &c.; and of all other sorts (except ordnance) 48,170 tons; of old iron, for re-manufacture, 9,271 tone; end of unwrought steel, 5,121 tone.

NEW CHURCHES AND SCHOOLS IN THE DIOCESE OF DURHAM.—The dean and chapter of Durham have recently voted the following donations for buildings connected with religion and education : — 300/. towards a new church in the parish of Berwick-upon-Tweed ; 25/. towards a school at Castlesides, near Lanchester ; 20/. towards a school at Ellerker ; 10/. towards a school at Coundon ; 20/. towards a school, and 200/. towards a new church, at Ferryhill.

OPENING OF THE RAILWAY FROM LONDON TO CAMBRIDGE.

THE continuation of the Eastern Countiesline to Cambridge, Ely, Norwich, and Yarmouth, was opened on the 29th ult. A large number of persons attended at Cambridge, and the whole of the proceedings passed off very satisfactorily.

tisfactorily. The most important station on the line is at Cambridge. It is a long, and handsome brick building, with stone dressings, consisting of a double series of arcades; one extending over the siding of the railway, and the other serving as a portico for the carriages arriving at the station. It was designed by Mr. Thompson, and erected by Messra. Jackson, of Pimlico; as were also the stations at Chesterford and Wenden. Mr. Robert Stevenson was the engineer, and Messra. Peto and Grissell the general contractors. The stations are all laid down with Seyssell asphalte, and afford a good example of the material.

There was a dinner at Cambridge on the occasion, and our chief inducement to notice the proceedings was, that we might record some remarks then made on the conduct of the workmen employed on the line, and the character of the contractors.

character of the contractors. The Dean of Ely adverted in the highest terms to the unremitting excellent conduct of the operatives throughout the line. As a magistrate of Bly, he had had every opportunity of witnessing their demeanour, and it afforded him unspeakable satisfaction to bear the most unqualified testimony to the bear the most unqualified testimony to the peaceable, orderly, and sober manner in which they had uniformly conducted them-selves. (Cheers.) With three exceptions only, throughout the whole of the period the works had been carried on, not the shadow of a complaint had been made against them, and those exceptions were of the most trifling character; it was due to the labourers to bear this testimony in their favour (cheers), but a still higher measure of justice was due to Messrs. Grissell and Peto, whose judicious and liberal arand Peto, whose judicious and liberal ar-rangements for the instruction and moral and religious welfare of the numerous band of workmen in their employment, were worthy of all praise, and had been productive of the greatest advantages. (Cheers.) He rejoiced at the accomplishment of the mighty work which had been achieved, and which they were that day met to commemorate. Not only would the material interests of the important districts by which the railway would be trapersed beimproved to an incalculable extent, but, which was far more important — the moral and intellectual interests of the community would be advanced and improved in a degree which perhaps it was impossible for human ingenuity to estimate. (Cheers.) Greatly as we were indebted to the piety of our ancestors for the stupendous institutions they had founded for the religious advancement of our race wet were they infinitely surpassed by the mighty efforts which were now in progress, and the union of all that science and art odald effect with all the elevation of purpose which characterized the present operations of the present age and controlled their influ-

or the present age and controlled their innuences, would produce results of the loftiest and most gratifying description. ²⁰ The Bishop of Norwich was obliged to repleat the sentiments uttered by his friend the Dean of Ely. But if it were a repetition, it was not as tedious as a twice-told tale—for it deserved to be told three times three and "with one cheer more," (cheers) and the tale was the good and exemplary conduct of the railway labourers. (Cheers.) The dean said that, as a magistrate only three cases of misbehaviour had come before him. In Norwich they could surpass the enlogy of the dean, for there they had not one. (Loud cheers.) Not one man throughout the line (loud cheering), but the men were everywhere described as doing their duty like Englishmen, and none ever did it better (cheers), and here he would give credit and honour to whom credit and honour were due. He was himself a churchman, and holding high office in the church, and believed that in that church was the purest faith, but he was still a Catholic Christian (loud cheers), and as such would hold it as a dereliction of his duty if he did not express his approbation, respect, and regard for the exertions used for the moral benefit of the railway labourers by Mr. Peto. All down the line he had met with his agents, and had found them not merely giving directions and instructions, but also giving to the men religious books, and schools for the education of themselves and their children (loud cheers), and thus shewing them that education can civilize the mind, reform the habits, and elevate the understanding. The gin shops were left deserted, and the schools were full. (Cheers.) Who was there who would throw a damp upon the means even the humblest of education, come whence it may. Mr. Peto was a dissenter, and he (his lordsbip) envied the sect to which he belonged, the possession of such a man; he would gladly purchase him at his own price, and heartily he prayed that he would ere long become a member of the Church of England. The Vice-Chancellor said, "The world of

The Vice Ohancellor said, "The world of science had been employed in the accomplishment of the stapendous operations which railway proceeding had developed, but with him it was a source of inexpressible gratitude that not only had the regions of science been resorted to by the men who had created new and vast fields of enterprise, but that they had taken the opportunity which the concentration of the powerful body of artisans and labourers under their direction, and in their employment afforded them of diffusing amongst them the precepts of religion and morality. He bore just testimony to the excellent conduct of the labourers throughout the whole period of the formation of the line, and stated that their attendance at the Norman church, in the neighbourhood of Cambridge, which had been conceded to them at the earnest request of Messrs. Grissell and Peto, had been uniformly marked by diligent attention and reverent devotion.

INSULATED BUILDINGS: ACCORDING TO THE BUILDINGS ACT.

S1R,—A point that would appear to be one of general interest having arisen between a district surveyor and myself, the following letter, addressed to the district surveyor, which will perhaps suffice to explain the subject, may not be uscless :—

"My dear Sir,—I am leaving town to-morrow morning, but hear (even after your assent on Saturday to the proceedings) that you demur to the two houses in Lyndhurst-square, of which you have notice as 'insulated buildings,' upon the ground that they are not twice 30 feet, or in the whole 60 feet apart. I was quite prepared (sanctioned by counsel's opinion), to have proceeded with any additions I chose to make to any "commencement," not offensively setting up my opinion against the referees. My point is, they have no power to limit or control the express words of a public Act; more especially relating to matters clearly not within their province. There can be no question of my perfect right of trying the extent or limitation of the word 'commencement' in a court of law, which I was quite prepared to do, and am still prepared, if any question is raised—but prefer paying your fee as of "insulated buildings," my abject being not collision with authorities, but permission to carry out my barge-boarded pediments, &c., in conformity with the houses already erected.

The objection taken I was quite alive to, and that induced me so cautiously to word my notice.

I had intended some months since to address a letter to. THE BULDER upon the subject; as I do not disguise my intention of so carrying out my operations to some considerable extent in this neighbourhood, as availing myself of a rational permission in this suburban district, believing as I do, that additional ground adds value to the outlay.

I had, however, hoped that no attempt would have been made to pervert the clear and singularly (for this Act) intelligible clause under which I presume you ground your objection.

which I presume you ground your objection. I cannot avoid remarking, I think it would be but an act of courtesy if district surveyors were to supply the architect concerned in the building with the ground of their objections in writing, when most frequently a dispassionate discussion would settle all points in difference.

The course, however, taken is an appeal to the referees; the first step being, that the district surveyor is called upon formally to state the grounds of his allegations or irregularity; the party, by a transmission of a copy from the referees, obtains the information by a costly mode of proceeding. I have also been told by a district surveyor,

I have also been told by a district surveyor, in the presence of the referees, that a party producing a plan of intended operations and seeking advice as to its conformity with the provisions of the Act, the district surveyor is not bound to assent or dissent from its accuracy.

I believe a party serving the district surveyor with a copy of a plan of intended ope-rations, and seeking his advice, which being refused, and for the sake of the argument assuming non-conformity to the provisions of the Act to exist in some parts,—I think, I say (if permitted to proceed, and the errors are eventually complained of), the district sur-veyor would be told in a common law court that he was not merely ministerially act-ing, but in respect of the prescribed fee for superintending this particular work, he would be held liable for his wrong doing. If my arguments fail to convince your judgment, I would request, as a preliminary step, the grounds, in writing, of your objections. Should you withdraw your objections, I shall then feel obliged by your so informing me, that my works may proceed without the suspense and doubt of their conformity, which brings me to what I presume to be your grounds of objec-tion, viz., under schedule C, second paragraph, part 7, which, describing what are to be deemed 'insulated buildings,' states :- 'And with regard to such building, so far as relates to the distance thereof from any other building, or from ground not in the same occupation therewith, or connected therewith only by a fence or fence wall, it must be distant from such other building, or such other ground, at the least 30 feet.

We will first try the question by the actual position of my houses. They stand on my freehold, 50 feet from each other; and you have admitted, by measurement with my builder, that no portion of the ground surrounding the houses is within 30 feet 'from ground not in the same occupation;' as no fence or apparent division exists as dividing this 50 feet, I would challenge your authority to call upon me to state to which I meant to attach at least 30 feet.

We will now try the question upon a broad principle. Since hearing of your objection, I have consulted two intelligent legal friends, who not only fully confirmed my views, but expressed surprise how such plain language could be attempted to be perverted—with the permission to creet with any 'dimensions and materials' such buildings. To prevent accidents by fire the controlment is enacted and if a number of houses were in crection together, 30 feet apart controls the matter; but it clearly was evident to the minds of those who framed the clause that one house only might be built: and then comes the restriction (and which be it borne in mind is in the disjunctive), 'or from ground,' that is to say, you shall not avail yourself of this permission unless you have in the same occupation at least 30 feet of ground, so that any future erection cannot possibly be nearer than 30 feet. Hypothetical cases might be multiplied, but I will not further entangle the discussion thus, or by shewing how readily the cleause may be evaded altogether.—Yours faithfully,

GREENWAY ROBINS."

EMPLOYERS AND WORKMEN.—Our notice of entertainments given by employers to the men in their service, and the view we took of the advantages likely to result from such a course, have led correspondents to send us accounts of various similar meetings. Last week more than 200 persons connected with the brewery of Messrei Hanbury and Co. dined and supped at Rosherville Gardens, near Gravesend, at the expense of the firm, Mr. Davison, engineer, in the chair. A local paper says, "At 8 o'clock the whole party embarked in the most orderly manner on board the Vesper, Star Boat; and it is but an act of justice to add; that if partics holding higher birthe, and assuming greater rights of civilization, were to conduct themselves throughout a festival of this kind with as much propriety, it would go far to establish a better order of 'things."

Correspondence.

GLASS PIPES.

Sis,—At the late meeting of the English Agricultural Bocisty at Shrewsbury, I noticed with interest some specimens of glass pipes, introduced there by Mr. Freeman Roe, of London. This invention strongly recommends itself to notice and approbation, by its securing the cleandiness and salubrity of the water in its conveyance from its source, whilst the cost of manufacture will not be much, and its durability will be lasting. It is well known that all matural waters contain in solution bicerbonate of lime, in greater or less propor tions, which act in two manners injuriously The evaporation of a in the ordinary pipes. portien of carbonic acid will precipitate the in-soluble carbonate of lime or chalk, well known as a deposit in pipes and the far in tea-kestles, which obstructs and finally closes up the passage, whether in lead or iron. The carbonates of lead and iron are also formed at the expense of the metals, the former of which has proved to be highly injurious to health, whilst thelatter, though less so, produced, by its astringency, bad effects upon the burnan consti-tution, and at the same time from the formation of these soluble salts, the metals rapidly corrode and wear away. Where water is recorrole and wear away. Where water is re-quired for vegetation, the presence of the smallest quantity of iron is injurious, whilst its brack ish taste renders it unfit for domestic appliances. Now, as points are necessary for the first crystallization, from the uniformity the first crystallization, from the uniformity of surface in glass, no deposition can take place in pipes formed of this material as in those of lead or iron; nor can the material be acted upon chemically, so that whilst the pipes are kept clean, the water is insured in the same condition of purity as at its source. The abolition of the duty on glass will doubtestly lead to its intraduction at its source. The abolition of the duty on glass will doubtlessly lead to its introduction gass will doubtlessly lead to its introduction to many other purposes useful and ornamental, as vases, basins, and other parts of decora-tive fountains, where the transparency of the material would have an interesting effect, much above that produced by the opacity of the matter at means considered the matter at present employed.

A. BOOTH. L. Finsbury-equare.

BUILDERS' ESTIMATES.

SIR,-Knowing you to be an advocate for correcting abuses, I trust you will excuse the liberty I take in addressing you relative to certain works which were to be executed and are now in progress at an institution belonging to the united parishes of St. Giles and Bloomsbury; and for which I, among others, was requested to estimate, and received a letter stating ""the trustees hoped to be favoured with a tender from me for the works, which were to be divided into two classes, one constrict to be divided into two exists, one con-taining brickluyer, plasterer, cal penter, smith, &c.; the other the plumber, glazier, and painter, so as to form *two estimates*, distinct and separate" (these are their own words).

I accordingly sent my estimates at the time and place appointed, where four of the trustees met the surveyor for the purpose of opening and deciding on the tenders which were to be adopted. My tender for the principal of the works, vis., the bricklayer, plasterer, carpenter, and smith's work, &c., was the lowest of any, and another tradesman was lowest in the painting, &c.; which estimates, had they been accepted, would have been "a saving to the institution of 37, 106.," and honourable and straightforward on the part of those assembled. But no, the surveyor advises the trustees to accept the tender of another party (one of his own neighbours). "because," as he says "he was lowest on the gross amount;" and en being asked for an explanation, said the trus-tees did not hind themselves to divide the works. Then why have requested two "dis-tinct and senarate columnets of

tinct and separate estimates? Here I beg to state that there were similar works executed last year at the same institution, and under the same surveyor, on which occasion they divided eres the plumbing from the painting, which invariably go together as a matter of course. Thinking I was dealing with honourable men, I did not make a ques-tion about the division of the works previous to forwarding my tender, which perhaps I to state, ought to have dong, but shall be more cautious for the future, and hope my brother builders society.

will be on their guard also against such injustice Hoping you will find space in your valuable journal for this,—I am, Sir, &c., J. S., Junr.

Tottenham Court-road, 28th July, 1845.

FIRE-PROOF CEILINGS.

SIR,--- My attention being directed by a letter in THE BUILDHE to a project for diminishing the combustibility of houses by the substitution of iron for wooden lathing, the idea of substiof iron for wooden lathing, the idea or substi-tuting elates "for partitions, ceilings," &ce., instead of laths of any description, presented itself to my mind. I accordingly tried the ex-periment on a small scale, and found; it to answer exceeding well. I fixed some spantlings together, and mailed the slates to them, allowing a proper space between each slate., I like-wise cut slits in each slate about three inches long, and three-eighths of an inch wide, thus;

each row being about four inches apart. I, by this means, secured the perfect keying of the lime. I then laid on two thin coats of

plaster, both of them not being more than half an inch thick. After allowing the plaster to dry properly, I applied a fire of dry fir shavings directly below it, for the space of a quarter of an hour, the heat and flame from which were exceedingly intense; some of the slates were merely a little cracked at the edges, where they were not well covered with lime. The difference of expense between slates and wood latha would not be considerable, and buildings might by this simple and cheap means be rendered almost fire-proof. I perceive a similar idea has struck the mind of your Kensington cor-respondent.—I am, Sir, &c., J. R. Hartlencol Aug 2nd Hartlepool, Aug. 2nd.

Miscellanea.

DECORATIVE ART SOCIETY.—On Wednes-day, the 30th ult., "the consideration of Geo-metrical figures in the foundation of graceful outline" was resumed. The elements of spiral, waved, and scrpentine lines, were discussed with the usual methods of pro-ducing them, and as these lines are, in practice, generally adjusted and regulated by the haud and eye of the artist and work-man, it was felt that a mechanical system mend he of gract utility and importance prowould be of great utility and importance, pro-vided simplicity could be combined with the process. After some remarks on the properties of the Greek spiral, such as admitting a tangent to be drawn at right angles to a ra dial perpendicular, and having the convolu-tions at a certain uniform ratio (as evidenced by examples in the British Museum and in Stuart's works), distinctly different in principle from the logarithmic or any other spiral, attention was devoted to Mr. Jopling's explanations of his septenary system of generating curves by continued motion. This system had been brought before the society at a previous meeting, and was received with some attention by the members, but as only one of the seven divisions had been published by the author in an extended form, its application to the lines under consideration was novel and strikingly illustrative of its merits; and from the courteous and liberal manner in which Mr. Jopling gave his valuable information, it was agreed by several of the members to endeavour to apply it experimentally in their respective occuply it experimentally in their respective occa-pations, as far as their limited acquaintance with it would enable them to do so; and to re-port the results to a future meeting. The drawings of serial conchoid, cardioid, and other curves produced by the above system, led to the supposition that new combinations of pleasing character (varied as in diapering, engine-turning, &c.) might be derived and ap-plied economically to decorative purposes in munufactures. This being the last meeting of this season, the chairman congratulated munufactures. This being the last meeting of this season, the chairman congratulated the members on the very satisfactory nature of the past meetings, as yielding to those of few (if any) other societies in interest; and in adjourning the meetings for two months, he felt much pleasure in being able to state that sworth purpose were in prepara to state, that several papers were in prepara-tion likely to sustain the reputation of the

EXTENSION OF THE RECENT'S PARK. EXTENSION OF THE RECENT'S PARK.— During the past week, workmen have been employed, by order of the Commissioners of Woods and Torrests, in erecting a fence round the fand (including Primfose-hill) on the north side of the Regent's Park, recently be-longing to the Easton estate, but exchanged with the commissioners for other lands, for the purpose of increasing the Regent's Park, and sectoring a public through fare to the top of Primrose-bilk. The hill, and land adjoining if, from the suspension-bridge over the Regent's Canal, comprising 150 acres, will be converted into plantations, serpentine, and other gravel walks, and small pieces of ornamental waters, the whole of which when completed will be thrown open to the public. ART-UNION PRIZE ANNULL. We have

before us the first volume of this work, published by Sprigg, of Great 'Rüssell-street, and intended to present each year engraved repre-sentations of every work of art purchased by the prizeholders in the 'London Art-Union.

the prizebotters in the London Art-Union. We shall notice it at greater length next week; and in the meantime recommend it to the sub-scribers and all interested in art. New Powhen Madazinte—The purchase of the Kinterbury estate by the Government, as the site of the new powder magizine, has been completed for 23,0002. The works will be commenced for the new powder magizine in the formation of the second be commenced forthwith.

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom teader, &c., are to be addressed. For the convenience of our readers, bowever, they are entered in a book, and may be seen on application at the office of "The Builder," 2, York street, Covent-garden.]

For the executing the skeleton of Glenorthy Castle, County of Limerick, Ireland.

ounty of Limerick, Ireland, tain 1180 Persons, for the Guardians of the Clifton Union.

For the complete restoration of two. Windows on the south-side of St. Thomas's Church, Salis-bury ; also, for Cleaning and Whitewashing the interior of the same Church-

For the execution of Works on the Levils and Thirsk Reilway.

For Coupled Locomotive Engine and Sour-wheeled Tender, to contain 700 gallons, for the Mandaceter and Bigningdiam Railway Company.

For the electron of that portion of the Newcastle and Berwick Raitway, extending from the Newcast the and North Shields Reilway to Netherton, be-ing a distance of about 123 miles.

For the execution of several lengths of Earthwork on the Aberdeen Railway. There are 5 separate Contracts, varying in lengths from 3.1 miles to 42 miles.

For the erection of a Wesleyan Proprietary College at Taunton.

For the supply of 70,000 Larch, Oak, or Fr Sleepers, and Fencing for 504 miles, or any part thereof, for the Ipswich and Bury St. Edmund's Railway Company.

For the erection of a new Village Infirma Brampton, near Huntingdon, for the Lady Olivia

Sparrow. For execting a Convalescent Ward, Nurse's Rosan, and a Wash-house, adjoining the Infirmery of the Sudbury Union. For Building 700 feet of Sawer in Lower Ga

len-street, Westminster, for the Trustees of Tothill Fields.

For the Construction of the Gas Works at Wells, in the county of Norfolk, with all necessary apparatus

For a supply of eighty fathoms of Yellow Deal Ends and Boards, in equal proportions, of the best description, to the Trustees of the Parish of Islington, Middlesex.

For a supply of fifty fathons of the best Yellow Deal Ends, to be worked direct from the ship, to the Directors and Gaardians of the Poor in the Parish of St. Marylebone. The works on the Notting: For the execution of the works on the Notting:

barn eod Linosh Bailway, in two parts; 1 from Nottingham to Newark, being a distance of 174 miles; 2 from Newark to Lincoln, being a dismiles, 2 from N tance of 15⁴ miles.

For the construction of the entire Line of Railway through the County of Anglesca, for the Ches-ter and Holyhead Bailway Company. It is divided into four separate Contracts, being respectively in length 5 miles and 28 chains, 5 miles and 26 chains, 7 miles and 55 chains, and 3 miles and 60 chains.

For the execution of the several works required in the Tynemouth Extension Railway, comprising about 740 yards of Tunnelling, with Earthwork, &c. The length of the extension is one mile.

For supplying her Majesty's several Dockyards

ds of African Timber. with 11,000 For the Buildings intended to be erected at King's Langley, for the Committee of the Booksellers' Provident Institution.

COMPETITIONS.

Plans are required for Laying out and covering with Villa residences about 20 Acres of land having a frontage of about half-a-mile to the Queen's-road Richmond, Surrey, extending from Spring-grove towards Richmond-hill. Premiums will be given of 25 guineas for the most approved plan, and 15 guir for the second.

guiness for the second. The Committee for the establishment of Pablic Parks, Walks, &c., at Manchester, offer two prizes, one of 50 guiness and the other of 25 guiness, for the best and second best set of Plans (with esti-mates), for the laying out, &c., of the sites already manchest by them inchased by them. The Board of Guardians of the Bridlington Union purch

offer a premium of 10% for a Plan and Specification of a Workhouse, the expense of which is not to exceed 2,000%, and to accommodate 150 inmates.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

At Little Bentley Hall, Essex, 2,000 straight and good Larch Firs.

BY TENDER.

In the Plantations of the Duke of Montrose, situate in the Pariates of the Date of Minister, Stirlingshire : many Thousands of Larch Trees of some size, adapted for Railway Sleepers, Roof-ing and Joisting, and other purposes.

(Knight); "Medical Times" for July; "A Peep into Architecture," by Eliza Chalk (Bell, Fleet-street). "An Old Subscriber."

BRRATUM. — The quotation by Mr. Angell in his paper read at Institute of Architects, reported at p. 351, ante, was from Empedocles (the Agri-gentine philosopher) and not from Pericles, as stated.

*** Correspondents who threaten to cause to be subscribers because we differ in opinion from minications which them or refuse to insert comm would really injure to inters communications which would really injure them in public opinion, must think meanly of us if they consider the threat likely to alter our course of proceeding. Our duty is to give sound information and honest opinions, and we will perform this to the extent of our childs and we will perform this to the extent of our ability without respect to persons.

ADVERTISEMENTS.

SASHES Frimed and Glazed at 7d. per foot.—CROWN-GLASS, 6d. per foot.—WHITE LEAD, 26s. per cwt.— PIPE and SHEET LEAD (cut) 21s. 6d. per cwt.

WINCH, late Foreman to R. Cogan, WINCH, late Foreman to K. Cogan, the base to acquain the Trade that he can supply them with WINDOW GLASS, SHEET LEAD, PIPE, CO-LOURS, WHITE LEAD, &c., of the best quality at the lowest prices. CABVERS and GILDERS, CABINET MAKERS, and others are respectfully informed that their glass is looked out with pseuliar care.—Every inquiry im-mediately answered, and equal attention paid to small or large orders. LAMP SHADES and GAS GLASSES at wholesale terms.—Address, 15, High-row, Knightshridge.

MOREALE CERMI. -AUDICES, 15, HIGHTOW, REIGHTANGCI MONS. BOUTIGNY'S EXPERI-HOT CRUCIBLES, &c., will be repeated by Dr. Ryan. in his Lectures on the CAUSES of EXPLOSIONS in STEAM-BOILERS, daily at half-past Three, and in the Evenings of Mondays, Wednesdays, and Fridays. at Nine, at the ROYAL POLYTECHNIC INSTITUTION. The AT-MOSPHERIC RAILWAY, carrying from Six to Eight Visitors at once, is lectured upon by Professor Bachhoffner, and exhibited daily, and in the Evenings. The art of SWIMMING and DIVING illustrated by a Youth Eight and a half years of age, the Son of Capt. Stevens, the celebrated teacher of Swimming, on Mondays, Wednesdays, and Fridays at Two o'Clock, and on the Evenings of Tus-days and Thursdays, at half-past Eight. All the other popular Exhibitions and interesting Works as usual.--Ad-mission, One Shilling's Schools, half-price.

PRIZES IMPORTANT TO INVENTORS AND PATENTEES.

PATENTEES. GOLD MEDAL, value 1007. and a SILVER MEDAL, value 507., will be given by Mr. M. JOSCELIN COOKE. The Gold medal for the beat Patent, and the Silver medal for the beat Design taken out or Registered at the OFFICE for PATENTS and DE-SIGNS, 30, Haif Moon-street, between the 1st of Novem-ber, 1844, and the 1st of June, 1866. The Prizes will be awarded by competent judges on the 10th June, 1846. The conditions to be observed, together with instructions, charges, and every information for obtaining Patents in England or Foreign Countries, or Registering Designa, will be forwarded gratis, on application to Mr. M. JOSCELIN COOKE, at the Office for Patents and Registration of Designs, 20, Half-Moon-street, Piccadilly, London.

FAINTING BRUSHES OF SUPEBIOR QUALITY. TO PAINTERS, BUILDERS, &c.

J. J. KENT AND CO.,

MANUFACTURERS, 11, GREAT MARLBOROUGH-STREET, LONDON, 11, GREAT MARLBOROUGH-STREET, LONDON, Offer to Painters, Builders, &c., Painting Brushes of a quality far superior to those generally offered for sale, to which they beg to call the attention of all who prefer quality and durability to apparent cheapness. ocooco.--7 in. Justers. ocooco.--7 in. ditto, extra. ocooc--Ground Brushes. Plasterers' Brushes. Distemper ditto. Ground and Unground. Sash Tools, and Common Tools. The Brushes and Masoar's Brushes, and all other Brushes used by Painters and Artists. Lists of Prices of Painting Brushes, and of all other kinds of Brushes, forwarded on application. Established 1777.

VENTILATION.

VENTILATION. "A most ingenious, simple, and effective plan." Mr. Reid's Lecture on Ventilation, delivered, June 7, 1845, before the Mechanics' Institute, Liverpool. BAILLIE'S PATENT TRANSPARENT VENTILATOR, tentilates rooms or public buildings without causing unpleasant draughts of air-may be fixed as easily as a pane of glass, whose place it supplies-does not derange blinds, shutters, or other fixtures belonging to windows-most methal to public places of every descrip-tion, especially anoking and eaffer rooms, and moreover a simple remedy for smoky chimmeys. This article may be ob-tained from all respectiable glass dealers in London; Mr. Edgar Parks, ironmonger, 140, Fieet-street; Measrs. Stock and Halland Sons, and Measzs. Dixis and Williams, Bristol; Measrs. Thos. and Will. Stock, Liverpool; Measrs. John Hall and Sons, and Measze. Dixis and will be glad to give any further information; also to be seen in use at Mr. Fred. Smith's, the Albion, 250, Blackfriars-road; Mr. Edgar Mr. Seaton's, Dublin Castle, Park-treet, Canadea Town; a, Coleman-street-buildings, Moorgate-street, and at the office of this Paper.

THE PROJECTED BAILWAYS.

NALYSIS of the PATENT METALLIC

TO ENGINEERS, ABCHITECTS, AND CON-TRACTORS.

THACTURS, CREAVES'S LIAS CEMENT and GROUND BLUE LIAS LIME, at 3, South Whar, Paddington, London, and Works, Southum, Warvickshins. Agent for Liverpool, Mr. WYLIE, 56, Glosier-streets; Agent for Liverpool, Mr. WYLIE, 56, Glosier-streets; ditto for Chester, Mr. J. THOM PSON, Back King-street; ditto for Chester, Mr. J. HARBISON, Linea Hall-street.

A TKINSON'S CEMENT.—The public is respectfully informed, that the price of this very ex-collent Coment, which has now been in use for Architecture and Engineering works upwards of thirty years, is reduced to 2s. 3d. per bushel, and may be had in any quantity as Wystt, Parker, and Co.'s Wharf, Helland-street, Samey side of Blachfrigm-bridge.

2s. Sa. per Dustici, and may be used for stucce with Blackfrian-bridge. N.B. — This Cement being of a light colour, requires no arti-ficial colouring or painting, and they be used for stucce with three parts its own quantity of sand.

MARTIN'S PATENT CEMENT. TO ABCHITECTS, BUILDERS, AND PAINTERS IN FRESCO.

TEVENS and SON, PATENTEES and SOLE MANUPACTURERS, beg respectfully to announce that this bouutiful Consent has now arrived at a degree of excellence far supposing their most sanguine expectations. For all internal work it possesses a great superiority over every article hitherto in use; it is new bring used extensively by Government in the British Masseum and other public buildings. It DOES NOT THINOW OUT ANY SALT, but prevents a beautifully publicable far walks for days without peeing. It is equally applicable far walks for admitted to form the best ground for fiesco publicing, having been used for many of the prise freeson subty enhibiting in Mestiminater Hall. It will bear an intense beas without reaching, and for hardness, durability, and economy, cannot be equalied. 196, DRURY-LANE, LONDON.

196, DRURY-LANE, LONDON.

Agent for Liverpool and Manchester, Mr. R. Part, 13, Atherton's buildings, Dale-street, Liverpool.

KEENE'S PATENT MARBLE CEMENT.-The Patentees of this composition beg to refer to the British Museum, the Royal Exchange, the new works at Bethlem Hospital, Grosswich Hasspital, and the Co-liseum in the Regent's-park, as beildings finished or in pro-gress, in which Kenne's Cement has been used as an internal stacco. Its superiority to common plastering consists in its extreme hardness, and the rapidity with which it dries, which qualities fit it to receive paint or other finishing sconar than other water Cement. When employed for divinings, architrave, and other mouldings, in place of wood, it checks dry-rot, is impervious to vermin, prevents the spread of firs, and is more eco-nomical in its application than the material for which it thus becomes the substitute. Confirmation of these statements is to be found in the almost universal adoption of Ksene's Cement for Stirting and Hall flooring in the new housees on the Hyde Park Estate, where its application is to be seen to the fulles advan-tage. In Livernool and Manchester, Ksene's Comment has he

where its application is to be taken to be the tage. In Liverpool and Manchester, Keene's Cement has in several cases been used for the covering of the fire-proof warchouse floors, where its lightness and hardness give it that prefarence over tiles and flagging, which are much beavier, and necessarily leave the floor intersected with numerous joints, whilst Keene's Cement is laid down in one unbroken surface.

Joints, which accure a concept is and cover in our ended aurises. The high polish and marblé-like hardness of which this Coment is susceptible render it the most suitable metanic for the manufacture of Scargliola, Patentees, J. B. WHITE & SONS, Millbank-street, Westminster, Manufacturers of Roman and Parland

Depót in Liverpool, 36, Scel-street ; James Woods, Agent.

O ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MER-CHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL.

CHANTS, SHIPPERS, AND THE FUBLAC IN GENERAL. JOHNS and CO.'S PATENT STUCCO CEMEENT.-The following are the positive advantages possessed by this Invention over every Cament hisherto in-troduced:--It will effectually resist Damp. It will server vegetate not turn green, nor otherwise discolour. It will never erack, blister, ner peel off. It will form a complete Stone cealing to any Building covered with it. It so clearly resembles Stone that is impossible to datest it. It are requires either to be painted at coloured. It will keep from and good in the cask in any Climate for any number of years. It is the only Cement that an be used with eenfodence by the Sca-side. It may be used in the bettest or coldest Climates at any scasen. It will aftere to any anbatance, even to Wood, Iree, er Glass. If will every a lagrar Proparities of Sand than any other Cement. It may be used with eenfodence by the Sca-side. It may be used in the bettest or coldest Climates at any scasen. It will aftere to any anbatance, even to Sand than any other Cement. It may be worked through the Winter, as front has an best for any lower, and he ormes perfect when other Cements begin to perial. It may be worked through the Winter, as front has an effect mpon id. It may be used on the Inner Wall can an advanaged by the severest Storms. Any Flasters may apply it, the Instruc-tions for use being very clear and distinct. The first cout of this material does not exceed that of the cheepest Cement row in use; but with all the above-lamed distinct. The first coust of this material does not exceed that of the cheepest Cement row in use; but with all the above-lamed distinct. The first coust of this material does not exceed that of the cheepest Cement row in use; but with all the above-lamed distinct. The first coust of this material does not exceed that of the cheepest Cement row in use; but with all the above-lamed distinct. The first coust of this material does not exceed that of the cheepest Cement

deconomy. Architects and Builders who have used this Canasa declared that it requires only to be known, to be univ

Architects and Bunners who nove used this Cantes and y declared that it requires only to be known, so be assummaly speciences may be seen, and a Prospectus fully describing the Cement and its mode of application, together with a volume of Testimonials from every part of the Eingdom, may be obtained on application to MANN and CO., SOLE AGENTS for the Patentees, 5, Maiden-knos, Queen-sizes, Cheapside, London: of whom also may be bad, JOHNS and CO.'S PATENT STOME.-COLOUR STUCCO PAINT, expressly intended for Painting over ex-terior Walls of Houses that have been covered with Rouses or other Cements, and which have become dirive and disco-loured. It is in every way better suited for this purpose than White Lead Paint, which will frequently come off in fikkes, being in direct chemical opposition with Cement : whereas MESSRS, JOHNS and CO.'S PATENT PAINT baving as affinity for Stucco, binds itself with it, stopping the emerica, thereby rendering the wall proof against wather, and in the finish producing a pure stone-like effect, producemblas by mo other Paint whaterer. It is application, with a subset, inter by any Painter, in any clinate, wear in the mass may be used by any Painter, in any clinate, wear in the mass exposed Mather structions.

SATURDAY, AUGUST 16, 1845.

ER Majesty's visit to Ger-many will probable even s even a greater number of our countrymen to travel to the banks of the swift Rhine in the present year than

usual, large as that number always is. To those who know any thing of architectural history, and have sufficient knowledge of styles and dates to read and enjoy old buildings, Belgium, the Netherlands, and Germany, offer extraordinary attractions. It is greatly to be regretted, that comparatively few of our tourists know any thing about the matter, notwithstanding the subject now occupies much more attention in England than was the case a dozen years ago. They visit the cathedrals, and churches, and castles, both at home and abroad -they are amused and interested ; but the instruction which these buildings offer, the information that they silently convey, is in a cipher to which they have not the key, and so is lost to them.

The delight of travel is increased four-fold by a knowledge of architectural history,-we speak for a few minutes to such of our nonprofessional readers only as may not have this knowledge,-and we advise all who would derive the fullest advantage from their summer rambles, and the greatest amount of pleasure, to apply themselves to acquire it. Every old building is an open book, which may be understood without difficulty by those who know the language: it tells you when it was erected, very often the state of society at that period; at which end it was begun, at what time alterations were made. You find it to be a stage in a progress,-a part of a whole, and can see clearly what preceded it and what it led to. Architecture, as a fine-art, should form part of general education; and, indeed, probably will before long. We once heard an educated friend, who had made the grand tour, inquire the difference between classic and Gothic architecture, and have often found men who have stood in the Athenian Acropolis and wintered in Rome, who yet did not know the Doric order from the Corinthian, and had not the most remote idea that a connection exists between the structures of Greece and Rome, and the cathedrals of the middle ages on this side of the Alps; still less, that the differences between them, now so strikingly apparent, can be traced step by step, and explained.

Such ignorance in other branches of knowledge would be considered disgraceful; but in this it is not so, being almost universal : further, these very men, with others equally well informed, and not better, will never scruple to sit in committees, to decide on the merit of designs submitted to them in competition by foolishly confiding architects and speculating charlatans. Let this pass, however, being simply a parenthesis, and return to our tourists.

Antwerp, where the Queen landed, is full of interesting matter. The wood-carving in some of the churches is admirable; the ironwork over the well near the cathedral will give a lesson as to the modern working in metal, not to maention the cathedral and other buildings (duly set forth in the guide-books), which furnish a rich treat.

BUILDER. THE

Bruges and Malines afford many remarkable specimens of domestic architecture of various periods, besides churches curiously illustrative of architectural history. An air of stateliness and by-gone consequence, tinged with the melancholy traces of modern decay, characterizes these and other of the Flemish towns, and gives rise to peculiar emotions and instructive musings. The change from buildings intended for defence to those wherein convenience and comfort were alone studied, may be every where traced; while the growth of the third estate is brought to mind by the belfry and hotel de ville, found in each town. A bell to call the people together, and a place for them to meet in, were amongst the earlier requirements when they first discovered that union was strength, and began to feel their own importance. Ghent, Louvain, and Brussels give fine examples of these town halls. In the first-named town there are further illustrations of the progress of domestic architecture for those who have "eyes to see."

Germany, especially the southern parts of it, contains a large number of early and interesting specimens of what has been called the Romanesque architecture, as well as many noble and well-known examples of the pointed style. We should ourselves rather coin a word, and call the former Byzantinesque, if not Byzantine: their resemblance to the buildings of the lower Greek empire being strikingly apparent. No one can visit Santa Maria of the Capitol, the Church of the Apostles, or St. Gereon's, all in Cologne, without this conviction.

The first-named church is one of the most ancient in the city. It consists of nave and side aisles (separated by rectangular piers and plain semicircular arches)," transept terminated north and south by a semicircular absis, crowned by a hemispherical dome, and a choir with similar absis at east end. An aisle is formed around the absides by columns and semicircular arches. These columns have enormous cushion capitals, and diminish in diameter from the bottom towards the top. They would seem originally to have been rectangular piers, and afterwards worked into their present form.

Externally, St. Mary's is a rude type of most of the ehurches to be found in Cologne. It is, unfortunately, so far decayed and otherwise injured, as to be literally bound together, in parts, by iron bars introduced for that purpose.

Hope remarks of the Apostles' Church, begun in 1021, that on beholding the east end of it, immediately after entering the ancient gates of Cologne, he almost thought himself at Constantinople.

St. Martin's Church has internally the Greek distribution. Externally it has a fine square tower with four lesser towers at the angles. Of the Cathedral, a construction of a later date than those last named, we must not The circumstances which atnow speak. tended the discovery of the original drawings, the restorations which have been effected, the way in which the works are done, may afford us matter for some observations hereafter. Cologne has been called the Rome of this side of the Alps, and deserves the title. At Bonn, the cathedral is exceedingly interesting: part of it perhaps belongs to the time of the Empress Helens.

The castles on the banks of the Rhine would well pay for investigation, analysis, and classification; at present we know little of them.

• The archways are 9 feet wide, and about 22 feet high to the springing of the arch, Kach pier is 5 feet 5 inches wide on the face.

At Aix-la-Chapelle, where the queen stopped the great church has many peculiarities. The church originally built by Charlemagne was destroyed, but was rebuilt in the tenth century. The æra of Charlemsgne (in the eighth and ninth centuries), produced many fine buildings, and materially influenced the progress of architesture and the other arts; he drew from the Grecian empire artificers and artists of all kinds, and brought wholesale from Italy materials to decorate his new buildings, Our object, however, when we began this notice was simply to urge on tourists the advantage of obtaining a knowledge of architectural history and the characteristics of style. We must leave for some other opportunity the pleasant task of discussing the progress of the art in Germany.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

HAVING briefly mentioned the proceedings at Windhester in our last number, we now place before our readers notes of some of the papers which are more immediately connected with our subject. We would premise, how-ever, that the president's address was exceed-

"All party-feeling," said his lordship, ought to fade away before true archeologists. Thescience we profess ought to shew to man the vanity of his position. The knowledge of the vanity of his position. existence of many a prince and king, on whose word the lives of thousands depended, has only been brought to us by the researches of some student in charters, or the decipherer of in-scriptions upon coins. I may quote the poet in illustration-

Ambition sigh'd, she found it vain to trust The faithless column and the crumbling bust; Huge males, whose shadows stretch'd from shore to share. Their ruins perish'd and their place no more ! Convinced, she now contrasts her vast design, And all her triumphs shrink into a coin !

Nay more, ladies and gentlemen, when we look at the record of past ages, ought we not to recollect that their virtues or their errors have only been gathered from their tombs? Antiquarianism is not then the narrow pursuit its detractors would imply; the true antiquary marks the progress of races and institutions, and draws a lesson from the past. Is it not worthy of us to reflect on the history of our nation, and of mankind? It will not have been in vain, then, that the Archæological Association has been established, as affording matter for the graver studies, and giving food for superior minds."

called for the shafts of ridicule ;-attempts to illustrate an ancient inscription, decipher a charter, or explore a ruin, were treated with indifference, if not contempt. Poets lent their aid to this effect :-

'With sharpen'd sight pals Antiquarians pore, Th' inscription value, but the rust adore,'-Pops.

"Curiosities now," says Feltham, "ought "Curiosities now," says Feltham, "ought not to be neglected, especially antiquities; for these shew us the ingenuity of past ages, and include in them both example and precept. By comparing these with modern inventions we may see how the world improves in know-ledge." Shakspere, that great master of the human heart and mind, was sensibly alive to the value of antiquities of all kinds. How beautifully in his Twelfth Night he makes the Duke to easy to Viola as Casario in disquise...... Duke to say to Viola as Casario in disguise-

' No, good Cæsario, but that piece of song, That old and antique song we heard last night.'

And again-

O, fellow ! come ; the song we heard last night ; Mark it, Cesario ; it is old and plain : The spinsters and the knitters in the sun,

he free maids that weave their thread with And t bones, Do use to chaunt it : it is silly, sooth,

Digitized by Google

And dallies with the innocence of love; Like the old age.'

It is easy to throw ridicule upon any science; and antiquities have received their full share and antiquities have received their full share-perhaps not altogether unjustly bestowed. The time for poring over old grave-stones has, however, gone by; antiquarian researches have taken a bigher stand, and the ardour. with which ancient MSS. have been sought out, perused, and submitted to the public of late, promises most favourably for the develop-ment of the habits and customs of past ages. When we consider the mutual relations which connect all departments of learning, and the variety of knowledge requisite to form the true variety of knowledge requisite to form the true antiquary, the acquaintance necessary with heraldry, genealogies, inscriptions, monaments, numismatics, languages, etymologies, history, &c., we immediately see the importance of an association of many individuals, who by their joint labour are able to illustrate the progress of art, display the habits and custom 18, and elucidate the events and things of past

ages." The early history of the Society of Anti-quaries as sketched by Mr. Pettigrew, may interest some of oar readers. The Society of interest some of oar readers. Antiquaries of London was incorporated in 1751, but there was a society of gentlemen in 1751, but there was a accrety of gentiemen in London, as early as 1572, who were in the habit of meeting to pursue the study of an-tiquities. The society was under the petron-age of Archbishop Parker, and the meetings were held at the house of Sir Robert Cotton. Archbishop Whitgift became the president, and from 1572 to 1604 the society numbered Archoisnop whitght became the president, and from 1572, to 1604, the society numbered forty members. After treating of this society at length, he said the meetings of this society fell into abeyance in the time of James I.; and the latest date of its meeting is 1604. James I. was petitioned to establish an academy royal, or college, to meet at Westminster or Windsor, to have a general chapter in a year, and four quarterly dinners. In Ash-mole's Diary an entry occurs of the anti-quaries' feast, held July 2, 1659. All subsequent antiquarian labours, up to the eighteenth century, seemed to have been confined to in-dividual exertion and pursuit. Weekly meet-ings were held at the "Bear Tavern," in the Strand : there assembled Humphrey Wanley, Peter Le Neve, Mr. Maddox, Mr. Elstot, and other names well known to antiquaries and other names well known to antiquaries; and after a time they removed to the "Young Devil" tavern, in Fleet-street, and afterwards to the "Fountain" tavern, in the same street. The association was continued to the latter part of the reign of George I., and in the commencement of that of George II., at apartments in Gray's-Inn, then at the "Mitre," in Fleet-street; and other meetings were held on the evenings after the Royal Society broke p. The admission fee was a guinea. In 722, the number of members was limited to up. 100. In 1751, an Act of Incorporation was obtained, and the Society of Antiquaries was permanently established, the king naming himself founder and patron, and the admission fee raised to 51. 5s.

Mr. Edward Cresy read a very interesting paper on

WINCHESTER CATHEDRAL.

The number of the cathedrals and churches built of stone throughout England, from the period of St. Augustine to the Norman Con-quest, is so well attested, that it cannot be believed that the whole of them were swept away before the eleventh century, and that v have not a vestige remaining. That style which had for its peculiar character simplicity, and the Roman construction for its model cannot wholly have disappeared while so many buildings which served the Saxons for imitation remain scattered over the greater part of Europe. The fantastic character found in the sculpture, and sparingly introduced in the capital, and over the entrances of their buildings, and which materially differs from the Norman, agrees precisely with the embellish-ments met with in the Saxon manuscripts which have come down to us. An eastern or Byzantine invention pervades the design, as well as the execution of the works of art at this period. There is not good ground for supposing they did not accompany St. Augustine. It has become a very general opinion that we can shew no remains of Saxon architecture, and that the sumptuous churches and cathedrals erected by the Saxons, in the most solid and perfect manner, only a century before the Conquest, were destroyed by the Normans,

that others, on a grander scale, might be con-structed on their sites by that enterprising The manner of building intr people. oduced by the Romans, the cutting and hatching of stone, the forming of mortar, and more particularly a concrete with or out of flint, gravel, and chalk, was not only adopted by the Saxons, but continued in use for many centuries after but continued in use for many centuries enter they were subdued by the Normans. Both churches and castles have been found with their walls formed of these materials. cathedral of Winchester exhibits much of this construction, the oldest part of which may be attributed to the time of St. Ethelwold, who flourished about the year 980. The crypt, which has three separate divisions, is all east of the transpt; the ground at present has ac-cumulated nearly to a level with the capitals of the columns from which the vaults spring, but enough of them is to be seen to prove two of them, at least, to be the work of a time prior to the construction of the great central Norman tower. The first division is under the present choir, and has a row of five round columns up the centre, with four piers on each side, and four others which sweep round in a half circle, and form the aisle to the eastern termination of the first crypt. Masses of masonry have subsequently been introduced to accommodate Masses of masonry have the changes which have been made above, as well as to support some of the chapelries on either side of the choir. The masonry at the termination of the two aisles seems also to termination of the two alses seems also to have undergone a change, and at the present day it is difficult to say whether the exterior followed the sweep of the interior; but in all probability it did. Where the great Norman central tower has its foundation, it is evident that the crypts have been cut away for its introduction, and afterwards made good, which is proof of their construction anterior to the igs, and vaulted in a simple manner but solidly. Beyond this, and under the nave of De Lucy's building, is a smaller crypt ; its termination is also circular, and its vaulting resembling the great crypt. This was the termination of the Saxon church. The smaller crypt beyond is of much later date, and belongs to the time when the present Lady Chapel was erected. In the western aisle of the north transept the junction of the Norman and Saxon work is very evident, as is the difference in the character of the masonry of the two periods. The transepts, where attached to the tower, shew in part that they have been reconstructed, and that additional strength was given to the piers when that was done. Mr. Cresy alluded to when the twas done. Mr. Cresy alluded to the symmetry and order of setting out of these piers, and to the thorough knowledge of the most extraordinary kind for that period. When it is supposed that science was nearly forgotten. In that adopted by Bishop Ethel-wold, we have the genius of those principles wold, we have the genius of those principles will is construction that can be demanded by management was required (and is taken the work of walkelys. This prese, and its very position. Mr. Cresy pro-sected to state that the entire cathedral was entirely rebuilt by Bishop Ethelwold, in a substantial manner, towards the close of the substantial manner, towards the close of the substantial manner, towards the science the will an of Wykeham. The difference between the Saxon and Norman workmanship is clearly discorrise to the foreme. The tower is and in a styli-far superior to the foremer. The tower is and in a styli-far superior to the foremer. The tower is and will Norman buildings, but no particle of while in the present instance. If this difference periods of the supposed by Dr. Miller, the twas event and the the support to the supposed by Dr. Miller, the terms was even used that form the different periods of the supposed by Dr. Miller, the terms was even and the the different periods of the supposed by Dr. Miller, the the fore the supposed by Dr. Miller, the here the cater, the great than period of Gothic archite-ture, and Mr. Britton—authorities to whose the symmetry and order of setting out of these piers, and to the thorough knowledge of geometry shewn to have been possessed by

opinions he paid due deference-that the transepts were erected by Walkelyn; but after studying the subject for more than 30 years, and thoroughly investigating the point, he could entertain no doubt that the transepts were of Saxon erection, in which belief he . 7 24 supported by Sir Christopher Wren, Dr. Nott, and Mr. Garbett.[•] The parts of the transcets immediately connected with the tower would shew, by the superior masonry, how far the Norman workmanship extended into them. Another specimen of Norman workmanship was the ancient font, which illustrated by its sculpture various legends of St. Nicholas, a saint in high repute with the Normans. The able author proceeded next to notice the portion of the cathedral erected by Bisbop De Lucy at the close of the twelfth century, and which exhibited the first specimen to be found in any cathedral of the style known as the in any cathedral of the style known as the early English, and some of its purest and best workmanship. He then directed the attention of his auditors to the alterations effected in the nave and sisles by Bishops Edyngton and Wykeham, and pointed out how the latter ef-fected the difference now visible between the aisles of the transepts and the nave, the upper windows of the latter filling the same situation occupied by those inserted in the original building by Ethelwold. Wykebam retained the original arch of these windows and inserted within them a pointed arch, hence their peculiar form, as may be distinguished by all careful observers. The magnificent altar screen, the peculiar glory of Winchester cathedral, was next touched upon by Mr. Cresy. It was commenced by Cardinal Beaufort and finished by Bishop Fox. During the episco-pacy of the former the vaulting of the nave pacy of the former the valifing of the nave and its aisles was completed, as commenced by Wykeham. Bishop Waynfleet does not appear to have made any alterations in the building, several of which were effected by Bishop Langton near its eastern extremity To Bishop Fox the church is indebted for that portion which surrounds the altar; and to his friand Prior Silkestead for the chard his friend Prior Silkestead for the chapel bearing his name, and for the extension of the Lady Chapel, the last work effected previous to the Reformation. Mr. Cresy illustrated his paper by numerous diagrams, plans, and drawings, shewing the principle upon which the whole church and all its parts and portions were set out; and after a very curious illustration on the subject of the rose windows (one of which it appears is to be seen in the northern transept of this cathedral), with all their curious yet scientific details, Mr. Cresy concluded amidst great applause.

The Rev. S. Isaacson read a paper on

. THE ANCIENT TEMPLE AT ARBORLOWE, DERBY

The paper commenced by stating that the circular temples of the ancient Druids are universally allowed to be the most important of all the monuments having reference to the early history of our country; and, conse-quently, any researches calculated to throw light upon their origin or character, or which may bring them more prominently before the public, and thus lead the inquiring mind to a minuter investigation, cannot fail to be inter-esting to the Archeeological world. Though Though Arborlowe does not pretend to the magnifi-cence of Abury or Stonehenge, it is still far incidental and scanty notices which it has hitherto received. With the assistance of a friend, Mr. Bateman, the author had succeeded in discovering the original deposit in the great barrow immediately adjoining the circle, which had hitherto defied the scrutiny of all previous excavators. The reverend author proceeded to give a history of circular temples, oasidered without reference to the British lake, deducing their origin from the very earliest agree, and throughout all parts of the world. The altar under the hill, with the twelve pillars under the hill, erected by Moses, the twelve stones set up in the midst of Jordan by Joshus, and the twelve stones taken out of the Jordan and pitched in Gilgal, are striking illustrations of these temples of unhewn stone among the Israelites. The great stones or temples of the Druids in Britain, were as temples of the Druids in Britain, were as little worked as possible, and it is at least possible that the form was borrowed from the Phonicians or Tyrians, who preserved it in their religious structures wherever they went. In Greece and Rome circular temples were erected, and open at the top. Homer describes them; in Baruch we read of their construction in Assyria. It was not, there-fore, for ignorance of the fine arts that Druidi-real temples were erected without pillars. cci temples were erected without pillars; regular architecture and sculpture were sedulously avoided in these erections. Magnificence was sought for in vastness and large masses of stone : in Abury and Stonehenge specimens of this Cyclopsen architecture ap-pear in all their colossal grandeur. Nor will the smaller temple of Arborlowe be found unworthy of attention, placed as it is at a remote distance from the eve of the ordinary traveller : and seldom witnessed except by those whose researches more immediately embrace such objects. The temple is surrounded by a large rampart, measuring 7 yards in height inter-nally, and 6 externally; the fosse, which is nally, and 6 externally; the 10556, which is on the inside, being 5 yards over at the bottom. The form is not strictly circular, but rather elliptical, or similar to a flattened sphere, the diameter heing 100 yards. The extreme diameter being 100 yards. The enclosed area is 60 yards in diameter, and the author had no doubt the number of stones originally amounted to thirty, which would harmonise with the ancient cycles. It is quite clear that these stones were never placed in an erect position, but laid on the bare surface of the rock at regular intervals. Probably the area was divided into twelve equal parts representing the divided into twelve equal parts representing months, so that the whole structure would con-stitute a calendar, consisting of 360 days, into which the year was originally divided. The two entrances to the temple were north and south, consisting of benches of earth across the fosse, on each side of which orginally stood a large stone. In the centre is one very large mass of rock, 15 feet by 8, and nearly 3 feet thick, weighing probably 5 tons, and called the sacrificial stone, from a large basin, caused perhaps by exposure to the weather, in which the blood of the victim was poured. Near this are two other stones much broken; and pro-bably a fourth existed. The idea of this being a Roman work is described by the reverend author as altogether preposterous, as it agrees with no known specimen of their erections; and the Danes and Saxons have still less claims to its paternity. In fact, the contents of the cist lately found will place its construction at least 500 years before the invasion of Cæsar. We must conclude our notice with the following remark: --- The position of the largest state, immediately facing the east, renders it highly probable that the founders were sun worshipers; and the two other stones exhibit-

ing indisputable marks of having undergone the action of intense heat, it is not at all unlikely that on these were kindled the great fires with which the earliest inhabitants of the British Islands were accustomed, at the return of the equinoxes and solstices, to worship their god Belus or Baal, the Grecian Apollo." Mr. Planché read a valuable paper "On the arms of Saer de Quincy, first Earl of Win-

chester, and on early armorial bearings, espe-cially those termed 'honourable ordinaries.'" The excellent author considered the heraldic figures, entitled the ordinaries, had their origin ngures, entitled the ordinaries, and their origin in the necessity for strengthening the long kite-shaped shield, in use during the 11th cen-tury, and exhibited drawings of a variety of shields of that period, in which the forms of all but "the pile" were to be traced in the metal or wooden clamps or fastenings and de-fences of the shield. To the same origin he traced several other charges. Mr. Planché argued, that the symbolical characters at tached to them were the inventions of later hands, and could not be traced higher than the 15th century.

INFLUENCE OF NEWLY-BUILT HOUSES ON THE HEALTH OF THEIR OCCUPIERS. DR. SUTRO'S REPLY.

-Having seen the two last numbers of SIR,your valuable journal, I feel called upon to con-sider, dispassionately, the objections raised by Mr. G. Robins against the article extracted from a medical journal under the above title. Of course the article was only intended for the course the article was only intended for the medical public, but since you chose to insert it in your journal, and thus occasioned the reply (if I may so call it), I think it my duty to enter fully into the writer's arguments, urged, I must say, in a most professional and gentlemanly manner, in which I should rejoice to see all scientific discussions carried on, though interest or fame may be affected. affected.

I perfectly concur with the writer, that experience deserves greater appreciation in such cases than theory, and that nothing would be more dangerous than to sacrifice facts to speculation. But the question is, how far do theory and practice agree with each other in this point? If your correspondent never met with the pale anœmic face, wasted muscles, this point? with the pale anœmic face, wasted muscles, decrease of strength, sluggishness of all the functions (not sluggishness of the pulse), all consequent upon inhabiting a newly-eracted residence, this only proves that he never placed persons in the early occupation of such dwellings, as are described as peculiarly inju-rious in the above article. Mr. Robins asks, "whether he has the charge of homicide upon "whether he has the ensities of a second parties in himself for having constantly placed parties in the occupation of their dwellings within six months from the commencement thereof ? ask, whether any charge of that kind can be inferred from the quoted article? Its whole purpose consists in warning against the too early inhabiting newly-built houses without properly testing their fitness for occupation. sanatory commissioners to examine it, when, if sufficiently dry, it might be inhabited." Your correspondent shews himself by the

careful tests he employs, that he must be satisfied of the dryness of a house before he places the occupier into it; and it can but be beneficial to point out and explain the in-juries arising either from bad material of the house, or from exposure to its dampness, and to recommend the proper remedies sgainst such evils. I must certainly admit, that new houses may be earlier occupied in this country than on the continent, inasmuch as the houses are mostly built here of burnt bricks, which contain and attract the smallest proportion of humidity, and thus occasion the least damp-ness. This may account for the less frequent maladies caused in this country by the above influences. I need not enter into the practical points mentioned, and the theoretical points doubted (but not disproved). By-the-bye, I could not find the expression, "*floating* par-ticles of lime." The phrase referred to, runs thus: the following foreign substances are

mixed with the air (speaking of newly built and not yet dried houses, as particles of time which have been proved beyond doubt to exist in the atmosphere of new habitations, being suspended by the evaporation of the moisture. As regards the injury of fresh paint (for the question only turns upon undried paint), I have unfortunately had myself an opportunity very lately of witnessing serious consequences. A taleated young friend of mine, to please an acquaintance, took a newly-painted room in house; when I saw him after three weeks, bis I found him suffering with a severe and most obstinate cough. His removal was ordered, but the cough having resisted the most ener-getic remedies, he was advised by his medical attendants to try the effects of the bath. Without much pain, and without great fever, his lange are so intensely irritated, that it would be sanguine to expect his complete reines on your valuable space, I am, Sir, &c., Sisismund Surro, M.D.

3, Great Marlborough-street, Ang. 7th, 1845.

SUSPENSION BRIDGES.

Sra,....I am not disposed to enter into a con-troversy with Mr. Dredge upon the subject of suspension bridges, even if I had the leisure and ability so to do; but still I cannot refrain from offering a few more remarks on the sub-ient. I feel narticularly obliged (as I am sure from offering a few more remarks on the sub-ject. I feel particularly obliged (as I am sure the rest of your readers must do) for the dia-grams and explanatory matter contained in your 128th number; the principles of which are so clearly set forth and exemplified in a supplement to "Hosking's Treatise on Bridge Bailding " that the matter is not abcord Building," that the matter is not altogether new to me.

Mr. Dredge, in reply to your remarks with reference to suspension and compression bridges, was peculiarly unfortunate in his choice of a subject for illustration, because the works that failed at Derby and Ashton were in course of construction, and incomplete, therefore it was anfair to take advantage of such a circumstance, and arrive at such conclu-sion; but Mr. Dredge having a principle and theory of his own, does not rest his argument on such futile ground, but rather, as I before understood, against the principle of compres-sion bridges generally. Suspension and comunderstood, against the principle of compres-sion bridges generally. Suspension and com-pression bridges are totally different in princi-ples, in their mode of construction and composition; and I should be sorry if an remark of mine should have a tendency ty injure an invention that may be said to be "io its infrare." But whatever ominion may bu its infancy." But whatever opinion may bu entertained of its usefulness and general applie cability, I do not think sufficient evidence been produced in its favour for us totally to abandon a principle which is generally acknowledged to be, and has proved itself effi-cient; and which has received the impress of time and experience, and been sanctioned and adopted by every professional man of eminence in this and other countries, both in the past and present age. As we very rarely hear of bridges of fixed principles falling after they have once been completed, the accidents above alluded to came very opportunely to fill up the vacuum there would otherwise have been in Mr. Dredge's argument. As so much has been said upon the subject, we may as well in-quire if ho failure has attended suspension bridges? I think I can enumerate many in-stances; one in India, the Broughton, the Montrose bridge, occasioned by the passage of troops; one at Morpeth, Northumberland, from a crowd of persons returning from a fair; the Yurmouth bridge, and others (which shew the effect produced by percussion, &c., on iron), and generally attended with a serious loss of life. The Menai and Montrose bridges, the Brighton chain pier, &c., have also been partially destroyed by the violent action of the elements or other causes.

A Madras paper, which seems to be well informed upon the subject, observed with reference to the fall of the bridge in India, "that the severe strain or vibration, occasioned by the measured tread of a body of military is indeed so trying to these structures, that it is considered by engineers that they will in Is considered by engineers that they will in this case bear but one-eighth part of the weight they might otherwise be safely loaded with. We have numerous examples of bridges of masonry, many of which have withstood the

SATURDAY, AUGUST 16, 1845.

ER Majesty's visit to Germany will probably lead even a greater number of our countrymen to travel to the banks of the swift Rhine in the present year than

usual, large as that number always is. To those who know any thing of architectural history, and have sufficient knowledge of styles and dates to read and enjoy old buildings, Belgium, the Netherlands, and Germany, offer extraordinary attractions. It is greatly to be regretted, that comparatively few of our tourists know any thing about the matter, notwithstanding the subject now occupies much more attention in England than was the case a dozen years ago. They visit the cathedrals, and churches, and castles, both at home and abroad -they are amused and interested ; but the instruction which these buildings offer, the information that they silently convey, is in a cipher to which they have not the key, and so is lost to them.

The delight of travel is increased four-fold by a knowledge of architectural history,-we speak for a few minutes to such of our nonprofessional readers only as may not have this knowledge,-and we advise all who would derive the fullest advantage from their summer rambles, and the greatest amount of pleasure, to apply themselves to acquire it. Every old building is an open book, which may be understood without difficulty by those who know the language: it tells you when it was erected, very often the state of society at that period ; at which end it was begun, at what time alterations were made. You find it to be a stage in a progress,--a part of a whole, and can see clearly what preceded it and what it led to, Architecture, as a fine-art, should form part of general education; and, indeed, probably will before long. We once heard an educated friend, who had made the grand tour, inquire the difference between classic and Gothic architecture, and have often found men who have stood in the Athenian Acropolis and wintered in Rome, who yet did not know the Doric order from the Corinthian, and had not the most remote idea that a connection exists between the structures of Greece and Rome, and the cathedrals of the middle ages on this side of the Alps; still less, that the differences between them, now so strikingly apparent, can be traced step by step, and explained.

Such ignorance in other branches of knowledge would be considered disgraceful; but in this it is not so, being almost universal: further, these very men, with others equally well informed, and not better, will never scruple to sit in committees, to decide on the merit of designs submitted to them in competition by foolishly confiding architects and speculating charlatans. Let this pass, however, being simply a parenthemis, and return to our tourists.

Antwerp, where the Queen landed, is full of interesting matter. The wood-carving in some of the churches is admirable; the ironwork over the well near the cathedral will give a lesson as to the modern working in metal, not to mention the cathedral and other buildings (duly act forth in the guide-books), which furnish a rich treat.

Bruges and Malines afford many remarkable specimens of domestic architecture of various periods, besides churches curiously illustrative of architectural history. An air of stateliness and by-gone consequence, tinged with the melancholy traces of modern decay, characterizes these and other of the Flemish towns, and gives rise to peculiar emotions and instructive musings. The change from buildings intended for defence to those wherein convenience and comfort were alone studied, may be every where traced ; while the growth of the third estate is brought to mind by the belfry and hotel de ville, found in each town. A bell to call the people together, and a place for them to meet in, were amongst the earlier requirements when they first discovered that union was strength, and began to feel their own importance. Ghent, Louvain, and Brussels give fine examples of these town halls. In the first-named town there are further illustrations of the progress of domestic architecture for those who have "eyes to see."

Germany, especially the southern parts of it, contains a large number of early and interesting specimens of what has been called the Romanesque architecture, as well as many noble and well-known examples of the pointed style. We should ourselves rather coin a word, and call the former Byzantinesque, if mot Byzantine; their resemblance to the buildings of the lower Greek empire being strikingly apparent. No one can visit Santa Maria of the Capitol, the Church of the Apostles, or St. Gereon's, all in Cologne, without this conviction.

The first-named church is one of the most ancient in the city. It consists of nave and side aisles (separated by rectangular piers and plain semicircular arches),* transept terminated north and south by a semicircular absis, crowned by a hemispherical dome, and a choir with similar absis at east end. An aisle is formed around the absides by columns and semicircular arches. These columns have enormous cushion capitals, and diminish in diameter from the bottom towards the top. They would seem originally to have been rectangular piers, and afterwards worked into their present form.

Externally, St. Mary's is a rude type of most of the ehurches to be found in Gologne. It is, unfortunately, so far decayed and otherwise injured, as to be literally bound together, in parts, by iron bars introduced for that purpose.

Hope remarks of the Apostles' Ohurch, begun in 1021, that on beholding the east end of it, immediately after entering the ancient gates of Cologne, he almost thought himself at Constantinople.

St. Martin's Church has internally the Greek distribution. Externally it has a fine square tower with four lesser towers at the angles. Of the Cathedral, a construction of a later date than those last named, we must not now speak. The circumstances which attended the discovery of the original drawings, the restorations which have been effected, the way in which the works are done, may afford us matter for some observations hereafter. Cologne has been called the Rome of this side of the Alps, and deserves the title. At Bonn, the cathedral is exceedingly interesting: part of it perhaps belongs to the time of the Empress Helena.

The castles on the banks of the Bhine would well pay for investigation, analysis, and classification; at present we know little of them.

• The archways are 9 feet wide, and about 32 feet high to the springing of the arch. Each pier is 6 feet 3 inches wide on the face.

At Aix-la-Chapelle, where the queen stopped the great church has many peculiarities. The church originally built by Charlemagne was destroyed, but was rebuilt in the tenth century. The æra of Charlemagne (in the eighth and ninth centuries), produced many fine buildings, and materially influenced the progress of architecture and the other arts; he drew from the Grecian empire artificers and artists of all kinds, and brought wholesale from Italy materials to decorate his new buildings, Our object, however, when we began this notice was simply to urge on tourists the advantage of obtaining a knowledge of architectural history and the characteristics of style. We must leave for some other opportunity the pleasant task of discussing the progress of the art in Germany.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

HAVING briefly mentioned the proceedings at Winchester in our last number, we now place before our readers notes of some of the papers which are more immediately connected with our subject. We would premise, however, that the president's address was exceedingly judicious.

ever, that the pressure ingly judicious. "All party-feeling," said his lordship, "ought to fade away before true archeologists. The science we profess ought to shew to man the vanity of his position. The knowledge of the existence of many a prince and king, on whose word the lives of thousands depended, has only been brought to us by the researches of some student in charters, or the decipherer of inscriptions upon coins. I may quote the poet in illustration—

Ambition sigh'd, she found it vain to trust The faithless column and the srambling bust; Huge moles, whose shadows stretch'd from shore to shore.

shore to shore, Their ruins perish'd and their place no more ! Convinced, she now contracts her vast design, And all her triumphs shrink into a coin !

Nay more, ladies and gentlemen, when we look at the record of past ages, ought we not to recollect that their virtues or their errors have only been gathered from their tombs? Antiquarianism is not then the narrow pursuit its detractors would imply; the true antiquary marks the progress of races and institutions, and draws a lesson from the past. Is it not worthy of us to reflect on the history of our nation, and of mankind? It will not have been in vain, then, that the Archæological Association has been established, as affording matter for the graver studies, and giving food for superior minds."

'With sharpen'd sight pals Antiquarians pore, Th' inscription value, but the rust adorp,'-Pors.

"Curiositide now," says Feltham, "ought not to be neglected, especially antiquities; for these shew us the ingenuity of past ages, and include in them both example and precept. By comparing these with modern inventions we may see how the world improves in knowledge." Shakspere, that great master of the human heart and mind, was sensibly alive to the value of antiquities of all kinds. How beautifully in his Twelfth Night he makes the Duke to say to Viola as Cæsario in disguise—

' No, good Cæsario, but that piece of song, That old and antique song we heard last night.'

And again-

'O, fellow ! come; the song we heard last night; Mark it, Cæsario; it is old and plain : The spinsters and the knitters in the sun,

And the free maids that weave their thread with bones,

Digitized by Google

Do use to chaunt it : it is silly, sooth, And dallies with the innocence of love; Like the old age.

It is easy to throw ridicule upon any science; and antiquities have received their full share perhaps not altogether unjustly bestowed. perhaps not allogether injustly bestowed. The time for poring over old grave-stones has, however, gone by; antiquarian researches have taken a higher stand, and the ardour with which ancient MSS. have been sought out, perused, and submitted to the public of late, promises most favourably for the develop ment of the habits and customs of past ages. When we consider the mutual relations which connect all departments of learning, and the variety of knowledge requisite to form the true antiquary, the acquaintance necessary with heraldry, genealogies, inscriptions, monements, numismatics, languages, etymologies, history, &c., we immediately see the importance of an ments, association of many individuals, who by their joint labour are able to illustrate the progress of art, display the habits and customs, and elucidate the events and things of past

ages." The early history of the Society of Anti-quaries as sketched by Mr. Pettigrew, may interest some of our readers. The Society of Antiquaries of London was incorporated in 1751, but there was a society of gentlemen in London, as early as 1572, who were in the habit of meeting to pursue the study of antiquities. The society was under the patron-age of Archbishop Parker, and the meetings were held at the house of Sir Robert Cotton. Archbishop Whitgift became the president, and from 1572, to 1604, the society numbered forty members. After treating of this society at length, he said the meetings of this society fell into abeyance in the time of James I.; and the latest date of its meeting is 1604. James I. was petitioned to establish an academy royal, or college, to meet at Westminster Windsor, to have a general chapter in a or year, and four quarterly dinners. In Ash-mole's Diary an entry occurs of the anti-quaries' feast, held July 2, 1659. All subsequent antiquarian labours, up to the eighteenth century, seemed to have been confined to in-dividual exertion and pursuit. Weekly meet-ings were held at the "Bear Tavern," in the Strand: there assembled Humphrey Wenley, Peter Le Neve, Mr. Maddox, Mr. Elstot, and other names well known to antiquaries; and after a time they removed to the "Young Devil" tavern, in Fleet-street, and afterwards to the "Fountain" tavern, in the same street. The association was continued to the latter part of the reign of George I., and in the commencement of that of George II., at apartments in Gray's-Inn, then at the "Mitre," leet-street; and other meetings were held on the evenings after the Royal Society broke up. The admission fee was a guinea. In 1722, the number of members was limited to 100. In 1751, an Act of Incorporation was obtained, and the Society of Antiquaries was permanently established, the king naming himself founder and patron, and the admission king naming fee raised to 51. 5s.

Mr. Edward Cresy read a very interesting paper on

WINCHESTER CATHEDRAL

The number of the cathedrals and churches built of stone throughout England, from the period of St. Augustine to the Norman Con-quest, is so well attested, that it cannot be believed that the whole of them were swept away before the eleventh century, and that we have not a vestige remaining. That style which had for its peculiar character simplicity, and the Roman construction for its model. cannot wholly have disappeared while so many buildings which served the Saxons for imitation remain scattered over the greater part of Europe. The fantastic character found in the sculpture, and sparingly introduced in the capital, and over the entrances of their build-ings, and which materially differs from the Norman, agrees precisely with the embellish-ments met with in the Saxon manuscripts which have come down to us. An eastern or Byzantine invention pervades the design, as well as the execution of the works of art at this period. There is not good ground for supposing they did not accompany St. Augustine. It has become a very general opinion that we can shew no remains of Saxon architecture, and that the sumptuous churches and cathedrals erected by the Saxons, in the most solid and perfect manner, only a century before the Conquest, were destroyed by the Normans,

that others, on a grander scale, might be con-structed on their sites by that enterprising people. The manner of building introduced people. The manner of building introduced by the Romans, the cotting and hatching of stone, the forming of mortar, and more particularly a concrete with or out of flint, gravel, and chalk, was not only adopted by the Saxons, but continued in use for many centuries after they were subdued by the Normans. Both churches and castles have been found with their walls formed of these materials. The cathedral of Winchester exhibits much of this construction, the oldest part of which may be attributed to the time of St. Ethelwold, who flourished about the year 980. The crypt, which has three separate divisions, is all east of the transept; the ground at present has ac-cumulated nearly to a level with the capitals of the columns from which the vaults spring, but enough of them is to be seen to prove two of them, at least, to be the work of a time prior to the construction of the great central Norman tower. The first division is under the present choir, and has a row of five round columns up the centre, with four piers on each side, and four others which sweep round in a half circle, and form the sisle to the eastern termination of the first crypt. Masses of masonry have subsequently been introduced to accommodate the changes which have been made above, as well as to support some of the chapelries on either side of the choir. The masonry at the termination of the two aisles seems also to have undergone a change, and at the present day it is difficult to say whether the exterior followed the sweep of the interior; but in all probability it did. Where the great Norman entral tower has its foundation, it is evident that the crypts have been cut away for its introduction, and afterwards made good, which is proof of their construction anterior to the tower. The crypt is lighted byrounded open-igs, and vaulted in a simple manner but solidly. Beyond this, and under the nave of De Lucy building, is a smaller crypt; its termination is also circular, and its vaulting resembling the great crypt. This was the termination of the Saxon church. The smaller crypt beyond is of much later date, and belongs to the time when the present Lady Chapel was erected. In the western aisle of the north transept the junction of the Norman and Saxon work is very evident, as is the difference in the character of the masonry of the two periods. The transepts, where attached to the tower, shew in part that they have been reconstructed, and that additional strength was given to the piers when that was done. Mr. Cresy alluded to when unt was done. Mr. Cresy alluded to the symmetry and order of setting out of the symmetry and to the thorough knowledge of the symmetry and to have been possessed by bishop Ethelwold, and that its application was nearly forgotter. In that adopted by Bishop Ethelwold, and that its application was nearly for determined which we admire in the skill is construction that can be demanded of an architect for any age, and more than is used to the second the transcept more norther of the size of the size of the second the transcept more norther of the size of the second the size of the second the size of the second the transcept more norther of the second the size of the second the second the size of the second the size of the second the the symmetry and order of setting out of these piers, and to the thorough knowledge of geometry shewn to have been possessed by

opinions he paid due deference-that the transepts were erected by Walkelyn; but after studying the subject for more than 30 yean, and thoroughly investigating the point, he could entertain no doubt that the transpu were of Saxon erection, in which belief he wa supported by Sir Christopher Wren, Dr. Nott, and Mr. Garbett. The parts of the transpu immediately connected with the tower would Shew, by the superior masonry, how far the Norman workmanship extended into them. Another specimen of Norman workmanship was the ancient font, which illustrated by it sculpture various legends of St. Nicholas, a saint in high repute with the Normans. The able author proceeded next to notice the portion of the cathedral erected by Bishop De Lucy at the close of the twelfth century, and which exhibited the first specimen to be found in any cathedral of the style known as the early English, and some of its purest and best workmanship. He then directed the attention of his auditors to the alterations effected in the nave and aisles by Bishops Edyngton and Wykeham, and pointed out how the latter effected the difference now visible between the aisles of the transepts and the nave, the upper windows of the latter filling the same situstion occupied by those inserted in the original building by Ethelwold. Wyketiam retained the original arch of these windows and inserted within them a pointed arch, hence their peculiar form, as may be distinguished by all careful observers. The magnificent altar dral, was next touched upon by Mr. Crey. It was commenced by Cardinal Beaufort and finished by Bishop Fox. During the episcopacy of the former the vaulting of the nave and its aisles was completed, as commenced by Wykeham. Bishop Waynfleet does not appear to have made any alterations in the building, several of which were effected by Bishop Langton near its eastern extremity To Bishop Fox the church is indebted for that portion which surrounds the altar; and to his friend Prior Silkestead for the chapel bearing his name, and for the extension of the Lady Chapel, the last work effected previous to Lady Chapel, the last work enected previous of the Reformation. Mr. Cresy illustrated his paper by numerous diagrams, plans, and drawings, shewing the principle upon which the whole church and all its parts and por-tions were set out; and after a very curious illustration on the subject of the rose window illustration on the subject of the rose windows (one of which it appears is to be seen in the northern transept of this cathedral), with all their curious yet scientific details, Mr. Cresy concluded amidst great applause.

ł

The Rev. S. Isaacson read a paper on

. THE ANCIENT TEMPLE AT ARBORLOWE, DERBY.

The paper commenced by stating that the circular temples of the ancient Druids are universally allowed to be the most important of all the monuments having reference to the early history of our country; and, conse-quently, any researches calculated to throw light upon their origin or character, or which may bring them more prominently before the public, and thus lead the inquiring mind to a minuter investigation, cannot fail to be inter-esting to the Archeological world. Though Though Arbarlowe does not pretend to the magnifi-cence of Abary or Stonehenge, it is still far to important to be allowed to repose under the incidental and scanty notices which it has hitherto received. With the assistance of a friend, Mr. Bateman, the author had succeeded in discovering the original deposit in the great barrow immediately adjoining the circle, which had hitherto defied the scrutiny of all previous excavators. The reversed author proceeded to give a history of circular temples, considered without reference to the British lake, deducing their origin from the very earliest ages, and throughout all parts of the world. The altar under the hill, with the twelve pillars under the hill, erected by Moses, the twelve stones set up in the midst of Jordan by Lebbar and the trajlar stores theore out of by Joshna, and the twelve stones taken out of the Jordan and pitched in Gilgal, are striking illustrations of these temples of unbewn stone among the Israelites. The great stones or temples of the Druids in Britain, were as intile worked as possible, and it is at least possible that the form was borrowed from the Phonicians or Tyrians, who preserved it in their religious atructures wherever they went. In Greece and Rome circular temples were erected, and open at the top. Homer describes them; in Baruch we read of their construction in Assyria. It was not, there-fore, for ignorance of the fine arts that Druidical temples were erected without pillars; regular architecture and sculpture were sedulously avoided in these erections. Magnificence was sought for in vastness and large masses of stone: in Abury and Stonehenge specimens of this Cyclopæn architecture ap-pear in all their colossal grandeur. Nor will the smaller temple of Arborlowe be found unworthy of attention, placed as it is at a remote distance from the eye of the ordinary traveller; and seldom witnessed except by those whose and seldom witnessed except by those whose researches more immediately embrace such objects. The temple is surrounded by a large rampart, measuring 7 yards in height inter-nelly, and 6 externally; the fosse, which is on the inside, being 5 yards over at the bottom. The form is not strictly circular, but rather elliptical, or similar to a flattened sphere, the extreme diameter being 100 yards. The eaclosed area is 60 yards in diameter, and the author had no doubt the number of stones originally amounted to thirty. of stones originally amounted to thirty, which would harmonise with the ancient cycles. It is quite clear that these stones were never placed in an erect position, bat laid on the bare surface of the rock at regular intervals. Probably the area was divided into twelve equal parts representing the months, so that the whole structure would con-stitute a calendar, consisting of 360 days, into which the year was originally divided. The two entrances to the temple were north and south, consisting of benches of earth across the fosse, on each side of which orginally stood a large stone. In the centre is one very large mass of rock, 15 feet by 8, and nearly 3 feet thick, weighing probably 5 tons, and called the scrificial stone, from a large basin, caused perhaps by exposure to the weather, in which the blood of the victim was poured. Near this are two other stones much broken; and pro-bably a fourth existed. The idea of this being a Roman work is described by the reverend author as altogether preposterous, as it agrees with no known specimen of their erections; and the Danes and Saxons have still less claims to its praternity. In fact, the contents of the cist lately found will place its construction at least 500 years before the invasion of Cæsar. We must conclused our notice with the following remark: -- "The position of the largest stone, immediately facing the east, renders it highly probable that the founders were sun worshipers; and the two other stones exhibit-

ing indisputable marks of having undergone he action of intense heat, it is not at all unlikely that on these were kindled the great fires with which the earliest inhabitants of the British Islands were accustomed, at the return

of the equinoxes and solatices, to worship their god Belus or Baal, the Grecian Apollo." Mr. Planché read a valuable paper "On the arms of Saer de Quincy, first Earl of Win-chester, and on early armorial bearings, espe-cially those termed 'honourable ordinaries.'" The excellent author considered the heraldic figures, entitled the ordinaries, had their origin figures, entitled the ordinaries, had their origin in the necessity for strengthening the long kite-shaped shield, in use during the 11th cen-tury, and exhibited drawings of a variety of shields of that period, in which the forms of all but "the pile" were to be traced in the metal or wooden elamps or fastenings and de-fences of the shield. To the same origin he traced several other charges. Mr. Flanché argued, that the symbolical characters at-tached to them were the inventions of later hands, and could not be traced higher than the 15th century. 15th century.

INFLUENCE OF NEWLY-BUILT HOUSES ON THE HEALTH OF THEIR OCCUPIERS.

DR. SUTRO'S REPLY.

-Having seen the two last numbers of SIR.your valuable journal, I feel called upon to con-sider, dispassionately, the objections raised by Mr. G. Robins against the article extracted from a medical journal under the above title. Of course the article was only intended for the course the article was only intended for the medical public, but since you chose to insert it in your journal, and thus occasioned the reply (if I may so call it), I think it my duty to enter fully into the writer's arguments, urged, I must say, in a most professional and gentlemanly manner, in which I should rejoice to see all acientific discussions carried on, though interest or fame may be effected affected.

I perfectly concur with the writer, that experience deserves greater appreciation in such cases than theory, and that nothing would be more dangarous than to sacrifice facts to speculation. But the question is, how far do theory and practice agree with each other in theory and practice agree with each other in this point? If your correspondent never met with the pale anœmic face, wasted muscles, decrease of strength, aluggishness of all the functions (not sluggishness of the pulse), all consequent upon inhabiting a newly-erected residence, this only proves that he never placed persons in the early occupation of such available of the pulse of such a provide the pulse. dwellings, as are described as peculiarly inju-rious in the above article. Mr. Robins asks, " whether he has the charge of homicide upon himself for having constantly placed parties in the occupation of their dwellings within six months from the commencement thereof?" I ask, whether any charge of that kind can be inferred from the queted article? Its whole purpose consists in warning against the too early inhabiting newly-built houses without properly testing their fitness for occupation. As a proof of this I beg to refer to the follow-ing phrase, occurring before the proposal that a sanatary commission should be appointed to sanatory commissioners to exa nine it, when, if sufficiently dry, it might be inhabited." Your correspondent shews himself by the

careful tests he employs, that he must be satisfied of the dryness of a house before he places the occupier into it; and it can but be beneficial to point out and explain the injuries arising either from bad material of the house, or from exposure to its dampness, and to recommend the proper remedies against such evils. I must certainly admit, that new houses may be earlier occupied in this country than on the continent, inasmuch as the houses are mostly built here of burnt bricks, which contain and attract the smallest proportion of humidity, and thus occasion the least damp-ness. This may account for the less frequent maladies caused in this country by the above influences. I need not enter into the practical points mentioned, and the theoretical points doubted (but not disproved). By-the-bye, I could not find the expression, "*floating* par-ticles of lime." The phrase referred to, runs thus: the following foreign substances are

mixed with the air (speaking of newly built and not yet dried houses, as particles of time which have been proved beyond doubt to exist in the atmosphere of new habitations, being suspended by the evaporation of the moisture. As regards the injury of fresh paint (for the question only turns upon undried paint), I have unfortunately had myself an opportunity very lately of witnessing serious consequences. A talented young friend of mine, to please an scquaintance, took a newly-painted room in his house; when I saw him after three weeks, I found him suffering with a severe and most obstinate cough. His removal was ordered, getic remedies, he was advised by his medical attendants to try the effects of the bath. attendants to try the effects of the bath. Without much pain, and without great fever, his larges are so intensely irritated, that it would be sanguins to expect his complete re-covery. Apologizing for intruding these hasty lines on your valuable space, I am, Sir, &c., Signs wurn Surno, M.D.

3, Great Marlborough-street, Ang: 7th, 1845.

SUSPENSION BRIDGES.

Siz,....I am not disposed to enter into a con-troversy with Mr. Dredge upon the subject of suspension bridges, even if I had the leisure suspension bridges, even if I had the leisure and ability so to do; but still I cannot refrain from offering a few more remarks on the subfrom offering a few more remarks on the sub-ject. I feel particularly obliged (as I am sure the rest of your readers must do) for the dia-grams and explanatory matter contained in your 128th number; the principles of which are so clearly set forth and exemplified in a supplement to "Hosking's Treatise on Bridge Building," that the matter is not altogether Bailding," new to me.

new to me. Mr. Dredge, in reply to your remarks with reference to suspension and compression bridges, was peculiarly unfortunate in his choice of a subject for illustration, because the works that failed at Derby and Ashton were in course of construction; and incomplete, therefore it was unfair to take advantage of such a director active at each or only. such a circumstance, and arrive at such conclusuch a circumstance, and arrive at such conclu-sion; but Mr. Dredge having a principle and theory of his own, does not rest his argument on such futile ground, but rather, as I before understood, against the principle of compres-sion bridges generally. Suspension and com-pression bridges are totally different in princi-ples, in their mode of construction and composition; and I should be sorry if an remark of mine should have a tendency. remark of mine should have a tendency ty injure an invention that may be said to be "io its infancy." But whatever opinion may be entertained of its usefulness and general applie cability, I do not think sufficient evidence has-been produced in its favour for us totally to abaudon a principle which is generally acknowledged to be, and has proved itself effi-cient; and which has received the impress of time and experience, and been sanctioned and adopted by every professional man of eminence in this and other countries, both in the past and present age. As we very rarely hear of bridges of fixed principles falling after they have once been completed, the accidents above alluded to came very opportunely to fill up the vacuum there would otherwise have been in Mr. Dredge's argument. As so much has been said upon the subject, we may as well inquire if no failure has attended suspension bridges? I think I can enumerate many in-stances; one in India, the Broughton, the Montrose bridge, occasioned by the passage of troops; one at Morpeth, Northumberland, from a crowd of persons returning from a fair; the Yurmouth bridge, and others (which shew the effect produced by percussion, &c., on iron), and generally attended with a serious loss of life. The Menai and Montrose bridges, the Brighton chain pier, &c., have also been partially destroyed by the violent action of the

elements or other causes. A Madras paper, which seems to be well informed upon the subject, observed with reference to the fall of the bridge in India, "that the severe strain or vibration, occasioned by the measured tread of a body of military is indeed so trying to these structures, that it is considered by engineers that they will in Is considered by engineers that they will in this case bear but one-eighth part of the weight they might otherwise be safely loaded with. We have numerous examples of bridges of masonry, many of which have withstood the test of conturies, and will no doubt continue to resist the injaries of time for scatteries yet to coups, afforcing striking proof of the dumbility of stone constructions; and as iron as amaterial for bridges (more particularly as applied in suspension bridges) is comparativaly of modern introduction, and as its properties are but imperfectly developed and understood. I think it would be premature in us to pronounce an opinion upon its merits and fitness for such structures in the present state of the question, or until time and experience have more fully tested its qualities."

Professor Hosking says, "Stons is, however, pro-eminently the bridge builder's material. The carpenter can supply the want of a bridge in a comparatively short time, and in most cases at a small cost. The smith and franker will, with moderate assistance from the mason and bricklayer, effect what cannot be done with stone, and will in cases supply the place of stone with iron when stone might be used, but grandeur of effect, pewer of resistance and elernity of endurance, are to be mason's material !! We know of and posses nothing as a material for massive, permanent construction, and fitted for bridge building particularly, so free from liability to change in bulk from any satural iafluence as stone : and nothing, therefore, some sidering its other qualities as essential, so well adapted for the main constituent of a bridge." It is well known that iron is injuriously

It is well known that iron is injuriously affected by many squees that produce little or no impression on stone; viz., by atmospheric changes, electricity, continual percussion, vibration, galvanic action, &c.; it is light to oxidation (a suspension bridge being composed of a series of small bars of iron presents a great surface to the corroding powers of the atmosphere), which in a series of years seriously impeirs its strength, notwithstanding the precautions taken to preserve it; and percussion and vibration operate so injuriously upon it, as altogether to alter its internal structure and destroy its tenacity; in proof of which sge the accounts of the numerous secidents that have occurred on the various lines of railway carriages, &c., and the discussions that have taken place on the subject at our scientific institutions.

scientific institutions. I have observed in the fractures of iron axles that the internal character of the iron was completely changed, having formed into large crystals, while the external parts of the fracture presented a discoloursed and smooth surface, as if it had commenced there, and gradually extended itself to the centre, until the axle was unable to bear the weight imposed upon it. Mr. Glyan, civil engineer, in shewing the effect of perpussion upon iron, observes, "that the breaking action of railway axles commences with the first journey, and that they continually receive such injury as they would if they were laid over the edge of an anvil and received a constant succession of smart blows from a hammer.

"I consider the chains, or rather the bar, of a suspension bridge would be similarly operated on by the passing traffic, and this would readily account for the failure of the Yarmonth Bridge, as it was distinctly stated in evidence that more than double the number of persons had been upon the bridge at one time since it was widened than were upon it at the time of the accident; under these eircumstances we should naturally have supposed that the failure would have taken place then when the grantest weight was upon it; and the inference I draw from this is, that some other cause than the one attributed occasioned that sad catastrophe. I am quite aware that smiths, in welding bars of iron, do not always bestow that attention to it they ought to do; and this shews the necessity of having iron properly tested; that is likely to be subject to much strain; and as it is the usual practice to prove it to a much greater weight than it is intended to support, the iron even in that operation may sustain an imperceptible injury, and fail under much less weight than it was calculated to bear when applied in its proper place."

To obviate the danger arising from the breaking of the axles of railway carriages, it has been recommended to change them frequently; but to change the bars, plates, bolts, &c. of a suspension bridge would be rather an inconvenient and expensive operation. There is another subject to which I wish to draw your attention, and that is, the undulating and oscillating motion of suspension bridges; it is this circumstance that precludes the possibility of railway companies adopting them, in consequence of the great danger attending the passage of a heavy weight, concentrated to one point, and the sudden percussive action of a railway train.

The tremulous motion upon the Hungerford and other foot bridges is unpleasant to foot passengers, and the passage of the or-dinary traffic over the Menai and other bridges opened for general purposes is particularly disagreeable; and I am informed that, during a heavy gale of wind, it is almost impossible to pass over the Menai and other bridges similarly exposed. This is occasioned by the want of rigidity or stiffness, which has not yet been attained in suspension bridges, and which it seems almost impossible to attain, in consequence of the effect variations in tempermitte produce upon iron chains of great length. This to a bridge of large span ex-posed to gales of wind, operating both sideways and underneath the roadway, must be ruinous in the extreme; in confirmation of which I may instance the injuries sustained some time ago by the Menai, Montrose, and other bridges, the chain-pier, Brighton, &c. Mr. Dredge's bridges have hitherto been constructed on a small scale, and in favourable situations. I am apprehensive, if the principle was carried out on a large scale, and in similar trying situations to those alluded to, it would be attended with no better result. Mr. Dredge, I hope, will have the opportunity of trying his suspension bridge at Weston-super-Mare, where its advantages and powers may be fully proved; sithough I consider such a situation the least suitable for iron structures, from the injurious effects of salt water upon iron.

On the correctness of Mr. Dredge's system or theory, I shall not attempt to enter, my object being to shew the superiority of bridges of fixed, to those of iron on the suspension principle, wherever it is possible to introduce them, " for heavy general traffic, and where great strength and durablity are required."

Suspension bridges, as beautiful picturesque objects, are certainly great embellishments to a landscape, but I think in our public works in this country other points ought to be kept in view; namely, usefulness and durability, combined with economy.—I am, Sir, &c., Brecon, July 29, 1845. B. B.

NOTES IN THE PROVINCES.

WITHIN the last few months some rather extensive alterations have been effected in the Interior of Durham Cathedral, under the direction of the dean and chapter. The old pulpit has been removed, and one of stone erected in its stead ; the pews appropriated to the ladies on the north side of the choir have made way for carved oak benches with backs and cushions. A new font, more in keeping with the general architecture of the church than the present one, will shortly be erected, and the screens which inclosed the side chapels on either side of the organ have been taken down, producing, it is said, a remarkably good and striking effect.----The Earl of Carlisle is making great improvements and additions to his ancient baronial castle, Naworth. Fifty workmen are employed at present, and the interior of the roof of the hall is just completed. It is formed of oak, richly panelled; the height is 30 feet. The dining-room which, before the fire, was separated by a wooden partition from the hall, is now added tolit, which makes the entire length 96 feet. The noble proprietor has now decided upon building a new tower, and restoring the ancient entrance on the west side of the castle, which was discovered after the fire, and which is said to have been walled up by Lord Wil-liam Howard, "Belted Bill," in the reign of -A memorial, numerously signed by James I.the residents of Broad-street. Bristol, was lately presented to the Governor and Directors of the Bank of England, in London, soliciting that the new building, intended as their branch might be forthwith commenced, so as to be finished at the same time as the new Guildhall. The directors, in compliance with the re-quisition, have commenced taking down the old buildings for that purpose.

The commissioners of the port and harbour of Whitby having adopted the plans of Mr. Pickernell, their engineer, for the improvement of the harbour, operations for extending the east pier into deep water ware commenced on the 7th instant. Forty feet of foundations in ten atones, 6 feet wide by 3 feat thick, were laid; the bed in the rock so correctly levelled that no part of the superficies varied 1 inch; and the vertical notches filled with broken whinstone and cement in seventy-seven minutes. From the beginning to pump the water out of the dam, to the foundation stones being covered by the flowing tide, two hours only in-tervened. — On the 17th ultimo, the coremony of opening the chancel of Leamington church took place in the presence of fifty clergymen. The church is being reconstructed in a style of cathedral grandeur, the chancel end only being as yet completed. Its new nave is so lofty, that it covered in the tower of the eld parish church, which was left to stand for some time within the building, as it afforded the workmen the means of elevating their scaffolding upon it, while they carried up the works to at least 25 feet above the altitude of the once mach thought of tower ! After this tower had been thus useful, as a mere scaffold pole to the in-side of a new and spacious structure which was raised above it, the semoval of it as an obstruction then commenced, and now there exists not a single vestige of the ascient village church of Learnington. — Lady Bassett, daughter of the Earl de Dunstanville, has subscribed 1,000/. towards the fund for the erection of a new church at Illegan. Nearly four acres of the space here-tofore known as the New Buildings, Portsea, have been purchased by Government, at a cost of little less than 60,000%, for the forent. at mation of a basin for steam-vessels. One hundred and thirty persons have been ejected and the ground is already cleared.---- A proect is being entertained at Sunderland fer the construction of docks on an extensive scale. During the last two or three weeks, persons have been employed in surveying, taking levels, and drawing out plans of the moor, as it is called, and the bed of the sea adjoining it, on the west of the town. The line selected is from near behind the present south pier to Hendon, the whole length of the moor, an extent of nearly 3,000 feet, and from the bank of the moor extending into the bed of the sea about 400 feet; the dock is proposed to be 2,500 feet in length and 350 or 360 in breadth, with entrance from both north and south.——Plans are being prepared in ac-cordance with instructions gives by the Dake of Sutherland for a new church, which his The grace purposes erecting near Longdon. church is to hold 460 persone, and will be commenced forthwith.---- The Town Council their intention of applying to the Lords Com-missioners of her Majesty's Treasury for their approval and permission to erect and build markets for the sale of meat, fish, poultry, &c., and for that purpose to raise a sum of money not exceeding 16,000/......Very extensive im-provements have been made during the last two or three years in St. Mary's Church, Truro. Recently two stained-glass windows have been erected at the entrance end. The altar window consists of five compartments; each of which comprises a niche and lofty canopy, in the perpendicular style. In these five principal niches, on rich damascene grounde, are represented full size figures of the Saviour, St. John the Evangelist, St. James the Less, St. Philip and St. Simon. The Saviour holds in his right hand a globe, on which are depicted emblematical represent tations of the three great eras of the Church ; while depending from his serm is a scroll, bear-ing the inscription, "Surgite, eamus." The four Apostles named bear emblems significant of the mode in which they severally suffered martrydom; they also bear scrolls with their names inscribed thereon. Above these five principal figures are smaller representations of St. John the Baptist, St. Peter, and St. Paul, with Angels, in attitudes of prayer and praise, and various other appropriate figures and emblems. The south window is mostly em-blematical. The body of the window is composed of *quarrels*, interspersed with labels and texts, presenting a quaintly antique appearance, and inclosed by a rich bordering which re-

solves itself into luxuriant headings of foliage. Inwrought with these are medallions, containing the Christian monogram, and the erangelical emblems, and pendant from the foliated arches are escutcheons, on which are depicted symbols of our Lord's passion. The depicted symbols of our Lord's passion. The tracery of the window is chiefly occupied by angels bearing scrolls inscribed with Scriptural texts. The artist who designed and executed these windows, and who superintended the other improvemnts is Mr. Warrington, of London. — The exten-sive river-side property of Messrs. Cook-son, situate at South Shields, having recently passed into the hands of the wealthy and influential firm of Messrs. Swinburne and Co., in which Mr. George Hudson, the eminent railway director, is the principal partner, the scheme for constructing deep and capacious docks within Jarrow slake, and adjoining Mr. Hudson's purchase, is about to be revived under auspices that ensures its complete and rapid success. The Round Church at Cambridge was re-opened on the 10th inst. It appears that the incumbent is responsible for nearly 300% for alterations and immemoria made since the stone altar case was decided, and for the liquidation of which he solicits assistance. —— The marble statue of decided, and for the liquidation of which he solicits assistance. — The marble statue of Dr. Goodall, the late provost of Eton, by Mr. Henry Weeks of Pimlico, was placed hast week upon a marble pedestal on the south side of the ante-chapel of Eton College. The late provost is repre-sented in a sitting posture, with an open book in his left hand, resting on his knee, the right hand helps shirthy raised as in the attitude of hand being slightly raised as in the attitude of resting aloud, and his left foot resting on a reised cushion. The work is what may be termed a "seven-feet-six-inch figure," but the venerable deceased being in a sitting pos-ture, the height of the statue is not more than above five feet. The pedestal bears a Latin above five feet. The pedestal bears a Latin inscription, said to be from the pen of the Rev. Dr. Hawtrey, the head master of Eton school. ——The old market house at Epping, school. — The old market house at Epping, which was exected about the time Queen Eli-sabeth renewed the charter for the market, was entirely removed last week, in accordance with the expressed wish of the inhabitants. It had been for a long time in a decayed and had been for a long time in a decayed and even dangerous state.——A lunatic asylum is about to be erected for the county of Wilts, the cost of which will be 31,750?.——The Manchester Parks' Committee have made a fourth purchase of the Walness estate, which building of the training school at Durham, and the national society for the education of the poor have granted 300%. for the same purpose.-----It is in contemplation at Manchester to erect a new exchange by means of a company, and to raise 200,000*l*. for the purpose in 25*l*. shares. The *Manchester Courier* states, "We have had an opportunity of inspecting a drawing of the intended elevation, which, if carried out, will be a very great ornament to the town,— indeed, we have no building in Manchester that can at all be compared with it; it bears some resemblance in form to the Liverpool Custom House, but is altogether a very su-perior and handsome structure, of two stories. The site is at the upper end of Market-street, High-street, Canon-street, and Palace-street, covering Marsden-square, the whole of the shops, warehouses, and other property within those limits having to come down. The build-ing is to form three sides of a square, having the open or principal front to face Highthe open or principal front to street; the open space in front of the centre and between the two wings will be a raised stone platform, to be approached by a hand-scme flight of steps from High-street, for the some flight of steps from High-street, for the convenience of the congregated merchants and manufacturers during 'change hours. The news-room is to occupy the Market-street side of the square or wing, occupying two stories, thus forming a spacious and lofty room, lighted by three domes and the side-lights; the size of this room will be nearly the same as the large room at Exeter Hall, London, about 12,000 square feet; the ap-proach to it is made by three entrances from Market-street. The centre of the building in

both stories will be converted into offices, which will be let off for mercantile purposes. The northern, or Canon-street wing, will form a Stock Exchange, and a public mercantile sales room; above these rooms, on the second story, will be a large room of corresponding dimensions with the news-room in the other wing, which will be a public room applicable to the purposes of a large music-room, or public meetings, or it will be divisible into three rooms, as occasion may require. At Taunton, a committee has been formed for the purpose of improving the town. Suggestions are courted and may be addressed to the Editor of the Taunton Gazette .---- The erection of a New Market is at the present time occupying the attention of the inhabitants of Coventry. There is scarcely another town in England There is scarcely another town in England possessing a similar population, viz., 31,000; that is so wretchedly off for market accommo-dation.— The subscriptions for erecting the proposed New Church in the district of St. Simon, in the out-parish of St. Philip and Jacob, Bristol, amounts already to nearly 5001. — The owners of the late Suspension-Bridge at Yarmouth bave subscribed 501. towards the fund now raising for the restora-tion of the venerable church of St. Nicholas, and the establishment of a National School in and the establishment of a National School in that town. Lord Woodhouse has sent 204, and a lady 1004 towards the same purposes. The foundation-stone of the new National School Rooms in St. Saviour's parish, Bath, was laid last week by the Rev. Dr. Stamer, rector of the parish, in the presence of a great concourse of persons, among whom were the architect, Mr. Wilson, and the builder, Mr. Freeman. The railway tunnel at Bangor, through hard rock, has been commenced, and the superintending engineer has taken up his residence at Bangor Ferry. The site for the new bridge has been determined upon, but no decision has yet been come to respecting the kind of bridge to be thrown over the Menai Straite:

SETTING OUT RAILWAY CURVES.

S1R,—I for one am obliged by Mr. G. Hawkins' reply to "Amateur" upon the subject of railway curves, and hope he will not complain of my obtuseness in requiring a little more information; after stating the formula for the value of B D as being always equal to rad.— $\sqrt{rad.^2-sin.^2}$, he says "and the same process will apply to any other required point in the curve, merely substituting the value of $sin.^2$ in the expression, as the distances in the tangent A T, increase from the point A. Perhaps he will be good enough to explain this, and how it is applicable (supposing B D to be laid off at the lst chain) to the several distances squared off from the tangent at the 2nd, 3rd, 4th &c. chain to the 10th.

Perhaps he will be good enough to explain this, and how it is applicable (supposing B D to be laid off at the 1st chain) to the several distances squared off from the tangent at the 2nd, 3rd, 4th &c. chain to the 10th. Again he says, further on, "the above method will be convenient, as it affords a facility for calculating tables for the versed sine of an arc of any radius from the one already obtained; for since the curvatures of circles vary inversely as their radii, a simple proportion will give the value of the versed sine of any other required." I dare say he will think the proportion of my attainments simple enough—but I should feel more obliged by any explanation he may

I dare say he will think the proportion of my attainments simple enough—but I should feel more obliged by any explanation he may please to give, illustrating the same by an example in both cases, which perhaps might enable me to reduce the theory more readily to practice. Liverpool.

Referring to the diagram (BUILDER, July 26th), it is scarcely necessary to observe that in the expression radius $-\sqrt{rad.^2 - sin.^2}$, which is the trigonometrical value of the square of the distances measured on the tangent, A T, thus supposing A D to be equal to two chains, and the corresponding ordinate B D be required, it is merely necessary to substitute in the formula the value of A B or two chains for sine.² For instance in a curve of 80 chains radius B D \equiv radius $-\sqrt{rad.^2 - sin.^2} = 80 - \sqrt{6400 - 4} = 80 - 79.975 = .025$ chains or 2.5 links. The same process will give the ordinate for

The same process will give the ordinate for any other point, substituting in each case for sin.⁹ the squares of whatever number of chains that point may be from the commencement A. Generally, the formula may be thus stated :-The ordinate is always equal to the radius of the curve, less the square root of the difference of the squares of the radius, and the distance measured on the tangent to the point where the ordinate is to be laid off.

With reference to the curvatures of circles varying inversely as their radil, it ought to have been stated, that although as an abstract proposition it is strictly correct, yet its use in the manner proposed is only to be recommended within certain limits, since the actual relation between the curvatures of two arcs, measured by their versed sines, is only mathematically true at the point of contact. The practical application of the principle, if not rigidly warranted, may however be adopted in arcs whose radii du not greatly differ, and where the sines are small compared with the radii---the error in such case not being appreciable, thus supposing it were required from the ordinate corresponding to it for an arc of 78 chains radius --we have by the proposition before-stated the following proportion 1---As -78 chains to 2.8 links :: 80 chains : 2.56 links---which control one-hundredth part of a thek is the inter-

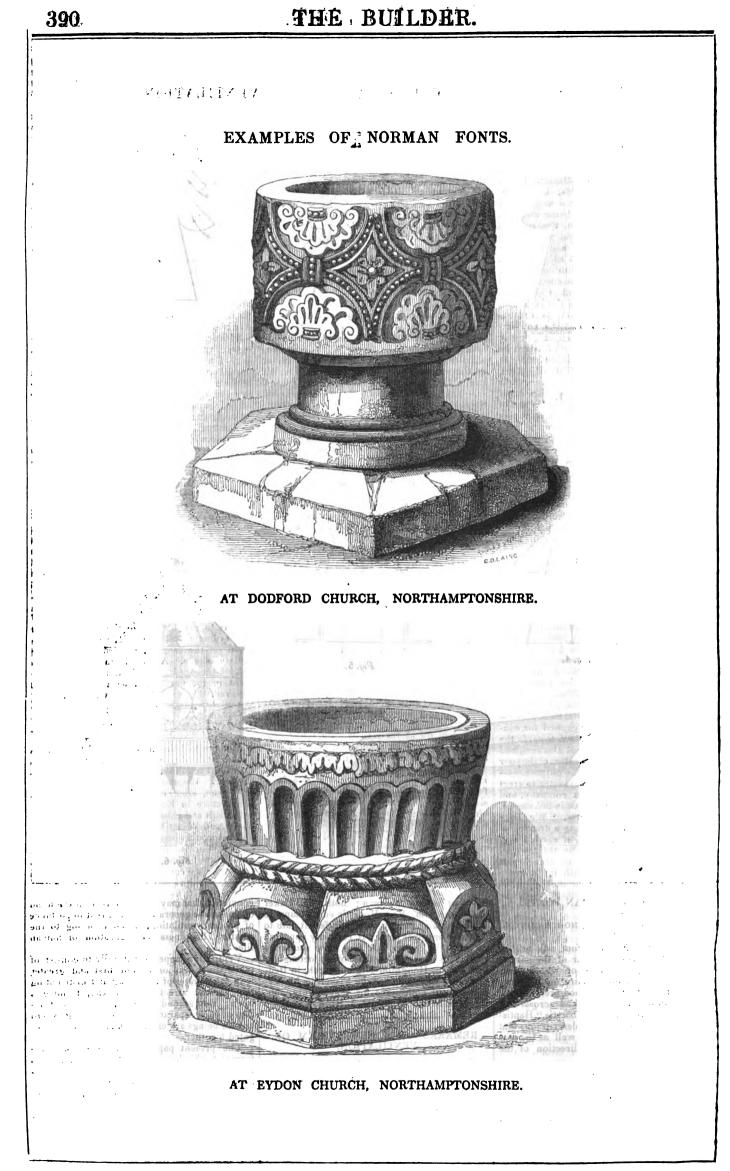

Although implying additional time, it would, as the safer codise, be better perhaps to calculate every separate ordinate according to the formula, and the labour may be much abridged by using an ordinary table of powers and roots.

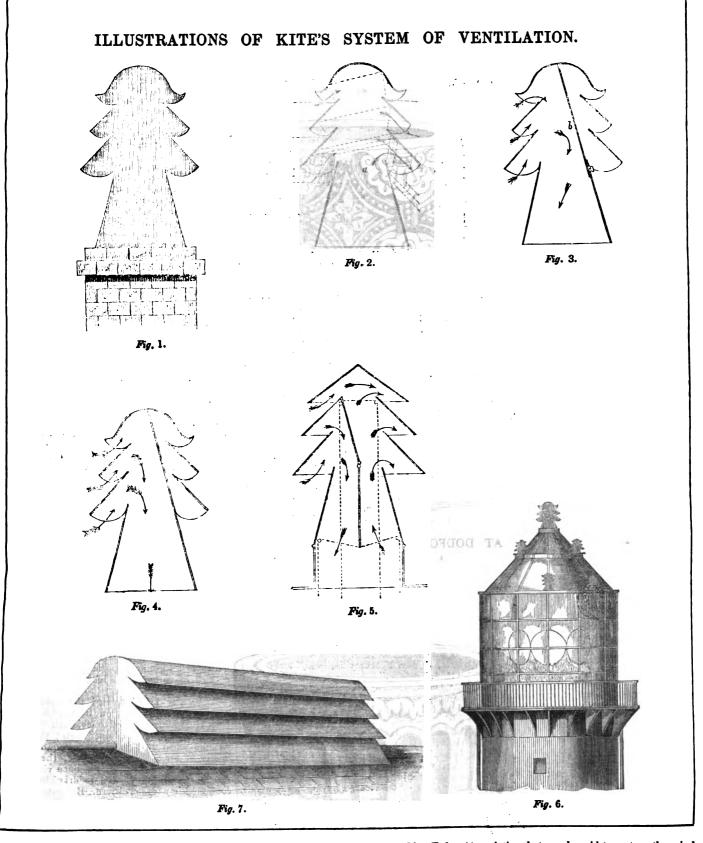

The radii of railway curves being usually confined within certain limits, a table calculated by the above method for ordinates up to eight or ten chains might be prepared beforehand, and would save time and materially facilitate the subsequent work in the field. It was before observed that usually it would be found convenient to recommence the ope-

It was before observed that usually it would be found convenient to recommence the operation at every 8 or 10 chains, and a instead accordingly was suggested for setting out a new tangent to the curve. The following will perhaps be found in many respects superior to the one already given; as no ground is lost, and affords a better position for ranging the new line. Let D be the point from whence it is required to start with the new tangent, from A set off on A B a portion equal to $\frac{AB^{2} \times BD^{2}}{2AB}$: that is to say the sum of the squares of the last ordinate and the whole distance measured on the tangent, divided by twice the same distance. A line from the point so obtained ranged forward through D—the last point in the curve will be the new tangent required.

NEW WINDOW IN ST. JAMES'S CHURCH.

WE are told that it is proposed to put up a Gothic stained glass window in St. James's Church, Piccadilly, but hope our informant is in error. We abuse and scoff at those architects who, after the introduction of Italian architecture in England, disfigured our noble cathedrals and churches with Corinthian altarpieces and Wyatt-knows-what organ screens, and yet would commit similar absurdities ourselves. Consistency is surely as necessary in an Italian building as in one of the pointed style, and we conjure the vestry or committee, who are said to be about to perpetrate this enormaty, to panse before they write themselves dows, "foolish." The neighbouring church of St. George, Hanover square, should be a bescon to warn, them : ence such mistake in London at this date is early enough.

EXAMPLES OF NORMAN FONTS.

5

FONT AT DODFORD CHURCH, NORTHAMPTON-SHIRE.

THIS beautiful Norman font adjoins the north side of the western pillar of the nave of north side of the western pillar of the nave of Dodford church; the stone of which it is formed is the Northamptonshire oolite. The sculpture of the font is in good preservation, but it is unfortunately cracked across. A print of it is given in Van Voorst's "Baptis-mal Fonts," who states in the description, that it has lately been cleaned, as well as the ma-terial would permit, by the direction of the vicar, the Rev. W. Thornton.

FONT AT EYDON CHURCH, NORTHAMPTON-SHIRE.

the font is late Norman; both Mr. Baker and, after him, Van Voorst's editor suppose the octangular base to be of a different date to the bowl or upper part. It certainly appeared to me to be earlier. A font very similar to this, with a square instead of an octangular base, is in Houghton-Regis church, in Bed-fordshire, and is given by Fisher in his Ty-pographical collections for that county, pub-lished in 1812. C. J. RIGHARDSON.

REMARKS ON A NEW SYSTEM OF VENTILATION.

BY JAMES KITE

VENTILATION has been of late so much the A representation of this curious font is given in the 3rd vol. of Baker's "History of Northamptonshire," from which it has been copied (without acknowledgment), on a little less scale, for Van Voorst's work, where it forms the sixteenth example. The style of

conviction that may be said to rest on the mind of the public generally of the great importance of proper ventilation, as contributing to the comfort, happiness, and duration of human

or proper ventilation, as contributing to the seconfort, happiness, and duration of human life. Ventilation appears naturally to consist of two distinct divisions. The first and greater is in the manner of arranging and distributing the various streets, alleys, &c., forming a town; the second or lesser, in the construc-tion of each separate house or building where human beings are either domiciled or congre-gated together. The present paper has more especial re-ference to this latter part of the subject, and therefore has for its object the application of proper arrangements for the ventilating of churches, hospitals, manufactories, dwelling-houses, ships, carriages, &c. It is not necessary to occupy time in attempt-ing to describe the deleterious effects of the products of combustion or respiration, and the

Digitized by Google

391

badly ventilated apartments; these predominant evils occupy a considerable share of the attention of the scientific and legislating classes of society. We shall therefore proceed to describe the nature of our improvements, and begin by remarking that there are few who dispute the propriety and advantage of imitating nature as far as possible in works of art, and especially in such operations as ventilation: where we can render any particular natural law available to our service, to take advantage of it both for the sake of economy and effect. How far this has been accom-plished in the present instance remains to be seen.

It is a well-known law, that when an elastic body impinges upon a firm plain surface, the angle of reflection is equal to the angle of incidence. Referring to fig. 1, which is a section of a roof suitable for being fixed on the top of a chimney or flue, or by being pro-longed, to form a ventilating ridge for a church or other public building, it will be observed that this roof is formed of a series of surfaces inclined more or less from the perpendicular, of which those below form a less angle than those at the top, being in regular gradation in this respect from bottom to top.

When the wind blows against the roof, as it impinges upon the lower plain, it would be reflected upwards upon the under surface of the second reflector or plain surface, from thence on to that on the opposite side, where it is deflected downwards outside. When the wind blows against the roof, or cover, an upward current is produced, and even a wind falling perpendicularly will actually facilitate the upward draught.

It is a known fact, and one which admits of being easily illustrated, that when a very small stream of air or other fluid is propelled amongst a body of the same, it carries a very extended current along with it, which arises from the friction of the particles or atoms of the air in motion against that at rest. In the case now before us the friction produced by the wind, or current passing through, takes along with it that with which it comes in contact in the cover, causing a partial vacuum or rarefaction of the air in that part; and which cannot be supplied by a portion of that passing in at the entrance side of the cover, because it comes with an acquired velocity sufficient to carry it through, and therefore the partial vacuum must be supplied from that in the chimney or shaft, but as the action of the wind is constant, so the upward current is also constant. It is then upon the application of these principles, namely, the reflection of elastic bodies from plain surfaces at the same angle at which they impinge thereon, and the effects of friction, which is pro-duced between one current of atmospheric air in passing over another, that the present improvements are carried out; it is upon the proper arrangement of the reflecting surfaces that the whole success depends; this being attained, there is no need for any mechanical arrangements such as require to be kept in constant motion, and are therefore subject to being speedily worn out, neither is there necessity for the application of any costly prime moving power which would be the source of increased expenditure. These covers, or roofs, are quite sufficient to create an upward current where they are exposed to the wind, and have been already found fully equal to any thing here reported of them; they are susceptible of great variety of form either as almost any of the present known forms, such as the lobster back, the malt-house cowls, &c., and it may be here remarked that one great peculiarity of this ventilating covering is, that however light the wind may be, still its action must be favourable, whereas, in almost all if not in every one of its forms heretofore in use, when the wind is light they are found in their most unfavourable position, or their action ceases to be effectual. For the ventilation of ships and carriages this top is peculiarly spplicable, and when provided with a valve, a downward current can be produced with equal facility. By using two of these tops, one for producing a downward current, and another for the upward current, a ship

state he put in the bottom part of the ship, allowing room for the admission of air, the moment that a current of air is projected against the reflectors, the smouldering substance is brought into a flame from the upward current produced; the same will be the case when we blow right down upon it.

Fig. 2. The dotted lines in this sectional figure shew the course that would be followed by the wind in passing through the roof were each separate atom of the atmosphere coming at an interval apart from that preceding it but as this is not the case, the atoms being in immediate juxtaposition, the resultant of these dotted lines will be in the direction indicated by the arrows, which has a tendency to create a partial vacuum in the upper part of the lowest chamber (a) of the roof, and thereby causes an upward draught in the shaft over which it is placed.

Fig. 3 is a section of a roof for producing a downward current in any shaft, flue, or opening over which it may be placed, when that is desired. For this purpose it is farnished with a valve (δ) attached by a screw to the lower de-flector on one side. When this valve is put up in the position represented, the current of atmosphere is thereby made to follow the course marked out by the arrows.

Fig. 4 has this valve put on in a permanent manner. Both these are peculiarly applicable to the ventilation of ships, and such places as are so circumstanced as to require the purer air to be taken in from an elevated situation.

Fig. 5 is expressly designed for shipping; the fresh air is admitted on the one side, the vitiated is ejected from the other; the two values in the centre are hinged with their edges closely together, and may be put over to any side of the roof at pleasure by means of the cords represented by the dotted lines. The arrows shew the action in the position in which they are represented.

Fig. 6 is an exemplification of light-house ventilation, with fixed roofs, the action of which will be sufficiently obvious from the previous description.

Fig. 7 illustrates the application of the ventilating roof or ridge to a church or other public building.

HOUSES AND PEOPLE DESTROYED BY MUD.

THE Quarterly Geological Journal gives the following account of a remarkable torrent of mud, translated from a newspaper lately received from Colombia. The facts are attested officially by the local authorities. The first extract is a simple translation of an account dated "Tasa-jeras, Friday, February 21, 1845," and signed "R. J. Treffery."

"On Wednesday, the 19th instant, a little before seven, A.M., there was heard a great noise in the plain of the river Lagunilla," and at the same time an earthquake took place. Immediately there appeared in the strait or ravine in the mountains from which the river Lagunilla arises, an immense flood of liquid clay, which pursued its course with the greatest rapidity through the whole plain on both sides of the river, carrying away woods of tall trees like straw, rolling them away, and covering them in such a manner as to leave no sign of there having been a wood at all. The same happened with regard to the houses and cottages which it met with in its course, overwhelming them with their inhabitants, and carrying away and burying those unhappy persons who were fleeing from death, so that nearly all the population of the higher part of been destroyed, and many who the valley has had escaped from the torrent and gained some high or enclosed place have found themselves insulated, and have perished by famine. It was quite impossible to succour them, for the whole plain was covered with a layer of mud and sand, so deep that no one could pass without being swallowed up. Some few persons, however, found an asylum by being near the edge of the torrent, and saved themselves by roads formed of the branches of trees."

The space of land covered may be estimated at from four to six leagues; and the quantity of matter poured down at 250 millions of tons.

may be most effectually aired and ventilated in either hold or cabin.
 To prove the efficacy of these coverings, if a piece of flammable substance in a smouldering
 To the claquilla is a small stream emptying itself into the river Magdalena, and situated in the north-western extremity of South America, in New Granada. Ibague, the town alluded to in the subscience table and the subscience table and the subscience table.

LEAD PIPES.

WE copy from The Medical Gazette the following statement relative to the dele-terious effects of water impregnated with carbonic acid passing through lead pipes. It is written by Mr. Rust, of Windsor, who was consulted on the respective cases :-

"On the 23rd of last April a labourer, residing at Ascot, and employed by Mr. Hibburd, clerk of the race-course there, applied to me at the dispensary at Windsor, evidently suffer-ing from the poisonous effects of lead; his complexion was sallow, and he was constantly suffering from severe pain in his bowels, at-tended with flatulence. He had the dark blue tended with flatulence. He had the dark blue mark round the gums, so peculiar to those who are suffering from the deleterious effects of that metal. On inquiry I found that his chil-dren had been in bad health since they had lived at Ascot, and that they had become weak and sallow, and had suffered from pains in their bewels and indication and that he had sent bowels, and indigestion, and that he had sent one of the most affected away, believing that the air of the heath was prejudicial to their health. I immediately asked him if the water he drank, and used for cooking, passed through lead, and was answered in the affirmative. I procured a quantity of it, and, on the addition of water impregnated with sulphuretted hydrogen, a large precipitate of sulphuretted by dio was thrown down. By the use of other water, and of appropriate remedies, the principal of which we alway he is a sub-

which was alum, he is slowly recovering. In November, 1842, one of the whippers-in at the royal kennel at Ascot, applied to me, suffering from lead palsy, after a severe attack of colic during the previous summer, which was believed to have been inflammation of the bowels. Having previously met with similar cases, I felt convinced that lead was dissolved in the water which he had used for cooking and drinking; and, on inquiry, I found that disorders which could be attributed to the effects of lead had for a long time been preva-lent in the establishment at the royal kennel, and that the dogs had for a long period suffered from a species of paralysis denominated kennel lameness. The water was in consequence analysed by Dr. Ryan, at the Polytechnic In-stitution, the results of which were as follows: Water at the spring head, specific gravity at 60 degrees, 1 018. The contents of an imperial pint, on evaporation to dryness, yielded 2.37 grains of solid matter. The solid contents of an imperial pint being—Chloride of sodium, 1.54 grains; chloride of magnesium, 0.71 1.54 grains; of carbonic acid: total, 2:378 grains; a trace water, after it had passed through the leaden pipes, was found to contain .164 grains of carbonate of lead in an imperial pint, or one and a third of carbonate of lead in an imperial gallon.

Soon after I had treated the case of the whipper-in, a young man, Richardson, from East Hampstead, applied to me, with the worst form of lead palsy I had ever seen; this came on him when in service as footman in the family of Sir Willoughby Rooke, then inha-biting a mansion in the immediate vicinity of Ascot, and was attributed to drinking water contained in a leaden cistern. Recently I have seen other persons from the immediate vicinity of Ascot, suffering from various symptoms, which might be caused by lead, and, on inquiry, found that they were supplied by water which passed through the leaden pipes of pumps. I think it may be fairly deduced from the above facts, that the spring-water at Ascot contains a small portion of free carbonic acid, which dissolves portions of lead in passing over its surface, and it will readily account for the fact, surface, and it will readily account for the fact, that the leaden cisterns and pipes usually so innocuous, should occasionally produce such deleterious effects. The paralysis of the whip-per-in was entirely removed by alum, com-bined with guaiacum, and Richardson was very much relieved by the same remedy. From the almost specific effects of alum in vainters the almost specific effects of alum in painters' colic (a disease I have been frequently called on to treat), I was induced to try whether it would be found serviceable in the paralysis produced by lead, and have on many instances found it of the greatest service, although in many more it has been useless."

BRITTON TESTIMONIAL.-The subscription lists are still open, nor have the committee yet determined on the nature of the testimonial

THE QUESTION OF SEWAGE IN METRO-POLITAN SUBURBAN DISTRICTS.

SIB,—I hail with much gratification the ex-tracts from the pamphlet by Mr. John Leslie in your number of this day, not as proposing either to vindicate the charges or defend the conduct of those so charged, but simply on account of the attention of practical men being thus drawn through your columns to a subject, that however deeply it has apparently arrested public attention, has hitherto been only theorized upon. According full credit to my Lord Lincoln for his untiring zeal in the matter, any broad legislation cannot meet the particular difficulties of individual locali-ties; instead, therefore, of attempting to enter upon any discussion of this pamphlet, I will state the course I have taken in a suburban district, upon the wants of which, in regard to sewage, I have bestowed cheerfully much labour; and I would entreat our professional brethren, each in their own district to address their attention to the subject; such a mass of useful evidence would thus be obtained, that subsequent legislation thereon would, by a variety of provisions, become applicable to each individual case; the parties interested (making such reports) knowing best their own

(making such reports) knowing best their own grounds of complaint, which broad legislation may avoid giving relief to. The power of appeal from a parish or an in-dividual (described as existing in the Finsbury distict) would appear as of much advantage over the present irresponsible authority of most com missions.

I am not prepared with Mr. Leslie to charge any commission with malversation in the exe-cution of their duties : I sincerely believe their powers are too prescribed to afford the relief they would desire to give; and it would be absurd to imagine they individually were all Solons, and at their appointed conclaves could divine the wants of large districts. If in a public question, then, parties are too indolent to raise their voice as to their particular grievances, it cannot be wondered at that, as of necessity, broad legislation takes the place of detailed enactments upon fair ground of complaint, which would, so to speak, bring re-

lief to each man's door. I will set the example (instead of discussing the question at large) of confining myself to what has recently fallen within my own obser-vation; if such a course is approved and followed, then by a similar discussion, comes followed, then by a similar discussion, comes the suggestions for remedy, and, I again repeat, a mass of evidence would thus be obtained that must be irresistible, and cannot be expected to be within the knowledge of those to whom we look for relief through legislation. All commissions of inquiry can only grapple with broad facts, sometimes perverted for particular interests, and at no time developing the whole truth. Blue book upon blue book may be heaped, like Pelion upon Ossa and Ossa upon Pelion, and still the case of individuals, nay, of whole localities, may have been uncared of; if we are therefore longer silent, the blame is to a great extent with un.

I would state, as introductory to the remarks I would state, as included by to the seamed I intend making, that it must not be assumed that I condemn the deep sewage described in Mr. Leslie's pamphlet as constructed in metropolitun districts: confining myself to endeavour to shew my objections to such sewage in a suburban district.

No parish round London (that I am aware of) having the power of making a rate for internal operations of drainage, the appli-cation for relief must necessarily be made to the commission within whose authority the district chances to be situated; such, then, was the case which drew my attention to the subject: a large and respectably inhabited locality feeling they had no power internally, applied to a court of commissioners to form a new district, and by the authority they possessed to raise the necessary funds by loan, to be repaid through the medium of a rate within a prescribed period. It may be well to pause, and state the condition of this district with respect to drainage, as defining the position of most suburban districts; the ground, naturally rising, partakes of the acclivity of the balls—at the extremities of the boundaries to sorne considerable extent. The land when used for agricultural purposes was drained by boundary ditches, and the course of the hill water took that pointed out by nature, the whole of course flowing to the low lands. As the land became occupied by buildings, the front boundary ditches were arched over, but at no greater depth than they then existed, and the soil to the extent of these ditches was generally abandoned as public footpaths, under which was, and is, conveyed the filth of large neighbourhoods. In other cases, the ditches being in the rear of the buildings, drains were made thereto, but in this case the ditches were left uncovered. mention these facts particularly, as I shall presently have occasion to allude to them as a strong ground of complaint against the limited and perfectly inefficient powers of commissions to remedy such evils.

With reference to the subsequent argument, it may be well to state what would appear to been the intention of the original aphave pointment of such commissions to be gathered from the recital of all the old Acts of Parliament, viz., to drain low lands.

The commission alluded to as being requested to append a new district, have under their control a considerable district below their control a considerable district below high-water mark, many portions of which were constantly flooded. They some years since exercised scientific and sound principles by constructing large, deep, reservoir sewers, having their exit at dead low-water, protected by gates during the tide, and having a fall of two inches in a mile only to prevent the pressure of back water forcing itself up the drains communicating therewith. This effectually answered the purpose, not only of affording relief to house drainage, but also as draining the level. These sewers were after a time ex tended to outlying districts, which, partaking of rising ground, the sewers naturally were at a very considerable depth. Thus stood the matter when application was made to append this new district; the houses on the portion thereof from which the application originated being situated 2,500 feet apart; the hill water taking its course through the centre of a large open space, partially deposited in a pond, and eventually finding vent by an easy, tortuous, deep ditch to the low lands. I was startled by the proposition of the mode of affording relief to house drainage (the object of the application) by finding it was the intention to con-struct a sewer 15 feet deep in communication with a sewer 20 feet deep, to be driven through this pond to take the hill water from its natural easy course at an immense declivity, which may be imagined when I state, had it been constructed as a reservoir sewer with the little described tall, it would have been 50 feet deep at its termination. I then considered that no owners of houses distant 1,250 feet would attempt to avail themselves of the proffered relief, and the water, like that in an inclined bottle, would always be at the bottom, and certainly flood (at times of unusual high tides and extra ordinary run of hill water) the basements of all houses which had drains communicating, the heads of which were below the level of the back water; and I was confirmed in this by finding, that since the described continua-tion of the reservoir sewers in low land, the level was no longer drained, and basements frequently had water, under extraordinary circumstances, thrown back upon them to the ex-

tent of 2 feet in depth. I took the liberty of addressing the court, stating the thorough uselessness of such a sewer for the desired object, and that there was no reason why the hill water should be taken such a depth under ground.

I also stated my opinion that the vast ex penditure in the district in deep sewers had been money thrown away, to the damage of the rate-paver.

I have great pleasure in acknowledging the courtesy with which my communications were received, and the ready facilities afforded me

to assist in the inquiry. I then, after investigation, and having by the direction of the court been furnished with all necessary levels, suggested the construction of a small sewer near the houses on either side the common, to meet at a point of junction below the pond, and thence to take the natural course, which I found had a fall at its junction with these proposed new sewers of 13 feet, which, crossing a high road, say 10 feet deep, ould eventually have its vent into the Thames t a higher level, but a depth of 20 feet could never thus be diverted. I met, at first, with

some considerable opposition, but the eventual result was my report being agreed to unani-mously by the surveyors, and proposed by the court to be carried into effect.

I trust I shall have convinced your readers that, taking a rational course, commissioners of sewers are not such impracticable overbearing persons as they are frequently described ; they can have no private object to serve, but I be-lieve their powers are far too limited, and that we do not sufficiently and clearly define our wants. A sketch of the mode I would suggest I will, if acceptable, intrude on your columns at a future period.

Having put myself in communication with Mr. Chadwick, I have great pleasure in acknowledging the courtesy with which he has received it. GREENWAY ROBINS. Peckham, 8th August, 1845.

THE COURSE OF STUDY IN THE SCHOOL

OF DESIGN. I OBSERVE that your correspondents are continually arraigning the methods of instruc-tion adopted in the School of Design, conceiving that at the most they produce but inferior draughtsmen, while they leave the primary object of design entirely disregarded. Mr. Pugin has given up all hope of its producing any good, as there is not enough study of good, as there is not enough study or ure. Your correspondent last week finds nature. fault with some of the finest inventions of the fault with some of the finest inventions of the ancients; and those most modest remon-strators, the students, consider it utterly useless, as the directors do not adopt that course of study which they, in their wisdom, think fit to prescribe. But among them all, for my part, I have read no attempt to disclose a practicable remedy. Fixing the capacity to design as the object of his exer-tions the individual must first learn to draw tions, the individual must first learn to draw straight lines and curves of every dimension, and in every possible combination. He must proceed to copy forms of acknowledged beauty, the productions of men who have studied the beauties of nature and concentrated them in their works; which will form his taste, and enable him to perceive what it is that constitutes real beauty. He should then study nature, in order to enrich and vary his knowledge. He must observe and imitate the various turns and conbinations of leaves; the different forms of bodies, and most particularly the beautiful composition and arrangement which she everywhere presents; and, lastly, he must continually, unceasingly exercise himself in the production of works from his own imagination. These, I humbly conceive, are the most obvious means to the end proposed. It is clear that no one can design till he can make lines to express his intention, and to my mind at least equally clear, that he should not study nature till (as artists say) his cyc is formed. There are many humpbacked, crooked, ill-formed persons in life, but no one would wish them to be imitated; and this remark in a proportionate degree extends to all nature.*

Now, Sir, should you allow these theses to be true, allow me to apply them to the case in point. The professors of Somerset House first set a student to simple manipulation; they lead him on to the imitation of the best forms that can be procured, allow him the frequent review of beautiful designs of ornament, the loan of treatises on all the arts, and finally, to crown all, encourage him to design himself by the offer of prizes, and the great chance of employ by those gentlemen who offer them. This is at least my view of the case. If you deem this paper worth insertion, I hope these gentlemen will favour us with their remedy as an answer. I am, Sir, &c., Frith-street, Soho. J. MORGAN.

recently examined a contrivance by Messrs. Palmer and Stepney, carpenters, of Churchstreet, Camberwell, for putting together bedsteads without screws. A metal projection fastened into one part of the frame fits into a socket at the other, and one turn of the hand makes the juntion secure. It seems to us, from its simplicity and the saving of time effected by it, deserving of notice.

* Which proves that all nature is not fit for elementary study

RAILWAY ACCIDENTS.

Fi Tana obsurrence of two or three railway aceidents; wither simultaneously or in rapid sucand sometimes significant hints from those in matherity... Such has been the case lately on the occasion of two great concussions in the naighbourhood of the metropolis; both of them

neighbourhood of the metropolis, both of them erightating in the purest negligence. :: On the South-Eastern line, a train having been allowed to go away without its signal lights at the back, was in 'jeopardy from the possibility of an engine running into it; and an angine was accordingly sent off to realize the fear that was entertained. It is impossible to consoling any thing more groundly stroid than conceive any thing more grossly stupid than dispatching an engine at a rapid, rate after a train which was only in danger from the chance of any thing coming behind it. Going away without the lights would have been, as it hap-pened, of no consequence, for the train was the last for the day. It was only by dispatch-ing a special engine, that mischief could be done. done

On the London and Birmingham line, the morning was misty, and there was conse-quently more than ordinary danger in allowing the trains to be either later or earlier than usual. It was difficult to see further than a few yards; and by way of meeting the diffi-culty, the mail train was hurried forward till it came into violent collision with the luggage train. This, too, went out later than on or-dinary occasions; though, as we have already said, the obscurity of the morning rendered exactness in all the arrangements on the line particularly requisite. Such are the usual causes of all railway accidents ; for by a strange parteneness, whenever there seems to be a necessity for increased care, the persons em-ployed on a line are guilty of increased negli-

Mr. Bernal, a few evenings since, very properly called the attention of the House of Commons to the sublest property called the attention of the House of Commons to the subject, when Sir G. Clerk observed; "that although the Board of Trade generally found that, any suggestions they made were attended to by the companies, yet they, had no, power, whateven to enforce com-pleance. Is might cartainly be hereafter ne-cessay, to impose, some more efficient check on the relivery, companies for the prevention of seedents".

Sir Robert Reel also took occasion to say and with more than usual emphasis : " It is constantly brged that the accidents by sailways but no proportion whatever to those which add to body by stage coaches. That is no answer—it is a mere sophistication. We have sright to be insured that those who derive the profits from these railways shall take every possible precaution on behalf of the public. If by the employment of ill-qualified subordinate, officers these accidents are rendered inore likely to happen or more frequent, then it will be the duty of Parliament to step in and demand a reduction of the profits of those who are concerned in the railway, in order that the due precautions may be taken to in-sure the public safety."

. 20

THE ASSOCIATION OF ARCHITECTURAL , THE ASSOCIATION OF ARCHITECTURAL DRAUGHTSMEN.—At the last meeting of the Association, Mr. Colling read a paper upon the churches of Norfolk, pointing out their peculiarities: the subject was illustrated by many original sketches and drawings. Trunch, Lutham, and Kospton churches give ample scope for the research of the antiquary or architect." The roofs of several of the buildmge moticed are well calculated to produce admiration, and the number and fidelity of their illustrations entitle Mr. Colling to praise for his industry. A proof of a lithograph of one of his quarterly subscription drawings was brought forward, to a copy of which each member is entitled. The Committee projects an exhibition of architectural drawings; if decided upon, it will open for a week upon the 1st September, the day of the *third* anniversary dinner.

THE BRITISH MUSEUM .- Last week the whole of the eastern wing of this building was disposed of by auction, in order to be removed for the erection of the new stone wing, to correspond with that on the western side, which is now finished. The foundation for the intended wing has been laid some weeks.

THE GLASS TRADE.

WE receive many complaints of the conduct of the English glass makers in keeping the price of that material much higher than it should be. They may be assured that they are acting most unwisely; they will induce fresh competitors to come into the trade, and lead buyers to the foreign markets, whence they may not be able to wean them hereafter. The Gardeners' Chronicle invites attention to the fact, that an agency for the sale of foreign glass has actually been established in London, and that any quantity, from a single square up to as much as would glaze a village, may be procured by all purchasers. "We have examined that glass, and can say that it is excellent. It is as good in quality as English sheet plass, called the second quality of No. 1; and thus far better—that the English glass weighs only 16 onnces to the foot, while this glass averages 18 onnces, a very important difference.

As to the price, we find the difference to amount to this. We quote English prices from the tariff circulated by Messre. Chater and Hayward.

| | English glass 16 of. to the foot. | Foreign glass 18 of. to the foot. | Difference againat the English glass, and in fayour of the buyer of fo- roign glass. |
|---|--------------------------------------|--------------------------------------|--|
| 6 by 4, and under 9 by 7 9 by 7, and under 12 by 10 12 by 10, and under 24 24 to 36 inches | 9s. 9d. 0 10 | 5d. 5 | 4d. 5 8 |
| 24 to 36 inches | 1 2 | 5 | 9 |

And if larger sizes are required, the only in-crease in price is 2d. a foot, up to the greatest dimension made abroad, which we believe is much beyond any thing that can be required for glazing purposes.

And here we see one of the most striking differences between the system of glass deal-ing in England and on the continent. An English glass-cutter tells you that he cannot cut you a square of glass 91 inches long, and 71 inches wide, unless you give him 1d. a foot more for it than if it is 9 inches long and 7 inmore for it than if it is 9 inches long and 7 in-ches wide. He sets out by charging in the first place 9d. a foot for little pieces of glass worth 2d. or 3d. If half an inch is added he claps on a 1d. more, until you arrive at the magnificent dimensions of 12 inches one way and 10 the other: for the new matter 2^3 and 10 the other; for that you must pay 3d. a foot more. And so he goes on adding 2d. a foot, till at last, by this ingenious manœuvre, he contrives to extract 2s. 3d. out of his customer's pocket, for that which is worth 3d ; or, taking his own exorbitant standard of value, he converts that which he admits to be worth only 9d. into 2s. 3d. Our calculating powers are unable to determine how many thousands are unable to determine how many thousands per cent. are pocketed by this scheme. That it is a mere scheme of trade is quite clear from the foreign practice. Messrs. Testa and Co. publicly advertized, that if their glass is under 40 inches long, they must have 14 francs per 100 feet, and if it is more than 40 inches long they must have 17 francs per 100 feet. This is a very reasonable advance, the necessity for which is intelligible. But the necessity for which is intelligible. But the English glass trade say that they must have from 1d. to 3s. a foot extra. So that an Eng-

from 1d. to 3s. a foot extra. So that an Eng-lish glass-dealer requires a greater advance upon a single foot of glass than a foreign dealer finds it necessary upon 100 feet." Ordinary English glass can be had cheaper than is stated above, but not so cheaply as it should be, and as manufacturers would find it to their interest to make it.

ST. PETER'S AT ROME .--- We learn from Galignani that the dome of this celebrated edifice has excited serious alarm. For a long time past, the cupola has been cracked in many places, and ten arches of iron, weighing 60,000 kilogrammes, have been placed so as to prevent its fall. It has just been discovered that the lanternino, above which rises the cross that crowns the edifice, is cracked through and through. The numerous lightning con-ductors, which had been erected by Pope Pius VII. for the protection of the edifice, remove all idea of this mischief having been the effect of a thunder storm. The lanternino is being surrounded by heavy iron chains, to prevent the cracks from extending.

Correspondence.

THE NEW DOORS FOR YORK MINSTER. S18,-In your valuable publication of the 15th July, 1 observed a letter from Mr. F. Tyrrell, of Tynemouth, near Newcastle, relative to the execution of three new doors for the west front of York Minster. Mr. Tyrrell is strictly correct in stating that the doors were originally made by Messrs. Scott and Wallace, of Newcastle. He says be considers it is only justice to name by whom the work was executed. I quite coincide in this opinion, but at the same time beg to state that when the doors arrived at York Minster, they were minutely inspected by Mr. Sydney Smirke, the architect for the restoration of the nave, and that that gentleman then distinctly declared "that he could not sanction the execution of the carving," and ordered Messrs. Scott and Wallace to take it all off the doors, and replace it by some other carving of superior quality. The contractors reluctantly renewed the carv ing, but only upon the lower part of the doors, where it now remains for the inspection of the curious; and they having subsequently refused to renew the carving upon the upper part of the doors, Mr. S. Smirke contracted with two of my fellow-citizens, viz., Mr. John Wolsten-holme, to renew the said carving, and Mr. George Coates, the joiner's work, the expense of which was deducted from Mesure. Scott and Wallace's amount of contract. The doors were again inspected by Mr. S. Smirke, and were again inspected by ant. S. Summer, and ordered to be fixed forthwith; the original carving was then carefully packed up, " and sent to the place from whence it came.

The above are " stubborn facts," and as a convincing proof of the great superiority of the work executed by Messrs. Wolstenholme and Coates, the very rev. the dean and chapter have intrusted the execution of the new doors for the north-west tower to their care. The door is nearly finished, and will be fixed during the present month, when the public will be enabled to decide upon the merits or demerits of the respective works.

Justice demands the above explanation; and as you are a consistent enemy of trickery, and as staunch advocate of fairplay, I hope you will have the good gras; to inact; this letter in an early number of THE BUILDER. — I am, Sir, &c. A. CONSTANT READER. Volt Aug 4 1845 Sir, &c. York, Aug. 4, 1845.

OF ST. GILES' AND IBLOOMBURY.

Sin,-My attention has been called to a Sir, My attention has been course as a letter in The Buthban of Saturday last, signed "J. S., Junr." (page 383), respecting a contract for some works now being performed at the School Honse of the Charity Schools of contract for some works now being performed at the School Honse of the Charity Schools of St. Giles' in the Fields and St. George Bloomsbury. I am surprised that the writer should have sent such a letter for the sale purpose, as it appears to me, of imputing to the committee of trustees of that charity, and to the architect (also a trastee, and a geateman, who has for many years given his valaal and gratuitous services to the enanty, both pro-fessionally and in other ways), improper motives in selecting the tender referred to. The facts are these; tenders were applied for to various parties, all, I belleve, subscribers to the charity, for the works required; and the builders were requested to state separately the cost of the bricklayer's, compenter's, and plasterer's works, and the cost of the painting. There were six tenders, as follows :-

| | | 11) د د ه ه د م د | | • . • | 1 | +t+ | fateres | b. | lae. | Sec. |
|------|---------|-------------------------|-----------------|-------|-----------|------|--|--|------------------|--|
| | | | ю. | | | | | | | |
| | TRACT | onde | •• • ••• | 33 | - | YIA. | R | | | |
| | | | | 160 | 8 | 10 | 79 | -ð | | |
| •••• | ••• | •••• | .,) | 135 | 14 | | 91 | 10 | n. 4 | 4 |
| •••• | | • • • • • • • | | | | | | | | 2 0 |
| | • • • • | ••••• | •• •• | 99. | 0 | | . 73 | | . S | 5 0 |
| | | | | | | | •••••••••••••••••••••••••••••••••••••• | ورة ال _ا ولي ال ورو التعامية معامية م | و ور د ور د د ور | ······································ |

The committee unanimously agreed to accept G's tender for all the works. cept G's tender for all the works. Your cor-respondent, B, complains that the committee respondent, B, comparing that the commutative ought to have accepted his tender for brick-layers works &c., 72*l.*, as being 1*l.* under G's for that portion of the works, and E's tender of 23*l.* 10s., for painting, which together would have been 3*l.* 10s, under G's total. The tras-tees thought that under all circumstances it would be better to accept G's tender, that it would be inconvenient to have two sets of workmen, and that the difference of 3. 10s. was too slight a set-off on that account.

In consequence of this decision, your cor-respondent got a special meeting called (a very unusual thing) of the trustees. They assembled in a large number. A motion was made by A, one of the parties who had tendered, and a relative of B, that B's view should be adopted; but, after some discussion, the trustees present expressed so distinctly their con-viction that the decision of the committee was correct one, that A requested permission to withdraw his metion, which was granted, and I thought the matter had then been settled, natil THE BUILDER was this morning put into my hands. I should mention that H , whose tender for painting was a little lower than G's, deelined to execute the paintar's work only, so that the committee could not have done what B wished.

I am sorry that B's disappointment has induced him to act as he has. He should re-member that his tender for this trifling amount of work for the charity, exceeded the tender accepted by 377.! He had the decision re-viewed by the trustees, and now in your largely circulated publication charged the committee circulated publication charges the committee with unfairness, and infers that the architect recommended G's tender to be accepted, because he was "one of his own neighbours." When G's tender was accepted, the architect asked mie who be was; for although certainly "sne of his own neighbours," be did not previewsky know him.

I cannot imagine that the loss of this small contract is of any importance to your corre-spondent, but this I do know, that he has no ground for the complaint he makes against the committee of trustees of this charity, who, with other trustees, devote much time and at-tention to forward the objects of the very important and useful charity to which they are also subscribers. I am, Sir, &c.,

Aug. 11, 1845.

1000

A TRUSTER.

*** The name of the architect referred to which we have just now learnt, is an ample assurance to us, that whether the decision was the right one or not, it was not influenced by motive contrary to the strictest integrity and honou r.

🤐 - Atiscellanca.

THE GRAVE OF SIR WALTER SCOTT-WE are happy to learn that a monument at Dry-burgh Abbey, to the memory of Sir Walter Scott, will bed immediately commenced. Various obstructions and delays have occurred to interfere, with this pieus and patriotic duty. contemplated shortly after the death of the great minatrel. Sir Francis Chaptrey had premised a design, but died ere he carried his beention into effect. Mr. Allan Cunningham, the friend; and assistant of Chantrey, knowing the friend and assistant of Chantrey, knowing what/was proposed, draw a sketch of a monu-ment; and it is a melancholy and interesting fact; that, the last letter ever penned by "honest Allan" was one transmitting this sketch to Mr. Cadell, Edinburgh. The same day that he ment off his design for the tomb of Scott, Mr. Cunningham suddenly died, and followed his illustrious friends the next and followed his illustrious friends, the poet and and sculptor, to the grave. After a delay of thirteen years, the original object, however, will be attained, and beautiful as is the poet's tomb.in St. Mary's Isle (where nature has decorated the Gothia ruins with a profuse and picturesque wariety of foliage, and the mur-mura of the Tweed are heard in the diatance). the spot will be readered still more impressive by this external commemoration, the offering of gratitude and affection, combined with those higher and more solemn feelings which consecrate the grave of genius .- Inverness Courier.

NASMYTH'S STEAM HAMMER .- It appears that a patent for an invention similar to the above was granted so long ago as the year 1806. In the **Bepertory** of Arts," vol. ix., second bergeh. The patent was granted to William Deverell, of Charles street, Blackfriars-road, for "certain improvements in the mode of giving motion to bammers, stampers, knives, shears, and other things, without the applica-tion of wheel, pinion, or any rotative motion, by means of various powers now in common use." It does not however appear that Mr. Deverell, contemplated the application of his invention to the driving of piles.

ABCHITECTUBE IN PARIS.-The Art. Union remarks that the prevalent taste in the architectural improvements of Paris may be said to resolve itself into very opposite styles-that of the twelfth and thirteenth centuries on the one side, and on the other that of the Renaissance; both of which being carried to extremity-forcibly, on the one hand, revert to a period of barbaric art; and on the other to the character of a time which, with our best efforts at progress, we have not yet been able to rival. We have from time to time noticed the progress of the works in the churches of Paris, and described those of St. Germain des Pres, St. Germain l'Auxerrois, of St. Denis, and others. The whole of the interior decorations of some of these are variously painted -flowers and foliage are represented on the shafts of the pillars; and all the superior embellishments, statues, painted glass, and other paintings are in the style of the twelfth and thirteenth centuries. Notwithstanding the yet effective taste for antique architecture, it is yet surprising that in Paris such a feeling should have arises, where, in the memory of those professing such taste, nothing but pagan art was taught. This is, however, one of those extremes of which we have here so many art was taught. This is, however, one of those extremes of which we have here so many examples—equally in things great and small. It is an excess of that principle which main-tains the supremacy of early art. Among the architects whose works are most con-spicuous in Paris are M. Gau and M. Hittorf, both of where are previous of Colorne but both of whom are natives of Cologne, but Parisians by education. The predilection of the former is strongly in favour of the archi-tecture of the middle ages. It is to him that the erection of the new church in the vicinity of the Invalides is confided. This work is not yet commenced; the plans, however, are pre-pared. The position, on the contrary, as-sumed by M. Hittorf is more favourable: his name is connected with many of the most considerable architectural projects in Paris. A great part of the Place de la Concorde was planned and executed by him—he designed the candelabra here, and the fountains; also the elegant fountains in the Champs Elysées; he built the Cirque Olympique, besides numerous other edifices, domestic and otherwise. If evidence of his powers on a grander scale be demanded, it is only necessary to turn to the church of St. Vincent de Paul, which in 1824 was commenced, according to the ground plan of Lepere, but continued and finished for the most part by Hittorf, who has conducted the work since 1831.

REPARATION OF SEPULCHRAL MONU-IENTS .- The little church of Greatham, near Petersfield, whose lofty wooden porch, with its carved gable-board and crowning canopy of ivy, attracts the attention of the traveller on the Farnham road, has recently been much improved in its interior by the renovation of the pews on the south side of the aisle, at the expense of their respective owners, and of the parish, in conformity with those on the the parish, in conformity with those on the north side, similarly repaired about ten years ago; and the tomb and recumbent effigy of Dame Caryll, lady of the manor temp. Chas. I., has been restored at the expense of Francis Love Beckford, Esq., as her ladyship's more provided by a backgroup to prorepresentative, although he possesses no pro-perty in the parish, nor, it is believed, in the county. The restoration of the above hand-some monument was entrusted to Mr. Ubsdell, of Portsmouth, artist, who, having caused the alabaster and black marble to be cleansed, repainted the parts which had been originally coloured, applying ultra-marine and vermilion, so as effectually to resuscitate the gorgeous hues of former ages. It is to be hoped that the liberal example of Mr, Beckford will not he without its imitators, while such specimens of ancient art, mementos of human mortality and affection, and (where they speak sober truth) records of Christian virtue, may form integral portions of the decorations of churches; but, at the same time, the writer of this notice avows his opinion, generally that, except perhaps in large cathedrals, and even there he questions their propriety, the space monopolised by these erections were more suitably occupied by accommodation for living worshippers of God.—Hampshire Chronicle.

NEW CHURCH AT PRESTOR .- A new church is being built at Preston, the fund for erecting which is being raised by penny-a-week sub-scriptions; 600% has thus been obtained, and more is expected from the same means.

MONUMENT TO THE BROTHERS OF FATHER MATHEW .- A monument has just been exe-MATHEW.—A monument has just over cau-cuted in Tipperary to the memory...of. Francis and Thomas Mathew, Esquere bothers of the Rev. Theobald Mathew, from the design of Mr. James. K. Fabies, of that plates.... It is composed of a devescoloured megnesian dime The men is medangular... The operio stone. The plan is, rectangular. a The opena ing forms three fronts, each bearing a tablet for inscription, sermonated by three trifelinted depressed carved arches; there are mimerous buttresses, and crocketted pignaeles, segminated by carved finials. In the centre stands a equare edestal, on which is to rest a bust of the Rev. Theobald Mathew, covered by a projecting actagonal canopy. The whole is surmousted actagonal sunopy, The whole is summounted by a wrought Gothic cross ; the extreme width is 15 ft. 3 in., and height from the floor 24 feet.

SATURDAY, AUGUST 23, 1845.

N the last number of our journal we expressed a hope that a statement which had been forwarded to us, to the effect that a *Gothic* stainedglass window was about to

be put up in St. James's church, Piccadilly, was erroneous; considering that consistency was as necessary in an Italian building as in one of the pointed style. We have since seen the design, and have been led to inquire into the circumstances connected with it. It seems that it has long been desired to fill the window at the east end of St. James's church, which is in six compartments and two stories, with stained glass. Nearly twenty years ago, Mr. Backler adapted to it Raffaelle's "Transfiguration," and had a small glazed model made, whereon he painted the picture. Recently, funds having accrued, the desire was revived, and a committee was appointed to carry it into effect, with Mr. Charles Mayhew, the architect, for honorary secretary. Mr. Fairs, in conjunction with Mr. Backler and Mr. Wilmushurst, submitted the "Transfiguration;" but, after inquiry and consideration, Mr. Willement, Messars. Ward and Nixon, Mr. Hoadley, Mr. Warrington, Mr. Gibbs, and Mr. Wailes, of Newcastle, were invited to submit designs. The two first being much occupied, declined. The last, namely Mr. Wailes, with a candour which is creditable to him, stated in reply, that having devoted himself and his workmen exclusively to the production of glass adapted to Gothic structures, he hardly considered himself a proper person to execute a window for a church "in the modern style." At the same time, however, he gave the committee his reasons for thinking that stained glass of the Norman or Byzantine period was fitter for a Roman church than copies on glass of Italian pictures. In return, the committee said they would be happy to receive any design he might think fit to submit, without restriction as to style.

Accordingly, Mr. Wailes submitted a design in competition with the other parties named, and ultimately it was selected by the committee and ordered to be executed. It is unquestionably an admirable design, and the drawing in which it is set forth is very beautiful; in style, however, it is, as its author knew perfectly well, as different from the church of which it should form a part as Sir Joshua Reynolds' "Virtues" are from New College Chapel, at Oxford, and will be quite as much out of place. It is essentially Gothic, and even if the vesica-pisces, agnus Dei, trefoil, and other forms characteristic of the period be removed, will still remain so, and if put up, will entail opprobrium on those concerned. Inigo Jones, Wren, and others, shewed if not their contempt for pointed architecture, at all events their preference for Italian art, by destroying the unity of our noble cathedrals and churches with Corinthian porticos and Ionic altarscreens,-a proceeding which now forms the only drawback from our admiration of their great genius. If any man were to attempt to do so now, he would be laughed at by the public, and trampled under foot by the Cambridge Camden Society. Why then is con-

THE BUILDER.

sistency to be disregarded in a reverse case? Can we expect to shew our preference of one style to the injury of another without the castigation of those who, following after, will see clearer? Gothic doors would hardly be permitted yet in a Grecian or Roman church, the idea would be universally laughed at,—no where approved of. Why are Gothic windows then to be suffered in such a position, or how can those who introduce them expect to escape the ridicule in which they would themselves indulge in the other case?

In the first letter from Mr. Wailes, which was read to the committee, he stated, that whenever he had been called on to fill " Roman windows " with stained glass, he had always inserted Norman glass, on the ground that that was the earliest style of glass painting known, and that as it partook strongly of the Roman character, so much as to be called Romanesque, the use of Norman glass did not entail holf the anachronism or incongruity that introducing copies of the works of modern painters did, as these latter were removed six or eight centuries further from Roman architecture than the Norman. "I, myself," said Mr. Wailes in his letter (of which we gladly give him the full benefit). "I, myself, see nothing in the pictures of the old masters, as that school is termed, which at all approximates to Roman architecture. The earliest Christian decorations we know, are found in some of the Byzantine churches in Sicily, and these have all the characteristic features of Norman or Romanesque glass; whilst in a copy of an ancient picture, the material of the window (glass) is totally lost sight of, in most cases differing but little from the effect of a transparency on canvas. Glass, from its intractable nature, can only be applied in one particular way, as an architectural mosaic embellishment.'

Further, when the artist submitted his design, which he said was totally at variance with the usual mode of ornamenting a Roman window, he urged that it was more in accordance with the Roman style of architecture than the manner adopted by most glass painters. Stained glass, he again maintained, could only be consistently applied in the manner of Roman mosaics.

Now, throughout this argument the artist and those who assented to his views proceed upon an entirely wrong assumption; they forget that St. James's church, like most of our "classic" buildings, is not after the ancient models, is not in what we understand, strictly speaking, by the term the "Roman style," but is in reality an Italian building, after the models produced by those great men who in the fifteenth century adapted ancient architecture to modern wants and their own views, and induced what was termed the revival :men who sedulously avoided any thing that was Gothic, and in whose works the principle adopted is totally different from the principles exemplified in pointed architec-The question is not which is ture. the best style for stained glass : if it were, assenting as we do to the opinion expressed by Mr. Wailes, that stained glass windows ought to be treated more like a mosaic device than a picture, we should have nothing to say. The question, however, is, what character of glass, if any, should be used in St. James's Church, and the obvious, incontrovertible reply is, NOT GOTHIC. We have great respect for the committee appointed (which includes the Bishop of London, and other names of high character), and would not willingly cavil at their decision' Feeling

however, strongly on the subject, and knowing full well that if this wrong step be taken it may be the prelude of many others, we strenuously call upon the committee to reconsider their decision dispassionately. The selected design, as we before said, is admirable of its class,—it is simply to the proposed introduction of it in St. James's Church that we loudly object, being satisfied that if persevered in, it will prove a great and serious mistake.

GOTHIC IRONWORK.

CONSIDERED IN REFERENCE TO ITS INFLUENCE UPON THE FUTURE DEVELOPMENT OF THE STYLE.

THE constraining influence upon style in Gothic architecture, induced by an exclusive desire for reproducing works, which have, or might have been erected at a former time, has been in part indicated by us in previous numbers of this journal.* A reign of taste, which subsists entirely on the produce of former ages, fertile as those ages may have been, bids fair soon to be exhausted, and already there is that resemblance in most of the designs of our new churches, which be-tokens the probable aspect of the future. It is vain for the architect to trust to no ideas but his own; and without the suggestions, which ancient models afford, he will either lapse into a system of routine, in which the principle of life is wanting; or will run in quest of originality, into eccentricity and bizar-rerie. But it is equally true, that unless the powers of the artist's own mind are exerted, and unless the advantages peculiar to present times are considered; if to the native ore the reducing flux be not added, the matter will remain an object of interest, but unproductive of those new combinations, to which the fusion in the crucible of art might have led. It is our peculiar humour at this crisis, to content ourselves with a very partial study of ancient models, and a total disregard of all internal resources. We have, therefore, endeavoured to urge the importance of an increased study of the principles of art in former times, and a more active use of the advantages of the preent. Amongst these advantages are a greater ability to execute substantial work, through our better knowledge of the properties of ma-terials. Many of the Gothic buildings, though constructed on principles, on which we have not improved, have failed from causes, which modern experience could readily avert. The disuse of uncoursed rubble, a better knowledge of the qualities of materials, the addition of proper drains and gutters, the employment of concrete, and the application of iron to constructive purposes, are some of the advantages which we may be said to be in possession of. Of these, not the least important is the knowledge of the properties of metals.

It must be considered, as one of the greatest merits in Gothic architecture, one which emi-nently distinguishes it from other styles, that each material, which became the vehicle of design, was invested with the precise character, which its peculiar physical properties and capabilities best admitted of. Whatever the occasional eccentricities, perchance observable occasional eccentricities, perchance observable in a style of such fertility, it was unquestion-ably the leading principle of the Gothic archi-tect to give to stone the appearance of stone, to wood the appearance of wood, and of iron that of iron. Though to produce surprise was one object in view, he did not excite it by means, which were not evident; the arrangements, necessary for construction, were not less apparent, than those belonging to de-coration, for they were identical. Whatever the space to be decorated, or the constructive object, he yet considered the particular advantages of the material employed, and held, that it was better to seize those advantages than to mimic, in one material, the form and treatment of another. In a screen, or canopy, the ar-rangement of mullion, and foliation was by no means similar in wood, stone, and metal, and in no case did he desire, by paint, or other mode of deception, to make any thing appear what it was not. Where metal was employed, we it was not. Where metal was employed, we find the mullions of less thickness, the crockets of greater projection, and in every respect the

* Vide ante pp. 39, 98, 171, 181, 217, 266, 314, &c., &c.

peculiar capabilities of the metals availed of, and still with the minimum of labour and ex. brasses, or by the simple use of a pair of pincers, a description of ornament was produced, having the true metallic character, and yet with less labour, than is needed for a yet with less labour, than is needed for a similar effect, in a casting. Our modern iron-work—especially the Gothic—betrays a com-plete disregard of the nature of the material. It has become bulky and massive, in a degree, more suited to stone and wood; the great beauty of the old ironwork, produced by hand, is wanting, through the absence of relief and undercutting, and the ability to supply a multitude of copies is co-existent with the almost worthless character of the work itself. It is the duty of the architect, to avail himself of every aid to the proper execution of his design; but in the present use of reating, facility of execution, and reproduction are deemed to be advantages, the which every beautiful form must bend. If, however, the former treatment of metal work were more generally understood, and the kitle labour required to produce an effect in wrought iron; we might hope to see a more securate definition of the limits of the two sits; whilst it would be found, that the labour now devoted to iron work, where rasting has been employed, often is actually greater, than necessary to produce a better effect, when the process is entirely by hand. In "The true Principles of pointed Architecture," Mr. Pugin has very clearly pointed out the original method, and there shewn, that with plates of metal, laid over one another, and perforated in forms, differing in each, the character of Gothic panelling is given, in a manner better adapted to the material, and with less expense than by the process of senting. The execution of larger tracery, and of folinge is not less simple. It is not only -in Gothic iron-work, that the misuse of the art of casting is apparent; the scrolls and antifixœ in modern wark gates, and railings are elabo-rate, but unsuccessful attempts to imitate a school of art, in which, at one time, the painter and the scalptor were operators.* At the best, where the casting has been improved upon by subsequent labour, that labour is extreme, and indeed in many cases, where the pattern is costly, without being of further use, the want of manual dexterity can be the only impediment: The increasing taste for decoration will probably remedy this defect, and if the operative skill be properly directed, we may

Though examples of Gothic iron-work are not very numerous, there is ample evidence of remarkable skill in the material. The railing, round the tomb of Henry VII. at West-ninster, the monument of Edward IV., at St. George's Chapel, Windsor, certain cano-pies to recumbent effigies in Westminster Abbey, the hinges of the doors at Lichfield, and Windsor, and other examples, still exist-ing in Earland and on the retingence. ing in England, and on the continent are proofs of the fact, and will afford hints, as to the mode of working. Had the material been as plentiful as it is now, and the ready mode of reducing it from the ore been as well understood, there is no doubt, that it would have played a still more important part in the construction, and decoration of buildings. But we have iron in abundance; it has been applied to purposes, which our ancestors did not dream of; it has floated on the ocean, and carried the passenger over the strait; it does the work of men's hands, and work, which hands could not do, and has become the way on which in hours, we count the days of former times. Bridges, beams, roofs, whole houses are now made of iron; every day it is being applied to some fresh purpose, and therefore it is a material, which has influenced, and will most powerfully influence the decorative character of our architecture. Such being the case, it seems, that it may be employed in Gothic architecture. It may not be the most important item in the future style, but it is at least one, which may advantageously be used, decoratively, and constructively to a much greater extent, than it formerly was.

There can be no reason that its use should

• Francia, who painted the "Dead Christ" in the Na-tional Gallery was a goldsmith, "Francia Aurifex" is in-scribed upon one of his works, -Quentin Matsys painted "The Misers," at Windsor castle.

rigidly be confined to such parts of a building we are accustomed to see it in, as railings, locks, and hinges; though in these, there is great scope for invention, and certainly for improvement upon their modern forms. may be applied to more fundamental constructions, without violating any real principle, and with a new field for the display of Gothic Gothic architecture. Roofs, window-tracery, slender shafts, pinnacles and crosses, spires of openwork, and font covers may be executed in it, with the best results, and without offence to the taste of any one, who really understands Gothic architecture, and whose love of pre-cedent does not blind him to the merit of originality, and the inspiration of inventive genurs. But, say the book-learned, "tracery! columns! spires! in iron!! this is contrary to all propriety, and there is no authority for it !" But, if invention is a thing, which cannot or must not be, then do we at once sorrowfully abandon the practice of the style, along with all such, as are content to forget the artist in the virtuoso, who venerate less the creative the virtuoso, who venerate less the creative power of mind, than the sweepings of centu-ries past, who live entirely in this compa-rative ignorance, and have no hopes in the prospect of the future, to all the cavillers at the Gothic style, during its, in such case, short-lived existence. We have ourselves urged the examination of ancient models, but we deprecate a state of-it cannot be art where imitation is the only end and object. Imitation is an aid to art, the matter out of which originality springs, and not the point, at which art stops short.

Those who are conversant with ancient models can hardly think of Gothic bridges, or of columns of iron, without reverting to many attempts to imitate the forms, and proportions of timber and stone, unhappily, common enough. We do not wish to see more constructions of that solid character. Co-lumns must not be painted like stone, but have the proper appearance, and proportions of the metal employed, whether iron or brass. In metal, we shall be able to carry out the forms of slender shafts with perfect security, and consequently better effect, than is dis-cernible in the old buildings. The desire of the Gothic architects to make these shafts perfectly secure, led them to use a material, different to that of the rest of the building; this they found in the Purbcck marble; but it was still requisite to band them at intervals to the neighbouring pier. Where these bands were omitted, the shafts have failed, as in the Temple church, where it has since been necessary to tie them with iron to the multion. Conse-quently, with iron we should be able to execute slender shafts with better effect, than in the original manner. It is well, sometimes, to listen to an openet, and we quite agree with the following remarks: —"The grove at the east end of Salis-bury cathedral, which, like the banyan tree, seems to be composed of pendants from the roof, in different dimensions, rather than columns to support it; beautiful, indeed, but so fragile, that the blow of a stick, or the movement of an awkward visitor would put the whole fabric in peril. If, instead of a friable stone or marble, the shafts were made of brass, the mind would relax into that security, which is ever the first requirement of our art." Salisbury cathedral is a remarkable instance of the use of slender shafts, and it cannot be denied, that our satisfaction would be greater were those shafts of metal. spire should not be, like that recently erected at Vienna, a reproduction of the forms of masonry, but should be of open work, not resembling the spires of stone at Freyburg, and elsewhere, but entirely sui generis, with the character of iron-work, and not with the form, and proportions of stone. On the continent, it is not unusual to find windows entirely destitute of stone mullions, the tracery being formed in iron-work. It is possible, that this idea might be turned to some account, though the absence of stone mullions is attended with a poverty of effect, the colour of the iron-work, not contrasting with that of the window, when seen from the exterior. As a matter of course, in combining iron with other materials, it will to consider the effect of colour. be necessary

Thus we think, that in iron, we have one aid to the future development of style in Gothic

* Cockerell's Lectures on Architecture at the Royal Academy.

architecture, one of great importance, whose advantages were not unfelt by the architects of old, and were met by them in a manner, from which we can learn much in its more extended application. Hitherto in modern architecture, where iron has been used, it has been misused, and in employing it, it must be our endeavour to invest it with the character of ornament, for which its peculiar properties best adapt it; the masonic must be carefully avoided. When once so important a material is properly treated, and with the originality, which cannot fail to be the result, we may fairly hope to see a better style, influencing all parts of future Gothic buildings. E H

ASSERTED ABUSES IN THE WESTMIN. STER COURT OF SEWERS.

IN a recent number of THE BUILDEB WE nserted extracts from the pamphlet written by Mr. John Leslie, one of the Commissioners of Sewers for Westminster and part of the County of Middlesex, in which he alleges that great abuses have existed, and do still exist, in the Westminster Court of Sewers, in the waste-ful and extravagant expenditure of large sums of money, levied on the inhabitants for sewer's rates, by the building of new and the repair of old sewers. At the time we made those er-tracts we did not pledge ourselves to the accuracy of Mr. Leslie's statements, but gave incartion to them simply with a vious to juicate insertion to them simply with a view to inquiry.

At a Court of Sewers recently held at the Sewers Office, in Greek-street, Soho, a most important communication was made to the Commissioners from the Secretary of State for the Home Department, and which was read to the commissioners then present, and was as follows :---

Whitehall, August 13, 1845.

SIR,-I am directed by Secretary Sir James Graham, to transmit to you the inclosed copy of a pamphlet by Mr. John Leslie, one of the Com-missioners of Sewers for Westminster and part of Middlesex, to which Sir James Graham's attention has been called by representations from various parishes in Westminster, and I am to request that the Commissioners of Sewers will favour Sir James Graham with any observations they wish to make upon the allegations contained in this pamphet.

I am, Sir, your obedient Servant, slet, Esq., H. MANNERS SUTTON.

Lewis C. Hertslet, Esq., H. MANNERS SUTION. Clerk to the Commissioners of Sewers, 1, Greekstreet. Soho.

Considerable discussion then ensued as to the best course the commissioners should take in reference thereto; at length it was decided that the clerk do simply acknowledge the re-ceipt, and also state that the court will take it It was reinto their earliest consideration. solved that a committee be appointed at the next court at two o'clock, "to draw up observations, in accordance with the request of Sir James Graham," and that these observations should be prepared and laid before the court at their earliest convenience. Considerable excitement seems to prevail at this court, and among the rate-payers under its jurisdiction, with respect to this question of lavish expenditheir money; and each succeeding ture of court will be extremely interesting to the public, particularly the very large portion now so deeply engaged in the important question of the good and efficient sewer age of the me-

tropolis. For some time past, a very large sewer has been in course of construction along filou-been a course of construction along the several at a cester-road, Paddington. It was ordered at a former court, that a further length of 450 feet of this sewer be built, esti mated at 1,23/l. On the question being put that the order be confirmed, Mr. Leslie moved the following amendment:—"That the work for building 450 feet of severe in Club 450 feet of sewer in Gloucester-road, Padding ton, be not done until after a plan, section, and specification, carefully prepared, which must include every expense; and that when those plans, specification, & C., are prepared, that the work be thrown on on to public comthat the work be thrown op en to pu petition, by advertisements in the public parters and the weekly journal called The BULDER.

This amendment created In animated div cussion, on which the comma i ssioners divided, when there are the comma i state the lines cussion, on which the comma sisteners autors, when there appeared, ayes 6 = ler, Messrs. Biffin, Chambers Leslie. Noes 6 : Messrs. Donaldson, Eyre, Gutch, G. chairman, E, Willoughby.

This division was rather unexpected, and considerable excitement and confusion was the result in consequence of this near approach to what Mr. Leslie has been laboriously endea-vouring to effect for some considerable time past, that is, that every large work under this commission be thrown open to public competition, so that the rate-payers may by this means partake of the benefit which must naturally result from the adoption of a good and wholesome system.

ON BRICKMAKING.

ON BRICKMAKING. Sig,—Having seen an account in THE BUILDER, (p. 182, ante), and considering it to set forth by far the best management of clay, together with other ingredients necessary for the purpose of making bricks and for their durability and colour, that I have ever before met with, I should feel much obliged if the writer of it would answer me the following questions, viz.:—Ist. After the clay is raised, what sized mesh the sieve should have for passing the scheet through before being thrown passing the ashes through before being thrown on the clay, and whether the breeze might not be reduced so that the whole might pass through the same sieve, as I have put breeze in the clay, and though not coarser than a common white pea, it has invariably blis-tered the brick in the burning. 2nd. How to reduce the chalk to that state capable of being intimately mixed with the clay; my reason for asking this question is, that I have a field of fine red clay that does produce ex-cellent building and floor bricks of a uniform red colour; I have also made floor bricks and pavings with the same clay that have burnt a pavings with the same clay that have burnt a very good white by adding whiting, &c., &c.; but the process of grinding chalk and manu-facturing it into whiting is attended with too great an expense for general purposes. Hence my wish to know a more easy process of reducing it by other means, if such can be done. I remain an attached friend to THE

BUILDER and A SUBSORIBER FROM THE FIRST. Wisbeach.

SIR,-Your correspondent asks first of all, what is the most advantageous size of the breeze to mix with the clay in brickmaking? As a general rule, I believe, it may be asserted that the smaller the better, so long as the extreme case of mere dust is avoided; for it will be evident on consideration that the smaller the breeze is the more thoroughly can it be incorporated with the mass of the materials constituting the brick, and the more uniformly they are blended the better will be the brick in every respect. With regard to the case in which your correspondent states, that he has used breeze "the size of a common white pea," which has blistered the bricks ia which it was used, this blistering must, in my opinion, have proceeded from some other cause than the mere consequence of the admission of breeze of the average size stated. I think the cause would more likely proceed from haste in burning, that is, that the bricks were not thoroughly dried in the stacks, when they are very apt not only to blister, but to crack; and if in such case they have not been well pressed into the moulds, every crack and joint in them will open. The proper sized meshes through which to run the breeze to get it of a uniform size is somewhat arbitrary, and depends in some degree upon the amount of labour intended to be given to the proper mix-ing of the clay, for it is clear that to obtain fine breeze it will require much care in its various siftings; the general sized mesh used in the neighbourhood of London varies from about three-sixteenths to three-eighths of an inch for the square of each mesh, say from about Fourto six wires to the inch; but a five-sixteenth mesh is as good as any, it neither being too I arge nor too small, but of a medium size, fit for almost any purpose.

Many brickmakers, however, use their breeze Many brickmakers, however, use their breeze uch larger than the above meshes would allow, hut, as a general rule, I would not re-commend such an extreme size to be used. The more thoroughly the breeze is incorpo-ated with the clay, the more likely is the brick o turn out well in the burning, as the heat if the more diffused through the mass than if only had particles of breeze scattered wough it in unequal portions and improperly ixed, which statement may be well illustrated

by breaking and examining a badly prepared brick, in which clinker breeze will be easily traced

With respect to your correspondent's second question, I can only repeat what I have already often said before, viz., that the more thoroughly the chalk is cleansed and mixed with the clay the more clear and uniform will be the colour of the brick. I scarcely understand what your querist means when he speaks of converting the chalk into whiting before he mixes it with the clay; that would indeed be too expensive, but if he calls washing the chalk turning it into whiting, then I can scarcely tell him what to do, as there is really no way of getting good

clean white stuff without washing. In ordinary purposes, however, the chalk is often merely broken into small lumps, and well slaked with water before mixing with the clay, but this method requires that the clay itself should be well kneaded and worked to mix the chalk and clay, otherwise the bricks will turn out full of white lumps, rotten, and of very poor quality. To produce really good bricks, the chalk ought to be washed in a bricks, the chalk ought to be washed in a common circular horse mill, and poured over the clay in a fluid state; this I take to be the only means of giving anything like certainty to the process. I have known many a clamp of bricks rendered almost valueless from the careless mixing of the chalk; and as a general rule it may be stated, that chalk cannot well be mired too fine end that it is more certain in its mixed too fine, and that it is more certain in its results if used in a fluid state before the clay is finally ground for the moulders.

I have seen some decent bricks, as far as regards colour, made in Yorkshire, without the application of breeze at all, or indeed of any other ingredient but the mere clay and a little chalk, but then they were coarse, and full of cracks, which appear to be characteristic of this mode of brickmaking. Brickmaking, as a separate trade, seems but little attended to in country districts, as it is not uncommon for mere farm labourers to turn their hands to brickmaking, as I have known in several cases; this probably accounts for the uniform coarseness of the bricks used in such parts of the country. JOSKPH LOCKWOOD. 6, Child's-place, Temple.

ART-UNION EXHIBITION.

THE works of art purchased by the prize-holders of the present year in the Art-Union of London, are now being exhibited to the subscribers and their friends in the Suffolk-street gallery. They are nearly 300 in number and form a very interesting collection. Although there are no leading pictures, the in-crease of taste exemplified in the choice of productions is highly satisfactory. A very judicious movement has been made on the part of the committee, who have commissioned Mr. Marshall to produce his excellent work "The First Whisper of Love" in marble, for a 300/. prizeholder, who deputed them to select. This branch of art has been as yet neglected by the society, and we see with pleasure their deter-mination of further encouraging this important department by offering premiums. Among the excellent pictures (of which there are not a few), we noticed the extremely clever work entitled "The Gaugers are coming," by Philip, which was committed to utter dark-ness by the Academy; Elmore's work, "The Origin of the Guelph and Ghibeline quarrel;" the fine landscape by W. Linnell, that wor-thily created a sensation at the British Gal-hery: a heaviful landscape by Willow. lery; a beautiful landscape by Müller; In-skipp's "La Cephaline;" Johnston "Trysting Tree," that was treated so ill by the British artists; some fine Lee's; one or two by Hart; a particularly good Clint, and many excellent specimens of Cooke, Pyne, Bright, Montague, Boddington, Kennedy, Witherington, &c. The water colours contain some favourable

specimens of Topham, Wehnert, the two Fripps, Bentley, Fielding, Richardson, and others. The two bronzes exhibited are in the highest

made by Stevens, fac-similes of which are to be issued in statuary porcelain next year. The Duke of Cambridge visited the exhibition on Saturday last, and was attended round the gal-lery by Mr. G. Godwin and Mr. Pocock, the Honorary Secretaries. His Royal Highness entered warmly into the merits of some of the pictures, and expressed himself as ever, warmly interested in the prosperity of the Association.

IMPROVEMENTS AT BRISTOL.

THE corporation of this ancient city seem determined not to be behind in the movement towards improvement new making itself felt. Amongst the most important projects is that of forming a new street between the terminus of the railways and Bristol bridge. If efficiently and wisely carried out, this cannot fail to prove of great value to the city. At a meeting of the town council, on the 13th instant, the Mayor, Bi J. P. King, Esq., said in the course of his admirable address "The necessity of this improvement will be abvious when I men-tion that the present road was only tolerable when the whole, traffic upon it was that from London eastward, and that it is now altoge-ther inadequate for the great railway traffic which traverses it not only from the east, but from the north, south, and west. The subject has been taken into consideration by the Improvement Committee, and a remedy recommended by them to the citizens, and the only thing which deterred the Improvement Committee from before bringing it forward was the great expense. It has been before the committee for two years, and that was the only obstacle. One of the advantages of a broad street into Bristol would be the ventilation and fresh air introduced into, at present, one of the most crowded districts; the better drainage of that part would be another great consequent improve-ment. If we look at the expense it does carwould be another great, consequent: improve-ment. If we look at the expense it does cer-tainly form an obstacle, but it is an obstacle we must get over. If the burden fall on us in one or two years it would be immense; but if the cost be spread over 20 years, it will be greatly reduced, and when put in comparison with the benefits to be derived, I do not think that the citizens will consider the taxation worthy to be set off against the advantages. One thing I wish gentlemen to guard against, and that is looking at the sum in the total only. If gentlemen would calculate what each individual had to pay, the sum would be found so mederate in comparison with the great improvements to he effected, that I do not think it would be feit. It is not the intention of the committee, nor the architects, Mr. Pope or Mr. Fripp, to re-commend the erection of magnificent buildinge. All that is recommended is a good wide street of 60 feet, leaving it to individual parties to construct such houses as they may deem most desirable for carrying on their business; by this means all the expenses attending emforcing strict uniformity in the plans will be avoided, and the street will still be, if not so handsome, as useful and sightly to the city. Another con-sideration, which I hope will not be lost sight of, is, that the money will be expended in our of, is, that the money will be expended in our own city, and a great part of it smonget the industrious mechanics. It will merely be an exchange of property, from one class to ano-ther—an exchange the best of any—from the wealthy to the poor. If the money was to go out of our city, I confess I should think more of it."

Another thoroughfare is to be improved, and Bristol-bridge widened. The Froome, and Bristol-bridge widened. The Froome, at present a source of infection, is to be deepened, and many other important steps taken. Relative to the proposed new street (Victoria-street it is to be called), we may mention that the length is 2,100 feet, and total width 65 feet. The number of premises re-quired to be purchased is 263; the number of lots to be created in the new street, allowing 18 feet to each lot, is 167. Frontage in ad-18 feet to each lot, is 167. Frontage in ad-dition to the above-mentioned will be gained on the proposed line of improvement to the extent of 1,800 feet, equal to 100 additional lots. It was estimated that the first division, commencing at the terminus and ending in Temple-street, would cost, allowing as a set-off the value of ground to be cleared and sold for building lots, 13,000*l*.; the second, com-mencing in Temple-street and ending in Thomas-street, 11,550*l*.; the third, from the corner of Longram of the Bed corner of Long-row to the corner of Red-Digitized by GOOSIC

cliff-street, 15,7401. The general estimate of the whole cost of making the new street, towith it, is 85,510%; towards which it was estimated that 44,220% would be obtained for sites for building, old materials, &c.; leaving the cost of the improvement 41,290/. This amount seems very large; without

however, now going into the question of the best means of opening a new road in the best means of opening a new road in the direction pointed out, we would repeat a re-mark made by Mr. Herspath at the meeting, and caution the committee against widening old roads instead of making new ones; the latter course wisely pursued will usually pay for itself.

The new Guildhall is approaching comple-tion, and the restoration of St. Mary Redcliffe is to be commenced immediately.

WORKS IN THE METROPOLIS.

NEW iron gates have recently been erected at the Albert Gate entrance into Hyde Park, from Knightsbridge. They consist of two openings for carriages and two for pedestrians, and are affixed to buttresses on each side, each but-tress being surmounted by the figure of a stag. The whole is lighted by six large gas lamps. Mr. Barry, the latter under that of Sir Robert Smirke. — The new church on the west side of Chester-square, Eaton-place, is nearly finished. The consecration will take place in about three weeks by the Bishop of London. It is to be dedicated to St. Michael, and will accommodate 1,400 persons. This is the fourth church which has been built in that portion of the parish of St. George, Hanoversquare, within the last few years.—On the south side of Vanxhall-bridge-road, Pim-lico, the sites for two new churches are already marked out.—A new Roman Ca-tholic chapel in the Gothic style is in course of constinue and parial parameters. of erection, and rapidly approaching completion, in Farm-street-mews, at the back of Mount-street, Grosvenor-square. It is to give of accommodation to between 1,400 and 1,500 persons.—On the 1st instant, the founda-tion stone of a new church in Charlotte-street, Fitsroy-square, was laid by the Bishop of Lon-don. It is to be dedicated to St. John the Evangelist.----The works connected with the Victoria Park are now in very active operation, and considerable progress has been made in the principal lodge entrance in the approach from Bethnal-green, which is being built in the Norman style of architecture. Adjoining this, the piles have been sunk in the Regent's Canal for the erection of the suspension bridge, which is at an angle of the two roads from the Hackney and Bethnal green roads. Nearly the whole of the paling has been placed up round the park, and on the roads through it there is a handsome iron railing.

IMPROVEMENTS IN CHELSEA. - The Bill "for better paving, lighting, cleansing, regulating, and improving the parish of St. Luke, Chelsea, having received the royal assent, it becomes incumbent on the parishioners to see that its powers are wisely exercised. Its operations are to be guided by forty-five commissioners (to be elected by the parish), and five nominees. A society has been formed to promote the welfare of the parish, and they have issued a list of gentlemen eligible to serve as commissioners, who seem well quali-fied for the office. The parishioners should watch jealously lest the public good be made to yield to private interest. OPENING EXHIBITIONS TO THE PROPLE.-

The Royal Hibernian Academy, in order to enable the operative classes to visit the exhibition, reduced the charge for admittance to one penny. 1,300 persons availed themselves of it the first day, and the number afterwards increased to more than 4,000 a day. Not the slightest disorder occurred.

New Town Hall, North Shields.-The new Town Hall at North Shields was opened on Tuesday week. The interior of the building is said to be handsome, and well adapted to its purpose. Besides being used by the magistrates as a justice-room, the hall is intended as a repository for works of art and portraits of eminent persons.

IRON AND THE IRON TRADE.

SCARCELY any change has taken place in the price either of pig or bar-iron since our last quotations.* In the former some large sales have been effected at 62s. 6d. and 65s., and the market remains firm at the latter price. Rails are in good demand at 91, 10s. per ton.

The admission of British iron into France duty free is undergoing the most serious con-sideration of the French Government. The fact of Great Britain and other countries now so largely extending their navies by the con-struction of iron vessels has led to the raising of this important question. The preliminary investigation has been referred to the general council of mines, which, after examining the progress of metallurgy in France, and the cost of iron in England, Belgium, &c., is to decide whether iron shall be admitted into France duty free, or whether such duties shall still be levied. While on the subject of iron, it will be interesting to many readers to trace it will be interesting to many readers to trace the progress of its make during the past cen-tury. In 1740 the quantity of pig-iron pro-duced in England was only 17,000 tons, from fifty-nine furnaces; in 1750, it had increased to 22,000 tons; in 1788, the amount was 68,000 tons, and 121 furnaces; in 1806, the number of furnaces had increased to 169, producing 250,000 tons; and in 1820 the amount of pig-iron in England was 400,000 tons; while last year the total produce of pig-iron could not have been less than 800,000 tons, which has considerably increased in proportion in the first six months of the present year.

The use of iron as a material for bridge building has at length found its way to the United States. The first construction of this kind has just been completed at Pottstown depôt of the Pottsville and Philadelphia Railway: it is on the truss principle, 34 feet span, weighs rather over nine tons; the cords are of wrought-iron, and its cost is about 3251.

THE ARCHITECTURAL PECULIARITIES OF GALWAY, IN IRELAND.

BY W. F. FAIRHOLT, F.S.A.+

BEFORE I had visited the western coast of Ireland, my attention had been frequently directed, by the remarks of previous travellers, to the striking peculiarities of the city of Gal-way. I was told that the houses and public buildings still remaining — the relics of the "high and palmy days" of Galway, when its port was the centre of Irish commerce—exhi-list commerce—exhibited specimens of pure Spanish taste and style, and that the dark features and coal-black hair of the people also strongly indicated their Spanish descent. As I approached within a few miles of the city, I at once recognized the truth of these remarks; the peasant girls, who were returning from the market in that town, were, in many instances, strikingly dissimilar in figure and feature to the Irish peasantry I had before seen. Their slender, tall, and grace-ful forms, long black hair and keen eyes; their dress, a petticoat of intense red or rich brown, with a closely fitting black boddice, ending just below the waist; their arms and feet uncovered, and the head only shaded by the dark hood hanging down to the waist, - brought forcibly to the memory the paintings of Murillo. On walking through the town on the morn-- brought ing after my arrival, I could scarcely imagine myself in Ireland, so singularly Spanish were the relics of the old buildings exhibited at each step. 1 had never visited Spain, and knew it only from pictures; but N. P. Willis, the American, and our own countryman, Inglis, had both done so, and they had, in their repective notices of this town, recorded this curious feature. Inglis had indulged in "rambles in the footsteps of Don Quixote" but a short time previous to his visit here; and he says, "I had heard that I should find in Galway

some traces of its Spanish origin, but was not repared to find so much to remind me of that land of romance. At every step I saw some-thing to recal it to my recollection. I found the wide entries and broad stairs of Cadiz and Malaga; the arched gateways, with the outer and inner railings, and the court within-needing only the fountain and flower vases to emulate Seville. I found the sculptured gate-ways and grotesque architecture, which carried the imagination to the Moorish cities of Gra-nada and Valencia. I even found the little sliding wicket for observation, in one or two doors, reminding one of the secrecy, mystery, and caution observed, where gallantry and superstition divide life between them."

Fig. 1 delineates one of the most perfect of the ancient residences of the town; it is known as "Lynch Castle," and was the dwelling-place of that powerful family of merchant-men for many generations. Their names occur either as provosts, portreves, or mayors of Galway, no less than ninety-four times between the year 1274 and 1654, and the last mayor of the family in that year resided in this mansion." A row of gargoyles run round the summit, precisely similar in style to those so commonly seen in Spanish ecclesiastical and other buildings, of which the pictures by Roberts furnish so many fine examples. The windows have been modernized, and all the mullions and tracery that no doubt once existed have dis-appeared.† The mouldings that now surround the upper portion of each are in their original state, and are exceedingly rich in detail, and beautiful in workmanship. The corbels which support them flow at the ends into elegant foliations, and sometimes surround small shields bearing the arms of the family and its alliances, while the outer angles of the moulding which springs from them are sometimes similarly decorated. A blank window occurs above the two to the spectator's right hand, between the second and third stories, where the original tracery remains; it is divided by a central mullion into two lights, and a transom beneath allows a small space between that and the outer frame-work to be devoted to a display of decorated masonry resembling a Gothic canopy. The window on the first floor on the same side of the house is equally peculiar, but in a different taste; the mouldings are supported by shields of arms; a lion stands above, supporting a circular piece of enriched above, supporting a circular piece of enricate masonry, containing in its centre another shield. The execution of this bas-relief, and of one very similar on the other side of the mansion, is very peculiar, and indicative of its southern origin; the surface is cut in very low relief, and the entire depth of the carving forms a straight side, raised at once from the wall, when viewed at an angle. Over the principal door is another heraldic display similarly executed, and enclosed in a frame-work of orna-ment and coat-armour. The door beneath has no decoration, and is not ancient in its character; the smaller door beside it preserves a few decorations similar in style to the windows above. At the side of the mansion, beneath the further second-floor window, are projecting supports for a balcony; and the house alto-gether is a striking and remarkable specimen of the Spanish taste of its builder.

Many other such mansions exist in the town, but they are in nearly all instances suffered to go to decay and ruin. There is one avenue known as "Dead Man's Lane," but which formerly bore the title of " Lombard-street," from its being thickly populated with the rich mer-chants of Lombardy; it has on both sides of the way a row of these highly decorated stone houses, standing roofless and untenanted, with-out a floor remaining, and the walls falling gradually away at the summit. From being the homes of wealth and luxury they have sunk down to receptacles for the dirt and filth of the lowest and most neglected of the poor of the town, who congregate about them, and are to

See ante p. 381. + We are indebted to Mr. Fairholt and the committee of the British Archieological Association (Lord Albert Conyng- han's division, if we may so describe it), for their ready com- plance with our request to be allowed to transfer the follow- ins the our request to be allowed to transfer the follow- ins paper from the second number of their journal (pub- lished by H. G. Bohn, York-street), which is full of interest- ing matter, comprising papers on "The Transmission of ob- jects of Antiquity to our times," by the Rev. Beale Post, "Ragland Castle," by Dr. H. Edwards : "Anglo-Saxon Masonry," by Mr. J. G. Waller; "The Nimbus," by Mr. Thos. Wright; "The Ancient Trassures of the Exchequer," by Mr. W. H. Black, &c. We hope shortly to refer to the journal of the other division of the association which also contains several valuable papers.

[•] Their arms, a chevron between three trefoils slipped or, occur frequently on the public buildings and religious edifices of the town. Their crest was all ynx present grundward. The motto, Semper fidelis. They were descended irom Wisham le Petit, who came to Ireland in 1185, with Sir Hurch be Lucy. John De Lynch, the first settler in Galway, all but the middle of the thirteenth century, married the daughter and sole heires of William De Marsechall, whose father was the great Earl of Pembroke. † In Inglis's "Ireland" there is a plate, after a drawing by Bartlett, of "a street in Galway." in which this ancient house is represented as it may have originally appeared, although there is nothing said to give any other theat than that it is delineated faitfully as it now stands. I merely notice this to prevent a misconception of my own the tech. Their arms, a chevron between three trefoils slipped or,

be seen in some instances shrouding themselves be seen in some instances survouring themselves in the lower rooms, where the wind and the weather do not yet fully penetrate, the upper ones being unroofed and exposed to its full influence. The doorway here delincated (fig. 2), influence. The doorway here delineated (fig. 2), stands nearly opposite Lynch castle; it is a beautiful example among the many which abound in its neighbourhood. The deep moulding above is elegantly varied at each side, where the flat projection from the wall would only meet the eye, by an angular cutting resting upon the terminations of the hood moulding, as upon a corbel. The doorway is suched and the spaces between the arch and arched, and the spaces between the arch and the mouldings above is filled on each side with the montainty source is find on each side with a boldly sculptured triple leaf, radiating from a central ball flower: the way in which the heavy hood mouldings terminate in delicately executed leaves at the base on each side, is very beautiful.

The hood-mouldings of all the doors, and many of the windows of these old mansions, always terminate at each side by a graduall aways terminate at each side by a gradually inward slope towards the wall, so that each rib contracts to one point, from whence foliated ornaments spring forward and entwine in the most quaint and beautiful manner. Two ex-amples are given (figs. 3), from doors in Lom-bard-street. They show the single and double bard-street. They shew the single and double turn of these ornements: when single, they invariably turn on each side toward the door. The trefoil is the prevailing ornament, as in the instance here exhibited, as well as on the doorway already described; the vine is also equally common, as delineated in the second example. The trefoil was the national emblem, as well as the armorial bearing of the powerful ruling family. the Lynches: the vine may, inas well as the armorial bearing of the powerful ruling family, the Lynches; the vine may, in-dependently of its beauty and fitness as an architectural enrichment, have been chosen as a badge of the staple trade of the town—wine, with which it supplied nearly all Ireland. In 1615, the records of the town state that "up-wards of 1,200 tons of Spanish wine were landed here for account of the merchants of Galway." Over many of the merchants of calway.

Over many of the gates are sculptured shields, displaying the arms and quarterings of the persons residing there, with all their family connections, as well as others containing their marks as merchants; very frequently the names of the owners are also engraved above them, together with the date of erection. One of the simplest and latest of these decorated doors bears the arms and crests of the families of Brown and Lynch, joined by intermarriage as proprietors, surrounded by mantling, and inscribed above each MARTIN BROWNE-MARIE

macribed above each MARTIN BROWNE-MARIE LYNCH, separated by a cross springing from L.H.S., beneath which is the date, 1627. The cause of the peculiarities that thus ex-isted in ancient Galway may be explained by the very singular laws and regulations made by the inhabitants for the exclusion of the patient risk. to the incluse propage is which native Irish; to the jealous manner in which they lived within their strongly walled town, enriched by an exclusive trade, and holding little or no connection with the people without. Among the bye-laws of the corporation for 1516, it was ordered, "that no man of the town hold, it was ordered, "that no man of the town shall lend or sell gally, botte, or barque, to an Irishman." And in 1518 it was ordered, that none of the inhabitants should admit any of the Burkes, M'Williams, Kellys, or any other sept into their houses; "that neither O ne Mac of Galway." Hardiman, the historian of this town, has given many other curious entries from these laws, which shew that Spanish pride from these laws, which shew that Spanish pride and jealousy operated most forcibly upon the ruling powers of the town. He engraves a curious map of the town in 1651, which gives a bird's-eye view of every building, and dis-plays the strong walls and bastions with which it was encompassed. He observes that this map "gives an accurate idea of the former opulent state and magnificence of Galway, adorned with superb and highly decorated buildings, and surrounded by every requisite for security and defence which either art could suggest or wealth command : it was universally suggest or wealth command; it was universally admitted to be the most perfect city in the kingdom, while its rich inhabitants stood con-spicuously distinguished for their commercial parsuits, public zeal, and high independence of spirit." A brief notice of the rise and decline of this town, gleaned from Mr. Hardiman's quarto volume, may be here acceptable. In 1124 a strong castle was built, and the town put in defence, to the great jealousy of the Munster

men. between whom and the men of Connaught, men, between whom and the men of Connaught, of which Galway was the capital, a deadly enmity existed, and which continued until very recent times.[•] In 1132, Connor, king of Mun-ster, dispatched a body of troops under the command of Cormac M'Carthy, who took the castle, put all the inhabitants to the sword, and, after destroying the castle and town, soon after defeated and slew Connor O'Flaherty, the lord of Lar Connaught II 1140 after recoverof lar Connaught. In 1149, after recover-ing themselves from this invasion, they were doomed to another from Turlough O'Brien, the new king of Munster, who did them nearly as much mischief. With indomitable perse-verance the inhabitants soon righted again, and in 1154 the ships of "Galway Dune" and of Conmacnamara were out upon an expedition to the northern part of the kingdom. After the invasion of Ireland in 1170, the

After the invasion of Ireland in 1170, the castle was fortified, and the town put into a state of defence. It at this time consisted of a small community, composed of a few families of fishermen and merchants, principally under the protection of the O'Flahertys, who held the castle and surrounding territory, as feudal lords, from the kings of Connaught; but it ultimately came into the hands of Richard de Burgo, and became his principal residence, and finally the capital of the province, which it still continues to be. Ile fortified against the incursions of the Irish, and appointed a magis-trate, called a provost or bailiff, who governed the inhabitants and established laws. It now the inhabitants and established laws. It now increased rapidly in wealth and importance, and being the stronghold of the De Burgos, was always receiving additional military strength; yet incursions became frequent and destructive. yet incursions became frequent and destructive. An entry in the pipe roll, temp. Henry III., informs us that Gillepatrick Mac Carthy was fined 50s. " on obtaining his pardon for burning the town of Galway, and for the death of David Bree;" a singularly reasonable rate of charge for so much mischief!

During the reign of Edward the First, the trade and prosperity of the town rapidly increased, and many new settlers appeared, lay-ing the foundation of its future wealth. A bout this time some of the most important of the old familles first came—families that continued for many centuries its wisest rulers and richest traders. The earliest settlers were the families of Blake Bedities before layer layer. of Blake, Bodkin, Ffont, Joyes, Lynch, Mar-tin, and Skerret.† With the spirit and enter-prise of these men Galway flourished greatly, foreign trade improved, and in 1277 Dermod More O'Brien, who resided at Tromra in Clare, received twelve tons of wine yearly, as a tribute from the merchants of the town, for protecting the port from pirates, and maintaining a suit-able force for that purpose. In 1303, the revenue called "the new customs," being an impost of three-pence in the pound, due from merchant strangers only, upon all commodities imported or exported, was farmed out for one year only to Richard le Blake for 32*l*. In 1375, the king's staple was fixed in the town for the sale of wool, sheep-kins, woolfels,

and leather; a privilege only before granted to Cork and Drogheda. During the fourteenth and fifteenth centuries the trade of the town wonderfully increased, both with France and Spain, from whence the merchants annually Spain, from whence the merchants annually imported vast quantities of wine, as well as other commodities. They were still as exclu-sive as ever, and as anxious to keep out the Irish, as well as all external rulers. For this purpose they exerted themselves to obtain from the pope a separate religious jurisdiction within their own walls, which was granted them; and they also procured from Richard III. a power to remodel their corporation, turn out the De Burgos, who had become exceedingly unpopu-lar, and elect a mayor and two bailiffs from their own body as rulers, and that no person, not excepting the king's lieutenant and chan-cellor (who were then privileged), should enter the town without their license. The first election of officers under this charter took place on the first of August 1485.

During the next century Galway was re-garded as the stronghold of the English govern-ment and trade. Its wealth increased, and its improvement as a town continued. About the middle of the sixtcenth century an Italian tra-veller is quaintly described in the annals as having seen at one view "the blessed sacrament in the hands of the priest," boats passing up In the hadds of the priest," boats passing up and down the river, a ship entering the port in full sail, a salmon killed with a spear, and hunters and hounds pursuing a deer; upon which he observed, that although he had tra-velled over the greatest part of Europe, he had reares before wineseed o sight which ere bigst

velied over the greatest part of Europe, he had never before witnessed a sight which combined so much variety and beauty." The downfall of Galway began with the fall of the Stuarts. In 1642 the fleet of Alexander, Lord Forbes, consisting of seventeen ships devoted to the Parliamentary party, landed at Galway, took possession of St. Mary's church, lanted ordnance against the town burt the planted ordnance against the town, burnt the surrounding villages, but did not gain the fort, which was, however, taken and demolished in 1643. Ludlow, the commander in chief, who, in 1657, was making the country around bitterly feel the "curse of Cronwell," was sent to by the people of Galway, to propose terms of capi-tulation, they having held out for the Stuarts. He coolly told them, that " if the Lord inclined their hearts to submission, such moderate terms would be consented to as men in their condi-tion could reasonably expect;" refusing all other tion could reasonably expect;" refusing all other arrangements, and also forbidding an appeal to the parliament. The principal nobility and inhabitants now shipped themselves off and abandoned the town, which surrendered, and was placed under the military government of Colonel Stubbes, who tyrannized over the in-habitants, fining them at the rate of 400%. a month, and enforcing payment at the sword point of his soldiers, who would 'ush' like ban-ditti into the dwellings of the wretched ihha-bitants to obtain it. He even seized and shipped to the West Indiës upwards of a thou-sand persons, of all conditions, under the pretence of insurgency and variance. The Jobs sand persons, of all conditions, under the pretence of insurgency and vagrancy. In July 1655, all papiets were ordered to leave Galway before the following November 5 and "the superb houses which, in the language of the Annals, were fit to lodge kings and princes, and described as the best built and most splen.

and described as the best built and most splen-didly furnished in the klugdom, were seized upon and occupied by the lowest of the popu-lace, until they were completely rulhed.³⁴ Not only did the houses of the merchantmen of Galway display their taste and magnificence; they are described by Sir Henry Sidney as "refined, of urbane and elegant manners, con-traction costs in from their weld and englished tracting no stain from their rade and anpolished neighbours." Heylin calls their town " a noted empire, and lately of so great fame with foreign merchants, that an outlandish merchant, meet-ing with an Irishman, demanded in what part of Galway Ireland stood." With such men of Galway Ireland stood." With such men the churches and monastic buildings received their full share of decorative enrichment, but of which little now remains. Civil war ori-ginally, neglect afterwards, and recent "im-provements," have all done their part in the demolition. There is still a convent in Lombard-street, possessing its old external features, but the collegiate church of St. Mary, origin-ally founded in 1320, contains the most interesting vestiges. The porch was crected by James Lynch Fitz Stephen, mayor in 1493, as a protection to the poor from the inelemency of the weather, and as a residence for the sexton, who still lives in the rooms above, which are reached by an external stair beside it. The door leading into the church (fig. 4), is a good example of the prevailing taste displayed throughout; the ornaments surrounding it re-sembling those so frequently seen in French architecture at this period, and known as that of Francois premier, or the Remaissance; but the slender pilasters shooting upward from the sides and centre, with their peculiar foliated pinnacles, shew its direct transmission from the country where that style originated. The windows of the church externally present the same features as this door, the tracery flam-

^{*} This must have been before 1569, when public mass was

[•] This must have been before 1569, when public mass was problibited. † flardiman, "History of Galway." The town never recovered these fatal wars. Charles the Second, with his usual ingratitude, behaved ill to the Galway men, who had incurred debt and ruin in his cause. He left them to destitution, but he gave the town the privilege of being a free borough of itself, taking in two miles in a direct line round it, to be called the county of the town of Galway. The walls and batteries were levelled by William III. in 1691 after the surrender, and fresh Government forts erected by the sea.

boyant and elegantly varied, the corbel heads quaint and peculiar. Gargoyles, like those at Lynch castle, project from the roof, and are occasionally more grotesque. Within is a noble nave, separated from the side aisles by a series of columns of great solidity. They are now unfortunately perfectly plain, but only a few years since they were richly sculptured with wreaths of flowers and fruit, with canopies and figures of saints, in the style, as well as I could guess from the description I obtained, of the famous pillars in Rosslyn chapel. I could hear of no view taken while the church was in this state, and I could listen only to the regret of all who described the "improvements," and join with them. The day of spoilation came, "a great builder" came from Dublin, and as ornament was not necessary, and canopied saints "smelt of papistrie," the beautiful pillars were cut smooth, and the whole interior, to use the old woman's phrase, made "as plain and nate as a new pin." A blank surface succeeds the enrichment of the olden time, and the exquisite pillars have become mere blocks of stone to support a roof! Some few remains of its former glories exist. The tomb of Nicholas Lynch still stands embedded in the wall of the south transept, or " Lynch's aisle," as it is termed. Long may it lie, and continue as perfect and beautiful as I saw it when the sketch was made for the accompanying cut (fg. 5). It is in a remarkably fine state of preservation, and the beauty of the flamboyant tracery which fills the space between the outer and inner arch is perfect. I can hope to give but a general idea of this on the small scale I have represented it.

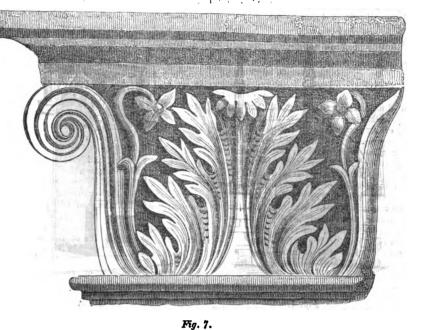

In the wall of the south aisle is the elegant recess here engraved (fig. 6). The shaft of the pillar which divides it in the centre is decorated with a spiral line from top to bottom. The base and capital are sexagonal, and support ogee arches filled with elegant tracery. A curious plain doorway is near this, with a circular cap-moulding, at each side of which crouch a hare and hound (fig. 7). The spandrils in the square-headed doorways, of the florid English style, were frequently decorated with some such quaint figures. The combat of St. Michael with the dragon was not uncommon, the saint occupying one side and the fiend the other. In the screen of St. Saviour's church, Southwark, a singular example occurs—a monk is chasing a fat pig, and endeavours to secure the animal by the tail as it runs down one side of the arch, while he scrambles up the other.

the arch, while he scrambles up the other. The font has originally been very beautiful, but it has suffered from mutilation. It is placed in the nave, on three steps. It is square, standing upon an octagonal base, richly sculptured with a row of trefoil or lozenge shaped leaves, having a smaller trefoil between, similar to the Tudor flower, which forms so common a finish to the screen-work of Henry VII.'s chapel at Westminster. Each face of the square basin is elaborately sculptured, with pointed arches filled with flamboyant tracery, or richly decorated quatrefoils. The Irish hound and three fleur-de-lys appear on one side; the arms of De Burgo on another. This font has been engraved from my sketch in Van Voorst's "Illustrations of Baptismal Fonts."

I cannot dismiss this imperfect paper without adding a few words on the interest and importance of Irish antiquities generally. Not only do many of their towns display architectural remains of much curiosity, but vestiges of early times of the most extraordinary character abound. Unlike the English peasant, the humblest Irishman has a love for the history of the great men of his country; he treasures their names, their deeds, and story; and he is always full of anecdote, and ready to accompany the traveller anxious to investigate the remains of "the fine ould ancient times," which he himself delights to descant upon, and to offer all information and service in his power. In his humble cabin the stranger always finds a warm welcome; and his deep-seated love of his native land urges him to treat any one as its friend who can lead his mind back to the days of its former glory.

WENTWORTH HOUSE.—Arrangements are making for the intended lighting of Wentworth House with gas, to be produced from coal in the immediate neighbourhood, the property of Earl Fitzwilliam.

ANCIENT CAPITALS FROM THE SOANE MUSEUM.

IN former numbers of THE BUILDER* we have given representations, from drawings by Mr. Richardson, of various ancient fragments now in the Soane Museum. The annexed engravings, figures 7 and 8, represent two other marble capitals of the same class, and afford pretty examples for the ornamentist or modeller.

AIR A MOTIVE POWER.

An ingenious application of the power contained in condensed sir to locomotive engines has recently been patented, and is now being exhibited, on a small scale, at the residence of Mr. Parsey, patentee, Spur-street, Leicestersquare, who courts the fullest inquiry into the pretensions of his invention. The engines are to be filled at a terminus with highly condensed air, previously generated and replenished from stationary receivers at the various stations of railroads as often as occasion may require. To the receiver or receivers of the engine so filled, to obviate the excessive force and gradual decline of pressure as the working cylinders draw it off, a receiver is attached into which the air passes till it reaches a given working pressure, which it cannot exceed but by adjustment of the engineer, as the self-acting regulator belonging

* See pp. 211, 234, and 247.

to the working receiver shuts or opens the inductive passage from the high-pressure receiver or receivers uniformly with the discharges from the driving cylinders, by which means as much power is carried by the engine as will propel it and a train any distance. It seems to have one advantage over steam, inasmuch as steam must be used as it is generated, whereas condensed air may be generated at leisure [and can be kept any length of time without losing its elastic or expansive power, and therefore can be used at any time it is required. Whether the invention will realize Mr.

Whether the invention will realize Mr. Parsey's expectations we cannot undertake to affirm. The working model has been seen in operation by many mechanicians and practical engineers, all of whom speak of it in terms of approval. Should success attend the carrying out the plan on a full working scale, a complete revolution must be effected in our railway system, as the wear and tear and numerous other expenses would be reduced to a mere fraction of what they are at present, many of the present causes of accidents removed, while any speed might be secured which could possibly be required. Our observations have been limited to locomotive engines, of course they apply equally to those which are stationary.

which are stationary. While Mr. Parsey has been devoting his time and ingenuity towards obtaining a motive power by means of a pressure from *within*, others both at home and abroad have been Digitized by

403

attempting to produce the same effect and at the most expeditious and economical rate by means of a pressure from without; indeed the vacuum and plenum systems appear destined ere long to be worthy rivals for supremacy, when steam shall be known only as a thing

that was, or at most as an auxiliary. Mr. Nasmyth, in a letter to the editor of the Mining Journal, propounds a novel method of procuring a vacuum by the direct action of low pressure steam. He says "the object de-sired to be attained is, to remove the air en-tirely from the interior tirely from the interior of certain large chambers, so that they may, as it were, become vast magazines of vacuum. The ordinary mode of doing this is to pump out the air by air-pumps, which receive their power from a vacuum, created above or below the piston of a steam-engine. The principle I set out upon is simply this—why employ one vacuum to create another, when we could, by the pri-mary process, attain the desired object, without the intervention of any secondary action, or machinery, whatsoever? Now, let us ex-amine how this is best to be done. One cubic foot of water, converted into low-pressure steam, will, in round numbers, yield 1,700 cubic feet of steam, which will be capable (on being introduced at the upper end of an upright air-tight vessel) of displacing, or forcing out at an aperture below, 1,700 cubic feet of air; if we now stop the further influx of steam, and close the sperture below, and either permit the steam to condense, per se, or perform that duty by a separate condenser, we shall have for our 1,700 feet of steam, 1,700 feet of very nearly perfect vacuum (supposing, of course, that our vessel was exactly 1,700 cubic feet capacity). Now, if we suppose a com-munication opened between this magazine of 1,700 cubic feet of vacuum, and an atmospheric railway pipe of similar capa-city, we shall abstract one-half of its contents of air, and at once reduce it to the state of a vacuum of 74 lbs. to the square inch, or thereabouts. Here, then, we have done some work so far, with our first 1,700 cubic feet of steam. It will be evident that the remaining vacuum in the exhausting chamber, and that in the pipe it has partially exhausted, will be similar in extent—namely, each a half perfect vacuum. Now, let us suppose that we have, during the performance of this operation, discharged the air from a second chamber of like capacity to the first—viz., 1,700 cubic feet, and that that vessel is just filled with steam on a balance with the atmosphere: if before opening the communication between our condenser and this steam-filled vessel, we first open a communication between it and our first vessel which, as before described, is in the state of half vacuum, it is evident that this first vessel will abstract from the steam-filled vessel a very large portion of steam, until the two are then on a balance; on this simple system of mutual transfer we not only employ the first vessel to act on the second, as a preliminary condenser, but also, as it were, use the steam of the second vessel in great part twice over, inasmuch, as this transferred steam will so far act the same as fresh steam from the boiler in satisfying the wants of the first, or "used up" chamber: this being the case, the second up" vessel has its vacuum rendered complete, by being brought into communication with the condenser, while the first vessel has its complement of steam made up direct from the boiler; which steam, flowing in at the upper end, per-forms the air-discharging office to perfection."

NEW CHURCHES .- On Saturday, the 25th annual report of the Commissioners for Building New Churches (which was presented to Parliament) was printed. It extends to fifteen pages. It appears that 343 churches have been now completed, and provision has therein been made for 402,259 persons, including 225,217 seats appropriated to the use of the poor. There are 36 churches now in the course of building, to the erection of which the commissioners have contributed pecuniary aid from the funds placed at their disposal The commissioners state that plans for 23 churches have been approved, to be built at the places mentioned in the report. Applications have been made for further church accommodation to the commissioners from 74 places, which are detailed in the annual statement.

BARTON HOUSE, IN THE ISLE OF WIGHT.

HER Majesty the Queen having purchased the site of the old convent or oratory of Barton in the Isle of Wight, for the erection of a marine residence, the following notices of its history, from a paper read at the late Winchester meeting, by Mr. John Alfred Barton, of Barton village, may not be uninby Mr. John Alfred teresting to our readers.

In archæological remains, and more par-ticularly those of an early date, the Isle of Wight has been represented by some writers to be very barren, which, if true, may have arisen from various causes; and amongst them, doubtless, the sweeping devastions, which have so frequently passed over it in by-gone times, are to be considered as primary ones. Yet there is much that will repay the antiquary for a patient investigation, — much that may yet be brought to light, hidden beneath the soil; and amongst those relics which time has spared, not the least interesting portion, is that which comprises the old manorial residences of ancient families, many of which still remain in nearly their original state, and being generally in secluded situations, have almost en-tirely escaped the notice of the tourist, or the antiquary. A considerable list of these might be given, but I shall now limit my remarks to the ancient oratory of Burton, or Barton, which has survived to the present day, and, till within a very brief period, presented a curious example of the domestic arrangements of a different state of society from the present. This fine old place is, at this time, an object of peculiar interest, from its having so recently become the property of her most gracious Majesty, and from the demolition (withsmall exceptions) of the venerable walls, which for nearly six centuries have withstood the assaults of time and the injuries of man. It is true that another building is in progress of erection, and that taste and genius preside over the work; but it is difficult to forget that, with its destruction, the associations attached to the time-hallowed and hoary dwelling of a distant age are passed away; and, however we may admire the new creation, still we must regret the old and the familiar. Very fortunately, during the lust year, I had taken a series of sketches of the house as it then appeared, and as it remained till within these few weeks. I shall briefly describe the old house as it

lately stood, and then proceed to give such account of its uses and of its history as I have been enabled to collect from the scanty sources of information available. It is much to be regretted that these are so meagre and unsatisfactory; but the truth is, that the religious house of Burton having been dissolved long before the Reformation, it has escaped the at-tention of our writers on ecclesiastical antiquities altogether, and with the exception of a lew scattered notices of it in old documents, some traditionary matters, and the preservation of the building to illustrate them, its history is involved in obscurity. Barton Court House icas an extensive mass of buildings erected at various periods, and having that general character which has been denominated the Elizabethan style; but it is little to be doubted that it belonged to a period somewhat anterior, and that it offered a specimen of the domestic architecture of Henry VI.'s age. The reasons for the adoption of this opinion are, that the houses of Elizabeth's time are usually more ornamented, whereas the prevailing characteristic of Barton was a severe simplicity; and also, it is well known that when the oratory was surrendered in the reign of Henry VI. great alterations were made in the building; and to that era, therefore, the late dwelling house was to be attributed.

There were two principal fronts, the castern, in which was situated the porch entrance, and the southern; but from whatever quarter it was viewed, a picturesque and massive group of moss-grown walls, towering and elegant chimnics, and ornamented gables, the whole embosomed in fine old trees, formed a scene of the greatest beauty and cheerfulness com-bined. The castern front comprised wings, with a central porch of two stories, and was very beautifully varied in its combinations, and exhibited a rich and interesting assemblage of details. The southern front was of much greater extent, and of greater simplicity in its outline, yet exceedingly impressive and noble, are now being made to carry into e while, from its more weather-stained hue, it a pidly as possible the original design.

had an appearance of the most venerable kind. These two fronts are the only portions of the ancient building which will be preserved, and it is creditable to the taste of those entrusted with the restorations, that they should have spared these antique remains, although it might have been wished the chimnies could have been also exempted from destruction, as their elaborate and elegant design and massive grouping well entitle them to this distinction.

During the progress of demolition, a wall of very solid construction, the sole remainder of the original building, was brought to light; and it having been stated in the public papers that is was interesting with respect to its architecture, I made a visit of inspection to Barton, but was, unluckily, too late for the swift progress of destruction - a considerable part having been then demolished, and with it an which the clerk of the works informed me was a plain chamfered one, possessing little of architectural merit. He also stated that the discoveries, concerning which so much had been written, were of a much less important character than had been represented, the arch being precisely similar to that at the eastern entrance, and the only point of interest visule. That portion of the wall which remained, certainly presented no features to distinguish it from any other, with the exception of its antiquity. It was a plain but massive piece of masonry. I was informed by the same gentleman, also, that a few coins had been discovered during the demolition of the house, which had been sent to his royal highness Prince Albert; but he could give me no information as to

their age or character : they are of silver. To describe the interior distribution of a dwelling which has ceased to be, may seem unnecessary, but there were some peculiarities about that of Barton which may entitle it to notice; and although it no longer retained its original monastic character, its details were of sufficiently remote period to excite curiosity, and to gratify it. One apartment, about 12 feet square, bore the title of the chapel, and was very singular, having been apparently fitted up as a secret chapel for the performance of the mass, subsequent to the Reformation, and within the memory of living individuals, retaining an altar, crucifix, and other Gatholic accessories. The hall was also a spacious and nuble room, though subsequently divided into two, and had its ample fire-place at either end, and its hospitable and antique table, formed from one immense plank of oak.

The oratory of Burton, or Byrton, as it is originally written, was founded about the close of Henry the Third's reign, or the commencement of that of Edward the First, by John de Insula (a member of the ancient family of that name seated in the Isle of Wight) the rector of Shalfleet, and Thomas de Winton, rector of Godshill, and by them dedicated to the Holy Trinity, and endowed with certain lands and manorial rights, situated in the parish of Whippingham and elsewhere, in the Isle of

Wight. By the Winchester register we are informed that in A.D. 1290, the prior being then a captive in France, and the buildings of the oratory in a state of dilapidation, instructions were issued by the bishop that the house should be repaired, and other necessary things be done.

A.D. 1439, about 150 years after its institution, and in the eighteenth year of Henry VI. the oratory of Burton or Burton, was surrendered into the hands of the bishop of Wiachester by Walter Trengoff, the arch-priest, who afterwards became Archdeacon of Cornwall. This was undoubtedly through the influence of William Waindeet, the bishop; and by the same influence the oratory with its lands were granted to the college of St. Mary, at Winchester, founded by William of Wykeham, and with this foundation it has remained till the recent transfer to our most gracious queen.

DEVONPORT DOCKYARD .--- For many years past, the Government has contemplated the enlargement of Devonport dockyard, but various interests have hitherto successfully prevented its execution. The additional powers recently given by parliament to the Admiralty having placed that department in a better position, very active arrangements are now being made to carry into effect as yle GOO igitized by

38. For what reason is an egg-shaped curve the best, and what is the best egg form for the section of a sewer?

39. What is the best egg shape or other curve for the section of a railway tunnel 40. In what way can a workman describe such egg formed curves for such purposes, full size, by simple continuous motion ?

41. What is an isometrical ellipse?

42. In what ancient Grecian building has the isometrical ellipse been adopted ?

43. Shew how a cylinder or cone may be cut to produce an isometrical ellipse. 44. State in which modern bridge the half of an isometrical ellipse has been selected as the form of the centre arch.

45. Can any reason be assigned why the ancient Greek geometrical architects selected the form of the isometrical ellipse?

46. And why should that curve be selected for an arch in modern bridge building?

for an arch in modera bridge building? 47. Shew how the varying ribs of a Gothic groin should be formed from any given curve for one rib, so that all the other ribs, differing in length of span, but rising to the same height, and with the same transverse section throughout, shall be perpendicular over their plan, intersect truly, and each spring at the same

distance from a point on the cap of the pillar. 48. Shew how several ribs of like sections, &c. as in the last can be placed so that their intersections shall be all of the same length.

49. Shew how several ribs, as before, can be placed so as to intersect truly, and although of various lengths and making various angles with each other on plan, will at the springing not be more crowded in one place than another.

50. What is a catenary curve? 51. Is it an asymptotic line? 52. Prove whether it is or not. 53. Show the simplest way of setting out a railway curves in a tunnel as the work pro-ceeds-whether the line is a portion of a circle or a line baving two points of contrary fixture to which the right lines of the railway at both ends are tangents to the curve at those points.

54. Supposing several radii proceeding from the centre of the eye of any ancient example of the Greek volute, at what point of any revolution is a tangent to the curve perpendicular to a radius ?

55. And at what point is a tangent most oblique to a radius?

56. Compare these with any modern ex-ample of the Greek volute, and point out the difference.

The study of architecture, engineering, and decorative art, would be greatly facilitated by a series of cones, right cylinders, circular cy-linders and spheres, to as large a size as convenient; some of them being cut to shew their several distinct plane sections; others to shew their their various distinct intersections with each other; and these accompanied by their several envelopes.

They would thus be proceeding on the same principle that the ancients made use of to ascertain true geometrical forms-true lines of beauty. The Greeks knew the right line, of beauty. the circle, the true form of the ellipse, the hyperbola, and the parabola, practically; and their relation to solids. They also knew other varying curves, but if they had ascertained their relation to solids, that knowledge appears to have been lost.

Some hundreds of pieces may be necessary to complete the illustration that would be desirable. Even the platonic bodies and their plane sections should be included, and the importance of all these may be shewn by askcube? In how many ways can a cube be cut by a plane section into two equal and similar parts? How can a cube be cut parts? How can a cube be cut by a plane section so that its half shall have five, in other cases six, and in other cases seven plane surfaces?

The knowledge of intersections and enve-lopes is essential for the construction of groins, skew-bridges, &c. Mr. Morgan justly says the student should first have his mind formed by drawing straight lines and curves of every dimension, and in every possible combination. To what extent is this done at present in any

British or foreign school from true geometri-cal forms? The better geometry is under-stood the more accurately nature can be exa-mined—nature in perfection is geometry. Jos. JOPLING.

29, Wimpole-street, 16th Aug., 1845.

NATIONAL ANTIQUITIES. Is the British Museum visited for curiosity

alone? Can there be a higher proof of the intellectual appreciation of its contents than the desire so universal for a more liberal endowment,—the off-repeated hope that it will be built as one national monument of which at least we may be proud? And the proposal to establish Museums of Art throughout the principal cities of the land,—was that no indication of the state of popular opinion? We say popular, for men do not discuss these questions as the interests of a class, but as the common benefit of all. Can any one doubt but that, after the expression of opinion in the House of Common upon the National Gallery House of Commons upon the National Gallery, that building must and will be ultimately given up? Can we suppose that when it is admitted by the premier to be inadequate, and that we have thrown away "the most magnificent site in Europe," it will be long suffered to exist as it is, or remain unaltered or unremoved? Not the most virulent opponent of measures con-nected with these subjects can be found willing to repeat a so stultified confession of faith. Very few we suspect would be found so courageous as to oppose them. Unless percourageous as to oppose them. Unless per-haps, the Chancellor of the Exchequer, for the time being, whose "Whole Duty of Official Man" is, apparently, to take from the public as much as parliament votes possible, and to return the little which government votes enough. We cannot, indeed, withhold the expression of our extreme regret upon the manner and arguments with which Mr.Wyse's motion, "To establish a Museum of National Antiquities," was met. Without a juxta-position of works of art of different periods, how can we estimate the past, or produce for the future? How can artists conduct his-torical works without a knowledge of the spirit of each age? Manners, habits, cos-tumes, ceremonial observances, and peculiar traits of national character are all incidentally or immediately connected with this study. Is there any one who does not feel an interest in there any one who does not feel an interest in there any one who does not feel an interest in the preservation of public monuments, who would not restrain the dilapidations, who would not restore them? Yet how shall we restrain, if we do not place them beneath the protection of public feeling; how restore, un-less we know the origin, principle, and style of their construction? But is not the study of the antiquities of Art intimately connected with literature? has it not an historical import-ance? He knows but little of the history of with literature ? has it not an historical import-ance? He knows but little of the history of civilization in Europe who has neglected this interesting witness of its progress. The French Government, the most liberal in Europe, has ever wisely considered the patro-nage of literature and art, and the protection of national monuments, as a stringent duty, and made it a distinct part of their adminis-tration. Those only who have read the docu-ments transmitted to M. Guizot by the Com-mittee of Art and Monuments can be aware of the proof it affords of the honourable feelof the proof it affords of the honourable feel-ing of the minister, and the general desire of the people to give effect to his intention. But in England we live under a different dispen-sation. History is here an old almanac; antiquity of no repute, unless as the record of fiscal regulations; and works, the evidence and illustration of manners, events, and arts, valueless, if not as tribute to the Treasury, or according to the gold and silver standard of the Custom-house. And we have, notwithstanding, an enlightened Government; and we standing, an enlightened Government; and we are, as we say we are, an enlightened people!! The Chancellor of the Exchequer reluses the appointment of a commission for the esta-blishment and maintenance of a Museum of National Antiquities, because, abroad, "these were the care of the Government, and in England they were not, for *custom* (or the Custom-house?) left the advancement of such objects to private individuals." Can any argument be more cogent? Sir J. Graham was equally concise. and equally argumentawas equally concise, and equally argumenta-tive. "Will you establish a museum?" "We will not." "Why?" "Because we have not!" and thereupon ensues the negative

without a division. But we do not despair; the ministers are better than their speeches; "the grave consideration" the chancellor re-"the grave consideration" the chancellor re-quires will be followed by the adoption of the measure which the country asks for. It is in measure which the country asks for. It is in cases of this kind that figures are more argu-mentative than facts; there is no solvent which acts so powerfully upon exchequer reasoning as the surplus on quarter-day.—Art Union.

NOTES IN THE PROVINCES.

Crosthwaite Church, Keswick, one of the most ancient in the kingdom, has recently been almost rebuilt at the sole expense of James Stanger, Esq. of Lairthwaite. The whole of the interior decorations were under the superintendence of Mr. Jones, the architectural carver and modeller of London. The alte-rations and adornments are said to have cost rations and adornments are said to have cost upwards of 4,000*L*.—During the past year the committee of council on education have made the following grants towards the erection of schools, masters' houses, &c., in Yorkshire:— 400*L* to Batley Carr; 400*L* to Honley; 188*L* to Bedale; 110*L* to Connonley in Kildwick; 65*L* to North Frodingham; 45*L* to Dalton; and a few other smaller amounts for less ponnlous places.—It is in contemplation at populous places.——It is in contemplation at Hull to enlarge and improve the forry boat dock. At a quarterly meeting of the Town Council, held last week, it was determined that Council, held last week, it was determined that means be instantly adopted towards obtaining plans and estimates. It is probable that an Act of Parliament will be applied for next session to empower the council to obtain loans of money to defray the immediate expense, and to levy funds in the form of borough rates, for the purpose of liquidating the loans and paying the interest.—A large body of quarry 1 mean have lately been employed in horing for paying the interest.—A large body of quarry 1 men have lately been employed in boring for. stone on the Weston Hills, for the erec-tion of the new docks at Runcorn, Cheshire, which when finished will exc.; tend nearly a mile in length. — Her Majesty and Prince Albert recently had. Mr. Webster's new patent hand-pipe and tile-machine exhibited and explained to them, and after seeing it in operation, gave instructions after seeing it in operation, gave instructions it is said to have the estate in which Osborne it is said to have the estate in which Osborne. House stands, consisting of about 1,500 acres, thoroughly drained upon Mr. Webster's plan. — On Monday last the foundation-stone of the New Church at Middleton, near Leeds, was laid by C. J. Brandling, Esq., assisted by the architect, Mr. J. B. Chantrell. Upwards of 2,000 persons were present, including most of the neighbouring clergy and gentry.— The Commissioners of Woods and Forests have just determined upon several improvements in just determined upon several improvements in the Home and Great Parks at Windsor, according to the designs of Mr. Edward Blore. A lodge is to be erected at the en-trance to the Great Park, close to Cumberland Lodge the residence of Major General trance to the Great Park, close to Cumberland Lodge, the residence of Major General Wenyss, the manager of the farming esta-blishments of his Royal Highness Prince Albert. The gardener's cottage close to Adelaide Lodge, in the Home Park, is to be taken down, and a picturesque building to harmonize, in the style of its architecture, with Adelaide Lodge, erected on its site. and fourteenth centuries, during the reign of Edward III. There will be two spacious school-rooms underneath, with every conveni-ence, and the whole will be executed with a fine red stone found on the ground.——A coped tomb (of which there is an example in the Temple church, London) has recently been erected in the churchyard of Hanley Castle, Worcestershire, to the memory of the late head master of the Grammar School. The following is the inscription, which is in capital letters of an ancient form :---

ABEL SMITH B.A. PRESEVTER ECCLESIF ANGLICAN: IDEMQUE LYDI VETEBIS PROXIME SITI MAGISTER DISCESSIT E VITA DIE DECEMBRIS XVIII ANNO SALVTIS MOCCALIIII #ATATIS XLY

have determined upon enlarging their church nave determined upon emarging their church according to plans prepared by Mr. J. Wing, architect. They propose 1st, To erect an aisle on the north side of the nave; 2nd, To lengthen the gallery at the west end; 3rd, To take out and widen the arch under the west side of the tower; 4th, To re-arrange the whole of the pews in the church, and make them into open seats of uniform size and height. The estimate cost is 520%. It is further proposed to erect a vestry at an additional cost of 210%.—A de-putation from Armagh had an interview last week with the Lord Lieutenant of Ireland to present a memorial representing the great ad-vantages which that ancient city possesses as the most suitable site for the new college in Ulster. His excellency stated that he would take especial care to place the arguments in favour of Armagh before Sir Robert Peel. During the first six months of the present year notices of the erection of sixty warehouses and of 1,645 dwelling-houses were lodged with the corporation surveyors of Liverpool. with the corporation surveyors of Liverpool. Since then several Hundred additional no-tices have been served. It is estimated that during the present year upwards of 2,500 new houses will be erected in Liverpool. After raising 600,0001. or 700,0002. for churches, the Free Church people of Scot-land determined recently to have a college, and twenty individuals instantly put down their names for 1,0002, each for the purpose. Since then they have commenced a subscription to build parsonages for their ministers, and in a few weeks 40,000%. or 50,000% has been raised for that purpose. _____St. Ives Bridge, the property of the Duke of Manchester, is at present undergoing numerous extensive re-pairs. Various minor dilapidations, evidently, however, more affecting the external appearance, than the actual stability of the fabric, having become manifest, the noble duke has employed Messrs. Harratt and Balbirnie, of Huntingdon, to effect this restoration. The new stone work of some of the piers has already been completed, and considerable preparations appear in progress for the other The wharf stairs and steps also, which parts. have been long in an exceedingly dilapidated state, are to be replaced by substantial new ones. West for some

NEW METHOD OF PROTECTING WOOD PILES IN SEA WATER FROM INSECTS.

The destructive effects produced by the insect called by entomologists tereno navalis, or sea worm, on wood piles subject to the action of sea water is well known. In the Trinity pier, at Newhaven, in the Frith of Forth, so rapid were the ravages of this insect (which when perfectly formed bears some resemblance to a diminutive shrimp) that in the course of six years the piles were reduced from 12 to 14 inches diameter to 9 or 10 inches. At the Brighton pier in the course of a few years the whole of the piles in the outer head which were all 14 inches square, were reduced to 8 or 10 in some parts, and the second or third stations were also much injured.

Many suggestions have been made from time to time, and many experiments tried, having for their object a protection against this evil, but hitherto with no success. In the case above referred to the piles had been charred and saturated with boiling coal tar in an iron trough made for the purpose. Kyan's anti-dry-rot has been tried, in a few years the piles were quite perforated; Prichard's oil of tar was tried, and failed; Payne's process was also unsuccessful; asphalte hus been attempted, but, with the utmost care in driving, it breaks off.

Captain Sir Samuel Brown, R.N., in a letter to Admiral Sir Byam Martin, states that, from numerous experiments and observations, he is satisfied "that at present there is really no specific remedy against the attacks of the insect except iron nails." He proposes to encase the pile with broad-headed iron nails resembling scupper nails, but considerably larger, and says that in the course of a few months corrosion takes place and spreads into the interstices. He further suggests the adoption of squareheaded nails, which leave the smallest possible extent of the surface of the pile exposed. Experiments tried at the Trinity pier, Newhaven, and Brighton pier have fully established the effectiveness of Sir Samuel Brown's method,

THE COLOURS AND FORMS OF FURNI-TURE AND ROOM DECORATIONS.*

MUCH has been written within the last few years respecting the choice of colours and of forms in the chief articles of household furniture. At present, each individual selects for himself according to what may appear to him beautiful or fitting; but no very considerable progress has hitherto been made in laying down rules of taste to be followed generally. Indeed, it is a much disputed question whether such rules could be laid down with any thing like general sanction. A few paragraphs may here serve to shew the views entertained on these points by writers who have paid some attention to them.

Mr. Pugin makes the following comments pattern papers for hanging walls, where a wretched caricature of a painted building is repeated from the skirting to the cor-nice, in glorious confusion; door over pin-pacle and pinnacle over door. This is a great nacle and pinnacle over door. This is a great favourite with hotel and tavern keepers. Again, those papers which are shaded, are de-fective in principle; for as a paper is hung This is a great round a room, the ornament must frequently be shadowed on the light side. The variety of these miserable patterns is quite surprising; and as the expense of cutting a block for a bad figure is equal, if not greater, than for a good one, there is not the shadow of an excuse for their continual reproduction. A moment's reflection must shew the extreme absurdity of repeating a perspective over a large surface with some hundred different parts of light; a panel or wall may be enriched or decorated at pleasure, but it should always be treated in a consistent manner. Flock papers are ad-mirable substitutes for the ancient hangings, but then they must consist of a pattern without the forms relieved by the introcolour, with duction of harmonious colours.'

Mr. Loudon, in a work to which we have before had occasion to refer, takes the following view of the relations which ought to exist between the several parts of a room as to colour :--- "Much of the opinion which we form of all objects depends on the effect of the first impressions which we receive from them. Our first ideas of any man or woman, in seeing them at a short distance, are taken from their height and clothing; and our first ideas of a room from its size, and the covering or colour of its floor and walls. Taking the room as a whole, and considering its effect as a picture, the colours of the carpet and of the walls will form the principle masses in the composition, and will necessarily influence every other component part. If the floor and the walls were of the same colour, there would be a deficiency of force and of effect from want of contrast; if they were of different colours, equally attracting to the eye, the effect produced would not be that of a whole; because a whole is the result of the co-operation of different subordinate parts with one principle part. The harmony of the colouring o a room, therefore, can only be produced by the same kind of knowledge which guides an artist in painting a picture. The principles of the art of painting supply the principles for the art of distributing colours in furnishing; but as this art cannot all at once be communicated to the reader, all that we shall attempt at present is to supply him with a few hints, drawn from the usual practice of upholsterers. These are, that neither the colours of the carpet should be so brilliant as to destroy the effect of those of the paper, nor the contrary; and that the curtains should always be of a colour suitable to both. It is not necessary that they should be of the same colour, but that they should be of colours that harmonize, or, in other words, look well together. A very brilliant colour, such as crimson, in the carpet, may have a drab or other subdued colour in the curtains and paper; but then there should be some of the brilliant colour introduced in both, as bordering or ornaments. Thus a room with a bright blue or crimson carpet may have white or yellow or drab curtains and paper; but then a crimson bordering or ornaments should be introduced in them, to barmonize the effect. It would not do, in the case of a blue carpet, to have green curtains or paper, or with the crimson to have scarlet, because these colours

* From the " Pictorial Gallery of Arts,"

do not accord. A green carpet may have black' red, or white curtains, with green borders and ornaments. A yellow carpet may have black curtains, and a dark grey paper with yellow borders and ornaments. Whatsoever will apply to a self-coloured carpet, curtains, or paper, will apply equally well in all cases where those colours predominate. It should never be forgotten that the whole effect of an elegantly fornished room may be destroyed by the selection of a carpet, which, though handsome in itself, does not harmonize with the other furniture."

Mr. Pugin, in treating of the relations which interior fittings bear, or ought to bear, to each other, and to the general purpose of the whole, visits with some severity the usual mode of hanging window-curtains. He says that whatever elegance may be shewn in such articles of room furniture, their use should be first considered. This use is, to exclude cold and wind from windows and other openings, and yet to admit of the curtain to be closed or drawn aside at pleasure ; and hence there is a rod, on which the curtain may be drawn aside by means of a ring, and a short valance to hang down over the openings above this rod. "Now the materials of these curtains," says Mr. Pugin, "may be rich or plain; they may be heavily or lightly fringed; they may be embroidered with heraldic charges or not, according to the locality where they are to be hung; but their real use must be strictly maintained. Hence all the modern plans of suspending enormous folds of stuff over poles, as if for the purpose of sale or of being dried, is quite contrary to the use and intention of curtains, and abominable in taste; and the only object that these endless festoons and bunchy tassels can answer is, to swell the bills and profits of the upholsterers, who are the inventors of these extravagant and ugly draperies, which are not only useless in protecting the chamber from cold, but are the depositories of thick layers of dust, and in London not unfrequently become the strongholds of vermin. It is not less ridiculous to see canopies of tomb and altar screens set up over windows, instead of the appropriate valance or baldagnin of the olden time. It is proper in this place to explain the origin and proper application of fringes, which is but little understood. Fringe was originally nothing more than the ragged edge of the stuff tied into bunches to prevent it unravelling further. This suggested the idea of manufacturing fringe as an ornamental edging, but good taste requires that it should be designed and applied correctly. In the first place, fringe should never consist of heavy parts, but simply oft hreads tied into ornamental patterns; secondly, a deep fringe should not be suspended to a narrow valance; thirdiv, no valance should be formed entirely of fringe, as fringe can only be supplied as an ornamental edging to some kind of stuff; fourthly, fringe should not be sewed upon stuff, but always on the edges. It is allowable at the very top, as it may be supposed to be the upper edge turned over."

Mr. D. R. Hay, of Edinburgh, in his "Treatise on Harmonious Colouring," dwells on the importance of so selecting colours in a room as to form a consistent and harmonious whole. He also insists on the point, that the colouring of rooms shall be an echo to their colouring of rooms shall be an echo to their uses: the colour of a library ought to be com-paratively severe; that of a dining-room, grave; and that of a drawing-room gay; while light colours are most suitable for bed-rooms. He also adds, "Apartments lighted from the couth and suitable are the suitable for the south and west, particularly in a summer residence, should be of a cool tone; but the apartments of a town-bouse-ought all to approach towards a warm tone, as also should be such apartments as are lighted from the north and east of a country residence. When the tone of an apartment is, therefore, fixed by the choice of the furniture, it is the business of the house-painter to introduce such tints for the ceilings, wall, &c., as will unite the whole in perfect harmony; and this it may be ob-served, is a difficult task. The colours of the furniture may be arranged by a general knowledge of the laws of harmony, but the painter's part can only be done by the closest attention to all the minutize of the art."

The late Sir John Robinson, of Edinburgh, sent to Mr. Loudon, for insertion in the "Enclopædia of Villa Architecture," a description of a drawing-room which he had caused to be decorated, with especial reference to what was

Digitized by GOOGLE

deemed by the artists the proper harmony of colouring in the principal parts. There were only three decided colours throughout, viz., white, crimson, and green. The ceiling, cor-nices, woodwork, and canopies of the windowhangings were white, enriched with gilding; the hangings, the ground of the walls, and that of the carpet, crimson, while the pattern on the carpet was a sort of tracery of creeping plants in shades of green. The chimney-piece was of white marble, reaching nearly to the ceiling, with a panel, equal in width to the opening of the chimney, filled with a mirror or looking-glass. The walls of the rooms were painted in imitation of Morocco leather, enriched with roses in gilding, shaded by hand, and the whole varnished with copal. The woodwork was dead white, bordered with gilt mouldings. The window-curtains were of a very simple form, being merely large curtains, without draperies or fringes, and they hung in vertical lines, so as to catch no dust. They ran on gilt wooden poles, and inside the cornice was a common French curtain-rod, on which ran a very fine but plain muslin suncortain, edged with crimson cherry fringe. The cords for drawing the curtains, instead of being concealed, are made very conspicuous, and contribute much to the general effect : they are about the thickness of half an inch, of pluited worsted cord, with handsome termi nation. In speaking of the general colours adopted throughout, Sir J. Robison observes: "The whole of the crimson is, as near as practicable with the different materials, of the same bue, the lake for the walls having been first procured, and the silk and worsted dyed to match it. From this circumstance, and from its being contrasted by the green, and relieved by the white and gold, it has no more of a predominant hue in the arrangement than is perfectly agreeable, while it gives great distinctness in the pictures, and a general air erfectly agreeable, while it gives great of warmth and comfort, without appearing glaring or gaudy. In the design and con-struction of every thing in the room, the aim

has been to avoid harbourage for dust. In tracing the principles on which the early English builders are supposed to have acted in the construction of churches and edifices. Mr. Pugin states that they adapted their designs to the kind of materials employed, and made no attempt to bide any of the latter. With us, hinges, locks, bolts, and nails are, as far as possible, hidden from view, as if unsightly; whereas in the "pointed" style (whether of architecture or of room decoration) they were rendered conspicuous features in the general design. The hinges covered the whole face of the doors with varied and flowing scroll-work; a lock was made the object of much curious decoration; and the key was often cast or carved with emblems appropriate to the purposes of the lock belonging to it. Mr. Pugin adduces as an argument in favour of carving instead of metal-castings wherever both may be used, that "all castings must be deficient of that play of light and shade consequent on bold relief and deep sinkings, so essential to produce a good effect. Cast-iron is likewise a source of continual repetition, subversive of the variety and imagination exhibited in pointed design: a mould for casting is an expensive thing; once got, it must be worked out. Hence we see the same window in greenhouse, gatehouse, church, and room; the same strawberry leaf, sometimes perpendicular, sometimes horizontal, some-times suspended, sometimes on end; although, by the principles of pure design, these various positions require to be differently treated." Whether or not, according to any particular theory of the principles of art, the employof casting leads to the heterogeneous ment mixture of things that ought to be kept separate, we must not forget that the power of rapid and cheap production, possessed by and inherent in the system of custing-whether ornamental impressions from a mould, or printed impressions from a stereotype plate has been, and is, one of the most powerful of all means for diffusing among the many that which had before been attainable only by the few.

OPERATIVES IN PARIS .- We learn from Gulignani that nineteen journeymen carpenters have been ordered by the council chamber of the civil tribunal of the Seine to be brought to trial for illegal combination against their masters.

LIST OF NEW PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &c., GRANTED FOR ENGLAND.

Furnished by Mr. A. Prince, of the Office for Patents of Inventions, Lincoln's-inn Fields, London,

[SIX MONTHS FOR ENROLMENT.]

Stephen Hutchinson, of the London Gas

Works, Vauxhall, engineer, for certain im-provements in gas meters. July 2. John Hopkins, of 1, Rector-place, Wool-wich, gentleman, for certain improvements in rails and trams for railroads and tramways. July 3.

Thomas Walker, of Buston-square, mecha-nic, and George Mills, of Dover, coal-merchane, for certain improvements in springs, and elastic power, as applicable to railway carriages and other vehicles, and to other articles and purposes in which springs or elastic power is

now used. July 3. William Mather, and Colin Mather, of Salford, Lancaster, engineers, for certain im-provements in boring earth, stone, and sub-terraneons matter, and in the machinery, tools,

or apparatus applicable to the same. July 3. William Newton, of Chancery-lane, civil engineer, for certain improvements in railways, and in the means of propelling carriages. July 3.

George Myers, of Laurie-terrace, Westminster-road, Lambeth, builder, for improvements in cutting or carving wood, stone, and other materials. July 8.

Jacob Brett, of Hanover-square, Middlesex, esquire, for improvements in propelling car-riages on railways, and other roads and ways. July 8.

John Samuel Templeton, of Sussex-place, Kensington, artist, for improvements in pro-pelling carriages on railways. July 12.

Edmund Ratcliff, of Birmingham, manufacturer, for a certain improvement, or certain improvements, in the furniture of door-locks and latches. July 12. and latches. July 12. Joseph Falton Meade, of Dublin, gentleman,

for certain improvements in steam-engines and boilers. July 12. Horatio Sydney Sheaf, of Waterloo place,

Old Kent-road, artist, for certain improvements in obtaining and employing motive power. July 12.

Samuel Tretheway, of Watergrove Mine, near Stoney Middleton, Derby, civil engineer, and Joseph Quick, of Summer-street, Southwark, engineer, for an improved combined expansive steam and atmospheric engine. expansive July 12.

Joseph Malcolmson, of Portlaw, Ireland, for improvements in apparatus used for propelling carriages on roads, and vessels on inland waters when employing atmospheric pressure. July 12.

John Shaw, of Broughton, in Furners, Lancaster, chemist and druggist, for a bydro-pneu-

Julius Adolph Detmold, of the City of London, merchant, for improvements in the means of applying steam as a motive power. July 21.

Angier March Perkins, of Francis-street, Regent-square, an extension for the term of five years of an invention for certain improvements in the apparatus or method of heating the air in buildings, heating and evaporating fluids, and heating metals. July 21. Jacob Brett, of Hanover-square, Middlesex,

gentleman, for improvements in atmospheric propulsion, and in the manufacture of tubes for atmospheric railways and other purposes. July 21.

William Breynton, of the Inner Temple, London, esquire, for certain improvements in rotary steam engines. July 25.

George Beadon, of Batterses, Surrey, commander in the royal navy, for improvements in propelling vessels and land-carriages, in raising and drawing off water for driving machinery, which means of raising and drawing off water are applicable to other useful purposes. July 29. Sir Samuel Brown, of Blackheath, knight

of the Hanoverian Guelphic Order, captain of her Majesty's navy, for improvements in the formation of embankments for canals, docks, and sea walls, and in the conveyance and propulsion of locomotive engines, and other car-riages or bodies on canals and other inland waters, and also on rail and other roads, and in propelling vessels on the ocean and navi-gable rivers. July 29.

John Paltrineri, of Skinners'-place, Size

John Paltrineri, of Skinners'-place, Size-lane, London, gentleman, for certain new and improved modes of obtaining and applying motive power. July 30. Joseph Quick, of Summer-street, South-wark, engineer, and Henry Austin, of Wal-brook, civil-engineer, for improvements in the construction and working of atmospheric rail-wave. Into 31 ways. July 31. 5.1

Dew Books.

Memoir of John Aubrey, P.R.S. By JOHN BRITTON, F.S.A. Published by the Wilt-shire Topographical Society. 1845.

THE object of the Wiltshire Topographical Society is to collect materials for, and publish occasionally, historical and descriptive ac-counts, either illustrated or otherwise, of places and things in the county of Wilts and the adjacent districts, which have not hitherto been satisfactorily elucidated. The present work forms the second volume of the society's publications, and is a yaluable addition to biographical literature. It seems that Mr. Britton had commenced for the society a history of the parish of Kington St. Michael, of which Aubrey was a native. It was proposed therefore to include in the work a notice of Aubrey's life. In arranging the materials for this, however, it was found that they were sufficiently copious and interesting to make a separate volume, which was accordingly done, and the result is one of the most charming memoirs that we have seen for some time, well calculated to sustain the reputation of its author and increase that of the society. It includes some very singular and interesting auto-biographical notices of his early. life and studies, copied from a manuscript in the Ash-molean Museum Option with molean Museum, Oxford, which have never

molean Museum, Oxford, which have never been printed before. Aubrey was born at Easton Pierse, March 12th, 1625, and when very young shewed a love of antiquarian pursuits. "Ile may be regarded," says Mr. Britton, "as essentially an *archaeologist*, and the first person in this country who fairly deserved the name. His-toriana, chroniclers, and (prographers there country who fairly deserved the name. His-torians, chroniclers, and topographers there had been before his time; but he was the first who devoted his studies and abilities to archeology in its various ramifications of architecture, genenlogy, paleography, numis-matics, heraldry, &c. No one before him investigated or understood any thing of the vast Coltic temple at Avebury, and other monu-ments of the same class; and certainly no person had preceded him in attempting to distinguish the successive changes in style and decoration of ancient ecclesiastical edifices, or to ascertain, by observing architectural features and details, to what era any particular building belonged. Aubrey's remarks on this subject are certainly interesting, and their publication at the present day, when the study of architectural antiquities is so deservedly general and popular, would add much to his credit as a careful and discriminating observer and delineator of the peculiarities of Christian architecture."

He was entered as a gentleman commoner of Trinity College, Oxford, in 1642, but was removed thence soon afterwards in consequence of the hostilities between the King (Charles I.) He wrote twenty-two and the Parliament. He wrote twenty-two works, and died in 1697, after being much involved in debt and oppressed by litigation.

We trust that the appearance of this interesting and valuable work, with the promise of the early publication of a history of Castle Coombe, by Mr. Poulett Scrope, M.P., will lead a host of new members to join the Wiltshire Topographical Society, and enable the committee to carry out efficiently what it has so well begun.

A Peep into Architecture. By ELIZA CHALK. Bell, Fleet-street; Meggy and Chalk, Chelmsford, 1845.

A VERY pretty little illustrated book; well adapted for a present to youth of either sex. It traces the history of architecture from the earliest times, and describes in a pleasant manner the peculiarities of the various periods of Gothic art.

In our leading article last week we urged the value of architectural knowledge to the general student, and expressed a desire that Digitized by GOOSIG

THE BUILDER.

it might become a part of ordinary education:

"The public buildings of a people say,

How unrefined, how far advanced were they; And on the temple's architectural page, We read the mind, the manners of the age."

The book before us contains much information, and, moreover, is calculated to induce a further and more precise study of the subject ; as such we recommend it to our non-professional readers.

The London Art-Union Prize Annual of 1845. R. A. Sprigg, Great Russell-street.

This work, to which we referred briefly a fortnight ago, contains 250 engraved sketches by Mr. Henry Melville of pictures and sculp-ture purchased by the London Art-Union, and cannot fail to be acceptable to a large number of persons. Apart from the interest of the volume in the eyes of subscribers to the association, who will find it if continued, the most comprehensive catalogue of the works annually purchased by the Art-Union, it presents a collection of interesting and useful memoranda to artists and others studying composition, and is moreover, a pretty drawing-room book. It would be easy to find fault with the execution of some of the engravings, but we are contented, in consideration of the boldness of the attempt and its general value, to overlook minor defects. A large sale alone can remunerate the proprietor, and this we cordially hope it may have.

Tender.

For rebuilding the Prison at the back of Clerkenwell church, delivered to the magistrates of Middlesex on the 12th instant, according to the plans of their Architect, Mr. Moseley. The lowest was that of Mr. Grimsdell which was accepted.

| Mr. Trego | £38,051 |
|--------------------------|---------|
| Messrs. J. and W. Bennet | 36,365 |
| Messrs. Hayward & Nixon | 36,170 |
| Mesars. Lock and Neasham | 35,970 |
| Messrs. Piper. | 34,995 |
| Mr. Winsland | 34.766 |
| Messrs. Baker and Son | 33,600 |
| Mesara. Lee | 31,860 |
| Mr. Grimsdell | 28,684 |

NOTIERS OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our readers, however, they are entered in a book, and may be seen on application at the office of "The Builder," 2, York-atrect, Covent-garden.]

For the execution of Works on the Leeds and Thirsk Railway.

For the execution of several lengths of Earthwork on the Aberdeen Railway. There are 5 separate Contracts, varying in lengths from 3½ miles to 4‡ miles.

For the supply of 70,000 Larch, Oak, or Fir Sleepers, and Fencing for 501 miles, or any part thereof, for the Ipswich and Bury St. Edmund's Railway Company.

For the erection of a Wesleyan Proprietary College at Taunton.

For the execution of the works on the Notting-ham and Lincoln Railway, in two parts; 1 from Nottingham to Newark, being a distance of 174 miles. 2 from Newark to Lincoln, being a dis-

miles. 2 from income to annound, and the present perochial school-house at Bethnal-green, and crecting a new one on the same site.

For Lighting a portion of St. John'z district, Notting-hill, with Gas.

For Paving and Relaying the Footways and Pav-ing or Macadamizing and Relaying the Carriage-way in Somers-town, St. Paneras, for the term of three years.

For the supply of 500 Tons of dark-coloured hard Guernsey Granite to the Guardians of the Brentford Union.

For supplying the Aberdeen Railway Company with Scotch Fir Sleepers. For supplying the Dundee and Perth Railway Company with 50,000 Scotch Fir Sleepers. For supplying the York and North Midland Railway Company with 2,000 Tons of Chairs. For supplying that participant of the Dundee and

For executing that portion of the Dundee and Perth Railway, commencing at Dundee and ending at Kingoodie, being about five miles 360 yards in length.

For supplying her Majesty's several Dockyards with Cast-iron Articles for twelve months certain. For the erection of a Malting at Bury St. Edmunds.

For the supply of 100 Wrought-iron Bedsteads to the Portsea Island Union. For supplying 300 Sets of Wheels, Arles, and Guard Irons to the Great Southern and Western Poilmer (Lalard)

Railway (Ireland).

For the supply of 4,400 Tons of Rails and for about 900 Tons of Cast-iron Chairs for the Dundee and Perth Railway.

For taking up and relaying the Carriage-way Pavement of a part of Maze-pond. For taking up a certain portion of the present Carriage-way Pavement of Maze-pond and Great

Maze-pond, and relaying the same with Wood Pav-ing, to consist of Dantzic or Memel Timber. For making a Cylindrical Sewer in the town of Cambridge. The length will be about 48 yards,

and the average depth about 12 feet. For the execution of the whole works of the first

For the execution of the whole works of the nist tan miles of the Howick branch of the Edin-burgh and Howick Railway. For Raising Mud in the Ship-bash of the Re-gent's Canal Company, for a term of three years. For the execution of that portion of the Cum-nock Branch of the Glasgow, Paisley, Kilmarnock, and Ayr Railway situate between Lock Brown and and Ayr Railway, situate between Loch Brown and Auchinleck, being about 7 miles in length.

COMPETITIONS.

The Committee for the establishment of Public Parks, Walks, &c., at Manchester, offer two prizes, one of 50 guineas and the other of 25 guineas, for the best and second best set of Plans (with esti-mates), for the laying out, &c., of the sites already purchased by them.

The Board of Guardians of the Bridlington Union offer a premium of 10*l*, for a Plan and Specification of a Workhouse, the expense of which is not to ex-ceed 2,000*l*., and to accommodate 150 inmates.

APPROACHING SALES OF WOOD, &c. BY TENDER.

In the Plantations of the Duke of Montrose, situate in the Parishes of Drymen and Buchanan, Stirlingshire : many Thousands of Larch Trees of some size, adapted for Railway Sleepers, Roof

ing and Joisting, and other purposes. A Quantity of Old Wrought and Cast Iron, in store, at the Royal Arsenal at Woolwich.

TO CORRESPONDENTS.

"A Constant Subscriber."-In reply to our cor-respondent's inquiry, Mr. Jopling says: "It is now more than twenty years since I invented the Sep-tenary system. For many years I used every effort to shew the necessity of a complete illustraeffort to snew the necessity of a complete inustra-tion. Absence from town for several years retarded those efforts which I now revive with an increased and increasing conviction of the desirableness of the object, your columns contributing greatly to the impression that I am right. If taken up as extensively as it would be useful, it might be pub-liabed at a small cost to each wurchese

extensively as a would be each purchaser. "A Constant Subscriber."—We believe Weale's work is the best. Five-feet rods are generally used

Like-wise Swing Centres, which consist of a combination of power unequalled by any made at present. Manufactured by F. W. Gerish, East-road, City-road; and sold by all se-spectable Ironmongers in the United Kingdom.

PATENT METALLIC SAND CEMENT, PATENT METALLIC SAND CEMENT, requiring no Colour or Paint, and free from Cracks and Blisters. Mired ready for use at 88. 6d. per cask. 2s. 6d. allowed for each cask returned in good order. 2d bushels common sand to be added to each cask of Metallic Cement, which will float fourteen square yards Stucco. Ap-ply at the Metallic-Cement Wharf, King's-road, Camden New Town (opposite Pratt-street), London.

TO ENGINEERS, ARCHITECTS, AND CON-TRACTORS.

TRACTORS. GROUND BLUE LIAS LIME, at 2, South Wharf, Paddington, London, and Works, Southam, Warwickshire. Agent for Liverpool, Mr. WYLIE, 56, Gloster-street; ditto for Manchester, Mr. J. THOM FSON, Back King-street; ditto for Chester, Mr. J. HARRISON, Linen Hall-street.

A TKINSON'S CEMENT.—The public is respectfully informed, that the price of this very ex-cellent Coment, which has now been in use for Architecture and Engineering works upwards of thirty years, is reduced to \$8. 3d, per bushel, and may be had in any quantity at Wyntt, Parker, and Co.'s Whart, Holland-street, Surrey side of Blackfriare-bridge. N.B.—This Comment being of a light colour, requires no arti-ficial colouring or painting, and may be used for stucce with three parts its own quantity of sand.

There parts its own quantity is able: **KEENE'S PATENT MARBLE** cemeration of the composition beg to refer to the British Museum, the Royal Exchange, the new works as Bethlem Hospital, Greenwich Hospital, and the Co-liseum in the Regent's-park, as beildings finished or in pro-greas, in which Keene's Coment has been used as an internal stacco. Its superiority to common plastering consists in its extreme hardness, and the rapidity with which it dries, which qualities fit it to receive paint or other finishing sooser than other water Cement. When employed for skirtings, architrave, and other mouldings, in place of wood, it checks dry-rot, is impervious to vermin, prevents the spread of fire, and is more eco-nomical in its application than the material for which it thus becomes the substitute. Confirmation of these statements is to be found in the almost universal adoption of Keene's Cement for Skirting and Hall flooring in the new houses on the Hyde Park Estate, where its application is to be seen to the fullest advan-tage. In Livernool and Manchester, Keene's Cement has in

White he applied and Manchester, Keene's Cement has in several cases been used for the covering of the firs-proof warehouse floors, where its lightness and hardness give it be preference over tiles and flagging, which are much heavier, and necessarily leave the floor intersected with numerous joints, whilst Keene's Cement is laid down in one unbreken arfa

surface. The high polish and marble-like hardness of which this Cement is susceptible render it the most suitable material or the manufacture of Scagliola. Patentees, J. B. WHITE & SONS, Millhank-atreet, Westminster, Manufacturers of Roman and Portland

Depót in Liverpool, 36, Seel-street ; James Woods, Agent.

O ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MER-CHANTS, SHIPPERS, AND THE PUBLIC IN то GENERAL.

JOHNS and CO.'S PATENT STUCCO Generate. Generate the series of the solution of the solution

now in use ; but with hit the above-mainter transmission of the solven saturable advantages, nothing can approach it in point of economy. Architects and Builders who have used this Cement have declared that it requires only to be known, to be universally preferred. Specimens may be seen, and a Prospectus fully describing the Cement and its mode of application, together with a volume of Testimonials from every part of the Kingdom, may be obtained on application to MANN and CO., SOLE AGENTS for the Patentees, 5, Maiden-lane, Queen-street, Cheapside, London : of whom also may be hed. JOHNS and CO.'S PATENT STONE-COLOUR STUCCO PAINT, expressly intended for Painting over exterior Walls of Houses that have been covered with Roman or other Cements, and which have become dirty and discoloured. It is in overy way better suited for this purpose than White Lead Paint, which will frequently come off in fakes, being in direct chemical opposition with Cement; whereas mESSRS. JOHNS and CO.'S PATENT PAINT having an affinity for Stuceo, binds itself with it, stopping the suction, thereby rendering the wall proof against weather, and in the finish producing a pare stone-like effect, produceable by no other Paint water way betters. It is cheaps in the application, and may be used by any Painter, in any climate, even in the most exposed Marine situations.

Digitized by GOOgle

SATURDAY, AUGUST 30, 1845.

OTWITHSTANDING the search that is now made after old buildings, and the efforts used to induce their preservation, there are numerous interesting struc-

tures in the villages and hamlets of England falling to decay unknown and disregarded,structures which are most valuable as records of the past, and evidences of the skill of our forefathers. Shrouded by a clump of trees, in some cases not a hundred yards from a high road, they remain unnoticed, even by the passers-by, although worth a pilgrimage,-and, full of the accumulated remembrances of past centuries impressed in the varying handwriting of different generations, are allowed to fall into ruin, or, worse still, are destroyed for the sake of the materials of which they are composed, and so disappear entirely.

It would hardly be thought that this could occur in a locality so close to the metropolis as Slough, the much-frequented station of a railroad. But so in a great degree it is : for we will venture to say that of the crowds of sight-seers who daily go from that place to Eton and to Windsor, not one in a week is aware that he passes within five minutes' walk of an interesting structure six or seven centuries old, if not more, dismantled and decaving; and perhaps there is not one in a month leaves the road and wends his way to visit it.

Yet there it is. Old Upton Church, so called to distinguish it from a modern monstrosity seen in the high road to Eton, is a genuine remnant of the Norman period, consisting of nave, chancel, and solid square tower, the latter standing between the two former. The chancel is peculiarly interesting, and should on no account be suffered to fall further into ruin. It is small and low; lighted by narrow, semicircular-headed windows in the sides, and a plain three-light window, of small dimensions, in the east wall, this latter being an interpolation of later date. It is covered with groinvaulting, and is paved, or rather was paved, with encaustic tiles. There is a pretty Norman doorway on the north side of the nave, and another entrance, through the tower, on the south side. The tower itself is covered with a mass of ivy of extraordinary magnitude, the main stem being no less than three feet wide and one foot two inches thick.

The interior presents a melancholy scene; all the fittings are removed with the exception of one rude desk with a prayer-book upon it : the stained-glass and brasses have been stolen, the plastering is tumbling, and the whole in ruin. Full service has not been performed in this church since 1837, but the burial prayers are sometimes read here, in the midst of the desolation, over the bodies of those who have desired to be buried in the quiet yard around it, where

" The rude forefathers of the hamlet sleep."

This line from Gray's " Elegy in a country churchyard" reminds us, that independently of the interest thrown around this structure by time, there are other circumstances which render a visit to it pleasing, and should aid in inducing its preservation. It was probably THE **BUILDER.**

this very church that Gray had in his mind's eye when that elegy was written :--- " the ivymantled tow'r," whence " the moping owl does to the moon complain." Gray was educated at Eton, and long bore it in memory. The elegy in question was not written there, but was commenced a few years after he had left, about the same time that he wrote the ode on a distant prospect of Eton College, beginning:-

"Ye distant spires, ye antique towers, That crown the watery glade, Where grateful science still adores Her Henry's holy shade."

Further, in this interesting old church rest the remains of our eminent countryman Sir William Herschell. In the tower, amongst ruin, is a modern slab of marble recording his name and merits, looking sadly out of place and suggesting to the mind the uncertainty of such memorials. "In perpetual memory," writes upon marble an affectionate son or sorrowing widow :-In a score of years the church may be a ruin, and the "lasting testimony" part of the paving of a churchwarden's pigsty !

" So perish monuments of mortal birth,

So perish all in turn, save well-recorded worth."

Surely, however, Herschell's grave is not yet to be desecrated. Every tomb that can awaken some sentiment, excite to enterprise, or stimulate to good, should be religiously preserved as of national importance.†

As regards the church itself, it is seriously to be hoped that means will immediately be taken to preserve it yet for many years to come. Mr. Britton interested himself warmly to effect its restoration some time ago, and at this moment Mr. Jesse, well known to the reading public, is seeking to raise a subscription for that purpose. We trust he will not relax in his endeavours, and that he will be aided by all in the district who have influence.

THE UNREWARDED EXHIBITORS IN WESTMINSTER HALL.

THE following letters have passed between the royal commission on the Fine Arts, and a certain number of the competitors at Westminster Hall.

Chester-street, July 17th, 1845. S18,—In concurrence with a general feel-ing among the competitors whose works are now exhibited in Westminster Hall, I have the honour to transmit to you the accompany-ing memorial to the royal commission on the ine Arts, signed by a few of the competitors who happen to be in town. The necessity

• Gray was one of the first to apply himself to the revived study of pointed architecture, and from him Mr. Bentham derived much assistance in his celebrated "History of Ely." Horace Walpole was one of his most intimate associates at Eton, and they afterwards set out together for the tour of France and Italy, but quarrelled on the road through Gray's greater love of antiquities. Gray died 1771. T We take this opportunity to refer to a letter on the present dilapidated state of Chaucer's tomb, in Westminster Abbey, which appeared in *The Times* a few days ago. The writer says that the name of the father of English poetry can only be deciphered by the assistance of a tracing in the chalk over the letters. Thus few persons are aware when loitering through Poet's-comer, that they are treading over the ashes of one whose memory ought to be respected by all his countrymen; and foreigners visiting England must feel surprise in viewing the ruinous appearance of the swall, with the old inscription, which is extant, cut neatly upon it, this would be something, and might be done at but a trifing cost. The tomb of Edmund Spenser was restored by private sub-

would be something, and might be done at but a triffing coat. The tomb of Edmund Spenser was restored by private sub-scription in 1778. Shall we feel less alive than our fore-fathers seventy years ago, to the claims which these fathers of verse have upon our loving and respectful memory? The tomb of the great father of poetry was created by N. Brig-ham, who, in the year 1556, "in the name of the Muses," placed the present inscription (now by the hand of all-de-vouring time rendered almost illegible). Let us then enter-tain a hope that very shortly, in these days of light and hnowledge, some respect will be shown to the might dead, and that the author of the "Canterbury Tales" will not be suffered to lie in a spot unmarked, and with scarcely his name discernible, except to some inquiring antiquary. Let us in this imitate the excellent feelings of our continental neighbours, who treasure up with the most sacred love the tombs and inscriptions relating to their poets and states-men.

for its being submitted without delay prevents its being signed by several who are out of town, and who, I am informed, would hasten their return for the purpose of signing it if that were deemed necessary. A consideration of delicacy alone prevents

some of the rewarded candidates from affixing their names to the suggestion, which they cordially approve. I am, Sir, Your obedient Servant,

F. Y. HURLSTONE.

To C. L. Eastlake, Esq., R.A. Secretary to the Royal Commission of Fine Arts.

To the Right Honourable Her Majesty's Com. missioners on the Fine Arts, —The memorial of the undersigned Artists, Competitors for the decoration of the New Houses of Parliament, and exhibitors in the present exhibition in Westering Wester Westminster Hall.

Sheweth,-That the improvement of public taste and the encouragement of those artists who are disposed to forego the more lucrative branches of art for the higher walks of historic and poetical composition, are essential objects of your royal commission.

That three experimental exhibitions have now taken place under the authority of your honourable board; an amount of talent far beyond expectation has afforded gratification to the public, and received the repeated ap-probation of your honourable commission. On the first occasion 137 artists responded to your the first occasion 137 artists responded to your invitation. In 1844, besides sculptors, sixtyone painters applied their exertions to cartoon-drawing and fresco painting, and received the sanction of your honourable commissioners, as worthy to be selected for public exhibition. In 1845, thirty-seven painters and twenty-nine sculptors are again before the public, with the approbation of your honourable commission.

That the advantage of these exhibitions to public taste and to the arts are indeed great, but unfortunately they have been attended with serious injury to most of the artists from the great expense (as well as loss of time and connection) that has resulted. The actual outlay of the painters for materials and models cannot be less than 8,000% or 10,000%; loss sufficient to check their progress in future attempts, and in some instances perhaps to involve them in serious difficulties. Their desire to co-operate in this great national experiment, and to assist in furthering the noble course marked out by your honourable com-mission, will surely be listened to with that indulgence and respect that is seldom denied to men who have suffered in a good cause, and must be their excuse for thus troubling your honourable board with the following remarks.

That it appears that the receipts of the ex-That it appears that the receipts of the ex-hibitions of the first and second years were, repectively, 2,900*l*. and 1,400*l*.; and if we sup-pose 1,000*l*. to be received this year, the amount is 5,300*l*., of which sum 1,000*l*. were given in 1843, in additional premiums, leav-ing 4,300*l*. unappropriated. If 500*l*. are de-ducted from the second, and 200*l*. from the vers' receipts for the scultors, who acc third years' receipts for the sculptors, who according to the general opinion were not, like the painters, led out of their accustomed course, there will be the following sums to be divided by the number of unrewarded candidates in each year.

| 1843, | 1,900/. | among | 116 | unrewarded | Candida | tes, | | |
|-------|----------------|----------|------------------|------------|------------------------|------|-----|-----------|
| | 9001. 8001. | \equiv | 85 2 6 | | give ditto ditto | 16/. | 84. | each _ |

Thus, to those who have tried but once, there would be a return of from 15*i*. 10s. to 30*i*. 15s.; those who have competed twice would receive from 31*i*. 18s. to 47*i*. 3s., and the few who have struggled on through all the three years, would have 62/. 13s. out of a fund raised from their own previous sacrifices; not indeed half the amount of their actual outlay in models and materials, but each in propor tion to his former exertions and sacrifices would be enabled to make another effort in this great national experiment, with fresh energy

Your memorialists humbly submit to the wisdom of your Honourable Commission the advantages of a self-supporting system of emulation, instead of that of premiums which renders each succeeding competition more un-equal; and in the hope that the proceedings of your honourable commission will secure to

the arts of this country high honour and preeminence, your memorialists will ever pray. R. W. Buss. F. Y. HURLSTONE.

S. BENDIXEN. ALEX. BLAIKLEY. FORD M. BROWN. W. RIVIERE. July 25th. 1845.

JAMES FOGGO. GEO. FOGGO. W. P. SALTER.

"Whitehall, 31st July, 1845. -I beg leave to acknowledge the re "Sir.ceipt of your letter, accompanying a memo-rial, dated the 25th instant, from numerous artists who are competitors for the decoration of the New Houses of Parliament, and who are exhibitors in Westminster Hall, recommending the division of the receipts of the exhibitions in Westminster Hall among the unrewarded candidates in each of such exhibitions.

I had the honour to submit the memorial in question to her Majesty's commissioners on the Fine Arts on the 29th instant, when the commissioners, referring to their decision respecting similar applications in 1843, directed me to reply that they do not think it expe-dient to adopt the course suggested by the memorialists.—I am, Sir, your obedient ser-vant, C. L. EASTLAKE, Sec. F. Y. Hurlstone, Esq."

"7, Fitzroy-square, 31st July, 1845. Sir,-Herewith I have the honour to send you the answer which her Majesty's commis-sioners on the Fine Arts have directed me to return to the memorialists referred to in your letter, received on the 29th instant.

In further explanation I venture to state, that in consequence of various applications, similar in their object to that of the memorialists, during the exhibition in Westminster Hall, in 1843, the question respecting a divi-sion of the receipts of the exhibition was frequently submitted by me to the consideration

of the commissioners. This subject was, from first to last, consi-dered to admit of discussion only in one form, viz., the appropriation of the nett proceeds of the exhibition, after payment of the expenses.

The statement contained in the memorial, respecting the gross receipts of the exhibition, is incorrect. In 1843, instead of 2,900/., the receipts were 2,472/. In 1844, instead of 1,400/., the receipts of two exhibitions (in King street and Westminster Hall) were 1,259/. 5s. The receipts of the present exhibition up to the 28th instant are 638/. 8s. 6d.

the 28th instant are 6381.88.6d. The balance, after payment of the expenses incident to the exhibition in 1843, includ-ing 1,0001. in additional premiums, was 5691.28.11d. In 1844, the expenses far ex-ceeded the receipts of both exhibitions (the rent of the premises in King-street amounting alone to 8501.) That cost being defrayed by the Treasury, through the Office of Woods, the balance was 4001.38.4d. Before the exhibition took place. the cost

Before the exhibition took place, the cost of advertisements (with other expenses strictly defrayed by the Treasury. Such expenses would, if enumerated, cause a further considerable reduction from the receipts. Again, the woodwork fittings in Westminster Hall, and in King-street, and the cost of the work-men employed on them, has not been defrayed from the receipts of the exhibitions. This is the state of the case applicable to

the view taken by the commissioners, and by the treasury, with regard to the proceeds of the exhibitions

I have lately made application to the Treasury respecting the payment of the three premiums of 200*l*. each this year awarded. In the event of my receiving instructions to make such payment (600*l*.) from the fund arising from the present and the balance of the former exhibitions (amounting on the 35th instant) to 1,0071. 16s. 10d., the balance at the close of the exhibition will probably be insufficient to

It will be apparent that the Lords of the Treasury may justly require such payment to be made from the funds referred to, in consequence of having defrayed the extraordinary expenses above mentioned during the last year.

In entering into this explanation, I have perhaps taken a course unusual for official agents. I have done so on my own responsibility, from a desire to put the memorialists in

possession of the facts which, in the view of the commissioners, bear upon the question herein referred to.—I am, Sir, your obedient servant, C. L. EASTLAKE, Sec. F. Y. Hurlstone, Esq."

The memorialists have since published the correspondence in the shape of a small pamphlet, and have added some remarks expressive of their disappointment, and their opinion that the expenses of the exhibitions should be defrayed by the nation.

"One small circumstance that concerns all the exhibitors must not be omitted. There is a principle, founded on equity, till now in-variably maintained at our exhibitions, viz.: that every contributor shall have free admission, and be supplied with the catalogue that contains the account of his productions with-out charge. The royal commissioners alone have rejected this wholesome and just regulation: the charge of a shilling on the paying days, and of sixpence for the catalogue, has been exacted from the competitors; thus, regardless of their previous sacrifices and their rights, they have been made to contribute to the very last towards expenses over which they were allowed no control.* This has been the treatment of the artists; but that of members of both Houses of Parliament, of ministers and officers of state, of the high and puissant of this wealthy kingdom, has been more considerate; they were, to the number of 2,000, admitted gratuitously at the private view, and were presented with catalogues, for which

they were not required to pay! Is it love of money that induces artists to memorialise, or a desire for emulation and memorialise, or a desire for emulation and fame? Their past deeds must decide this question.⁺ In the last century, when our artists first attempted exhibitions, the profits were given by them to public charities, and they received the grateful acknowledgments of the governors of the Foundling, the Mid-dlesex, and other hospitals, for their generous liberality. In our our time, if path are reliberality. In our own time, if parks are required for the health and recreation of the people; if literary and scientific institutions have to pay off a building debt, or to extend the means of their usefulness, an appeal to artists for disinterceted assistance is never made in vain. At Manchester, Liverpool, Leeds, and other towns, the liberality of British artists is in this respect fully established. But how can they continue their vo-luntary exertions for the good of others, if a system is adopted that deprives them of all their means? If the example of the royal commission were followed, if its mode and measure of patronage and munificence were to be adopted by our corporate, parochial, and other authorities, what must be the fate of artists? In this model of encouragement at the conclusion of a great national experiment for the promotion of art and the introduction of the proudest style of historical painting, the outlay of a great nation is about one-half the actual expenses of artists who enthusiastically responded to the invitation of the royal com-mission."

FRESCO PAINTING .-- The Commissioners on the Fine Arts having received various applications from artists, candidates for employment as fresco painters, respecting the mode in which specimens of fresco painting may hereafter be submitted to them without may nereatter be submitted to them without reference to public exhibition, have issued a notice to the effect that such specimens may be sent to Westminster Hall from the 1st of March to the 1st of May next. The subjects and dimensions are left to the choice of artists, but these who have next the remaining of this. but those who have not previously exhibited are required to send specimens of drawing with their fresco paintings.

If the royal commission had looked to parliament, as it should have done, for the expenses, the artists would have had no concern in them; but as the funds raised by the exhibition of their works are applied to the liquidation of those expenses, some control ought to have been allowed. If the same love of art and desire for fame that impelled Barry and his contemporaries to offer to paint St. Paul's at their own expense would have induced the artists of the present day to nerve their energies and exhaust their means in the great experiment at Westminster Hall if no premiums had been offered by the royal commission. But however enduring their energies may be, their pecuniary means are limited; as they become exhausted, their zeal is rendered impotent, and the struggle for pre-eminence in historical composition hopeless. The principle recommended by the memorialists, of a self-supporting emulation, is surely the most economical, as it is the most effective mode of promoting genus.

-

ARCHITECTURE, A STUDY OF UNI-VERSAL INTEREST.

THERE is no circumstance in the present period of architectural history so conducive to a future prosperous state of the art, as the increasing love of the study of it amongst those who are not practically engaged in the pursuit. The day may be far distant when the high and wealthy of the land will aspire, by a similar course, to attain to the eminence which the great Lord Burlington reached, not only the great Lord Burnington reached, not only by means of an arduous inquiry into the prin-ciples of the art, but by the labour of the craft; and it can hardly ever be deemed a wise proceeding to submit constructive details to the consideration of others than architects. But we deem that in the other department of the art no mistake has led to worse results, than that very common one, that architects must necessarily be the sole judges of architec-tural works. We hail, with pleasure, the in-creasing knowledge of ecclesiastical architec-ture, which has already done more towards ture, which has already done more towards the acquirement of correct principles in church building, than the years subsequent to the Re-formation which preceded it. As already urged in this journal (vide *ante*, p. 385), a source of infinite pleasure is entirely lost, through the want of that knowledge which we recom-mend; one-half the page of history is blank to the tourist, who discovers nothing in the monuments of art, but their abstract forms. The collecting of stones and minerals, with-out a knowledge of the mighty revolutions in out a knowledge of the mighty revolutions in out a knowledge of the mighty revolutions in the earth's surface, and the component parts of the specimen, or the contemplation of the form of man, without the perception of the intellect, which animates and ennobles; these would be fit parallels for that state of igno-rance to which non-professional persons have been for a long period ready to submit, and which professors have not desired to reand which professors have not desired to re-move. Do the hundreds, that annually pass along the stream of the "exulting and abound-ing river" leave the scenery of their own islands unnoticed, because this is of inferior beauty, or rather for the sake of that interest, with which legends and the chroniclers of wars have invested the "chiefless castles" of the Rhine? But how much their interest would be enhanced could they feel that these "gay but leafy walls, where Ruin greenly dwells," contained "matter to be learned" dwells," contained "matter to be learned" more than cicerone and sight-seer think of, "sermons in stones," vocal of the customs and habits of centuries. The decorative character of an architectural work, the system adopted in points of detail, or the constructive ar-rangement, have more to tell, than the written obversion of the next. But it is not only the chronicle, of the past. But it is not only the antiquarian part of the art, which might be studied with advantage; an earnest applica-tion to the theory, an elaborate study extend-ing into all points of detail, could tend only the improvement of architecture. to

It would at least be some advantage if those who will probably always be the judges of architectural works, were acquainted with the mode of expression in plans and sec-tions. Without this necessary knowledge, the member of a committee is quite unable even to know what is placed before him, and it is therefore the highest injustice that he should be allowed to sit in judgment. He is very much in the position of one who looks over a foreign author, without having opened a dic-tionary. But, much more than this is necessary; we wish that such an extent of information as the late Mr. Hope possessed, may become a thing of common occurrence rather than a solitary exception. Architects would then gain from those by whom entirely new ideas are most likely to be imparted, and archi-tecture would no longer be "a thing of shreds and patches," but an art expressive of the state of national manners and acquirements. To praise any thing in such a building as Fonthill Abbey would now be deemed a proof of igno-rance; yet the builder of that pile manifested that he was one of those who might have aided the art, though he was ignorant of the fashions in style. The architect has still more to do, though he may be well acquainted with the grammar of his art, and, however much the details of certain Gothic buildings, erected a short time since, are at variance with the original method, the whole con-ception is often grand and imposing. From their errors we may learn as much as from their successful features, and may discern the

way to a style in architecture, in which elegance and novelty of effect shall be co-existent detail. In doing any thing to repress the study of architecture amongst non-professional persons, architects would be acting most blindly against their interest these with the most scrupulous attention to points of blindly against their interest; hasty and in-correct judgments are the result of want of information, and a slight study of the art would lead to the conviction, that much greater study was needed ere the ability to give a correct opinion could be reached. Perhaps the want is not easily supplied, the information is scattered through a multitude of books, and is gained by the professor only by extreme difficulty and labour. But with the conviction that we have still to learn, and the earnest desire to do so, every difficulty is removed; the art becomes a source of delight, an index to the records of history, an intellectual accomplishment to men and women, alike. The field of the profession is expanded; it enters into the scheme, where building alone was thought of ; it is alike called for in the palace and the manufactory. Let architects, there-fore, aid in spreading the knowledge of their art, and themselves be prepared to learn, whilst so teaching, and the second half of the nineteenth century will be more remarkable for the prosperous state of architecture, and the estimation in which its professors will be held, than the first, for its thousand copies of old examples, and its ignorance of the pleasures and a dvantages which the pursuit is so amply able to afford. E. H.

THE VENTILATION OF BUILDINGS.

THAT many of our readers agree with us in considering this subject one of the greatest importance is proved by the number of letters relating to it that we receive. Efficient arrangements in this respect universally applied, in conjunction with others for draining, cleansing, and an ample supply of water, would effect an improvement in our social condition, and increase the sum of happiness enjoyed by the community, to an extent that cannot be fully estimated. Perhaps we should not be far wrong if we asserted that less than the enormous amount annually expended in England in the maintenance of hospitals and dispensaries, would be sufficient to effect this and render the great majority of these establishments unnecessary, *if we but knew the way*. Let us earnestly strive to find it.

The second volume of the second report published by the Health of Towns Commission, contains twenty-one valuable plates illustrative of the principles of ventilation, accompanying a report from Dr. Reid on the state of Newcastle-upon-Tyne and other towns in the northern coal-mine district. From this report we take the following notes on the subject :----" The state of ventilation in any apartment

depends essentially on three conditions,--the quality of the external air; the quantity that can be made to flow throughout it at a given time, including its mode of distribution, and the regulation of which it is susceptible, whether we regard the temperature communicated to it or the force with which it impinges on the system; and its freedom from any noxious ingredient that may be developed by lamps, candles, fire-places, or any other special cause. Where sanatory measures sus-tain a pure external atmosphere by effective drainage, cleansing, and prevention of nui-sances, one-half of the remedy may be suid to be already secured, and without such measures no system of ventilation can be successful. Examples are not wanting where it may be a fair subject of discussion, whether it is not better to suffer a certain amount of deterioration of the atmosphere from within, when this does not proceed to extremities, than to permit a free and overflowing atmos phere from without where it is overloaded with emanations from drains or extreme accumulations of decomposing refuse known to produce disease. Such cases, however, are to be considered as rare exceptions,—a stagnant atmosphere without receiving in general additional contamination from within, which renders it still more deleterious and oppressive by the impurities communicated to it in all inhabited apartments. It is thought right, how-ever, to advert to the extreme importance of

with a pure atmosphere, as cases have occurred where disease has been propagated by ventilating apertures, selected without reference to the nature of the air which necessarily entered by them, particularly when taken from the surface of the ground, or from sites not regularly cleaned or subject to inspection.

In the northern district, as in other places, little or no ventilation is in general observed in any of the dwellings of the different classes of society beyond those usually accessible by the medium of doors, windows, and fire-places. In such examples of any attempt at systematic ventilation as came under observation, the leading defect was, that though an escape was provided for vitiated air, systematic arrangements were rarely adopted for securing the admission of fresh air.

The consequence of this was, that the discharge could not operate, except with such casual force as the irregular entrance of air permitted. It did not appear to be practically understood that, where there is no entrance there can be no exit, except through the conflicting process of a double current (an ascend-ing and descending movement) through the aperture that ought to act as a discharge alone. Nor did the operation of the fire and fire-flue, in relation to ventilation, appear to have been more specifically investigated than in most other places. Again, where ventilation had attracted considerable attention (and in this mining district certainly many individuals were well aware of the important relation which it bears to health), the means of regulating the quantity, or diminishing the offen-sive impression produced by local currents, had not been brought into extensive operation. The constant complaints were—'we have too much air;' or, 'we have too little;' 'the much air;' or, 'we have too little;' 'the draught is too strong;' or, 'we are oppressed with heat;' 'our feet are cold, but there is a sense of fulness and of headache.' These evidently indicate the necessity of controlling and regulating the ingress to a much greater than can be effected by doors or winextent dows alone; of establishing a proper relation between the ingress and the egress, and of proportioning the ingress to the amount of supply, required both for any fire-place that may be in action and for such egress as may be provided.

It fortunately happens that the means requisite for these essential positions are much more simple for individual apartments (which are not densely crowded like public buildings) than for larger structures, for if an aperture for the admission of air of sufficient magnitude be always left open, then it will only be necessary to diminish the extent of opening left for the discharge by a superior aperture, or the opening in the fire-flue, according to the relative rapidity with which it may be required that the ordinary ventilation, or the heating power of the chimney shall act.

In the preceding observations no reference has been made to ventilation by forced currents, induced by any means, except those accessible in almost every apartment, as these are not considered absolutely essential for ordinary purposes, though very desirable when provision is made for them by arrangements incorporated with the original structure. I cannot omit to notice, however, that, where gas is introduced, or any brilliant illumination is employed, there the saturation of the air with moisture, and the extent to which it is vitiated by carbonic acid, demands in general a special provision, in order to secure satisfactory ventilation. Few cases presented themselves where gas is so largely used as in the metropolis, and none such as are so abundant there, more especially in shops and offices, in which the ordinary gaslamps are lighted during the day (when required for heat and not for light), and the external air excluded as much as possible, that the vitiated air with all its warmth and oppressive deleterious products may be retained, no other source of heat being provided.

cumulations of decomposing refuse known to produce disease. Such cases, however, are to be considered as rare exceptions,—a stagnant atmosphere without receiving in general only additional contamination from within, which renders it still more deleterious and oppressive by the impurities communicated to it in all inhabited apartments. It is thought right, however, to advert to the extreme importance of beginning, in all cases where it is practicable,

which gas-lights, candles, and all other warm objects usually have, is in reality a ventilating power, which may, almost universally, with proper management, be made to correct the evil they otherwise induce, and even to assist or command general ventilation. Further, independent of the occasional presence of sulphureous and other offensive products from gas, the quantity of air consumed by excessive illumination produces an amount of carbonic acid and moisture far exceeding that commonly evolved by lamps and candles, and this neces demands a proportionate increase of sarily ventilation. In some cases, gas-stoves may be observed, which in very small spartments not provided with fire-flues, often prove more manageable than any other stoves or fireplaces, notwithstanding the expense of fuel; but these also, unless the products of com-bustion are removed by an iron or other tube as systematically as those that proceed from a common coal fire, are still more injurious than lamps, from the lower position in which they usually placed. are

Ventilation is universally observed to be most defective where great destitution prevails, as a low diet renders the system less capable of bearing that amount of air which would otherwise be agreeable. Protection from cold is the first and great desideratum which the constitution demands in any apartment, and the less the supply of the air, where the chemistry of the system is not in high condition and amply supplied with materials for producing internal warmth by those processes that elaborate the products of digestion and apply them in every part of the living system, the less is the extent to which its influence is felt. Hence, in the habitations of the poor, economy in the management and application of fuel, and diffusion to an extent, such as will render the air gentle in its impulse upon the person, become more and more important in proportion as the circumstances of the inmates are reduced. Similar remarks apply imall cases when the constitution has been enfeebled by disease, want of exercise, or a vitiated and too warm atmosphere, even among those whose means command every luxury that can be purchased for their gratification.

Again, the extreme difference in the demands of the same constitution at different periods (passing over the diversity of different temperaments) scarcely satisfied with one or two hundred times that amount of air when it is warm and loaded with moisture, which is abundantly sufficient when comparatively dry, and at a very low temperature, shews the necessity of providing in each individual apartment such openings as may admit at all times of a gentle and regulated movement, though cases constantly occur when, without a wide opened window, or a special ventilating power, an adequate supply of air cannot be obtained.

The application of any measures for forced ventilation in ordinary apartments beyond what can be commanded by their natural warmth, and the influence of the fire, or of the fire flue in warming the wall, does not appear to have been made a particular object of attention. Were the kitchen fire-flue—or any separate flue immediately adjoining it—to be arranged so as to rcceive a communication from each individual apartment being made of a magnitude corresponding with their number, great facilities for ventilation could be introduced in all new structures for promoting those natural movements by which ventilation is most satisfactorily sustained.

The ventilation of workshops and manufactories claims as much attention and is fully as important to those who are engaged in them as the ventilation of their dwellings. In the latter they may spend from a third to a half of their life in a vitiated atmosphere, and at all events that period of repose which is often oppressive and unrefreshing from this cause. But in manufactories, more especially where the occupations are sedentary, where the vicissitudes of temperature are extreme, where siliceous, metallic, or other particles are received into the lungs, and induce disease by mechanical irritation, or when acid and corrosive or other deleterious emanations produce still more rapidly dangerous consequences, the subject of ventilation demands a more earnest attention, and is important to the manufacturer who is deprived by early death of skilled and valuable workmen, independent of the

severity with which such causes prey upon them and their families.

In all such cases the great point which the manufacturer should endeavour to attain, when emanations from the very source at which they are developed. General ventilation must they are developed. General ventilation must be superadded to give complete relief, but if noxious emanations be once permitted to escape into the atmosphere of the spartment or workshop, the entire change of atmosphere is essential to restore freshness to the air: whereas if every noxious product be treated as much as possible on the same principle as emake he providing averangements for the smoke, by providing arrangements for the direct exclusion of the products of combus-tion, a much less amount of ventilation is sufficient, and at the same time the ventilation becomes much more effectual.

Excepting sedentary occupations, where no peouliar nextous product is to be guarded against, the extreme variety of circumstances peculiar to each occupation in which noxious ingredients are communicated to the air in ingredients are communicated to the air in confined apartments, renders any general plan of operations impracticable beyond what has been indicated, without introducing an amount of interference that might be too prejudicial to the interests of the manufacturer to be generally supported. The amount of suffering, however, and of early death under many circumstances, is so great, that any systematic means of fixing public attention on this subject. to such an ex-

public attention on this subject, to such an expublic attention on this subject, to such an ex-tent as would explain the cause of death in factories where it is excessive, and the economy of sanatory measures, would be attended with very beneficial results, equally apparent both to the proprietor and the workman. To the former alone can we look for the general in-troduction of sanatory measures in their re-spective establishments; but more intelligence among the work men is essential for enable them among the workmen is essential to enable them

among the workmen is essential to enable them to appreciate and Take full advantage of such opportunities as they may have. As to the improvement of ventilation in crowded workshops occupied by tailors, millinges, shoemakers, and all persons en-gaged in sedentary occupations, where few or no deleterious products are evolved beyond those that arise from respiration and combus-tion, the question would be more justly stated were it described as a question of warming as well as one of ventilation, as it is rarely observed well as one of ventilation, as it is rarely observed that there is any objection to the discharge of vitiated air when that which enters is adapted to the state of the system. Undoubtedly, a regular egress for the system. Undoubtedly, a seldom provided; but this can never be placed on a right footing, however much it may relieve distress, till the ingress of air, and the warmth it may be necessary to communicate, shall have been satisfactorily adjusted.

shall have been satisfactorily adjusted. In no case do the evil effects of the im-perfect distribution of air manifest them-selves in a more palpable manner than where rooms are crowded with individuals engaged in sedentary occupations. An under-current passing along the surface of the floor to the fire-place in winter may occasion, on the whole, a considerable change of air, but its local movement deprives it of almost all its value. The fire may receive pure air but value. The fire may receive pure air, but little or none moves upwards to supply the organs of respiration. The evils from defective ventilation are then

of great magnitude, and the continuity of their operation gives them a power and influence over the system which cannot be too minutely investigated. Few pause to consider the necessary consequence of twenty respirations per minute, 1,200 per hour, or 28,800 in a single day and night, where not only a noxious atmosphere is inhaled, and brought directly in contact with the blood, but where also the state of the air diminishes the amount of discharge of those noxious products which the system discharges more and more largely, in proportion to the purity of atmosphere in-

spired. Bad ventilation, also, is as injurious to the mind as to the body; and in its more aggra-vated forms not only induces headache and apoplexy, but, conjoined with other circum-stances, is prone to favour that depression which leads at times to low spirits, or even to suicide.

If the progress of air be examined in a room of ancient date, where neither the doors nor windows are air-tight, an ingress of

fresh air is almost invariably observed below, and an equivalent discharge of vitiated air above; the fire-place being in this case sup-posed to be inoperative and closed by an airtight board. Stagnation is thus prevented, and a continuous, though subdued ventilation, maintained through the apartment, to an ex-tent dependent on the magnitude of the crevices in the doors and windows, and the condition of the internal and external atmosphere.

Again, if the fire be in action in the same apartment, the air in general enters by all crevices to supply the draught it creates, so creates, so that in this manner also the freshness of the air is maintained. Farther, the great altitude of the open fire-place in ancient chimney-breasts sustains a very powerful circulation at a higher level than is commanded by low cottage-grates in modern rooms, when the feet may be bathed continuously in cold air, while the head is placed comparatively in a warm stagmant atmosphere, unless crevices in warm stagnant atmosphere, unless crevices in doors and windows permit a considerable change.

It is a matter of much regret that in many houses the supply of air is so perfectly in-adequate, both for individual rooms and for passages, that they act continually upon each other, the powerful fire in one room over-coming the weaker draught in the other, and communicating through the passage, which is accordingly more or less filled with smoke, that is—carbonic acid gas, mingled with various visible impurities, particularly char-

coal, oily, or other substances. Vitiated air from lamps and candles, well as from respiration, tends to ascend, though, as projected from the nostrils and the mouth, it moves, at first, more or less downwards, or in a horizontal direction. In experiments made on this subject, the tem-perature of air from different individuals placed in a box lined with cotton and open above and below, was found to be generally four degrees higher above the head than below the feet (the box was suspended in the air), and, at natural temperatures, a current constantly ascended on every side from the person. Thus then it is obvious, that, if the natural movements of vitiated air in ordinary apartments be facilitated by one opening at the lower part, and another above, every room will ventilate itself sufficiently to prevent the more extreme effects that are so often observed

at present. If the lower opening be diffused by extending it along the skirting, the current becomes more mild and equal and less liable to strike upon the person, so as to produce an offensive draught.

draught. If the upper aperture be led into a chimney flue, or into an independent flue warmed by its near position to a hot chimney, its action is more powerful and more uniform than a mere aperture in the wall near the ceiling, and not so subject to modification in windy weather. If it communicate with a newerful weather. If it communicate with a powerful chimney-flue, it works still better, except when the fire declines, or the supply of fresh air is interrupted, a dangerous recoil taking place, and the upper aperture discharging smoke into the apartment: this defect may be obviated to a great extent, though not entirely, by the use of valves, unless they be regulated, and adapted from time to time according to the

varying circumstances of the case. Two apertures, then, at different levels are the great essentials in each apartment, and so the great essentials in each apartment, and so ample a supply to all stairs and passages, that they shall not borrow or draw down air from individual rooms, but give freely to all that do not draw their supply from an external source. The most serious evils from offensive draughts and currents may be greatly diminiched by I he most serious evils from offensive draughts and currents may be greatly diminished by proper diffusion of the air, as well as by the previous communication of warmth to it. Diseases from exposure to draughts appear principally to arise when the constitution has been heated excessively, in consequence of a defective supply of air; but, were a small aperture left continually open, the constitution could never attain that extreme susceptibility of cold and aversion to the slightest breath of of cold, and aversion to the slightest breath of air which so often accompanies to limited a supply, and that reduction of the insensible cutaneous and pulmonary exhalations by an atmosphere loaded with moisture which leaves the surface of the lungs and skin unduly ex-cited and turgid with a load of material that

would have been dissipated by exhalation and

evaporation with a better supply of air, When a fire-place is in action, it necessarily complicates the ventilation. But all cases of this kind resolve themselves into the following classes :

classes: The first comprehends those in which the fire-flue alone becomes the discharge of viti-ated air. This cannot be considered the best, as, under ordinary circumstances, the fresh air travels along the floor, and little rises to the head, where it is most largely required. In the second class, the evil effects of the vitiated air, which is prone to accumulate above the chimney breast, are diminished by its being raised to a bigher level than is now common, or by admitting the external air from

common, or by admitting the external air from an aperture above, near the ceiling, so as to sweep across the apartment in its descent to

the fire-place. In the third and best class, the chimney face is reduced to a minimum, and carries off solely is reduced to a minimum, and carries off solely the products of combustion; another superior aperture discharging the products of respira-tion and of lampe and candles, while a free in-gress of air prevents all interference of the fire-flue and the ventilating flues. This ad-justment is carried still farther in some places by the union of the fire and ventilating flues, and by the provision of a sufficient local supply for the fire in its immediate vicinity, which reduces greatly the general force of the

which reduces greatly the general force of the current throughout the apartment. The above principles involve the more im-portant bearings of the question of ventilation, so far as it affects the individual apartments in so far as it arects the individual sparmaens in tenements occupied by the poorer classes of society, it being taken for granted that the evils arising from defective drainage, closets, and cleaning, and a bad external atmosphere, and cleaning, and a bad external aurospone, have been removed. Practically thes, a well-constructed window, capable of being opened above and below, realizes, when the fire-place is well arranged, all the essentials for effective ventilation in such apartments. Window, ventilation in such apartments. Wisdow, however, are not recommended as affording the best means of insuring ordinary ventilation, though they may be resorted to with adma-tage when the weather is not severe, or under peculiar circumstances, and should therefore always be available when large supplies of an are required; but for that more minute venti-lation which the system requires and tolerates in the severity of the winter's cold, and at a time when the dryness of the air promotes rapid evaporation both from the skin and lungs, a much less extended opening is required, and one capable of more minute and delicate adjustment to the ever-varying circumstance of the case, than a window can be made to command. The complaints arising from draughts and currents exist only when the movement of air becomes excessive, and inor suited to the termonomet on which it im suited to the temperament on which it im-pinges. The human frame is so constinued that a movement of air is perpetually sustained around it by natural causes during life. Very cold air having a very gentle movement around the person may not be offensive, while a mach warmer atmosphere moving rapidly may be

productive of extreme annoyance. Taking these circumstances into considera-tion, with the fact that doors and windows appear generally, if not universally, to have formed no barrier against the most defective ventilation, great improvements may be anti-cinated when every anotyment shall be provided ventuation, great improvements may be and cipated when every apartment shall be provided with an independent ingress for fresh air, and an egress for vitiated air, which, though small, shall be incessantly operating, much more ca-pable of regulation, and one which can beer induce those violent and extreme charget induce those violent and extreme changes which are produced by the occasional opening of doors or windows that may have been closed for too long a period.

In the great majority of cases where any attempt at systematic ventilation has been carried into effect in ordinary spartment, the objections which have followed its introduction appear to have arisen principally from two causes, viz., the excessive introduction of fresh cold air, or its local movement arising from cold surfaces or defective diffusion, which might have been obviated by leading in the air at any more remote part of the room, or in any position, so as to admit of the first impulse being broken by a diffusion board, or by ex-tending the tending the aperture of ingress along the

skirting. Another cause which appears to have re-

tarded considerably the introduction of ventilation in ordinary apartments, is the idea that some special force or power is required for this purpose. It is true, indeed, that a power is required; but nature has provided this power in the movements which the warmth of the person necessarily induces in the air which it vitiates; and hence, if the natural movements of vitiated air in ordinary apartments be not opposed and resisted by the absence of apertures at those levels where air, if left to itself, will enter or escape, the discharge of vitiated air upwards by ordinary currents is as fixed and certain as the descent of water by its natural gravity in draining operations; and, if a modification be induced in apartments by kindling a fire, still, if the chimney-flue be not excessive in size, and an adequate supply be given for it, as well as for superior ventilation, these natural movements will be sustained, and proceed in harmony with the functions of the system.

Apertures such as are now adverted to may not command the extended movements that give the most complete ventilation that machinery, furnaces, and other arrangements can sustain; they may be rendered more or less irregular by the action of the wind; but, without inducing severe draughts, they will remove the extreme evil that induces so large an amount of weakness, discase, and death, and it is this result that is necessarily most important to society.

portant to society. It is also important to know that mere openings operate in another way than by facilitating ordinary currents, according to the relative pressure within and without in any apartment; though this second mode of action is to be regarded principally as an auxiliary force, in respect to its power of changing the atmo-sphere in any apartment, however important its functions may be, where the air comes in direct contact with the living frame. So careful has nature been in the securities taken careful has nature been in the securities taken to prevent any stagnation of air around the person, that, besides the movements dependent on an alteration of the specific gravity of each successive portion of air that is received into the lungs, or brought in contact with the sur-face of the body, a power of penetratiou, re-vealed in modern times more especially by the experiments of Dalton and Graham, is found to be incessantly in operation, promoting natural ventilation, and discharging vitiated air from every place in which it is prone to ac-cumulate. This force operates in every direc-tion with a power superior to that of the pressure of the atmosphere, and its tendency is slowly to diffuse all gases and vapours through each other, whatever may be their difference each other, whatever may be their difference in specific gravity; its action is never arrested except where air-tight barriers are interposed between one portion of the atmosphere and another. Hence, then, where internal and external temperatures approximate so closely as to reduce the movements that commonly ensue between the atmosphere within and that without, and even where they may be reversed (as when a higher temperature prevails externally than is found within), still the power of pene-tration between the particles of different gases or vapours never ceases to reduce the intensity with which they may be prone to accumulate in any individual place, provided a communi-cation be maintained between it and the external atmosphere.

THE TOOLS AND IMPLEMENTS OF INDUSTRY AND ART.

A LECTURE on the above important and interesting subject was delivered on Thursday, 21st inst., at the City of Westminster Literary and Scientific Institution, Great Smith-street, by Mr. Wm. Higgs. The lecturer commenced by observing, that man was distinguished by the proper exercise of which he is enabled to administer to the comfort and happiness of himself and all by whom he is surrounded. The mechanical powers, the means whereby muscular force is augmented and man is enabled to perform with ease many things, of which his unassisted strength would be quite incapable, were next glanced at, and an experiment or two given in illustration. Hunt's Patent Receiving Box was also alluded to as an ingenious and useful invention, illustrating the employment of the lever.

Having taken a brief view of the progress of the building art from the most primitive but to the convenient dwelling and the elegant and stately mansion, the lecturer next commenced a detailed examination of some of the implements by which that art had been advanced to its present state. The spade first engaged attention; the properties of a good one were described, and the audience put on their guard against the spurious, but good-looking article formed by rolling, &c. The axe was then described, and its varieties exhibited, with notices of ancient instruments of this kind, of stone, and subsequently of an alloy of copper, as preceding the use of iron and the more improved steel-edged and steel-polled axe and adze of the present day : the Canadian, or Backwoodsman's axe, from its formidable appearance, excited much interest. After detailing the manufacture of these important tools, the hammer was noticed, and many of its varieties submitted to the inspection of the audience. The delicate hammer of the watch-maker, weighing together with its handle not more than 140 grains, was contrasted with the metal helve of our ironworks, weighing seven or eight tons, a diagram of which and of the tilt hammer made their mode of operation easily understood; the sledge of the smith, and the highly-wrought and beautifully polished planishing hammer of the silversmith were also examined. A form of mallet, differing from that in use by the carpenter, was also suggested, as having its weight so concentrated as to strike a heavier blow with less expenditure of labour. The saw was described as an instrument of

The saw was described as an instrument of great importance, both as regards facility of operation and economy of material; its history and high antiquity were noticed, and its principal varieties submitted to inspection in a number of most beautiful and highly-finished specimens. The manufacture of saws was described as calculated to call into operation the skill and ingenuity of first-rate workmen. The properties of a good saw were thus described: " It should not be so thick as to be heavy or clumsy, nor so thin as to be easily crippled by fair use; the plate should be equally ground, not gouty or thick in the middle, for then it will require too much set, but if it gradually taper from the teeth to the back it will work with the smallest amount of set to the saving of wood and labour; it should not be too hard, but be capable of being filed, nor to soft, for then it will not retain its edge; upon examination, it should not discover any weak or crippled part, but all the particles should have an equal tension." A tool not much known but very useful was noticed, the flote, as intermediate to the saw and file. The antiquity and importance of the file also claimed attention. Filecutting was described, as also the subsequent process of hardening; many beautiful varieties were exhibited, some of the most exquisite workmanship, and some so exceedingly small as to bear a value of 2*l*. per ounce.

NEW RAILWAY BREAK.—The Rev. F. H. Maberly, of Stowemarket, has lately obtained a patent for a break, by means of which he states, "every carriage of a whole train may be easily, safely, and almost instantaneously stopped," and further, that "if applied in all parts, it will be the means of preventing the carriages being thrown off the lines by oscillation or otherwise,"

THE OLD CHURCH AT FULHAM.

THE venerable tower of Fulham church, adjoining the palace of the Bishop of London, has long called for restoration : brickwork capped with Yorkshire paving formed the battlements, the turret was stunted, the belfry windows, strings, and plinth, were tumbling to pieces, and the great west window had disappeared altogether, and was boarded up. Partly by a rate, and partly by subscription, funds have been raised, and the work is now rapidly proceeding, under the direction of Mr. Godwin, the architect. His lordship the bishop, the Rev. Mr. Baker, the rector, John Gunter, Esq., and several other of the principal inhabjtants of the parish, have exerted themselves to effect this restoration. Mr. Samnel Cundy, of Pimlico, is the contractor. When completed we shall give some account of the church, which has several points of considerable interent.

PROTECTION OF BUILDINGS FROM LIGHTNING.

The effect of a thunder storm on the hothouses and frames of the Marquis of Lansdowne, at Bowood, has led to a correspondence on the subject of conductors in the Mark Lane Express. Mr. White, of Walworth, says :--- "I am fully persuaded that if a range of conductors had been placed on the nearest rising ground, the severity of the storm would have been drawn off, and the noble marquie's property preserved in part, if not altogether. But it frequently happens that many mansions are provided with "numerous conductors," like those erected by Pope Pius VII. for the protection of St. Peter's at Rome, the cupols of which edifice is cracked in many places, and ten arches of iron, weighing 60,000 killogrammes, have been placed so as to prevent its fail. The lanterino above the cupola, which supports the cross, is found to be cracked through and through, and hasbeen surrounded by heavy iron chains to prevent the crack from extending. All this heavy iron they say is to prevent mischief by thunder storms / Now the same building, it is evident that they will attract the passing storm to that focus, and there the elemental strife will rage; and again, the application of ten iron arches, and heavy iron surrounding chains, are sufficient to draw from the thunder clouds such a vast amount of the electric fluid as to shiver the building to atoms. We not unfrequently see a tall chimney, or a stack of chimneys, supported by slanting bars of iron fastened to the roof of the building. It commonly happens that the electric fluid as to shiver the building to atoms. We not unfrequently see a tall chimney, or a stack of chimneys, supported by slanting bars of iron fastened to the roof of the building. It commonly happens that the electric fluid will follow the slanting irons, and, not finding a free passage, frequently damages the roofs or the walls; and then the wonder is, how came the walls cracked ? An architect is consulted, the foundation must be defective, and thee walls must be shored up; whereas if the conductors had

VIEWS IN SAXE COBURG AND GOTHA.---Mr. Hogarth, of the Haymarket, is preparing for publication a series of views of the ducal palaces, castles, and hunting seats in Saxe Coburg and Gotha, drawn on the spot, and lithographed by Douglas Morison. The work is announced under the patronage of the Queen and Prince Albert, and will be dedicated by permission to the Duke of Saxe Coburg Gotha.

Gotha. **ROYAL DURLIN SOCIETY.** — The appointment of drawing-master in the figure school of this society is at present vacant. Candidates are required to send in probationary drawings by the 25th of October next. The election will take place in the following month.

Font Cover, St. Dunstan's Church, Canterbury.

FONT COVER, ST. DUNSTAN'S CHURCH, CANTERBURY.

It is very probable, that in ancient times overs were considered a necessary adjunct to fonts, and that there were few erected in Rngland without them. The material of Ragland without them. The material of which they are mostly constructed being wood, and liable to decay and accident, but few of these interesting objects are now found. The subject of the plate is a very fine one, it still re-mains suspended over the font at St. Dunstan's church, Canterbury. It is a good specimen, first, of the rich architectural features these font covers must often have presented, and secondly, of the ease with which they were con-structed, for though they appear to be elabosecondly, of the ease with which they were con-structed, for though they appear to be elabo-rate when completed, they are in truth of simple design. In this cover there are only three pieces of separate pattern, these by being repeated eight times each, form the font cover. For the assistance of the young designer, I have given sketches of the three pieces with a portion of the plan, to shew how they are put together.

a portion of the plan, to together. The font cover at Ewelme, in Oxfordshire, and that at Foedyke, in Lincolnshire, are con-structed upon similar principles. The effect of such composition, curious as it may seem is the more beautiful, as the parts are less dissimilar.

less dissimilar. The font at St. Dunstan's is a plain stone octagon one, standing about 4 feet 10 inches in height, it is of similar date to the cover. Carter, in his great work on the ancient archi-tecture of England, gives a print of the font and cover complete, but the latter is most strangely drawn, totally unlike the object it affects to represent. He places it among the specimens of the latter part of the reign of Edward the III. The style of the cover ap-pears to me to be that of the middle of the sixteenth century, when Gothie architecture sixteenth century, when Gothic architecture was rapidly becoming debased.

was rapidly becoming debased. Few, very few font covers remain in Eng-land of earlier style than the one at St. Dun-stan's church, but several can be found of similar character; at Littlebury church, in Essex, is a very curious one of very novel de-sign, but it has been lately removed from its original position, and half destroyed. The facility, through the aid of machinery, with which all sorts of Gothic tracery and Elizabethan ornament, in wood or stone, can

Elizabethan ornament, in wood or stone, can now be produced, will, before long, change the now be produced, will, before long, change the appearance of our architecture, giving the picturesque enrichments of the olden time both to our churches and domestic edifices; a font cover in oak, equally as rich as that of St. Dunstan's, can be made in London by Pratt's carving process for 15*l*. The young carver must exert his ability, and make the powers of his mind the rival of the forces of mechanical agency. C. J. RICHABDSON.

THE STAINED-GLASS FOR ST. JAMES'S CHURCH, PICCADILLY.

To be designed in *keeping* with the interior, which is con-sidered one of the finest specimens of Sir Christopher Wren's abilities."-Vide Mr. Mayhew's Circular to Ar-tists, on July 16, 1844.

SIR,—As a constant subscriber to your valuable journal THE BUILDER, your able and candid protest against the absurdity and manifeat solecism about to be perpetrated in St. James's Church has naturally come under my notice, and is so correct, that it must, and will, no doubt, carry with it a conviction of justice and propriety to every rightly-informed mind, and thereby arrest the progress of such a monstrosity.

monstrosity. What can be inferred of a committee who could select for an Italian building an altar-window of a Gothic design, a positive com-pound of Norman and Early English, and in the face too of their very circular and the specified terms of it, viz. that it should "be designed in *keeping* with the *interior*, which is considered one of the finest specimens of Sir Christopher Wren's abilities?" I boldly assert the only conclusion that can be come to by any candid person is, that they have acted by any candid person is, that they have acted ignorantly and unjustly-ignorantly, seeing that a committee of their own papers could not have committed so great a mistake, each of the other designs being in perfect accordance

* An engraving of this font and cover has been in our hands for some time, and will shortly be given in TEE BUILDER.-ED.

and in *kceping* with the interior; the one selected being the only exception—and un-justly, because by the terms and conditions they put forth they have misled and wasted the time and talent of artists, as well as wasted, by misapplication, the funds intrusted to them by misapplication, the funds intrusted to them by the subscribers, by adopting an unfitting de-sign, not "in keeping," &c. &c., from an artist who candidly confesses his incompetency to any other. What, Mr. Editor, would Sir Christopher Wren have said? that perhaps which Boilleau has said—" nothing is beautiful which is false." Mr. Willement and Messrs. Ward and Nixon wisely declined the competition, and, Sir, can it be wondered at, if, after such ex-hibitions of thoughtlessions in a number of eminent persons (who ought to know, and some of whom, no doubt, do know better)

That artists in future should decline To throw their "pearls before the swine;" Donors, too, devotionally bent, May have a care their meed is not mis-spent.

I am, Sir, &c., WILLIAM WARRINGTON. 42, Berkeløy-street, Hyde Park-square, August 25, 1845.

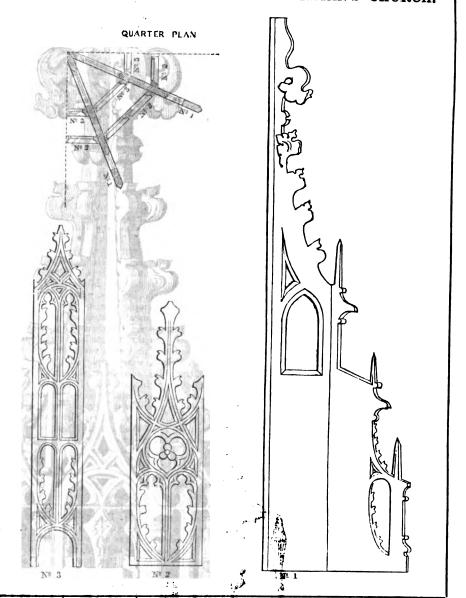

August 25, 1845. In your article I believe you are not exactly correct in one point. The persons originally applied to (as I am informed) were Mr. Wil-lement, Messrs. Ward and Nixon, Mr. Backler, and myself. Eventually the Duke of Cleve-land and the Bishop of London wishing Mr. Wailes to be applied to, it was thought proper by the committee to open it to an extended competition. The Bishop of Armagh, the Bishop of London, and the Duke of Cleveland are, I perceive, the three principal subscribera are, I perceive, the three principal subscribers with Mr. Byng. Level Salar Ca

FREE ADMISSION TO PUBLIC BUILDINGS.

ON Saturday last a petition, signed by the mayor, magistrates, town council, clergy, and principal inhabitants of the city of Lincoln, to the number of 160, was forwarded to the Right Honourable Sir Robert Peel, Bart., the pre-mier, praying him in the appointment of the new dean to the cathedral chapter of that city, to have regard to the free admission of the public to the cathedral at proper periods. At present a fee of one shilling is demanded to view the interior; this acts as a severe tax upon the citizens, who may have visitors, and who, in shewing "the lions " of the city, do not like to be charged with a payment of one shilling per head for walking through an edi-fice, profusely rich in sculptured decorations and groined vaultings of the nave, yet possess-ing few attractions of stained glass or monu-mental records. The recent decease of Dean Gordon, the discussions in Parliament, the correspondence with the Dean of Westminster, On Saturday last a petition, signed by the correspondence with the Dean of Westminster, and the various articles in the public prints, about the example given by the Deans of Durham and Norwich, have all suggested to the citizens of Lincoln the propriety of making the present effort for a free admission to the interior of the cathedral. Of course it is not intended to exempt those who are curious enough to clamber up the rood-tower, to visit the great "Tom bell," from the payment of a proper fee to the guide. The same remarks apply equally to York and other cathedrals in the country, where a diagraceful system of fee-taking is too frequently carried on. correspondence with the Dean of Westminster,

taking is too frequently carried on. As regards Norwich Cathedral being open to the public, we are disposed to think any person applying to view it would find they

DETAILS OF FONT COVER TO ST. DUNSTAN'S CHURCH.

• ould see very little of the building without payment, and that only during a certain number of minutes each day. While on this subject, we would allude to the insolent and discreditable behaviour, in his office, of the principal verger at St. George's Chapel, Windsor, a man named Tucker, who seems to regard every person that looks into the nave of that building, in the half-hour previous to divine service on week-day mornings, during which it is open, as committing a robbery; and when the first lesson is over, drives them out of the door with the greatest incivility. We seriously advise this worthy functionary to alter his course before stronger representations are made.

ENGLISH DECORATORS AND THE NEW HOUSE OF LORDS.

COMPLAINTS have reached us, that either the Royal Commissioners on the Fine Arts have behaved ill to the decorative artists who submitted works in competition, or that their recommendations are put aside by others. A communication in the Spectator of last week contains the whole complaint : we extract from it the following :--

"There are at this time some sixty or eighty decorators — wood-carvers and ornamental painters—at work upon the enrichments of the Chamber of Peers in the new palace; and among them, I believe, are only one or two of those artists whom the commissioners expressly recommended for employment. Certain it is, that the most skilful and experienced practical workmen among the carvers and painters thus recommended have not been engaged; and what makes this still more extraordinary, is the statement of Mr. Pugin, who superintends the interior decorations, that for want of competent assistance from Englishmen he is compelled to send for foreigners. "When the royal commission in 1843 invited

the English decorators to send in specimens of their ability in the various branches of ornamental art, no premiums were offered ; it being understood that the prizes for successful competitors would be employment. In pursuance of this arrangement, a committee was appointed to inspect the specimens exhibited in the spring of last year at the St. James's Bazaar, and to report on the merits of the artists. These re-ports, from which I shall presently quote, are printed in the third Report of the commis-That the ornamentists whose specinoners. mens were approved have been officially re-commended to be employed in preference to others, I know for certain; having seen letters signed by the secretary to the commission, Mr. Eastlake, and sent for the information of the parties. I can also state of my own personal knowledge, that the artists in question have applied to Mr. Barry for employment, and are both willing and able to enter upon the work. but have been put off with smooth words and promises. Not being aware of any but woodcarvers and ornamental painters being em-ployed at present, I confined my inquiries to these two branches of decoration. Six carvers, namely, Messrs. Cummings, Ollett, Ringham, Freeman, Browne, and J. Thomas, were favourably noticed in the Report of the committee; and another, Mr. Rogers, is especially men-tioned in these terms : 'It is the opinion of the committee, that among the carvers whose works have been exhibited he holds the first place; and they consider him as the person best qualified to be entrusted with those parts of the woodwork of the House of Lords in which great richness of effect and delicacy of execu-tion are required.' Nothing can be stronger or more explicit than this. And that the commission adopt the recommendation of the committee is proved by a letter from the secretary, directing Mr. Rogers to communicate with Mr. Barry. Mr. Barry says there is nothing for him to do at present; and bows out the applicant with this flattering excuse,— 'There is nothing worthy the exercise of your talent, Mr. Rogers, in the House of Lords !' So that the doors, for which designs were especially required, the stalled and canopied seats of the peers, and the throne, are all to be left to common workmen. The soffits of the ribs of the ceiling, though they are of pierced carving, gilt and relieved upon a coloured ground, cannot be considered very important, since they are cut out of Canadian pine, the commonest and most fragile wood that could be chosen, and a favourite haunt of insect vermin. Of the other six carvers I have only heard of one being employed, and he only as a journeyman; and two individuals might be named who have suffered serious loss and disappointment by leaving their business in the country, in consequence of the committee's recommendation.

⁴ In the department of stablesque painting, the artists noticed in the detailed report of the committee sre Mr. Collman, Mr. Goodison, and Messrs. F. and J. Crace,' say the commissioners; and they add the opinion of the committee, that the specimens sent by Mr. Johnson 'evince considerable taste and ability.'

The following significant hint was appended to their report :--- 'The commissioners, having had reason to suppose that some of the persons who have exhibited works of decorative art may have employed other hands, or even the assistance of foreigners, in the execution of such works, have resolved that those persons who may be selected for employment in those branches of decoration shall, if the commissioners think fit, be required to produce specimens of their art, to be completed under such conditions as the commissioners may think necessary.' The meaning of this is, that the commissioners will employ none but practical men-working artists. Mr. Collman is an architect, and employed German painters Mr. Collman is to execute his design. Messrs. Crace are very respectable shopkeepers, who undertake decorespectable shopkeepers, who undertake deco-rations and employ artists to execute them; but they are men of business and taste, not working artists. Of themselves they are in-competent to the production of the specimen they sent in; on which various artists, French and English mere employed. Mr Gooding and English, were employed. Mr. Goodison and Mr. Johnson were the only successful competitors in arabesque painting who de-signed and executed their specimens themselves ; yet neither of them is employed ; while Messrs. Crace have both the honour and profit accruing from the painted decorations of the House of Lords, which are being executed by foreign and English artists, from designs fur-nished by Mr. Pugin, and under his direction, to the exclusion of the only two artists who were qualified for employment according to the decision of the committee. To the application of Mr. Goodison, the same flattering answer was given by Mr. Barry—that there was no scope in the House of Lords for the exercise of his talent; it was mere journeyman's work. If this injustice be suffered, the inference is in-evitable, that the Royal Commission either wants the will or has not the power to enforce its recommendations. In either case, the artists whose labour has been taxed, and whose hopes have been disappointed, will have good ground of complaint of a breach of faith. The country also will have reason to be dissatisfied that the best native talent has not been engaged on a national work, that is intended to exemplify the highest state of perfection to which British art can attain in this age. The pecuniary loss to several ornamentists, through their being thrown out of employment by competing against their masters, or their giving up pri-vate business in the country to come to Londou, has been almost ruinous.

But, taking a wider view of the matter, there is great cause for regret that such a grand opportunity as this for calling out any original talent in ornamental design that exits in the country should be suffered to escape, by excluding from employment all but merely mechanical copyists of Gothic patterns."

RARE BUILDING GROUND. — The beautiful domain known as the White Knights Estate, near Reading, to which we referred a short time ago, is now fairly in the nurket as building ground. A company is in course of formation to make the roads and drains, build the lodges, and grant leases of plots for building on, and will not fail by a spirited and judicious outlay to secure a large return. The American and Chantilly Gardens, the wilderness and lake are to be reserved for the enjoyment of the inhabitants. It is impossible for the most graphic pen to describe the exquisite grouping of the splendid timber, shrubheries, and the slopes of sward, forming as a whole, perhaps the happicst effort of landscape gardening this or any other country in Europe can produce. We know of no such sites for houses at the same distance from the metropolis, and have little doubt that the shares will be eagerly sought after.

STIR IN THE SCHOOL OF DESIGN.

SIR,-As an article has appeared in your per of the 16th instant on "the course of paper of the l6th instant on "the course of study in the school of design," the writer of which appears to have settled the matter very much to his own satisfaction, will you permit me to prove that he is either ignorant of the course pursued by the students, or that he has endeavoured to produce wilfully erroneous impressions of the grounds of their complaints. After mentioning the opinion of Mr. Pugin, and a previous correspondent in your paper, he goes on to say, "and those most modest re-monstrators, the students, consider it utterly useless, as the directors do not adopt that course of study which they, in their wisdom, think fit to prescribe." Immediately following this comes, "But among them all, for my part, I have read no attempt to disclose a prac-ticable remedy." How those two assertions can be both true I do not see, unless the students have offered a practical remedy which Mr. Morgan has not taken the trouble to read. But the first assertion is utterly false, and without the slightest foundation : the students never have attempted to prescribe any course of study, or even to offer any suggestions to the council or the authorities of the school. The facts are simply these :--- The council lay down for the students a certain course of study, and they offer to them a certain amount of instruction; they spoint a director and clearly define his duties. Now what are the complaints of the students? They complain that the course of study prescribed by the council has never been followed out; that the instruction promised by the council has never been given; and, that the duties of the director as defined by the council have never been fulfilled. These are questions of facts, not matters of opinion. We have never discussed the merits of the system laid down by the filled. council; we have never attempted to dicta douncil; we have never attempted to dictate or criticize their plan: we have laid before them depositions which prove (beyond all constra-diction) that the instruction promised has never been given, and the duties of the director never fulfilled. If any further proof were wanting, hear the director's own admissions. In a special report of his, delivered to the council on the 4th of February (exactly a month previous to our petition being sent in), he says :-- "As the subject of lec-turing is of much importance, I wish to state briefly what has been the amount of my efforts to comply with this duty.".... "I have delivered a very few written ad-dresses," "and from time to time, when a new example or set of examples was purchased, I have prepared myself and deli-vered a little lecture upon them." And very And very little ones they must have been; and in som very snug corner they must have been deli-vered; they most certainly were never given to the students, nor did they ever benefit them. One solitary effort was made to get up a lec-ture upon architecture, but painful to relate, it was found to draw too heavily upon the talents of the director, and it was abundoned. Immediately following the sentences quoted above, he says (speaking of his little lectures), "This cannot be deemed any sufficient substitute for the course stipulated for by the council."

At the same meeting of the council at which this report was read "Mr. Wilson was directed to obtain from Mr. Herbert a written statement of the most efficient mode in which he conceives the figure can be taught in the school with reference to ornament." In the report accordingly prepared by Mr. Herbert, he thought fit to suggest that a black board should be used by the director, practically to demonstrate to the students the various points of the lectures upon the history and principles of the various styles of ornament which it was his duty to give. Now, immediately on the sending in this report by Mr. Herbert, Mr. Wilson wrote to him, saying, that in consequence of the feeling which had incited him to suggest to the council the use of the black board, he should hold no further correspondence with him. Now what reason could there be to consider this suggestion as so severe a personal affront. I have attended lectures on various subjects connected with arts and sciences, and I have found it a common (almost a universal) practice for the various professors to draw upon a black board in the presence

of their audience, various diagrams illustrative of their subject. Is it possible then that the gentleman who undertook to furnish original designs for the various classes in the school, who agreed to teach the whole body of the students in the varied round of instruction promised in the school; and who took exclu-sively upon himself the task of teaching the upper class of the school, should feel himself upper class of the school, should feel himself incompetent to the use of so common and generally received a vehicle of instruction as the black board? And yet upon what other grounds is it possible to account for such a message as that sent by the director to Mr. Herbert, or for the virulence with which he Herbert, or for the viruience with which he has pursued that gentleman, until at last he has procured the dismissal of one who had done, and was doing, more for the success of the school, and the benefit of the nected with it. The truth is, the council had hoped to have veiled from the public their want of foresight, in appointing to the office of director a gentleman practically ignorant, and to have imposed the belief that the school was rapidly progressing to perfection under their management. The students have dared to rend the mask from before them. They have said to the public what the council had said to each other over their own tables long before; and we are punished accordingly. Not for uttering falsehoods, but for daring to apeak the truth.

I trust, Sir, that you will excuse my intrud-I trust, Sir, that you will caute any ing so long on your valuable time, and I re-main yours. &c., R. BUBCHETT. main, yours, &c., August 25th, 1845.

SUSPENSION BRIDGES.

SIR,-I do not think Mr. Hosking, in his "Treatise on Bridge Building," investigates the principle illustrated by the diagrams in your 128th number. I cannot contradict "B. B." on this point, but can say I have never seen it, and should like very much to have it pointed out to me. I did not make a choice of the works at Derby and Ashton, but inserted them in my letter because they were the first instances that occurred to me at the time, probably for the reason that they had lately happened, and were therefore fresh in my memory. I know nothing of the particulars in either case further than was given by the newspapers at the time; but, if my recollection serves me, the centres in if my recollection serves me, the centres in both bridges were being struck, and therefore they were completed. Neither did I require these examples to fill up a vacuum in an argument which was of minor importance, and which I did not enter upon in my first letter until after stating I had replied to "all that concerns me;" for I could adduce a score of bridges that have fallen, and an immense num-ber in a very dilapidated state, if it were not imidiant to the replication to make the score of "B. B." mistakes my position if he and

"B. B." mistakes my position if he sup-oses it to be suspension versus compression bridges. It is the principle upon which both suspension and compression bridges are generally built to which I object, and which I say is incorrect. To set it clearly before you, let it be allowed, that of two principles (which require for their investigation data differing from each other), when carried out in practice, and compared together, that which is superior in power, and admits of unlimited extension, may be termed correct, whilst that which is inferior in power, and continually approaching towards a maximum, incorrect. This being premised, here are a few experiments with suspension models, constructed on the catenary, and on my plan.

"In Bristol, Jan. 6, 1838, two models of equal materials and dimensions were tried. The parallel chain model bore 1.565 lbs.; the taper chain model hore 3.681 lbs. Again, in Bristol, Jan. 10, 1838, the parallel chains bore 1.456 lbs.; the taper chains bore 3.696 lbs. Another trial before the same party, the same day, was made with models constructed by Mr. Cross, of Bristol, unknown to Mr. Dredge, in order to prove that all was fair in the former trials; and the result was, the parallel chains bore 2.632 lbs., and the taper chains bore 6.849 lbs. Each model broke on adding more weight, and the chains throughout on the taper principle was reduced one size by the experiments."#

These experiments are proved by practice and verified by mathematical investigation, which does not shew a maximum in extent of span. Hence, that principle which demon-strates the tapering chains may with propriety be termed correct; whilst that which compels the catenary, incorrect: and now to apply this reasoning to compression bridges. The only condition involved in our present inquiry depends upon the line of resistance which is traced from the resultants of the pressures applied to the arch of the bridge. Now, since these pressures are similar, and similarly applied both in suspension and compression bridges, their resultants are similar; and because it is the relative magnitude and position of these pressures which constitute the principle, we argue that since they are similar in each, the principle is the same in both. But the investigation turns on this point, that in the former the direction of the bars in the curve is determined by the direction of the resultants of pressures, whilst in the latter these resultants trace out some line within the boundary of the voussoirs, and the stability of the structure depends upon this line not intersecting the extrados or intrados of the arch. Now, if the fundamental principle is the same in both, and has been proved in one to be wrong, it follows it must be wrong in the other also.

By this time "B. B." will see that the feilure of the suspension bridges which he brings forward are proofs in my favour, because they tend to shew that the principle upon which they are built is erroneous, - the very position I take. I have merely to remark in reference to the extract from Professor Hosking's work, that it is the opinion of an eminent man, to which I offer no objection, when the span is small, the command of capital large, provided the head room beneath the arch, or a hill over it be of no consequence; for in such cases any error of principle may be counteracted by immense masses of material, which the public have been used to see, and there-fore think substantial, but because the error increases in a greater ratio than the span, when we come to extensive bridges there is this objection, viz. that the use of stone is impossible, in large spans it is very difficult of application, and in very extensive ones impracticable. "B. B.," Still dwelling upon suspension

bridges, after alluding to many circumstances which are supposed to alter the internal struc ture of iron, goes on to say: "in proof of which see the accounts of the numerous acci-dents that have occurred on the various lines of railway from the fracture of the axles of railway carriages," &c. This is no proof at all, Sir, for in the axle of a railway carriage the forces are applied at right-angles to the direction of the fibres, but in the bars of a suspension bridge in the direction of them, the mechanical action of the fibres of the two is very different, the mathematical principles distinct, and therefore the comparison is erroneous.

With regard to the Yarmouth bridge, the immediate cause of failure is easily accounted for by the fact that the section of iron in the chains was not sufficient to resist the effects of a loaded platform, for at the time of the accident there were several tons of tension in the chains more than the engineer should have allowed, and this, coupled with the inferior quality of the iron, accounts for the failure. It may be very true that twice the number had been upon the bridge, but then the weight was equally sustained by both chains ; and besides, perhaps this weight might have permanently injured the iron by straining it beyond its limits of elasticity, so that when the lesser weight came on one chain it broke down. A question may be asked of me, would not your plan if similarly situated be attended with a similar result? Certainly not; for in the first place, if any part of the chain had an under rise, is any part of the chain had an under strain upon it, the rest would be immediately active to resist it; and secondly, even sup-posing the chains to fracture similar to the Yarmouth onlyang circle is in the armouth, only one-eighth of the bridge would have sunk, and this not sufficient to have en-dangered life, because the remaining seveneighths would have stood as firm as ever, and

reference to the oscillation which "B. B." here speaks of, I beg to refer him to my letter published in your 128th number.

I am, Sir, &c., 18th. JAMES DREDGE. Bath, August 18th.

P.S. " M. Navier speaks of a chain stretched r.S. "IN Ivavier speaks of a chain stretched across between two rocks that command the town of Mourtiers, in the department de Basses Alpes. It is 656 feet long, and made of rods about 2 feet 1 inch long, and 1 inch diameter, hooked one to the other without any diameter, hooked one to the other without any intermediate links. The date of its erection is not certain, but it is supposed to belong to the thirteenth century. It does not, however, appear to have been ever intended for a bridge, but is thought by some to have been an offer-ing to the Virgin to obtain protection against being overwhelmed by the rocks that overhang it. By others it is attributed to a knight of Rhodes, who is supposed to have erected it in consequence of a vow made during his capti-vity in the holy land. The iron is said not to be injured by rust."—Drewry, page 9.

We learn from the newspapers that a suspension bridge near Calcutta has just now fallen in. It was known as the Ballee Khall fallen in. It was known as the ballee huan bridge, and was the largest of the kind ever constructed in India. It gave way in the middle just as it was completed, and fell into the creek over which it was erected. The accident is attributed to an error in judgment of the contractor, while making some necessary alterations, and does not in any degree effect the principle on which the bridge was built.

POWER OF CORONERS TO INQUIRE INTO THE CAUSE OF FIRES.

lives have been lost and property destroyed to; an enormous extent. The attention of Europe is awakened to the importance of an inquiry. into the means of averting this dreadful cata trophe, and it is to be hoped that some atens,

with that end in view may speedily be taken. Last week a jury of the inhabitants of the ward of Cripplegate-within were empanelled before Mr. W. Payne, the city coroner, at the School kourse Dhills before Mr. W. Payne, the city coroner, at the School-house, Philip-lane, Aldermanbury, to inquire into the cause of the late fire on the premises of Messrs. Bradbury and Co. Manchester-warehousmen, of Aldermanbury. The investigation, from its novelty, excited considerable interest, several of the common council of the ward, together with the civic authorities, being present. The coroner, on taking his seat said be

The coroner, on taking his seat, said he would take the liberty of stating, as the present was rather a novel proceeding, why he had called them together. Latterly the number of fires in London had considerably increased, and when they took into consideration that nothing was so fearful as fire, they would be of opinion with him that when they had the power to inquire into the causes of such fires, nothing could be more important to the public at large than that the cause should be closely investigated. The ancient authorites shewed that in olden times it was the practice of the coroner to inquire into all burnings within his district, and that power still belonging to the coroner, although fallen into desuetude, he thought that they would be of opinion with him that it was most important that it should again be brought into force. In "Horne's Mirror of Justice" the duties of the coroner were clearly laid down, and among those duties the coroner was to inquire of all burnings, whether they were caused by felony or mischance. If they were of opinion that they had been set on fire with a felonious intent, then it was their duty to inquire and ascertain who the party was who was guilty of that felony. It was clear, therefore, in the olden time, that part of the coroner's duty was to inquire into all burnings; and he need not say how necessary it was to revive it at the pre-sent time. No one had the power to inquire into the causes of a fire-not even a magis-trate, unless a party was in custody charged with causing it. The persons living in the neighbourhood of a fire were always most anxious to know how it occurred, and he thought the public would think that he had would have supported it. I have again to remark that all the objec-tions urged against suspension bridges gene-rally are arguments in my favour. And in

ure, fires being so numerous. He had directed a number of persons to be summoned to give evidence as to the cause of the recent fire in Aldermanbury, so that they might come to a proper verdict, whether it was caused by accident or otherwise.

As every thing connected with this novel and most important proceeding must be of interest, the following is the form of oath administered to the jury :-- "You shall well and truly into the jury:-" You shall well and truly in-quire, on behalf of our Sovereign Lady the Queen, why a certain house and premises, in Aldermanbury, were lately burned, and a true verdict give according to the evidence; so help you God."

After a patient investigation the jury re-turned a verdict, "That the fire was caused by accident."

NOTES IN THE PROVINCES.

THE inhabitants of Taunton are displaying no little spirit and judgment in carry-ing out their determination to improve their town, and thereby render it more attractive to strangers as well as more pleasant and healthy to themselves. A public meeting is about to be convened for the purpose of electing a committee of taste, and of devising means to carry into execution those improve ments which may be considered desirable may be considered desirable. Many excellent suggestions have already been made, among them we may mention the re-moval of the alms-houses in Magdalene-lane, and building in their stead a number of elegant and building in their stead a number of elegant and uniform cottages; the purchasing ground for public walks; the erection of a suitable building for public concerts, lectures, &c. A prospectus for the erection of public baths has also just been issued. It is proposed to raise a capital of 800% in shares of 10% each. 500% to be appropriated to the building, and the remainder to furniture and incidentals. These and other improvements will not only raise Taunton in the scale of places of resort, empedially during the winter months, but will especially during the winter months, but will was celebrated by a public dinner, at which up-wards of eighty gentlemen sat down, and George Round, Esq., the high-sheriff of Essex, pre-sided. The building is situate close to the old Exchange, at the entrance of High-street. The forced is composed of a receding centra The façade is composed of a receding centre and wings, the entrances being under an fonic colonnade, and the wings are connected by pilasters of the same order. The wings by pilasters of the same order. are ornamented in niches or panels with two bas-relief figures the size of life, emblematic of ancient and modera agriculture. A figure of Ceres, to cap the centre colonnade, is now in course of preparation. A flight of steps leads to the interior, which is an apartment 78 feet by 47, a row of light pillars on each side supports the centre part of the roof, the northern end is semi-circular, there is a row of sky-lights running all round, and a large lan-tern-light in the middle. The cost of the building, independent of the purchase of the ground, is about 2,400%. — The committee for the restoration of the Norman Tower, Bury St. Edmunds, have once more issued an appeal to the public for means to enable them to rescue this fine specimen of Norman archi-tecture from the destruction that threatens it. The total sum required is 2,794. The sub-scriptions amount to 2,294., leaving still a deficiency of 5001. — A cemetery is about to be formed at Dudley, in Wolverhamptonstreet. The ground, comprising part of the fields and gardens between there and the castle bounds, in extent about ten acres, with a frontage of a hundred yards to the main street, is given by Lord Ward.—A new church is about to be erected in the Wielder Scheffeld at the effected for the Wicker, Sheffield, at the sole cost of the Misses Harrison, of Weston. ---- Great im-Misses Harrison, of Weston. — Great im-provement is in progress at the Market-street entrance to Trinity Church, Cambridge. A local paper states that very handsome iron gates have recently been put up there by Messrs. Shallow and Coleman.—Govern-ment has appropriated 25,000% of the grant for the improvement of barbours to that of the improvement of harbours to that of Harwich, and the works will be commenced almost immediately. — Part of Cabourn Wold Pillar, situate one mile from Caistor, in Yorkshire, may now be seen above

the trees. The stone-work is of such firm and nest execution, that great time is required even in gaining a few feet in height. Persons sailing on the Humber may now see part of the building, which, when finished, will be an ornament, and a use to most extensive views, both by sea and land, from the highest ground in Lincolnshire. — The Cliff Bridge Comin Lincolnshire. — The Cliff Bridge Com-pany, Scarborough, have accepted the tender rary and Philosophical Society of Newcastle, Dr. Glover, as secretary of a committee ap-pointed to take steps for the immediate formation of a collegiate institution in this town, stated that the committee had memorialized Sir James Graham on the subject, and that although the answer of Sir James Graham was not favourable to the prayer of the memorial, yet it was not such as to preclude all hope of receiving assistance from Government.-----The Wesleyan Chapel, at Bramley, Yorkshire, has recently been considerably enlarged and improved, and an infant school erected at a cost of upwards of 1,0004. Mr. Simpson, of Leeds, was the architect. — Holy Trinity Church, Hull, is undergoing a complete resto-pation under the superintendence of Messra. ration, under the superintendence of Messrs. Binks. All the contractors are bound to complete their works before the 9th of October. A prospectus has been issued during the past week for the erection of a harbour of refuge in the Downs, between Deal and Sandvich, and close to the branch of the South-Eastern Railway. The proposed capital is 200,000*l*.—.At Huntingdon, workmen have recently been employed in pulling down the Theatre, preparatory to a chapel being erected on the spot. on the spot.

Aew Books.

Compositions from Shakspeare's Tempest. By J. NOEL PATON. Chapman and Hall. 1845.

MR. PATON has already made himself favourably known by a volume of outlines il-lustrative of Shelley's Prometheus (rewarded by the Art-Union of London with an honorary premium),* and a cartoon now exhibiting in Westminster Hall, for which he has been rewarded by the Commissioners of Fine Arts. The compositions before us will not fail to increase his reputation, some of them indeed display extraordinary genius, and lead us to anticipate that their author who is quite a anticipate that their author who is quite a young man, will take a high place in his pro-fession. We would instance more particularly No. 5, "The foul witch, Sycorax," and No. 11, "Caliban musing," which are full of power. With much cordiality, we bid him or on, and prospergo on, and prosper.

A Manual of Writing and Printing Characters, both ancient and modern. By B. P. WILME, Civil Engineer. Weale, Holborn.

This is a very valuable work, and should be purchased by all young engineers, architects, and surveyors. The author asserts no more than the truth when he says, "The ground-work is laid for a system of analysis never before attempted, and which will be found to afford the greatest assistance as well to the teacher as to the learner, from its placing in their hands the correct principles for the practice of the art to be acquired. "The analysis here referred to is that of the

Roman alphabet-upper and lower case, and numerals. A careful examination of the system will enable the most inexperienced to extend the investigation of the subject to all the other alphabets." This Manual commences with an investiga-

tion of the most generally useful letters, viz., those of the round hand, the first hand taught in schools, on account of its great utility in after life. Next in order follow the Roman upper and lower case letters and numerals, in full detail, exhibiting at one view both their analytical or integral parts, and their mechanical construction. Also, the Old English and German text alphabets as adapted to English The architect is furnished with nine use.

* Published by Holloway, Bedford-street,

plates of curious ancient alphabets, with the authorities for each.

Mulhatiser says, in his analysis of his method of teaching writing :--- "Writing is a species of drawing; and, as such, an imitative art. To imitate is natural and delightful to children; the power of imitation is therefore an important agent in education, and ought to be developed and directed. In writing, the child is required to produce an imitation of letters and words, *i. e.* of complex and combined forms, which are subject to a definite order and proportion. To enable the child to do and proportion. To enable the child to do this with ease, the instructor must render the process natural and therefore intelligible. He must dissolve the combination of letters which are called words; and he must resolve complex forms called letters into their simple elementary parts; in other words, the *in-*structor must ANALYZE the objects which the child is to imitate. The next step is also to be taken by the master—he must arrange the elementary forms in the order of their simplicity, i.e. the instructor must CLASSIFY the elementary forms, so that the first efforts of the child may be directed to the imitation of the simplest forms. By this natural process, the child soon becomes familiar with, and enabled to imitate the separate parts of letters; he gains a rational conception of their elementary forms; easily combines them, and writes LETTERS and then WORDS. The child, therefore, proceeds by SYNTHESIS, and constructs the object from the elements furnished by the analysis of the instructor."

The author gives ample directions for con-stucting titles for maps, railway plans, &c., with numerous examples. In writing a title, he observes :--" 1st. We should decide on the size of the

title we would have.

2nd. The number of lines we would have. 3rd. The style of characters to be used. 4th. The model or trial title should be formed, which if it suit not our taste when done, can be altered or amended in writing the title itself.

5th. The spacing or distance between the

lines should be determined on. 6th. Form the lines of writing (in pencil) by putting the centre letter of each line on the centre (perpendicular) line of the title, and working the other letters in the line from the centre to either extremity. Thus we find, by referring to the model title, that the first line contains seven letters, of which the fourth from the commencement will of course be the centre one, and will be placed on the centre centre one, and will be placed on the centre line; N is placed in position, and we next (at the proper space which has been previously determined on) put down A, and at another similar space therefrom we put down L. It now only remains (for that side of the line) to put down P, which is placed at an equal space from L as A was from N. Proceed in a einily monner to work from the contra letter similar manner to work from the centre letter N to the right hand, and when the letters are all properly shaped out with black-lead pencil at equal distances, ink them over; when this is done, the construction lines may be rubbed out, and the title will be complete."

Mr. Wilme's book should be in every office.

LIQUID AIR A MOTIVE POWER. – In our last number we referred to the rival systems, at present dividing public attention, for ap-plying as a motive power, to railway propulsion and other purposes, air in a highly condensed, or in a highly rarified state. We have this week to record another step made in the same direction: — by means of enormous compression a person of the name of Evans, residing in Phidelphia, is said to have succeeded in liquifying atmospheric air, which resumes its original volume with an elastic force quite prodigious, on applying a few drops of some chemical composition. is asserted that a train of twenty loaded waggons was transmitted a distance of sixty miles in less than an hour and a quarter, the whole motive power being the liquid air en closed in a vessel of two gallons and a balf measure, into which fell drop by drop and from minute to minute the chemical composition in question. We should mention that the source of this information is a private letter from Philadelphia published in the Memorial de Rouen, and seems to need the authentic confirmation of the American journals.

Correspondence.

HOLLOWAY CONGREGATIONAL CHAPEL. Sig.—I may perhaps be allowed, in confir-mation of the remarks of "Vigilans," to mention on good authority, that two of the designs sent in were considered preferable to that of Mr. Emmett, but that both were thrown aside ostensibly *in justice to the other parties*, because the estimates did not precisely tally with the sum stated in the advertisement. You will then perhaps be surprised to hear that this notorious committee have actually had the effrontery to accept an estimate (artfully omitted in the first instance), which proves to exceed that amount by only 7001.; viz. 3,200, instead of 2,5001.

This is indeed insulting, but as I suppose they are fully prepared to carry their *protegé* through thick and thin, it is hopeless to expect any redress, and nothing is left to the victimized but the dismal satisfaction of publicly making known such nefarious treatment, and defying the parties implicated to a clear explanation.

I am sorry to learn that at the head of the committee is the minister of the place, who from his station it might have been hoped would have been among the first to see justice dispensed to all, and check rather than (to say the least), connive at the unfair attempts of party influence.

I am, Sir, &c., E B.L.

THE GLASS TRADE.

SIR, — The article upon the glass trade, quoted from the Gardener's Chronicle in your journal of the 16th instant, is a misrepresentation of facts, and we shall feel obliged by your

giving the following observations publicity. The quotation of second quality at gross prices from our listin comparison with foreign glass nett, is unfair, British glass of fourth quality being fully equal to the best sheet yet imported; and, if from our price be deducted large discount we allow, the difference the

does not exceed one farthing per foot. Again, when British glass for horticultural purposes or skylights is made above forty inches in length, our nett charge is only three farthings per foot extra, and not from one penny to three shillings, as erroneously set forth.

The price of foreign glass is for squares not exceeding forty united inches, thus, 20 by 20, 30 by 10, and not forty inches long, as stated, or as we sell British glass 40 by 30, in sheets from 41d. to 51d. per foot, according to the substance required. We are, Sir, &c., CHATER AND HAYWARD.

SEWER IN HENRIETTA-STREET, BRUNSWICK-SQUARE.

SIR,-Having had occasion to pass frequently by the end of Henrictta-street, Brunswick-square, in which a new sewer is being built of the egg shape, the smaller end downwards, of about 2 feet 6 inches by 4 feet, inside measure, I have watched the men at their work, and was to-day much surprised at the mode in which it is being done. It is thus-a number of bricks are put together with cement (I believe in a mould), forming a block of about 18 inches long by 12 inches wide, and 4 inches thick; the blocks are then carried down into the excavation, and placed in it not only to form the bottom, but the sides also; the blocks are bedded solid on each other at the level joints, but at the cross joints they are put together dry, and then pointed up. The crown is made of two rings of brickwork, 4 inches thick in mortar.

Now, I think there are many great objections to this mode of proceeding. If 4-inch brick-work be enough for the bottom, that part being of a quick curve, it certainly is not enough for the sides, they being nearly flat, or very little curved, and must give way if any height of water get between the brickwork and the earth, for then we shall have an hydraulic pres-sure which will force in any brickwork only 4 inches thick, and of a flat curve; or if there be any pressure from any other cause, the sides will give way, and fall into the sewer. More-over, the 4-inch brickwork is built in the worst manner; every brick should be laid by itself, bedded solid on the brick beneath it, and also against the next brick, breaking the joint at every course, and also laid solid against the earth; but by the mode here adopted, we only get the level course solid, and, instead of the upright joint being broken at every course,

there is a straight upright joint to four successive courses, and that not made solid, but merely pointed up. It is all but impossible to lay a block of brickwork 12 inches by 18 inches solid against the earth ; at any rate, in this case a stick may be passed between them almost everywhere. The outside 4-inch ring of the crown has no abutment but the earth, so that the pressure from without is likely to make it run behind the 4-inch springing walls, and throw them into the sewer. Again, why not make the crown of the sewer of 9 inch brickwork, well bonded by bricks or headers, instead of two 4-inch rings, connected by a course of mortar. I believe it is allowed by mechanics, that a 9-inch arch will bear four or five times the pressure that a 4-inch arch will.

It is only right to state that I, being a builder, frequently notice how the sewers are built, I never before (as I can remember) saw less than 9-inch brickwork, even to the bottom or invert, and that in cement and well-bonded together except to some sowers in Camden Town, where the bottoms are but 4-inch in cement.

I hope this is the first and last time of build-I hope this is the first and last time of ound-ing a sewer in this manner, for I think it is very much like wasting the money it will cost, towards which, as a ratepayer, I shall be called upon to contribute.—1 am, Sir, &c., 6, Judd-street, THOS. ELDRIDGE,

August 26, 1845.

Miscellanea.

BELFAST.-Since the commencement of the resent year upwards of 400 houses have been built in Belfast and its suburbs. At the pre-sent moment there is not in the town a machine-maker, iron-founder, boiler-maker, stone-cutter, stonemason, bricklayer, brick-maker, or carpenter, unemployed who is willing or able to work; and yet we are told that the union has annihilated our trade. In 1822 the Belfast carrying trade was disposed of by a single steamer of 50-horse power, plying once a week, and there was no steam communication with any port but Glasgow. Belfast now sends out 26 steamers.—Northern

Whig. THE LEICESTER MONUMENT. — The first to the memory of the late Earl of Leicester, better known as Coke of Norfolk, was laid about a fortnight ago, by Lord Colborne, in the presence of a large number of persons, the architect, Mr. W. J. Donthorne, of London, assisting. The monument, as most of our readers know, the design having been both exhibited and engraved, will be a well-proportioned column with agricultural emblems.

THE ASSOCIATION OF ARCHITECTURAL DRAUGHTSMEN.—The works of members of this association will be exhibited to the public at their rooms in Southampton-street, Strand, during the whole of next week. We are during the whole of next week. anxious to draw attention to this society as offering facility of communication between principals desiring assistance and those competent and willing to afford it, which must prove valuable.

COMPETITION GOVERNMENT OIL IN PAINTING.—A notice has been issued by command of the Fine Arts Commission, to the effect, that the competition in oil painting, which was to have taken place in June, 1846, is postponed till June, 1847.

SNOKY CHIMNEYS .- Mr. Hope's chimney. doctor's bill, for his new hotel in the Rue St. Dominique, exceeds 5,000*l*., as we learn from an action just brought by the said chimney-doctor, M. Ducel.—Paris Paper.

For the execution of Works on the Leods and Thicak Railway.

For the excettion of several lengths of Earthworks on the Aberdeen Railway. There are 5 separate Contracts, varying in lengths from 31 miles to 44 miles.

For the supply of 70,000 Larch, Oak, or Fir Sleepers, and Fencing for 501 miles, or any part thereof, for the Ipswich and Bury St. Edmund's Railway Company.

For the erection of a Wesleyan Proprietary College at Taunton.

For the execution of the works on the Nottingham and Lincoln Railway, in two parts; 1 from Nottingham to Newark, being a distance of 174 miles. 2 from Newark to Lincola, being a distance of 153 miles.

For Lighting a portion of St. John's district, Notting-hill, with Gas. For Paving and Relaying the Footways and Pava. ing or Macadamising and Relaying the Carriagely way in Somers-town, St. Paneras, for the tarm of three years.

For supplying the Aberdesa Railway Company, with Scotch Fir Sleepers. For supplying the Dundee and Perth Railway Company with 50,000 Scotch Fir Sleepers.

For supplying the York and North Midland Railway Company with 2,000 Tons of Chairs. For executing that portion of the Dundee and

Perth Railway, commencing at Dundee and ending at Kingoodie, being about five miles 350 yards in length. For supplying her Majesty's several Dockyards

with Cast-iron Articles for twelve months certain. For supplying 300 Sets of Wheels, Axles, and Guard Irons to the Great Southern and Western Railway (Ireland).

making a Cylindrical Sewer in the town of Cambridge. The length will be about 48 yards, and the average depth about 12 feet.

For the execution of the whole works of the first For the execution of the whole works of the mrss ten miles of the Howick branch of the Edin-burgh and Hawick Railway. For Raising Mud in the Ship-basin of the Re-gent's Canal Company, for a term of three years. For the execution of that portion of the Cum-nock Branch of the Glasgow, Paisley, Kilmarnock, and the Bailmar situate how and the company and

and Ayr Railway, situate between Loch Brown and Auchinleck, being about 7 miles in length.

For 500 Tons of Cast-Iron Socket Pipes with bends, branches, syphons, &c., for the Com-mercial Gas Light and Coke Company, Stepney. For the construction of the Gas Works at

Wells, Norfolk, and all necessary apparatus. For the construction of Three Reservoirs for the Waterworks Company : also, of Stone Blackburn

Culverts for conveying the water a distance of about 23 miles. The earthwork will amount to about 180,000 cubic yards.

For paving and repairing certain Carriage and Footways in the parishes of St. Margaret and: St. John the Evangelist, Westminster. For supplying the East-India Company with

British Iron, &c. For the erection of an Infirmary at the Lambeth

Workhouse. For the execution of works on the Manchester

South Junction and Altringham Railway, in two parts : 1, being a distance of $1\frac{1}{2}$ mile; 2, being a distance of $7\frac{3}{4}$ miles.

For the execution of Works on the Manchester For the execution of Works on the Manchester and Birmingham Railway in 2 parts. 1. The Ashton Branch, being a distance of about 44 miles. 2. The Macclesfield branch, being a distance of about 30 chains, including a tunnel of 330 yards in length.

For the execution of that portion of the Edin-burgh and Northern Railway, extending from Burntialand Pier to Kinghorn.

For supplying the Trent Valley Railway Com-any with about 200,000 sleepers of good sound any with Baltic timber.

For erecting sundry Workshops for Engine and Carriage Repairs at the Brighton Station of the London and Brighton Railway.

For supplying the Clydesdale Junction Railway Company with about 2,500 Tons of Rails, and about 600 Tons of Chairs.

about 600 Tons of Chairs. For supplying the Leeds and Thirsk Railway Company with 100,000 Railway Sleepers. For the execution of works on the East Lanca-shire Railway, viz., the Accrington Contract, being a distance of about 8 miles. For the execution of the nortion of the New-

For the execution of that portion of the New-castle and Berwick Railway, extending from Netherton to Tweedmouth, being a distance of about 53 miles. To be let in four contracts.

For the execution of works on the Leeds, Dews

ror the execution of works on the Leeds, Dews-bury, and Manchester Railway, viz., the Churwell Contract, being a distance of about 24 miles. For supplying the Wakefield, Pontefract, and Goole Railway Company with about 7,000 tons of Malleable Iron Rails, and 2,000 tons of chairs.

COMPETITIONS.

The Committee for the establishment of Public Parks, Walks, &c., at Manchester, offer two prizes, one of 50 guineas and the other of 25 guineas, for the best and second best set of Plans (with estimates), for the laying out, &c., of the sites already purchased by them.

The Board of Guardians of the Bridlington Union offer a premium of 10*l*, for a Plan and Specification of a Workhouse, the expense of which is not to exorkhouse, the expense of which is not to exceed 2,000/., and to accommodate 150 inmates.

APPROACHING SALES OF WOOD, &c. BY TENDER.

In the Plantations of the Duke of Montrose, situate in the Parishes of Drymen and Buchanan, Stirlingshire : many Thousands of Larch Trees of some size, adapted for Railway Sleepers, Roof

A Quantity of Old Wrought and Cast Iron, in store, at the Royal Arsenal at Woolwich.

ADVERTISEMENTS.

NOTICE TO INVENTORS. OFFICE FOR PATENTS OF INVEN-TIONS and REGISTRATIONS of DESIGNS, 14, and every information upon the subject of PROTECTION for INVENTIONS, either by Letters Patent or the Design Acte, may be had by applying personally, or by letter, pre-paid, to Mr. ALEXANDER PRINCE, at the office, 14, Lincoln's-inn-fields.

PATENT OFFICE, 5, CHANCERY-LANE, NEAR FLEET-STREET.

IN VENTORS requiring protection by LETTERS PATENT should apply direct to the PATENT OFFICE, as above, where Patents can be speedily procured for the United Kingdom, &c., and by which a great saving of expense will be effected. CAVEATS are en-tered at this office, fee 11. 1s. DESIGNS of all kinds are BEGISTERED. Apply at the PATENT OFFICE, 5, Chancery-lane, near Fleet-street.

PRIZES IMPORTANT TO INVENTORS AND PATENTEES. A GOLD MEDAL, value 1007. and a SILVER MEDAL, value 507. will be given by Mr. M. JOSCELIN COOKE. The Gold medal for the best Patent, and the Silver medal for the best Design taken out or Registered at the OFFICE for PATENTS and DE-SIGNS, 20, Half-Moon-street, between the 1st of Novem-ber, 1844, and the 1st of June, 1846. The Prizes will be awarded by competent judges on the 10th June, 1846. The evaluation of the obtaining Patents in England or Foreign Countries, or Registering Designs, will be forwarded gratis, on application to Mr. M. JOSCELIN COOKE, at the Office for Patents and Registration of Designs, 20, Half-Moon-street, Piccadilly, London.

Moon-street, Piccadilly, London. ROYAL ADELAIDE GALLERY, Low-ther Arcade, Strand. — ATMOSPHEBIC RAIL-WAY daily, with a Lecture, at Two and at Half-past Eight. A series of Lectures, with Illustrations, on the manners and customs of the Ancient Egyptians, by Mr. E. Clarkson, every Monday Evening. Mr. Russell's Lectures on Cha-racter, with Musical Illustrations, every Tuesday, Thurs-day, and Saturday Evenings. Les Reunions Magiques, on Wednesday and Friday. Lecture on Science, Daily, in-cluding Major Beniowski's Artificial Memory; Beale's Ro-tatory Steam-engine, &c. Every Evening a grand Pro-mental and vocal. On Wednesday and Friday Evenings, a series of Lectures on "The Manners and Customs of New Zealand," by PAHE-A-RANGE, the New Zealand Chief.

A MAGNIFICENT, EXTENSIVE, and UNIQUE COLLECTION of TROPICAL PRUITS, modelled by Mons. Grimaud during his long Besidence in the late of France, is just deposited at the ROYAL POLY-TECHNIC INSTITUTION. The ATMOSPHERIC RAILWAY is lectured upon by Professor Bachhofmer, and exhibited Daily, and in the Evenings. A NEW AME-RICAN INVENTION, COLEMAN'S PATENT LOCO-MOTIVE ENGINE for ascending and descending inclined planes on Railways without the sid of stationary power. SWIMINIG and DIVING ILLUSTRATED by the Son of Capt. Stevens, the celebrated teacher of Swimming, on Mondays, Wedneadays, and Fridays, at Troo o'Clock, and on the Evenings of Tuesdays and Thursdays, at half-past Eight o'clock. joints, whist Acene's Cement is into over a surface. The high polish and marble-like hardness of which this Cement is susceptible render it the most suitable material or the manufacture of Scagliola. Patentees, J. B. WHITE & SONS, Millbank-street, Westminster, Manufacturers of Roman and Portland

Cement. Depòt in Liverpool, 36, Secl-street ; James Woods, Agent.

O ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MER-CHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL.

CHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL. JOHNS and CO.'S PATENT STUCCO CEMENT.-The following are the positive advantages possessed by this Invention over every Cement hitherto in-troduced :-It will effectually resist Damp. It will never ergetate nor turn green, nor otherwise discolour. It will never crack, blister, nor peel off. It will form a complete Stone casing to any Building covered with it. It is co closely resembles Stone that it is impossible to detect it. It never requires either to be painted or coloured. It will keep fresh and good in the cask in any Climate for any number of years. It is the only Cement that can be depended upon for export. It is the only Cement that can be used with confidence by the Sea-side. It may be used in the hottest or coldest Climates at any scason. It will adhere to any substance, even to Wood, Iron, or Glass. It will carry a larger Proportion of Sand than any other Cement. It matures by age, and be-comes perfect when other Cements begin to periah. It may be worked through the Winter, as froat has no effect upon it. It may be used on the Inner Walls of new Houses, which may be papered over or painted directly. Roofs laid or pointed with this Cement will remain undamaged by the severest Storms. Any Plasterer may apply it, the Instru-tions for use being very clear and distinct. The first cost of this material does not exceed that of the cheapeet Cement now in use; but with all the above-named extraordinary and valuable advantages, nothing can approach it in point of economy. Architects and Builders who have used this Cement have

Architects and Builders who have used this Cement have declared that it requires only to be known, to be universally

Architects and Bunder and the first property of the universally preferred. Specimens may be seen, and a Prospectus fully describing the Cement and its mode of application, together with a volume of Testimonials from every part of the Kingdom, may be obtained on application to MANN and CO., SOLK AGENTS for the Patentees, 5, Maiden-lane, Queen-street, Cheapside, London: of whom also may be had. JOHNS and CO.'S PATENT STONE-COLOUR STUCCO PAINT, expressly intended for Painting over ex-terior Walls of Houses that have been covered with Homan or other Cements, and which have beene dirty and disco-loured. It is in every way better suited for this purpose than White Lead Paint, which will frequently come off in flakes, being in direct chemical opposition with Cement; whereas MESSRS. JOHNS and CO.'S PATENT PAINT having an affinity for Stucco, binds itself with it, stopping the auction, thereby rendering the wall proof against weather, and in the finish producing a pure stone-like efficiency, and in the finish producing a pure stone-like splication, ---and may be used by any Painter, in any climate, even in the most exposed Marine situations.

SATURDAY, SEPTEMBER 6, 1845.

R N July last we referred to ment which prevailed on the subject of railways, the gambling carried on, and its probable conse-

quences: we mentioned some of the newest schemes before the public, and referred to the singular change in opinion which had taken place since the time when the towns were striving to keep the rail as far from them as possible, and spent large sums of money to injure themselves.

At the moment we wrote the mania for speculation in railway shares seemed almost universal, and might have been thought at its highest. Since then, however, it has increased in a fearful manner, and, at the present moment, possesses the whole mind of thousands. It is madness, and nothing short of it. Shares in projects to which an Act was refused for reasons which will exist when the application is again made, find purchasers at a premium; scrip, which could be bought yesterday for one pound, commands to-day three, although its circumstances remain precisely the same, and men talk of having made twenty, thirty, and forty thousand pounds by what seems a very safe and simple operation, namely, subscribing for shares at par, waiting a few days, until an adventitious value was given them by the prevailing desire to buy shares, selling them, and pocketting the difference.*

It is, perhaps, hardly our province to comment on these proceedings; our more legitimate business is the construction of railways, the design and arrangement of stations; but observing the extent of the prevailing mania and well assured of its injurious tendency, we cannot avoid earnestly conjuring our readers to resist the desire to gamble infused by example, and to seek to raise their condition by continuous industry, and the exercise of their abilities, rather than a lucky stroke of fortune.

It is hardly necessary to say, our remarks apply simply to buying shares to sell again. (speculating on a rise), and not to the legitimate investment of capital in railways. The extension of the railway system is in no way to be deprecated, but, on the contrary, to be assisted to the utmost consistent with the national resources, as by means of this, the general prosperity will unquestionably be advanced. At present the advantages of the system are but partially developed; every line which is brought into work will make them more palpable.

The Westminster Review for the current month contains an able article on the allengrossing topic, and brings forward some original and striking notions. After combatting the unwise system of high charges, the reviewer remarks :-

"The true value and uses of railways has not yet dawned on men's minds. They are the future streets of the coming time, when horse and foot transit shall be nearly extinct; when the conquest of time and space, by steam or other power, shall have made intercommunication perfect between every farm, village, town, and manufactory throughout the island; when the industrious races, no longer driven away by high or uncertain rates of transit, shall people the whole borders of the lines; when farms and manufactories shall work in unison, and contribute to increased results; when the most improved labour among processes shall be applied to the production of food as well as

BUILDER.

THE

other articles. This principle is obvious, and may be thus Interpretendent in the second but in being the medium of communication with numerous wealthy buildings on either Take away the buildings, and the street side. would become a comparatively insignificant road. And these houses have been built road. because there exists facilities for the supply of water, fuel, and provisions. Take up the water-pipes, and break up the road, the result would at no distant period be analogous to one of ' Sultan Mahmoud's ruined villages.

Crowded cities have been a result of slow and expensive transit, and therefore highways, on the old system, have not become lines of farms, factories, and dwellings. But for this, water-pipes would have been laid throughout. With the advent of railways the difficulty ceases, and towns may expand, for ten miles of railway are but as three miles of omnibus. Our railways will become streets of detached buildings, factories, dwellings, and farms, so soon as their uses shall be rightly appreciated; that the petty profits of distant transit shall merge and be overwhelmed in the huge gain to be wrought out from the land which bounds them; that the suicidal process of high fares shall be abandoned, which, like heavy turnpike tolls, deter the public from their territories."

Stationary engines, when not required for the line, should be used, it is urged, to carry on improved farming operations, independent of times and seasons, and with the minimum of human drudgery. " In all farm cultivation, as in factories, transit is one of the most costly items. No farms laid out on the ordinary plans, with mere highway transit, could compete with farms laid out along a line of railway, any more than a factory with distant cartage could compete with one situated on a canal or railway, and ultimately, when the uses of railways are thoroughly apprehended, all new farms and factories will be located thereon; and in self-defence, the existing farm and factory owners must construct railways along their roads and streets. Where the mountain cannot come to Mahomet, Mahomet must go to the mountain ! Upon this principle we feel assured that ere long the system will commence of laying down lines of rails along all the borders of highways, communicating with the various farms.

A stationary engine should be as much the central moving power-the nucleus of a farm -as of a factory. No factory of any magnitude is now constructed without an engine, and the factory is the centre of a neighbourhood of greater or less extent. Supposing a railway to be constructed through a line of factories, the engine power of those factories might be used for the purpose of atmospheric traction during meal times, exhausting a receiver for that purpose. And thus in farm districts the power need only be applied to road purposes when required, using it for farm purposes at all other times."

Viewing the Epsom line as the first of the atmospherics, the reviewer selects that as the seene of operations, and shews how he would proceed :-

"We would procure a well or underground tank to be made to receive the liquid contents of the sewers, either of Croydon or of the Deptford marsh. By stationary engine power we could force this sewer water through a line of pipes along the course of the railway to the next stationary engine, used for working the line, in the neighbourhood of which land fit

for agricultural purposes could be found. W would then, by means of the engine power would then, by means of the engine power, force the sewer water up a stand pipe precisely similar to the mode used by the water compa-nies for high service. Having secured, on lease or otherwise, a sufficient extent of ground proportioned to the supply of sewer water, we would apply it to the land in the mode thus described in Martin's 'Thames Embankment

and Metropolis Improvement Plans,' p. 17. 'The consideration which I have so long given to this most important subject, leads me here to propose a system of distributing the manure, which appears to me to be greatly superior in economy and efficiency to the foregoing, or to any at present in use :-- it is to going, or to any at present in use :—it is to spply the well-known principle of *fluids find-ing their level*—thus to convey the sewage in its most fluid state, by means of pipes, from the principal receptacle or great sewers, and to then pump it up into a small receptacle or hydraulic tower of sufficient elevation, from which a pipe should descend and he laid down which a pipe should descend, and be laid down into the centre of the tract to be manured. cock and strong caoutchouc cloth hose, with one or more small branches, should be attached to the extremity of the pipe, and a swivel cock placed at the junction of the branches to allow of their being easily moved round; by these means, each hose being guided by a man, the manure could be turned on, and projected in every direction in the same way as the firemen discharge water upon a fire; and, without moving the main hose, a space of three miles in circumference could be manured with only one half-mile of iron pipe, the same hose serving to manure the whole tract, and be then

readily transported to another locality." The value of this system may be under-stood from the fact that land in the neighbourhood of Edinburgh has risen in value from 2*l*. to 20*l*., 30*l*., and 40*l*. per acre, as meadow land, by the simple application of sewer water, by which means four and five annual crops of grass are obtained.* One cause of the value of this Edinburgh land is its proximity to the city. But land border-ing a railway is, if the railway be rightfully applied, equally available at ten miles distance as ordinary land at one.

To this same station we would lay down main of water-pipes from the most eligible supply along the whole course of the line; and we would also lay down a main of gaspipes.

At the station, we would inclose on the cheapest plan of an ordinary railway terminus, from two to four acres of land in a square form, with brick walls, say 20 feet high. The roof to be in spans of 50 to 60 feet, formed of iron, and supported on iron columns. The whole of this we would cover in with hailwhole of this we would cover in with pan-proof glass, a process that will be ultimately cheaper than slating, and far more durable. In Belgium, we believe, at this time glass for

<text>

^{*} In France the mania is as strong as in England, and occupies the thoughts of all. In Austria, it appears, no new lines will be authorized till 1850, when all lines already com-menced are to be completed.

green-house purposes is sold at the rate of green-house purposes is sold at the rate of ten shillings per hundred superficial feet, weighing fourteen ounces to the foot. We are much mistaken if the two railway mag-mates who have just established a glass-work fn Sunderland will not produce it cheaper than this.

Around the outer wall we would crect dwellings of two floors, leaving four gateways into the inner square. The exuvize from these dwellings would be carried by pipes to a common receptacle to be applied to the purposes of manure, so chemically prepared on the plans of Liebig as to neutralize all odour. The number of dwellings surrounding an in-closure of four acres would be about eighty. Assuming four grown persons for each, the exurise would be equivalent to manure the heavy corn crops of one hundred and sixty acres of ground, and be worth 300% per annum or more.

The internal building or green-house would thus be very cheaply attained. The external walls would be gratuitous, as being part of the houses, and the central columns would the interview of the gratuation of the gratuation of the second would re-

use nouses, and the central columns would serve as rain conduits; the ground would re-quire no paving or laying, and the only real cost would be the roof. The application of this large green-house would be for the production of vegetables in the winter time. Four acres thus inclosed and sheltered would be multiplied in value many fold. Produced on the very verge of the railway, the crops could be gathered and the railway, the crops could be gathered and delivered direct into the markets of the city within an hour of cutting. At other periods the external land could be applied to the same purposes.

or all these arrangements the steam-engine would be a most valuable adjunct. The waste steam would warm the green-house and the dwellings, and would serve the purposes of cookery, either in a general kitchen or sepa-rately. The condensation water would supply rately. The condensation water would supply baths, and thus be rendered available for ir-rigation purposes. It would serve also for washing clothes, and the steam would serve for drying them."

This is with a view to towns-people with small incomes; for the rich he goes further:

"On a healthy spot, say Epsom Downs, we would erect a similar glazed inclosure as a winter garden and walk for the inhabitants of surrounding villas. If the neighbourhood in-creased, a school and a lecture-room, a library, and newhone a theter bound be added to the and perhaps a theatre, should be added to the establishment; but in all cases a steam-engine or steam-engines should be the sources for warming, ventilation, and baths. We can imagine that all the luxuries procurable at the country houses of the wealthiest landholders might thus be achieved at a moderate cost. With large neighbourhoods even Chatsworth might be eclipsed. With double glass roofs a very small quantity of fuel would suffice to warm a conservatory of very large size.

It must be obvious that on such a plan the It must be obvious that on such a plan the whole road would rapidly become a system of detached buildings; for the facility of obtain-ing water and fuel at every point would re-move all obstacles. It would be worth the while of the inhabitants to pay an annual rate to the road makers, and throw it open to all dwallars on the line dwellers on the line.

If our views be correct, the time will come when railways will be made for the purpose of miles of land will be intersected with a railway throughout the whole country. If this be so, where is the wisdom of the men who are expending money in millions merely to oppose fancied rivals? Where is the use of crushing an opponent at ten miles' distance, when two or three other lines are sure to intervene subsequently? If we cast our eyes over the map, we cannot resist the conviction that every mile of highway will ultimately be replaced by two miles of railway. We cannot but laugh at the opposition to the London and York by the London and Birmingham, while perhaps at the very time a new line is in contemplation between both. As the conviction grows that the railway is not the mine—that the land is the true mine—and the railway is but the access to the mine, this sort of absurd opposi-tion will diminish and disappear."

The article ends with a proposition which will be ridiculed by many and deemed chi-

merical by most, but nevertheless is worthy of consideration.

"Unless a succession of bad harvests intervene to check prosperity, the year 1850 will behold the extinction of horses as a moving power in England, for the purposes of pe-cuniary gain in the public transport of pas-sengers and goods. Every new street, every village, every farm will have its railway, and village, every farm will have its railway, and stationary power will have become so com-mon in its numerous applications, that it will be turned on and off for the purposes of haulage as easily as gas jets for the purpose of lighting. And the modes of its application will be manifold. Beyond the mere purposes of traction, there are other important problems to work out. There is an important process to be achieved in English agriculture, which seems not yet to have entered into the imagination of any of our improvers. The reason seems to be that our chemists are not mechanicians, nor are our mechanicians che-mists; but be it as it may, we have never yet seen the matter proposed, and possibly may run the risk of being deemed mere visionary enthusiasts for propounding it. Yet_in_sober earnestness we propose-

To convey artificial heat beneath the earth, on open land, so as to maintain the tempera-ture suited to the growth and development of the vegetable tribes, by means of pipes of metal or earthenware; circulating steam, or hot water, or air, from a close boiler or stove. These pipes to be laid at depths of from 4 to 5 feet, in the manner of deep draining. Also, by a similar process, to inject the ground with gaseous manure, as ammonia and carbon, so that the heat and gases may be constantly as-cending towards the surface, and thus be ab-sorbed by the roots of the plants."

We may look for great things in the next twenty years.

JOTTINGS ABOUT BAILWAYS.

ANY iron wheel may be made to travel almost noiselessly along a railway, it is said, by inclosing its two sides with boarding or thin metallic sheeting, so as to confine a quantity of sawdust in immediate contact with its spokes; sawdust being anti-vibratory will effectually prevent the wheel vibrating, thus enabling it to roll without noise. All who are interested in lessening the noise of railway wheels, should make this easy method as pubwheels, should make this easy method as puo-lic as possible, so that railway directors may be urged to adopt a plan so inexpensive, effi-cacious, and desirable.—An ingenious plan for rendering the electric telegraph valuable as a means for indicating the precise position of a railway train upon different parts of the line, was lately submitted to the Academy of Sciences in Paris, by M. Dujardin, the inventor. He proposes, that as a locomotive passes by certain places, it shall touch a spring in connection with the wire, and then communicate with the index of the station by certain signs previously agreed on.——A project has just been made public having for its object the effecting a telegraphic communication, by means of electricity, between London and all means of electricity, between London and all the principal towns in England, and also between the principal large commercial towns. To carry out the project, it is proposed to establish a company, and to raise a capital of 500,0002.—In a recent number we gave an account of a method of obtaining vacuum for atmospheric relevant by the direct acc an account of a method of obtaining vacuum for atmospheric railways by the direct ac-tion of steam, and gave credit to Mr. Nas-myth for the invention. It appears, however, that he was anticipated by Mr. Robert Mallet, Mem. Inst. C. E., who minutely described the Arem. Inst. C. E., who minutely described the process in a recent number of "Weale's Quarterly Papers on Engineering," and who claims the credit of being "the first inventor." ——A series of private experiments has lately been made on the London and Croydon Rail-way, for the purpose of testing the powers of atmospheric propulsion. The question as fo the power of ascending inclines has been com-pletely set at rest. A train was brought to the pletely set at rest. A train was brought to the foot of an incline o fone in fifty, and stopped so as to deprive it of any power it might have acquired from the impetus of its previous progression. It was then propelled by the atmosphere up the incline, and that which many of our most eminent engineers have declared impossible was accomplished with the

greatest ease imaginable. Among other results that have been obtained, we may mention that five miles length of tube has been exhausted in its whole extent, and that the piston has traversed the entire length of the tube The death of Lord Canterbury, by apoplexy, in a railway carriage, has given occasion to a surmise that railway travelling conduces to that disease. Dr. Badeley, of Brighton, having fully investigated the subject, asserts that the surmise is wholly groundless. He says :-- "If surmise is wholly groundless. He says :- " If a calculation were made of the number of persons who have travelled by railway during the year, and the number of deaths from apoplexy that have occurred during the journey, I think that the question of cause and effect would at once be settled. Let the guards and the engineers be included in the calculation-men who are every day and all day engaged in their locomotive duty; has any single instance of apoplexy occurred in the whole corps? I have inquired of them whether their occupation has ever induced any affection simulating or threatening the disease in ques-tion, but I have, without exception been an-swered in the negative."—A novelty, in the form of a railway without steam or fire, presents itself in the proposed line from Callao to Lima, in Peru. The ground has a gradual and un-broken rise the whole way. Above Lima flows the river Rimac, which passes through a part of the city in its way to the sea near Callao. This river, though not navigable, affords at all seasons of the year a hundred times the water power necessary to work any traffic that can possibly come upon the rail. The saving of the usual expense of fuel is thus effected; and the cost of the steam-engines, and, what is no small item in railway expenditure, the charges for their after management are entirely avoided. — The Duke of Cleveland has issued the strictest orders to all his tenants and servants, on no account to allow any railway engineer to make a survey through any part of his property, by giving all who attempt to do so notice to desist; and if this is disregarded, commencing immediately an action for trespass against them. Two parties of surveyors in the neighbourhood of Barnard Castle have lately been repulsed. Watchers are posted night and day on the look out. Sapient duke !

ļ

STEREOCHROMY.

A NEW METHOD OF ARCHITECTUBAL PAINTING -BY DR. FUCHS AND PROFESSOR SCHLOTTHAUER IN MUNICH.

EXPERIMENTS which have been carried or in this respect for the last two years, in the Bavarian capital, have reached that point , where it may safely be said, "The thing is done." The first subject, however, to be broached is, that the new method of painting bears no analogy to the Pompeian, either in principle, far less in its technical part; and that it is something quite original and new. On account of its thorough novely and ori-ginalty, it would be wrong to consider it merely as a substitute, and we are sure that the more known, the more it will be applied EXPERIMENTS which have been carried or the more known, the more it will be applied to those purposes for which painting al fresco has been hitherto used. The distinctive characteristics of this new method, from all other sorts of painting hitherto practised, are its great durability and indestructibility-re-sulting from the particular chemical composi-tion and preparation of colours, and the method of using them. Under these circumstances, it is very probable, that it will outdo all ot her methods of architectural painting, and become a common property of civilized nations.

This new technicism has appeared under a new name—as Dr. Fuchs (Ober-Bergrath to new name—as Dr. Fuchs (Ober-Bergraff to the king of Bavaria) has thought, that the ap-pellation of stereochromy would be the best adapted to is peculiar features. Still, it is a truly national, German discovery, resulting from that all-sided development of art, which has been concomitant in Bavaria with an improvement in all branches of artistic mechanism, nay even the handicraft $\sim P^{ern-}$ tions of the action. What has been det are in ne in tions of the artisan. What has been day ne me that country for the casting of metals, me painting, and encaustic, may even for the metals chanism of the different sorts of lithog and galvanoplastic, is the best proof activity, which, in the present instance, have yielded a great result. The want of pliable and constant means of

pictorial representation (colours), has been felt in all ages, especially by those, who, like the practical artist, were most suffering by this deficiency. It is known to every such, how much this has been the case in monumental or architectural painting, which did not only afford no adequate means for ex-pressing the ideas of the artist, but subjected his creations to the everyday's influence and destruction of the elements. The usual *fresco* could not suffice the great masters; the inade-quacy of colours, and the limited scope of technical execution, did not allow of the execution of masterpieces, where a rich display of groups and vast perspective were to be achieved—in fact, the colorit could never be worked out to a natural and harmonic ensemble, still less where the more worldly disensence, still less where the more worldly dis-play of glaring colours was contemplated. Thus, several erroneous and noxious expedients were resorted to. In the *stanzas* of Raphael, we find corrections and after-work made obviously with *other* materials than those of *fresco* painting; and it is known, moreover, [that this great man had made preparations to paint the Hall of Constan-tine in oil — in imitation of *Schastian del* imitation of Sebastian tine in oil—in Piombo, who had resorted to the same in his Leonardo da Vinci had mural paintings. Leonardo da Vinci had used a sort of varnish-painting in his celebrated "Last Supper," and thus surrendered an incomparable masterpiece to precocious de-struction; and finally the frescos of the *Caraccis* and their pupils wouldn't have so much suffered, if they had not combined the simple method of fresco with the use of glue and a la tempera colours, for accomplishing a better colorit. It could not but happen, that in Munich, where similar pursuits were carried on of late, similar views and trials were resorted Mural paintings of the most diversified to. kind-the most stern and the most serene and lively--were to be executed; and it was natural, that the *fresco*, whose mild and quiet hue corresponded so well with the still and reserved character of the new historical, or rather religious school of painting, was found inadequate to these various exigencies. Many trials were, discover some new tech therefore, made to nicism, especially for mural puinting, which should possess the undeniable advantages of fresco, without partaking of its defects. To those manifold endeavours, which grew out from the increase of artistic tendencies, and the higher claims of the constantly varying character of art-we are indebted for the introduction of the new encaustic method of Mr. Montabert, detailed in his *Traité complet de la peinture*, as well as that of the deserving method of encaustic painting of Mr. Fernbach. To these experiments for discovering a new procedure of fresco painting, exhibiting a more natural and effectful colorit — Stereochromy owes its origin, at least in its incipient stages. A chemical discovery made by Dr. Fuchs (councillor of mines to the king), served to put in practice a series of thoughts, and ideas, and experiments, which Professor Schlotthauer had followed up for years, and it was proved again, how important it was that "science and art, theory and practice, should go hand-inhand," and also how much it required to ac-complish new things in art and its technics! While, in this instance, both talents, scientific, technical, practical, and artistic, were put into requisition — results were, indeed, achieved greater than they were, at first, contemplated ; as there is every reason to believe that this new method will be also adapted for painting on canvas.

The painting is done by colours chemically prepared for this purpose, and, moreover, on a coat materially analogous with them; which combines, in paintings on canvas, into a thin integument, with which it becomes saturated; in mural paintings on stone or mortar, it is used as a coat of only a few lines thickness, which, however, unites even with the hardest substratum into a mechanically inseparable mass. The picture executed sterochromatically on this coat, is fixed (after its completion) in a very particular way—so much so that, after this operation has taken place, colours, coat

• This procedure has been used with the best success in the execution of the large historical pictures in the Imperial Halls (Kaiser-Sillen) of the royal residence of Munich, by Mr. de Schnorr: and the description of the hitherto secret will shortly appear in a detailed description in the literaryartistic publishing Bureau of that city, as Mr. Fernbach has received the king's permission for so doing. His secret had not been hitherto known, but to the Committee of the Royal Academy of Arts.

and stone (or other substratum) present an intimately connected whole. It is, therefore, here not the case, as it is in al fresco painting, or even encaustic, that a defined, easily to be separated stratum of colour is formed; on the contrary, the very colours are converted, by the all-combining substance, into a rigid, nay petrified mass. In this intense combination with the stone or mortar, the colours become capable of even resisting pretty strong mechanical contact or force. We may pass with pretty sharp or pointed tools over the picture, —nay strike them with a hammer, without injuring or exfoliating the colour; and as to any endeavours of rabbing them off, there is no possibility of so doing. In a similar vigorous way, they resist chemical influence.

For testing these qualities, stereochromic paintings have been subjected to the most severe trials, which they have stood with astonishing success. It was resolved, to bring those elementary agencies which destroy pictures, as air and light, wet, heat and cold, and even acids, to bear upon them in forms more strong than they occur in the usual course of time. Stereochromic tablets, were therefore, exposed to the various effects of sun and rain; but they remained unchanged. A comparative experiment of these tablets, one al fresco and the other stereochromisedpainted on the same kind of sandstone, and the usual coating of mortar, were exposed to the severest test of the last rigid winter, and placed during the months of February and March, nearly for eight weeks in the frost, snow, and fog, and moreover water was thrown upon them, which converted them into a mass In this state, they were suddenly into heated rooms. After these exof ice. brought into heated rooms. periments, the tablets exhibited a most dif-ferent aspect. The fresco painting, although done in the most approved method, had experienced, especially in the parts representing carnation, the most complete destruction; whole parts became exfoliated, and the coat of mortar so softened, as to separate from the stone. The stereochromic painting, on the other hand, remained such as it had issued from the atelier of the artist, and the coat of mortar, formed (as well after as before the experiment) the same compact mass, combined with the stone. His majesty the king, who had seen the tablets as exhibited to the roughest weather, was much gratified at the results of this new discovery, which, according to royal command, has to be first employed on a large scale in the decoration of the outer walls of the Pompeian House, near Aschaffenburg. The durability of stereochromy has also stood the test of acids, which may be of importance, inasmuch as rain, especially that fallen during thunderstorms, contains nitric -it is true in small quantities; still large acidenough to produce some effect during the lapse of time. Acids, half diluted with water, will not affect perceptibly stereochromic pictures, while they produce on fresco paintings effervescence and immediate destruction.

With these rare qualities, perfectly resisting the ordinary effects of the elements, it is easy to be conceived what important advantages will be obtained for the ornamenting of outer walls with colour—advantages still greater, if we come to consider, that the layers of mortar required for the reception of stereochromic colour assumes, when dry, the hardness of marble; and we may not appear too sanguine in expecting, that this discovery will be pregnant with important advantages for the whole range of architectural pursuits, and, sooner or later, obtain general approbation.

We have to say, in conclusion, a few words on the artistic and technical character of the new discovery. The external appearance of these paintings is similar to that of fresco. Stereochromy possesses the same advantages as the latter, especially valuable for mural painting, viz. its great clearness, and the same lucid tones of the scale of colours; but, besides this, a greater force and depth, in which fresco is deficient. Stereochromy ranges over a greater extent of colours, and as those are capable of further mixture, it possesses more tints and shades than fresco, which is altogether to be compared to an instrument of a very limited range of tones. These were advantages appreciated by Mr. Cornelius, when, at his last stay at Munich, he saw the pattern tablets. To this is yet to be added, thut the stereochromically prepared colours will dry

uniformly and without any extraneous lustre whereby the ultimate effect of a picture can be calculated during its process, with a great degree of certainty, which is not the case with fresco. The process of painting itself is very easy and handy—much more so than in any any other branch of pictorial art; it proceeds nimbly and slake, and the colour flows full and liquid from out the brush. As the ground is laid on over all, at once, and not piecemeal, and does not require but to be wetted at each time of operation, it will not be the case here (as it is with fresco painting), that if one be unable to finish a certain piece in the course of one day, he be obliged to have it obliterated, and to begin the whole afresh. The painting may be interrupted and resumed at pleasure, at any place desired; and it is also possible to go over the whole signin after it has been once completed, for bringing all into due unison imparting the most delicate melting and smoothing together to the whole.

And thus stereochromy may expect to be received confidently within the pale of existing methods of painting, the more so, as it does not attempt to out-elbow any thing existing, but to supply the artist with a new, beauteous, and handy method of mind's-manifestationmaking its products almost indestructible, handing the *worthy* down to remotest posterity. --(From German Sources.) J. L---y.

EARLY DOMESTIC BUILDINGS,

At the literary institution of Frome, in Somerset, a number of lectures have been recently delivered by the gentlemen of the neighbourhood. In one on the "Feudal System," by Mr. Charles Bayly, of that place, the lecturer made the following remarks. "The science of architecture in France and

England before the thirteenth century almost exclusively confined to ecclesiastical and castellated buildings. Indeed, the style of domestic architecture was so mean, that we feel surprised at the slight attention previously paid to it, and that no attempt was made to imitate the comfortable and luxurious domiciles of the Romans. The English houses were built chiefly of clay, held together by wooden frames. But amidst this neglect, there was introduced an invention which has produced great comfort, and which has contributed much to the refinement of modern domestic society. I allude to the invention of chimneys, which the architectural skill of the Greeks and Romans did not, I believe, accomplish; the ancients having allowed the smoke of their fires to escape through an aperture in the roof. This ingenious and useful discovery did not come into general use in England until the fifteenth or sixteenth century; and even now is seldom seen in the cottages of the poor in Ireland, or in those of the Highlanders in Scot-land. The art of making glass, which was known to the Romans, and most probably practised by them in England, was lost soon after their departure. It seems strange to us, that the English, the Saxons, the Danes, and the Normans, should have submitted to the inconvenience of open windows in their houses for seven or eight centuries. Indeed, we are too apt to be misled in our estimate of the comforts of those times. The romances and ballads of the twelfth and thirteenth centuries would lead us to suppose that the spacious halls, the banquetting rooms, and chambers, they tell of, were more magnificent than those now in use; but if we could lift up the veil of departed years, we should see bare walls, without wainscot or even plaster, with the exception of some great houses which were furnished with hangings; and the greater part of these buildings had open windows, so small in size as to admit little light, but sufficiently large to allow the wind to sweep through them. But if domestic architecture was neglected, it is with the more astonishment we look back on the splendid ecclesiastical and castellated buildings which, at the same time, arose throughout Europe, and which I have before alluded to."

To elucidate this subject at greater length, we have put together a number of extracts from Mr. Bernan's interesting and valuable work on the history of warming and ventilating buildings, already referred to in our pages.⁴

> • Published by Bell, Fleet-street. Digitized by Google

"In the Anglo-Norman period small regard was paid to the habitations of the commonalty, which in London, the mother city of the kingdom, were, Stowe says, not more than sixteen feet high, poorly built of wood, and ill covered in with reeds and straw, with a hearth in the middle of the floor, and a smoke hole in the roof over it. Carpets were unknown, except as bedclothes or table-covers; and spreading straw and leaves on the floors formed part of straw and leaves on the noors formed part of the rough magnificence of the times. The practice was general. Pegge thinks it was adopted for coolness; and Nichols, with rea-son, adds for warmth also.* In the winter season the feet could be covered with the straw, and they required protection at all times from the cold damp floors of bare earth and stone in the hall and kitchen. The beds of the meaner sort were spread on the litter, and in great houses it served the purpose of a chair. Thomas à Becket, when chancellor to Henry II., according to Fitzstephen, was 'man-ful in his household, and had his hall strewed every day in the winter with fresh straw or hay, and in the summer with rushes and green leaves fresh gathered ; for which the whimsical reason is given, that such knights as the benches could not contain, might not dirty their fine clothes when they set on the floor.

From the contiguity and construction of the houses, accidental fires had been such cruel scourges of the Londoners, that, under Rich-ard I., a law was passed, that in future all houses in the city should be built to a certain height of stone, and covered with slate and burned tiles ; 1 and after the fire that destroyed the greater part of Oxford in 1190, the burgh-ers, following the example of the Londoners also began to construct their houses of stone and in those quarters where the poor people were unable to be at the expense of this im-provement, a high stone wall was raised be-tween every four or more houses.§

It has been observed, that the practice of trewing the floors was universal; and it seems to have extended into the apartments of the kings themselves. William, son of William of Aylesbury, held lands from Edward I. on con-dition of providing straw for strewing the king's chamber in winter, and herbs in summer. Glass windows, that in the time of William the Red were a mark of great luxury and magnificence, when placed in a church or palace, begin now to be seen in the houses of persons who affected Chaucer, who from his tastes and propensities may be considered one of the 'perfect gentle-men' of his time, says in his Dreme, that in his bed-room.

' with glas Were all the windowes well yglazed ;'

and kept in such good order as to be ' Full clore, with nat an hole yerased ;'

and moreover so beautifully painted,

That to behold it was great joy;

For holly all the story of Troy Was in the glaising ywrought.'

It may also be noticed that the windows were moveable; for he further tells us that when he was reposing, the

> Windowes weren shut echone, And through the glas the sunne shone '[]

upon his bed. The manner of hanging and fastening these windows is described by a co-temporary romancer. When the Squyr of Lowe Degre poured out the serrows of his disconsolate love for the king of Bohemia's daughter, from which it is clear that the window she opened was framed and fastened like the casement in a modera cottage. Returning to the poet's bed-room for a few illustrations, it is found that as well as the windows,

'All the wals with colours fine Were paint both text and glose;'

† Brand. Popular Antiq. vol. i, p. 241.
‡ Stow. Survey of London, p. 73, ed. Thoms. The dwellings of the Scots were either very mean or extremely inconvenient. The bishop, noble, and king lived in small stone castles, perched on some precipitous rock, with massive walls enclosing narrow stilled apartments, that had no chimneys, and loopholes for windows. The cottages were slight crections of wood, without hearth, chimney, or window, and their towns were a collection of such hovels. The use of wood in building had been so general, that castles were built with it. Several of these combustible strongholds, helonging to the Celtic chiefs in Moray, were burned in the rebellion of Gilliessop.—Chalmers's "Caledonia," vol. i, p. 172, I Works, fol. 229. Edit, 1602.

which shews that the wall must have been plastered with some care before it could receive a painting, rough as it might be, and, therefore, without the chinks that let the wind into the Saxon palaces. Arras or tapestry was also hung on walls, of which that ornamenting the hall in Warwick Custle in 1344 was a superb specimen. It should, however, be borne in mind, that it was most likely seen only in regal palaces, or in houses rivalling palaces in their furniture and in the presumption of the owner.

Amidst all this laudable attention to warmth in nocturnal climate, no mention whatever has been made of any means of heating the dormitory; and there does not seem to have been any except a pan of charcoal. A notion may now be had of the comfort enjoyed in the houses of persons of rank. The spacious lofty hall, left open to the roof, had its windows placed high from the floor, and filled with oiled linen or louver boards, or occasionally with painted glass. Its clumsy unframed doors were opened by latches; and when the walls were not coarsely painted in the fashion of the time, they were left rough, and covered with arras suspended by hooks at a distance of three or four inches from the wall. The floor of stone or earth had a part at one end raised a little above the general level, and laid with planks. On this platform or dais stood a mas-sive table and ponderous benches or forms, and a high-backed seat for the master under a canopy. On the hearth, in the middle of the hall, were placed the andirons for supporting the ends of the brands, that were arranged by means of a heavy two-pronged fork, the type and predecessor of the modern poker. On the roof over the hearth was a turret or louver, filled with boards arranged so as to exclude rain and wind, and permit the escape of smoke; and this was sometimes an object of considerable architectural beauty in the external aspect of the building.

The chamber, like the hall, was lofty, and lighted with tall narrow windows filled with oiled linen or glass, with a part made to open like a casement, and screened with a curtain; it had neither a hearth nor a flue.

The country houses of inferior landholders and farmers were generally one story high. If they were built with two stories, the roof was so deep as to reach to the ceiling of the lower room. The hall and kitchen forming one apartment, and roughly plastered, was open to the timbers of the roof, and sometimes had a louver, and a window that could be closed with a shutter. 'Barre we the gates, Cheke we and cheyne we and eche chine stoppe

That no light leopen yn at lover ne at loupe.

When these houses had a room to sleep in, old and young reposed in the same apartment, and several in one bed; servants made their beds on the floor in the kitchen. Cottages had neither louver nor loupe, and their inmates lay round the fire.

The chimneyed chamber was spacious and lofty, and usually formed with a large bay window, looking into the court of the castle. It adjoined the hall, and was used on ceremonious occasions as a reception-room for the guests before they were ushered into the hall of entertainment, and to which they retired on leaving it. At other times this privy, or presence-chamber served, according to the poet, as a dining-room. Anotherspartment, distinguished as our lady's bower or parlour, and appropriated to the exclusive use of the dames, was that in which they received their visitors, passed their time, and often took their family meals in. The windows of this also opened into the dismal quadrangle, for all were obliged to sacrifice their feelings and enjoyment to security.

The stronghold of Conway is remarkable for exhibiting another domestic refinement, not found, except at Kenilworth, in any cotemporary building. A hearth is recessed into the wall, and has a flue rising from it for the passage of the smoke into the air. It is true, that after this period, flued fireplaces were some-times made in rooms that had been erected without them, but the chimney in Conway Castle, and a similar one at Kenilworth, appear as if they had formed part of the original edifices.

Castles and mansions were now built of stone, but wood and plaster continuing to be the materials of ordinary houses, in towns destructive fires were common, and the custom

of strewing the floors with straw must have greatly increased the danger. Chaucer says-

> 'Whan a chambre a fire is, or a hall, More nede is sodainly to rescowe. Than to disputen, and ask among us all, Howe the candel in the strawe is fal.

1

This frequency of accident, more particularly in London, had led to the enactment of some judicious municipal regulations. The magis-trates, says the Chronicle of London, quoted by Strutt, 'are empowered to enqyre if there be any house in the ward that is tiled without other thing than tile or lead, and there be any chemeni that hath a reerdos made uncomli, cnement that hath a reerdos made uncomli, otherwise than it ought to be.' And also if any baker or brewer heat their ovens or other '(furnace) with strawe or reyde or other things that might cause peril of fire.' Every ward was also to have 'a reach with the line.' was also to have 'a racke with two long cheypes of yrne and two ladders,' and every house was to have a 'tub of water ready for peril of fire.' The scavengers' oath of office was, that they should examine that all 'chemys, reedossys, and furnessys be made of stone for defent of fire.'* But notwithstanding these precautions, the history of London and of other towns shew a lamentable disregard to the lessons of dire experience in every thing connected with the

protection of buildings from fire. The chimney has been considered an Italian invention. But if Winwall House be an Anglo-Invention. But If Winwall House bean Anglo-Norman edifice, its chimneys must have been built in the twelfth century; and those in the castles at Kenilworth and Conway will also long precede, in point of antiquity, the camini and fumajudi of Padua and Venice. The fourth example of a chimney in an English building is that described by Leland, in his 'Itinerary,' where he gives an account of his visit to Bolton Castle. This building, he says, 'standethe on a roke syde; and all the substaunce of the lodgynge in it be included in 4 principall toures. It was finiched or Kynge Richard the 2 dyed! One thynge I muche notyd in the hawle of Bolton, how chimeneys were conveyed by tunnels made on the syds of the walls betwyrt the lights in the hawle, and by this means, and by no covers is the smoke of the harthe in the hawle wonder strangely conveyed.'† It has been seen that, previous to the erection of this stronghold, the word chimeney is of frequent occurrence. Chaucer in several places speaks of chambers with chimeneys; Longlande, we have seen, also employs it: and Wiclif, in his translation of the New Testament, in 1330, has the expression, ' thei schulen send him into the chymeney of fier.' In the poetical vocabulary, 'chimerey' appears to be synonymous with 'fire-place,' or 'hearth recess;' and the verbal equivalent to the word in the reformer's Testament is 'furnace.' Leland, who wrote a century after, in using the word almost defines it. The chimeneys were conveyed by tunnels; or, in other words, the fire-place was continued by a tunnel to the top of the building; a de-scription that will accurately fix the meaning of the word when found in writers previous t the Tudor period; for it is quite obvious the chimneys in common use, and with which Leland was acquainted, had no tunnels to convey the smoke from the hearth-otherwise bis ad-miration of those in Bolton Castle would have been unexplainable. His observation, that the smoke from the hearth was not conveyed by covers,' also shews that at the time he was writing, covers were common appendages to fire-places for conveying smoke.

It was, perhaps, from a desire to diminish the risk of accidents by fire that the custom prevailed of laying the floors with a coating of prevailed of laying the floors with a coating of cement made of lime, and pounded rubbish, or pebbles. The floors in the upper rooms in the old part of the Abbey House, at Waltham, built by Sir Edward Denny, were overcast, or paved in this manner, with a coarse plaster of sand and pebbles, forming a crust about an inch thick, coloured deep red like a bright brick floor, and similar to the rude rough-cast or stucco floors seen in some parts of Lincoln and Yorkshire. ; Glass was rare in the windows of gentlemen's houses before the time of Henry VIII.§ Copyholders and poor people had none. The windows belonging to Con-

1

tarini, a rich Italian merchant residing in Botolph, were reckoned valuable moveable furniture. And in the riots at Oxford, in 1502, the glass windows were carried away as rich booty by the rioters.• In London, about 1510, Sir Thomas More, in his 'Utopia,' says, that they keep the wind out of their houses with glass, for it is there much used, and some also with very fine linen dipped in oil or amber; and that for two commodities, for by this means more light cometh in, and the wind is better kept out. In religious houses it was common. Alnwick Castle, in Northumberland, when the earl removed to another house, the glazed sashes were taken out of the window fi rames, and laid carefully by, in case they should be broken by the winds or other accidents, until 'my lord' again visited his mansion. How wind and rain were excluded after their the removal does not appear.

At the close of the reign of Henry VIII., domestic convenience and comfort had made a little progress. The rooms in the bouses of the upper classes were built capacious and lightsome, and the ceilings were often plastered, or formed of boards. Halls, and parlours, and the chief sleeping chambers, were, as in bygone times, hung with tapestry; or they were lined in a manner recently introduced, with boards of a foreign kind of oak, called wainscot. In houses of the inferior gentry and wealthy trades-men, parlours and the best bed-rooms were hung with arras, or with a kind of painted or sized cloth, made in imitation of it. Stamped hung or painted leather imported from Flanders was also latterly introduced as a wall lining. doors were clumsily made and fitted, but well hinged, for Sir Thomas More says those of London would follow the least drawing of a finger: locks were rare, and internal doors opened with a latch and string. Boarded floors in halls and parlours were becoming common.t Rushes and straw, however, still covered and polluted their surface.

RECENT AWARD UNDER METROPOLITAN BUILDINGS ACT.

THE following award involves a question of considerable importance : the papers came into our hands too late to allow us to offer any observations upon them in the present number, but we may return to the subject on another occasion.

On the 16th of June last Mr. Pownall, district surveyor, gave notice to Messrs. Mans-field and Co., builders, " that the works now in progress at the house situate in Lincoln'sinn-fields, No. 54, are not conformable to the statute in the portions thereof under men-tioned," and required them within forty-eight tioned," and required them within forty-eight hours from the date thereof to amend the same.

Irregularities referred to :-

The rebuilding a portion of the above-men-tioned house, consisting of two fronts of such The party wall between Nos. 53 and house. 54 having timbers running through it; and the party division between Nos. 54 and 55 being a ti nber partition.

Mansfield's reply to the information Measure was as follows :-

"As to the party structure situate between Nos. 54 and 55, we submit that such structure runs from east to west, and that the fronts thereof being at right angles thereto and running north and south have neither been taken down or rebuilt, or in any way touched, and therefore that the 33rd section in no way and incretore that the 33rd section in no way applies; that the building at present erecting is an attached building to No. 54, Lincoln's-inn-fields, situate in Duke-street, more than 17 feet from the party structure, and at direct right angles, and consequently at oppo-

site angles to the party structure. Inasmuch as the building owners of the south party wall between Nos. 53 and 54 have not required a survey, and the party structure is not so defective or so far out of repair as to render it necessary to pull down and rebuild the same, we consider that the district surveyor has no power to survey the wall under the 25th section."

After numerous hearings, the following award was made :---

* A'Wood. Hist. of Oxford, vol. i. p. 659. † In Samlisbury Hallitis curious to observe that the upper floors are massive planks, which, instead of crossing, lis parallel to the joists, as if dischaining to be indebted to them for support. — Whitaker, Whalley.

Office of Metropolitan Buildings, 3. Trafalgar-square.

In the matter of the reference by way of infor-mation of Mr. George Pownall, District Surveyor, against Mesars. James and George Mansfield, Builders.

With regard to the party-wall dividing and between the houses numbered, and situate and being No. 53 and No. 54, Lincoln's-Inn Fields, and with regard to the party-partition dividing and between the houses numbered, situate and being No. 54 and No. 55, Lincoln's Inn Fields, the said premises respectively being within the district of St. Giles's-in-the-Fields and St. George's, Bloomsbury, and within the limits of the Metropolitan Buildings Act, 7 & 8 Vict., cap. 84. We, the Official Referees of Metropolitan

Buildings, duly appointed in pursuance of the said Act, having received information from Mr. George Pownall, the surveyor of the said district by virtue of the said Act, that Messrs. James and George Mansfield, of Little James-James and George Mansneld, of Little James-street, Gray's-Inn Lane, builders, had not amended certain alleged irregularities, men-tioned in the Notice of Irregularity hereto annexed, and having on the 19th day of July, 1845, and again by adjournment on the 31st day of July, 1845, duly heard the said George Pownall and the said James and George Mansfield, and their agents in that behalf, at one of which hearings the said George Pownall proved the due service of the said notice on the said Messre. James and George Mansfield, and the inspection of the work after the expiration of the said notice, and the failure of the parties to amend the same; --Do hereby determine and award, with re-

spect to the party-wall first above mentioned, that if the said wall be made as nearly as may be practicable in conformity with the provisions of the said Act, relating to the construction and materials of party-walls, by stopping up all openings therein, and by removing there-from such timber and wood-work now lying in or running through the said wall, as is not by the said Act allowed to be laid or placed in the substance of party-walls, and by making good the said wall, such party-wall may re-main, and need not be pulled down or rebuilt, nor need an external wall be built against such party-wall.

And with respect to the said party-partition, inasmuch as the portions of the back front of the said house No. 54, which have been taken down and rebuilt, do not adjoin the said party-

partition, we make no direction thereon. And with regard to the costs and expenses attending this proceeding, we, the said Official Referees, do hereby further award :---

First; As to the fees and expenses of the office of metropolitan buildings, that on or before the 23rd day of August, instant, the sum of 144. 3s. 11d. be paid to the Registrar of Metropolitan Buildings at the said office, No. 3, Trafalgar-square, London, and that such sum be so paid in the first instance by the said James and George Mansfield and the said George Pownall, or by either of them; and that if such sum be paid by the said George Pownall, he shall be entitled to claim and be repaid the same by the said James and George Mansfield.

Secondly; As to the costs and expenses of the said George Pownall as such surveyor as aforesaid, that on or before the said 23rd day of August, instant, the said James and George Mansfield do pay to the said George Pownall the sum of 51. 5s., at his office, at No. 14, Upper King-street, Holborn, in the said district.

In witness whereof we, the said Official Referees, have to this our award, on three pages of foolscap paper, set our hands this 15th day of August, 1845. JAMES W. HIGGINS, WILLIAM HOSKING.

ARTIFICIAL STONE .- We learn from the Athenæum, that an architect at Augsburgh, Herr Alois Steiermann, has invented an artificial stone which for solidity is said to surpass the best free-stone, is one-third its cost, and to which any form can be given in the manufacture. It is composed of river-sand, clay, and a cement whose composition is the inventor's secret. It has been submitted to the proof of air, pressure, and fire, and resists The king of Bavaria has given his them all. gold medal of civil merit to Herr Steiermann, for this useful invention.

STAINED GLASS WINDOW IN ST. JAMES'S CHURCH.

MR. EDITOR, with regret as an amateur of the fine arts, I have read the unhappy conclusion to which the committee of taste have come, as touching the stained-glass window in St. James's church, Piccadilly.

Are we ever in this country to get out of trammels as regard architecture and the fine arts?

Thus, some writers designate Gothic architecture as *Christian* architecture, and decry all churches built in the Grecian, Roman, or all churches built in the Grecian, Italian style as Paganism. As if devotion was not congenial with the splendid churches of Germany, St. Paul's in London, or St. Peter's, Whilst others declare that because at Rome. Greece and Rome had no stained glass in ancient time, so putting stained glass in a Grecian or Italian built church must be anathematized as bad taste ; ideas, in my humble opinion, nothing better than vapouring puerilities, to which no man who has a relish for art ought for a single moment to lend an ear.

The love of antiquarianism at the present day approaches monomania. Not only are church windows glazed without subjects to interest the mind or heart, but to tabernacke work and grim figures in niches are also sometimes added affected corrosions of the stains of time !!! a true smack of what was formerly called " The Smell-fungus School."

What may a true love of art in matters pictorial be termed, but a zest for the de-lineation of nature in its highest, truest, and most perfect state, whether it be in animated subjects or still-life? The rest is mere con-ventionality. Window glass, of all colours, when it comes from the furnace is diaphan ous, and if objects in nature are described upon it, architecture, animal, or vegetable life, its real beauty consists in the truth of what it intends to describe, not in a dirty obscurity. But the windows of the smell-fungus school

must often excite a smile of pity. Cherubim like monkeys, bishops like mummies, and saints like chimney-sweepers with their faces and robes as dirty as if they had been up the chimney. How different the taste and execu-tion of stained-glass in the churches of Munich !!! But we are in trammels. Westminster Hall is forbidden ground to the splendid artists of the schools of Hesse and of Cornelius.

The protective system, as regards art, is still maintained by Sir Robert Peel in all its intensity. Our youthful aspirants of the pencil are not allowed to profit by a view of what a foreign school can do; and foreign talent and foreign genius are by Sir Robert put into the same category with the threads and tapes of foreign manufacture-what an Augustan age!

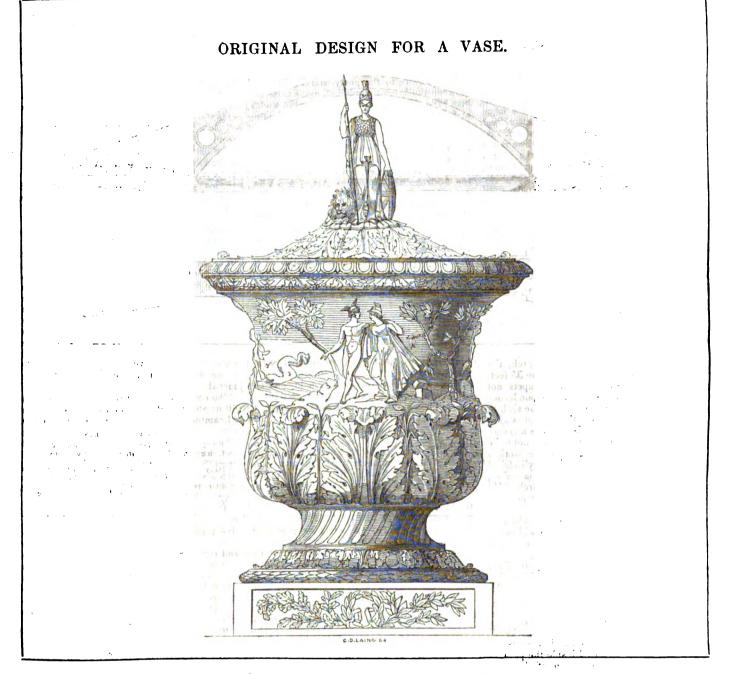

The poor artist, fettered by the res angusta domi, can know nothing of foreign power and execution, and is thus left to fancy that art can be perfectionized intuitively. The authorities of Hamburg want to build a splendid church; they do not call confining art to their own people "patriotism," but, like true lovers of genius, invite competition from all nations, and England gains the wreath.

The Prince de Joinville offers to sailors of all nations 1,500 france as a prize for rowing a six-oar sea boat-the sailors from Ports-

mouth row, and gain the wreath. Is England alone to consider talent and genuss as necessarily circumscribed to the place of its birth? Whatever the Government may do, the people, I feel assured, repudiate such narrow-minded ideas, and I trust the day is fast arriving when our "powers that be" will no longer tell Talent and Genius that their Genius is the common property of the world, and ought in all branches to find in England an affectionate welcome.

I am, Sir, &c., W. MASON. Neiton. P.S. Though not of "the smell-fungus school" I beg no one will impute to me a dis-taste to the Gothic. I passionately admire art and architecture in "all" its varieties.

CONSUMING OF SMOKE.-The Government has appointed Mr. Faraday and Professor Playfair to ascertain how far it is possible to consume the smoke from steam engine chimneys.

ORIGINAL DESIGN FOR A VASE.

THE vase represented by our engraving was designed and modelled at the School of Design designed and modelled at the School of Design by Mr. W. J. Wills, modeller, of 16, Cum-ming-street, North, Pentonville, and obtained a premium at the last distribution of prizes. On the body of the vase the Thames is allegorized, Commerce and Mercury, the god of merchandize, appear in the foreground; sur-mounting the whole is the figure of Britannia.

The engraving is one-seventh of the real size of the vase : the whole height is 3 feet 6 inches.

DECORATIONS OF THE NEW HOUSE OF LORDS.

SIR,—As it appears by an article in the last number of "THK BUILDER," as well as in notices contained of late in other periodicals, that a misconception prevails as to the nature of my employment in the works of the new palace at Westminster, I think it incumbent on me, in justice to Mr. Barry, to state that I am engaged by him, and by him alone, with the approval of the Government, to assist in preparing working drawings and models from his designs of all the wood carvings and other details of the internal decorations; and to procure models and drawings of the best examples of ancient decorative art of the proper kind, wherever they are to be found, as specimens for the guidance of the work-men in respect of the taste and feeling to be imitated; to engage with artists, and the most skilful workmen that can be procured in every branch of decorative art, and to superintend personally the practical execution of the works upon the most comomical terms

compatible with the nature of it, and its most perfect performance. In fulfilling the duties of my office, I do not do any thing whatever on my own responsibility; all models and working drawings being prepared from Mr. Barry's designs, and submitted to him for his saproval or alteration previous to their being carried into effect; in fine, my occupation is simply to assist in carrying out practically Mr. Barry's own designs and views in all respects.

Trusting to your fairness in giving insertion to this letter in your next number, I am, Sir, &c., A. WELBY PUGIN. London, Sept. 3rd, 1845.

SIR,—Replying to the observations contained in your last number "On English Decorators and the New House of Lords," I can state distinctly, that not one single foreigner is, or has been engaged upon the decorations of the New House of Lords; that after receiving the sketches from Mr. Barry, I have drawn them out full size with my own hands, and have entirely directed the execution of them under Mr. Barry's immediate instructions and control. I hope you will give insertion to this plain statement of facts in your next number. l am, Sir, &c, JOHN G. CRACE.

Wigmore-street, Sept. 2nd.

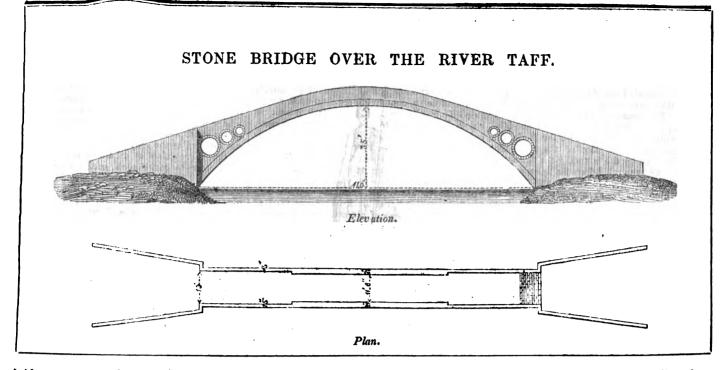

STONE BRIDGE OVER THE RIVER TAFF GLAMORGANSHIRE.

GLAMORGANSHIRE. PONT-Y-PRIDD (the bridge of the East-house), or the Newbridge, is an extraordinary piece of masonry, consisting of a single arch thrown across the river Taif. It is situated about halfway between Merthyr Tydfil and Cardiff, on the turnpike-road leading from the Merthyr and Cardiff turnpike-road to the

Taff Vale Railway Station and Llantrissant, and forms a conspicuous object in the beauti-ful vale of the Taff, which, being a favoured county, possesses unusual facilities of transit, namely, a good turnpike-road, a canal, and locomotive railway, running immediately parallel to each other.

Thescenery contiguous is of a rich and roman-tic character; the confluence of the Tuff and Rhonodn Vawr, the amphitheatre of hills, the bold and strpendous bridge, the luxuriance of the hanging woods, the projecting masses of rock, with the foaming and tortuous course of the river Taff, alongside which the railway winds its course, all may be seen at once, presenting a gorgeous and magnificent spectacle, more particularly if viewed from the eminence to the soath-west of the village on the road to Llantrissant. The architect and builder of the bridge was William Edwards, son of a farmer of the parish of Eglwysillan, in the County of Glamorgan, where he was born in the year 1719. Having a natural genius for masonry, he was observed to excel in that art, and has left many interesting specimens of his works, exclusive of the one above alluded to, in various parts of South Wales. In the year In the year 1746 he undertook to build a bridge over the river Taif, consisting of three arches, but owing to the uncommon rapidity of the current of this river when swollen by long and heavy rain (to which it is frequently liable from its rain (to which it is frequently hade from its contiguity to the Brecknock Beacons, whence it takes its rise), the bridge was soon after its erection swept away. He had given ample security for its stability for seven years (a stipulation which it is customary to make in all contracts for public works in South Wales), and he proceeded on his duty in erecting ano-ther with all possible speed. The second

THE BUILDER.

bridge was proposed to be of one arch, the span or chord 140 feet, its versed sine 35 feet. The arch was finished, but the parapets not erected, when the pressure of the ponderous weight over the haunches caused the arch to spring up in the middle, and the keystones were forced out. This second failure was a severe blow, but the spirit of Edwards was not to be disconcerted, and he engaged in the work a disconcerted, and he engaged in the work a third time, when, by means of three cylindrical openings through the work over the haunches, he reduced the weight upon the arch. He also added to the thickness of the parapet wall at the crown of the arch, and reduced it to its smallest possible limit over the haunches, as shewn on the plan, in order to throw additional weight on the former, and to lessen the weight on the latter. The bridge was completed in the year 1750;

previous to Edwards entering upon his task a third time, he, I believe, consulted the celebrated Smeaton, and, acting I have no doubt under his advice, adopted the expedients above stated. In the year 1798, the bridge underwent some extensive repairs at the hands of Edward David and Thomas Evans, as appears from a tablet inserted inside the parapet wall of the bridge at the crown of the arch. The arch, which is of 140 feet span, is a segment of a circle, its radius being 90 feet, and the proportions the various parts of this bridge bear to each other are as follows:— The rise or versed sine to span one-fourth, depth of the keystone to the span of the arch one forty-seventh. The latter is re-markable as being less in proportion than most bridges of modern construction. The masonry is of that description usually de-nominated rubble, and the stone of which it is composed is the level bedded and shelly sand and limestone of the country. At the time this bridge was erected, it was considered a great triumph of genius and skill, and is even now thought to be an extraordinary pears from a tablet inserted inside the parapet

and is even now thought to be an extraordinary piece of masonry to be accomplished by an uneducated and self-taught architect and masons; still I think if the works had to be masons; still I think if the works had to be performed in the present day, a much more convenient structure might be erected, viz. one of less altitude. The ascent to, and de-scent from the crown of the arch of this bridge is exceedingly steep and inconvenient, so much so, that if carriages with heavy weights pass over it, the descent cannot be accomplished with safety without the use of the drag (a square frame of timber with a long chain attached to it) which is kept there for that purpose: this is weighted and the chain fastened to the carriage at the summit, and as fastened to the carriage at the summit, and as the carriage descends the one side, the drag, which acts as a counterbalance weight, as-cends to the summit on the other. This opecends to the summit on the other. In sope-ration has to be repeated for every carriage that passes over this bridge. The danger of passing this bridge is considerably augmented, in consequence of the roadway being pitched, which renders it difficult for horses to obtain a good foothold. B. B. Brecon and Merthyr Tydfil.

DESIGN FOR SMALL FARM BUILDINGS. | HAVING been requested on more than one

occasion, to supply a plan for small and inex-pensive farm-buildings, we avail ourselves of the following communication :---

Sig.,—From solicitations of friends to the allotment system, I have been induced to forward you a design for a cottage with small farm buildings (containing in the area 500 square yards of land, including the fold yard) of simple construction, in brick-work, without any expenditure in external decoration.

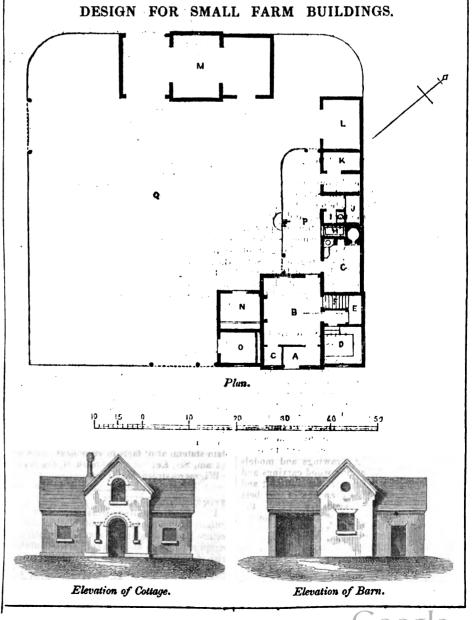

If you should approve of it, you will confer a favour by giving it a place in your valuable journal.

The cost for the erection of the building I am, Sir, &c. An Architect. will be about 2001.

COURSE OF STUDY IN THE SCHOOL OF DESIGN.

-Were I not fully confident that in-SIR. calculable good will result from the matter which has hitherto appeared, and I hope will still appear, in the columns of your truly valuable journal, I should be very sparing of my remarks upon the all-important subject of design. Your correspondent's letter of the aesign. 1 our correspondent's letter of the 25th ult., inserted in your journal of the 30th, contains most painful matter on the deplorable and most inefficient state of the "drawing school," called by the council "the School of Design;" and though I have no knowledge of the author (Mr. R. Burchett), yet from his letter, which has every appearance of truth, and the fair spirit therein evinced, I cannot help giving credence to it until I see it disproved. If then Mr. Burchett's statement is true, what is the council about? or what sort of informed minds on artistic matters must the majority of the members of this council have to allow such a destructive state of artistical education to take place? Surely they cannot be aware of the amount of evil that must accrue to the students' faculties for the arts, and which will be sure to take place if they are to be subjected to such an un-artistical school as this so-called "School of Design" is stated to be. Those members of the council who have shewn by their works that they possess a thorough knowledge of design, should immediately investigate this painful subject, and put their shoulders to the wheel to extricate their weighty burden from its clogging difficulty, that the students may have justice done to their faculties for the arts. should be the first step taken by those This members who are strongly gifted with the varied talents of design, in order to the establishing of a sound system of artistic instruction which shall be the most effectual for training the youthful mind up to every variety of true

design. If this "School of Design" is not a school of design, the pupils have been most unjustly treated, for by their own shewing they have had a loss of three years inflicted upon them in the very prime of their life, and to young men who depend upon employment for their existence, and to obtain which without the necessary qualifications would be next to an impossibility, this is most serious ; such a severity as that with which they have been visited must be painful to the greatest degree to those who depend upon their labours for their support. If, as I have said before, the pupils' statements are true, then let the members of the council look into this matter, and devise a remedy for a reparation of the injury inflicted on those pupils who have been made to suffer, and see for the future that sound instruction be imparted throughout the whole range of design, that those of our youth who intend to enter the profession of designers be made as perfect as possible. In fact, the council should no longer believe that its own "branches of instruction," as stated in its prospectus, will accomplish any thing of the kind they suppose they will do. Such half or quarter measures will do more mischief than good, therefore the sooner the council applies its wisdom to a remodelling of their "branches," and adds a much greater extension of knowledge, the better ; that those who wish to learn may have real knowledge imparted to them. It is most extraordinary that the council could not see when they drew up their prospectus that the meagre "branches of instruction" therein stated were quite in-adequate for the purpose intended; and the smallness of the amount of instruction appears to have been imitated by the head master of the establishment, as he is made to say by Mr. Burchett, "I have prepared myself and delivered a little lecture upon them.

This surely must be a mistake upon the part of Mr. Burchett, for no head master of an artistic institution could have delivered any thing so small as a *little* lecture upon so important a subject, or would have caused the students to waste their time upon a *little* lecture, when his duty would have been to have entered deeply into the merits and demerits of the examples which were purchased for the benefit of the students. Now, as this is what a director would be sure to do for the enlightenment of his pupils, there must have been, I think, some mistake in this part of the affair. And, indeed, the black-board part is so very dark, that I cannot comprehend

how any mind should be so unenlightened as not to thank Mr. Herbert for so wise and salutary a suggestion as the black-board, it being the readiest article of communication upon all forms which the instructor is bound to convey to his pupils. I can safely say from my own experience, that it would be utterly impossible to convey information upon design or individual forms without a black-board. In teaching drawings to please papas and mamas. the black-board is very little used; but in this matter the papas and mamas are to blame; they care very little about their children's faculties for the arts being duly cultivated. Their children bring home some pretty pencil copies of lithographic prints, and the parents are satisfied. But if the black-board was used at the commencement of all artistic instruction, in all schools as well as colleges, we should have a much more enlightened set of scholars in this country than we have. But it is not yet the order of these days, though somer or later to the black-board we must come. As much as we may painfully feel the dismissal of a highly talented artist, Mr. Herbert, for suggesting the use of a black-board, neverthethe council will ere long see the necessity of adopting Mr. Herbert's suggestion, though it appears they dismissed him for proposing it. This is, indeed, a state of things much to be deplored, as the students' designing talents are held in abeyance, to their serious loss and the nation's injury. This is certainly not very wise legislation.

As the faculties for the arts make up a most important part of the human mind, and as legislators make laws for the benefit of mankind, I would most humbly beg to advise all who intend to enter the legislatorial field, to have their faculties for the arts legitimately exercised, in order to obtain a thorough understanding of all the bearings which appertain to a sound system of artistic instruction; they would then see that those faculties ought to have their due exercise as well as all the others, and they would then legislate accordingly. Had this been previously done, we should not have such a prospectus of a "Government School of such a prospectus of a "Government Genomer Design" as we have now before us. The heading or arrangement of the classes is quite sufficient to shew that design could never spring from such puerility—"elementary and spring from such puerility—" elementary and outline drawing," to begin with, then "shading from the flat," "shading from casts," "drawing from the round," and "painting from the round," and such like. Any one would suppose that this collection of flat and round elementaries were for the pretty little dears of the suburban boarding schools. How the council could have sanctioned such unmeaning expressions to explain so grand a purpose, is inconceivable. However, we will look forward to a thorough reform, and which we trust will be set about in right earnest, when we shall have a real school of design, such a one as will be worthy of this nation, and to which its youth are justly entitled .- I am, Sir, &c., GEO. R. LEWIS.

Upper Norton-street, Aug. 30th, 1845.

BATHS AND WASHHOUSES.— There will be in the St. Pancras establishment about thirty single baths, fitted up in separate rooms, with all necessary conveniences, six vapour baths, and two plunging baths of large dimensions. The washing department will be quite distinct from the baths, and suitable accommodation is to be provided. The prices will be 1d. for a private cold bath, containing sixty gallons of water; and 2d. for a warm bath containing the same quantity. The establishment in Glasshouse-street, East Smithfield, for enabling the poor in that vicinity to use gratuitously an apparatus for bathing, and for washing and drying of clothes, is in full operation. The esgeness with which its benefits were availed of, far surpassed anticipation; 987 persons having used it in the short space of nineteen evenings.

PARISH CHURCHES. — Messrs. Brandon, authors of "The Analysis of Gothic Architecture," have announced a work consisting of perspective views and plans of parish churches, with descriptive letter-press. They propose to select such churches as from their beauty of design and peculiar fitness, seem worthy of being adopted as models by those who are engaged in church building.

ON EXTERNAL APPLICATION OF FORMS TO THE DISCHARGING OUTLETS OF BUILDINGS, AS THE MEANS OF EFFECTING VENTILATION.

In remarking upon the subject of ventilation In remarking upon the subject of ventilation by the application of any outward formation, much has to be taken into consideration, to which, in the majority of propositions, little or no regard has been paid. It is apparent, that where one particular form or combination of forms is proposed to attain this object, and is put forward as the only means, the assumption is, that there exists at all times ready for use the power to make such surfaces or forms available. That this can be any man's belief who reflects on it is impossible, for common observation alone contradicts it; but when hardly a week elapses without some new (?) nostrum appearing as the sine qua non-as the remedy for this now acknowledged necessity, it does but betray that the idea has taken pos session of the mind, that this power is at hand, session of the mind, that this power is at hand, and that we have lacked hitherto only the right application of the same. The fact is, however, that during the most calm, warm, and settled months of the year, we are the most deficient of this first requisite, without which all, and the most perfect applied forms, are mere useless material. Again, unless both the area of the exit from a building and the power used there to ventilate be carefully managed and properly proportioned, so as to produce in its progress through that building such currents as shall not be felt, ventilation will not be submitted to. The precise amount of air must be drawn in as is expelled or drawn out; and the currents which are produced by a power always varied and uncontrolled, are the several amounts of ventilation, sometimes inducing dangerous drafts, but offtimes when wind is wanting, no ventilation at all; so it is evident we cannot expect either constancy in action, or regularity in quantity, by depending on any outwardly applied form simply and alone for its attainment. In the summer months all are ready to acknowledge the necessity for perfect ventilation, and as common sense directs, we resort to the free opening of windows, doors, &c.; and for our usual dwellings there cannot be a more rational course. The more freely this is done, the less the danger of inconvenience by drafts; for as drafts are only caused by the difference of weight in the atmosphere within and without the house, depending upon the rarefaction produced in the chimneys by fires and other similar causes, so the more free and constant such openings are, the less will be the tendency to drafts, and the more pleasant and unobserved the ventilation. But during the winter part of the year, as these facilities cannot exist, this object must be effected by other means; and in looking to the wind for this power, as being that only by which out-ward formations can be acted upon, we exward formations can be acted upon, we ex-perience it at one time tempestuous, and at another powerless, but at all times vary-ing and uncertain, while we retain the same unchanging form to receive its action,—even admitting that form to be the most proper to induce the upward current. Now, allowing this action by wind to be at times effective to create this desideratum, we require at this season the addition of warmth in conjunction with ventilation: and this it is which makes it with ventilation; and this it is which makes it a complex question, certainly not to be solved by any outward application, because for every quantity of vitiated air withdrawn by any acknowledged power, we require a precisely similar amount at an agreeable temperature. As an illustration how little ventilation alone could be submitted to by some classes of society, we have but to turn our attention, and reflect upon the thousands now inhabiting the east parts of this vast metropolis, who are ill-fed, ill-clad, and worse housed (daily practically illustrating Hood's Shirt dirge), and consider that this ventilation would be death more hurried;-relieving from a more insidious, to expose them to a more acute, but a not less certain destruction.

But widely different is the question when it affects large or public buildings. "The temples of religion, palaces, or theatres are exceptions to this ban: the joint process is in them attainable and comparatively simple, for air can be introduced at such temperatures as we choose and combined too with moisture, not the arid breath of the torid zone, for we in them can imitate the climate of Madeira. To accomplish this three things are required:

lst. An air-warming chamber. 2nd. Minutely divided emitted currents from it into the building ; and, 3rd. A controlled external discharge for the vitiated air, ready, and capable of being made sufficiently active at all seasons. The practicable method of carrying out this combined operation is beyond consideration for ordinary dwellings, excepting in cases where they might be constructed as a block of building for a number of families, as has been fre-quently proposed."

The ventilation for common dwelling-houses can be carried no further, and need not be, in my opinion, than by admitting a regulated guantity of air by the upper sash, or by apply-ing in one of the upper panes some of the various guards to shield such apertures, as Fairs' Moveable Glass Louvres, Dr. Guy's Perforated Guarded Plates, or Bailey's Fixed Louvre, with a covering slide. Either of these will fulfil the purpose for the admission of air, and for the withdrawal of the same we have no means at hand so simple, so ready, and so costless as our usual chimney draught. Presuming the fire at the lower level to be capable of performing its part, viz. that of changing the lower stratum of air, there remains only to insert an outlet valve in the upper part of the chimney-breast communicating with the same chimney, to effect a ready and constant re-newal of the higher level of air sufficient to meet the wishes of the most particular upon this point.

Again, reverting to outward applications only, there is the following condition, to which our common dwellings are constantly exposed, which would totally defeat such ventilation. One part of a building, or one room is of greater altitude than another, and from the presence of an excess of heat in that portion over the other, or from its altitude, or from other causes productive of a like result, the current is from the lower or less rarefied portion to the higher or more rarefied; here, notwithstanding the outlets from each were furnished with similar perfect forms, yet it would be seen the ventilation would proceed from one of the two in the right direction upward, while the other would be the inlet for a reverse current, only excepting such times as when the power of the wind would be in excess over the rarefying power within the building. The one outlet fulfilling its intent independent of the original proposed outward form, but assisted by it in such times as supposed, and the other, although similar in every way outwardly, yet for any effect by it not only power-less but the actual passage of a reverse action. I think this will suffice to exemplify the

uselessness of depending for ventilation wholly upon any outward formation, as alike contrary to experience and entirely opposed to the usual conditions in which every occupied building exists. I have only one remark to make upon this point, viz. that whatever form may be applied at the external discharge of ventilators to keep out the rain, or guide the discharged current (for this is their legitimate use) in the direction of the prevailing wind, the plan of that form should be the circle, as being the only one equi-distant from the centre affording equal action in all winds. Drury-lane. G. B.

G. B. COOPER.

EXHIBITION OF ARCHITECTURAL DRAW-INGS. — The Association of Architectural Draughtsmen exhibited during the past week, at their rooms in Southampton-street, Strand, an interesting collection of their drawings, shewing that they have amongst them some very able men. We have not space to particularize, but we will mention with commendation the works of Mr. L. W. Collman (whose designs for decorations have been honourably designs for decorations have been honourably mentioned on several public occasions), Mr. Pritchard, Mr. J. R. Colling, Mr. J. D. Wyatt, Mr. W. B. Colling, Mr. Rodriguez, Mr. E. C. Sayer, the hon. secretary, &c. Architects requiring assistance will do well

to apply to the association. THE EMPEROR OF RUSSIA AND MR. SNOW HARBIS .- Through the medium of the Russian Ambassador, Baron Brunow, his imperial majesty has recently sent to Mr. W. Snow Harris, of Plymouth, a handsome porcelain vase, in token of the great estimation his majesty entertains of Mr. Harris's ability as displayed in his mode of constructing light-ning conductors for shipping.

MR. GRAINGER ON FORM OF SEWERS, DRAINS, AND SUPPLY OF WATER.

THE Health of Towns' Association bave published a lecture delivered by Mr. R. D. Grainger, of St. Thomas's Hospital, containing a general exposure of the causes of the unhealthiness of towns and its remedies. ing a general exposure of the causes of the unhealthiness of towns and its remedies. Foremost amongst the sources of disease in towns is defective drainage and sewerage. "It is impossible to exaggerate," says our author, " the defective state of the drainage generally found in towns: large districts, and those the most densely populated, entirely unprovided with these necessary outlets; sewers and drains placed on the surface, and constantly emitting pestilential exhalations; sewers, even in many of the principal districts in towns, so shallow as to be merely adapted to surface drainage, leaving the basement stories of houses and cellars where these are used for habitations, as in Liverpool and Manchester, altogether undrained, though in a special de-gree requiring it; sewers and drains con-structed upon wrong principles as to form, dimensions, and materials; a want of proper traps to prevent the escape of noisome stenches and effluvia; and, more than all these defects put together, a totally insufficient supply of water, without which, as Dr. Southwood Smith justly observes, ' not only is no good done by a drain, but the very evil intended to be avoided is positively increased and extended.' necessity of an ample supply of water, which ought to be as freely given as the air we breathe, meets the inquirer in every branch of the question; it matters not what you speak of -of house drains, court drains, street sewerage-of water-closets, privies-of wash-houses, baths, and personal cleanliness-or of decent habits and the comforts of home-to say habits and the comforts of home-to say nothing of the question of whole ranges of warehouses and the revenue of a principality annually destroyed by fire in some of our great cities; in all directions and upon all questions you are met with the want of water. As a complete and effective system of drainage, like so many other sanatory improvements, de-mands an ample supply of water, the two subjects may be advantageously considered in conuection.

The existing system would appear to indicate an expectation that the sewers and drains are to effect many things which it is quite certain they never have and never can accomplish; and, amongst the rest, that by impress-ing a kind of volition upon the more solid parts of their contents, these latter should obligingly carry themselves off, and in the case of Liverpool, for example, walk into the Mersey, or in that of Manchester, into the Irwell. But this is a kind of feat which matter, with its accustomed stubbornness, will not perform, however much desired. On the contrary, all liquids holding solids in solution or mechanical suspension, are so desirous of getting [rid of their burden, that they deposit it whenever and wherever they can.

Wherever there is any delay in the course of the filthy water of towns, there a deposit of offensive and poisonous mud takes place; in every angle and turn-on any the least in-equality of surface, an accumulation of solid matter does and must be formed ; and as much of this matter is in a state of minute division and moisture, and all of it, periodically, on the falling of rain, it presents precisely those phy-sical conditions which facilitate its escape into the air in the form of a poisonous vapour.

The great law, then, which regulates de-posits of matter held in solution, is, that whenever the current is retarded, the solid particles have an increased tendency to subside; or, to speak more exactly, the ordinary law of gravi-tation operates under more favourable circumstances. It becomes a point of consequence to know, whether there exist in our public and private drains and sewers, and in the surface of streets, courts, and alleys, any causes which will promote deposits according to the above principle. The answer has to the above principle. The answer has already been given in the invaluable reports and evidence of the Health of Towns' Commission. By their unnecessary size and defective form, most of the older sewers being flat at the bottom, they cause a retardation in the flow of their muddy contents, and thus, of necessity, produce a lodgment of putrefying animal and vegetable matter. Another source of deposit is the improper direction of these conduits, the sharp angles and curves of which, especially where the smaller sewers enter the main trunks, lead to obstruction, and to these must be added the various irregularities of surface connected with all masonry, especially when it is originally bad or gets out of order. construction of house drains is liable to the same remarks, all of them being built of porous materials, much too large for their contents, and ordinarily square, the worst of all forms for such a purpose.

The hest form of sewers and drains is a question of much moment. "If they are constructed with a flat bottom, an accumulation of animal and vegetable matter must take place; for in this form of drain the force of the water is weakest precisely where it ought to be the is weakest precisely where it ought to be the strongest, namely, at the bottom; and in ad-dition to this, the upright side-walls are liable to be forced in and destroyed. The best form of a common sewer is the egg-shape, which conduces to hydraulic pressure, and with this form and a plentiful supply of water, deposits would, to a great extent, be prevented, and whenever these did occur by increasing the whenever these did occur, by increasing the pressure of the water, which can readily be effected, they would be removed and the sewer scoured out. The egg-shaped sewer not only possesses the advantage of superior efficiency, but is likewise much more economical. It has been calculated by Butler Williams, Esq., one of the professors at the college for Civil Engi-neers, that by substituting this form for the sewer with upright sides and flat at the bottom, there would be a saving in the construction alone of 1,600%. per mile.

There is, however, a mode of drainage which to me seems infinitely preferable to any other— I mean the improved *drain tubes* recommended by Mr. Dyce Guthrie.[•] They are circular in form, and are made either of terra-cotts or of common brick clay; and as it is most desirable that all drains should be *impermeable*, to pre-vent their poisonous air escaping, Mr. Guthrie proposes that the drain-tubes should be glazed on the inside. "What !" some persons will exclaim, "would you glaze the inside of a drain as you would the inside of a basin to hold food ?" Exactly so; and in the end this tubular system of sewerage would be cheaper, for it is not only much less expensive as to material. but in construction and subsequent maintenance. The form being circular, combines these advantages: the drain is strong, and it would thus be enabled to resist the superincumbent pressure; it could be made of much smaller size than the ordinary drain; and it could be readily washed out by a flush of water; indeed, it is probable that the sewer would be kept cleansed by its own action. For house drains and smaller sewers, tubes of from four to six inclusion dismoster would be write while inches in diameter would be sufficient, whilst for larger sewers the size should be from twelve to eighteen inches or more. If this tubular system of impermeable drains could be introduced, with a sufficient supply of water for washing them out, so as to guard against ac-cumulations, the sanatory condition of a town would be immensely improved."

A copious supply of water is important in another respect. "By an improved supply of water in the city of New York, and a high pressure always being kept up in the mains, so that the hose can be directly supplied from them, the cost of insurance against fires has been reduced 25 per cent. Many who are pre-sent can form some estimate of the vast sum which such an improvement would effect in Liverpool, not only by a reduction of the yearly premium upon insurance, which, from the losses by fire, has been raised from 8s. to 35s. per cent.---the rate in London, for the same risks, varying from 2s. 6d. to 5s.,---but in the enormous amount of valuable property, which would thus be rescued from destruction. In Philadelphia, and in this country, in Nottingham and other places, corresponding benefits have resulted from similar improvements.

Economy would not only be consulted in this particular, by an ample supply of water, but in every other where it is concerned. It is found in the Holborn and Finsbury district, that by far the cheapest mode of cleansing the sewers is by washing them out, or flushing them, as it is called; in fact, the cost is about one-third of what it used to be: in one cleansing alone there was a saving of expense to the commis-sion of 1,2934. Again, the ordinary expense

> * See "THE BUILDEE," Vol. II. p. 632, Digitized by Google

429

of cleansing those ever-acting foci of pestilence, cesspools, is, in London, 1/. to 1/. 10s. per annum, or from 5d. to 71d. weekly; whilst it is stated that water companies could construct and maintain in repair an apparatus in the nature of a water-closet and house drains for the removal of all refuse and waste water, two points of incalculable advantage in sanatory respects, for a weekly charge of 21d. to 3d. per house. Mr. Chadwick, in his admirable sanatory report, has shewn the great loss in other respects from a want of water, and he has rendered a great service to the community by demonstrating that all the manifold benefits which would spring from an ample supply of this prime necessary of life would each, and every one of them, be accompanied by a pecuniary cain."

Mr. Grainger urges, very properly, the ne-cessity of extending scientific instruction to surveyors, builders, and others, with whom much of the details must rest. "When it is recollected that all persons charged with great public interests are expected to undergo a long and extended course of study; that the clergyman, the medical practitioner, and, now, even the lawyer, must submit to a rigid ex-amination before they are permitted to under-take duties involving the well-being, the health, and the property of the community, I confess I do not see why another class of officers, to whose intelligence and zeal are committed interests not less momentous, should not also pass through a preparatory course of study, and have their knowledge tested by a proper examination. There is no art, scarcely even any business, in which an acquaintance with science is not necessary, or at all events ad-vantageous; and we may remark, that it is quite possible for a person to be fumiliar with all the technicalities of bricks and mortar, and to know the contents of a cube of stone or wood, and yet to be ignorant of those important principles which are essential to an en-lightened system of sanatory measures. There Inghtened system of sanatory measures. Inere are scientific questions concerned in all the business of drainage, ventilation, and the supply of water; and thus a knowledge of hydraulies and other branches of physics, as well as of chemistry, becomes indispensable to an efficient surveyor,"

QUESTION OF PATENTS,

AND PROPOSITION TO ASSOCIATE THEORY AND EXPERIENCE.

SIR, - I do not consider your columns should be used as a medium of compliments between those who may indulge in scribbling for them, but I am disposed for once to depart from this proposition by thanking Dr. Sutro for his kind notice of my article touching the occupation of newly-erected houses, and more especially for his sensible remark as to the tone "in which I should rejoice to see all scientific discussions carried on though in-terest or fame may be affected," that is, with out asperity or overweening vanity. I avail myself of this quotation as opening the discussion of the question of patents, upon which I have perhaps peculiar views; and Dr. Sutro's frank admission that science and practice should walk as sisters, hand-in-hand, appears to afford a fair opportunity of discussing the point. With respect to improvements emanating from individuals tending to benefit and improve the condition of society, I hold our talents are entrusted to be diffused to the greatest extent upon the principles of reciprogreatest extent upon the principles of recipro-city, as it is not given to the human mind each to grapple with every subject. This in-volves the right of patent, and I am not pre-pared to contend that an individual having bestowed vast labour, and, probably at great cost, produced that which materially adds to the comforts or elegencies of life about not the comforts or elegancies of life should not, by such protection, be enabled to reap the fruits of his labour by fair protected remune-ration: but by a parity of reasoning, the public offering this protection have a right to public offering this protection have a right to demand the greatest and most useful results by enforcing conditions not interfering with the admitted rights of this purty. I would therefore suggest that a party having (as at present) registered a patent, before it be granted, a proposition should be submitted to a busnit continue of a correlated and comp a board constituted of accredited and scien-tific men, with power to suggest and insist upon such alterations and additions as should apparently make it more perfect and applicable

to its proposed use. And that the party should then have it patented with these improve-ments, of course, greatly to his gain, as being thus accredited, and with saving of anxiety and further cost to the individual whose invention was not thus accredited as of benefit to the public. Dr. Sutro's remark — " that expetion was not thus accretited as or benefit to the public. Dr. Sutro's remark — " that expe-rience deserves greater appreciation in such cases than theory, and that nothing would be more dangerous than to sacrifice facts to speculation," implies that his mind is not im-bued with the pedantry (and I use not the term offensively), that too frequently is an ad-junct to science. We shall cheerfully accord to science the evidence of cause and effect, Junct to science. We shall cheering accord to science the evidence of cause and effect, but then it has to be practically applied; let us therefore by free discussion, ascertain the pro-bable result of any theory, the desirableness of which I will endeavour to illustrate thus:-In my youthful days when under mathematical discipline, it was accredited as proveable to demonstration, that the progression of a body could be correctly ascertained as to its velocity, taking into account certain data, viz.: im-petus, resistance by friction, atmosphere, &c.; the formula adopted was proposed to prove the positive results upon the data, and thus univer-sally *scientifically* accredited, until a practical question arose in regard to the form of car-riages, &c., upon the Great Western Railway, having reference to these points. The course adopted was to call in Dr. Lardner and other scientific men to meet Mr. Brunel (whom we sell recorring in the one as the other chaall recognize in the one as the other cha-racter), and *practical* men; the result of the inquiry being, as I am informed, that too much value had been attached to friction, and too little to the resistance of the caprices of the atmosphere. I hail your journal as the neutral ground between science and practice, for free communication, whereby much good might result if practical men would publicly give their theory and proposed mode of operative detail. The scientific man might be induced to reason upon certain ascertained facts controlling the proposed results, or as rendering them efficient. Par exemple : limiting the desperate long period of Dr. Sutro for the occupation of houses, might be appended to his proposal (upon ascertained principles) the all-important desideratum, proper and un-controlled ventilation of rooms. Having devoted some attention to, and to some considerable extent using a mode for curing smoky chimnies, which has been adopted by several of my professional brethren (or I should rather mode of avoiding them in construcsay a tion, thinking their existence has been a sad opprobrium to us), it has long been my inten-tion to intrude my views upon your readers, waiting only for leisure to make a few diagrams. If my principle of creating currents be admitted, I then have a crotchet of connecting the ventilation of a room with the positive adjunct of a fire-place, never, I hold, to be omitted in even the garret of a fourth-rate house. Here then I want the aid of science : not professing to understand the principles of currents, the caprice with which they take their course, and the mode of displacing or associating with fouler atmosphere, a proposition made in ignorance of these facts may positively tend to counteract well recognized principles of nature, which it happens to be aside my habits or pursuits to understand. G. R.

NEW CHURCH, HUNTINGDON.

This church was commenced last week, on the site lately occupied by the theatre. It is to be built in the Norman style of architecture. The contract is taken by Mr. Howard, builder, of Newington Causeway, London. The amount of contract is about 3,000%. The size of nave, in clear of walls, is 55 by 27 feet: it is calculated to seat 800 persons, including gallery; the greater part of the seats are to be open benches, and free. The walls will be of brick, and dressings of doors and windows Caen stone. There are at present only two churches in the town, which will together seat about 1200 persons. The population of Huntingdon, according to the census in 1841, was 3,507, thus shewing the great want of more church accommodation. This church is to be built at the sole expense of the Ludy Olivia B. Sparrow. The architect is Mr. W. G. Habershon, of St, Ncots.

RECEPTACLE FOR SEPULCHRAL MONUMENTS.

The notion of erecting a sort of "Campo Santo" at one of the entrances to Paris, which formed the subject of considerable in-terest some time since, has become now, according to the Illustrated London News, at matter of almost certainty. The glories of "Pere la Chaise," says a writer in that journal, will be thus considerably eclipsed. The cemetery is to be covered, after the models of those of Piss, Verona, Bologna, &c., which are now imitated in several cities of Germany. The cemetery will become in a few years a species of temple consecrated to the dead, and ornamented with all that art can imagine to honour and perpetuate the memory of man. In the long vaulted galleries will be ranged sculptured tombs, as in the ancient charnels of the cemetery of the "Innocens;" in the the cemetery of the "infocens;" in the superior stages, sepulchral chambers, destined for families, will be decorated with mural paintings. The grounds of this immense edifice will be planted with trees, shrubs, and flowers; the "Campo Santo," being covered, will the efford believe to attenue here infinit will thus afford shelter to statues, bassi relievi, inscriptions, cenotaphs, from the degradations that the hand of time, and above all those of man, have visited on monuments which have sphere, the insults of the profane, and the severest "ills that store is heir to." It is principally in an art point, of view that the foundation of such a covered cemetery is to be considered. It will afford to architects, to sculptors, to painters, an added opportunity for the exercise of their gifts; and there is no doubt, if fully carried out, it will ultimately become the most vast, the most curious, and the most magnificent museum in Europe. A similar scheme for London has been proposed by more than one person, and will doubtless be carried out here before long.

ABBOT'S LANGLEY CHURCH, HERTS.

THIS church, which is dedicated to St. Lawrence, consists of a nave, two side aisles, a chancel with a chapel on the south side, and a square embattled tower having a short spire of lead. The tower, nave, and chancel, are built chiefly of flint covered with plaster, with the exception of the chapel on the south side of the chancel, which is a very good specimen of stone and flint, disposed alternately in square compartments.

compartments. The clerestory wall of the nave is supported by Norman piers and arches of good execution and in a fine state of preservation; each of the capitals are of different design and handsomely sculptured. Upright pieces of timber which support the ends of the tie-beams rest upon grotesque heads serving as corbels, and are decidedly of Norman workmanship. The fon: is of good design, its age between the thirteenth and fourteenth centuries. The pulpit, which is situated at the extremity of the nave on the north side, has unfortunately been erected with less taste than bounty, and to a certain extent mars the tout ensemble of the interior.

The chancel is in the perpendicular style, and was wholly appropriated to the reception of monuments until latterly, when the present incumbent with a liberal hand restored that and other parts of the church to their original purpose-removing a handsome marble monament of Lord Chief Justice Raymond, that then completely filled up the space now occa-pied by the perpendicular window over the communion table, which window has been replaced and filled with richly-painted glass re-presenting St. James, St. Peter, and St. John, in canopied niches. The floor of the chanin canopied niches. The floor of the chan-cel has been laid with encaustic tiles of grood device; the numerous alterations and repairs have all been done at the expense of the vicar, the Rev. Mr. Gee. The church is now perfectly restored to its pristine form, the parishioners therefore owe for this reparation of their church a debt of gratitude to their minister, and may congratulate themselve that their church this time, at least, has escape d that destroyer of architectural remains, white-" wash.

Amongst other circumstances worthy of record, this parish is famous in history for having given birth to Nicholas de Cumeracommonly called Nicholas de Breakspear, the

only Englishman who ever had the honour of filling the papal chair. "There is a farm in this parish in the possession of R. Solly, Esq., which still preserves the name of Breakspear, and probably was the place of his nativity. He was the son of Robert de Camera, and when a youth endeavoured to gain admission into the monastery of St. Albans, where he wished to assume the monastic habit, but was refused admittance upon the ground of in-sufficiency in learning. The manner of his sufficiency in learning. The manner of his death is differently related by different authors. Matthew Paris says, he was poisoned because he had refused to make the son of a Roman citizen a bishop, from his being unworthy of that situation. The parish is in the liberty of St. Alban's,

The parish is in the interivery or St. Attau s, one mile and three-quarters S. by E. from Kings Langley. The Grand Junction Canal and the Birmingham railroad both pass through the parish. The ground for the contemplated Booksellers' Provident Retreat, which was presented to the charity by Mr. T. Dickinson, is situated in the parish at an easy R. B. W. distance from the church.

Correspondence.

BUILDING STORE.

SIR,-As your columns are open to what-ever may be useful or interesting to your readers. I trust you will not object to find a niche for the present very brief note. My object is to draw attention to a stone produced from a quarry near Leeds, and called the Otley Chevin stone, but which, though excellently calculated for architectural purposes, is less known to surveyors, builders, &c., than its merits deserve. T have seen various testimonials in its favour from some of the best judges, but the following extract from a certificate by Dr. Ure is so explicit as to its qualities as to render-any further-recommendation almost superfluous. The doctor states, "I have subjected a sample of it (the Otley Chevin stone) to the appropriate test invented by the celebrated French engineers of bridges and highways, viz., MM. Vicat, Billandel, and Courard, and find it to be capable of resisting the decomposing force of the elements for an indefinite length of time. It is, in fact, a silicious grit, so closely aggregated, and so devold of fissures, as to bid defiance to the corroding tooth of time, and to be, therefore, admirably adapted to every architectural purpose where strength and durability are the great requi-sites." To the above may be added, that it is sites." To the above may be added, that it is also capable of resisting great heats, and con-sequently is adapted for many chemical pur-poses. These few remarks are offered in the hope and belief that they will be found as conducive to the public advantage as to the private interest of any individual, and I conceive that by giving this publicity you will confer an obligation on many of your readers.

I am, Sir, &c., Amicus.

DISTRICT SURVEYOR ON THE THAMES.

SIR,-A case has recently occurred at Greenwich which is of very great importance to the trade, and seriously affects all persons holding water-side premises on the banks of the Thames from Wandsworth to Plumstead.

The follow-ing are the brief outlines :- A short time sirace I was employed to repair and reinstate a jetty or platform, and small erec-tion thereon, consisting of privy and small warehouse, the whole entirely upon the same site and dimension as before, not connected with the house which is upon the banks, but placed upon piles driven into the bed of the river Thames, around which the tide constantly flows

Mr. Brown, district surveyor for that locality, has laid an information on the ground of neglecting to give due notice, and demands treble fees. My reply before the magistrate, last Friday week, was, that not giving due notice did not arise from any neglect, but from a firm conviction that Mr. Brown, as district surveyor, had no authority to interfere upon the river Thames. The case stands over for another hearing on the 10th instant.

The 3rd section of the Building Act. p. 7, specifically refers to boundaries and to localities; the words of the Act are, "to all such parts and places lying on the south side, or right bank of the said river, as are within the ex-

terior boundaries of the parishes of Woolwich, &c. &c." " and to all places lying within two hundred yards from the exterior boundary of the district hereby defined."

The question I wish to be solved is, looking at the express words of the Act, has Mr. Brown, or has he not, any supervision in this case :

My firm opinion is, that the words in the Act, banks and sides of the Thames, mean and intend to denote the fixed or starting point, and the 200 yards only apply to the boundary south of those fixed points, as the river Thames cannot be called place or places, and more es-pecially as I believe the river is within the libertics of the city of London, consequently cognizant to the city authorities, for which I think the Act provides. I shall feel obliged if you or any of your correspondents will in your next publication give me their candid opinion upon this very important matter.

I am, Sir, &c., Thos. Smith, Builder, &c., Dock Head, Bermondsey.

Miscellanea.

THE EXCHANGE AT FRANKFORT .--- A COTrespondent of the Athenaum remarks that there are in Germany a vast number of buildings, of which no boast is made, which give evidence of what is so extremely rare else-where—originality. Walking along the streets of Frankfort, we were suddenly arrested by the sight of a building of great beauty and simplicity. Neither Grecian, Italian, nor Gothic; obviously neither a palace, a theatre, nor an hospital; handsome, substantial, and harmonious, in proportion, ornament, and coloursit was the Exchange. To be sure ; who would doubt it? It is just what the Exchange should be; and exactly the Exchange of Frankfort; not of vast magnificent London, the queen of commerce, or of showy brilliant Paris, ----centres of powerful monarchies, but, of the wealthy free city, the seat of a substantial bourgeoistic. The material is brick of two colours - the architectural resources of which Lord Lovelace has shewn in the pretty schoolhouses he has built at Ockbam. At Frankfort it is of course employed on a grander and more elevated scale, and therefore without those pretty fancies in the way of borders and ornaments, which are so appropriate and so cheerful in these cottage-like buildings of which the design is, in a double sense, so honourable to the noble architect. You must not ask me for details which I cannot give, partly for want of technical knowledge, partly of accurate recollection. But as to the general im-pression I can never forget how harmonious, how original and appropriate (zweckmussiy is the very word), this unpretending and uncopied building appeared to us. The London Ex-change I have not seen ; that of Paris is one of those ludicrous misapplications to common in England and France, and what is more, a very ugly one. One asks till one is tired, why is every thing to be feudal, or Greek, or Palla-We want none of these things. dian? The whole actual idea and purpose of a building should not 'jurer' with its traditional idea and purpose, like the beautiful Madeleine, where, after it was finished, it was discovered that this Catholic church had no place either for confession or belfry (!), or the frightful Bourse, the frequenters of which have nothing in common with Greece or Greeks, but a peculiar beard the Frankfort Exchange mentioned, nor can I tell you the name of the architect. All I know is, that he is one of the few people who can do any thing but imitate.

RANELAGH SUSPENSION BRIVGE. - A company is being formed, having for its object the erection of a suspension bridge across the Thames for carriages and passengers, from a point a little to the east of Chelsea Hospital to a point on the west of the Red House, Battersea. The estimated expense, inclusive of a steam-boat pier, approaches, &c, is 90,000/. Mr. H. H. Bird is the engineer.

BUCKINGHAM PALACE, during the absence of the Court from town, is to undergo various embellishments and alterations. The grand hall is to be decorated somewhat in the style of the Royal Pavilion in Buckingham Gardens; and in the north wing altera-tions are to be forthwith made.

WOBKS AT ST. MARY REDCLIFFE CHURCH BRISTOL.---We direct the attention of builders and contractors to an advertisement which appears in our columns, for tenders to exe-cute certain works at Redcliffe Church. Only a part of the restoration is to be now contracted for, but it may reasonably be ex-pected that the parties employed in the first instance will continue on the work till all is completed. We trust, now that operations bave commenced in earnest, that fresh sub-scriptions for this noble undertaking will be Too much praise cannot poured in. be given to the committee appointed to effect the resto-ration, for the zeal and ability with which they are proceeding. New PRISON AT CLERKENWELL. -

Middlesex magistrates have determined to pull down the present building, and to erect on its site one of larger dimensions, on the plan of the Model Prison at Pentonville; the work of demolition commenced during the present week. It is expected that the new building will be completed in about eighteen months.

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our readers, however, they are entered in a book, and may be seen on application at the office of "The Builder," 2, York-street, Covent-garden.]

For certain Masons', Carpenters', and Plumbers' and Glaziers' Work about to be performed in va-rious repairs and restorations to St. Mary Redcliffe church, Bristol.

For Paviors, and Masons' Works to be done to the foot and carriage ways of St. James, Westminster, for a term of three years.

For Paving and repairing certain carriage and footways in the parishes of St. Margaret, and St. John the Evangelist, Westminster, for one year, and so on from year to year until three months' notice shall be given by either party to determine the same.

For certain Works to be done adjoining the present workhouse premises at Lower Homerton, for the guardians of the Hackney Union.

For building railway goods' waggons, ballast waggons and horse boxes, and supplying carriage couplings according to plan, for the Great Southern and Western reilway (Ireland). For the execution of Works on the Dundalk and

Enniskillen railway, being a distance of ten miles.

For Lighting the public Lamps on the Lucas estate, St. Pancras, with gas, and kceping the same in repair.

For supplying the North British Railway Com-pany with 2,500 tons of Cast-iron Chairs, and 140,000 Larch or Beltic Timber Sleepers.

For supplying the Middleborough and Ridcar Railway Company with 36,000 Oak Keys. For the execution of Works on the Leeds and

Thirsk Railway.

For the execution of several lengths of Earthwork on the Aberdeen Railway. There are 5 separate Contracts, varying in lengths from 3½ mlles to 4‡ miles.

For the execution of the works on the Nottingham and Lincoln Railway, in two perts; 1 from Nottingham to Newark, being a distance of 17 miles: 2 from Newark to Lincoln, being a dis-

Notingnam to Newark to Lincoln, being a dis-tance of 153 miles. For supplying her Majesty's several Dockyards with Cast-iron Articles for twelve months certain. For supplying 300 Sets of Wheels, Axles, and Guard Irons to the Great Southern and Western Railway (Ireland).

For the execution of the whole works of the first ten miles of the Hawick branch of the Edin-burgh and Hawick Railway. For 500 Tons of Cast-Iron Socket Pipes with

bends, branches, syphons, &c., for the Com-mercial Gas Light and Coke Company, Stepney. For the construction of the Works at Gas

Wells, Norfolk, and all necessary apparatus. For the construction of Three Reservoirs for the Blackburn Waterworks Company: also, of Stone Culverts for conveying the water a distance of about 24 miles. The earthwork will amount to about 180,000 cubic yards.

For the erection of an Infirmary at the Lambeth Workhouse.

For the execution of works on the Manchester South Junction and Altringham Railway, in two parts: 1, being a distance of 1½ mile; 2, being a distance of 7½ miles.

For the execution of Works on the Manchester and Birmingham Railway in 2 parts. 1. The Ashton Branch, being a distance of about 4²/₄ miles. 2. The Macelesfield branch, being a distance of about 30 chains, including a tunnel of 330 yards in length.

For the repair of all the roads within the Bridgwater trust for a term of three years from the 6th of October next.

432

For the execution of that portion of the Edinburgh and Northern Railwa Burntisland Pier to Kinghorn. Northern Railway, extending from

For supplying the Trent Valley Railway Com-any with about 200,000 sleepers of good sound n**y** with Baltic timber.

For supplying the Clydesdale Junction Railway Company with about 2,500 Tons of Rails, and about 600 Tons of Chairs.

For supplying the Leeds and Thirsk Railway Company with 100,000 Railway Slospers.

For the execution of works on the East Lanca shire Railway, viz., the Accrington Contract, being a distance of about 8 miles.

For the execution of that portion of the New-castle and Berwick Railway, extending from Netherton to Tweedmouth, being a distance of about 53 miles. To be let in four contracts. For the execution of works on the Leeds, Dews-

bury, and Manchester Railway, viz., the Churwell Contract, being a distance of about 2½ miles.

For supplying the Wakefield, Pontefract, and Goole Railway Company with about 7,000 tons of Malleable Iron Rails, and 2,000 tons of chairs.

COMPETITIONS.

The Committee for the establishment of Public Parks, Walks, &c., at Manchester, offer two prizes, one of 50 guineas and the other of 25 guineas, for the best and second best set of Plans (with estimates), for the laying out, &c., of the sites already purchased by them.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

Adjoining the entrance to the East Country Dock, Rotherhithe, about 85 loads of new East-India Teak, and 60 loads of sound African Oak Timber. BY TENDER.

In the Plantations of the Duke of Montrose, situate in the Parishes of Drymen and Buchanan, Stirlingshire : many Thousands of Larch Trees of some size, adapted for Railway Sleepers, Roof ing and Joisting, and other purposes.

TO CORRESPONDENTS.

Lists of Prices of Painting Brushes, and of all other kinds of Brushes, forwarded on application. Established 1777.

TO ENGINEERS, ARCHITECTS, AND BUILDERS, MATENT METALLIC SAND CEMENT. -The Metallic Sand, from its chemical qualities, To ENGINEERS, ARCHITECTS, AND BUILDERS. **DATENT METALLIC SAND CEMENT.** -The Metallic Sand, from its chemical qualities, forms, when mixed with blue lias line, a metallic cement of great strength and density; the iron, which is one of its principal constituents, combining with the bed in which it a greater degree of hardness than can he obtained by admixture with any other known material. Concrete and mortar in which the metallic sand has been used are more durable than any other, continuing to indust with line, and not being affected by damp, otherwise than by increasing in hard-ness from the oxydation which is thereby occasioned. Employed as a cement to turn water from brickwork in tur-nels, sewers, and other underground works, the Metallic sub found cheaper, and from its eminent adhesive qualities to form a more solid and hydraulic body, in com-bination with the brickwork, than any other green the test substitute for pozolano that has ever been presented to the public. As an external stucco, the Metallic Cement assumes a rich stone-colour without the aid of paint or tint of any bind, does not vegetate, and is entirely free from eracks and urability by exposure to the weather. The Proprietors refer with confidence to works in which the Metallic Sand as been extensively employed as concrete and mortar, specified in the prospetus, where also will be found refe-rences to very extensive erections which have been stuccoed with the Metallic Cement. Further information will be given, and specimens shewn, on application to Mr. C. Dyer, 4, New Broad-street; and at the Metallic Cement Want, King's-road, opposite Prati-street, Camden New Town.

TO ENGINEERS, ARCHITECTS, AND CON-TRACTORS.

REAVEN'S LIAS CEMENT and GROUND BLUE LIAS LIME, at 2, South Wharf, Paddington, London, and Works, Southam, Warwickshire. Agent for Liverpool, Mr. WYLIE, 56, Gloster-street; ditto for Manchester, Mr. J. THOMPSON, Back King-street; ditto for Chaster, Mr. J. HARRISON, Linen Hall-street.

A TKINSON'S CEMENT.—The public is respectfully informed, that the price of this very ex-cellent Cement, which has now been in use for Architecture and Engineering works upwards of thirty years, is reduced to s. 3d, per bushel, and may be had in any quantity at Wyatt, Parker, and Co.'s Wharf, Holland-street, Surrey side of Blackfrian-bridge. N.B.—This Cement being of a light colour, requires no arti-ficial colouring or painting, and may be used for stacco with three parts its own quantity of sand.

MARTIN'S PATENT CEMENT. TO ARCHITECTS, BUILDERS, AND PAINTERS IN FRESCO. STEVENS and SON, PATENTEES and SOLE MANUFACTURERS, beg respectfully to anounce that this beautiful Cement has now arrived superiority over every article hitherto in use; it is now being superiority over every article hitherto in use; it is now being superiority over every article hitherto in use; it is now being superiority over every article hitherto in use; it is now being superiority over every article hitherto in use; it is now being superiority over every article hitherto in use; it is now being superiority over every article hitherto in use; it is now being superiority over every article hitherto in use; it is now being superiority over every article hitherto in use; it is now being superiority over every article hitherto in use; it is now being superiority over every article hitherto in use; it is now being superiority over every article hitherto in use; it is now being being article hitherto in use; it is now being there used for many be painted upon dry work within four low of the prise fresco painting; and is additied to form the best ground for fresco painting; and is been used for many of the prise fresco painting; and is divestminater Hall. It will bear an intense beat without the equalla. 186, DRURY-LANE, LONDON.

186. DRURY-LANE, LONDON.

Agent for Liverpool and Manchester, Mr. B. Part, 11, Atherton's-buildings, Dale-street, Liverpool.

KEENE'S PATENT MARBLE CEMENT.—The Patentees of this composition beg to refer to the British Museum, the Royal Exchange, the new works at Bethlem Hospital, Greenwich Hospital, and the Co-liseum in the Regent's-park, as buildings finished or in pro-gress, in which Keene's Cement has been used as an internal stucco. Its superiority to common plastering consists in its extreme hardness, and the rapidity with which it dries, which qualities fit it to receive paint or other finishing searer than other water Cement. When employed for akirtings, architrave, and other mouldings, in place of wood, it checks dry-rot, is imperviews to vermin, prevents the spread of fire, and is more eco-nomical in its application than the material for which it thus becomes the substitute. Confirmation of these statements is to be found in the almost universal adoption of Keene's Cement for Skirting and Hall flooring in the new houses on the Hyde Park Kettake, where its application is to be seen to the fullest advan-tage.

tage. In Liverpool and Manchester, Keene's Cement has in several cases been used for the covering of the fire-proof warehouse floors, where its lightness and hardness give it the preference over tiles and flagging, which are much heavier, and necessarily leave the floor intersected with numerous joints, whilst Keene's Cement is laid down in one unbrokes surface

surface. The high polish and marble-like hardness of which this Cement is susceptible render it the most suitable material or the manufacture of Scagliola. Patentees, J. B. WHITE & SONS, Millbank-street, Westminster, Manufacturers of Roman and Portland

Cement. Depot in Liverpool, 35, Seel-street ; James Woods, Agent.

TO ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MER-CHANTS, BHIPPERS, AND THE PUBLIC IN GENERAL.

JOHNS and CO.'S PATENT STUCCO JOHNS and CO.'S PATENT STUCCO CEMENT.-The following are the positive advantages possessed by this Invention over every Cement hitherto in-troduced:-It will defectually resist Damp. It will never vegetate nor turn green, nor otherwise discolour. It will never crack, blister, nor peel off. It will form a complete Stone casing to any Building covered with it. It so closely resembles Stone that it is impossible to detect it. It never requires either to be painted or coloured. It will keep frash and good in the cask in any Climate for any number of year. It is the only Cement that can be depended upon for export. It is the only Cement that can be depended upon for export. It is the only Cement that can be used with confidence by the Sea-side. It may be used in the hottest or coldest Climates at any season. It will adhere to any substance, even to Wood, Iron, or Glass. It will carry a larger Proportion of we worked through the Winter, as frost has no effect upon it. It may be used on the Inner Walls of new Houses, which may be used on the Inner Walls of new Houses, which may be used on the Inner Walls of new Houses, which may be used on the Inner Walls of new Houses, which may be used on the above-named extraordinary and attend with this Cement will remain undamaged by the severest Storms. Any Flasterer may apply it, the Instra-tions for use being very clear and distinct. The first cost of this material does not exceed that of the cheapest Cement waluable advantages, nothing can approach it in point of commy. Architects and Builders who have used this Cement have

Architects and Builders who have used this Cemeer declared that it requires only to be known, to be univ at have

declared that it requires only to be known, to be universally preferred. Specimens may be seen, and a Prospectus fully describing the Cement and its mode of application, together with a rolume of Testimonials from every part of the Kingdom, may be obtained on application to MANN and CO., SOLE AGENTS for the Patentees. 6, Maiden-lane, Queen-street, Cheapside, London: of whom also may be had. JOHNS and CO.'S PATENT STONE-COLOURS STUCCO PAINT, expressly intended for Painting over ex-terior Walls of Houses that have been covered with Roman or other Cements, and which have been covered with Romas or other Cements, and which have been eitry and disco-loured. It is in every way better suited for this purpose than White Lend Paint, which will frequently come off in fakes, MESSIS. JOHNS and CO.'S PATENT PAINT having an affinity for Slucco, binds itself with it, stopping the auction, thereby rendering the wall proof against weather, and in the finish producing a pure stons-like effect, produccable by no other Paint whatever. It is cheap in its application, -and may be used by any Painter, in any climate, even in the most exposed Marine situations.

SATURDAY, SEPTEMBER 13, 1845.

OR some time past, the whole weight of the business at the office of Metropolitan Buildings has rested on Mr. Hosking and the registrar (Mr. Symonds), in conse-

quence of the retirement of Mr. Higgins. It was considered desirable, in making a fresh appointment, to stipulate that the new referee should undertake no other business; and this, it seems, has caused some delay. One architect of high standing, who was a candidate for the appointment, refused it when offered to him with the condition named, and the vacancy bas only just now been filled up. Without any disrespect to the gentleman who succeeds him, we must express our regret that Mr. Higgins should have felt it necessary, so soon after the establishment of the office, to withdraw himself from it. Doubtless he found the post not an easy one; and we can well understand that, possessing a sufficient fortune (which all who know Mr. Higgins will say he has worthily obtained and richly deserves), he might feel disinclined to continue to perform its duties. For the sake of the public, however, we would have had him remain until the Act had been amended by the legislature, which will probably be done next session. As it is, we must simply offer him our best wishes for health to enjoy his ease, and express a hope that Mr. Hosking may find in his successor as excellent a colleague.

The mode of proceeding in the office has now taken a settled shape ; and although there are points wherein alteration is desirable, must, in the whole, be considered as satisfactory as could be anticipated. The referees have shewn on several occasions that their chief office is to protect the public, and the two or three district surveyors who don't know how to behave themselves, -- fortunately a very small minority, - have been properly punished in several cases, and so checked. The expense of application, too great at any time, is often increased by the want of precision and care on the part of the applicants themselves. We recommend such of our readers as have occasion to appeal to the referees to state their case clearly, and without verbiage, and to avoid unnecessary meetings and postponements, by which means the costs will be much lessened; but we nevertheless urge upon the referees the importance of an early revision of their scale of fees.

We have before us a number of awards and certificates recently issued by the referees, and proceed to lay the heads of some of them before our readers.

Timber in external Wall of House commenced before January last.—Mr. Martyr, district surveyor of Deptford, gave notice of irregularity to the owner of a house in St. Nicholasstreet, Deptford, on the ground that when he surveyed it in January 1845, the front external wall was supported on a breastsummer and story posts, and that since then the owner had determined to make it into a private dwellinghouse, and had filled in between the timber with brick work, intending to compo the whole surface. The owner had, further, given no notice, considering that the district surveyor had no jurisdiction in the matter; but joined him in the application to the referees, in order that the question might be decided. The award was,—" That inasmuch as the house in question was commenced before the 1st day of January, 1845, and inasmuch as the works in question do not constitute an enlargement or alteration of the said building so commenced, and remaining unfinished at the time such works were executed, the said works are not liable to the provisions, rules, and directions of the said Act." The expenses to be paid by the district surveyor.

BUILDER.

THE

Approach to Stone Staircase in old House .-The builder of a stone staircase in a secondrate house in South street, Park-lane (while in progress), contended that, as the house was an old one, he was not required to make the joists to carry the landings, and the other internal connections, fire-proof. The district surveyor, Mr. Foxhall, thought otherwise, and, mutually, they sent the case to the referees. The award was,-"That the stairs in question being of stone, the passage from the entrance-door to the side of the staircase furthest from the door must have its floor fire-proof, and wholly upborne and supported by fire-proof constructions, and also that the landings on the third or one-pair, and on the fourth or two-pair floors, connecting the flights of stairs between the several stories, must be also made fireproof, and be wholly upborne and supported by fire-proof constructions." The expenses of the office, and one guinea to the district surveyor, to be paid by the builder.

Underpinning Walls adjoining a new Erection .- Mr. Winsland, the builder of a church to be erected in Upper Charlotte-street, Bloomsbury, having excavated the ground immediately contiguous to certain dwelling - houses and workshops, to a greater depth than the flank walls of the said houses and premises, underpinned the said walls along their entire length, but not to the full thickness of the said walls, nor to the full depth of the excavations adjoining them. On the information of Mr. Baker, the district surveyor, the referees went into the case, and determined that the underpinning was to be amended and altered in a substantial and workmanlike manner, throughout the full thickness of the walls in question, and to the full depth of the excavations referred to (or to such less depth as in the opinion of the district surveyor will meet the circumstances of the case), and conformably in every other respect to the rules relative to underpinning in sec. 28 of the Buildings Act. The expenses of the office, and a fee to district surveyor, to be paid by the builder.

Recesses in Party-walls.— Mr. Harding, of Deptford, being about to build a fourth-rate house in Rotherhithe, of which two side or external walls would probably be used at a future day as party-walls, asked the special sanction of the referees, to form four recesses in the basement story of these walls about two-thirds their extent, leaving nine inches at the back of the same.

The refereces certified, that as the said recesses were proposed to be made in a partywall, and in the first or basement story, and so that the back thereof would be nearer than seven inches from the centre of the wall, the same were contrary to the rules of the Act in schedule D, part 3, under the head "Recesses and Chases," and that they, the said referees, had no power to consent to or authorize the same.

Overhanging Roofs.—The builder of a detached house in Gloucester Road, Paddington (not sufficiently detached to render it "insulated " within the meaning of the Act), sought the permission of the referees to construct the eaves and cornice of timber, as was commonly done before the passing of the Act. The application was grounded on schedule E, describing projections from face-walls to be of such (proper and sufficient) materials as the official referees may approve and permit.

After considering the application, the referees certified, that inasmuch as the proposed eaves and cornice were not formed of, or efficiently protected by, proper and sufficient fire-proof materials, they could not permit them to be so constructed.

It may be well to remark, that the awards are necessarily influenced, at times, by circumstances which would not appear in short abstracts of the cases; we would suggest, therefore, that parties who find in any case reported in our pages a resemblance to their own, and would be guided by the award, should consult the whole of the documents connected with it; which may be done at the Metropolitan Buildings Office on payment of six-pence.

ARCHITECTURE—THE EXPONENT OF NATIONAL CHARACTER.

To few individuals does the term "architecture " convey any impression of its comprehensiveness, of the multitude, and apparently opposite nature, of its details. In its full extent, it includes the matter of every art, which ministers to the comfort, or to the delight of man, and in its service may be enlisted every variety of imaginative effort, and every form of mechanical skill. Dating its history from the age of the creation, it was the originator of all the arts, and throughout its after progress, the state of all has never been so felicitous, as when the connection, each with the rest, was intimate and mutually influential. All the forms in which the arts of design are expressed, with the operative skill ministering to, or as-sociated with them, were once one art, and generally the pursuit of one individual. Every variety of building, every object of decorative art, every machine; works of construction, whether built upon the surface, excavated in the earth, or projected into the ocean; in fine, every work, almost, in which the caprices of hand or the domonstrative of coincide or handless of the surface of the surf fancy, or the demonstrations of science can be wrought into form, was once the offspring of one mind, and that mind the possession of the architect. If, in its more circumscribed aspect, architecture is the index to the modes of life, the condition and political state, and the scientific skill of different peoples, in its more com-prehensive meaning, it is the embodiment of their thoughts and opinions, of their exact intellectual condition. It is the figure, in which the history of imperial sway is mirrored, for the perception of those, who are not blind to its instructive teachings. It is the voice of centuries past, speaking from the mist of unrecorded time, and the lamp, which illuminates the learning of one age to the contemplation of another

Though the world has witnessed the prevalence of many modes in architecture, they are each highly expressive of the thoughts, and habits of their originators, and in some styles, the expression of those characteristics is so complete and evident, that we have considered, that some illustration of them would not be uninteresting. Merely referring to Egyptian architecture, as illustrative of the mysterious rule of a dominant hierarchy,* who succeeded in enslaving the thoughts of men, through the influence on the senses of a mystic ceremonial, in which the art played an important part; we pass to the style of the Roman empire. The architecture of Greece had borne the stamp of that refinement, which was the peculiar property of the Grecian nation; it was characterized by a noble simplicity of form, to which ornament was always held as se-condary. Mouldings, whether ornamented or plain, were few in number, but arranged and roportioned with elaborate skill. Optical illusions were overcome by minute alterations, in the form and proportion, intentionally de-

* At p. 181, ante, arc some remarks on this subject by the writer.

ceptive to the eye, and which long eluded the test of close examination, and measurement. Sculpture was called into exercise in an extent. and with a success, since unknown; and the subjects; which it illustrated were such, as brought the recollection of the beholder to the early history of his nation, and to the exploits of the deities of his country. The victory in the theatre, or the games, was commemorated in the monument, rather than the victory in the field of war: The Romans, subjugating Greece -struck with the beauty of its architecture, sought to transplant it to their own city. But with them, it was no longer the result of an accurate analysis, and balance of varying forms, and of their effect in juxtaposition, each upon the other. Not content with adopting the forms of Grecian architecture, and enlisting the ser-vices of its producers, they transported the buildings themselves to the capital of a subject world. Their earliest structures were in the main Grecian, and sometimes, as in the portico of the Pantheon, were very strongly expressive of that influence. But this comparative brilliant state of the art was of short duration, and soon the Grecian architects appeared to follow the blind dictates of a master, rather than the inward promptings of reason, and good taste. The national characteristics of the Romansthe love of empire, the pomp and vainglory of the triumphal spectacle; the pride of dominion, the opulence, the luxury, and the crime, changed the whole scope and expression of the orders of architecture became the art; more framework for extravagant enrichments, annihilating the graces of form, and the happy arrangement of contrast, and exchanging magic of art for the meretricious, and the grandiose. In the supplementary volume of "Stuart's Athens," Mr. Kinnard, speaking of the comparative merits of Grecian and Roman architecture, remarks that "the latter style corresponds with the ponderous bearing of a people, who had subdued the world by their arms; the former with the captivating influence of a na-tion, that had enlightened the universe by her literature." In Roman architecture, beauty disappeared under a load of riches. Mr. Gandy, in the "Pompeiana," says, "With the Greeks, architectural ornament may be compared with those parasitical plants, which, continually intertwining, climb to the tops of the loftiest trees, and pass from branch to branch without injuring the individual grandeur of character in the various species they embellish;"---"whereas, with the Romans, all distinction of surface was frittered away in an endless maze of fretwork." The love of splendour, identified with the Roman character, exerted its sway and the chaste principles of beauty, exemplified in the Pantheon, were no longer beheld during the pomp of the empire. . "Another enemy to the beautiful, and even to the sublime," says Mr. Forsyth,* " was that colossal taste, which arose in the empire, and gave an unnatural expansion to all the works of art. In archi-tecture, it produced Nero's golden house, and Adrian's villa; in hydraulics, it projected the Claudian emissary, and Caligula's Baian bridge; in sculpture, it has left at the capitol such heads and feet, as betray the emperor's con-tempt for the dimensions of man; in poetry, it swelled out into the hyperboles of Lucan and Statius. This exaggerating spirit spread even to the games. Nero drove ten horses yoked abreast to his car, and double that number appear on an ancient stone.

The distinctive peculiarities of national character are evident in every feature of Roman architecture: they are seen in the almost constant use of the Corinthian order, in the cornices, in which no moulding was without ornament, in the sculptured representations of triumphal processions, and in the construction of immense works for the amusement of the citizens. The cornice of the temple of Jupiter Tonans has a fillet, as the only unornamented moulding; in the arch of Titus the enrichment is of like extent; and in the temple of Jupiter Stator, and in other examples, hardly inferior. The triumphal arches, in every detail of ornament, record the purpose of their erection; they sustained the triumphal chariot of the victor, and shewed portions of the procession. At Baalbec and Palmyra, the resources of decoration were exhausted, whilst the works were of vast extent.—The amphitheatres are mementoes of Roman osten-

* "Remarks on Antiquities, Arts, and Letters, during an excursion in Italy, in the years 1893 and 1803."

tation and cruelty; they are of great size, the Colosseum being large enough to contain seventy or eighty thousand people, and that of Verona, twenty thousand. They were of an elliptical form, and consisted of the arena, where the combats took place, and ranges of seats surrounding it, easy access to every part of which was gained by numerous passages, and staircases. The outside exhibited several ranges of arches placed one above another. The arena was surrounded by a wall, upon which was the podium, a kind of projecting box, generally highly ornamented; there sat the *cditor*, the senators, the vestals, and the magistrates, attended by lictors, and seated in their curule chairs. There was also the suggestum, the seat of the emperor. The podium was never less than twelve feet high, but, as an additional security from the beasts, lattices and gratings were raised, and large rollers contrived, so as to turn, whenever an animal attempted to leap on to them. Afterwards trenches, or canals were dug round the arena. But beasts were not the only victims in the shows of the amphitheatre; slaves were matched against each other, and the Roman ladies were amongst the spectators of the sanguinary exhibition. The calling of gladiator at length became an honourable one, in which senators, and even women, were proud to enlist themselves. The Emperor Commodus was so often victorious in the arena, that he signed himself conqueror of a thousand gladiators. To how low an abyse of degradation must the empire have fallen, when these brutal spectacles became the favourite amusement the nation. The Romans introduced them into whatever country they subjected to their dominion, thus we find amphitheatres at Rome, Verona, Pompeii, Pola, Nismes, Rome, Verona, Pompeii, Pola, Nismes, Corinth, and other towns in Italy, Gaul, Germany, and Spain. But the most consider-able of all was the Flavian amphitheatre at Rome, and its vast size merits the name Colosseum. It occupies an area of six acres, and was in height nearly 160 feet. At its dedication, in the reign of the Emperor Titus,* the number of beasts destroyed was, according to one author, nine thousand, and after the combats, water was introduced and a sea-fight commenced. The form of the edifice is that of an oval, of which the longer axis is 620 feet, and the shorter 513 feet. The seats are raised over the staircases leading to the several divisions; and it is to be remarked, that the utmost care has been taken to secure the facile egress of a large audience. The building was four orders in height, and there were eighty arches in each of the three lower ranges, the arches in the second and third range being once ornamented with statues. In the upper order of the exterior are blocks for supporting the poles, which sustained the cords of the velarium or awning, the supporting of which over so vast a space, was often a work of extreme difficulty. This awning was work of extreme difficulty. sometimes of the richest materials, as of purple spangled with stars. Stupendous as was the fabric, it was constructed from a part only of the materials of Nero's golden house, which was demolished by Vespasian, as too sumptu-ous for the residence, even of a Roman emperor. Six hundred years had tried its stability, when it suggested the well-known say-ing "Quamdiu stabit Colisæus, stabit et

Roma; quando cadet Colisæus, cadet Roma; quando cadet Roma, cadet et mundus." "Here (says Mr. Forsyth) sat the con-querors of the world, coolly to enjoy the querors of the world, coolly to enjoy the tortures and death of men, who had never offended them. Two squeducts were scarcely sufficient to wash off the human blood, which a few hours' sport shed in this imperial shambles. Twice in one day came the senators and matrons of Rome to the butchery ; a virgin always gave the signal for slaughter, and when glutted with bloodshed, those ladies sat down in the wet and streaming $aren \alpha$ to a luxurious supper. As it now stands, the Coliseum is a striking image of Rome itself; decayed, vacant, serious, yet grand; half grey and half green, erect on one side and fallen on the other, with consecrated ground in its bosom, inhabited by a bedesman, visited by every caste; for moralists, antiquaries, painters, architects, devotees, all meet here to meditate, to examine, to draw, to measure, and to pray."

Scarcely inferior to the amphitheatres were the magnificent thermæ, which were so numerous, and of such extent, as would defy credibility, did not the remains of those works at present exist. They included apartments for the purposes of the bath, halls for friendly intercourse, academies, theatres, and libraries. They often stood amongst extensive gardens, and walks, and were adorned with all the richness, which art could lavish. They were and lined and paved with mosaic, or with marble stained in various hues, and were embellished with the choicest productions of painting and statuary. The life of the Roman citizen may be said to have passed within their walls, and they became a main cause of that enervating influence on the Roman character, which in volved the empire in its decline and fall. But it is not meant, that pride of dominion and wealth were the only qualities which the Romans possessed; their skill in the arts of construction was shewn in the sewers, the aqueducts, and other great works, which se-cured the comfort of the inhabitants of each city, and which are entitled to our admiration. They, also, carried the influence of the arts to the very confines of the empire, and by the Emperor Hadrian, Athens was enriched with many important buildings.

Much of the effect of Roman ornament is lost by the confusion, and jarring of mouldings in immediate contact, profusely decorated. The art of sculpture has the same character, as that of architecture. Unlike the sculpture of Greece, where the simple beauty of the "human form divine" was held superior to any adornment, they arrayed the figure in all the trappings and insignia of office. Their national characteristics alike influenced both arts, and are proved by evidence more convincing than written history, the evidence of thought, of language speaking through the tongue of art. E. H.

MODERN CHURCH ARCHITECTURE IN GERMANY.

THE following review of a recent work, derived from German sources, will serve as an exponent of opinion in Germany on the subject of style in church architecture. It will be seen that it is widely different from opinion in England on the same point.

Professor Semper, on the building of Protestant (Evangelic) churches-Uiber den Bau evangelischer Kirchen. Dresden, 1845, 8vo.

Under this title the Dresden professor has published a spirited and instructive little work, which is chiefly intended for developing and defending the principles, upon which his pro-ject for the rebuilding of the St. Nicolas church, in Hamburg, is based. It tarns on the dispute between the adherents to the pointed arches and round arches style, and the author proves by a few concise (vet, as it seems to us, conclusive) reasons, that the former is not adapted by its extent to the wants of Protestant churches, destined chiefly for preaching - that it is incompatible with the erection of galleried churches (emporkirchen); that, in fine, this style has been wrongly called the ex-clusively national-German. The pointed arches style, he says—and this is the main feature of Professor Semper's work-has neither been invented, nor exclusively developed in Germany; Italy, England, and France have also adapted this style, each according to their own mind and genius, as the Germans have to theirs. This sort of architecture, therefore, is no more exclusively German than the Byzantine-Roman, to which German genius has as much impressed the stamp of national character as to the Gothic. Just the same as the Nibelungen is nearer to the German mind than the Titurel and the songs of the thirteenth century - the character of the style of round arches is more congenial to our times than that of pointed ones, which is nigh becoming antiquated. The former is more analegous to our scale of civilization, on account of the more varied elements it has received within its sphere, and its principles having attained a more perfect harmony, more analogous to our social condition, containing as it does a sigthe Christendom, nificative symbolism of which has come to us from the East, superstructed on notions of antiquity. Our churches

[•] How a good and humane prince could preside at the opening of an amphitheatre, and derive pleasure from the slaughter of men and animals, we leave others to explain; for ourselves, we are doubtful as to the truth of the received opinion. Possibly a Spaniard might not question it.

says the author-have to be churches of the nineteenth, not of the thirteenth century; as in every branch of art, the artist has not to adhere to the works of a completely developed epoch, but rather to go back to the type, to the source, whence these artists also have re-ceived their impulse. The origin of all is the same, but the end and aim diversified according to the different epochs of history and art. The assertion raised on several sides, that churches and the church are not to be considered as a work for the present time, is based on a misconception, and implies either a condemnation of those patterns, which have been, after all, a product of their times; or an accusation of the present age, as one un-holy and unsusceptible of true Ciristian devotion. This imputation, says our author, is not true, our century is not worse than the thirteenth(?). This proves, that our author has taken up the subject from varied points of -and we shall find, that those discusviewsions, which predominate within the whole of the present epoch, intrude as well on the neutral and peaceable department of art. neutral and peaceable department of art. Hence, therefore it seems, that the discussion on the pointed or round arches style will not be decided merely on artistic grounds, but other disparate predilections and tendencies will be called into aid for one or the other of the contending parties. The technical ar-guments of the author turn mostly on the necessity of galleries (Emporen); but this is not supported but by the topical advantages of the hearers during the sermon. The prejudice, however, against galleries is not an unfounded one, because the objection of their imparting to the churches a theatrical appearance, is not so easy got over. It may be further said, that the aim of a congregation is to exhibit by that the aim of a congregation is to extinct of their very contiguity the image of internal unity and oneness; but churches constructed with galleries, impart to the attendance a vith galleries, impart to the attendance a character of separation and disunion. construct a church affording an ample dis-play for the oratorical power of the minister, build in the round arches style, without emporæ-this seems to us a scope worthy of a thinking architect. But if this be impossible on account of some artistic or acoustic inconvenience-still, the empore style of churchbuilding is not to be neglected; they may be constructed as flat as possible, and the archi-tect may endeavour by some clever combination of the area of the style of pointed arches, to accomplish some pleasing combination, for avoiding the above inconvenience of separa-J. L. ting the congregation.

DECORATION OF THE NEW HOUSE OF LORDS.

As a constant subscriber to your valuable journal, the article headed "English Decora-tors of the New Houses of Lords," of course came under my notice, and has induced me to send you some information on the subject, knowing the able manner in which you at all times expose injustice and advocate the cause of the artist. I hope the press generally will come forward and expose the injustice the exhibitors at King-street bazaar have been treated with. I feel confident that the public are not aware of the system carried on, and the exposure may prevent others from experiencing the privation and difficulties many have already done. In the first place, it was understood from the notice issued by the commissioners, that none but practical workmen were expected to compete, as no premiums were offered, but the parties selected by the commissioners, if proved that they executed the works themselves, would be employed; and further, that other exhibitors who responded to their call were to be selected to assist those who were first appointed, giving the whole of the practical men a chance. Now, if the commishad been open to shopkeepers or any sions one else, a tailor might have had specimens done by foreign artists, and competed, and there would have been a far greater number of exhibitors; few of the respectable masters attempted to send in specimens, although equally capable of contributing English or foreign capable of contributing English or foreign works as Messrs. Crace, but they were more honourable, not attempting to oppose the working artist. But have they not as good a right as Messrs. Crace to a share, who have now the honour and profit the industrious and injured exhibitors ought to have had? is it

because they can give credit and send in fifty or one hundred men without drawing cash? No one will venture to say these gentlemen can execute the works they exhibited and are now employed to perform.

Mr. Pugin says there is no native talent, and he is obliged to seek assistance from foreigners. Has he sought for it? if so, he would have found it. There are the Parrises, Trebleses, Goodison, Lamberet, Glover, Cutbush, Coultoon, Elliott, Jones, Saddler, Lloyd and Rice, of the School of Design, who executed the arabesques for the Prince at the Pavilion, Buckingham gardens, and many others. Surely, some of these could be found capable of working out the designs of Mr. Pugin. Messrs. Crace are now doing the painting, gilding, pricking in colours, and arabesque decoration of the House of Peers, having artists at work at his shop upon the decorations, and yet Mr. Goodison was told there was no scope in the House of Lords for his talent, it w as mere journeymen's work; then why should not the exhibitors have the benefit of this so-called journeymen's work rather than Mr. Crace.

well know that Mr. Goodison, and Coulton, and Elliott are practical men in all the branches, and if employed, could send in journeymen as well as Mr. Crace, yet none of the appointed can meet with any redress. Surely such things ought not to be allowed to continue, and I hope the public and press will raise their voice against it. Only put Mr. Parris's cartoon in against it. Only put Mr. Parris's cartoon in the first exhibition, and his fresco in the second, in comparison with Mr. Crace's fresco of Henry VII., done by his foreigners, and I think you will say, and the public too, that Mr. Parris is as far superior to Mr. Crace as Raphael is to Parris. The fact is that most of the exhibitors have worked for Mr. Crace; Mr. Goodison, the best English decorator we have worked for him for years, and of course is used to his style of work, but when he sent in specimens in opposition to Mr. Crace, his services were no more wanted. I do not mean to charge Mr. Crace with having injured any one, but two things are certain. He must either have great interest, or have spoken ill of the exhi-bitors. Mr. Goodison, Collman, and others bitors. already named, are as capable of carrying out Mr. Pugin's designs as any one that Mr. Crace has working for him, and they were specially appointed by the commissioners, therefore thought they had as good a right to a share as Mr. Crace. They consequently called on Mr. Barry for employment, but were politely bowed out with the remark that Mr. Crace was employed by Mr. Pugin, and he was not accountable for Mr. Pugin's acts. Goodison then wrote to some of the commissioners, but with-Goodison then out effect, clearly shewing that they are a non-entity, as you will further see. If the work entity, as you will further see. If the work at the new houses had been given to the parties selected, all the exhibitors might have been employed, which would in some measure have aid them.

Will not the public, if not the exhibitors, be astonished, when I tell them that the whole of the windows that are to be filled with painted and stained glass are given to Messrs. Ballantine and Allan, Edinburgh, glass-cutters, entirely through interest. The public are not aware through interest. The public are not aware of the trouble, difficulty, and the great ex-pense of getting up stained glass: taking the exhibitors upon an average, the cost was not less than 50% each. Six were officially ap-pointed, of whom B. and A. were one, and who have now got the whole with no practical knowledge of glass painting. We shall now have foreign glass to decorate the new Houses instead of English; and I defy the commis-sioners to know but what it is done on the premises,-the tedious process and the quantity required could not be executed in the time: the commissioners are hardly aware that there are not many more than fifty journeymen glass painters to be found.

I have been informed that the method pursued by the commissioners with respect to the carvers is not exactly as stated, but is as follows :-- The commissioners were determined to employ none but good practical workmen, and to have the work done on the premises. Mr. Rogers is a dealer in carvings of good judgment, but himself a very poor hand; many of his works after Gibbons, being executed by Brown, stained, pickled, &c. &c., to give the required appearances. Those practical carvers who live in town, and were exhibitors, have met with employment. Mr. Nash, an exhibitor,

although not appointed, is selected to superintend the works. Mr. Brown, one of Mr. Rogers' best men, and two or three others, whose names I forget, have appointments as foremen over certain departments, at a salary of 2l. per week. This is the only instance where the commissioners have given the exhibitors a chance: the same course ought to have been pursued with respect to the other works.

In conclusion, I hope the decorative artists and glass-painters will call a meeting, and, throwing aside the jealonsies which now exist among them, units together in a friendly and good feeling, to protect their rights and awaken the commissioners to their promise. I am. Sir. &c., JUSTIOE. 1 am, Sir, &ci,

TIMBER TREES AND THE VEGETABLE WORLD GENERALLY.

THE study of the vegetable world is full of interest, and tends not simply to make better architects and builders, but better men. The phenomena which it presents, the adaptation of means to obtain certain ends, and the manner in which it affects and is affected by the animal world, fill the mind with astonishment, while by the contemplation of them our views are enlarged and corrected, and our capacity for the enjoyment of nature is increased.

The effect of animal respiration, as our readers know, is to vitiate the atmosphere by the absorption of the oxygen it contains, and the production of carbonic acid gas, which is fatal to life. How beautiful it is to find that the vegetable world is always acting to restore the atmospheric air to its original composition of twenty-one parts per cent. of oxygen, by the absorption of the carbonic acid gas and the liberation of oxygen. The leaves of the common lilac placed in a jar filled with atmospheric air will raise the proportion of oxygen to 29 or 30 per cent., and by introducing several plants into the same jar in quick succession, the proportion may be raised from 21 (the ordinary amount) to 39 per cent., thus almost doubling it. The presence even of a small moss in a vase in which fishes are kept, aids so considerably in maintaining the supply of oxygen necessary for their respiration, that it is not necessary to charge the water so frequently as when no plant is present. The power possessed by plants of taking up carbonic acid gas seems analogous to that by which food is collected by animals; it is at first taken up more eagerly than afterwards; a keen appetite, it may be said, is in operation which flags when satisfied. It was formerly considered that this compensating action on the part of plants ceased at night, and that they also then evolved carbonic might, and that they also then evolved carbonic acid gas. A series of valuable experiments by Mr. W. H. Pepys, F. R.S.* has proved, however, that this is not the case. The proper action is accelerated by the aid of light but continues even during the night, although more slowly, and from healthy plants carbonic acid gas is never given off.

There is, nevertheless, one class of trees, the cypress, yew, cedar, and arbor vitæ, which, if they do not actually diminish the quantity of oxygen in the atmosphere (and this is not quite certain), at all events do not increase it. Dr. Dickson (of St. George's hospital) published an interesting letter last year on the trees and shrubs proper for cemeteries, t wherein he drew attention to the fact that the trees we have mentioned, "Dark trees, fuuereal, cypress, yew, and shadowy pine, and spicy cedar," which almost by prescriptive right are the occupants of the spots set apart for the dead, and cupants of the spots set apart for the dead, and give our burial grounds a gloomy and almost repulsive aspect, are precisely those that for the reason stated should not be placed there. Dr. Young's sketch of the functions and characteristics of the vegetable world is con-cise, and may be usefully introduced here. He

says :-- § "The vegetable kingdom presents to us a "the variety and spectacle highly interesting by its variety and

* "Provincial Medical Journal," March 9, 1844.
* All these trees belong to one class, termed non-reproductive, because when cut down, no shoots spring from the roots. This was one reason why the ancients selected the cypress to plant by the grave, which to them was the end of existence. Viewed in this light it has been well observed, "the cypress is no meet emblem of a Christian's grave."
§ Lectures on Natural Philosophy and the Mcchamical Arts," new edition, edited by the Kev. P. Kelland, M.A., Taylor and Walton, Upper Gower-street.

^{*} Published in "Philosophical Transactions" for 1843, p.

by its elegance; but the economy of vegetation appears to be little diversified, although little nnderstood. With respect to the apparent perfection of their functions, and the complication of their structure, we may consider all vegetables as belonging to two principal divisions, in one of which the seed is prepared with the assistance of a flower, having its stamina and its pistils, with petals or a calyx; while in the other, the preparation of the seed is less regular and conspicuous, and hence such plants are called cryptogamous. In some of these there is a slight resemblance to the resemblance to the flowers of other vegetables, but on the whole, the class appears to form one of the connecting links between the three kingdoms of ing links between the three kingdoms of nature; its physiology is probably simple, but it has been little examined. The herbs, palms, shrubs, and trees, which constitute the nu-merous genera of flowering vegetables, exhibit the greatest diversity in the forms and dispositions of the organs of fructification, while they have all a general resemblance in their internal economy.

436

Every vegetable may be considered as a congeries of vessels, in which, by some unknown means, the aqueous fluids, imbibed by its roots, are subjected to peculiar chemical and vital actions, and exposed in the leaves to the influence of the light and air; so as to be rendered fit for becoming constituent parts of the plant, or of the peculiar substances contained within it.

The first process in the germination of a seed is its imbibing moisture, and undergoing a chemical fermentation, in which oxygen is absorbed, and a part of the mucilage contained in the seed is converted into sugar; a substance probably more nutritive to the young plant. The radicle shoots downwards, and the seed leaves, or cotyledons, which are generally two, although sometimes more or less numerous, raise themselves above the ground, till in a short time they die and drop off, being succeeded by the regular and more adult leaves.

In every transverse section of a vegetable, we commonly discover at least four different substances. The parts next to the axis of the substances. tree or branch consist of medulla or pith, which is supposed by some to be the residence of the vegetable life of the plant; but a tree may live for many years after being in great measure deprived of its medulla. The pith is of a loose and light spongy texture; it sends a ramification into each branch and each leaf, where it appears to serve also as a reservoir of moisture. The pith is surrounded by the woody part, composed of fibres more or less strongly compacted together, but not actually ramifying into each other in any great degree, there is reason to suspect some although lateral communications between them. are interrupted, at certain intervals, in many trees, by fibres, in a radiating direction, forming what is called the silver grain. Like the bones in animals, the wood constitutes the strongest part of the vegetable ; and, like them too, it is in a certain degree furnished with vessels. It has even been supposed by some, that the fibres themselves are distinct tubes, and by others, that the insterstices between them serve the purpose of vessels, but neither of these opinions is at present generally re-ceived. The wood consists of a number of concentric layers or strata, formed in successive years; the external part, which is last formed, is called the alburnum, or white wood, and this part is the most vascular. The bark encompasses the wood; and this also consists, in trees, of several layers, which are produced in as many different years; the external parts usually cracking, and allowing us at their divisions to observe their number, the inner layer only being of immediate use. This layer is called the liber, and since this material was once used instead of paper, the Romans called a book also liber. The bark consists of fibres of the same kind as the wood, but more loosely connected. It is covered by the cuticle, which extends itself in a very great degree, as the growth of the vegetable advances, but at last cracks, and has its office supplied by the outer layers of bark. Between the bark and the cuticle a green pulpy substance, or parenchyma, is found, which seems to be analogous to the rete mucosum, interposed between the true skin and the cuticle in animals. Mr. Desfontaines' has observed, that in palms, and

in several other natural orders of plants, the annual deposition of new matter is not confined to the external surface, but that it takes place in various parts of the plant, as if it were composed of a number of ordinary stems united together.

There are three principal kinds of vessels in the different parts of vegetables: the sap vessels, which are found both in the wood and in the bark, although their nature appears to require further examination : secondly, the air vessels, or tracheae, which are composed of single threads wound into a spiral tube, like the spring of a bell, and capable of being easily uncoiled; these, though they have been called air vessels, and supposed by some to serve the purposes of respiration, are described by others as containing, during the life of the plant, an aqueous fluid: and they are probably little more than sap vessels, with an additional spiral coat; they are not found in the bark, nor in all species of plants; and it has thence been in-ferred that they are not immediately necessary to the growth of the plant. The third kind are the proper vessels of the plant, which are generally disposed in concentric circles, and appear to be unconnected with the sap vessels, and to contain the milky, resinous, and other peculiar juices, which are found in different kinds of plants; for the sap is nearly the same in all, at least it is independent of the gums and resin, which often distinguish particular plants; it contains a certain portion of mucilage, and probably in some plants, as the

sugar maple, a considerable quantity of sugar. Mr. Mirbel[•] has also made a number of still more accurate distinctions respecting the structure of the different kinds of vessels. The circulation of the sap is not completely understood; when an orifice is made near the root of a tree, it flows most copiously from above: when near the summit, from below. Dr. Hope actually reverted the natural course of the juices of a tree, without changing its position; by inoculating a willow with two others, he completely united its existence with theirs, and then, removing its roots, he found that its vegetation was supported by the juices of the two others. A tree may also be actually inverted, and the upper part will strike root, the lower putting out branches and leaves.

Plants perspire very considerably, and also emit a quantity of gases of different kinds; they generate a slight degree of heat, which be observed by means of the thermometer, mav and by the melting of snow in contact with them. The growth of every tree takes place at the internal surface of the bark, not only the bark itself being formed there, but the wood also being deposited by the bark; for Dr. Hope separated the whole of the bark of a of willow from the wood, leaving it branch connected only at the ends, so as to constitute a hollow cylinder, parallel to the wood; and he found that new layers were formed within the bark : and in another experiment a part of the wood, deprived of the bark, although protected from the air, was also covered with new bark as it grew over from the old bark above and below. The layers of wood, which are added in successive seasons, and keep a register of the age of the tree, are very easily observed when it is cut across; sometimes as many as 400 have been found in firs, and oaks are said to have lived 1,000 years.

Mr. Knight+ has inferred, from a great variety of experiments, that the sap, either usually or universally, ascends through the wood into the leaves, and then descends through the bark to nourish the plant. The leaves seem to be somewhat analogous to lungs, or rather to the gills of fishes: for plants have need of air, and it has been found, that even seeds will not germinate in a vacuum. As the lungs of animals appear to be concerned in forming the blood, so it may be inferred from Mr. Knight's experiments, that the sap first ascends to the leaves through the external fresh wood or alburnum, and through the central vessels of the young leaves and branches, derived from the alburnum, and accompanied by the spiral tubes; and after being perfected by exposure to light and air in the leaves, it descends in the bark, and serves for the secretion of the alburnum, and of the internal lavers of the bark, being conveyed probably by two

distinct sets of vessels. The sap, thus prepared by the leaves in the summer and autumn, is supposed to leave its extractive matter in the tree throughout the winter, in such a state as to be ready to unite with the addeous juices, which ascend from the root in the succeeding spring. The internal parts of the wood, having served the purposes of vegetation, are hardened, and perhaps dried up, so as to be afterwards principally subservient to strengthen alone."

principally subservient to strengthen alone." Mr. Gwilt, in his "Encyclopædia of Architecture," has given much useful information on the subject of timber as used for building, already treated of at some length in THE BUILDER.[‡] We availourselves of a few notes from it.

" If the architect has the opportunity of selecting the timber whilst in a state of growth, he will, of course, choose healthy, vigorous, and flourishing trees. Those in which the trunks are most even are to be preferred. A mark of decay is detected in any swelling above the general surface of the wood. Dead branches, especially at the top of the tree, render it suspicious, though the root is the best index to its soundness. The notion of Alberti (De Re Ædificatoria) of using all the timber in the same building from the same forest, is a little too fanciful for these days, though we confess we have some miggivings in impugning an authority which, in most other respects, we are inclined to receive with the highest veneration.

In felling, not only the cak, but all other large trees, the great branches should be first cut off, so that the tree may not be injured or strained in its fall; and the trunk, moreover, must be sawed as close to the ground as possible. When felled, but not before, it is to be barked, trimmed of its branches, and left to season. Before, however, leaving it for this purpose, it is considered by workmen better to square it, which, it is thought, prevents its tendency to split. If to be employed for posts, boring it has been employed with success: but it is needless to observe, that in pieces subject to transverse strains such a practice is not to be spoken of.

The pieces selected for building most be chosen with the straightest grain; but there are pieces which are occasionally employed, as for knees and braces, wherein a curvilinear direction of the fibres of the timber is extremely desirable. It may, however, be generally stated, that, in the case of two equalsized and seasoned pieces, the heavier is the piece to be preferred.

In oak, as in all other woods, the boughs and branches are never so good as the body of the tree; the great are stronger than the small limbs, and the wood of the heart stronger than all. When green, wood is not so strong as when thoroughly dry, which it rarely is till two or three years after it is felled. It is scarcely necessary to say, that, containing much sap, it is not only weaker, but decays sooner. It is weakened by knots, at which, in practice, it is found that fractures most frequently occur; and it is important to the architect to recollect that he should always reject cross.grained pieces.

PRESERVATION OF TIMBER.

The preservation of timber, when employed in a building, is the first and most important consideration. Whenever it is exposed to use alternations of dryness and moisture, the pro-Whenever it is exposed to the tection of its surface from either of those actions is the principal object, or, in other words, the application of some substance or media to it which is imperviable to moisture; bat all timber should be perfectly dry before the use of the medium. In Holland, the application of a mixture of pitch and tar, whereon are strewed pounded shells, with a mixture of sea sand, is general; and with this, or small and sitted beaten scales from a blacksmith's forge, to their drawbridges, sluices and gates, and other works, they are admirably protected from the effects of the seasons. Semple, in this work on 'Aquatic Buildings,' recommended, that 'after your work is tied up, or even put together, lay it on the ground, with stones or bricks under it, to about a foot high, and burn wood (which is the best firing for the purpose), under it, till you thoroughly heat, and even scorch it all over; then, whilst the wood is hot, rub it over plentifully with linseed oil

2 See series of articles by Mr. Wylson in Vol. 11., and at pp. 13, 32, 86, current volume.

and tar, in equal parts, and well boiled together, and let it be kept boiling while you are using it; and this will immediately strike and sink (if the wood be totally seasoned) one inch or more into the wood, close all the pores, and make it become exceeding hard and durable, either under or over water.' Semple evidently supposes the wood to have been previously well-seasoned.

If timber, whatever its species, he well-seasoned, and he not exposed to alternate dryness and moisture, its durability is great, though from time it is known to lose its elastic though from time it is known to lose its elastic and cohesive powers, and to become brittle, if constantly dry. On this account it is unfit, after a certain period, to be subjected to various strains; however, in a quiescent state it might endure for centuries. Dryness will, if carried to an excess, produce this category. The mere moisture it absorbs from the air in demonstrates of the state of the states dry weather is not sufficient to impare its durability; so, also, timber continually exposed to moisture is found to retain for a very long period its pristine strength. Heat, with mois-ture, is extremely injurious to it, and is in most cases productive of rot, whereof two kinds are the curse of the builder, the wet and the dry rot, though perhaps there be but little differ-ence between the two. They appear to be produced by the same causes, excepting that the freedom of evaporation determines the former, and an imperfect evaporation the other. In both cases the timber is affected by a funguslike parasite, beginning with a species of mildew; but how this fungus is generated is still a vexata questio; all we know is, that its vegetation is so rapid, that often before it has arrived to its height, a building is ruined. From our inquiries on the continent, we believe the disease does not occur to the extent that it does in this country; a fact which we are inclined, perhaps erroneously, to attribute to the use of the timber of the country, instead of imported timber. Our opinion may be fanciful, but there are many grounds on which we think that this is not altogether the case. Our notion is, that our imported timber is infected with the seeds of decay long before its arrival here (we speak of fir more especially), and that the comparative warmth and moisture of the climate bring more effectually the causes of decay into action, especially where the situation is close and confined. Warmth is, doubtless, known to be a great agent in the dry rot, and more especially when moisture co-operates with it; for in warm cellars and other close confined situations, where the vapour and which feeds the disease is not altered by a constant change of air, the timbers are soon destroyed, and become perfectly decomposed.

The lime, and more especially the damp brickwork, which receive the timbers of a new building, are great causes of decay to the ends of them; but we do not think that the regulations of the 19 Car. 11., chap. 3, which directed the builders, after the fire of London, to bed the ends of their girders and joists in loam instead of mortar, would, if followed out in the present day, be at all effective in preventing the decay incident to the ends of timbers. Timber in a perfectly dry state does not appear to be injured by dry lime, and, indeed, lime is known to be effectual in the protection of wood against worms.

Nothing is more injurious to the floors of a building than covering them with painted floorcloth, which entirely prevents the access of at-mospheric air, whence the dampness of the boards never evaporates; and it is well known that oak and fir posts have been brought into premature decay by painting them before their moisture had evaporated; whilst in the timber and pewing of old churches which have never been painted, we see them sound after the lapse of centuries. Semple, in his "Treatise on Building in Water" notices an instance of some field gates made of the fir of the place, part whereof near the mansion were painted. and had become rotten, while those more distant from the mansion, which had never been painted, were quite sound. After timber is felled, the best method of

preventing decay is the immediate removal of it to a dry situation, where it should be stacked in such a manner as to secure a free circulation of air round it, but without exposure to the snn and wind, and it should be rough squared as soon as possible. When thoroughly seasoned before cutting it into scantlings, it is less liable to warp and twist in drying. The

ground about its place of deposit should be dry and perfectly drained, so that no vegetation may rise on it. Hence a timber-yard may be may rise on it. Hence a timber-yard may be strewed with ashes, or the scales from a foundry or forge, which supply an admirable antidote to all vegetation. It is thought that the more gradually timber is seasoned, the greater its durability; and as a general rule it may be stated, that it should not be used till a period of at least two years from its being felled. and for joiner's work at least four years. Much, however, is dependent on the size of the pieces. By some, water seasoning has been recommended; by others, the steaming and boiling it; smoking, drying, charring, and scorching have also been recommended. The latter is, perhaps, the best for piles and other pieces that are to stand in the water or in the ground. It was practised by the ancients, and is still in use generally for the posts of park paling and the like. In Norway, the deal planks are seasoned by

laying them in salt water for three or four days, when newly sawed, and then drying them in the sun, a process which is con-sidered to be attended with advantage, but it does not prevent them shrinking. Mr. Evelyn recommended the water seasoning for fir, but we incline to think that gradual dry season-

ing is the best method. Notwithstanding, however, all care in seasoning, when timber is employed in a damp situation it soon decays, and one of the principle remedies against that is good drainage, without which no precaution will avail. It is most important to take care that earth should not lie in contact with the walls of the building, for the damp is quickly com-municated in that case by their means to the ends of timbers, and rot soon follows. No ex pedient to guard against this contingency is so good as what are called air or dry drains, which are areas formed by thin walls round the building, with apertures in the paving laid between them and the principal walls, so as to afford a constant current of fresh air. When the carcase of a building is complete, it should be left as long as possible to dry, and to allow to the timbers what may be called a second seasoning. The modern practice of finishing buildings in the quickest possible period has contributed more to dry rot than perhaps any other cause, and for this the architect has been blamed instead of his ementry as possible. After, however, the walls and timbers of a building are once thoroughly dry, all means should be employed to exclude a fresh accession of moisture, and delay becomes then prejudicial."

NATIONAL ENCOURAGEMENT OF THE FINE ARTS.

WE solicit our readers' attention to the

postponed the exhibition of historical paintings in oil until 1847, and announced instead, that specimens of fresco painting may be sent to Westminster Hall in 1846,—but observe, not for public exhibition,—great uncertainty must be felt by those artists who have, during now the last three years, answered the call upon their profession by the royal commission. The object of thus submitting specimens of fresco can only be to obtain employment in assisting the few selected artists in the execution of their works. Now, it may fairly be asked, seeing that public competition in cartoons and fresco appears to be ended, what is to become of the talent and the time bestowed on innumerable experiments in the difficulties and vexations of fresco painting by the other competitors? Is it fair, is it just towards those artists (many of whom have distinguished themselves, although they be not among the selected few), to suffer this amount of talent to be useless ?—for useless it must be, unless some method can be proposed to keep up their practice. Surely after the enthusiasm shewn by them in producing so many large works, at a great expenditure of time and money, something should be thought of. Are there no publie buildings, no colonnades, no halls available in London, where frescos could be exe-cuted? If no better plan can be devised, wall can be built up, and painted on both sides.

Cannot the Government be induced to run up seven or eight hundred feet of wall, built upon public land, for this purpose, and inclosed with shed coverings, such as we constantly see erected for masons and workmen employed on buildings. Were accommodation thus pro-vided for fresco painters, finer works would be produced than any we have yet seen, and no doubt most of the competitors would gladly avail themselves of the opportunity thus afforded. Artists have been so taxed in the late competitions, that it cannot be expected they could enter upon the further expenses of building wall and the proposed temporary coverings, paying also a rent for the ground, and all perhaps without a ray of hope that their efforts would be patronized as nativo efforts deserve to be. I do sincerely hope that the competitors will associate for the purpose of historical painting and the improvement of fresco practice, and, if possible, prevail on the proper authorities to grant them ground and materials for some temporary exhibition place, which may have the sanction and patronage of the Queen and the Royal Cominission.

Many of your correspondents will be enabled by their experience to suggest improvements on this plan and the mode of accomplishing it; such information will be highly valuable, and assist materially the object proposed.

It is intended at an early opportunity to call a meeting of those artists who have competed in cartoons and fresco during the last three years, when some plan, founded upon the above suggestions will be proposed, and any information your correspondents can afford will be highly esteemed by, Sir, your most obedient servant, A COMPETITOR.

Communications may be addressed to " B.", Institute of the Fine Arts, Newman-street, Oxford-street.

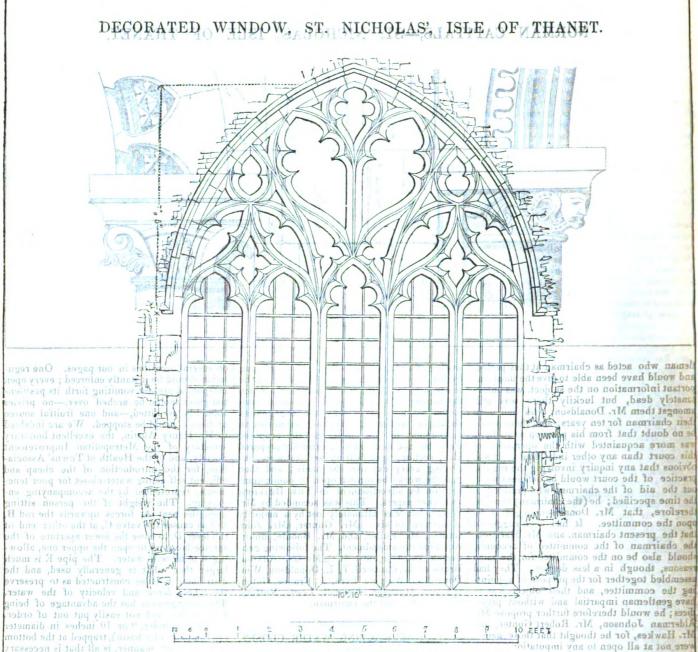

EFFLORESCENCE ON BRICK WALLS.

THE surfaces of new walls, especially those built of bricks, are usually spotted with a white silky efflorescence, of a fine crystalline charac-ter. It is also very light and pulverulent; has a cool acidulated, or disagreeable alkaline taste. It has much the appearance of snow, and gives to walls a rather strange and un-pleasing look. This flowery substance gathers soluble, on them very rapidly; but from being soluble, it becomes either melted or blown off by the weathering action of rains or winds; yet pe-riodically accumulates again. This saine efflo-rescence is produced through a chemical affinity which subsists between the acids of the atmo-sphere, and the acids and alkali contained in the lime and magnesia in the bricks, as well as in the mortar or cement which is used in bedding and connecting them together. Most brick earths or clays contain about 5; per cent. of carbonate of lime, and about 3; per cent. of carbonate of magnesia; but sometimes a large quantity of calcareous matter or chalk is added, in order to improve the character of the bricks which are to be made from it.

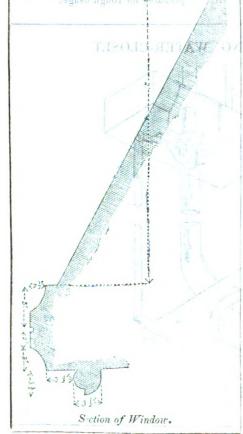

The water of the ocean is impregnated with muriate of soda to the extent of about one-thirtieth of its whole quantity; and the waters of many of our mineral springs are also highly impregnated with it, and likewise with a con-siderable quantity of carbonate of lime. The siderable quantity of carbonate of lime. efflorescence is generally composed of the nitrates of lime, magnesia, and soda; and sometimes of muriate of soda; and from the chemical action already noticed, these nitrates decompose or part from the lime and magnesia in the bricks and mortar or cement, and, by distillation, pass through the pores of the bricks, gathering on their exposed surfaces like spots and streaks of snow. It appears mostly on the surfaces of those bricks which have much chalk mixed with them, and which have When not been very much burnt or vitrified. mortars and cements are made with either sea or mineral waters, they give off, for some time after being used, in consequence of their alkaline character, considerable quantities of this saline efflorescence. It can very easily be washed away; but if it be allowed to crystallise, and be then heated and rubbed over the surfaces of the bricks, filling their pores, it will prevent them to some extent from attracting and absorbing moisture from the atmosphere. John Phillips.

water-closet, requiring n

WINDOW AND CAPITALS

FROM ST. NICHOLAS' CHURCH, ISLE OF THANET.

RICKMAN describes this church in the following words :-- " It is a large church with a lofty embattled tower; most of the church is also embattled; some portions are early English, and there are some good decorated windows, particularly the east window of five lights."

To this slight notice much more might be added, but it will perhaps be sufficient to mention, that the church contains very excellent specimens of all the styles from Norman to perpendicular, and will be found well worthy of attentive examination. The subject of the illustration, fig. 1, is the east window of the chancel, already alluded to; it has five lights, and is of very fair design, its only fault being the meagre appearance of the mouldings. The illustration comprises an exterior elevation and the moulding of the jamb at large.

In this same church, there is a great variety of moulded and ornamented capitals to piers. Among the most curious are those represented by figs. 2 and 3, which are very excellent specimens of the transition from Norman to early English. The arch-mouldings and enrichments are also well worthy of notice, and are included in the illustration.

Margate. W. CAVELER,

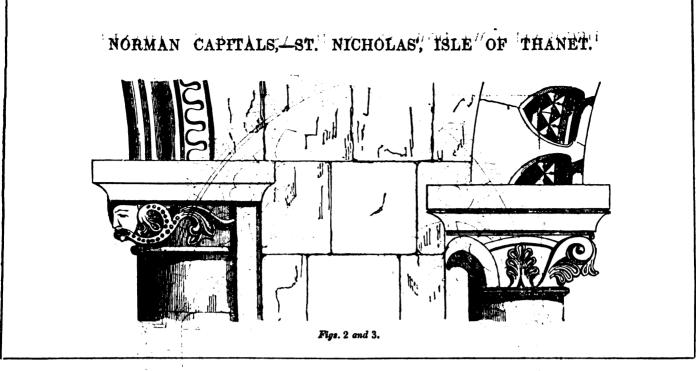

ASSERTED ABUSES IN THE WESTMIN STER COURT OF SEWERS.

AT a court of sewers for the city of We At a court of sewers for the city of West-minster, held on Friday, the 5th instant, Mr. Allason proposed a motion for the adoption of an amended mode for the construction of sewers, the one in operation at present being very deficient for that purpose. At the same time he laid upon the table three diagrams of the improved mode the improved mode.

The court ordered that Mr. Allason's motic

The court ordered that Mr. Allason's motion should be adopted, and that the diagrams should be lithographed and added to it. The chairman, Mr. Edward Willoughby, rose and said, they had now come to that part of their proceedings which related to Mi Leslie's pamphlet. In this case, at the lass sitting of the court, a letter had been sub-mitted from the Secretary of State, requesting them to favour him with any observations they would wish to make against the allegations of abuses in this court. It appeared that it was his desire to hear both sides of the question. He (the chairman) did not propose to invite He (the chairman) did not propose to invite the attention of the court to the pamphlet itself, but he would suggest that a committee be appointed to draw up observations upon it, and report them, at its earliest convenience, to a future court. The remarks in the pamphlet travelled ensure the pamphlet travelled over a large period of time, going to the year 1810, and from thence up to 1844 to the year 1810, and from thence up to 1811. It was quite clear, therefore, that the com-mittee would not be qualified to make thos satisfactory inquiries which were needed unless it contained in its composition some of those commissioners who took part in the pro-ceedings of this court at that fime. One gen-

* See p. 308, ante.

tleman who acted as chairman at that period, and would have been able to give the most important information on the subject, was unforfunately dead, but luckily there was still amongst them Mr. Donaldson, who had been their chairman for ten years, and there could be no doubt that from his position as such, he was more acquainted with the operations of this court than any other individual.' It was obvious that any inquiry involving the regular practice of the court would be deficient without the aid of the chairman who presided at the time specified; he (the chairman) thought therefore, that Mr. Donaldson ought to be upon the committee. It had been suggested that the present chairman, and Mr. Harrison, the chairman of the committee of accounts, should also be on the committee for the same reasons, though in a less degree. They had seemons, though in a less degree. I hey had assembled together for the purpose of appoint-ing the committee, and their object was to have gentleman impartial and without preju-dices; he would therefore further propose Mr. Alderman Johnson, Mr. Robert Gunter, and Ma Hawken for he theoret there there are Alderman Johnson, Mr. Robert Gunter, and Mr. Hawkes, for he thought that those names were not at all open to any imputation or fear that they would not form their judgment with fairness, and he (the chairman) would feel very much pleased to co-operate with those gentle-men. His endeavour was to appoint such a committee as would carry out their duty with fallity

fidelity. Mr. Gunter declined to act, his health not Mr. Gunter declined to act, his nearth not being sufficiently good to permit him to give the attention and application necessary for such an inquiry. All who are interested in the subject, and know Mr. Gunter's clear head and rigorous integrity, will regret that he was not induced to act.

obliged to decline, as he was going out of town. Mr. Hawkes also wished to withdraw, town. Mr. Hawkes also wished to withdraw, on the ground that he was not in office at the time alluded to in the pamphlet. Mr. John White was requested to join the committee, but he thought he ought not to do so, as he had often expressed himself strongly against the, proceedings of the court; afterwards, however, Mr. White consented to act. The. following gentlemen constitute the committee as ultimately formed : — Mr. Wil-loughby, Mr. Donaldson, Mr. Harrison, Mr. Alderman Johnson, Mr. Hawkes, Mr. John White, and Mr. Frederick Crace; three to be a quorum.

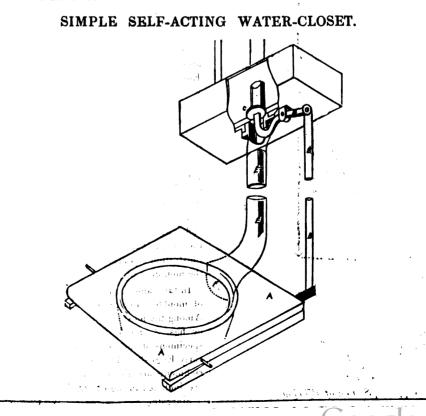

a quorum. On a notice being read of a motion to sanc-

tion an order of the court for building 450 feet of main sewer in Gloucester-road, Pad-dington, estimated at 1,2371. Mr. Leslie ob-jected strongly to certain proceedings by which an amendment on this motion moved by him an amendment on this motion moved by him at the last meeting had been set aside. He also accused the court of levying a rate upon the public in order to make a balance in the hands of the banker and whilst, he said, there were 20,0007, in the bank, not a single public

work was in hand. He objected to the abiding by the contract made for the building of the wer, urging the inefficient manner in which be the former part of the work had been com-pleted as the reason why the engagement should be broken off. He then submitted an amendment to the effect, that the proposed amendment to the effect, that the proposed work be not done until a carefully prepared plan, section, specification and estimate, in-cluding every expense, be made; and then that the works be thrown open to public com-petition by advertisement in THE BUILDER and other papers. This was seconded by Mr. White, but was ultimately lost by a majority of sixteen to six. Mr. Gunter, Mr. John Gunter, Mr. Fulker, and Mr. Boodle, junior, voted for the amendment. The following gen-tlemen voted against it : Messrs. Allason, Branscombe, Cantwell, T. L. Donaldson, Wm. Donaldson, Walpole Eyre, J. France, Gutch, Hawkes, Harrison, Kendall, Lewis, Nutting, G. O. Smith, and the chairman. G. O. Smith, and the chairman.

SIMPLE SELF-ACTING WATER-CLOSET.

on several occasions in our pages. One regu-lation should be instantly enforced ; every open cesspool at present vomiting forth its pestilencesspool at present vomiting forth its pestilen-tial gases should be arched over, —no privies should be permitted, —and one fruiful source of disease would be stopped. We are indebted to Mr. Henry Austin, the excellent honorary secretary of the Metropolitan Improvement Society, and of the Health of Towns' Associa-tion, for the introduction of the cheap and efficient self-esting water-cleast for noor tangefficient self-acting water-closet for poor tene-ments, represented by the accompanying en-graving. The weight of the person sitting upon the seat A, forces upwards the rod B, and so causes the valve C, at the other end of the lever D, to close the lower aperture of the service box, and to open the upper one, allow-ing it to fill with water. The pipe E is much larger than what is generally used, and the distributer F is so constructed as to preserve the whole force and velocity of the water. This arrangement has the advantage of being In a strangement in a the advantage of being inexpensive, and not easily put out of order. A metal cylinder, 9 or 10 inches in diameter (in the place of a basin), trapped at the bottom in an ordinary manner, is all that is necessary to make a complete water-closet, requiring no care, and prepared for rough usage. THE poisonous effect of the effluvia arising from decomposing matter has been adverted to

WORKS IN THE PROVINCES.

THE proposal to enlarge the parish churchyard at Gainsborough has led to another which has met with far more general approbation, vis., the formation of a cemetery. Two meetings have already been held on the subject, and there is little doubt but at the next, active proceedings will be determined upon-great "Peter" bell in York Minster The bell in York Minster is now great " safely suspended in its own tower. It is placed (at a height of nearly 200 feet) diagonally in the tower, for the greater security to the build-ing, and above 300 cubic feet of timber have been used for its support. It may be rung with two wheels, and will revolve entirely if necessary.—The new district church, at Blaydon, in the county of Durham, has been consecrated by the bishop of the diocese. It is dedicated to St. Cuthbert.——Ground has been purchased in the parish of Bradpole, near Bridport, for the erection of a Roman Catholic church, and tenders for commencing the work forthwith have been advertised for.----The restoration of Sudely castle, which has been steadily progressing for some considerable time past is now nearly completed.——The tenders for enlarging St. Peter's church, Bed-Francis and Son, Taylor, and George Small, was accepted for the sum of 3511. The works will be commenced immediately.—At Bridg-water a Roman Catholic chapel is about to be erected. The site chosen is in St. John'sstreet.——Some pillars, and other remains of a Roman building, and two beautiful coins of the Emperors Antoninus and Domitian, have been discovered in High-street, Stamford.-At Hull, the Kingston Cotton Mill Company have procured a site for their intended works at Wincolmbe, on the west side of the river Hull. The purchase consists of upwards of twelve acres of ground.—The Government have it in contemplation to dispose of the prisons at Prince-town, Dartmoor. They cover a space of thirty acres, and during the late war 10,000 prisoners were lodged within them. -The Rev. Hugh M'Neile has commenced the erection of a very spacious residence for himself and family at Aigburth, Liverpool. Messrs. Samuel and James Holme are the builders. No time has yet been fixed for laying the foundation stone of Mr. M'Neile's church in the Princes park.---- The new new church at Milton-next-Gravesend, an account of which has already appeared in The of which has already appeared in The BUILDER (see p. 365 ante), was consecrated last week by the Bishop of Rochester. It is dedicated to the Holy Trinity.——The clear-ing of a site for the proposed Free Church College, Edinburgh, has involved the removal extensive cluster of houses, mostly of of an great antiquity, situate between the Castle-hill and the head of the Mound. This range of buildings includes the palace and chapel of Mary of Lorraine, widow of James V., and queen-regent of Scotland from 1554 to her death in 1560. A new police office is being erected in the High-street, Edinburgh, the design for which a local paper mentions in high terms of approval. — The first stone of a new church at Winchester is to be laid during the first week of October by the high steward of the city, the Right Hon. Charles Shaw Lefevre, Speaker of the House of Comns, assisted by the mayor and corporation. -The Rev. H. Fardell having at his own mons, expense restored the south porch of Wisbeach Church, the parishioners have determined upon defraying the cost incident to the restoration of the other parts of the building. It is proposed to bring the fabric as nearly 38 possible to its original condition. — The monument erected by the Marquis of Lans-downe on Cherhill-hill is now completed, with the exception of the steps which are to surround its base, Mr. James Simpson, the eminent water-works engineer, has been in Newcastle and the neighbourhood during the last week, taking preliminary stops for the execution of the works of the Whittle Dean Water Company.—A wooden chapel was opened last week at Hinton Dyrham, near Bristol. The building, which will accommodate about 150 persons, is 27 feet long, 18 feet wide, and 14 feet high : the cost is about 150l. Messrs. Foster and Mees, of Bristol, were the builders.builders.----Government has recently pur-chased twenty-one acres of land near the town of Tipperary, for the purpose of erecting pulous locality.

THE BUILDER.

barracks to accommodate 2,000 soldiers. They are intended for a general army depôt in that part of Ireland.——The old abbey church at part of Ireland.—The old abbey church at Dunfermline is about to undergo a complete renovation. Mr. Nixon, the crown architect for Scotland, has recently inspected the building by order of the Commissioners of Woods and Forests. The result is a determination to erect a new roof, to restore the windows to their former size and style, to beautify the old pillars, and to give the entire church an appearance similar to what it had when Malcolm, its founder, and his good queen, Margaret, trod its aisles. The expense is estimated at 2,000/.---- It is the determination of several railway companies whose lines pass through Wolverhampton, to unite in the erection of one grand station as near the centre of that town as possible. The bottom of Queen-street is the spot named for the joint terminus.

JOTTINGS ABOUT RAILWAYS.

MR. DE LA HAYE, of Liverpool, has just made public a plan he has long contemplated for the construction of submarine railways applicable to rivers and narrow seas. His pro-position is to construct wrought-iron tunnels in divisions of about 400 feet in length, and to place them on the bed of the sea. He submitted the idea and its details many months since to Sir Joshua Walmsley and Mr. George Stephenson, and in all probability it led to the project of the latter gentleman to cross the Menai Straits by means of a suspension tunnel. -Amidst the many projects connected with railways, we find one now in course of adoption for the establishment of a club-house in London, where gentlemen of all ranks may daily meet for the interchange of railway information. A mansion has already been taken at the West End. Another project of a similar character is an attempt to form a Railway Club-house Chambers and General Goods Depôt Company, the object of which is to provide a suitable fire-proof building for the general concentration of railway business, a portion of which to be converted into a commodious commercial club-house for the resort of directors and shareholders, a large hall for the holding of general and other meetings, suites of private offices for railway companies, and an extensive range of warehouses for the reception and transit of goods. The pro-posed capital is 300,0002. — A prelimi-nary announcement has been issued during the past week to the effect that a company is in course of formation with the object of establishing a complete system of telegraphic communication, connecting the metropolis with the different ports and cities of the kingdom Messrs. Cooke and Wheatstones by means of The 5 feet 3 inch gauge is the one universally adopted there. It was recommended by the Board of Trade in the case of the Dublin and Drogheda railway. The gauge of the Ulster line, which at present is 6 feet 2 inches, is about to be altered to the above standard, the expense of which will be shared in equitable proportions by the lines running northward. The conversion of canals into railways is becoming so general, as to leave little doubt that in the course of a few years the former mode of transit will be entirely destroyed. A group of canals having at one of their extremi-ties the Chester and Birkenhead railway, and at the other the London and Birmingham, are to be converted into one extensive London and Birkenhead line.——The Kennet and Avon canal is about to merge into the London, Newbury, and Bath direct railway. Mr. Blackwell and Mr. Maclean are the engineers. This conversion will be effected for about 414,800*l*., or about 7,500*l*. per mile.

STONE BRIDGE OVER THE RIVER TAFF.-Since the appearance of the article on this bridge which appeared in last week's BUILDER, we have learnt that in consequence of the inconvenience and danger attending the old structure, the owners of property in the neighbourhood of Newbridge contemplate the erection of a new bridge below the site of the present bridge, so as to afford better accom-modation for that rapidly improving and po-

ARCHITECTURAL PRIZES IN ROME.

Rome, 21st August .- The Papal Academy Rome, 21st August.—1 he Papai Academy of Arts San Luca, whose chair had been once filled by Thorwalsden, has proposed several great prizes, open to artists of all nations (and of all confessions). Those of architecture are the following. First class. Plan of a splendid royal residence in a large city. Its chief ap-partments to be hall of throne, chapel, library, museum, theatre surrounded by saloons, all adequately decorated. Besides, the building to contain the usual apartments of a has royal abode, for the cold and warm seasons (both the latter on the first floor). On the ground floor are to be the offices, guerd-rooms, bath, kitchen, and in the entresol quarters for the high officers of the court. The place for stables and the servants is also to be marked out. Before the palace a large square, with monuments of the two preceding monarchs. Behind the palace, the gardens with appro-priate buildings. There are to be seven designs accompanying this prize-viz. two ground plans, two sections, two elevt ions, and one view of any chosen part of the building. Each plan 0,840 metres by 0,576. Second class. Entrance gate of a large metropolis (not fortified), with adjoining edifices for the porters; the excise and the police soldiers(!) The gates to have three passages, for elegant curricles, waggons and carts, and beasts of bur-then. The room for the guard is to be calculated at twenty privates and one petty officer. The officers on duty to have an orderly room, a dining and sleeping room There it to be a ching and sicepting room in large in Q be another guard-house for a detachment of car-valry with dwelling for the officers, prison, stables, and other appurtenesses. The ex-cise department to comprise a public office, dwelling for two superior and two inferior officers, a barrack for two detachments of troops, foot and horse soldiers, a guard-house properly so called, stables, and other appur-tenances; prison, stores for struggled and tenances; prison, stores for smuggled and seized goods, a place for the strict examina-tion of the vehicles, room for porters, and a waiting-room, also a dwelling for the porcers. The police has a room for the revision of the post (!!!) Another place for the searching of persons and goods, a prison for both meses separately (!), also a dwelling for the officers of police. This prize is also to be accompanied by seven plans, triz., one ground plan, one plan of the upper rooms, two prospects taken from the inner and outer part of the town, one longitudinal section, one transversal section, and one plan of miscellaneous details. Size of plans as above. The competitors have to plans as above. The competitors have to transmit their works to Mr. Silvagni, secretary of the academy, on or before the 20th July, 1846, under the usual formalities of prize com-The prices of the first class are petitions. forty, those of the second twenty zechins. The crowned plans are property of the academy. [As an English artist has met with such success in the competition for the Hamburg great prize-we consider it expedient to make known prize-we consider it expension to all the world.] the above prizes, open to all the world.] J. L.

ART-UNION OF LONDON.

.

In the three weeks ending Saturday last, during which the prizes were exhibited to the subscribers and their friends by tickets, 150,000 persons visited the gallery. During the present week, it has been open to the public without any limitation.

On Monday the works of art become the property of the various prize-holders and will be removed to their several homes. If the Art-Union of Loudon did nothing more than provide this annual enjoyment for all classes of the community, it would be entitled to our gratitude.

The distribution of the outline illustrations In edistribution of the outline illustrations by Mr. Rimer, of Thomson's "Castle of In-dolence," due to all subscribers of the past year in addition to Doo's fine print of the "Convalescent" after Mulready, which is nearly ready for the press, commenced on Monday. They form an interesting series, and are likely to be popular.

are likely to be popular. Holloway, of Bedford-street, Covent-garden, has published at a low price, a very beautiful edition of the text, with additional iliustrations by the same artist.

COURSE OF STUDY IN THE SCHOOL OF DESIGN.

SIR,-The publication of those designs for which premiums have been awarded by the School of Design, is certainly the best way to enable the public to come to a right conclusion as to the capacity of the masters, their mode of instruction, and the progress made by their pupils. The public are certainly indebted to your paper (No. 135), for giving them so practical a proof of the incapacity of the masters, the little progress made by the pupils, and the wretched designs. The Illustrated London News has published several of these premium designs, and if we except some few sketches made by the female pupils, whose innate taste for what is elegant and beautiful enables them better to skip over the stumbling blocks placed in their way, the whole of them are of the same indifferent character.

You must be aware, Sir, that if the School of Design had proper masters-those who were able to illustrate the first principles of design on the black-board (the only way by which any great body of pupils can be taught)-the authors such designs would get more kicks than halfpence.

You know that I have no connection what-ever with the School of Design, and that what I have stated is an unbiassed opinion. I have had great experience in teaching youth, and I know it requires the unwearied attention of the most able masters to ensure the slightest success.—I am, Sir, &c., M. I. B. A.

. We have refused insertion to several letters on this subject in favour of the management, because they throw no additional light on the question; and we must pursue the same course with those of its opponents. We have received another communication from Mr. R. Burchett, bat for the above reason do not print it. As regards the present condition of the school, he

kept in the school, 220 students.

In the same month, March, 1845, after two years of Mr. Wilson's directorship, with the lare of 200 guineas then forthcoming for prizes, the number in the evening school was 210, being a decrease of 10; and in July last, at the time of the private pic-nick exhibition of prodesperately forced and fudged up ductions-so for the occasion-the evening school consisted of no more than 114;—shewing a falling off of 106 !! from the number in the evening school at the time Mr. Dyce was forced by persecution to leave the institution. There is no denying these facts. They can be verified by any student in the school."

BOOKSELLERS' PROVIDENT RETREAT.

On the 4th inst., the first stone of a structure for the reception of aged and infirm persons who are members of the Booksellers' Provi-Provident Institution, was laid at Abbot's Langley, Herts, by the Earl of Clarendon. The situa-tion is beautiful, overlooking the London and Birmingham Railway, and the interesting old church described in last week's BUILDER. The structure is to consist at first of seven houses, after a design in the early English style of architecture, by Mr. Cooper; and, in addition to the dwelling apartments in the cen-tral house, there will be a large room for the use of the committee, and a commodious hall as a place of general meeting for the inmates, which is also to be fitted up as a library. We have not seen the design; some who

have, speak badly of it.

ST. JAMES'S CHURCH WINDOW.

WE learn that the committee have sent special instructions to Mr. Wailes that he is to take out of his design every thing Gothic. As well might you tell a man who brought you a French book when you wanted an English one, to take out of it every thing French. The window is essentially Gothic,-wholly Gothic, and no alteration can possibly fit it for St. James's church. Can nothing be done to induce the committee still further to modify their original determination, and so avoid the lasting annoyance they will otherwise lay up for themselves? They know they are in error, yet fear to retrace their steps.

EFFLUVIA FROM SEWERS.

SIR,--It is with great pleasure I peruse your continual advocacy of that necessary and essential requisite for the health of towns, namely, proper and sufficient, as well as systematic ventilation ; there however appears me one grand thing yet wanting, to provide a more cleanly, wholesome, and unvitiated atmosphere without, the consideration of which I shall but slightly discuss in my present letter; but as soon as I shall be in possession of the requisite statistical data, I will enter more fully into the consideration of this important subject, a subject becoming every day more interesting, as the present system of sewerage and drainage becomes more extended or improved.

The powerful and requisite enactments contained in Lord Lincoln's Bill for "Improving the drainage &c., of towns," I need hardly quote, having already been conspicuously before the public, and most ably commented on by the different journals; suffice it to sav, the more such measures are enforced, the more favourable will be the result of the plan 1 am about to propose.

It is quite unnecessary to remind any person accustomed to traverse the streets and alleys accustomed to traverse the streets and alleys of this great metropolis, more especially the confines of the city, of the nauseous and of-fensive gases and effluvis, continually arising from the "gulley-holes" and other openings connected with the sewers; and to such an extent (especially before heavy rains) do these gases and effluvia arise, as to be perfectly visible under the form of a vapour, causing epidemy and not unfrequently the worst symp toms of malaria in the immediate neighbourhood. What I would venture to propose is as follows :--- " Let every man-hole, guiley-hole, or other open communication with the sewers be trapped, so as effectually to prevent any effluvia from arising therefrom ; but in order to get rid of the effluvia, which must necessarily arise from the vast accumulations in sewers, I should propose the erection of columns at large thoroughfares, or grand connections of sewerage (carried to a height above that of the surrounding neighbourbood), which are to be connected with the sewers, and let the gases which arise either be consumed by fire at the top by jets of gas, or be carried away by the influence of the atmosphere. I have thus briefly brought before your notice a plan, which I am confident, if brought fully and properly into operation, would greatly benefit all classes of the community, and cannot see any difficulty in the plan (saving the ex-pense), as the all-powerful Commissioners of Sewers have power granted them "to take any property, upon proper compensation, that may be deemed desirable for the improvements in sewers, &c.," added to which, these erections of columns might be turned to a variety of useful as well as ornamental purposes the consideration of which will form a part of my next letter. 151, New Bond-street. J. L.

NEW BUILDINGS ON HAMPSTEAD HEATH. -Sir Thomas Maryon Wilson having deter-mined upon erecting a number of villas on Hampstead heath, the ceremony of laying the first stone was performed last week by his sister, Mrs. Drummond, in the presence of a large party of friends and a considerable number of the inhabitants. The new buildings are to be distinguished by the name of "East-park." Mr. Gwilt is the architect. and assisted Mr. Gwilt is the architect, and assisted at the ceremony. It is said that East-park will not in any way whatever encroach upon the heath, or any of those portions of Hampstead to which the public are in the habit of resorting for recreation.

FATAL ACCIDENT IN SINKING A WELL. Accidents frequently occur to persons while employed in digging wells; sometimes through the gross ignorance or carelessness of the operative, at other times through the false economy of the master in not allowing sufficient timber to span the work securely. Α case occurred last week at Whitechurch, near Charmouth, when a poor man while pursuing his labour, was buried under upwards of ten waggon loads of soil and stones. Assistance was instantly obtained to extricate him, if possible alive, but the attempt was ineffectual; there is no doubt that he met with instant death.

THE FRUGAL INVESTMENT ASSOCIA-TION.

THE first subscription meeting of the shareholders in this association was held, pursuant, to public advertisement, at the Hall of Commerce, Threadneedle-street, on Tuesday afternoon, the 2nd inst. The meeting was very numerously and respectably attended. The president, Mr. John Neale, took the chair, and Mr. Edward Smith, the solicitor, explained the principles and proposed advantages of the association. It is based upon the pro-visions of the Friendly Societies, Act 4 & 5 Wm. 4, c. 40, and contemplates the following objects :-

1. Investment of capital in 100% shares, payable by monthly instalments of 1% per share. 2. Pecuniary advances to the members (only) on mortgage of real or personal security, (only) on morrgage of real or personal security, or both, accompanied by a life policy of as-surance, they paying a redemption or antici-pating fee of 8s, per share per month. 3. The advance of the whole 100% on each share to those members who anticipate the discount or bonus :-- that is, the amount agreed to be sacrificed by the member upon his share, as the competition bidding is not deducted from the 100% all at once (as in the case on a from the 100% all at once (as in the case on a sale of shares in building societies), but is spread over the whole period of the associa-tion by equal monthly instalments. 4. The certain termination of the society at the ex-piration of eight years and four months. 5. An annual division of the profits in which both borrowers and capitalists, namely both classes of the members, participate, so that the borrower is not prejudiced as such by availing himself of the society's pecuniary resources by anticipation. Various questions were asked by the gentlemen present to elicit further explanation, and several hundreds of the shares (which are limited to 2,000), were then taken, and the first monthly subscription of 1/. per share paid thereon. The next monthly subscription meeting was announced for the 2nd Tuesday in October, at the same place.

FREE ADMISSION TO PUBLIC BUILDINGS.

WE mentioned a fortnight ago, that a memo-rial had been forwarded to Sir Robert Peel. from Lincoln, praying him, in the appointment of the new dean, to have regard to the free admission of the public to the cathedral.* One of the parties to the petition has received a note from the premier, acknowledging the re-ceipt of the memorial. Sir Robert concludes his letter with the following sentiment :-- "It will be gratifying to Sir Robert Peel if the Dean and Chapter of Lincoln shall be enabled to give the same facilities for free admission to the cathedral which are given at Westmin-ster and Durham."

Relative to the insolence of the verger at St. George's Chapel, Windsor, alluded to on a former occasion, we have received a letter of thanks from an influential inhabitant of the town for the reproof of this man's conduct. His incivility, it seems, is complained of on all hands. We shall pay him a visit before long, for the express purpose of observing his behaviour, and shall hope, if only for his own sake, to find an improvement.

From Paris we learn, that the Prefect of Police, having discovered that money was exacted from the persons who came to view the different parts of the Pantheon by the parties who are paid for taking charge of it, has interfered, and insisted upon this abuse being ended.

CALCUTTA CATHEDRAL .-- From a statement put forth by the committee, we learn that this cathedral, of which the model is now on view at Guildhall, is 248 feet long, 116 feet wide at the transepts, and 206 feet high from the plane of site. It is further intimated that the whole body of the building, with the tower and spire, is erected, and that the roof is on, but that the internal fittings are yet un-finished. The choir, for the performance of divine service, is 131 feet by 61, and 47 feet high—spanned by an iron trussed roof, and capable of containing 1,000 persons. It is expected that the consecration will take place at the close of next year, or very early in the fol-lowing, should the state of the funds admit.

THE SECOND ARCH & OLOGICAL MEET. ING AT WINCHESTER.

THE SECOND ARCH EOLOGICAL MEET-ING AT WINCHESTER. The second division of the Archæological Association have met in great strength at Winchester during the past week. Lord Northämpton it seems came from abroad to preside; and was supported at the opening miceting; on Thesday; by Lord Ashburton, Sir Wm. Erle, the Count Mortara; the Right Hon. Shaw Lefevre, Sire J. Boilean, S. R. Glynne, M.P.; Wm. Heatheote, M.P.; and R. G. Simeon, Barts.; Sir Richard Westmacott, Knt.; the very Rev. the Deams of West-minster, Winchester, Ely, and Hereford; the Revs. the Master of the University and War-den of New College, Oxford; the Warden and Principal of St. Mary's College, Winchester; the Master of Trinity College, Cambridge; A. B. Hope, Esq., M.P., J. B. East, Esq.; M.P., E. P. Shirley, Esq., M.P., General Frederick, Colonels Vandeleur and Colville; Oaptain Pearson; Revs. H. Addington; J. G. Bedford, F. C. Blackstone, Dr. Bliss, &c. On taking the chair, the president said, "Ar-cheeology had been justly called the hand-maid of history; without it history would have been little more than a skeleton—it re-ani-mated, as it were, the marrow, the bones, and the colours of life itself. Without the disco-very of antiquity history would have failed to guide the path of the statesmen of former times. They must consider those changes which time and the progress of human in-genuity had produced. He understood that a notion had been entertained that this meeting was in some degree a political meeting; but such a proposition was so truly absurd, that he though he was not colled unor to doen in the

was in some degree a political meeting; but such a proposition was so truly absurd, that he thought he was not called upon to deny it. It had also been supposed that this meeting was of a polemical character—a supposition not founded in fact. When he saw himself surrounded by so many ornaments of the church of England, and in the midst of such ecclesiastical monuments, which adorned a city that boasted of William of Wykeham, as the founder of its college, and the church of St. Cross, it was evident that it was not for the discussion of any polemical subjects that they were now assembled. If there was a difference among the members of the established church of this country, however deeply it was to be lamented, that was a circumstance with which the society had nothing to do. All it called upon its friends to do was to join with them in lending their sid to maintain those sacred edifices dedicated to the service of God. Although they had met together on the present occasion for the consideration of archeological subjects, still there was no reason why they should not discuss the wars of the roses, while they abstained from discussing the religious differences of the nineteenth century. With differences of the nineteenth century. these differences the society had nothing to do. It was not its province to revive any unfor-tunate differences which might have arisen amongst archæologists. It stood by itself on its own merits, but holding out the hand of fellowship and friendship to every man who was willing to join its ranks.

The Dean of Westminster read an able paper in defence of Archæology. The an-tiquary was looked upon by some as at best a harmless creature, and to a certain extent the reproach and ridicule thrown upon him may have been deserved. How this had arisen they have been deserved. How this had arisen they might inquire hereafter, but at present they would turn to other matters. They would look to the noble fellowship of bygone ages, which had made them what they now were, a link in the golden chain from the beginning to the end. Time had been likened to an old beggar putting good deeds into his wallet. They would look with earnestness and love into the wallet to ace what those good deeds, really wallet to see what those good deeds really were, and how brought about. This, then, was their purpose, to reproduce old times, watch with care over them, as a witness of that which was and is not; not considering the dust as precious as the writing it bore, but setting upon it a true value; with a scrutinizing, but no irreverent eye, to open the barrow, the monument, and ancient grave, linger over their words and deeds, of the thoughts they were thinking, and help us to reconstruct the busy active past-thus linking past and present. The history of the past exhorts all to venture on like noble deeds. Marathon, Thermopylæ, Agincourt, Trafalgar, the bowmen of Henry V and Nelson's sailor, alike made example, and said, "Thou art the child of brave men, who

never feared, never yielded ;" who would say, "Kill me, but I never will be a slave." Come what danger there will, he was prepared to meet it. But there were also peaceful bonds-one language, one common history, one birthplace, were the sinews that bound the past to the present. There were the seed and the bud, the virtues and the vices. We must know our father lives ere we can live. Without the past there is no future. We see this even in infancy; to its unformed age all is present. It has no future till it has made a past, and it is on the mouldering monuments of antiquity making our past that we must build our future. of antiquity The man who is a trifler in antiquity would be a trifler still did his mind take any other turn. Servile he must have been whether he gathered rusted coins, or, being a bookworm, became a mere pedant. There are those who, while ages have rolled away, would cling to their forms, but the spirit having left them, we cannot go back to them; we maintain there is a life in the past and in the present which have linked them to each other. These false claimants deny faith in the present life-they point to the liberality of former times, and will not allow we have the same quickening spirit within us now. They would make us unreal; they would dress the old man in the clothes of his childhood, thinking with such would come back the joyous days of youth. How unlike the spirit of one of those revered ancestors who, if he could rise up among us, would feel compassion for such a one, who could degrade the man to the mere outside shell. We see in the arrangement of churches much to love and study in their minutest details; but while we notice the hagioscope, we cannot forget the ill view afforded to the spectator; and admiring the intersecting aisle, its external magnificence, and the beauty of the lengthened chancel, we cannot forget that it shut in the clergy and shut out the laity. Looking to ancient monu-ments and matters of history, yielding ourselves in the newser within us. Let us only use them as study in their minutest details; but while we to the power within us, let us only use them as incentives to action; let us view them not as worn-out customs, but that we may fashion for ourselves the outward circumstances we need. The Dean of Winchester, Professor Whe-

well, and others, afterwards addressed the meeting. Dr. Plumptre took credit to the Gothic Architectural Society, at Oxford, for being the first in the field to revive a taste and knowledge of architecture amongst the clergy. On Wednesday the cathedral and the church

of St. Cross were examined, and in the even-ing papers were read by the Rev. J. B. Deane on the early uses of Drondical temples, Mr. E. A. Freeman on the architecture of St. Cross, and the Rev. J. L. Pettit on Romsey church.

CONTINENTAL NEWS.

As II. M. the Queen is now one of the subscribers for the rebuilding of the dome of Cologne, everything connected with that grand conception of the middle ages becomes of still greater interest. The splendid painted glass windows, which the King of Bavaria has pro-mised to furnish, have already been begun at Munich, by the artists intrusted with that task, Professor II. Von Hess, Inspector Ainmüller, and Mr. A. Müller. The next works in extent and beauty, which are now in hand, at the royal establishment for painted glass at Munich, are the large windows destined for the new dome of Agram, and made by order of the chapter. The three chief middle windows of the great choir have to receive these rich ornaments. The chief picture will represent the transfiguration of the holy Virgin, aside which will be the two patrons of Hungaria kneeling. The smaller *lunctics* around will contain various archi-tectural ornaments. The glass paintings of the church of St. Mary, in the suburb of Munich, have been completed and placed some time aro time ago. J.L.

RESERVOIR IN GREENWICH PARK .--The authorities having given instructions to form the threatened reservoir in Greenwich-park for the purpose of supplying the hospital with water in case of fire, the work was commenced last week. Some of the residents of Greenwich look upon it as an encroachment upon the rights of the public; while others, viewing it as a necessary evil, suggest making it as orna-mental as possible, and propose erecting a large oval-shaped stone basin with a fountain in the centre.

PAYMENT TO BUILDERS FOR ESTIMATING WORK NOT EXECUTED

WE state the following case without comwE state the following case without com-ment, as we may be only partially in possession of the circumstances. Mr. C., a builder, was requested to estimate for the erection of a public-house with the understanding that the tenders would be opened in the presence of the parties. Having made his estimate and deli-vered it, he hears nothing more of it, but ulti-mately learns that the first intention has been abandoned, and that the surveyor is preparing plans for a smaller house. Thinking it unjust that he should lose his time and trouble, he applied for compensation, and was told that his tender was not the lowest, and therefore that he had lost nothing by the abandonment of the plan. Not considering himself bound to believe this, as the tenders had been opened privately, he claimed five pounds and sum-moned the party who employed him, to the moned the party who employed him, to the Court of Requests on his refusal to pay it. After two hearings a verdict was given, last week, in favour of the builder, and he agreed to accept three pounds, the employer paying the builder's witness and all expenses.

LIST OF NEW PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &c., GRANTED FOR ENGLAND. Furnished by Mr. A. Prince, of the Office for Patents of Inventione, Lincoln's ins Fields, London.

[SIX MONTHS FOR ENBOLMENT.] [SIX MONTHS FOR ENBOLMENT.] William Young, of Paisley, manufactures and dyer, and Archibald McNair, of the same town, merchant, for certain improvements in the construction and means of manufacturing

the construction and means of manutacturing apparatus for conducting electricity. August 4. Charles Henry Joseph Forret, of Lille, in France, but now of 17, Great St. Helens, Bishopsgate, gentleman, for a new and im-proved Archimedean screw, which he calls "Davaine's Screw." August 4. Peter Francis Maire, of Mark-lane, mer-chant for improvements in combining iron

Peter Francis Maire, of Mark-lane, mer-chant, for improvements in combining iron and other materials for the purpose of con-structing bridges, roofs, arches, floors, and other similar structures. August $5_{A+1/2}$ Francis Taylor, of Romsey, Hants, surgeon, for improvements in giving alarm in case of fire, and in extinguishing fire. August 6. John Evans, of Kensington, gentleman, for a new perazotic product, and its application to the arts. August 7.

the arts. August 7. Henry Smith, of Liverpool, engineer, for improvements in the manufacture of wheels for railways, and in springs for railway carriages, and in axle guards for railway carriages. August 7.

Henry Emanuel, of Pond-street, Hampstead, gentleman, for improvements in atmospheric railways. August 7.

Peter Armand Lecomte de Fontainemorea u Feter Armand Lecomte de rontainemorea u of Skinner's place, Size-lane, for certain im-provements in apparatus for raising and sup-porting vessels and other floating or sunken bodies, and its application for the better pre-servation of life and property. August 7. Peter Higson, of Clifton, Lancaster, mining

engineer, for certain improvements in machinery or apparatus for connecting and discon-necting the steam-engine, or other motive power with or from the load, or other matter

Thomas Henry Russell, of Wednesbury, Stafford, tube manufacturer, for improvements in the manufacture of welded iron tubes. August 14.

Thomas Oxley, of Westminster-road, civil engineer, for certain improvements in constructing and propelling vessels and in the machinery connected therewith. August 22. Mathieu Francois Isoard, of Paris for im-

provements in obtaining motive power. August 28.

CHARING CROSS BRIDGE. — At the half-yearly general meeting of the proprietors of this bridge (better known at present as the Hungerford Suspension Bridge), it appeared from the report of the directors, that "during the period the bridge has been opened, nearly 14,000 persons daily have used it," and that "on two or three occasions there had been between 14,000 and 15,000 persons upon it, and it remained perfectly unshaken." It is in contemplation to lease the bridge to the Central Terminus Railway Company for the Central Terminus Railway Company for 186,000%, the proprietors to receive half their capital in cash, and half in shares in the new company,

Correspondence.

PREVENTION OF SOUND.

Sin,—An acquaintance of mine having a machine turned by hand for cutting meat, wished to have it inclosed, to prevent it from being a nuisance, the neighbours having complained of the great noise it made. I surrounded it with 9-inch brick walls, turned an arch all over in cement, lined the inside with patent felt, making it air-tight, and placed the feet of the machine on india rubber two inches in thickness. The sound, however, is only partly prevented by these arrangements; and I should feel obliged if some of your numerous correspondents will be so kind as to inform me, through the medium of your excellent journal, the best method which can be adopted to prevent the noise altogether.

I am, Sir, &c.,

W. H. '

Miscellanea.

THE "BAILWAY KING" OF FRANCE.-The "Bailway King" in France, the French Hudson, is an odd-looking, but keen-observing individual, of the name of M'Kenzie. He is a great favourite of Louis Philippe, at whose numerous and promiscuously attended soiries M'Kenzie cuts a droll and conspicuous figure. If not a native of Liverpool, he was at no dis-tant date a "navie" there, working—and no tant date a "navie" there, working-and no shame to him-in high-lows, ankle-deep at the dpcks in mud and clay. This gentleman, though entirely unclucated, and of brusque manners, is remarkable for his practical know-ledge of engineering; and it is proved by the flattering fact, that M'Kenzie is consulted by the Government authorities of France touch-ing the practicability of the various railway lines either in progress or contemplated; and this in preference to the engineers of Paris, who have long been celebrated for their knowledge in the science or art, for it partakes of both. McKenzje has a partner, named Barry, once-he may be so still-a gentleman con-nected with the Manchester newspaper press. These facts are highly honourable to all parties. M'Kenzie's oddity of manner and appearance present a curious contrast to that of the Pa-risians; malgré, he carries all before him, whe-ther on the Champs Elysées, where the railway shareholders, jobbers, &c., " most do congre-gate," or in the gilded salons of the Tuileries. *Livernool Chronicle*. The Mr. Wikenzie *Liverpool Chronicle.* [The Mr. M'Kenzie named above was a considerable contractor for public works in this country for many years. He was the contractor for the Junction Dock, at Hull, and other works there. Mr. J. D. Barry, who is stated to be his partner, was, subsequently to his connection with the Manchester press, editor of the Chester Chronicle. -- Manchester Guardian.

PICTURE GALLERIES.—It cannot but excite the surprise and regret of every person who has reflected on the subject, and been desirous of admiring and dwelling on finer works of art, whether pictures or sculptures, to find them placed in common rooms with several small windows directly opposite the subjects, and these windows indiscriminately facing either the east, west, north, or south; added to which disadvantages may be seen a total disregard to the colour of the walls, and to contiguous objects. After thousands of pounds have been expended on a collection, it is astonishing to find it thus sacrificed, thus immured, either in dark cells or exposed to the scorching and dazzling sun. Let us, however, hope that a better taste has commenced, and that the noble art of architecture will be liberally encouraged by the affluent, and skilfully employed by the professor to protect and adorn her sister arts.— BRITTON'S Illustrations of Fonthill Abbey.

WESTMINSTER BRIDGE.—From 1810 to 1838 this bridge cost in repairs, 83,097*l*. 6s. 94d. From 1838 to 1844 the amount was 82,661*l*., and a further sum of 52,879*l*. was required for further works. The property belonging to the bridge only realizes 7,464*l*. 11s. 8d. ayear.

MALT-HOUSE FLOORS. — A correspondent wishes to know the best material wherewith to construct malt-house floors. Either, faced slate slabs, or a coating of Roman coment on a solid foundation, will answer the purpose.

ORNAMENTAL CHAIR .- A very elaborately carved Gothic chair, in the style prevalent during the fifteenth century, has recently been placed in the vicinity of the altar of our cathe-dral. It is worked in oak, and the most striking feature about it, at first glance, is its high back, ornamented with rich tracery, and terminated by a crocketted gable, flanked by pinnacles. At each elbow or side of the seat, is the figure of an angel bearing a shield, and on the border of frieze beneath, is a scroll containing the following inscription :-- " PELLEW. DEC. NORWIC. DEC. ET ECCLIE. D.B. MDCCCXLV." This chair is for the use of the bishop, and another chair similar in general design, but differing in some of the details, has yet to be added for the dean. The chair which we have described has been executed under the superintendence of Mr. John Brown, the architect, by Mr. W. C. Vincent, a native of Norwich, but now carrying on business as an architectaral carver in London. He is ea-gaged in completing the chair for the dean, which, we understand, will be here shortly, and the effect of the two noble pieces of eccle siastical furniture in conjunction cannot fail to be not only rich and beautiful in itself, but also such as will materially enhance the appropriate character of that portion of the sacred edifice to which they appertain.— Norfolk Chronicle.

SPLENDID IRON BRIDGE OVER THE NEVA. -Messrs. Bury, Curtis, and Kennedy, the celebrated engineers, of Liverpool, have received instructions from the Emperor of Russia to construct an iron bridge of powerful dimensions to be erected over the river Neva at St. Petersburgh. This river is at present crossed by three bridges of boats only, and in the winter season the damage done to them by the ice is so considerable, that it has been deter-mined to erect the bridge in question; and it is probable at a future time the other two will be replaced by bridges of iron. The length of this bridge is 1,078 feet, and will consist of seven arches-the centre one being 156 feet span; and the three on each side, 143 feet, 125 feet, and 107 feet respectively. A separate arch at one end will be devoted to a swivelbridge, seventy feet wide, by which vessels can be admitted to the Custom House. The total weight of iron in this enormous structure will be nearly 10,000 tons, or about five times the quantity which was employed in the famous Mensi bridge; the cost of the iron alone will exceed 100,000*l.*—*Mining Journal*.

RE-OPENING OF COOMDE-BISSETT CHURCH. The parish church of Coombe-Bissett is an interesting one to the Ecclesiologist, portions of the edifice being as ancient as the early part of the twelfth century. The interior exhibits distinct features of the Anglo-Norman and early English styles-the font being of the latter class; and these features have been pre-served in the restoration which the building has undergone. Open sittings, of very sub-stantial oak, are liberally distributed on the floor, and have been fashioned from an ancient pattern of similar seats formerly existing in the church. The new roofing is formed of polished oak, with the ancient corbel heads restored. Appropriate texts of Scripture, in the illuminated style, are placed on the walls and pulpit. The exterior repairs have also been very considerable-large portions of the walls having been entirely rebuilt. Previous to its repair, the church was in a most dilapidated condition, and afforded miserable accommodation for about 150 persons; now at least 300 may find sitting room.

ADVICE TO GOTHIC ARCHITECTS, BY SIR WALTER SCOTT.--In his novel of "The Pirate," in reference to the Cathedral and Earl's and Bishop's Palaces at Orkney, the author of "Waverley" remarks, that "Several paris of these ruinous buildings might be selected (under suitable modifications) as models of a Gothic mansion, providing architects would be contented rather to imitate what is really beautiful in that species of building, than to make a medley of the caprices of the order, confounding the military, ecclesiastical, and domestic styles of all ages at random, with additional fantasies and combinations of their own device, 'all formed out of the builder's brain.'"

RISE IN THE PRICE OF IRON.—Several of the largest houses in South Staffordshire have issued circulars, quoting the price of bars at 20s. and pigs at 10s. in advance of the prices we recently published.

INCREASED VALUE OF HAND. If proof was wanting to show what an extraordinary increase has taken place in the value of land in this country during the last half century, wa might point to the great price which the sale of each successive estate brings that is, put into the market. In the "Scots" Alagazine," of 1792, it is stated, that the getater of Kelly, in Renfrewshire, was sold in that year to May John Wallece, for 10,7501. The same estate when sold the other day, brought 65,0001, cillough denued of a waluable part of the shore ground, which has been retained by the late proprietor. There is no other commodity in this country which is at all to be compared to land for an increase of value, especially if that land has received proper attention in agricultural improvement similar to the estate of Kelly.—Glasgow Chroniele.

JARROW COLLIERY EXPLOSION.—Sir H. de la Beche and Mr. Playfair have been appointed by the executive to make a searching investigation into the causes of the explosion at Jarrow Colliery.

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, & c., are to be addressed. For the convenience of our readers, however, they are entered in a book, and may be seen on application at the office of "The Builder," 2, York-street, Covent-garden.]

For certain Masons', Carpenters', and Plumbers' and Glaziers' Work about to be performed in va-rious repairs and restorations to St. Mary Redeliffe church, Bristol. For building railway goods' waggons, ballast

waggons and horse boxes, and supplying carriage couplings according to plan, for the Great Southern

and Western railway (Ireland). For the execution of Works on the Dundalk and Enniskillen railway, being a distance of ten miles.

For the execution of Works on the Leeds and Thirsk Railway.

For the execution of several lengths of Earthwork on the Aberdeen Railway. There are 5 separate Contracts, varying in lengths from 3¹/₂ miles to 4²/₄ miles.

For the construction of Three Reservoirs for the Blackburn Waterworks Company: also, of Stone Culverts for conveying the water a distance of

about 23 miles. The earthwork will amount to about 180,000 cubic yards. For the execution of works on the Manchester South Junction and Altringham Railway, in two parts : 1, being a distance of 14 mile; 2, being a distance of 78 miles distance of 74 miles. For the execution of Works on the Manchester

and Birmingham Railway in 2 parts. 1. The Ashton Branch, being a distance of about 4³/₄ miles. 2. The Macclesfield branch, being a distance of about 30 chains, including a tunnel of 330 yards in length.

or the execution of that portion of the Edinburgh and Northern Railway, extending from Burntisland Pier to Kinghorn.

For supplying the Clydesdale Junction Railway Company with about 2,500 Tons of Rails, and about 600 Tons of Chairs.

For supplying the Leeds and Thirsk Railway Company with 100,000 Railway Sleepers.

For the execution of works on the East Lanca-shire Railway, viz., the Accrington Contract, being

a distance of about 8 miles. For the execution of that portion of the Newcastle and Berwick Railway, extending from Netherton to Tweedmouth, being a distance of To be let in four contracts. about 53 miles.

For the execution of works on the Leeds, Dews-bury, and Manchester Railway, viz., the Churwell

ontract, being a distance of about $2\frac{1}{2}$ miles. For the performance of the several Works necessary in the erection of a Wesleyan Chapel at Alton, Hants.

For the execution of a portion of the Edinburgh and Northern Railway, being a distance of about 8 miles; to be estimated for in two lots.

For the execution of the Richmond Branch of the

Great North of England Railway. For supplying the Eastern Counties Railway Company with 100 Goods' Waggons, agreeably to

specification. For supplying the Eastern Union Railway Com-pany with 8 First Class, 12 Second Class, and 8 Third Class Carriages; to run on six wheels, the gauge being 4 fest 81 inches.

For supplying 15,000 Sleepers of Larch, 7 feet 6 inches long, and 7 feet 31 inches at the small end; to be delivered at the Menai Bridge, Holyhead, within the next four months.

COMPETITIONS.

The Committee for the establishment of Public Parks, Walks, &c., at Manchester, offer two prizes one of 50 guineas and the other of 25 guineas, for the best and second best set of Plans (with estimates), for the laying out, &c., of the sites already purchased by them.

APPROACHING SALES OF WOOD, &c. BY AUCTION.

Adjoining the entrance to the East Country Dock Rotherhithe, about 85 loads of new East-India Teak, and 60 loads of sound African Oak Timber.

On the Alderholt Park Estate, near Fording-bridge, Hants: about 500 Oak Trees, and about

100 Fir Trees; all of large dimensions. The remaining portion of the Old British Museum, consisting of the centre building, the entrance Hall and Grand Staircase, &c.

Adjoining the Canal Bridge, Kingsland-road: a very large quantity of capital Timber in all lengths and thicknesses; 10,000 feet of 11-inch warehouse floor-boards, &c.

BY TENDER.

In the Plantations of the Duke of Montrose, situate in the Parishes of Drymen and Buchanan, Stirlingshire : many Thousands of Larch Trees of some size, adapted for Railway Sleepers, Roof ing and Joisting, and other purposes.

TO CORRESPONDENTS.

"Italian Alabaster."-A subscriber wiskes to know where the white Italian alabaster can be obtained, and what is used to give it a smooth face after it is cut with the tool.

ADVERTISEMENTS.

A MAGNIFICENT, EXTENSIVE, and UNIQUE COLLECTION of TROPICAL FRUITS, modelled by Mons. Grimaud during his long Residence in the Isle of France. is just deposited at the ROYAL POLY-TECHNIC INSTITUTION. The ATMOSPHERIC RAILWAY is lectured upon by Professor Bachboffner, and exhibited Daily, and in the Evenings. A NEW AME-RICAN INVENTION, COLEMAN'S PATENT LOCO-MOTIVE ENGINE for ascending and descending inclined planes on Railways without the aid of stationary power. SWIMMING and DIVING ILLUSTRATED by the Son of Capt. Stevens, the celebrated teacher of Swimming, on Monday, Wednesdays, and Fridays, at Hos o'Clock, and on the Evenings of Tuesdays and Thursdays, at half-past Eight o'clock. The other Exhibitions, &c., as usual.-Ad-mission, One Shilling; Schools, half-price. MAGNIFICENT, EXTENSIVE, and

PATENT OFFICE, 5, CHANCERY-LANE, NEAR FLEET-STREET.

FLEET-STREET. INVENTORS requiring protection by LETTERS PATENT should apply direct to the PATENT OFFICE, as above, where Patents can be speedily procured for the United Kingdom, &c., and by which a great saving of expense will be effected. CAVEATS are en-tered at this office, fee 11. is. DESIGNS of all kinds are REGISTERED. Apply at the PATENT OFFICE, 5, Chancery-lane, near Fleet-street.

NOTICE TO INVENTORS. OFFICE FOR PATENTS OF INVEN-TIONS and REGISTRATIONS of DESIGNS, 14, and every information upon the subject of PROTECTION for INVENTIONS, either by Letters Patent or the Design Acts, may oe bad by applying personally, or by letter, pre-paid, to Mr. ALEXANDER PRINCE, at the office, 14, Lincoln's-inn-fields.

Lincoln's-inn-fields. PRIZES IMPORTANT TO INVENTORS AND PATENTEES. A GOLD MEDAL, value 1007. and a SILVER MEDAL, value 501., will be given by Mr. M. JOSCELIN COOKE. The Gold medal for the best Patent, and the Silver medal for the best Design taken out or Registered at the OFFICE for PATENTS and DE-SIGNS, 20, Half-Moon-street, between the 1st of Novem-ber, 1841, and the 1st of June, 1846. The Prizes will be awarded by competent judges on the 10th June, 1846. The every information for obtaining Patents in England or Foreign Countries, or Registering Designs, will be forwarded gratis, on application to Mr. M. JOSCELIN COOKE, at the Office for Patents and Registration of Designs, 20, Half-Moon-street, Piecadilly, London.

TARNISH.—It has long been a desideratum VARNISH.—It has long been a desideratum amongst the consumers of Varnish to obtain a good and genuine article; brilliancy, facility of drying, hardness, and durability are the qualifications necessary, but these are seldom if ever found united. The experience of a life-time devoted exclusively to the manufacture of this article, the great and important discoveries of modern chemistry, and the daily improvements in machinery, have enabled Messrs. George and Thomas Wallis to produce Varnishes (both oil and spirit) unrivalled in every respect, and they confidently recommend them to the trade, as deserving of notice both in price and quality. Builders, Coachmakers, Painters, and others may depend on being supplied with a genuine and unadulterated article. Fine Oil Varnish, from 10s. per gallon; best White Spirit Varnish, 21s. ditto; Best Spirit French Polish, 20s. ditto; White Lead, Oil, Turps, and Colours of every description at the very lowest prices.—WALLIS'S Varnish, Japan, and Colour Manufactory, 64, Long-acre, one door from Bow-street. Established 1730.

WALLIS'S PATENT LIQUID WOOD ALLISS PATENT LIQUID WOOD WOOT Composition which Messrs. Geo. and Thos. Wallis have the satisfaction of introducing to the trade, possesses the im-portant qualification of effectually stopping Knots in Wood, however bad, and preventing them cating through and dis-figuring the paint above. Many substances have been used and much time spent in endeavouring to find a cure for a bad Knot, but hitherto without success. Messrs. Wallis therefore feel much plea-sure in offering to the public an article so long and anxiously called for.

ire in offering to the purite an entropy of the problem of the application, skill is not required; a boy can use it is well and effectually as the best workmen: it is put on to a work with a brush like common paint, can be used in all limates and situations, and does not require heat. Sold wholesale and retail, by Messrs. G. and T. Wallis, farniah, Japan, and Colour Manufacturers, No. 64, Long acces. Price 20s. per gallon.

TO ENGINEERS, ARCHITECTS, AND CON-TRACTORS.

REAVES'S LIAS CEMENT and GROUND BLUE LIAS LIME, at 2, South Wharf, Paddington, London, and Works, Southam, Warwicksbire. Agent for Liverpool, Mr. WYLIE, 56, Gloster-street; ditto for Manchester, Mr. J. THOMPSON, Back King-street; ditto for Chester, Mr. J. HARRISON, Linen Hall-street.

A TKINSON'S CEMENT.—The public is respectfully informed, that the price of this very ex-cellent Cement, which has now been in use for Architecture and Engineering works upwards of thirty years, is reduced to 23. 3d, per bushel, and may be had in any quantity at Wyatt, Parker, and Co.'s Wharf, Holland-street, Surrey side of Blackform bridge

Blackfriats-bridge. N.B.- This Cement being of a light colour, requires no arti-ficial colouring or paining, and may be used for stucco with three parts its own quantity of sand.

MARTIN'S PATENT CEMENT. TO ABCHITECTS, BUILDERS, AND PAINTERS IN FRESCO. FRESO. STEVENS and SON, PATENTEES and EOLE MANUFACTUREBS, beg respectfully to announce that this beautiful Cenent has now arrived at a degree of scellence far surpassing their most surguine superiority over every article hitherto in use; it is now being used extensively by Government in the British Museum and other public buildings. IT DOES NOT THROW OUT ANY SALT, but presents a beautifully pain and perfect surface, which may be painted upon dry work within four days without peeling. It is equally applicable for walls or hat for mouldings, architrave, skirting, or flooring; and is been used for many of the prise freeces peinting, having been used for hardness, darability, ind scores, cannot be qualled. 166, DRURY-LANK, LONDON.

186, DRURY-LANE, LONDON.

Agent for Liverpool and Manchester, Mr. B. Part, 11, Atherton's-buildings, Dale-street, Liverpool.

KEENE'S PATENT MARBLE CEMENT.-The Patentees of this composition beg to refer to the British Museum, the Royal Exchange, the new works at Bethlem Hospital, Greenwich Hospital, and the Co-liecum in the Regent's-park, as buildings finished or in pro-gress, in which Keene's Cement has been used as an internal stucco. Its superiority to common plastering consists in its extreme hardness, and the rapidity with which it dries, which qualities fit it to receive paint or other finishing sooner than other water Cement. When employed for skirtings, architrave, and other mouldings, in place of wood, it checks dry-rot, is impervious to vermin, prevents the spread of fire, and is more eco-nomical in its application than the material for which it thus becomes the substitute. Confirmation of these statements is to be found in the almost universal adoption of Keene's Cement for Skirting and Hall flooring in the new houses on the Hyde Park Estate, where its application is to be seen to the fullest advan-tage. EENE'S PATENT MARBLE

where its application is to be the several cases been used for the covering of the fire-proof several cases been used for the covering of the fire-proof warehouse floors, where its lightness and hardness give it the preference over tiles and flagging, which are much baswise, and necessarily leave the floor intersected with numerous joints, whilst Keene's Cement is laid down in one unbroken surface.

surface. The high polish and marble-like hardness of which this Cement is susceptible render it the most suitable material for the manufacture of Scagliola. Patentees, J. B. WHITE & SONS, Millbank-street, Westminster, Manufacturers of Roman and Portland

Depôt in Liverpool, 36, Seel-street ; James Woods, Agent.

O ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MEE-CHANTS, SHIPPERS, AND THE PUBLIC IN то CHANTS, GENERAL.

CHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL. JOHNS and CO.'S PATENT STUCCO CEMENT.-The following are the positive advantages possessed by this Invention over every Censent hitherto in-troduced:-It will diffectually resist Damp. It will never vegetate nor turn green, nor otherwise discolour. It will never crack, blister, nor peel off. It will form a complete Stone caning to any Building covered with it. It so closely resembles Stone that it is impossible to detect it. It never requires either to be painted or coloured. It will keep fresh and good in the cask in any Climate for any number of years. It is the only Cement that can be depended upon for export. It is the only Cement that can be used with confidence by the Sea side. It may be used in the hottest or coldest Climates at any season. It will adhere to any substance, even to Wood, Iron, or Glass. It will carry a larger Proportion of Sond than any other Cement. It matures by age, and be-comes perfect when other Cements begin to perisk. It may be worked through the Uniter, as frost has no effect Upon it. It may be used on the Inner Walls of new Houses, which may be papered over or painted directly. Roofs laid or pointed with this Cement will remain undamaged by the serverst Storms. Any Plasterer may apply it, the Instru-tions for use being very clear and distinct. The first cost of this material does not exceed that of the chespest Cement naturable advantages, nothing can approach it in poant al conomy. Method freshing can approach it in poant al conomy. Method freshing for mery part of the Kingdom, may be obtained on application to MANN and CO., SOLE de OTAINT, expressly intended for Painting over ex-torior Walls of Houses that have been covered with Ronna, may be obtained on application to MANN and CO., SOLE de OTAINT, expressly intended for Painting over ex-torior Walls of Houses that have been dirty and disco-loured. It is in every way better swited for this purpoe than which have beerome dirty and disco-loure JOHNS and CO.'S PATENT STUCCO

SATURDAY, SEPTEMBER 20, 1845.

HE practice common in our law-courts of referring matters to arbitration after the causes are ready for the causes are ready for trial, has been recently severely reprobated by the

press, and with great justice. "All the expenses," says the Times, " have been incurred, the pleadings gone through, counsel fee'd, witnesses in attendance, the judge ready, the jury in the box; and then there is enacted a grave farce,-wigs converge, some whispering goes on, some flourishes of protestation follow ; and the client, nolens volens, is told to attend on such an evening at Mr. Emptybag's lodging; who is entirely ready and excessively willing to serve as judge and jury-for a consideration." This is epecially the case with matters connected with architecture and building ; so much so, particularly as to the settlement of accounts, that it seems surprising parties do not resort to reference in the first instance, and avoid the delay and additional expense caused by going into court. Our object in remarking on this subject is, not to induce parties to refuse to refer, because in nine of the cases out of ten to which we allude, a more just conclusion will be come to by able arbitrators than by a jury, but to point out to them the advantage of adopting this course without the interposition of a judge, the expenses of barristers, and, in many instances, a special jury. The saving of expense, moreover, is not the only advantage that will be gained by at once agreeing to refer a dispute, rather than commencing or defending an action at law. When a reference is ordered by the court, a barrister is always appointed referee, and that, too, without any regard to his knowing any thing about the matter. Generally speaking, he knows nothing about it whatever, and must depend on the statements of others rather than his own knowledge : he is necessarily less able to appreciate the merits of the case than one who does; and may be influenced by a legal quibble to commit injustice. Neither plaintiff nor defendant has a voice in the appointment, and the selection falls on Mr. Sharp or Mr. Dull, as friendly feelings may happen to dictate : the only hope contending parties can reasonably entertain is, that the referee so chosen may adopt the too common custom of his brethren in the same position, and "split the difference; "-a custom so general, indeed, as to have made this mode of settlement, namely, the division of the amount in dispute, synonymous with a "barrister's award."

.

. .

2غ الع

We do not for a moment deny the ability of the English Bar,-it is as unquestionable and as great, as the insolence, in court, of many of its members; but it cannot be expected that one man can know every thing, and as there is an educated and able class of persons who have paid undivided attention to the one subject in question, it is from this class that referees should be chosen. | We have seen evening after evening wasted; in satisfying a barrister-referee on points which an architect in that position, would have decided of his own knowledge in five minutes. We address these brief remarks more especially to two correspondents who have asked our advice in cases of apparent complexity, and we seriously advise them to

avoid the expense and great uncertainty (under such circumstances) of the law courts, with the probability, when the expense has been incurred, that the matter will be referred to a barrister, and to assent at once to leave it to the arbitrement of properly qualified persons.

WORKS IN THE TOWER OF LONDON.

On the 14th of June, the first stone of the Waterloo Barracks was laid by the Duke of Wellington, on the site of the small armoury, destroyed by fire in 1841.• It is placed at the north-east corner of the building, and is thus inscribed :---" This first stone was laid by Field Marshal the Duke of Wellington, K.G., G.C.B., G.C.H., Constable of the Tower, and Commander-in-Chief of H.M. Forces, on the 14th of June, 1845."

Since then the works have been proceeded with vigorously, and the building is now nearly one story high throughout. The structure was originally proposed to accommodate 826 men, but recent alterations have fitted it to receive nearly 1,000. The length in front is 288 feet, and at the back 271 feet 8 inches. The width of the main building is 65 feet, but at the flanks it extends to 82 feet. The size of the principal rooms is 23 feet by 24. The floors are to be formed with iron girders and brick arches, so as to render the building firebrick arches, so as to render the building fire-proof. The style of the building is castellated Gothic of the fifteenth century: the walls are faced with Kentish rag, and the dressings of windows, doors, &c., are of Anston stone. Major Hall, as chief of the engineering de-partment, is the director of the works; Mr. W. Harrison, the contractor for masonry, brickwork, &c., and Mr. John Harrison, for the carpenter's work. The total cost is estithe carpenter's work. The total cost is esti-mated at nearly 50,0007.

Many other works are contemplated in the Tower involving a very large expenditure. We should be rejoiced to hear that they included the restoration of the keep, known as the White Tower, which is at present a dis-graceful monument of ignorance and want of taste. This interesting structure is called taste. This interesting structure is called by many writers, "Cæsar's Tower." Shaks-peare says, in Richard II.,

- "This is the way To Julius Cæsar's ill-erected tower."

And Gray apostrophises,

"Julius' towers! London's lasting shame, With many a black ad midnight murder fed."

In Richard III., as Mr. Godwin pointed out in his "Churches of London," Shakspeare seems almost to discuss the question. The seems almost to discuss the question. The Prince of Wales says, when Gloster is about to send him to the Tower :-

Did Cæsar build that place, my Lord ?

Gloster. He did, my gracious Lord, begin that place :

Which, since, succeeding ages have re-edified. Prince. Is it upon record? Or else reported

Successively from age to age, he built it? Buckingham. Upon record, my gracious Lord. Prince. But say, my Lord, it were not registered :

Methinks the truth should live from age to age, As 'twere retailed to all posterity. Even to the general all-ending day.—Act iii., s. 1.

The present keep was built by William the Conqueror, under the superintendence of Gundulfus, Bishop of Rochester (originally a monk of Caen, and one of the best architects

of his time),‡ and contains one of the very few of his time),‡ and contains one of the very few • A procession was formed across the parale, having the troops on the right, to the foundation of the barracks, and which proceeded in the following order :- The chief warder, Mr. Lund, in advance, followed by the whole of the Tower Yeomen of the Guard on duty in their coronation dresses, hearing halberts, walking two abreast; Serjeant Major Howe, the master-gunner of the Tower. Then came the Government contractor, bearing the plummet, and also the clerk of the works with the mallet. Mr. Stacey and Mr. Barratt, of the Ordnance department, carrying the coins to be deposited beneath the stone. Next followed the officers of the Royal Artillery, and the Royal Sappers and Miners quartered in the fortress. Major Hall, the commander of the Royal Engineers, with the plans of the ordnance Depart-ment; officers of the Grance Depart-ment; officers of the garrison. Field Marshal his Grace the Duke of Weilington, accompanied by the Right Hon. Sir George Murray, M.P., Mlaster General of the Ordnance. Major Elrington, Col. Gurwood, the Chaplain of the Gran-misor, and a staff of officers as guard of honour bringing up the rear. The Rev. Mr. Mclvill offered up a praver; coins were deposited beneath the stone, and the Duke, having first spread the mortar, finished the ceremony by striking the stone several times with a mallet. • Vol. 1. Account of St. Peter's in the Tower. **‡ He also built Rochester cathedral.**

ecclesisstical examples of the Conqueror's time at present in existence. The chapel within time at present in existence. The chapel within the keep* is near the top of it, and though ponderous and rude, is a very interesting remnant. The roof is of singular construction. It is a barrel vault composed of small flat stones fixed wedge-wise in a bed of cement; and must have been supported by a wooden framework till it acquired consistency.⁴ This chapel for-tunately escaped the hands of the barbarous orbhlors who destroyed the outside.

coblers, who destroyed the outside. The Tower contains a second place of worship, the church of St. Peter ad Vincula, erected in the reign of Edward I., which nearly adjoins the west end of the new barracks.

Restorations have been in progress here for some time past under the direction of the office of works. The masons are now putting up a new three-light window at the west end, for the design of which we cannot give much praise. It may be apparently like the original window, but slight differences, almost inde-scribable, sometimes produce a striking change in the effect. It seems just possible that they

in the effect. It seems just possible that they have restored a restoration. The tower is to be recased, and a new bell-turret constructed. This church is re-markable as the burial place of the greater number of distinguished persons who were executed for treason during the sixteenth and seventeenth centuries. We avail ourselves of the following notice of them in a work before alluded to.t before alluded to.1

before alluded to. In one place rest the remains of Gerald Fitzgerald, Earl of Kildare, the Lord Deputy of Ireland, who, being committed to the Tower on suspicion of treasonable practices, died there of a broken heart, in 1534. In another were placed the worthy, the witty, but bigotted Sir Thomas More, and his friend, bighter bighter of Pochester who were has Fisher, Bishop of Rochester, who were be-headed in 1535. The body of the former, it is said by some, was afterwards obtained by his said by some, was afterwards obtained by his excellent daughter, Margaret Roper, and was re-interred in old Chelsea Church, in the chancel of which he had caused a vault to be made some years previous to his death. Faulkner, in his "History of Chelsea," how-ever, supposes that this could not have been the case from the circumstance that Birker. ever, supposes that this could not have been the case, from the circumstance that Bishop Fisher's body, which was originally placed in the Church of All Hallows, Barking, was re-moved to the Tower by Margaret, in order that it might be interred according to his re-quest, near her father. In front of the altur lies the ill-fated Anne Boleyn, the second wife of the abandoned Henry VIII.; and immediately adjoining is the resting-place of her unworthy adjoining is the resting-place of her unworthy successor, Catherine Howard; the brother of the former, George, Lord Rochfort; and the venerable Margaret, Countess of Salisbury, who was the last descendant of the Plantagenet family.

Near this group was placed the body of Thomas Seymour, Lord High Admiral of England, who was beheaded in 1549, under a warrant from his own brother, the Protector Somerset; and between the two queens lies the Protector himself, brought from the scaffold a few months afterwards. John Dudley, Duke of Northumberland, the rival of the latter, also decapitated, rests here, as do the unfortu-sete Left large Grave on a multiple unsure of a throne, and her husband, Lord Dudley. Thomas Howard, Duke of Norfolk, his son

Philip, Earl of Arundel, and the impetuous Essex, the favourite of Queen Elizabeth, were buried here during her reign. In 1685, tho body of James, Duke of Monmouth, the pro-fligate son of the "merry monarch," who was beheaded for high treason, was placed beneath the communion table; and at the west end of the church, beneath the gallery, are those of Lords Kilmarnock, Balmerino, and Lovat, leaders in the rebellion of 1745. Nor should us communication of the second second second second to the second se we omit in this mournful catalogue the name of Thomas Cromwell, Earl of Essex, who was originally a blacksmith's son, but raised him-self by his talents to be the first minister of king Henry VIII. and was his chief agent in the overthrow of the papal supremacy. Having offended the king, he was committed to the Tower on a charge of high treason, and not-withstanding the most humble supplication for mercy, was beheaded in 1540."

• "Dum idem Gundalfus, ex preceptis regis Gulielmi, prieesset operi magnie Turris Londonike." Textus Roffensis, Quoted by Mr. Gally, knight, in "An Architectural Tour in Normandy," &c. p. 225. † "Architectural Tour in Normandy," ut supra. ; "The Churches of London." Digitized by

CONSTRUCTION OF WASH-HOUSES AND "OTHER SMALL BUILDINGS. WESTVICATION OF METROPULITAN BUILDINGS ACT.

Unput the clause in the Buildings Act. which gives her Majeety's Commissioners of Works and Buildings power to modify any rules thereby prescribed, on the representation of the official reference that the objects of the et would be sitteined better for as effectually by the adoption of mich alteration, the fol-

Whereas the official referees have by their report in writing, bearing date the Sth day of August, 1845, certified to us, that with regard to wash-honses, privies, and other small at-tached or datached buildings, as offices to dwelling-houses within the limits of the Act before mentioned and referred to, it is their opinion that the rule of the said Act, in schebuildings or Offices," videlicet: "With regard to buildings or offices now built, or horesflor to be built (except green-houses vineries, aviaries, or such like buildings) and that whether such buildings or offices be at-tacked to or detached from the buildings to tached to or detached from the buildings to which they belong, every such building is to be desmed in respect of the walls thereof and all scher requisites as a building of the rate to which it would belong if it had been built separately,?' is inapplicable to such wash-houses and other small attached or detached buildings, as offices to dwelling-houses, and that by the adoption of the modification here-inance direction of the modification hereinafter directed of such rule, the objects of the said Act will be attained as effectually. And whereas the official referees have also stated in such report the grounds of such their opinion, and on the investigation thereof it appears to us, the said commissioners, that such opinion is well founded. Now, we the undergned, two of the Commissioners of Works and Buildings, pursuant to, and in exercise of the power in that behalf given to us by the said resided Act, do direct that such modification may be made in the rules prescribed by the said Act; by inserting after the rule of the said Act, in schedule e, part 7, under the bead "At-tached Buildings or Offices," above quoted the following mainter in the same state following words, videlicet :

"Provided siways, with regard to wash-houses, privies, and other small attached or detached buildings built as offices to dwellinghoness in the reference to the external walls

"Phat if any such office building do not excood in area one equare, nor in height eight fact, then the same must be built of brickwork at the least of the thickness of four inches, or bills briek, except the quoins and the jambs of allodog and window openings, which must be at the least eight and a half inches in thickness for a length of eight and a half inches upon every quoin and upon every such jamb, and the same must be built upon footings at the least four inches wider than the wall standing thereon.

And further that if any such office building consisting of one story, and not exceeding eight feet in height, and not exceeding half square in area, be detached from any other building and from ground not in the same oc-cupation to an extent equal at least to its own height from the ground, then the external walls thereof may be of any materials whatsoever.

But that every such office building must be built in every other respect in conformity with the rules and directions of the said Act.

Which modification being made in such rules, will, in our opinion, give effect to the purposes of the said Act.

As witness our hands this 5th day of September, 1845.

ber, 1845. (Signed,) LINCOLN. (Commissioners of Works A. MILNE. and Buildings.

NEW EXCHANGE AT AMSTERDAM .--- This building was opened with great ceremony on the 8th inst. The dimensions are much more considerable than those of the old Exchange as the following particulars will shew :--- Area of the new Exchange 2,833 square ells.; ditto of the old Exchange 2,156 ditto; the new Ex-change covered part, 2,043 ditto; ditto, un-covered 790 ditto; the old Exchange, covered I,163; ditto, uncovered 987.

" MAGNESIAN LIMESTONE, WITH REFERENCE TO ITS PROPERTY AND FITNESS FOR THE COMPOSITION OF MORTAR.

The magnesian limestone formation, from its resisting and extremely durable character, is exceedingly well adapted for a building stone, as well as for making mortar after it has been well as for making mortar after it burnt to a lime, and consequently is a great acquisition for building purposes. Its hardacquisition for building purposes. Its hard-ness appears to be a mean between the extreme haidness of the granitic formation below; and the freedom and softness of the collte above; and its superiority for architectural purposes is moreover considerably enhanced from combining in its formation great strength, com-pactness of texture, and facilities for working; and it is also remarkable in checking and pre-venting vegetation from gathering on its surface, owing to the presence of the magnesia. This stone is found in abundance in several of the northern counties of England, where it is net with in beds sometimes of considerable thickness, alternating with the new red sandstone formation, which, in several places, lies immediately above the coal deposits; and it also appears occasionally resting upon and travers-ing the mountain limestones. When observed by a magnifying power, the aggregated par-ticles of many varieties of this stone appear to have been crystallized into fine rhomboidal shapes, and, from this cause, it has generally the appearance of a very fine sandstone; indeed, it has very frequently been taken for such.

colour of this limestone The being of a pale yellow, light or dark cream, sometimes having a reddish appearance, but commonly of a yellowish brown. It is slightly impregnated with silics, oxide of iron, and alumina, but is almost entirely composed of carbonate of magnesia and carbonate of lime : the relative proportions of these ingredients varies very considerably, the carbonate of lime always predominating, there being from fifty-six to sixty-five per cent. of it in combination with from thirty-five to forty-four per cent. of carbonate of magnesia. Many varieties of this stone are, in their natural state, very hard, much more so than calcareous spars, and sparks of fire are usually emitted when struck with a steel instrument.

When a piece of this stone is expased to the simple test of diluted nitric or murlatic acid, the action of effervescence and the dissolution of its parts are extremely slow and feeble. Pure caustic magnesia, when water is thrown on it, does not become heated and fall to a hydrated powder like other limes; nor does it absorb carbonic acid gas from the atmosphere; but it has a remarkable affinity for silica. During calcination the carbonic acid contained in the magnesia is evolved with greater ra-pidity than it is from the lime; and when mortar is made from this lime it does not harden and indurate near so quickly as some other mortars, owing to its power of absorbing carbonic acid from the atmosphere being extremely slow; for the *lime*, having a much atronger affinity for this acid than the magnesia has, not only absorbs carbonic acid from the air, but attracts and deprives the magnesia of the greater part of that which it itself absorbs.

The setting property of common mortarthat made from nearly pure carbonate of lime, such as chalk— is dependent upon the slow absorption of carbonic acid; and when mortars absorb this acid with great rapidity, they do not attain to so great a degree of hardness as those which absorb it slowly and regularly; therefore from the very slow attraction be-tween the lime made from this stone and the carbonic acid, mortars made of it become very hard and strong, and are not so liable to decay as some which are made from other limestones: for the action of driving rains and the acids of the atmosphere upon the magnesia is so slight, that it affords a powerful protection to the composition; and, in fact, this mortar usually becomes so hard, strong, and resistable, that the exposed joints are often seen projecting before the bricks and stones—where these have been worn down by atmospheric influencesthe mortar being, as it were, untouched or unacted upon. After having been exposed to the action of the atmosphere, even for months together, the calcined stones will still be found in a caustic state; and owing to the great quantity of magnesia in their composition, they

do not slake when water is thrown on them near so readily as those limestones which contain a superabundance of carbonate of lime.

From the magnesia in the lime having a considerable affinity for the silleones and the calcareous sands" mixed with it, during the composition the heat obtained by the admixture of water in slacking, as well as from the chemical attraction between the ingredients, causes the exide of iron and alumina, but more especially the magnesia, somewhat to dissolve, and from the affinity already alfaded to, the ingredients, while in this state, in some degree enter into chemical combination with each other, and therefore these mortars possess the peculiar property of hardening and indurating when used in wet situations or under water. But still the degree of hardness under water. But still the degree of hardness to which they are susceptible of attaining is not extremely great when used in the latter situation; and if the best and most durable mortar is particularly required for hydraulic purposes, this, from the foregoing reason, is not much to be depended on without the addition of an aluminous or oxidating substance capable of improving its hardening and indu-

The properties. The properties. Quisite for proper admixture with this lime depends of course of its attorn and quality, and the sort of work for which it is intended to be used; but from observing the action, and from the appearance of a variety of mortars composed with this indepas well as from several experiments which I have made with it, one pair of lime to two parts of clean coarse sand appears to be the best, as sho the most usual proportion for "try bri damp situa-tions; but when "tijs" moitar "is used and and water, the process of induration is "tweeding by slow, and for this kind of work the propertion of sand to the lime should be something less than for the former purpose, or two parts of sand to one and a half of lime.-John PRILLIPS.

THE SECOND ABCH & OLOGICAL -MBET-ING 'AT' WINCHESTER. "Date

A wAR of words has again commenced ba-tween the friends of the respective divisions. The mighty Times has opened its page to the disputants, and while it batters both associa-tions, with too little consideration if we may venture to say so, for the ability and Tearhild which were unquestionably displayed in both meetings, leans clearly to the side of Lott Albert Conyngham's party, as comprehending the majority, of the original promoters and workers. With the various statements of the two parties our readers have been long ac-guainted: our own opinion, too, upon the ori-ginally insignificant squabble, and the present much-to-be-regretted position of attairs, has been several times expressed; we herefore shall not trouble our readers with any remarks of our own on the present occasion, but pro-ceed to place before them the heads of those papers read at the meeting which relate to A wan of words has again commenced bepapers read at the meeting which relate to architectural antiquities, and will at the end report briefly the ultimate result,

ROMSRY ABBRY ORUBOR.

The following is an abstract of a paper of this structure by the Rev. J. L. Petit.

this structure by the Rev. J. L. Petit.† This ecclesiastical edifice is valuable as pre-senting more completely the outline and general aspect of a purely Norman convential church, than any building of equal dimensions in England. For although a considerable portion of the nave belongs to a later style, still, if the whole is compared with the Norman parts that remain, and we notice how carefully the later part of the work is made to harmonize with the earlier parts, it will fead to a conclusion that the dimensions and proto a conclusion that the dimensions and pro-portions intended by the original architects are preserved throughout; and in fact the whole design followed as nearly as the dif-ference of styles would permit. The choid, transepts, and tower, evidently retain their original plan of elevation, changed only by the depression of roof and gables, and occa-sional alterations in the parapets; these are trifling when compared with those which almost every large Norman church in the country has undergone. Many have their choirs extended, or rebuilt on a different to a conclusion that the dimensions and prochoirs extended, or rebuilt on a different

plan, as Carliele, Ely, Southwell, Selby, Christ Church, in this county, and others. Some have a large superstructure on the old choir, as Tewkesbury, Gloucester, and Nor-wich, which completely changes the character, even if it be accomplished with little deviation from the ground plan; and the erection of later towers, or the addition. of a story to the older ones, as at Kirkstall, or of a spire, as at Norwich, however little the rest of the church may have been changed, gives the whole a totally different aspect from that intended by, the builder. The church, which is cruciform, has a low massive tower at the intersection. The internal arrangement of the east end is remarkable, as it is divided by a central pier, to which a flat external buttress corresponds, having on each side of it a window. The eastern himb of the cross exceeds only by a few feet the length of the transepts. This peculiarity the length of the transepts. This peculiarity is almost universal in pure Norman buildings, though at a very early period in the succeeding style the part eastward of the tower was much lengthened. The choir is a fine Early-English one of seven bays. The Norman part of the church seems to have been commenced a little before the middle of the twelfth century, and it would be difficult to find a purer or more characteristic specimen of the style. The central tower was evidently open as a lantern, and must have had a fine effect; for although perfectly plain on the outside, it is ornamented in the interior with two ranges of arches, in the lower one of which may be noticed a the lower one of which may be housed a peculiarity which shews, how carefully the medieval architects studied position and point of view. Few buildings tell more plainly the atory of their progress to completion. The of view. Few buildings tell more plainly the story of their, progress to completion. The choir, central tower, and transpots, were built in the Norman styles, which they still retain in the Norman styles, which they see small throughout, with a comparatively, a small number of subsequent insertions. The four first bays of the nave (from the tower) were also completed in the same style as high as the string under the clerestory range, though an increased number of mouldings in the triincreased number of mouldings in the tri-forium shew that the transition was in pro-gress, and this was probably the limit of the actual Norman work; but probably the Norman design comprehended the whole length of the present building. The elerestory of the four first hays belongs to that style of pointed architecture called the transition, dis-ing some characteristics of the Norman, espe-eially the square abaque. The three western bays of the nave are purely Early English; a very small interval of time must have elapsed between the completion of the former part, and the commencement of these. But though distinct in style, this new portion is made to distinct in style, this new portion is made harmonize as much as possible with the old. In the west front itself, the architect was altogether absolved from the necessity of con-forming to Norman proportions, and how he felt and appreciated his emancipation from the restraint, he has proved by a composition not exceeded in grandeur by any structure of similar dimensions. A vast triplet of lancet windows, the principal one of which must be near forty feet in height, occupies the central compartment; these are comprised under a wide pointed arch, reaching into the gable; in the head of this arch is a cinque-foiled opening. There is no western door, there being fine Early-English doors in the fifth bay of the There is no western door, there being fine Early English doors in the fifth bay of the nave (from the tower) on the north and south sides. This fine edifice is rather distinguished by massiveness and simplicity, than by pro-fusion of ornament; yet its enrichments are not wanting either in variety of design or delicacy of execution. The corbel tables alone would form a valuable study. Romsey Abbey is a remarkable proof how readily the pure Norman and the completely developed Gothic may be made to assimilate with each other. The transition, in fact, is gradual. I have now (continued the rev. gent.), after expressing my thanks for the assistance rendered me by Mr. Carter, in furnishing me with drawings, plans, Carter, in furnishing me with drawings, plans, and measurements, to trespass upon you for a short time langer. You will agree with me that none of our edifices have suffered more from neglect or from inadequate or injudicious repair, that our large, conventual churches; and this from no fault of those to whose care they are committed, but simply from the want of sufficient funds. Such buildings as those to which I have called your attention, are national monutaents; and eight not to depend

upon single parishes, or the exertions of a few individuals in one locality. In the present case private liberality has done much; the fabric is now undergoing a most careful repair. If we who are assembled here in consequence of the interest we take in this and similar objects, encourage by our assistance those engaged in the work (and it has been suggested to me that a proposal has been made to this effect) we shall prove that our interest, does not spring from motives of mere curiosity, but from admiration and affection; that we are in earnest when we profess to cherish those monuments which are most valuable as historical records, as developments of genius, and as legitimate aids to devotion. It is not my office now to appeal to higher feelings and motives; I rest the claim upon the mere value, as an architectual specimen, of the building in question; yet we shall not contribute the less readily from the certainty that while we are gratifying our own feelings, and presenting a suitable testimony to individuals whose work we approve, we are also conferring a benefit of the highest order. (70% were subscribed in onsequence.) Mr. E. A. Freeman read a paper on

THE HOSPITAL OF ST. CROSS,

of which the following is an outline:-In-teresting as are the remains of antiquity with which the city of Winchester abounds—poor fragments though they be of its ancient great-ness—none, perhaps, at all equal the charm at-taching to the hospital of St. Cross. Whether, among the numerous similar societies which fell beneath that spirit of sacrilegious rapacity which could not spare the very rosting places of aged poverty, any at all existed which ap-proached St. Cross in its wealth and splendour, protected St. Cross in its weathr and spiendour, is doubtful. It stands incomparable among its own class—the "roof and crown" of such foundations. No one can pass its threshold without feeling himself landed, as it were, in without feeling himself landed, as it were, in another age—the ancient features of the build-ing, the noble gateway, the quadrangle, the common refectory, the cloisters, and, rising above all, the lotty and massive pile of the venerable church; the uniform garb and re-verend mien of the aged brethrep, the com-mon provision for their declining years the verend mien of the aged orethren, the com-mon provision for their declining years, the dole at the gate house — all lead back the thoughts to days when men gave their best to God's honour, and looked an what was done to his poor as done to himself; and were as lavish of architectural beauty on what moas lavish of architectural ocating on and dern habits might deem a receptacle for beggars, as on the noblest royal palaces. The hospital was founded in 1136, by Henry de Blois, Bishop of Winchester, to whom also is attributed the design of the Abbey Church of Romsey. Like that church, it seems to have been built from one uniform plan, but being erected at the time when Gothic architccture was beginning to be engrafted on Ro-manesque, the details of the different parts of the church vary, so that, though in an inferior degree to Romsey, it affords a valuable lesson in the transition from Roman to Gothic architecture. It does not indeed exhibit some change in detail at almost every step, and some parts are apparently actual alterations, still the transition is well and plainly marked, and the idea of the whole church and many of the details are admirable. The church is cruciform, possessing, small as the building is, all the features of a conventual or collegiate establishment— that indescribable something which distinguishes the minster from the which distinguishes the minster from the parish church: no one, even were the hospital buildings not attached, could mistake it for a mere parochial edifice. The church is re-markably lofty for its other proportions, a great merit, as I think, English buildings, of whatever rank, being, with a few exceptions, ordinarily too low. Mr. Freeman gave a minute description of the church. The eastern end, which is the most ancient portion of the building, is a fine specimen of Roman-esque in all its purity and majesty. The west front is also advirable. It is well finished esque in all its purity and majesty. The west front is also admirable. It is well finished, with buttresses and strings, and this elegant doorway, with the splendid western window, the graceful lancets at the ends of the aisles, and the small gable lights, collectively form a mort house in a comparison. most beautiful and simple composition. The west window and clerestory, all fully deve-loped Decorated, are the latest portions of the original church, which seem to have been erected at intervals during a period of more

then a contury. On entering the church at than a contrys: Any warring our sum on any point, two: particulars are, abserved, in which English churches are, for the most part but too deficient—height and vaulting, the latter continued throughout the claroby. The choir and transpots are transition, and af-ford a vast mine of Romassaute ornaminat but, where the work remains, have death more of 'a Romannsque charaoser, ienbept in the pointed pier, and vaulting tambes, isid in the tendency to rounds and hollows in the mouldings; the abaoi are still isquare, fand all the capitals and fornamental surfaces mouldings retain the character of the late highly enriched retaining engraces, or and may my my entrunes. Norman style... But it is very remarkable that the original Norman piers; have either been cased or size removed, and have given way to have outgonal ones of perpendicular style. The choir seems, like that of Romsey church, to have been surrounded by a solid, wall as a screen. Some of the shafts are of marble, but screen: Some of the shafts are of marble, but their/tints, as well as those of the ancient: paintings; which seem nearly to have covered the chancel wall, are ruthlessly smothered by a dingy yellow wash. Above the pier arches is the celebrated triforium of intermeeting arches, to which Dr. Milner stributes the origin of the pointed style. It becomes as to speak gently of one who, though of course far behind the present advance of architectural knowledge, was certainly far before meet of his own are equally in knowledge, 'taste, and reverence; but it will be hardly necessary to do more to allude to this as s mere sepleded' theory. Probably the windows, which have been the occasion of so much controversy and theory, were merely out through the elder theory, were merely sut through the elder openings for the purpose of giving additional light, at the same time that the roof of the aiale was lowered, most probably during the fifteenth century. In the nave the rapid pro-gress of the transition 'may be easily traced. The first pier, reckoning from the easily is a half cluster, retaining the Romanesque capital and abacus; the reat may be considered as Early English, the final pier being a very graceful half cluster. The font remains in the neve, a Norman basin mounted on a later vise, as at Dorchester. The church appears to have suffered very much as to its arrangements, by being made a place of parochial worship for the parish of St. Faith, the arrangement of some of the stalls has been altered, and pawas and other incumbrances introduced. The doimestic buildings are said to have been originally situated on the south side of the church. and to have been rebuilt on their presentiate to the north, by the second founder of the hea-pital, Cardinal Beaufort, The most prantiment objects are the noble gate boute and the daily with its elegant windows and hold apent raded The whole retains, nearly " throughout and ancient air. be at the Tourt . The art to

THE ARCHITECTURAL HISTORY OF THE CATHEDBAL

vas undertaken by Professor Williss and was was undertaken by trotestor with stand was looked for anxiously by those whe had heard of his discourse last year at Canterbury. For the report of the professor's present remarks, we avail ourselves of the notice of it, in the Athenxum (where it appears evidently "by authority"), in preference to our own notes. He here had

He began by regretting that Winchester had not, like Canterbury, a Gervane for its histo-rian. The references to its early history were a few detached notes contained in two of our old chronicles, and in these cases unfortunately the name of the individual who furnished the funds was given, and not the individual who designed the building. It was his wish to com-pare these detached notes with the existing pare these detached notes with the existing building, and to assign the several portions to the probable period of their erection. Much had been done in this way by the late Dr. Mil-ner, the able historian of the city, and one of the fathers of the present race of architectural antiquaries. But Milner had still left someantiquaries. But Milner had still left some-thing for succeeding antiquaries to accomplish. "I will not detain you," he suid, " with the legendary history of the cathedral, but select only those parts, as I go on, which relate to the architecture of the building. The present transepts were thought by some writers to be of Saxon workmanship, but there was no por-tion of the edifice older than the Norman Con-quest and the period of Bishop Walkelyn. The excessive rudeness of the architecture of the transents has led people into this intenable. transepts has led people into this untenable opinion. Now we know for certain that the

centre tower of the building fell not long after the interment of William Rufus, in the choir the incoment of winnam funds, in the choir of the cathedral, and that the tower was rebuilt immediately, after this disaster. The tower-piers of the present edifice are the largest tower piers in England; they are a great deal too large for architectural elegance and for the weight they were required to carry; and I am inclined to think that they were erected by a people labouring under a kind of panic — a people determined to erect an edifice not likely to fall for a long time to come. Now the tower that fell he helieved to have been the work of Bishop Walkelyn, a Norman bishop, and this was partly confirmed by the circumstance, that the tower of Ely Cathedral, built by the Bishop the tower of Ely Cathedral, built by the Bishop of Ely, the brother of Bishop Walkelyn, foll in also, though, it is true, at a period somewhat later. But the brothers, it appeared to him, worked with the same school of masons, and probably with the same design. The plan of Bishop Walkelyn's building was preserved in the crypt of the present cathedral, and he would direct the attention of all who are curiwould direct the attention of all who are curi-ous in the progressive history of our architec-ture, to a careful study of this crypt—an ex-amination easy at this time, from the liberality of the dean and chapter, who had thrown open every part and recess of the cathedral to the machine of the Ambralogical Association members of the Archæological Association. And here he would wish to call attention to a curions discovery that had been only recently made, viz., that a bed of concrete foundation, extending to a distance of about fifty feet from the western portion of the edifice, had been laid there, evidently with the intention of carry-ing two large towers. The limits of this con-crete foundation had been laid open by the liberality of the dean and chapter, who were anxious to render every assistance in their power likely in any way to illustrate the his-tory of their cathedral. Bishop de Lucy, who died in 1204, was the builder of the low-roofed aisles and chapel, and the east of the choir, which are in the so-called Early-English style of architecture : and this he did without disturbing the walls of the Lady Chapel, as was evident from the distinct seam of masonry between them. Hereford, Salisbury, Chiches-ter, St. Albans, Wells, Exeter, and Romsey, afforded similar instances of the aisles to the amorded similar instances of the aisies to the east being lower than the choir itself. He would now make a jump from 1204 to 1370, from Bishon de Lucy to Bishop de Edington, Wykeham's predecessor in the see of Winches-ter, William do Edington left certain moneys for the completion of the anthedrel, but no one ter, William do Edington interesting on one for the completion of the cathedral, but no one determined what portion of the mas mapping determined what portion of the edifice was erected with this money. The whole of the nave and of the west end of the cathedral, were built, either by Edington or Wykeham, and it now became desirable to dis-tinguish the work of Wykeham from the work of his predecessor in the see. After a very careful examination of the whole of the area careful examination of the whole of the nave for this purpose, and after an equally careful examination of the two passages in Wyke-ham's will, which relate to the works at Winchester, he had come to the conclusion that the great west window, and a west window in each of the side aisles, were the work of Eding-ton. The curious observer might remark this ton. The curious observer might remark this for himself, by contrasting the coarse mould-ings of Edington's work with the more delicate mouldings of Wykeham's workmanship. Wil-liam of Wykeham was a very practical man, and was, moreover, the architect of his own cathedral. But Wykeham rather re-adapted the Norman work, than rebuilt the whole of the new from the foundation. The Norman the nave from the foundation. The Norman nave originally consisted of a low pier arch, nave originally consisted of a low pier arch, a triforium, and a clerestory; the nave of Wykehum (the present nave) of a high pier arch, a balcony (rather than a gallery), and a lofty clerestory window. The difference be-tween the two would be seen at a glance by the sections he had prepared for this purpose. William of Wykeham scraped and reduced the old Norman piers—shaped their square edges of masonry into ornsmental monIdings—three of masonry into ornamental mouldings-threw the triforium and small clercstory windows into a handsome balcony and lofty clerestory windows, producing in this way the style dis-tinguished as Perpendicular. It would be, perhaps, sufficient evidence of this view of what Wykeham did, to refer solely to the Norman character of the masonry, so distinctly "observable in the piers of the nave; but, hap-nully for this wind there was a further and still plly for this view, there was a further and still stronger evidence in the original Norman

arches of the triforium, which still remain, left there by this great architect, to strengthen and support the work he had reduced from rude strength into work equally strong, and far more elegant and graceful. From the work of Wykeham he would then pass to the choir, the work of a later period, for which there was no other than heraldic evidence, and the infor-mation derived from the study of the several eras of architecture which it exhibits."

In comparing this account of the cathedral with that by Mr. Cresy, which appeared in our pages a few weeks ago,[•] the main point of difference is seen to be the existence of any part of the Saxon structure. We may hereafter discuss this question.

Professor Cockerell followed Mr. Willis with some cbservations on

THE WORKS OF WILLIAM OF WYKEHAM.

He said, "As a professional architect, ac-customed to contend with the difficulties of uniting in an extensive and therefore, necessarily a complex plan, the paramount conside-ration of convenience and economy of distribution with proportion and beauty, I have been ever impressed with the great merit of William of Wykeham in these respects, and with the lessons of wisdom and of taste which his works display. As the deviser of the Kings's Buildings at Windsor and at Queen-borough, versed in military no less than in civil architecture, Wykeham acquired all the sagacity of an experienced tactician in the management of the accidents and advantages of site. His works at Winchester and at Oxford will well repay an attentive examination; by such an examination the architect will be enabled to appreciate the skill of a great master in the science of his art, while they reveal to him the leading motives which guided the economy and the style of monastic and ecclesiastical buildings in a very interesting period in the history of English architecture." The professor then explained the course pursued by William of Wykeham in enlarging

and rebuilding the grammer school where he received his education, and described the various portions that he erected :-

"The chapel is a very fine one. The chief ornaments of this noble chapel are the groined ceiling in wood, perhaps the most elegant spe-cimen of groining in its day, and, at the same time, a most carious specimen of the carpentry of the period. It has been erected at greater cost and in better taste than the roof of the chapel of the same great architect at Oxford, which is a mere hammer beam roof. We are to attribute this superiority, I presume, either to the affection of the architect for the scene of his early education or to the greater funds at his command when his college at Win-chester was built, for New College, Oxford, is a building of an earlier date than the noble college in this most interesting city. The second glory of this elegant chapel is the contemporaneous east window describing the genealogy of our Saviour. Near the head of Jesse are three small figures kneeling. These three figures are in the highest degree interesting-representing, as they do, the effigies of the surveyor, carpenter, and glazier of this most noble edifice.

I wish I could extend my commendations to the small chapel and oratory at the west end of the building as you enter, and to the bell tower, built simultaneously against Wykeham's Chapel, seventy years after the death of the founder. But I cannot. These works, however tasteful they may appear in their external forms, have proved alike ruinous to the work of the founder, and the architectural reputations of all concerned. The bell-tower of this interesting chapel is now in a most hazardous condition, and will undoubtedly entail considerable expense before many years

are over. The proportions of Wykeham's chapel, at Winchester, are infinitely superior to the pro-portions of his chapel at Oxford. The chapel at Winchester is three diameters in length, and not quite two in height. The chapel at Oxford not quite three. I wish I could explain to you the superior beauty of the three diameters over the not quite three. The comparative drawings which I have had made for the purpose of illustration, which are open to your inspection, will best explain to you the superior beauty of the Winchester proportions,

* See p. 386,

and I shall be happy to answer, to the best of my ability, any questions which you may please to put to me on the subject of the architecture to put to me on the subject of the architecture of Wykeham's College, in the college itself, which it is your intention to examine this afternoon on your way to the cathedral. The perception of proportion seems to be the last acquirement of the student of architecture. e begin by admiring ornaments, details, and forms, but it is at a more advanced state that we make all these considerations subordinate to that sense of rhythmical proportion, that harmony of dimensions, which affects the mind through the eyes, like a mathematical mind through the eyes, like a mathematical truth, and like a concord of musical sounds is perceived and confessed by the ear as obvious and unalterable."

It is pleasant to find the professor, notwithstanding the expressions of contempt with which he occasionally alludes to Gothic architecture from his chair at the Academy, expa-tiating eloquently on the genins of William of Wykeham.

Mr. E. Smirk offered some remarks on

THE COUNTY RALL. 1 /

THE COUNTY HALL. The late Dr. Milner, and others who pre-ceded him, have stated as a fact beyond con-tradiction, that the Assize Hall of Winchester had been a chapel dedicated to St. Stephen, and coeval with the king of that name, by whom they suppose the castle to have been built, and the round table of Authur made. In consequence of this conrest belief, a con-troversy has lately arises at Winchester, and the county has been charged with the descra-tion of an ecclesiastical building. The object of the paper was to shew that it was an ancient hall of the castle eracted, or rather rebuilt, by Henry III. The arrangement and, plan of the hall of the castle crected, or rather rebuilt, by Henry III. The arrangement and plan of the building indicate that this was its original destination, being wholly unlike those of any sacred edifice. The windows and scats under them, and the position and form of windows shew this. Nor is it probable that so large a chapel existed where there was no collegiate or conventual establishment. The contem-porary records shew that there were, four chaplains and chapels in, or attached to the castle, who were paid by elecanosynary stipends out of moneys that annually came into the sheriffs hands, and there was no endowthe sheriffs hands, and there was no endowthe sheriffs hands, and there was no endow-ment or provision for an establishment ade-quate to the service of so magnificent a chapel. These presumptive proofs against its dedica-tion as a chapel are confirmed by the Pipe Liberate, and other rolls and accounts, extend-ing through thereigns of Henry IIL, Edward L, Richard II., and Henry VI., in all of which the "Great Hall" is constantly referred to and no such chapel as St. Stephen ever men tioned. The castle was probably spected by tioned. The castle was probably erected by the Conqueror, and there was a hall before the time of Henry III., but the latter sovereign was doubtless the substantial founder of the present hall, which was perhaps based on the old one. Numerous entries in contem-porary rolls point out the gradual progress of the work, and the expense of the carriage of stone for the columns is mentioned in detail in detached accounts. The hall was probably always used for the administration of justice. There is a striking instance in the reign of Henry III., mentioned by Matthew Paris. In the reign of Elizabeth it was in a decayed the reign of Elizabeth it was in a decayed state, and underwent repairs by the corpora-tion and the crown; and the local records of the county, which begin in the 16th century, shew its constant designation as "the Great Hall," and constant use for the purposes of sectors and essertions assizes and sessions.

EAST MEON CHURCH, HANTS.

Was chosen by Mr. O. B. Carter for illustration. He said, a correspondent in the Gentleman's Magazine of 1816, states thus—It is a well-authenticated fact that Wolkelyn, the cousin of the Conqueror, evinced his liberality and taste by the erection of this present fine church. Be this as it may, this parish appears church. Be this as it may, this parish appears to have engaged his special attention, and this circumstance may, perhaps, be accounted for by the close connection between the parish and the see of Winchester. The church, as it at present exists, presents a fine specimen of Norman architecture in its lower and principal doorware. It was conjudently a considered doorways. It was evidently a cruciform structure in its original state, lighted by small windows, of which one only at present remains. and is shewn on the north-west angle of the

pave. The south aisles, both of the nave and chancel, are evidently additions in the early part of the thirteenth century, and the manner in which the communication with the south transept is effected, under the flying buttress, is worthy of notice. The east and west windows present indications, in their joint mouldings, of having been insertions of the same period, but they have been subsequently sltered, and are, at present, in a very anoma-lous condition. The straight-sided arch of the south transept is well worthy of notice, and is particularly effective. The pulpit is of stone, and is a very good specimen of perpendicular work. It remains merely to notice the font.-It is of the same date as the fonts at Win-chester cathedral, and St. Michael's church, Southampton, and is the work of the same in-dividual. The material of these fonts has been described as black marble, but I have been informed by a competent authority that they are of blue lias. The spire is of lead, and from the character of the corbel table which finishes the tower, and is, probably, of the same date, I should assign its erection to the early part of the thirteenth century, the same date already montioned as that of the aisles. In the south-western window of the tower is still suspended the tintinabulum or saint's bell, by which appellation it is still distinguished.

The Rev. C. H. Hartshorne contributed the following paper on

PORCHESTER CASTLE.

The natural position of Porchester rendered it eligible as an early fortress so soon as the Romans had gained a fonting in Great Britain; the precise age of it is uncertain, but probably bater than the works at Richborough, Peven-sey, and Dover. The inhabitants of Hamp-shire having assisted those of Brittany in their revolt against the youthful Crassus, urged Cæsar the following year to undertake the conquest of Britain, His landing-place doubtful, but effected exactly 1900 years back. In the uncertainty as to the precise dates of the different Roman fortresses on the southern coast, it is essential to examine the modes of construction employed in the works themselves, since this plan will exhibit the close analogy and characteristic marks of Roman architecture in England, with what is observable on the opposite coast; and shew that all the military works of that age are precisely the same in their principles. The works on the coast are the earliest; and as the conquest of the country extended, the same quadrangular forms of en-campment followed its progress. The foundations of these buildings, npon examination, shew them to have been laid in conformity to the rules given by Vitruvius. The towers on the walls, the modes adopted to give them the walls, the modes adopted to give them stability, and the method of binding them to-gether, by means of Roman brick, the bad building materials employed in the work, are all in obedience to the precepts of this great architect, as shewn at Leicester, Lincoln, Wroxeter, Burgh, Richborough, Dover, Por-chester, and other places. The same system, in fact, prevails from Caenwent and Caernaryon to Dover and Silchester: and from Lillhonne to Dover and Silchester; and from Lillebonne and Soissons to Autur in France. The dura-bility of these tiles is occasioned by the clay having been thrown up a long time previously to its being used. The more important question of cements was next entered upon, from which it appeared that by a careful analysis having been made of several, they were found to agree with the rules of Vitruvius, and, moreove , to shew that their peculiar hardness depends upon their coarseness, which hastens crystallization, and causes the latent cohesives of the slaked lime to be brought into neas of the slaked lime to be brought into action, so that the mass became more perfectly carbonated. By the application of this kind of inquiry it is proved that Porchester still exhibits, notwithstanding the continued repairs it has undergone, from the reign of Henry II. to the present day, indisputable marks of its high antiquity. But there is no connecting link between the genuine Roman work of the link between the genuine Roman work of the second century and the Norman keep of the twelfth. This keep, which was the temporary residence of King John on nineteen different occasions, gives a curious insight into the do-mestic inconveniences of the early English monarchs, who, when compelled to stay within doors, must have passed much of their time in murky twilight,-a gloom they tried to dissi-

pate by the great quantity of wine that was These always ordered to precede their visits. castles were always held by constables under the crown, and garrisoned by its tenants, who were bound to perform service here during time of war, on which tenure they frequently held their estates. During the prevailing taste for the outdury of concentration architecture, it for the study of ecclesiastical is to be feared that the military remains of England, which do not make the same sacred appeals for preservation, do not receive the attention that patriotism should excite, and are suffered to perish without any exertions being made to record their character. Yet they must ever be dear to the history of our country, as having been at once its terror and safeguard. Structures, it is true, that rose at the bidding of ambitious rulers, and at a time when the upper classes tyrannically repressed every exertion that aimed at extending the natural rights of society, yet are still to be preserved as the memorials of a despotism which civilization has overthrown, to shew posterity that the misery and rapine inseparable from feudalism has been transferred from bitter endurance to the pages of history, or the records of national injustice, and to teach them how dearly those privileges should be cherished which a gracious sovereign has ratified to a united people. Stained as these fabrics may be by the deeds of unrelenting and merciless men, still let their tottering walls be kept from entire destruction, were it only to afford a sequestered spot where the unlettered hind may gaze in mute astonish-ment and moralize, where the painter may gather up those broken lines of beauty that charm and captivate the eye when traced upon his canvas, and where the exploits of chivalry - the songs of wandering minstrels - the fictions of legendary lors — and the charities of holy men may become idealised by the crea-- and the charities of tions of poetry.

Our notice of the papers read already engrosses more space that we can spare, and only leaves us room to mention briefly, that at a general meeting held on Monday last, Lord forthampton in the chair, the name of this division of the old society was changed to "The Archeological Institute of Great Britain and Ireland." Lord Northampton was elected Lord Northampton was elected and Ireland." Lord NorthBurgers, and York was president for the ensuing year, and York was fixed on as the next meeting-place. highly applaud the committee for the alteration in the title, and trust that the two societies will now separately pursue their important objects each in their own way and without collision.

ENGLISH CARVINGS.

WE have recently examined with much gratification a number of beautiful carvings by Mr. Rogers, of Newport street; the more so because some of them are executed for a foreigner, and are to be sent to Paris. We allude particularly to the decorations of a ca-binet for the new mansion of Signor Mario, in The frieze is composed of grotesques, Paris. masks, the infant genii sporting in the foliage; the tablets below have boldly sculptured trophies of the sports, shields, and monograms. Above the cornice are six Fiamingo-like boys half life size, representing the seasons, another room is an enriched border for a pichalf life size, representing the seasons. &c. In ture, from "Spenser's Faëry Queen," 8 feet high, 6 feet wide, projecting about 16 inches; this is composed of the lightest Venetian foliage, bound together with garlands of flowers, in which are gamboling boys with musical in-struments, mounted with the bust of Queen Elizabeth, and a scarf to be chased in the manner of the old Venetian work.

Mr. Rogers has addressed a letter to us denying the truth of a remark on him in the communication signed "Justice," which ap-peared in our columns last week. As to his personal skill in carving (a matter with which, excepting in connection with the terms of the Government competition, we should not sllow any remark in our journal), Mr. Rogers re-marks that he "served seven years to it with it with the late David Mc Lauchaulan, and therefore ought to know something about it. I have created, by my own industry during the last twenty years, a *large* business, and have been rewarded by liberal patronage from almost every capital in Europe, as well as in my own country, where her Majesty's Commissioners awarded me the most unqualified and marked approbation.

In reference to the workman whose name was mentioned as one of my best men, I never had a man of that name in my establishment; but in looking over my books, I find in 1837, during an excess of business, that several outdoor journeymen as supernumeraries were em-ployed, and that one of that name had three weeks' work. What impression that could have made on the carvings sent to St. James's Bazaar (as their value was six or eight hundred pounds), I leave you to judge."

MACHINE FOR MAKING BRICKS FROM UNTEMPERED CLAY.

A PATENT for this purpose has lately been granted in America to Mr. Benjamin H. Brown. The following abridgment is from Mr. Keller's reports in the Franklin Journal.

The clay, as it is taken from the bank, is deposited in a hopper by elevators, and from the hopper it passes between two rollers, that move with different velocities, by which it is drawn through in thin cakes, and thrown on to a set of permanent teeth, and there cut up by the action of sets of teeth on a roller that works between the permanent teeth. It is then conducted by a spout into a moveship mould which, when filled, slides under a piston, actuated by a cam, to be compressed and formed into a brick, which is then discharged by a follower, actuated by another cam that forms the bed of the mould.

Claim .- " I do not claim the use of the cams for operating the pistons in pressing brick, nor do I claim the manner in which the bricks are received, compressed, and de-livered; but what I do claim as my invention, and which I desire to secure by letters patent, is the arrangement of the two cams for effecting the pressure and delivery of the bricks, in combination with the pistons and moveable mould. I also claim the combination of the rollers and pins for pulverizing the clay as above described."

SETTING OUT CURVES ON RAILWAYS.

SIR,-Permit me, through the medium of your valuable columns, to express my obliga-tion for the very useful information given by Mr. Hawkins respecting the setting out of curves on railways. Although I have never had any practice in railway surveying, yet I have taken considerable interest in the subject; it may not, therefore, be deemed presumptuous in me to offer the following method (in addition to those already given by Mr. Hawkins), for setting out a new tangent to the curve, which presented itself to me whilst investigat-ing the formula given in your journal.

Referring to the diagram (in BUILDER, July 26th), let D be the last ascertained point in the curve from whence it is required to set off the new tangent. From A, lay off on A T A $B + B D^2$

a line equal to $\frac{\overline{A B}}{2}$ a line from the point

thus determined ranged forward through D, will be the tangent required. E. Ordnance Trigonometrical Survey Office, Preston, E. NUGENT.

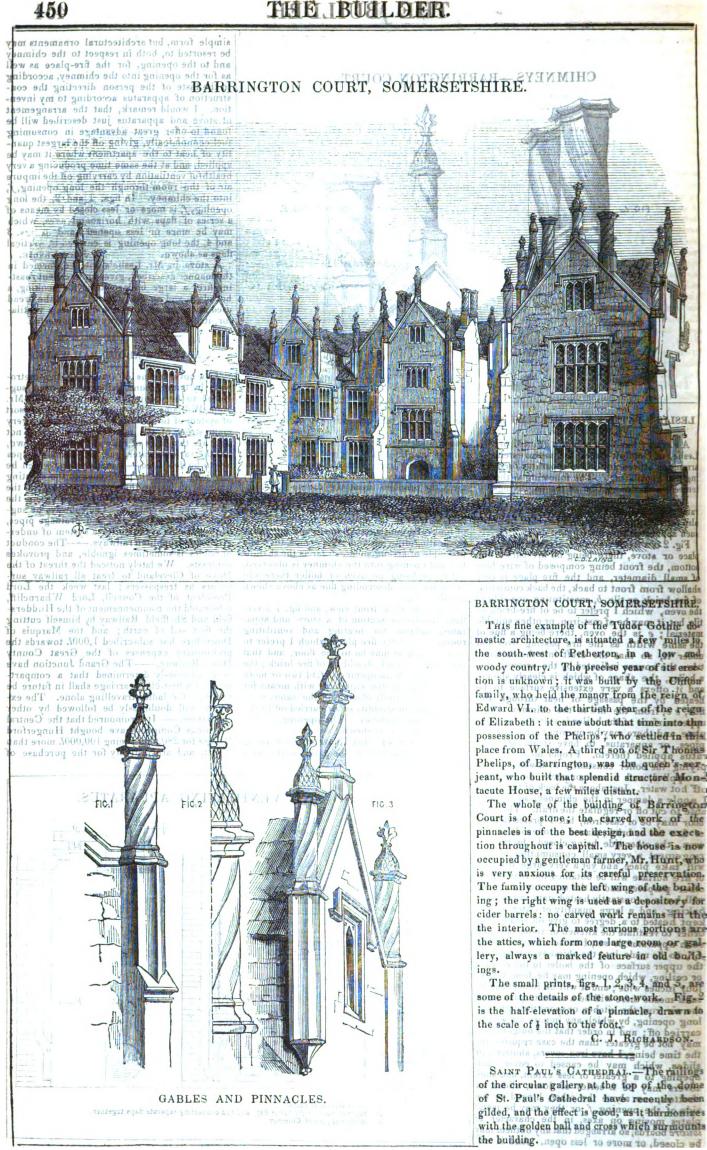

. If our correspondent will reconsider the formula given by Mr. Hawkins, he will find that it is a reduction from the above impression.

ARCHITECTS' DESIGNS.

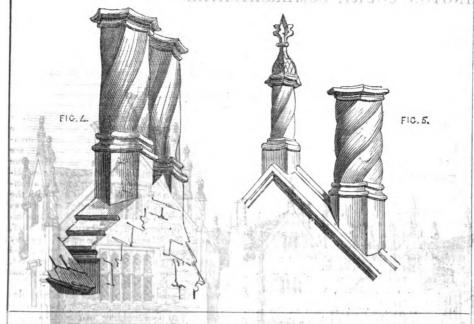

WE have received a letter from Mr. Cooper, rchitect of the "Booksellers' Provident Architect of the "Booksellers' Provident Retreat," referred to in our last number, complaining, as we had not ourselves seen the design, that we had inserted the opinion of some who had. If architects will not furnish us with information of their works, or afford us opportunities for judging of them by litho-graphs, &c., when published, and in some cases even neglect to reply to a polite inquiry, they must take the chance of being misrepre-sented in ignorance. We have yet to learn, however, that our informant's opinion of Mr. Cooper's design is unsound.

ABUNDEL CASTLE.-The Duke of Norfolk has given permission to view the exterior of Arundel castle, and the keep, on Mondays and Fridays during the season.

THE BUILDER.

CHIMNEYS, BARRINGTON COURT.

LESLIE'S PATENT FOR HEATING AND VENTILATING.

A PATENT has been recently granted to Mr. Leslie, of Conduit-street, for improvements in arranging stoves and other apparatus for heating and ventilating. The following is the patentee's own description of the engravings :-Fig. I shews the section of a stove and appa-

Fig. 1 shews the section of a stove and apparatus for heating a boiler and an oven, and also for ventilating a kitchen or room, in which such apparatus may be employed. Fig. 2 is a front view thereof; *a a* is the fireplace or stove, there being no fire-bars at the cottom the for the being no fire-bars at the

bottom, the front being composed of wire-bars of small diameter, and the fire place is very shallow from front to back, the back consisting of fire brick or tile, b, constituting one side of the oven, which I prefer to be of fire-brick or tile, but it may be of cast iron, or other suitable material; e is the oven, there being a flue of the same width as the fire passing over and under 'it, so that the draft into the chimney takes the course indicated by the arrows; d is a boiler, the shape of which is clearly shewn, and it offers a very extensive surface to be heated by the passage of heat through the flue, e e, from the fire to the chimney. The piper surface of the boiler is suitable for a hot plate, and there may be openings with suitable pipes, or apparatus, to have steaming appa-ratus applied thereto. Proper means of sup-plying the boiler constantly with water are to be applied, and a cock or cocke for drawing upper surface of the boiler is suitable for a hot e applied, and a cock or cocks for drawing off hot water. Just above the back of the boiler I apply a damper in the chimney, so as to be able to cut off or regulate the draft. The oven door may be of cast-iron, but I prefer it to be of fire tile or brick, placed on one side of the oven, the other side being closed; by this arrangement a very small consumption of fuel will take place, and yet a very large frontage of fire surface will be obtained for roasting or other purposes, and at the same time the oven will be in a constantly heated state suitable for baking, and a large quantity of water will be kept heated to a degree to give off steam. In order to ventilate the kitchen or room in which such apparatus is set, I cause a long opening, f, to be made into the chimney, rising from the upper surface of the boiler to the cornice or ceiling, which opening may be from two to four inches wide; and it will be found that by such means there will be a constant passage of the size form the bitchen or room through such the air from the kitchen or room through such long opening, by which any impure air will be carried off; and in order that the outgoing air may not be greater than the case requires for the time being, I have iron covers, shutters, or slides, which may be caused to cover such opening to a greater or less extent, and such covers may be a series of doors, slides, or shutters, one above the other, hinged to the side of the opening, f, or they may be metal plates moving on axes, in the character of *louvre* boards, so arranged that any of them may be closed, or more or less open. And it will

be found by this arrangement of apparatus there will be no tendency for the smoke or vapours passing up the chimney from the fire to pass into the kitchen or room, but there will be a constant draft from the kitchen or room up the chimney, which will not only carry away the products from the fire up the chimney, but also the air from the room or kitchen, thus producing any desired degree of ventilation, as well as an advantageous consumption of fuel. In constructing stoves and apparatus for heating drawing and other rooms, the same principle of arrangement, so far as the shallow fire and opening into the chimney is observed, but there being no oven or boiler there will be no tortuous descending flue as above shewn and described.

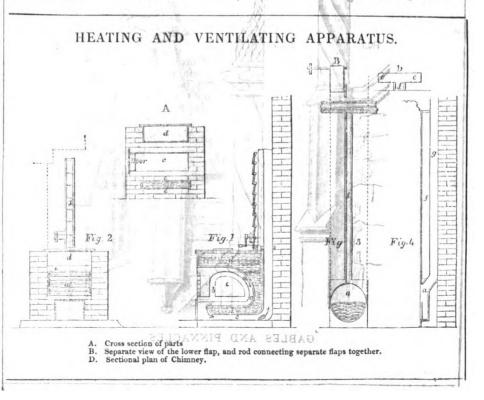

Fig. 3 shews a front view, and fig. 4 a vertical transverse section of a stove and apparatus, suitable for heating and ventilating rooms; a a is the fire-place, which I prefer to have as near as may be to the floor, and that the sides and back should be of fire-brick; the chimney, g, has an opening, ff, of two or more inches wide in the chimney, with means for closing or partially closing of the same, so as to regulate the quantity of air carried off by the draft up the chimney. The opening, f, rises to the cornice as is shewn.

I would remark, that I have in the drawing shewn the apparatus in the plainest and most simple form, but architectural ornaments may be resorted to, both in respect to the chimney and to the opening, for the fire-place as well as for the opening into the chimney, according to the taste of the person directing the construction of apparatus according to my invention. I would remark, that the arrangement of stove and apparatus just described will be found to offer great advantage in consuming fuel economically, giving off the largest quantity of heat to the apartment where it may be applied, and at the same time producing a very healthful ventilation by carrying off the impure air of the room through the long opening, f, into the chimney. In figs. 1 and 2, the long opening, f, is more or less closed by means of a series of flaps with horizontal axes, which may be more or less opened; and in figs. 3 and 4, the long opening is covered by vertical flaps as shewn.

and 4, the long opening is covered by related flaps as shewn. JOHN LESLIE. A stove in Mr. Leslie's kitchen, formed in the manner described, gives an excellent roasting fire, a large boiler, steam for cooking, a hot plate, and an oven that bakes all the bread used in the house, for 7d. a day. As a ventilator, its effect is necessarily very powerful.

JOTTINGS ABOUT RAILWAYS.

The novel means of traversing the metropolis by underground railways has been suggested to her Majesty's government by a Mr. John Williams. He proposes to make a sort of system of tunnels under and through every main street of the metropolis; in which not only are two lines of railways to be laid down, but the various water, gas, and drainage pipes are to be deposited — a matter alone which he has long urged in preference to the existing practice of laying the water pipes, &c., in the earth, inaccessible except by breaking up the streets and pavements. The subways he suggests for the water, gas, and drainage pipes, are to be made available for a system of underground metropolitan railways. — The conduct of nobles is sometimes ignoble, and provokes contrasts. We lately noticed the threat of the Duke of Cleveland to treat all railway surveyors as trespassers; last week the Lord President of the Council, Lord Wharncliff, celebrated the commencement of the Huddersfield and Sheffield Railway by himself cutting the first sod of earth; and the Marquis of Downshire has subscribed 1,000%. towards the preliminary expenses of the Great County Down Railway. — The Grand Junction have very judiciously determined that a compartment of a first-class carriage shall in future be reserved for ladies travelling alone. The example will doubtlessly be followed by other companies. — It is rumoured that the Central Terminus Company have bought Hungerford Bridge for 280,0002, being 100,002, more than it cost, and are in treaty for the purchase of

the market itself as their station .--- A correspondent of the Rost has suggested that at might, or during fogs, when signals are not wisible, the signal man should reply to the whistle of the angias by some sound—a large bell, for instance, giving thereby an assurance The savans of the French that all is right.-Academy are busying themselves with rail-ways. M. Laborde proposes an electric tele-graph, which is to tell its signals by sounds. M. Ruaux has a plan to substitute horse power for steam in locomotives.----The immediate effect of the opening of the railway to Guildford has been to reduce the prize of coals 10s. per ton-an effect which has had a sensible influence in smoothing away the prejudices with which the advent of the railway was regarded. Three months ago there were three coaches between Guildford and London daily. There are now trains ten times in the day.-Perhaps the most startling project in modern times, is the attempt to establish a Great European Railway Company, whose object is to supply railway accommodation to a popula-tion of only 236,000,000 of human beings. From their prospectus now before us, we learn that the portion of the earth comprehended stitution have procured the model of a novel invention recently brought from the United States ; the object of which is to enable trains to ascend acclivities or steep gradients on railroads. It has an Archimedean screw between the axles of the carriage, which comes in contact, when required, with a series of friction follers, placed between the rails; and by means of this contrivance the carriage and train attached to it are forced up the incline. The apparatus is brought into action without delay or stoppage, and in the model mounts a gradient of about 1 inch in 6. Two gentlemen, claim the merit and the patent-right of the invention, the one is Mr. Coleman from America, whose model we have just described; the other is Mr. Templeton, who we under stand obtained letters patent for this and other improvements in railway propulsion some time previous to those of Mr. Coleman. Messrs. Bailton and Son, of Manchester, in their circular, make the following remarks on their circular, mane the longering for the she present day for becoming railway directors in a many companies as possible. "From an many gompanies as possible. "From amongst many who eminently figure as aspirants for railway fame, we matching figure as aspi-rants for railway fame, we may quote a gentle-man lauded in the *Hampshire Independent* as the railway vice oy, and who vertainly seems as worthy of extensive fame as any literary or scientific D, D., M.D., or F.R.S.; and, if ab-breviated titles of honour mean any thing, this gentleman is entitled to the following appendages to his name, as signifying the relation in with one London and Windsor railway are nearly completed. We understand the line decided upon is through Knightsbridge, Kensington, Hammersmith, Turnham-green, Brentford, Hounslow, Bedfont, Staines, to Windsor, by a tunnel under the Long Walk, with an alternative line from Staines to page with an alternative line from Staines to pass by Datchet, and enter Windsor by a bridge at Black Potts.—The following is the course determined upon for the Richmond railway. The terminus will be in the Broadway, Richmond. The line will then run nearly parallel with the Richmond-road, as far as East Sheen, leaving Kew a mile and a half distant on the left. It will afterwards cross Barnes-common, having a station as near to the high road leading to llammersmith bridge as convenient, and ing to Liammersmith-bridge as convenient, and funning alongside the Upper Richmond-road, will cross Putney High-street by a cutting of from 12 to 18 feet in depth, over which a bridge will be thrown, to continue the old thoroughfare. This cutting will be continued to North-fields, Wandsworth, where a viaduct will be commended and as the will be commenced, and carried across the road leading from Wandsworth to Putney,

THE BUILDER.

through a row of houses called Point-pleasant, across some marshy land to an extensive osier bed. Here the excavation will have to be carried 18 feet deep before a foundation can be obtained for the viaduct, and in consequence of the tides overflowing this part, it will be the most difficult undertaking on the whole line. Continuing the viaduct, a double arched bridge will cross the Wandle, after which the works, meeting with littleengineering difficulty, will be continued to their termination at Falcon-bridge, Battersea, where men are already at work. There will be stations at Putney and Wandsworth, and it is expected that the whole line will be opened on the 1st of May next.

CHURCHES AND CHAPELS, UNDER METROPOLITAN BUILDINGS ACT.

THE following application and certificate serve to shew the requirements of the official referees on this subject, and may enable other parties so to arrange their drawings and statements when applying as to prevent delay. Messrs. Locke and Nesham being about to build Trinity Church, in Wenlock Barn, Cityroad, submitted the drawings to the refereos, and asked for their certificate.

In reply to the application, the following letter, from the registrar, was received by them :---

"GENTLEMEN,-With respect to the proposed Church at Hoxton, I beg, on the part of the official referees and myself, to inform you that it appears to the official referees upon careful consideration of your drawings, that the spread of the concrete under the footings of the tower is too much restricted, and that you have not indicated in detail the mode of springing the walls of the tower from the inerted arch, or of abutting them against that arch; the mode of tying in the sides of the spire has not been indicated, and the northern buttresses of the tower are not shewn upon the plan as to be built from the foundations with the walls in the same manner as the other It also appears, that timber plates buttresses. are intended to be inserted into the walls of the tower, which the official referees consider objectionable, and in opposition to the rule in schedule D, part 2. It is also to be observed, schedule D, part 2. It is also to be observed, with reference to the roof of the nave, that no efficient means appear to be provided for preventing the roof from spreading ; and with reference to a gallery indicated on the plan, that none of the drawings submitted show the manner in which it is proposed to be con-structed. Under these circumstances the official referees request that you will be so good as to state whether you would prefer to supply the deficient information before they proceed to certify, that any conditions upon the points alluded to may be avoided in the certificate, or that the certificate should be prepared with such conditions as the official re-ferees may deem necessary to secure sufficient strength in the construction throughout."

The builders stated that the architect preferred the official referees should add their requirements to the certificate, rather than that the drawings should be withdrawn and altered.

The sides of spire would be ticd in by a strong chain bond—stone and iron. The northern buttresses would be made to project above the body of the church and not built from foundations.

The timber plates the architect will omit and carry on stone or iron corbels.

The architect considers the roof of nave not likely to spread, especially as the roof of the side aisle abuts against it.

With regard to the concrete for the tower and body of church, the architect would leave it to your discretion to award as much beyond what is shewn as you please. We herewith send you additional drawings shewing the gallery."

The following is the certificate :--

"With regard to a certain church proposed to be built in Wenlock Barn, City-road, Hoxton, in the parish of St. Leonard, Shoreditch, in the county of Middlesex, and in the district of St. Leonard, Shoreditch, within the

limits of the Metropolitan Buildings Act, 7 & 8 Vict. cap. 84. Whereas the Official Referees of Metro o-

Whereas the Official Referees of Metro olitan Buildings, daly appointed in pursuance of the said Act, have received and duly considered certain particulars and drawings of the said church, submitted to them by Messrs. Locke and Nesham, builders, of Theobald'sroad, London, copies of parts of which drawings, representing the foundations, walls, roofs, and other constructions, are hereto annexed, and marked respectively A, B, and C.

Now the said official referees do hereby certify that (it being understood that no excavations for graves or otherwise are to be made at any time within the said proposed building, or within ten feet of the footings on the outside thereof,) the heights, thicknesses, and dimensions, shewn in the said annexed drawings, are approved by them, except in so far as the same may be inconsistent with the following conditions, and that the works may proceed in conformity with the said conditions and with the said drawings as modified thereby, subject, as to the soundness and sufficiency of the foundations, and of the work in every part thereof, and as to its accesses and stairs, and in every other respect, to the provisions, rules, and directions of the Metropolitan Buildings Act, and to such supervision and special espervision as are therein prescribed in that behalf. And the said official referees do hereby de-

And the said official referees do beroby determine and declare that the said church is to be deemed to be a building of the extra firstrate of the third class within the meaning df the said Act. — Dated this 16th day of August, 1845.

Conditions referred to in the foregoing certificate.

That the concrete foundations of the tower extend at the outer sides at the top 6 inches beyond the toes of the footings, and at the base 6 inches more for every foot beyond the first foot that such concrete foundations may be in depth.

depth. That the walls of the tower be built of regularly coursed and bonded brickwork or masonry over the concrete bed, throughout the spandrels of the proposed inversed wrokes as well as above the springings upon: these arches.

That the two buttresses on the north side of tower be built up from the foundations; coursed and bonded with the walls in such manner that no part of the superstructure shall overheag the substructure thereof.

That the sides of the towerst the springing of the spire be efficiently tied.

That no timber as bond or as plates be laid into any wall upon the face of a wall, and that all beams, girders, joists, or other bearing timbers requiring a bearing upon any wall, rest upon a stone template of not less length than twice the thickness of the timber to be borne.

That the bearings of the breastaummer beams of the gallery do not exceed 10 feet, unless their scantlings be increased to justify longer bearings.

That some more efficient means be applied than the drawings indicate of preventing the roof over the nave of the church from spreading."

22

VENTILATION,—Amongst the new systems of ventilation is the plan proposed by Mr. Wroughton, which consists of a mercurial valve acting upon a spring, and opening a portion of a window in such a way that the room will always remain at the temperature desired, and the foul air be replaced at every instant by a supply of pure air from without. Mr. Wroughton's plan is indeed but an extension of the principle of the mercurial self-acting valve of Dr. Amot's stove, but the application of it to the purposes of ventilation is new.

EXHIBITION AT THE ROVAL INSTITUTION, MANCHESTER.—The exhibition of paintings this year is universally admitted, says the *Manchester Guardian*, to be the best we have ever had. The number of pictures already sold is eighty-three, and the aggregate amount received for them is greater than the total amount of sales last year, including even the thirty-six pictures taken by the holders of prizes in the Art-Union. The exhibition is to be opened in the evening at a lower rate than at present on and after the 29th instant.

WORKS IN THE PROVINCES.

Ar Canterbury a company is being formed baving for its object the establishment of a general genetery without the walls of, but contiguous to the city. The capital required is 15,000%.——The present extravagant price of gas in Wolverhampton has suggested the project of a new company, with a capital of 30,000%. When the situation of the town is considered, its proximity to the coal-fields, and its cheap water communication therefrom, it cannot but be matter of surprise that gas should have retained a higher price, ranging from twenty-five to thirty per cent., than what is charged in many towns of inferior local advantage.~ -A new corn hall has lately been opened at Bungay. The Ipswich Eapress opened at Bungay. The Institute Lapress says, it is scarcely possible to speak too highly of the liberality with which the proprietors have endeavoured not only to accommodate the persons attending the market, but also to beautify the town, by the erection of this building. May There Exercise The top 3,0004 towards the restoration of the Bishop of Exeter's Palace. Considerable progress has recently been made towards completing that magnificent and colossal undertaking the Queen's Drive, Edinburgh. The portion which runs through what was formerly a marshy meadow, and a great nuisance, is finished, and joined at the one end to the portion com-mencing opposite the foat of Arthur-street, and at the other end to the outlet at Parson green, so that the low lying portion of the carriage-way and footpath is now finished and more elevated section of the drive, com-mencing at Mushat's Cairn, and terminating at St. Leonard's, the operations are in a for-ward state. Workmen have lately been em-ployed in throwing down the old city wall on the west side of Bristo-street, Edinburgh, for the purpose of widening the thoroughfare in that part of the city. This old wall, which is now fast disappearing, is a venerable relict of past times, having been crected immediately after the battle of Flodden Field, and has, therefore, stood upwards of 300 years. There is still a considerable portion of it standing in the north of Drummond-street.----- Extensive improvements are now in progress at Dun-robin Castle. The John o' Groat Journal says, when they are finished "the old castle will have to boast of some rooms as noble as any of which our southern nobility are proud. Its antique character will also he preserved ; and the magnificent snito of spartments (marked in the architect's plan as "The Queen's Rooms") will harmonize, at least - bees externally, with the ancient feudal towers of Dunrobin, that have braved fully five centuries." A new bridge of a neat and substantial cha-racter is being erected at Widford, near Chelms-ford.----The new Catholic church in Coventry, the nave of which was opened for public worshi about twelve months since, is now finished. The ceremony of consecration took place last sweek.----.An attempt is being made at Yar-month to raise by subscription 5,000/., for the purposes of restoring the parish church of St. Nicholas, and of establishing a national school in connection therewith. With respect to the restoration, the committee say, "As a parish observed, it is one of the largest in the kingdom, and has many parts of great architectural interest. Its present aspect is extremely mefancholy, but as there is now a strong desire throughout the kingdom to render churches worthy of the high and holy purposes to which titley are devoted, it is hoped that the voice of the prophet of old, which says, "Is it time for you, O ye, to dwell in your ceiled houses, and *Mis house* lie waste ?" will now be heard, and that a building which in former ages appeared "exceedingly splendid and solemn, may once more assume its pristine grandeur."-Lord Mostyn has given the munificent donation of 2001. towards rebuilding the ancient church at Flint, which has now fallen into great decay. The Hon. E. M. Lloyd Mostyn has also given 1000."in furtherance of that desirable object. It is proposed that the new church shall afford accommodation for 800 persons.—A tempo-tary building in the New London-road, Chelmsford; designed for the Roman Catholic service, is nearly completed, and will shortly be opened. It is built within an enclosure,

purchased for the erection of a more extensive building, on the completion of which, the to proceed with the excavation for foundations forthwith, and the buildings are to be completed by Lady-day, 1847.— The Rev. Mr. Smith is building new schools at Taunton, entirely at his own expense. There will be two rooms of 50 by 20 feet each, with sliding doors, the whole room when the doors are slid back being 102 feet 6 inches. At the southern extremity is the master's cottage, behind which are to be ample courts. The style chosen is that of the collegiate and domestic edifices, of the latter part of the fifteenth century, having large transomed and mullioned windows, and steep gable ends to the roof. The school-rooms will accommodate 420 children, and are designed for Sunday and day schools.--The old poor-house, Walcot, new theatre at Manchester is nearly completed. The stone façade in Peter-street will be finished by the opening day, the 29th instant. The marble statue of Shakspeare, which is to occupy the niche in front of the building, has not yet arrived from Italy.——For a long time nothing has remained of Panxworth Church but the tower, standing in an arable field, a reproach to the parish and the neighbourhood. ----Lately, h owever, efforts have been made for the restoration of the edifice; and as a compara-tively small sum, 500% is required, several gentlemen have resolved to raise the necessary funds. Mr. Watson, of Norwich, whose plan will probably be adopted, has offered the east window, equal in value to 25% subscription. The design is in the style of the fourteenth century, with a pave and chancel .--The Barl of Ripon is rebuilding his family mansion, at Nocton, destroyed some few years back by fire.----Extensive alterations and improve ments are in progress at Hatfield House. At Birmingham Street Act have expressed themselves in fayour of the plan proposed by the Birmingham, Dudley, and Wolverhampton Railway Company, of erecting a capacious station in the centre of the town. — The Dock and Harbour Commissioners at Leith have closed the lower drawbridge for the purpose of levelling the bridge and other-wise improving this extensive and increasing thoroughfare. The work will be one on group expense, and will, it is expected, occupy three in the execution.—. The Hull Dock Company are prosecuting their various, exten-sive, and highly important works with a vigour and dispatch rarely witnessed. The railway dock, the great east dock, the warehouses, the iron yards, &c., are now in course of rapid construction, and when completed cannot fail to raise Hull far above her present position.

EFFLUVIA FROM SEWERS.

SIR,—I was very pleased to observe the letter of "J. L." on the important subject of "effluvia from sewers" in your last number, letter of and I believe that whenever this matter is taken up in good earnest, a remedy will not be long wanting to lessen, or altogether get rid of, the mischievous effects of the postiferous gases continually rising from our subterranean drains or sewers. You are of course aware that the subject has engrossed the attention of persons connected with these matters for many years past; and with respect to the plans pro-posed by "J. L.," I believe the first of them can lay no claim to originality; in fact, the idea of "trapping," in connection with our street can lay no claim to originality; in fact, the idea of "trapping," in connection with our street sewers, has been proposed and laid aside as futile and visionary long since. The remedy for this serious grievance appears at first sight so simple, and at the same time so effective, that no doubt it will strike some persons as strange that it has not been applied to some extent before this time. I am not prepared at this moment to assert that it has, but I am in-clined to believe so. The bar, however, to its introduction, you are no doubt aware, has been the danger and serious injury that would result

by the explosions and bursting of the several the natural consequence of shutting the safety valves-for in such relation may the gulleyholes be considered to stand with reference to the main sewers. Your correspondent's plan, however, of meeting this difficulty is not so common, and in some measure provides a remedy for the danger to be appreheaded from explosion, although here spain many difficut-ties would present themselves in obtaining sufficient, safe, and convenient sites for the "columns," or vitiated alr flues; as they should recur very frequently, not only to insure the stability of the sewer; but also the lives of persons whose duty it is occasionally to pass through them for the purpose of examination or repair. The experiment, however, in the manner proposed — that is the combination of a system of "traps" and "columns," may, I believe, be tested without any enormode outlay; and with regard to the mode of destroying the gasses on their emerging from the columns, chemistry would lend us innumerable aids, and, I believe, might be made an indux whereby to shew the amount of vitisted sire consumed under the various changes of the seasons and atmosphere, and other circumstances, and which we are now compelled to inhale in our daily search after London fresh air. I am also of opinion that the system could be made more complete by the introduction of draft-creating machinery on the principle of the wind grards and ventilators. This would, I believe, prevent much of the annoyance felt at times, within doors, from the back or down-drafts in the sewers in windy weather.

474

Before concluding these few remarks on a subject, perhaps one of the most useful 'that can occupy the varied pages of your paper, let me ask your correspondent whether he has conceived, and is prepared with, the detail as regards the "traps" which he proposes to regards the "traps" which he proposes to use; as on this point much of the successful working of the system would depend. These traps must of course always contain a'suffitraps must of course always contain a suffi-ciency of whice, and they must be continuitify replenished and cleansed, or they would in time become themselves the receptacles (in a more prominent position) for stagnant matter, and thus increase the evils which they were designed to remove. Nothing, it appears to me, would so effectually conduce to the 'con-stant efficiency of the " traps ³¹ as a 'shift branch from the " water main," furfied at will, so as to keep up a greater of less flow of water so as to keep up a greater or less flow of water down the sulleys, " share of d / and to guods down the guilleys. State of the states of your restlicits

who take an interest in the subject to give us the benefit of their opinion thereon, a distant

the benefit of their opinion thereon, and there I am, Sir, &c.; and the trade is the state P.S. It just occurs to the the treformation, like charity, should begin at home; and there fore it behaves us before crying too loadily against "public" sewers, to put a proper "trap (not on our months only) but on our own priorite drains and cesspools; for I feel persuaded that mach of the annoyance before adversed to proceeds (from inattention to this latter point), from the vaults and areas of our houses, and not entirely from the gulleys of our public scherk,

DRAIN TRAPS .- Contrivances to prevent the escape of foul air from drains often fail to produce the intended effect, and great expense is often incurred in attempting to apply a ra-medy in the wrong place. 'The drains smell, we shall have rain,' is a common expression, but perhaps few inquire why drains send forth their peculiar intimation of a change in the state of the atmosphere. It has become the practice to the almosphere. It has become the practice to trap drains where they leave the house to prevent the ingress of rats from the sewer, so that a large quantity of air is inclosed in the drain between these large traps and the smaller ones, at the sinks in the house. Now, this air being liable to expansion from various courses (one ranking high to expansion from various

.... BARLY DOMESTIC BUILDINGS.

By the restorers of sucient architecture chimney shafts, though mecessary, were con-sidered to be excresseness on the design. In edifices draigned in forms darived from temples, theatres, and other ancient buildings, with their parapets and roofs decorated with vases. their purpose and point to be introduction of chimney shafts destroyed, in the eye of its te, the antique impress attempted to be given to the composition. A shaft rising from the apex of a pediment, or from the cornice of a façade, on coping of its parapet, would have been an ensione like a cooked hat placed on the Apolio Belviderey - To avoid the mecessity for this barbarous combination, the Italian sichlisets formed the hearth recess in the internal walls, and by this disposition, brought the chimney shafts into a situation where, if they could not be hidden, they could be grouped and disguised to have the appearance of something they were not, and be thus made to harmonize better with the general character of the building. It was rarely that the hearth recess was made in an external end wall, and then it was seldom indicated by any projection. The chimney shaft was placed on the parapet as a base, or ap-peared to rise from a phinth or pedestal placed on the corriges of roof. At this period, when the Italians were raising palaces and villas an-equalled for their beauty, the English archi-tects, whose eye had been educated amid combinations seen in buildings of the pointed style, practised a maanles of design most extraordinary in its display of magnificence in plan, and Wandafism in the tuste and application of decoration. "Lumence windows and an absord while static of infittees while while with a local and a second made their edifices uppear better adapted for aviaries, that protection from a cold humid variable climate like that of England. + In variable climate like that of England.⁺ In such houses, Lord Bacon said, one did not know where to be out of the sun; and maugre their great fire-places, and blazing logs, he might with equal truth have added, nor where, in winter, to be out of the solid unless one stood within the chimney. In buildings erected, from the Conquest to the close of the reign of Heary MIAI, the rule appears to have been to make the hearth recess in the outer wall, and hearth and havindown.

and between the windows. When three or four hearths were thought sufficientin a large mansion, their position and form were of minor importance; but whan, in the progress wfiimprovement, a chimney had to be commasted an each of a number of apartments, they became objects of much con-sequence, both in the interior and in the aspect of the building:" The chimney stacks were stranged in two ways on the exterior, one by attaching them like towers to the walls as at Bilthefield and Costasy, the other by resting them on the parapet, as at Thornbury. The first, though not the most frequently practised, is the most ornamental. It is difficult to say which is the most ancient. The single chimneys of the upper floors often rose like a column stached to the walks, supported by a corbel. The form given to the shufts was the same, whether they rested on a projection or on a parapet ; sometimes they were carried up from the perspet like separate calamas, in imitation enetical chimbeys -or they were united at top by a cornice....or appeared like a group of pillars attached to each other. A third manner was practiced when architects, in the reign of Elizabeth, discarded the ancient rule, and in imitation of the Italian practice, placed the hearth recess in the inner wall, and opposite, instead of between, the windows. The shafts were then sometimes made to assume the appearance of a parapet, ornamented in different ways, rising above the roof; but their shafts ceased to be so ornamental to the building as in the earlier fashion. The chimney piece, however, in its, turn became an object on which much architectural decoration was lavished.

But, if their fireplaces and windows were faulty, the sound judgment and good taste of Druelt, Moston, Percy, John off Padus, Mascelt, Havens, Hoite, Thorpe, and other architectorof this period, were, in one point, worthy of infinite praise and admiration. Feeling that houses were made to live in, as well as to look "Beep. 415, some. Notes from Bernan's "History of Warming and Venithating." " Carber's Views of Tudor Houses, and Britton's Arch. Mathemist." THE BUILDER

at:mand that, from the nature of the climate, and habits and wants of the inhabitants, fireplaces in rooms were essential to enjoyment and comfort, they were not ashamed, like the "artists? who snaceeded them; to let the chimney shafts appear in their designs, but, on the contrary, by ornament and position, they brought them forward as essential parts of the fabric, and pleasing and picturesque objects in the composition. This was in trath the period of the triumph and glory of the chimney shaft. Invention was racked for variety of form, and novelty and elegance of decoration; Dorio, Corinthian, composite, and other sorts of columns, fluted, twisted, square, polygonal, and elliptical; single, clustered, and in groups; crowned with pediments, scrolls, and vanes; obalisks, altars, vases, all covered with roses lozenges, frets, guilloches, festoons, armorial bearings, heads of monsters, initials, figures, and a host of other devices, combined with a most fantastic and capricious imagination, gave a superlative lightness, and grace, to the parapets and roofs of Tudor houses.

With the exception of regal and baronial mansions, the greater part of the houses throughout England were mostly one story high; except in towns, a two storied habitation was a mark of distinction, and were constructed of timber, but in parts of the west country, they were built of stone, and some few houses in London were of brick. This partiality for wood was, however, as much from taste as economy, for Holinshed says, they might have been built at nearly the same expense of one material as the other. In the woody districts, fabrics were strong, and so well timbered as not to have more than six or nine inches between stud and stud. But in tracts, such as the fens, where wood was scarce, no studs were used, but only "raysins, groundsells, transomes, and upright principalls, with here and there an overthwart post in the walles, whereunts they fasten their splintes and radles, and then cast it all over wyth clay to keepe out the winde," or strike them over with a rough plaster, which was afterwards whitened, and ornamented with a fine mortar, often beautified with figures and other curious devices. In other cases, instead of clay, bricks were used to fill in the spaces between the timbers; and instead of being plastered over, they were laid so as to form sig-sag, lozenge, and other simple patterns on the face of the wall. This was a very common method in Kent and was a very common method in nent and Essex. They had large porches before their entrance doors, and generally one large hall, or parlour, or kitchen, the other rooms were comparatively small. Town houses, more pleasing to the painter's eye than comtortable for habitation, were built with one story jutting over the other so that when the atreets were over the other, so that when the streets were narrow, the people in the upper stories on opposite sides of the street might not only converse with each other, but shake hands if so minded. The fashion was carried to an absurd excess; Ray saw an old house at York, of which the upper story projected fifteen feet beyond the foundation. In towns, more especially in London, where the houses were generally three or four stories high, + they were full of rooms with low ceilings, built at random, without any thing of contrivance, having steps from one to another, and blind staircases. Although their fronts were nearly composed of glass, with the windows projecting, the apart-ments were dark, as if the inhabitants were afraid of light and good air, and loved to play at hide and seek.1

The pompous mansions of the Tudor period are deplorably deficient of all that comfort and convenience arising from a plan suitable to the wants and habits of an improved state of society. The whole interior was sacrificed for a certain display in a small portion of it. In a mansion consisting of eighty apartments, as at Leckinfield, four or five rooms only, says Bishop Percy, were adapted for the use of the noble owners and their guests, the rest were cheerlees cabins to sleep in, coarsely plastered and white-washed, with ill fitted doors and imperfect glasing, or they were appropriated for offices.⁶ In houses of this class, the presence or privy chamber, my lady's chamber or bower, and two or three bed-rooms, form the list of what would now be called, from their finishings and furniture, habitable apartments. In the presence another the walk arere hung to a part of their height with tapestry, or they were lined with papelled weinsect, ornemested with a profusion of earved braaments, that often also envered the ceilings, or with stamped leather having gold devices on coloured grounds, that came into fashion in the time of Henry VIII. The doors were clumsy, and still coarsely Minged and fastened. It had shutters secured by rough bolts and padlocks.

shutters secured by rough bolts and padlocks. These evils were tolerated from habit, not from ignorance, for the public was familiar with the most judicious precepts for the preservation of health, and the construction of buildings. For health's sake, says Lucar, one of the neglected monitors, "let the principal doors and windows of your house be doen to the north-east, south-east, south-west. Moreover, make all the rooms within your house lightsome, of a convenient height, and of a laudable largenesse. Build in every chamber within your house a chimney. Lodge always in a high phanbar, that is severed from the roofe with a floore betweene, rather than in a roome belows, and hease you do not sleepe at any time in a close place nor upon the ground. And in no wise suffer. as stable, ax stall, standing poole, filthy dicth, or stinking sink, to be mear your house or garden."

Sush windows, that were introduged shout the time of the great fire, were very common. The upper valve was fixed, and the under one, The upper valve was bred, and the under, such the upper valve was bred, and the under, such as when raised, was, kept at various, heights by a means of a series of notches, and a satch to hook into the m, ..., The next, improvement, iartroduced with, King, Willium, is resorting to be a Dutch invention, ..., in this the under, such was suspended by a weight and line, and moved over a pully. . The wood work of these sushes was very massive and from the was very massive and clumsy, and, from the thickness and width of the astragal, a, large window had much the appearance of a portcullis filled with glass, of a very indifferent quality. The sill of the window frame was most imperfect. Shutters were common and corresponded in clamsiness with the same same They had not yet, however, become necessarian in bed-rooms, except in the best, chambers of great houses. Rebated doors, were also another contribution to comfort at the Revolution ; and carpenters now began to tongue and groose the flooring boards, which prevented personal in the chamber overhead seeing what was going: on in the room under, where the ceilings, were on in the room inder, where the ceilings, were, not plastered. Tongueing and growing, boarded partitions was apother clever innova-tion which shut, up, a multitude of holes, that made as many crevice, winds as there were deals used. When I compare, says Neve, the modern way of building with the old way. the modern way or building what the old times. I cannot but wonder at the genius of old times. Nothing is, or can be, more delightful, and convenient than height, and nothing more agreeable to health than free air; and yet one would think the people of former ages were afraid of good air and light, whereas, the genius of our, times is altogether for light staircases, fine sash windows, and lofty cellings. And such has been of late our, builders' in-dustry, in point of compactness and uniformity, that a house after the new way will afford an the same quantity of ground many more con-veniences. The contrivance of closets in most rooms, and painted wainscot, now so much rooms, and painted wainscot, now so much used, are also two great improvements, the one for convenience, the other for cleapliness and, health; and indeed for so damp a country as. England nothing could be better contrived than wainscot to keep off the ill impression of damp walls. In short, for handsome ac-commodation and neatness of lodging, London has undoubtedly got the pre-eminence. The greatest objection to its buildings, mostly of brick, is their slightness, occasioned by the fines exacted by the landlords, so that few of the common houses are built to last longer, than the ground lease, which runs from fifty to sixty years. In the meantime, however, if there happens to be a fit of excessive heat or cold, the tenant must needs be uneasy at it. The plustered ceilings also, so much used in England beyond other countries, make, by Ine plastered cerings also, so much used in England beyond other countries, make, by their whiteness, the rooms much lightsomer, and are excellent against raging fires; they stop the passage of the dust, lessen the noise overhead, and in summer time the air of a room is something the cooler for them, and in the winter something the warmer, because it

÷. THE SMOKE NUTSANDE - Seven persons and Max Thomas (Ogden, the chimneys of whose works have king set an example to the district. "Mr. Holdstop this lated, and, as far as such matters can be proved in a court of justice, proted, that the means essential to an almost perfect combustion 'of smoke were by no means costly; that, in ordinary cases, they might be applied at a cost of 10% or 15%; and that the result, while it secured all that could be desired in the removal of the nuisance, was in this case attended with a saving in his consampfloir of fuel of not less than 18 per cent. In the three years, 1838-1840, his consumption of cost was one ton per hour; in 1841 the antible consuming "apparatus was adapted to his furnisher and in the three following years, 1842-1843; his consumption of coal was re-duced to 16 36 10 the cwt. per hour. The general accuracy of these statements impugned by Mr.! Armstrong was confirmed by Mr. Fullbarn, O.E., who stated that two simple efements only were needed to ensure the construption of smoke, a sufficiently high temperature and the admission to the furnace of a sufficient quantity of atmospheric air. " Abyission To Public Buildings. - We

are happy to state that it is her Majesty's intention to abolish the office of state housepensation to the lady who at present holds the office, and thereby getting rid of the unpopular tax upon the public in the shape of house-keeper's fees for shewing the state spartments at Windsor, which will in future be placed under the custody of the Lord Chamberlain. We feel traly grateful for this concession to public opinion, and since rely hope that this excellent example will be followed in all public places where fees have been hitherto

HULL GLASS WORKS .- A company is being formied at Hull for the manufacture of glass The prospectus, which is now before us, states that " the reneal of the data and the repeal of the duty on glass, and its consequent reduction in price, must necessarily occasion an immense increase in the demand for it, not only as concerns such portion of its manufacture as relates to domestic and horticultural parposes, but in the higher and more elaborate branches of its manufacture in plate and flint glass, as well as in the hitherto un-known articles of water-pipes, drains, and roofing." The capital required is 200,000*l.*, which it is proposed to raise in 10,000 shares of 20% cach.

MALT-HOUSE FLOORS. - Mr. Livesey, architect, of Portsmouth says, Claridge's Seyssel Asphalte, laid on a sound concrete bottom, makes the best floor for malt.

King's COLLEGE, LONDON. — The classes r engineering, architecture, and manufac-ring art will be re-opened on Wednesday, for turing art will be re-opened on Wednesday, the 1st of October next. Houses of PARLIAMENT. - Rumour says Mr. Gwilt has been appointed to examine and

report on the present state of the building.

· Country and City Purchaser. Art. Building.

BLEOT BIUTT. --- A cobrespondent of the Mining Courset states he opinion this the simultaneous and instantaneous ignition of gas lamps in bities and towns by weats of elecu trieity wild ere long be substituted for the presentelow and irregular method. He further states, "I confess that I am astonished that electricity has nover been cullsted into the servive of the steam-engine, when every sound reflecting mind, and clear intellect, must relidity perceive that it must ultimately do away with the present employment of fuel and boilers, and their auxiliaries. I have no pretensions to the vision of the prophetic visits, when I verture to predict that the time is not far distant when the globe will be circum-navigated by the agency of electricity." "

NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our readers, however, they are entered in a book, and may be seen on application at the office of "The Builder," 2, York-street, Covent-garden.]

For the execution of Works on the Dund alk and Enniskillen railway, being a distance of ten miles.

For the execution of several lengths of Earthwork on the Aberdeen Railway. There are 5 separate Contracts, varying in lengths from 31 miles to 43 miles.

For the execution of works on the Manchester South Junction and Altringham Railway, in two parts : 1, being a distance of 14 mile; 2, being a distance of 7[‡] miles. 12

For the execution of Warks on the Manch and Birmingham Railway in 2. parts. 1. The Ashton Branch, being a distance; of about 42 miles. 2. The Macclesfield branch, being a distance of about 30 chains, including a tunnel of 330 yards in length.

For the execution of that portion of the Edin-burgh and Northern Railway, extending from Burntisland Pier to Kinghorn.

For supplying the Leeds and Thirsk Railway Company with 100,000 Railway Sleepers. For the execution of works on the East Lanca-

shire Railway, viz., the Accrington Contract, being a distance of about 8 miles.

For the execution of that portion of the New-castle and Berwick Railway, extending from Netherton to Tweedmouth, being a distance of

Action to I weedmouth, being a distance of about 53 miles. To be let in four contracts. For repairing the Footways of the Streets and Public Places within the liberty of the Bishop of Winchester, Manor of Sonthwark on the Clink, for one, two, or three years. For the execution of Works on the Syston and

Peterborough Railway, in 2 parts : part 1 being a distance of about 94 miles ; part 2 being a distance of about 12 miles,

For supplying the Liverpool and Bury Railway Company with Sleepers, conformable to specifications.

For Re-building the White Hart Inp, at Beaminster, Dorset.

For supplying the Parish of Christ Church, Surrey, with Guernsey Granite of the best quality, and broken to a two-inch ring.

For the execution of works on the Leeds, Dews-bury, and Manchester Railway, viz., the Churwell Contract, being a distance of about 22 miles.

For the execution of a portion of the Edinburgh and Northern Railway, being a distance of about 6 miles; to be estimated for in two lots.

For supplying the Eastern Union Railway. Bor supplying the Eastern Union Railway Com-pany, with 5 First Class, 12 Second Class, and 5 Third Class Carriages; to run on six wheels, the gauge being 4 feet 84 inches.

For the Erection of Stone Booking-offices for Sheffield and Manchester Railway Company.

THE BUILDER

TO ABCHITBOTS AND BUILDERS.

The PATENT ALBERT WEATHER BAR for simpli-tity and effect superselsa any thing of the kind yet offered to the public. The expense varies from 184, to 254. Invented and manufactured by T. WILKIN-SON stad Co., Iremmongers, 77, Boyent quadrant. T. W. also excentes all kinds of fron-works, Biaircases, Warming by Hot-water, Fitting up Stores and Ranges of all kinds; size Bell-hanging extensively executed. Estimates given.

MOREWOOD and ROGER'S PATENT MOREWOOD and ROGER'S PATENT GALVANIZED TINNED METAL. - This article was at first sold under the name of Galvanised Tin Plates, but the Patentees finding that the public, in some instances, over-looking the word Tin, confounded the article with Galvanised Iron, and that the character of their metal has thereby sus-tained injury, are desirous of giving it a name so distinctive as to prevent such mistakes, and consequent disappointment to purchasers in future. They therefore respectfully request pur-chasers to inquire for MOREWOOD and ROGER'S PATENT GALVANIZED TINNED IRON. In order to enable the public readily and at first sight to distinguish between the two metals, it may be well to inform them, that Galvanised Iron has a plain sine-like spoerance, while M. and R.'s Patent Galvanised Tinned Iron has a smooth crystalline surface. MOREWOOD and EOGER'S PATENT GALVA-NIZED TINNED IRON, Patronized by the Admiraly and the Hosourable Board of Ordance, being extensively used is har Majesty's Dock-yards, at the Towse, and elsowhere, for every variety of Roding, and other purpose, where a strong, light, chesp, and durable material is ro-quired. It has been found by experience that this article is beyond

elsewhere, for every variety of Boohng, and other purposes, where a strong, light, chesp, and durable material is re-quired. It has been found by experience that this article is beyond all comparison superior to sinc; possessing, as it does, all the advantages arising from the strength and firmness of iron, combined with perfect immunity from rust; whils it is free from the very serious objection which applies to sinc, vis. its contraction and expansion, consequent upon every change of temperature, and from whick elemenatance leakage must of course result. This material is not likely to be destroyed by fire, as is the case with rinc and lead, which melt and run down, thus freely admitting fresh air to the fire, and causing it to burn more forcely. It is, therefore, obviously well adapted for all the purposes above-named, and most importantly so, when there is the possibility of fire. It is also peculiarly suitable for chinney-tops, gutters, sponting, and out-door work generally, possing the strength of ron, without its liability to corrosion. It is by far the most economical metal roofing that can be obtained, in consequence of its strength as it may be laid without boards, and upon the lightest rafters. This mode of preserving matal from rust does not only ap-

as it may be laid without boards, and upon one inguess-rafters. This mode of preserving mstal from rust does not only ap-ply to sheet-iron, but also to manufactured iron in any form, as bolts, nuts, hinges, nails, &c. &c. For full Particulars apply to S. HOLLAND, 34, Grace-

church-street.

Phurch-street. PERSONAL Sectors of the sector of the sect

rust. Amongst outer transmission (Copy.) Lloyd's Register of British and Foreign Shipping, 2, White Lion Court, Cornhill, February 7, 1848. This is to certify that the undersigned surreyors to this society did, at the request of Messrs. Malins and Rawlinson, eramine the Patent Galvanised Iron Sheathing upon the bottom of the Mary Stewart lying at Messrs. Curling, Young, and Co.'s Dry Dock, Limehoute, and lately returned from a voyage to the Island of Ichaboe, on the coast of Africa, and found it unbroken and perfect throughout the ship's bottom, and no supearance of corrosion, or oxide of iron upon its surface. This iron that had been exposed by puncturing the nail holes had become coated with sinc; the sheathing was nearly clean and free from marine gross and animalculze. It appears to have answered very well during the before-mentioned voyage, and the ship has sailed without its being found necessary to do sny repairs to it. PETER COURTENAY, J.

Digitized by GOOGLE

SATURDAY, SEPTEMBER 27, 1845.

VERY architect in practice has cause to complain of the want of skilful and earnest operatives,-men who understand the trade they profess to practice, find plea-

sure in the exercise of it, and are anxious to produce good work. We have; before this, commented on the decline apparent in many of the constructive arts, and shewed that it proceeds from excessive competition, which induces the master to require a certain quantity of work from a man without reference to its quality: he cannot afford to develope a man's ability, but demands the greatest amount of work in the smallest space of time : "superior work wont do; work that will pass is all that he can hope to give ;" and the natural result is, that our workmen, as a body, have gradually "lost their cunning," and that the majority of operatives now employed are incapable of exconting work which is at all out of the common way. Our bricklayers and smiths afford the most striking example of this decline; the old enthusiasm, which still lingers, though feeble, amongst other trades, especially with the masons, seems to have departed from them : they do their work as mere labourers, and have no pride in the result. There are, of source, many elever exceptions; but we speak of the mass. Very glad should we be if we could induce a different feeling on the subject, at all events in the minds of the rising operatives, and induce them to strive to excel. and to find their chief pleasure in the exercise and exhibition of their skill. The earnestness of the ancient workers is figured in the following curious passage from the "Apocrypha:"

"The smith sitting by the anvil, and considering the ironwork, the vapour of the fire wasteth his flesh, and he fighteth with the beat of the furnace : the noise of the hammer and the anvil is ever in his ears, and his eves look still upon the pattern of the thing that he maketh ; he setteth his mind to finish his work. and watcheth to polish it perfectly."*

It has been justly observed that, there is nothing so inconsiderable which may not become of importance when made an object of serious attention. An operative who applies an intelligent mind resolutely in the practice of his craft, elevates both the craft and himself, and will pass a much happier life than one who drudges through his day's work without excitement or feeling of interest.

To insure improvement in the constructive arts, it is of importance to obtain for the able and ingenious artisan a better place in society than he now holds. The intellect required is much greater than is wanted to form a very smart shopman, for the disposal of goods from behind a counter,-yet in the opinion of the world, the former holds a much inferior place to the latter; and is excluded from society to which the other would be admitted. This is not us ft should be, and we would anxiously assist in bringing about a change of opinion in this respect. As matters now stand, an intelligent, well-informed youth has no inducement to apply himself to the practice of the constructive arts; as instead of gaining position by so doing,

* Ecclesiasticus, c, xxxyill. v. 37. Written shout 200 years

he will lose it, and the course is therefore left to men of less ability and lower grade.

We should be right glad to see all the master-builders following the good example set by a few of their body, and taking every means to increase the comforts, and raise the character, of the operatives in their employ. They would themselves find advantage in it, and we earnestly call upon them to commence the attempt forthwith.

To workmen we would say,-put your own shoulders to the wheel; become masters of your trade — artisans, not mere labourers artists if you can, able to give a "because " for a "why,"-make your work your pleasure. An upright man who will do this cannot fail to rise, and better still, will pass a more useful and happier life, other things being equal, than one who has not pursued this course. Able workmen,-men with heads on their shoulders. are not plentiful, and are far two valuable to be disregarded. Notwithstanding an old writer 5878 :

"A cunning workman fine in cloister close may

And carve and paint a thousand things, and use both art and wit; Yet wanting world's renowne; may 'scape un-

sought or seene : It is but Fame that outruns all, and gets the goale I weene;"

Such a workman may depend on securing re-

munerative employment, the good will and respect of his fellow citizens, and the applause of his own mind.

ST. MARY REDCLIFFE, BRISTOL.

THE restoration of this justly celebrated parish church is now to be commenced in earnest. Tenders for certain portions of the cavator, bricklayer, and mason's work; Grif-fiths for carpenter's work; Fears for plum-ber's work; Edbrookes for smith's work; and Parkers for glazing. The ground is to be lowered all round the church, and a system of drainage introduced the charcel is to be drainage introduced; the chancel is to be new rosfed; the east window, long since bricked up, is to be opened, and the external masonry of this end of the chancel with certain parts on either side from the bottom to the top, including some of the beautiful flying buttresses and pinnacles, is to be wholly renewed. We sincerely hope that the masons will now never leave the ground till the whole building is restored, and the finial affixed to the spire which is to crown the glory of this noble pile. Mr. A. B. Hope, M.P., suggests that a separate subscription for the tower and spire should be made, and has forwarded a donation in furtherance of it.

Over the altar screen of the church as some of our readers will remember, there are three large paintings by Hogarth, "The Ascension of Christ," "The three Marys at the Sepul-chre," and "The High Priest and Servants Sealing the Tomb." Being quite out of place here, though year valuable as zero examples here, though very valuable as rare examples of the master in a different line of art from that which he generally pursued, it is to be hoped they will be purchased for some public institution, and the proceeds applied to restore the ancient altar-screen, now hidden by a *pseudo* classic composition, and to bring into the general view of the church the ladychapel, seen through the Gothic panelling of

the screen. These pictures were put up in 1755, at an expense of 7611.* It is worth remark that, if instead of expending this sum in a manner not consistent with the character of the church, the money had been invested and the interest allowed to accumulate, it would now amount to 50,000*l.*, or more than enough to restore to the whole church its original stability and beauty, and give to modern Bristol one of the most perfect and noble monuments in Europe.

* Hogarth received for them 5451. The frames and fit-tings swallowed the remainder.

This fact might be usefully reflected on by committees in the present day. A similar statement will perhaps be made fifty years hence (or less), when subscriptions are soli-cited to defray the cost of restoring the homo-geneity of St. James's church, Piccadilly, by tak-ing out and changing the stained-glass window which they are now about to erect there at an expense of a thousand or two sources of states. expense of a thousand or two pounds. Further, they will say, this was done by the men who called their grandfathers barbarians, for place ing Italian fittings in Gothic churches, and and spent enormous sums of money in correcting the mistake, and rendering their ancient buildings in some degree consistent! It would seem after all, that we are little wiser than our forefathers.

THE EVIDENCE OF ITALIAN INFLUENCE UPON ELIZABETHAN ART.

THE increased desire for the preservation of national antiquities must afford extreme or national antiquities must afford extreme gratification to all in whose pursuits the science of archæology takes part. The histo-rian, and archæologist, and the lover of the picturesque, now represent a large section of the people, whose interests, and whose tastes; not less than those of the agriculturist, or the manufacturer, might fairly demand recogni-tion, and aid from Goverament. That there is no national institution, by which the review tion, and and from Government. That there is no national institution, by which the rapid course of decay and spoliation, may, at once, be put an end to, is in truth a national dis-grace, and the occasion of losses irreparable; made manifest in the continuance of much unmade manifest in the continuance of much un-certainty in points of social and political his-tory. Works of art are the archives of a country, of which the annals of history are impressions; whilst as the "exponents of national character" and manners, they are the crystallizations of thought, and the silent teachers of instructive lessons.⁶ If the re-mains of churches and monastic buildings are valuable, and interesting for the light they shed valuable, and interesting for the light they shed upon the religious element of the state ; the examples of domestic architecture give the picture of that history, which of all others is supremely valuable, least understood, and most in need of such illustration, the history of social life. Therefore it is deeply to be regretted, that they hand so often stretched out, successfully, for the preservation of a parish church, has been withheld from the less conspicuous, but not less important castle or manor-house.

It is not our intention to give a history of domestic architecture in England, though in its connection with political events, and with the economy of private life, it would afford a most extensive field for research, and illustra-tion. But, there was one period in the history of Evolution of the hist of England, of which, more than any other, we of brighter, of which, inder than any other; we can say, that we feel the influence; an age, in which literature was in an extraordinary state of brilliancy, — the truly glorious period of English history; and at that epoch it will be interesting to examine into the influence of architecture, of literature, and politics, each upon the rest. The time of Elizabeth is one, which, viewed

in every aspect, stands boldly conspicuous. The resistance of liberty to foreign aggression, and to papal influence, was then most powerfully developed, and the country placed in a high position in the scale of European nations. Literature and art shed a halo round the court of the British Gloriana: Shakespeare, Jonson, Spenser, and Sidney were the great "not for this age, but for all time." The link between the chivalry, that had gone before, and the refinement, that was to succeed; the Elizarefinement, that was to succeed; the Eliza-bethan age was the creation of most, that, at this day, we contemplate with pride, as Englishmen, and with gratification, as lovers of literature and poetry. The state of the art of architecture of that day was singular, the state of the build. yet, in some respects, prosperous. The build ing of palaces was a passion, singularly pro-lific. The settled state, into which the kinglific. dom came after years of bad government was a circumstance favourable to the display of genius, and to the appreciation of its works. At this juncture, it will be our object to consider what circumstances, in the state of art and literature, were mutually influential, and are explanatory of each other. The earliest remains of English domestic

458

architecture, were rather strongholds in time of war, than buildings, which represent the neual residences of the people. The most ancient of such fabrics, traceable in this island, are the circular towers rejsed upon a mound of earth—which was either natural, or artificial—with little provision for convenience, but ingeniously contrived, for defence. Many of these, remain, in Scotland, and Conis-borough Castle, Yorkshire, and Castleton Castle, Derbyshire, are examples in England. Both these were inclosed by a court or bal-lium, with a fortified entrance, as usual in Norman fortifications; though it has been thought, that these castles were erected, at an earlier date. In the naxt stage of, pro-gress, the keep was relinquished, as a place of residence, except during actual asge; whilst more convenient apartments were con-structed over the great gateway, which led to the inner ballium, or courtyard, as at Top-bridge, in the thirteenth century. Subsequent architecture, were rather strongholds in thus bridge, in the thirteenth century. Subsequent to this arrangement, were the Edwardian castles, of which Caernaryon and Conway, in Wales, are examples. In these, the keep Wales, are examples. In these, the keep was done away with, or rather expanded into a circuit wall, which contained the apartments, and was fortified with towers, at short distances. The next step was to the castle-palace, leaving us the older parts of Windsor, Alnwick, and Warwick. These belong to the fourteenth century, and shew the progressive desire for comfort and ele-gance, induced by the cessation of the baro-nial wars. The long slits, which, except in the upper, story, had been the only windows, were often replaced with larger, and more splendid openings, as in the halls. Haddon Hall, Derbyshire, is an example of a castel-lated house of the fifteenth century, in which convenience was greatly considered; and which, though fortified in the gate-house, and other, parts, was almost powerless to resist a other parts, was almost powerless to resist a protracted siege; though during the Parlia-mentary wars some of them were successfully defended. Succeeding these were the quaddefended. Succeeding these were the quad-rangular houses of the time of Henry VIL, in which the old form of buildings, surrounding a court, was still preserved, as indeed, in many parts of the country, it was till, a very late period. — In the fifteenth century, the arrangewent of the house was of the most simple character. An entrance passage, with a ball on one side, a parlour beyond, and the kitchen one side, a parlour beyond, and the kitchen and offices, opposite, and an upper story of domitories, such was the ordinary manor-house of this entury, and the sixteenth. There were few writcles of furniture, or other conve-nieuces. Of less important habitations the records are very scapty, but leave no doubt as to the slight adjuncts to convenience.—Tim-her was the ordinary material for a new conto the slight adjuncts to convenience.—Tim-ber, was the ordinary material for a very con-siderable period; the earliest houses being, each a huge frame, independent of walls, resembling the inverted hull of a ship, and forming, as it ware, the skeleton of a Gothic hall. The principal beams, springing from the ground, curved, forming a Gothic arch over-head; and the intervals of these were filled up with borizontal planks. At a later period, the hull was raised on walls, the intervals of the woodwork being filled with stones, or plaster, and strengthened by braces. In the reign of Henry II, stone had sometimes been used, but probably merely loose rubble, ce-mented. Brick was introduced, early in the fourteenth century, probably from Flanders; mented. Brick was introduced, early in the fourteenth century, probably from Flanders; but did not come into general use till the reign of Henry VI. During the reign of Edward IV. brick was much employed; but there are few buildings remaining, of the fif-tearth early in However, at Eton college and there are few buildings remaining, of the fif-teenth century. However, at Eton college, and some other places, are portions in hrick; --it was most used in the eastern counties. In in-teriors, walls were commonly bare, without wainscot or plaster; though some great houses had hangings, subsequent to the time of Ed-ward IV. Plate was uncommons, and all other conveniences were of another when the terms conveniences were of small number. Larger structures than these were built by men of property, during the reigns of Henry VI. and Edward IV., but few are traceable much higher; and it would be difficult now to name a house-not castellated-older than the time of Henry VII.; though it is true that frag-ments of doors and windows are found, of earlier date.

UILDEK

The accession of Elizabeth 1558, and it was subsequent to this period, 1555, and it was subsequent to this period, that a vast majority of the residences in Eng-land were erected. The style of building as we have seen, had regularly progressed, in-fluenced, only in such features, as we should expect from the usual adaptation, to circum-stances, of material and convenience; being in fact the castellated, or domestic variation from the coelesiestical erebitecture. But a new the ecclesiastical architecture. But a new ingredient was now to alter the whole face of nogregient was now to alter the whole face of architecture; applied rather in the mansion than in the church, but producing a revolution, the effects of which have never been entirely got rid of. By what circumstances was this change occasioned?

Flanders had probably, considerable in-fluence upon the style of architecture of Henry VIII.'s reign. Brick had been imported from that country, and Holbein was the ed from that country, and Holbein was the architect of many important buildings. The connection of the two countries was intimate, and continued so under Elizabeth. Garden-ing, by which we may understand flower-gardening, was introduced from the Nether-lands about 1509; the previous gardens in England, being formed of arbours, hedges, and trees. But, what most of all led to the change in taste, was the extinction of the old style of architecture by the Reformation. Its eccleaiastical semblance was done away with ecclesiastical semblance was done away with, during a period, in which no churches were erected. The art had small means of display-ing itself, during the progress of calamities, which made the name of religion a pretext for massacre. Elizabeth was hailed as a deliverer, and the progress of society received a new im-petus. Men looked to the future, rather than back to the forgotten past, and were in this state, best calculated to receive new impressions. The first half of Elizabeth's reign was too much occupied in the cares of Government, to find room for other matters; but that period over, the age commenced, of which no Englishman can ever think without pride, and admiration

The influence of Italian architecture in England, was soon apparent in the numerous palaces, crected at this period. But, it was not only the influence of architecture, but also that of Italian literature, and manners, which that of Itslian literature, and manners, which accompanied, or rather created the first.— In Italy, during the *fifteenth* century, domestic architectore had not attained the elegance, which might have been expected from a people, usually so attentive to the refinements of life. In several towns, the houses were covered with thatch, so that fires were of common occurrence. But the change was not the less rapid, and complete. Costanzo, a Neapolitan historian, writing towards the close of the sixteenth century, remarks upon the of the sixteenth century, remarks upon the change of manners, since the time of Joanna II., 150 years before. The chief families had expended all their wealth upon their retainers; and the house of Caracciolo, high steward to the queen, having fallen into very inferior hands, had to be enlarged, being ininferior hands, had to be enlarged, being in-sufficient for customary accommodation.* But there is no reason to doubt, that before the reign of Elizabeth, churches, and houses in Italy alike exhibited that splendour which is now the admiration of Europe, and could not fail then to make a lasting impression upon travellers, and would be imitated by them in their own countries at least where them in their own countries, at least, where ever the national architecture, through any circumstances, had fallen into comparative disuse. But, it is also necessary to consider, whether other circumstances may not have exerted an influence upon the architecture of England, leading those who were about to build, to desire a style of architecture, remind-ing them of the literature, with which they had already become familiar.

The general spirit of the fifteenth century, was one of decided progress.† Education was cultivated, and academical foundations instituted in England. In Italy, the Italian language gained great elegance, and the Medici were the munificent patrons of art, and letters. Printing was invented; and architecture was remaining was invented; and architecture was never fa a more prosperous condition. Albert Durer was born 1470; Holbein in 1498; in Italy, Michael Angelo in 1475, Giorgone in 1477, Tritan in 1477, Raphael in 1483, and Curreggio in 1494. In the commencement of

ENGLISH' AND FOREIGN COTHIN ARCHITECTURE COMPARED. BY SIR JOHN AUDREY."

MR. RICKMAN has attributed more pure simplicity and boldness of composition to Gothic architecture in England than elsewhere. My acquaintance with Continental models is (I regret to say) very slight; but I think I can see that he is right, and can point out one or two leading points in which our architecture is more pure, and one or two ex-ternal circumstances which, though they could not create the genius or the taste, might leave them more free to work out the unadulterated result of their own principles. I do not speak of the Romaneaque period, during which our Norman architects were probably, both in art and in time, behind their countrymen on the Continent; nor (on account of my own ignorance of the Flamboyant) of the latest period, when I must think that architecture, however increasingly subservient to use and luxury, after the day of Wykeham, was on the decline as an Æsthetic art. For the peculiar prin-ciples I only refer to the Master of Trinity, in whose observations on Rickman I shall strictly concur when, but not before, I have added to them, that it was himself who inspired with a living soul the nascent body produced by the patient and acute inductions of Rickman, and which has since advanced so far towards adolescence.

The favouring circumstances which strike me are, first, the comparative freedom from private war and local disorder, and, secondly, the comparative want of Roman works. Private war and local disorder would have far greater tendency than public, even though they were civil conflicts, to waste and destroy local monuments, and consequently, to cause that sense of insecurity, which will prevent their frequent and familiar construction: hence, to prevent the art from becoming inbred in the minds, and apparently indigenous in the soil of the country. One who twenty years soil of the country. One who twenty years ago had the early thin edition of Rickman in his pocket wherever he travelled, has a right ay that every little village church, which to has been spared by time and churchwardens, proves such to be the case in England.

The same insecurity which would prevent the frequent construction, would thwart that construction when it took place, Protection construction when it took place, Protection would be necessary, even to the defriment of their architectural ends. This requires no proof, but I imagine it to be illustrated in passing along the high road through Hereford-shire and Western Shropshire-border counties, where, I fancy, I see more than their pro-portion of rude and naked bulk in Early-English and Early-Decorated towers; but where, when the victories of Edward I, had given free scope to the arts of peace, I cer-tainly observe more than I have myself been elsewhere used to of the prevalence of quiet and humble structures of the Decorated style. It may be objected that the turbulent reign

of Henry III. was that which produced the glory of our native art, the early English, so glory of our native art, the early English, so pre-eminently, if not quite peculiarly our own. The reign of Henry III. was turbulent; but not so much so as it appears to posterity, in whose eye its half century appears as a unit by the side of shorter reigns. Nor were its wars private, whatever human intermixture of private violence they may have involved. They were wars of furblic privale. were wars of public principle. A weak reign afforded the opportunity, whilst it succeeded united weakness and violence to one whose called forth the necessity of claiming that in-creased public liberty, for which the social improvement of the nation was ripening it. The age of Magna Charta is no less appropriately the age of early English art, than the matured excellence of decorations coincides with the settlement of our Parliamentary constitution under Edw. I.

The student of Hallam and Fortescue, the best concise expositors of our laws and liberties, and our consequent national greatness, will probably, with me, divide the actual pro-duction of our happier state of things between duction of our nappier state of things between Norman prerogative and Saxon liberty—the superincumbent pressure of the crown baving prevented the well-compacted social economy of the humbler frames from being broken up as elsewhere (if elsewhere hit existed) by the

all-pervading violence of the military tenants It being important to the to assume the fact, "I may be excused in thus digressing to account for it; m order to make it credible to those impressed with a general idea of the lawless-ness of that age. s of that age.

The favourable effect of the absence of Roman works of art will be two-fold. The eye will be less distracted by a beadty depend-ing not only on different but on anatomist principles , and the wrentied will not be principles, and the architect will not be tempted, or required by his employers to un-pair the free and pute development of his own style, by the use of insterials (particularly old columns) too precious to be rejected, yet difficultito be adapted.

These two drawbacks have effectually pre-These two drawbacks nave enecually pre-vented the formation in Italy (except, perhaps, at Naples) of a school, though there was long a fashion, of pointed Gothic architecture in that country. This is conclusively shewn by the splendid work of Gally Knight—the more conclusively, as it was not his object to draw conclusively, as it was not his object to draw the conclusion. I must not be considered as undervaluing, except in the single particular of the *purity* of Gothic art, the edifices of other countries. I can there there who may consider the French of German, who make nearer approaches to puffy than the Italians, as on the whole our superiors in great edifices; and even in Italy I can admire great edifices; and even in Italy I can admire sometimes even more than my judgment can approve; and I may both approve and admire a work not Gothic, but still generis. The matchless splendour of Milan' pleases a cultivated taste the less because it is mani-festly intended to be, what yet it' is not, purely Gothic. That gen, the Capella defla Spina, at Plea, wants in its outlines the truth-fulness of Gothic art; but he must be such a master of language is I at not, who can find words adequately, yet soberly, to extol the cathedraf of Florence. It is neither classical, nor Romanesque, nor modern Roman, nor Gothic; but, with much of the breadth and expansion upon earth of the school founded on classic wit; it earries the eye and the mind up expansion open early of the school lounded on classic art; it carries the eye and the mind up to beaven; and onward towards the unseen, in the truest spirit of the romantic. We scarcely need be told that its wonderful capita is the first, in order to look upon it as the most admirable of its kind which the country most admirable of its kind which the country produced. Yet we must come home to Salis-bury, Beverley, Westminster, Tintern, Lin-coln, York, and Winchester. I place them in the chronological order of the style to which (of the many which must of them coin-tain) I attribute in each the leading effect. Early English pure Early English, with all the later styles admirably harmonized to it-Early English, verging on Decorated, Decorated and Perpendicular. and Perpendicular.

and Perpendicular. I must not be supposed to be laying down rules without exceptions, that what I have been impressed with on the prevalent taste ought to be admitted by others, to be so. I have not time, not indeed materials to prove have not time, nor maced materials to prove —perhaps I may be wrong; but if I am not, it is still a chance—whether their 'recollections of objects seen without any such idea baving been suggested to them, will bear me out, or whether if my observations should be honoured with a place in their recollection, they will be confirmed by their future experience. In En-glish Gothic we have scarcely any where but at Canterbury the column substituted for the pier. Now, in every one's eye and mind, whether he have expressed it in words or not, pier. the pier is subordinate to the arch, but the column cannot be made subordinate to the intercolumniation. The column, where it exists, is always the thing dwelt upon, and the intercolumniation, be it arched or not, dwindles into the mere form which the column does not fill.' This is contrary to the primary canon that Gothic is the architecture of interiors, in which the supporting parts are subordinate to the contained space.

In the eastern apso which our pointed ar-chitects scarcely ever constructed except at Westminster, or even adorned except at Tewkesbury, I am inclined to admit that where it does not lead to narrow and wire drawn pro-portions, our continental neighbours have an advantage over us; but in the long west window, so comparatively rare in the French west fromts, we have an immeasurable advantage---it makes our great front more one, more ascending, more indicative of the con-

^{*} Read at the late Winchester Meeting.

THE BUILDER.

tained nave than the window either circular or in which the circle is the prominent object.

m which the circle is the prominent object. Some of the most admired French fronts have also a great prevalence of horizontal lines carried through the two towers. Notre Dame is a known instance, as far as I recollact, Amions, Abheville, Troyes, Sens, and many others may be referred to, to show the prevalence of the tasts. I am by no means disposed to treat as a fault the almost Gracian ground plan of many of these buildings, but it certainly tends to produce a form in the profile of which horizontal lines shall be conspicuous. Now in the great breadth of the west front of York, though some may disapprove the low pitched roof, or others the general proportion, yet the lines of buttress and window preclude any such effect. Salisbury, though without towers, is in some degree open to it. Lincoln is worse than any French building, but the fault is in the Norman work.

In richness and depth of moulding, and in the progress of roof tracery, I believe that foreign buildings are oftener behind what would be suitable to the general advance of enrichment than English. Canterbury has much which I do not think English in character.

If a horizontal effect has been often directly given to French fronts, an opposite cause has in some admirable German buildings impaired the effect of the division into bays vertically divided. The office of the buttress with pinnacles not only to be the truthful index to the essential support of a Gothic building, but to carry up the eye in vertical lines, and to divide the structure to the eye according to its enclosed parts, as admirably arranged on the north aisle at Winchester, cannot be overrated. But such is its office, and if from its too great projective proximity, and want of set-off, the line of buttress form to the eye the outline of the building, as occurs in the glorious Cathedral of Colegne, it wells instead of exhibiting the form and character of the contained spaces.

The great height, and consequently relative narrowness, of the parts of this structure, has much tended to this effect; but where there is much flat wall often full of highly enriched parts, but still one wall with many enrichments instead of a series of bays grouped inte ope harmonizing whole. This often, with a marrow strip of window too insignificant in breadth to give individual character to the acyaral bays, is, I believe, seen to prevail in the architecture of Nurenberg. It is more necessary to be guarded against, as it is the very fault into which many of our recent attempts have fallep. They have walls pierced with windows, they have sometimes three windows under one gable, which never can satisfy the eye, though it may not know the nature of the objection.

I must regard the ostentatious disproportion of the most celebrated steeples of Germany to the rest of the building as a fault. I can hardly regret that Ulm has never been carried up, yet who can object to Freyburg, completely as it overpowers the church.

Yet more questionable is the gorgeous open-work of Strasburg and others of these structures. A pinnacle, which is an excrescence, may be open, but not a leading member of the edifice itself, which ought to resist the weather and shoot off the rain; and there is a further objection where the tower is crowned with a spire — a spire, whose silent finger points to heaven, has that silence broken over by the beautiful addition of crockets. How much more by a surface broken up in all its parts. I believe in all these points the prevalent taste in English architecture has the advantage in purity. It is no part of my object to attempt any comparision in point of positive excellence.

DECORATIONS OF THE HOUSE OF LORDS.

Sin,—No one comes forward to release the Royal Commission from the dilemma in which your correspondents show them to be placed. The Commissioners can alone extricate themselves by doing justice to the English decorators, and giving them a fair trial, as they appear to be doing with the painters and sculptors. And unless they do so they have only to choose upon which horn of this dilemma they are to be impaled; whether they will consent to be reproached with breach of faith to the decorators, or submit to have their power and influence set at nought, and their intentions frustrated.

The statements made in your columns by Mr. Pugin and Mr. Crace were ingeniously framed, so as to let it be inferred that Mr. Barry makes the designs of all the ornaments both for the carved and painted decorations; Mr. Pugin being his draughtsman for the carved work, and Mr. Crace for the painted work. Mr. John Crace's declaration, that he drew with his own hands the sketches of Mr. Barry, is calculated to excite some ap-prehension for the execution of the painted decorations amongst those who are conversant with Mr. Crace's powers of delineation; and though it is possible that Mr. Crace may have taken lessons in drawing lately, so that his performances may no longer elicit such shouts of laughter from his foreign artists as they used to do, still the difference between Pug in and Crace is rather too great for their performances to be on a level. If Mr. Barry finds it necessary to engage such valuable as-sistance as Mr. Pugin's for the carved work, where the feeling and skill of the carvers would supply some deficiency; how much more important is it to have the working drawings If Mr. Barry for the painters made by a masterly draughtsman.

Mr. Crace's statement, that "not a single foreigner is or has been engaged upon the decorations of the new House of Lords," is at variance with Mr. Pugin's observation in his letter to Mr. Herbert on the School of Design, that, in consequence of not finding English artists competent, he was obliged to send for decorators from abroad. And since it is part of Mr. Pugin's daty to engage the most skilfal workmen, it is surprising that he should never have thought of those especially recommended by the Royal Commission. Mr. Barry professes to prefer practical men, and regrets that the Commission did not confine the competition to working artists; yet the first thing he does is to employ a dealer in decorations—telling Mr. Goodison that there is nothing worthy of his ability in the House of Lords !

The architect, of course, ought to have the control of the building, so far as regards the general character and effect of the deco-rations; but surely the details should be left to the decorative artists to invent. It is for the decorator to send in his designs, and for them to receive the architect's sanction; but there should be no need for the architect to design every scroll or ornament, nor do more than suggest to the decorator, and exercise a veto over his designs. An accomplished, practical decorative artist should be a clever designer, draughtsman, and painter; able to conceive the plan of a decoration and fill in the details, with a knowledge beforehand of the effect of the whole when completed. But there is no such artist employed in the House of Lords. It is all done by guess, bit by bit. There is no complete design settled before the work is begun, as there ought to be ; but first, this notion is tried, then that, and then another.

The ceiling is moulded in compartments; and these are filled with decorations. Now, I have heard for a fact, that as many as forty different designs have been made for one compartment before the architect was satisfied; and then, when the work had been proceeded with, the effect proved disappointing, and there was a change from coloured figures to gold, or from diaper to plain grounds. Then the ornaments, instead of being exe-

Then the ornaments, instead of being executed on the ceiling, are painted on strained linen, and stuck up alterwards ! And this in a national work that is to last for ages ! But that plan is most convenient for the jobbing patchwork that is being perpetrated; when a design for the compartments is settled, one is

finished in colours, and a set of mechanics are employed to copy it from pounded putlines. Their work will, of course, have all the tame, timid, characteriess servility of copyints afraid to go beyond the tracing, and even to come up to the line. And this is the sort of work that is to adorn the Houses of Parliament. are to But if the new Houses of Parliament. are to

But if the new Houses of Parliament are to be made a senio of old flothic patterns, where is the promised encouragement for British talent? Why are not Messre. Goliman, Jobastone, and Goodison—who are all designers, though only the latter is a practical painter also—why are not these and other decorators competent to invent and execute, allowed the opportunity of exercising their talent? Nour correspondent "Justice," speaks disparsingly of Mr. Rogers as a carver, but I are pennoaally acquainted with his talent as a designer, and his skill as a carver. I pride myself on possessing a little specimen of his work that he executed for me more than twenty years ago, that is equally beautiful for taste and execution. Besides, Sire, we want directing minds as well as skilful hands in each a building as this.

Since the Government has sanctioned the very laudable scheme of making this building a monument of the present state of the arts of the country, it behaves these in authemity fo see that this purpose is accountry processes in that the best talent the country processes is employed in contributing to it. This will be done in the case of painters and scripton; why should it not be done in the instance of decorators? The talent of Givinling Gibbons was brought to light by Sir Christophers. W with in St. Paul's. Did that great amhiteet fatter the fertile fancy and consempate shill be the famous carver in wood and stone R is N's, be gave scope for the genus that he footered and appreciated. Let us hope bis examplemile he followed in the Parliament knows in the rate.

Ir is very desirable that guarde should be able to communicate with the driver of a train while it is travellingt Practical men are well aware that cords, flage, or signal lights, enh never be depended upon; and "even whistles under existing circumstances are petfectly useless for this purpose. The most prictically plan is to reduce the noise of a wain ; it's well known that while steam is blowing of from a safety valve (which is nearly sivers the case when an angine is running), engine drivers are 'quite unable on account' of the great noise thereof, to hear any other sounds beyond those made by their engines. It has been proposed instead of letting the supplus steam escape from the valve directly into the open air, that it be made to pass from the valve through a gradually enlarged tube and allowed to escape upwards through an aperture of about the same diameter and height as an engine chimney; this plan would cause the steam to expand very considerably before striking the external air, and would consequently produce comparatively little noise; were this method adopted, it is the opinion of several practical men that engine-drivers would then have no difficulty in hearing a guard's whistle provided the guard was scated upon one of the foremost carriages.

As respects the guards, the one placed near the end of a long train cannot at present make the front guard hear even a very powerful whistle, owing to the excessive noise of the carriage wheels, but this difficulty may be obviated by enclosing the sides of the wheels, as before mentioned in our pages, so as to confine a quantity of sawdust in contact with their spokes; sawdust having the effect of enabling them to roll without noise.

UNIVERSITY COLLEGE, LONDON: The classes for civil engineering and erchitecture will be re-opened on Wedneeday, the 15th of next month.

NAMES OF STREETS.—A correspondent of the Morning Herald makes the following useful suggestion. When abroad I observed a practice, particularly at Liege, which, if adopted in our large towns, might, I think, be attended with beneficial results. It is simply to have the name of each street on one pane of glass, transparent, in the first lamp at each end of every street. It may be remembered what confusion there was last winter when the fogs set in, by people losing their way in the streets, and being misdirected by pickpockets and other designing persons.

LESS NOISE AND MORE SKIET C

COMPETITION FOR LAXING-OUT GROUND, BICHMOND. — The Bichmond vestry have awarded the premiums for laying but the land at Queen's-road, Richmond. The first to Mr. Edward Sherrard Cole (in Mr. Moentta's office), and the second to Mr. Gifford, of Pimlico. Several architects of standing were competitors.

On Friday evening last, a lecture was delivered at Croeby Hall, Bishopsgate-street, under the sanction of this useful association, by Dr. Guy. The lecture occupied two hours, but was throughout listened to with marked attention by a large and highly respectable audience.

After a short explanation of the objects of the association, the lecturer proceeded to establish, one by one, the several positions put forth in its prospectus; and fortified them by spt quotations from the evidence laid before the Health-Commission. The waste of life in England and Wales, which was estimated at 30,000 a year, and was stated to be accompanied by about 750,000 cases of unnecessary sickness—a similar waste of life in the metropolis of 10,000, with a quarter of a million cases of unnecessary illness:—The low average age at death of the labouring class and of tradesmen, compared with the gentry inhabiting large towns, the striking but now familiar fact that the mortality increases with the density of the population; the filth and wretchedness in which the lower orders live corresponding to their low duration of life; the unbealtby condition of their houses and workshops, depending on want of water, drainage, and ventilation; the expense insurred by the public for unnecessary sickness and premature death; the burden imposed on "rate-payers' by the diseases created by the imediate of these simple measures:—were the isopics which the lecturer discussed and illustuated. The locture will probably be published by the association, when the public will be able to judge of the success with which its objects ware explained and advocated. Wé subjoin the following extract, which we

think worshy of the attention of our readers. Allading to fever, Dr. Guy says :-- " It loves the banks of rivers, the borders of marshes, the edges of stagnant pools; it makes itself at home in the neighbourhood of cesspools, and badly constructed drains, and takes especial delight in the incense of gully-holes. It has a perfect hower of freeb air, eap, and white-wash, but when left to itself will linger for years amid scence of filth and corruption, and fold in its deadly embrace all human beings who have the same depraved taste, or are so anfortunate as to he thrown into its company. It, is the favourite child of laissez-faire (in plain English let alone) and hears the same relation to filth, as crime does to ignorance. Unfortubately for us, it has kept the same Unfortubately for us, it has kept the same name for a long time past, and has grown so familiar, that no one minds it. When the cho-lera did us the favour to pay us a visit, we made preparation for his reception. We cleaned out many an Augean stable, set the scavengers to work in right earnest, white-washed sundry houses, and shewed a whole-some respect for the threatened invader. He came at last, and he was too strong for us; he landed, and took up his quarters where we should expect to find him, on the banks of rivers, in low marshy spots, in the crowded, filthy, and ill-draind districts of large towns; and wherever we had either made no efforts to remove accumulated filth, or where the long neglect of years admitted of no immediate reparation. I saw sundry cases of cholera my-self, and they all occurred (they were the first in that neighbourhood) in a quarter of the borough of Southwark, hopelessly sunk below the level of the surrounding district, and which set at defiance all attempts at drainage.

Now, it is a strange example of the effect of habit, and the influence of names, that this formidable stranger should have produced such a sensation, and roused us for a time into so much activity, and yet this domestic pestilence should be allowed to go on poisoning and killing year by year thousands of our people, without setting a broom or a brush in motion.

When the cholers was on his way to us, and while he was among us, we were really up and starring, and waging a not unsuccessful war against the causes of disease, but no sooner did he take his departure than we lapsed into our accustomed negligence. The Commissioners of Sewers laid down their trowels, the scavengers walked away with their brooms in their hands; there was a madden falling off in the consumption of soap and whitewash; the boards of health closed

their books and their labours; the Government fell into its habitual state of calm repose; all things returned under the sleepy rule of *laisez-faire*; and filth, with its attendant train of disease, and misery, and crime, resumed his empire."

We must not omit to state the gratifying fact that there were present at the lecture several members of the "Metropolitan Working Classes Association for Improving the Public Health," of which we are happy to see that the Bishop of London has consented to be president. An abstract of their prospectus was read in the course of the lecture.

CHINGFORD CHURCH, ESSEX.

SIR,-Knowing your readiness at all times to give publicity to whatever may interest either the architect or antiquary, I venture to trouble you with the following note. Strolling from Woodford the other day I came to the parish church of Chingford, and was agreeably surprised when, on entering the churchward it proved to be one of these

Strolling from Woodford the other day I came to the parish church of Chingford, and was agreeably surprised when, on entering the churchyard, it proved to be one of those venerable piles that some centuries back were to be found in most towns in this country. It cannot boast of great beauty in its design, but is valuable by reason of its great antiquity. It is situated on a slight eminence commanding a good view of the surrounding country, the scenery of which is very pretty, and much superior to what you generally see in Eases.

a good view of the surrounding country, the scenery of which is very pretty, and much superior to what you generally see in Essex. The church itself is covered with ivy, especially the tower, which is completely hidden from view, with the exception of the pole, on which a weathercock has heen placed. I am very sorry to say that the shurch is in a very dilapidated and ruinous state; in fact, so much so, that if timely assistance is not given, it will, in the course of a short time, fall to pieces. Many of the windows are either broken or cracked, and pieces of board in some places are nailed across to supply the deficiency, and in others the vacancies are left uncared for, and through which the wind howls mournfully through the aburch. The remains of the reading deak are just visible, and where the pulpit used to stand is now actually one mass of bricks and mortar, which have fallen from the wall. The rough and is dare say, in a very short time, will be seen to decorate what remains of the paws. I have seen many fine specimens of the ivy in different parts of England, but I never saw a finar than the one which is here. The state of repair of the tower, I could not, with any certainty, ascertain, as it is so overgrown with ivy as to be almost hidden; the part I could manage to get a glimpse of appeared to be pretty sound. The body of the church is beginning to decay, and the walls are cracking very fast. The small gallery is falling to pieces. The aisle(?) where the communion-table is, is by far in the best state of repair. Several large coats of arms and tablets are hung on the walls. Service has notbeen performed for

Stopping at a wayside inn, on my return, I entered into conversation on the subject with a person who was connected with the parish. When I lamented the state of the building, he very abruptly said that the parish had no money to throw away on such tritles, and that they had enough to do to support the poor. Finding words were of no avail, I very soon after left him. I am afraid from what he said the church may fall to pieces before they will render any assistance.

WHITE-ENNIGHTS ESTATE, READING.—We are glad to learn that the directors have already received applications for more than the whole number of shares, and, moreover, that building operations will go on immediately. The lodges are in progress, and some new roads are about to formed. The Berkshire Chronicle, speaking of this beautiful locality, says truly, that it "will afford to Reading a suburb of unrivalled attractions and value, and we see no reason why a residence there should not become quite as eagerly sought as at Cheltenham, Bath, and many other inland towns, which must ever want that most desirable advantage possessed by Reading—a close proximity to London, the great centre of wealth, pleasure, and business."

FRANCIS BAILY, F.R.S., &c., &c. A PORTRAIT PAINTED BY T. PHILLIPS, R.A.; ENGRAVED RY T. LUPTON. (Private Plate.)

THE life and writings of this emittent astronomer and estimable man, as well as the origin of this portrait, are matters of history, as well as of deep interest to lovers of science, art, and philosophy. To Mr. Baily the British public, and indeed all Europe, are indebted for the formation and permanent estalishment of the Royal Astronomical So-ciety. Feeling this debt of gratitude, some of the most active and sealous members con-sidered it due to him and to themselves to produre a good portrait of their friend, to be preserved in the meeting-room of the society. The late Mr. Phillips was selected to perform this pleasing and honourable task; and he produced a picture and a likneness, which, whilst it conveys a vivid record of the fine personal features of the individual, gives evidence to the casual spectator of an intellectual and thoughtful man. Never was the human face more faithfully depicted on canvas than in the present instance, for the picture seems to live and breathe, and even prepared to speak. As long as it be carefully preserved by its guardians, it will be viewed with melancholy pleasure by all the sincere friends of its once living prototype, and with admiration by all lovers of art. In this picture, and in others preserved in the meeting-room of the Royal Society, Phillips has leit behind him proofs of his own professional qualifications as well as graphic memorials of men who have enlightened and adorned the hemisphere of science. These pictures may fairly rank and compete with the many exquisite portraits by Vandyck and Revnolds.

The late Mr. Baily bequeathed a very handsome fortune, — nearly 100,000*L*, — amongst his relatives and friends; one of whom, the **Rev.** Richard Sheepshanks, has most liberally and nobly applied his legacy to the production of the engraving now under our notice; and he has presented proof impressions of the plate to the intimate friends of the deceased astronomer, and to a few distinguished men. It is but justice to Mr. Lupton to remark, that he has reduced the picture, and translated it into black and white, with the utmost fidelity; and that the engraving is characterized throughout by skill and taste.

We are informed that two other legatees of Mr. Baily,—Sir John Herschel and Lient. Stratford, the scientific author of the Nantteal Almanac,—are about to have a bust of their late estimable friend executed in marble for the Astronomical Society. Sir John Herschel has written and published a very interesting memoir of the life of Mr. Baily.

COLOGNE CATHEDRAL

WHEN the Queen was in Germany her Majesty gave about 560% to the fund for restoring this wonderful building. The committee, it is said, propose to return it, considering the sum too small. An English provincial paper objects to the donation, that it was hardly judicious or well principled; and says, "for the Protestant monarch of a Protestant nation to give so munificent a sum to a Popish cathedral does not seem to our comprehension altogether right." We are disposed to think the writer's comprehension must be very small.

THE ASPECT OF THE CATHEDRAL ON LEAVING COLOGNE.

Like a dismanbered stone God thou appearest, Knowing the course of ages will restore The giant limb and front divine thou rearest,

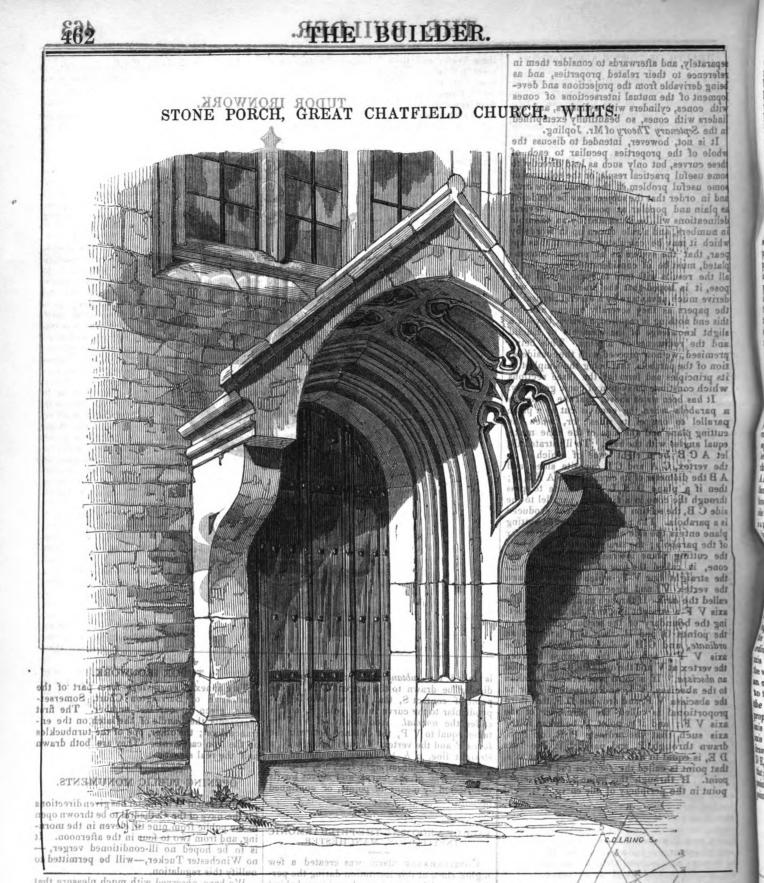

As the great Titan proudly did of yore;

And even now is thy abasement o'er, For man admits thy long-neglected right,

Resolving to endure the shame no more; ----Lo! where the weed had growth, the owl delight, Again the chisel clinks with hundred-handed might. J. ELLIS.

NEW RESERVOIR AT HIGHGATE.—The New River Company are constructing, under the superintendence of Mr. W. S. Mylne, their engineer, a large reservoir upon flighgate-hill. Messrs. Mansfield and Sons are the contractors.

^{*} Amongst the numerous novelties of the age, we should be glad to see a spacious Gallery of British Worthics

mSTONE PORCH AT GREAT CHATFIELD s doith yd stCHURCH, WILTS. burgh, burgh, SEVERAL of the churches in Wiltshire, possess porches of a singularly picturesque character, quite unlike those which are to be found ind other dparts of England. It These porches are of very late date, mostly of the periods of Henry VII. and VIII. In the first wolume published by the Wiltshire Topographical Society the one at Grittleton church is given. the followin ormation.

The porch at Great Chatfield church is about the time of Henry VIL ; the church, dedicated to All Saints, is a small but, beautiful structure. "It has been fally described and Hustrated by Mr. T. L. Walker, who devotes no less than eight plates to it, in his little volume on "The Manor House and Church at Great Chatfield."

To this work I recommend any of your readers to refer who may require the details of con-C. J. R. struction

THE CONIC SECTIONS CONSIDERED IN REFERENCE TO THEIR PRACTICAL APPLICATIONS.

THE conic sections being of considerable utility in the various departments of the constructive arts, it is a matter of the utmost imscructure aris, it is a matter of the utmost im-portance to practical men that they should be familiar with the fundamental properties of these curves, and the methods by which they are generated or described; it is therefore proposed to give a brief exposition of the different sections, and to illustrate the method of applying them to varions useful practical purposes,

Conic sections are usually defined to be " the figures formed by the mutual intersection of a cone and a plane," and according to the dif-ferent positions which the cutting plane as-sumes, there are formed five figures or sections essentially distinct from one another; namely, a triangle, a circle, a parubola, an ellipsis, and a hyperbola, but because the triangle and the circle are ranked amongst the figures of elementary geometry, they are excluded from the conic system, and the remaining three only are strictly considered as *conic sections*. The manner of their formation by cutting the cone

manner of their formation by cutting the con-is as follows: — When the cone is cut by a plane parallel to one of its sides, or when the cutting plane and the side of the cone make equal angles with its base, the section is a *parabola*. When the cutting plane passes obliquely through both sides of the cone, or when it meets the base produced in a less angle than the side of the cone does, the section is an *ellinsis*.

the side of the contrast, when the cutting plane makes a greater angle with the base than the side of the cone makes, the section is a hyperbola; and if all the sides of the cone be produced beyond the vertex, constituting an equal and an opposite cone, the intersecting plane being also conti-nued to cut this cone; the section is an opposite hyperbola, and this, together with the former, are denominated opposite sections; or apposite hyperbolas.

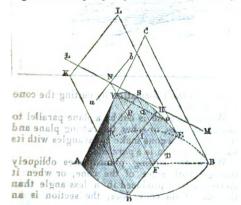

are denominated opposite sections, or opposite hyperbolas. A line and of size of the section of

THE BUILDER.

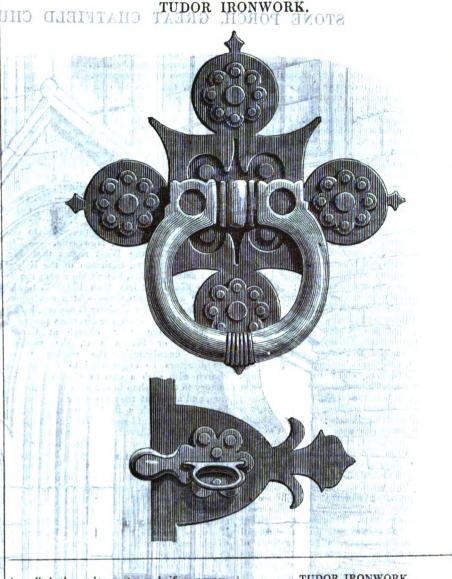

separately, and afterwards to consider them in reference to their related properties, and as being derivable from the projections and development of the mutual intersections of cones

lopment of the mutual intersections of cones with cones, cylinders with cylinders, and cy-linders with cones, so beautifully exemplified in the Septenary Theory of Mr. Jopling. It is not, however, intended to discuss the whole of the properties peculiar to each of these curves, but only such as lead directly to some useful practical result, or the solution of some useful problem in the constructive arts, and in order that the subject may be rendered as plain and popular as possible the several and in order that the subject may be rendered as plain and popular as possible, the several delineations will be illustrated by an example in numbers, and a rule drawn up in words by which it may be calculated. It will thus appear, that the system as at present contem-plated, must be of considerable extent, but as all the results will tend to some useful purpose, it is hoped that the practical man will pose, it is noped that the practical man will derive much advantage by a careful pernsal of the papers as they severally appear, and for this end nothing is required, *á priori*, beyond a slight knowledge of the elements of Euclid and the rudiments of algebra. This being premised, we now proceed with the considera-

slight knowlenge of the elements of Euclid and the rudiments of algebra. This being premised, we now proceed with the considera-tion of the parabola, that being the simplest in its principles and form of the three sections which constitute the system of conic geometry. It has been stated above, that the section is a parabola when the cone is cut by a plane parallel to one of its sides; or, when the cutting plane and the side of the cone make equal angles with the base. To illustrate this, let A C B be a right cone of which C is the vertex, C A and C B opposite sides, and A B the diameter of its circular base A E B D; then if a plane D K L E be made to pass through the cone in a direction parallel to the side C B, the section D V E thereby produced is a parabola. The point V, where the cutting plane enters the side of the cone is the vertex of the parabols; the straight line D E, where the cutting plane intersects the base of the cone, is called the base of the parabola, and the straight line V F, which passes through the vertex V, and bisects the base in F, is called the axis. If through any point, I, in the axis V F a straight line, G H, be drawn, meet-ing the boundary of the section both ways in the points G and H, then G I is called an *ordinate*, and G H a *double ordinate*, to the axis V F; and V I the distance between the vertex at V and the ordinate, G H, is called an *abscissa*. If a third proportional be taken to the abscissa, V F, and ordinate D F, that third proportional is called the *parameter* of the axis V F; and if a point, P, be taken in the axis V F; and if a point, P, be taken in the The abscissa $\forall F$, and ordinate D F, that third proportional is called the *parameter* of the axis $\forall F$; and if a point, P, be taken in the axis such that the ordinate P R, or P S, drawn through P, and parallel to the base D E, is equal to half the parameter of the axis, that paint is called the force or the describing that point is called the *focus* or the *describing point*. If through the point S, or any other point in the periphery of the curve, a straight

line S T be drawn parallel to the axis V F, **the line S T** is called a *diameter*, in contradis- **line to the principal diameter** V F, which **is laways** called the axis. If a straight line, **is Low** to teach the curve in S, at the vertex of **iany** diameter as S T, without cutting it, that **line is called a** *langent* to the curve at the **real** S, and if through any noint in the June is called a *tangent* to the curve at the point S; and if through any point in the diameter S; T, the straight line V O be drawn parallel to the tangent L M, and intersecting ithe diameter S; T, in the point Q, the straight line Y O, is a *double ordinate* to the diameter S; T, and Y; Q, or O Q, an *ordinate*. If the many F||V be produced beyond the vertex, m to meet the tangent L, M, in the point N, P N,

is called the subtangent; and if a perpen-dicular be drawn to the tangent L M, in the point of contact S, that line will also be per-pendicular to the curve in the point S, and is called the normal. And finally, if V N be taken equal to V P, the distance between the focus P and the vertex V, and through N, a straight line, a b, be drawn parallel to the ordinate R S, the straight line, a b, is called the directrix of the curve, and serves for its description by means of points, or continued description by means of points, or continued motion.

FALL OF A ROOM AT THE PHILHARMONIC INSTITUTION, MANCHESTER.

CONSIDERABLE alarm was created a few nights since at this institution during the per-formance. A loud crash was heard from behind the scenes and great shricking, and noise of falling bodies. Immediately afterwards, Mr. Weston, the musical director of the institute, Weston, the musical director of the institute, came forward, and explained that a plank or two had given way, and caused more alarm than danger. He subsequently stated that only one person was much hurt, but the nature of his injuries he had not learned. The *Manchester Guardian* says, "From an in-spection of the place, we may state that the accident consisted in the giving way of the planke or refers supporting a dressing way of planks or rafters supporting a dressing-room, in which a great number of the male chorus were congregated taking refreshment. The were congregated taking refreshment. The weight being greater than the beams could support, they gave way, and fifty or sixty persons were at once precipitated to the stage, a fall of about 12 feet. It is really wonderful looking at the place, that an occurrence so alarming in appearance and in reality, should have been attended with so little serious in-Only one person, so far as we could jury. ascertain, was much hurt, and he was conveyed at once to the infirmary, to have his injuries examined.

TUDOR IRONWORK.

463

THE annexed engravings form part of the illustration of Barrington Court, Somerset-shire, given in our last number. The first represents the handle of the latch on the entrance door; the other, one of the turnbuckles on the iron casements. They are both drawn half the real size.

OPENING PUBLIC MONUMENTS.

THE Dean of Winchester has given directions for the nave of the Cathedral to be thrown open to the public from nine till eleven in the morning, and from two to four in the afternoon. It is to be hoped no ill-conditioned verger, -no Winchester Tucker,-will be permitted to nullify this regulation.

We have observed with much pleasure that the Trustees of the Royal Institution, Edin-burgh, have made arrangements by which a large, varied, and valuable collection of paintings, marbles, and bronzes are now thrown open twice a week for the gratuitous inspec-tion of the public. This collection now contains the paintings bequeathed to the Univertams the paintings bequeathed to the Univer-sity by the late Sir James Erskine, of Torre, Bart, comprising specimens of the genius of the Carracci, Guido, Vandyke, Rembrandt, and other celebrated painters. The Edin-burgh Advertiser, in making known this in-formation, has the following remarks on the general question of gratuitous admission to works of art. "It is often said of this country that it provides little or no means of rational amusement and beneficial recreation for the amusement and beneficial recreation for the working classes; that, in short, the principles of conservation and exclusion are too strictly applied to institutions which ought rightly to be open and accessible to all classes, and more particularly to that class which within them-selves have little or no means of cultivating a taste for the sublime and beautiful, although it is admitted on all hands to be a most effectual

means of elevating their thoughts and habits. We hail with pleasure the facilities which the board of trustces have afforded, and trust that the boon will be exgerly embraced, and that the visitors will show their grateful acknowledgments by in no way abusing the privileges so generously granted to them.

privileges an generously granted to them. The Hull Advertiser, in an article on Mr. Joseph Hume, M.P., refers with just praise to his endeavours to obtain for the humbler classes free admission to our national monuments, with a view to enlarge their sympathies, purify their tastes, and exalt the standard of their moral feelings; and, we are delighted to add, with most gratifying success. Principally through the exertions of a society of which he is chairman, and which numbers amongst its members Lord Francis Egerton, Lord Low-ther, Lord Worsley, Lord John Manners, Mr. Huit, and others, many of the national edifices hitherto closed against the working classes, by reason of the fees charged for viewing them, are now either wholly or partially open for some days of the week free of any charge whatever. For instance, the British Museum is open free three days in every week; the National Gallery is free four days; St. Paul's and Westminster Abbey (exdays; St. Paul's and Westminster Abbey (ex-cept the chapels) are free every day; the Society of Arts is free five days; Hampton Coart Palace six days; the Woolwich Models every day; the Norwich Cathedral an hour daily; the Bath and Wells Cathedral every days; the Dath and Wells Cathedral every day; the Durham Cathedral (except the chapel of the Nine Altars) every day; and the whole of the treasures of the Tower of London can now be inspected for one shilling, instead of eight times that sum. Liverpool admits its mechanics to its Botanical Garden two days in the week, free of expense; the Royal Botanical Garden of Edinburgh is open free to all applicants; and the Dublin Botanical Garden is accessible to the peasantry, free of charge, two days in every week. Mr. Hume urges that fifteen years' experience has satisfied him that the people, when adhas satisfied him that the people, when ad-mitted free to cathedrals, museums, and gar-dens, uniformly conduct themselves with the greatest propriety; and that the effect upon them, mentally and morally, is of the most gratifying description. They acquire habits of personal meatness in dress, politer forms of speech and deportment, a greater love of order, and a general desire to extend the boun-dering of upbatwark power low may neases. daries of whateverknowledge they may possess. The more imperfect their own acquirements may appear, the more eager are they to obtain a better education for their children.

JOTTINGS ABOUT RAILWAYS.

1 A maw project has been started during the past week, having for its object the supply of city and West-end accommodation to pas-sengers arriving in London by the existing railways, as well as by several projected lines when finished. The plan contemplates the erection of an explanade on the site now occupied by the coffer dam in front of the New Houses of Parliament : we copy the following relating thereto from the prospectus :--- "It appears that some who have not sufficiently studied the matter think that it is impossible to pass before the New Houses of Parliament without eliciting the opposition of the several branches of the legislature. No objection branches of the legislature. No objection can be more futile. On the contrary, when the project is fully developed by the plans and sections, the support of both Houses may be confidently calculated upon. It will give to the building a grand esplanade of 70 feet in width in front of the towers, and 100 feet in the contra instead of a nearest indexed alia the centre, instead of a narrow inclosed slip 30 feet wide, confined between the two projecting towers, to which the public can have no access. Here is a facade, the grandest, for its extent and beauty, in the world, elaborately sculptured by artists of the first ability, at an enormous expense, which, if the present ter-race be not widened, will be lost to public ob-servation, inasmuch as the only place from which a sight can be obtained will be from the centre of the river, where the beautifully finished carving cannot be appreciated. To accomplish this object it is proposed to carry out an esplanade on the site now occupied by the coffer dam. The esplanade will be on the same level as the present terrace, and below this terrace the railway will be inclosed in a tunnel 14 feet in height, made perfectly]water-. 1 ..

tight below, and lighted in front by openings

above the water level. This tunnel will, of course, be out of sight, and there will be no rouse, be out of sight, and there will be no noise or smoke to indicate the passing of the train; in fact, no member of either House will be aware of the progress of the carriages. In the same manner the Marquis of Westminster's property may be passed, the top forming a grand terrace, 70 feet wide, next the river, which cannot be otherwise than a great desideratum to the property. As to the wharf property, that will also be greatly improved. It is not proposed to interfere with the water-way at all. The railway will be some distance from the present frontages, and carried upon arches of from 60 to 100 feet span. It is only necessary to add that all these great objects may be accomplished without taking down ten may be accomplished without taking down ten buildings, either dwelling-houses or ware-houses." The project has been named the Surrey Grand Junction Railway, and the capital required is 500,000?. — Mr. Hud-son has promised that any antiquities dis-covered in constructing the Newcastle and Berwick Railway shall be presented to the Society of Antiquaries, Newcastle. — The local papers of the West report that Mr. Frederick Ricketts, chairman of the Bristol and Exeter Railway, has within a very recent period added not less than 160,000?. to the balance at his bankers. — At a meeting of balance at his bankers.—At a meeting of the Grand Junction Railway Company, held a the Grand Junction Kallway Company, held a few days since, when the directors proposed to endow the new church at Crewe with 60*l*. or 80*l*. a year, the meeting carried unanimously the motion "that the directors be empowered to endow the church with such a sum as should be satisfactory to the bishop in order to its consecration, and also that they pay the clergyman to be appointed such a further annual sum, so that he receive not less than 2007. per annum." The Railway Chronicle, in commenting on this exemplary and munificent proceeding, well observes :- This liberal act is one among well observes :many signs-the testimonials to Stephenson. many signs—the testimonials to Stephenson, Hudson, Saunders, and others—which seem to foretell that great, noble and national deeds and works, incidental only to railways, will come out of railways; such works as may chance to compete with our ancient cathedrals. Railways are the corporations of our time, which have the most real life and energy in them, and, like the corporations of olden time, will do noble deeds. Though their first object is professedly a selfish one, the selfishness very soon ceases to be paramount, and becomes assoon ceases to be paramount, and becomes as-sociated with larger and nobler objects.— The Tunbridge Wells line, a new tributary to the traffic of the South-Eastern Railway, of about five miles in length, was opened last week. At present the line extends only to the temporary station at Jackwood Spring. The permanent station will be in the centre of the town, and will be approached by a tunnel 800 yards long. The works are heavy. There have been half-a-million of yards of earthwork chiefly in rock. An elegant viaduct, 254 yards in length, with 30 arches, carries the line over Powder mill valley. The line is a curiosity in railway construction, from the fact of its having been commenced twelve months before the Act was obtained, and of its being completed within a few weeks from receiving the royal im-primatur. It is a double line; has cost, in-cluding land, 100,000%, and the extension to Funbridge Wells will be 80,0007. more. Mr. Hoof is the contractor, and Mr. Barlow, son of the Professor, has the credit of having carried through the engineering department in a satisfactory manner. — The greatest novelty in railway literature is a pamphlet entitled "New System of Locomotion, without Tunnels, Bridges, Rails, Steam, and Accidents, by Thomas Parkin." The Times having ventured to treat the New Sustem as a hear the suttor to treat the New System as a hoax, the author, full of conscious innocence, has referred for the contrary, "to all the periodicals of London and Paris, as well as to all the ambassadors in Paris, and fifty mayors in France."—A special general meeting of the Regents' Canal Company is called, to take into consideration a proposal which has been made to this company, for the purchase of the canal property, with a view to the construction of a railway

Hague and Rotterdam railway this is entirely prevented by very simple means. In addition to the usual lock, each door is provided with a stout bolt or lever, working on a joint, which, when the door is closed, drops into a socket attached to the door-facing. This simple apps-ratus provides an almost certain preventative against accidents from the cause we have mentioned, and ought to be adopted on all railways, ——The model of a very simple but ingenious contrivance for the purpose of enabling the contrivance for the purpose of enabling the guards of a train to communicate instantly with the engine driver, in case of any danger being perceived, was exhibited on Saturday evening last, at the Bristol terminus of the Bristol and Birmingham line, by its inventor, Mr. J. K. Williams, the superintendent of the line. The Williams, the superintendent of the line. The machine consists of a large box having on its top a sonorous bell, which is struck like the bell of a clock. Within this box is a piece of clock-work, precisely similar to that of an alarum, and a red lamp for foggy weather or night; and from the box, which is intended to be affixed to the nearest carriage to the nearest carriage to the engine, ropes proceed over the roofs of to the engine, ropes proceed over the roofs of the various carriages to the guard's box, who, upon perceiving any signal of danger or ob-struction on the lines, has only to pall the cord, and the large bell is instantly rung, and the red lamp shown, if at night: or a large board with the word "stop" upon it flies up. and Cheshire ; and we understand, that; under certain restrictions, the telegraph will be made first time by the ministers proceeding to Os-borne House, to form a cabinet council on Saturday last. The cost is under \$,000. See benefits which Mr. Hudson, by his energy and talents, has conferred upon the public fa regard to railway matters were not fikely to remain unacknowledged and unrewarded. The committee appointed for carrying sit the proposed testimonial to that gentleuran, have announced, that in pursuance of resolution passed at meetings recently held of the Mid-land, York, and North Midland, Newessle, and Darlington, and Great Newoastle and Berwick Companies, that they have deter-mined that the best mode of offering a sufficiency testimonial to Mr. Hudson, in acknowledgment of his services to the public and the railway of his services to the patho and the raises, world, is to raise a fund by individual subscrip-tion, rather than by grants of money from the public stock of the companies." Nearly 5,0004. public stock of the companies. Iscarry of has already been subscribed amongst forty of the shareholders, subscribing 100%, each, and three of them 200%, namely—Sir John Lowthree of them 2001., namely-Bir John Low-ther, Bart., M.P., Mr. Alexander Danlop, Largs, and Mr. Graham Hutchinson.

WORKS IN THE PROVINCES.

Powder-mill valley. The line is a curiosity in railway construction, from the fact of its having been commenced twelve months before the Acti in a few weeks from receiving the royal imprimatur. It is a double line; has cost, including 1and, 100,000, and the extension to Tunbridge Wells will be 80,000. more. Mr. Hoof is the contractor, and Mr. Barlow, son of the Professor, has the credit of having carried through the engineering department in a satisfactory manner. — The greatest novelty in railway literature is a pamphlet entitled "New System of Locomotion, without Tunnels, Fridges, Rails, Steam, and Accidents, by Thomas Parkin." The *Times* having ventured to treat the *New System* as a hoax, the author, full of conscious innocence, has referred for the contrary, "to all the periodicals of London and Paris, and fifty mayors in France."—A special general meeting for the Regents' Canal Company is called, to take into consideration a proposal which has been made to this company, for the purchase of the canal property, with a view to the construction of a railway on the same line.— There have been lately some narrow escapes owing to the doors of against, in consequence of defects in the locks which fasten them. In the carriages on the

485

Field, Essex, was signed last week, by Mr. Winsland, of London, and Tuesday next is fixed upon to break ground. The commencement of operations will be the erection of the apartments for females and debtors, and the chaplain's and governor's houses. — The Edinburgh Advertiser states that the Provost of Kirkwall lately received a letter from the Duke of Sutherland, intimating that Sir Robert Peel had agreed, on the part of the government, to grant a sum of money for putting the ancient and venerable Cathedral of St. Magnus in a state of efficient repair. The Scottish Railway Gazette says that some of the railway companies contemplate ment of operations will be the erection of the parish church of Turrant Gunville, rebuilding under the direction of Mr. Wyatt, the diocesan architect, is nearly completed, and will very shortly be consecrated by the Bishop of Salis-bury. — The new church at Wilton, near Salisbury, built at the sole expense of the Hon. Sydney Herbert, and to which we have more then once draws attention, is to be consecrated on the 9th proximo, by the Bishop of Salisbary-mullady Emma Pennant has not only contributed handsomely towards the rebuilding of the aid church at Whitford, near Holywell, but undertaken to build a new sisle at her own expense.-----Cottingham Church, situate in the East Riding of Yorkshire has recently undergone very extensive alterations and im-provements. Three hundred additional sittings have been previded, Among the many improvements, that have of tate been effected in the port of Hull, may be mentioned the graving Son. site dock of Mesers. Edward Gibson and Son, situate on the ganrison side of the town. The works have been carried out on a liberal inciple, and the space so much extended, path in length and breadth, and depth of water, as to insure the commodious recention of the largest ships navigating the Humber, whether under narves or impelled by steam.......A cor-respondent of the Hull Packet has revived the project, which, has more or less slumbered since 1843, of creeting an additional bridge across the river Hull. He says, every one who has frequent occasion to cross the Old Dack or North Bridge, must be fully aware that an additional bridge is now much wanted, and its formation will soon be indispensable to accommodate the additional traffic of the east dock defences of Portsmouth Harbour. The improvements at Blackhouse Fort are also rapidly progressing, a large number of men being now employed under contract for that work. The fort is being made into a two-tier battery of fifty guns. At the northern part of Blockhouse Point a new battery or circular fort is being formed, which will flank the entrance of the harbour. Between this new battery and the Blockhouse Fort a new barrack battery and the Blockhouse rolls new contained of the restoration of the ancient church of St. Mary de Crypt, Choncester, is nearly completed. This inter-Gloucester, is nearly completed. This inter-esting specimen of ecclesiastical architecture contains several examples of the earlier styles. The Norman doorway at the west entrance, and the Early-English window in the southeast aisle, are deserving of especial notice .-A, few days since the workmen employed in excavating for the new branch railway which is intended to run from the Stratford station of the Eastern Counties line to the mouth of the river Lea, near Blackwall, lighted upon some curious and interesting remains connected with the Benedictine monastery. About 2 feet below the surface a sort of chamber presented itself, of an obload shape, rounded at one end and square at the other, about 12 feet long, 8 feet wide, and 5 feet in depth. The outer wall, which is of strong masonry, is about 6 inches Within that is a layer of cement, which thick. is again lined with thin red tiles of peculiarly close texture. It is clear that this chamber, which, when whole, must have been a very handsome one, was intended as a lavatory, for which purpose a well, that was discovered two or three feet of it, furnished an within abundant supply of water. A few yards lower down towards the Thames the workmen broke into an archway very strongly built, somewhat after the Danish manner, (?) which has given rise to much conjecture.

SUBABCUATION AND WILLIAM OF WYKEHAM.

At the recent meeting of the Archæological Institute at Winchester,* the following interesting letter, addressed by Dr. Ingram to Dr. Williams, Warden of New College, was read, but seems to have escaped the London reporters:---

" Monday, Sept. 8.

"MY DEAR WARDEN,-I thank you much for your kind letter received yesterday. • • You flatter me too much by supposing my presence at Winchester to be of much importance, though I am placed in the Architec-tural Section. It is now nearly half a century since I used to pace the gorgeous aisles of Winchester Cathedral, and make the Church of St. Cross the object of my almost daily walks. Since that time I have been gratified to find how universal almost has become the correct taste and knowledge, as well as admiration, of medieval architecture; and there cannot be a better school for it than the various portions of Winchester Cathedral, the churches of St. Cross, Romsey, &c. The gradations and transitions of the art are numerous, but easily traced; from the plain crypt of St. Ethelwold under the presbytery of the cathedral, and the Norman transept of Wal-kelyn, to the splendid works of Edyngton, Wykcham, Beaufort, Fox, and Langton. The members of the Architectural Section should particularly notice and examine the manner in which William of Wykeham carried on the work which his immediate predecessor, Edyngton, had begun at the west end of the nave. A difference is observable not only in the windows, but in the mouldings and tracery of the panel work below in the interior. Perhaps w sketches in detail of the respective works of these two prelates might be interesting and useful, as tending to illustrate the progress and advancement of architectural taste and science, during the long and brilliant reign of Edward the Third, under the auspices of such patrons as these; the one the King's Treasurer, and the other, constituted by letters Treasurer, and the other, constituted by letters patent, Surveyor of the King's Works. The large church which Bisbop Edyngton erected from the foundation in his own native place, in Wiltshire, from which he de-rives his name, is well worthy of the attention of the archeological antiquary and the artist; some details of which, at least, might be considered as not unconnected with the examination of his other works at Win-chester. In the same manner, if the various works of William of Wykcham, executed at Adderbury, King's Sutton, Oxford, Bishop's Waltham, and Winchester, were placed in juxta position with each other, it would be found that he began with the Decorated, and ended with the Perpendicular, according to the nomenclature of the late Mr. Rickman. There is one point which deserves particular attention in the late architecture of William of Wykeham. No other architect before his time so well understood, and practically applied, the principle of subarcuation; that is the mode of constructing two inferior and subordinate arches under the third or main arch. They both seem to rise naturally from the middle stem, or principal multion in the centre of the window, diverging at a certain point with an easy sweep or curve, so as to form two independent arches, filled with corresponding tracery, and serving to strengthen, at the same time that they adorn, the master This principle, arch that contains them. This principle, which is so obviously predominant in all large windows, was not unknown at an earlier period, and was practised to the latest; but the arches were often lost in the intersection or crossing of the multions; and sometimes, as in the windows of the clerestory of St. Mary's, at Oxford, the diverging point is so unscientifically chosen, as to produce the worst pos-sible effect. The best examples of this principle of construction, therefore, I have no hesitation in ascribing to the superior taste and skill of William of Wykeham; and of those examples, perhaps, no better can be found than in the windows of New College Chapel. I call this the principle of subarcuation; and the arches themselves, in the memorials of Oxford, I ventured to call subarches; but I observed some writers since confounding them with the soffits of arches. As the subject,

* See pp. 442-446 ante.

therefore, appears to be new, if any thing in architecture can be so, J. have submitted it now to the consideration of the architectural section of our society...I semain, my dear Warden, yours truly, in basto, ...J. UNSMARS

WESTMINSTER COURT OF SEWERS.

Ow Friday, the 19th instant, a meeting of the commissioners took place at the Court House, in Greek-street, Soho, when a great deal of mere routine business was transacted. Mr. J. Ponsford having petitioned the court to allow him to build 840 feet of 24-inch barrel drain in the old line of the Bayswater stream, and the following letter on the nuisance caused by the diversion of the sewer having been read:—

"62, Moorgate-street, 4th Sept., 1845. Sin,—Mr. Kerr, of Kensington Gardens Terrace, has consulted with us on the subject of the nuisance to which he and his neighbours have been subjected in consquence of the arrangement made by the Commissioners of Sewers in turning the course of the rivulet which ran at the back of his house; and as the inconvenience is so great, that he is gearcely able to live in the house, it becomes necessary that the commissioners should take the necessary means for removing the ansoyance complained of; or if they fail to do so, we shall be compelled to adopt such steps for, gompalling them as our counsel may advice.

ling them as our counsel may solvies. When Mr. Kerr took the house, he was subjected to no such inconvenience, which we understand it is admitted has been, produced by the act of the commissioners; and if this be so, we are sure that so respectable a body will lose no time in taking the proper steps to remove it.

steps to remove it. Had the present summer been as hat on usual, it is frightful to imagine what might have been the consequence; but having now formally called your attantion to the subject, we are sure that it will be removed at bound

The Gourt refused to grant Mr. Possford a petition, but allowed the permission formalength of third size sever, instead soft the barrel drains. The only other question of the portance during the day was Nos 6 in the business paper, "To consider the steps to be taken for new contracts for the works. Identical Mr. Ledie moved and Mr. Robert Gurtage

Mr. Leslie moved and Mr. Robert Ganter seconded a motion, in nearly the same words: which we have before given, that all works exceeding 50/. be carefully prepared for by estimates, plans, and specifications, i and besequently advertised for in the deily papers and in this journal.

An amendment was moved by Mr. William, Leverton Donaldson, and seconded by dire-Gutch, "That the present system of contracting for works be pursued." For the amendment, three :--Messrs. Frederick Crace, Wa-L. Donaldson, and Gutch. Against the amendment, ten :--Messrs. Baylis, Cantwell, Clowser, Fuller, J. Gunter, R. Gunter, Leslie, Marriott, Unwin, and Wood. The original motion was then carried by twelve to one.. The court adjourned to Friday, the 3rd October.

PLYMOUTH BREAKWATER. — We understand that the attention of the Board of Admiralty has been again directed to the important question as to whether or not Ply, mouth Sound has lessened in depth of water by reason of the construction of the breakwater. It will be recollected that about four years since accurate soundings were taken throughout the Sound, and the result marked upon a chart constructed for the purpose. During the present week, similar soundings have been again connenced, and we doubt not, that when complete the result will prove of the most satisfactory description. It is intended that the bottom of the Sound shall be examined with the aid of the diving-bell, and arrangements are now making for that purpose. Connected with these proceedings Mr. James Walker, the engineer, arrived here on Thursday.—Plymouth Times.

FAILURE OF WOOD PAVING IN THE STRAND. —The authorities of St. Clements Danes bave is advertized for sale as fire-wood about 500 yards: of wood paving, now laid down between the top is of Arundel-street and Norfolk-street, and in a top is tend to replace the same with stone as before.

THE BUILDER. BUILDER THE

THE LIVERPOOL ASSIZE COURTS. both Saturday we took a harty glanice at the interior of this make pile of buildings, and fond that the work continues bill to make Wind this the work continues suit to make borry, slow progress. The sound of the ham-inet and chirot is to be heard ab overy angle ; shill we have nd doubly, from what we saw and learned an equ. visits, slibough the walls are bare, and the building 'testif is wetther russes bare, and the buildings itself is wetther roofed non figured, Alar a very remainership partien of the preparatory part of the wetkenenship has been accombined of the wetkenenship framise columns, which are a structure four granife columns, which are a structure of the decree of the instantiation of the first of them hits he position will take place forday. The cor huma will take place forday. The cor huma will take place forday. The cor huma will take place being of the fields foring effect the grante being of the fields point we were before had the opportunity at the sine were before had the opportunity at the siscific? "The only dher columns in the kingdom which bear any comparison to them are the four in the British Museum in London. There the columns are each hearn from the one block, and, present to the eye of a py-bolder in very elegent appearance. Here, in order to eave expense (each column will conaist of five or air different pieces, and the join. aist of five or aiz different pieces, and the join-inge must necessarily detract to some extent from the general effect. Still, viewed from sither and of the magnificent hall, which will be 199 fest in leogth, the grandeur and mas-siveness of the sight will be unequalled. The columns for the front entrance are also nearly columns for the front entrance, are also nearly ounpleted, and so are the sixteen Corinthian capitals! The capitals are from the design of Mr. S. C. Relacy, of London, who has been superintending sheir execution; and some ides of their massiveness will be gathered from the fact, that each of the orrelar ones weighs 9 tons, and wach of the orrelar ones weighs 9 tons, and wach of the square ones 11 tons. May of the internal embellishments, though not yet faced in their respective places, are either completed or in a state of creat forwards not yet fixed in their respective places, are either completed or in a state of great forward-hess, and we may add, as a proof that Mr. Ringe, the architect, is availing himself of the present, and we ther, that he has at present Jul workmen daily simployed. There ap-pears to be very little difference of opinion, howaver, on this important point. that it will take from two to three years, at the very least, to finish the pulding. But, however distant the meried of its completion may be, it will, when which dt be set and to Liverbe 498 feet. manufacturing it. The defendent wrote back. a letter, in which he said ha could prove that the pattern had ben appled from a prior to the pattern and ben appled from a prior to the pattern and yes and original original original to the public original original to the second of the second o registration. a notadi tranteo'

Mr. Aldernan Moon asked ifethis wan not property a question for the Court of Oliancery P Mr. Clarkson said he was sure the alders wis, like bimself, one of the last persons who would advise anybody to get into Chandery who could possibly keep out of it. 'The very would advise anybody to get into Chandery who could possibly keep out of it. The very object of the law was to give a small trades man a speedy relief at a small, expense, in gases of piracy upon some invention or im-provement he had registered. Exidence was then adduced to prove had

The defendant had printed, and sold paper exactly corresponding in design with the de-sign, registered, by the complainant; after which Mr. Alderman Kelly and Mr. Alderman Muon consulted together, and pronounced the defendant's paper a fraudulent imitation of Mr. Boswell's, and fined the defendant 5/.

Mr. Denton promised he would sell no more of the paper.

Correspondence.

WORKS IN THE TOWER OF LONDON.

Sin,-Permit me to correct one or two trifling inaccuracies in your account of the works at the Tower, in your last number. Under ordinary circumstances they may not be of much importance, but as you have been particular in giving inches, the statement in some measure particles of the appearance of an official one; it is therefore, I think de-sirable that the correction should be made. The length in front and at the back is as you state 288 foot and 271 feet 8 inches respectstate 288 fort and 271 feet 8 inches/respect-ively. The width of the main building is 87 feet 6 inches, but at the flanks it extends to 65 feet 8 inches. The extreme width in the centre including the projections of the towers is 82 feet 9 inches. The size of the princi-pal rooms is 28 feet 25 inches. The total cost is estimated at little more than 30,000%. in-stead of 50,000%.

regret to say, the other works contemplated in the Tower do not include the restoration of the White Tower, which is at present, as you justly observe, a disgraceful monument of ig-

STRAM FROM COMBUSTION OF GAS.

Sin,-I am teased to death every winter with a nuisance, the cause of which I dare say some of your intelligent readers may be able to point out, and tell me how to remedy. As soon as, or at least very soon after, the gases are lighted, the windows of my shop are covered with damp. It is in vain for me to put any thing tempting into them, for no one can see what some remedy, you would greatly oblige, Sept. 17, 1845. A SHOPKEPPER.

BOCHESTER CATHEDBAL .-- One who has lately been staying at Rochester says, the roof of the nave has been stained, and the side aisles have been newly roofed. The increased darkness of the roof (the effect of staining) will throw out to a greater degree than formerly the magnificent Norman architecture of this portion of the cathedral, the massive columns and arches of which, supporting an elegant amoulatory, are, I believe, unequalled in antiquity by those of any other cathedral in England. The nave and western transept are England. The nave and western transept are also being repayed with stone; the old red tiles, which were so great a disfigurement, having been taken up. The choir, too, which is an excellent specimen of pure Early-English anybitecture (built in the thirteenth century), is undergoing great alteration, the fronts of the gews, as far up as the pulpit and bishop's thrase, which were formerly stained deal, and oute plain. having been removed, and caryed quite plain, having been removed, and caryed Gothic panelling being introduced in their stead. Four additional pews are also erected. Act (1 & 2 Victoria, cap. 117) control al. Man Act to abridge APARALIZZING to be even pomitte, and to make bottom provision for the re-

THE BUIEDER

A TKINSON'S CEMENT. — The public is respectfully informed, that the price of this very ex-colleat General, which has now been in use for Architecture and Engineering works upwards of thirty years, is reduced to s. sd. per bushel, and may be had in any quantity at Wyatt, Parker, and Co.'s Wharf, Holland street, Surrey side of Blackithärs-bridge: N. B. — This Cement being of a light colour, requires no arti-ficial soluting or painting, and may be used for stucco with three prints its ewn quantity of sand.

ARTIN'S PATENT CEMENT. MARTIN'S PATENT CEMENT. TO ARCHITECTS, BUILDERS, AND FAINTERS IN PRESCO. IN SOLE MANUFACTURERS, beg respectfully to and SON, PATENT TEES and. SOLE MANUFACTURERS, beg respectfully to ansounce that this beautiful Commt has now arrived st a degree of excellence far suprassing their most sanguing expectations. For all internal work it possesses a great supergingty oper every strieds hitbert on uses; it is now being used extensively by Government in the British Museum and other public buildings. IT DOES NOT THROW OUT ANY SALT, but presents a beautifully plain and perfect suffice, which may be painted upon dry work within four days without peeling. It is equally applicable for walls or lath, for mouldings, architpaves, skirting, or flooring ; and is demitted to form the best ground for freese plaining, having been used for mark be best ground for freese plaining, having been used for mark best ground for freese plainting, sharing been used for mark best ground for freese plainting, the sum Westminster Hall. It will beer an intense heast without creaking, and for hardness, durability, and economy, cannot be equalled. 196. DEURY-LANE LONDON

- 186. DRURY-LANE, LONDON. Agent for Liverpool and Manchester, Mr. R. Part, 11, Atheston's-buildings, Dale-street, Liverpool.

Kinercon's-ballange, Date-street, Laverpool. KEENE'S PATENT MARBLE CEMENT.-The Patentees of this composition beg to refer to the British Museum, the Royal Exchange, the new works at Bethlem Hospital, Greenwich Hospital, and the Co-liseum in the Regent's-park, as buildings finished or in pro-greas, in which Keene's Cement has been used as an internal stucco. Its superiority to common plastering consists in its extreme hardness, and the rapidity with which it dries, which qualities fit it to receive plant or other finishing sconer than other water Cement. When employed for akirings, architrave, and other mouldings, in place of wood, it checks dry-rot, is impervious to vermin, prevents the spread of fire, and is more eco-nomical in its application than the material for which it thus becomes the substitute. Confirmation of these statements is to be found in the almost universal adoption of Keene's Cement for Skirting and Hall flooring in the new houses on the Hyde Park Estate, un Lingerpool and Manchester, Kaene's Cement's Cement's the in In Lingerpool and Manchester, Kaene's Cement's the in In Lingerpool and Manchester Internation in Internation in the internation in the material in Internation in the new internation in the new internation in the internation in the new internation in the new internation in the new internation in the nemployed

Cement. | Depòt in Liverpool, 36, Seel-street ; James Woods, Agent.

O ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERRES, MER-CHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL:

CHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL: JOBNERAL: CHENT.-The following are the positive advantages possessed by this laveation over every Coment bitherto in-troduced.-It will effectually resist Damp. It will never regetate nor turn green, nor otherwise discolour. It will never crack, blister, nor peel off. If will form, a complete Stone caning to any Building forther with it. It is of odely resembles Stone that it is impossible to detect it. It never requires either to be painted or coloured. It will keep fresh and good in the cask in any. Climate for any number of years. It is the only Cement that can be and with confidence by the Sea-side. It may be used in the hottest or coldest Climates at any season. It will adhere to any substance, even to Wood, Iron, or Glass. It will earry a larger Proportion of Sand than any other Cement. It matures by age, and be-comes perfect when other Cements begin to perish. It may be worked through the Winter, as frost has no effect upon it. It may be used on the Inner Walls of new Houses, which may be papered over or painted directly. Roofs lad or pointed with this Cement will remain undamaged by the serverost Storms. Any Plasters may apply it, the Instruc-tions for use being very clear and distinct. The first cost of this material does not exceed that of the cheapest Cement or use but with all the above-named extraordinary and valuable advantages, nothing cas approach is in point of the used that it hend they have used this Cement hare

economy. Architects and Builders who have used this Cement have de lared that it requires only to be known, to be universally preferred.

d: Lared that it requires only to be known, to be universally preferred. Specimens may be seen, and a Prospectus fully densitying the Cement and its mode of application, together with a volume of Testimonials from every part of the Kingdow, may be obtained on application to MANN and CO., SOLE AGENTS for the Patentees, 5, Maiden-lane, Queen-street, Cheapside, London t of whom also may be had. JOHNS and CO.'S PATENT STONE-COLOUR STUCCO PAINT, expressly intended for Painting over ex-terior Walls of Houses that have been covered with Roman or other Cements, and which have been covered with Roman being in direct chasting of whom also may be the grant of the second loured., Lt is in every way better suited for this purpose than White Letd Paint, which will frequently come off in fakes, MESSRS. JOHNS and CO.'S PATENT PAINT having an affinit fee Stueboo, binds ittelf with it, stopping the suction, there it wandering the wall proof against weather, and in the finish producting a pure stone-like effect, produceable by no user With Whitewer. It is cheap in its application,—and may be used by any Jeinster, in any elimate, even in the most exposed Marine situations.

٦

SATURDAY, OCTOBER 4, 1845.

EW street-fronts are now raised, either in London pr the provinces, without an attempt to render them in some degree ornamental, and it is undeniable that the

aspect of our streets is considerably improved. In all the new thoroughfares recently opened, pains have been bestowed, if not always sucsafally, to produce elevations novel and pleasing, shewing a regard for the beautiful as well as the useful. A hundred years ago Savage said in his poem "Of public spirit in regard to public works :"---

- "The' no proud gates, with China's taught to vie, Magnificently useless strike the eye; (Useless, where rocks a surer barrier lend, Where seas encircle, and where fleets defend) What the' no arch of triumph is assigned To laurell'd pride, whose sword has thinned man-
- kind : The' no vast wall extends from coast to coast,
- No pyramid aspires sublimely lost; Yet the safe road through rocks shall winding tand.
- tend, And the firm causeway o'er the clays ascend: Lo I ample streets, Lo I ample squares invite, The salutary gale, that breathes delight; Lo ! structures mark the charitable soil
- For casual ill ; maimed valour ; feeble toil :"

Since then, although a dark period intervened, our streets have been getting wider, our squares more ample, our roads and ways improved to an extent at that time not dreamt of, and withal there has been a growing desire to combine ornament with utility in the houses of the commonalty, and improve appearance without lessening convenience.

The fears expressed by Pope to Lord Burlington were not wholly vain when he said :

- " Yet shall, my Lord, your just and noble rules Fill half the land with imitating fools; Who random drawings from your sheets shall
- take,
- And of one beauty, many blunders make. Load some vain church with old theatric state,
- Turn arcs of triumph to a garden gate ; Reverse your ornaments and hang them all
- On some patch'd dog-hole ek'd with ends of wall.
- "Then clap four slices of pilaster on't, That, laced with bits of rustic, makes a front."

What Pope feared, did really take place, and this recipe to make an elevation, under various disguises, was followed until it ceased to have effect. The public, however, having become accustomed to external adornment, looked to have it, and continued efforts have since been made to improve street architecture. If we compare the new squares and crescents in the neighbourhood of Hyde-park, Pimlico, and Brompton, for example, with the "Paragons," &c., of thirty or forty years ago, we shall be compelled to acknowledge that a considerable improvement has taken place. Colman, in his "Eccentricities." has some lines on suburban architecture, under the title of "London Rurality," which recur to us so strongly, and are so accurate, that, in our present quoting mood, we cannot refrain from giving them.

" Stretching, round England's chief Emporium, far, (No rage for Building quench'd by raging War,) What would be Villas, rang'd in dapper pride, Usurp the fields, and choke the highway side !

He says :--

• Printed for R. Dodsky at Tulley's Head in Pall-Mall, folio, 1737.

BUILDER. THE

Peace to each swain, who rural rapture owns, As soon as past a toll, or off the stones ! Whose joy, if buildings solid bliss bestow, Cannot, for miles, an interruption know Save when a gap, of some half dozen feet, Just breaks the continuity of street; Where the prig Architect, with style in view, Has dol'd his houses forth, in two by two And rear'd a Row upon the plan, no doubt, Of old men's jaws, with every third tooth out. Or where, still greater lengths of taste to go, He warps his tenements into a bow; Nails a scant canvas, propt on slight deal sticks, Nick-nam'd Veranda, to the first floor bricks; Before the whole, in one snug segment drawn; Claps half a rood of turf he calls a lawn; Then chuckling at his lath-and-plaster bubble. Dubs it the Crescent,-and the rents are double.

We hope before long to commence a series of notices of the new parts, and to follow out the foregoing brief remarks.

We have lately received communications from several correspondents on the want of attention generally manifested at this moment to classic architecture,—gothic architecture engrossing it wholly. The most recent of them, who signs himself "A constant reader and admirer," says :--

"Can you inform me whether there is any publication giving plates and descriptions of the works of Sir John Vanbrugh? Surely the architect of Blenheim is as well deserving of paper and printing as many whose works are in the hands of all architects. We have a 'Glossary of Architecture' (so called), which is simply a collection of Gothic details; but we have no work giving in an equally accessible form the beauties of Italian architecture, as exemplified not only in the works of artists in Italy, but also in those of the master minds of our own country, such as Jones, Wren, Van-brugh, Burlington, &c. Without intending to deny the beauty and merit of Gothic architecture, I cannot but regret that so little pains should be taken to popularize the other and purer styles. The mania just now is for Gothic architecture only; and this may be (and doubtless is) greatly owing to the circumstance, that the only books on architecture which are sufficiently cheap, and sufficiently brief, to suit the means and time of the general reader, are on that style. The consequence is that as he knows nothing of any other styles, he is glad to assume that there is nothing worth knowing therein.'

We cannot shut our eyes to the fact, as stated, that little or no attention is paid at this time by writers, investigators, or students in England, to any style but Gothic; and are disposed to think, notwithstanding the great admiration with which we regard the works of the middle ages, and our conviction of the great superiority of gothic architecture for ecclesiastical purposes over all others, that harm will be done by pursuing this course.

In reply to our correspondent's very pertinent inquiry as to Vanbrugh's works, we are ashamed to say there is no book which adequately illustrates them. Vanbrugh was illappreciated, and most unjustly treated by his contemporaries. Walpole's strictures on him, unjust, and reprehensible as they were, passed current for some time. Judge :-

"What Pope said of his comedies," wrote Walpole, " is much more applicable to his buildings :

How Van wants grace !

Grace! He wanted eyes, he wanted all ideas of proportion, convenience, propriety. He undertook vast designs, and composed heaps of littleness. The style of no age, no country, appears in his works; he broke through all rule, and compensated for it by no imagination. He seems to have hollowed quarries, rather than to have built houses; and should his edifices, as they seem formed to do, outlast all record, what architecture will posterity think was that of their ancestors? The laughers, his contemporaries, said, having been

• There is a work consisting of sixteen large engravings, by Vandergucht, Rigaud, and Baron (may be had of Weale), to illustrate Blenheim and Stowe, "with costume, &c." of the time.

confined in the bastile, he had drawn his notions of buildings from that fortified dungeon. That a single man should have been capricious, should have wanted taste, is not extraordinary. That he should have been selected to raise a That he should have been selected to raise a palace, built at the public expense for the hero of his country, surprises one. Whose thought it was to load every avenue to that palace with inscriptions, I do not know; altogether, they form an edition of the Acts of Parliament, in stone. However partial the court was to Vanbrugh, every body was not so blind to his defects. Swift ridiculed both his own diminutive house at Whitehall, and the stupendous pile at Blenheim; of the first he says :

At length they in the rubbish spy A thing resembling a goose pie.

And of the other;

That if his grace were not more skill'd in The art of battering walls than building, We might expect to see next year eer." A mouse-trap man chief engin

Vanbrugh was himself a wit, made many enemies, and was further attacked from party feeling. Pope, amongst other things, said, in allusion to his works.

Lo ! what huge heaps of bitterness around, The whole a laboured quarry above ground."

Abuse in rhyme lasts a long time. Posterity, however, view his works differently, and almost unanimously assent to the opinion of him expressed by Reynolds in one of his discourses :--- "he had originality of invention, be understood light and shadow, and had great skill in composition." Vanbrugh composed like a painter and produced most artistlike effects. His style was his own, and displays consummate knowledge of perspective, and the power of producing picturesque outline, combined with the regularity and elegance of Italian architecture. There are few works of the same class that excite a longer succession of new ideas (a great test of excellence) than Blenheim and Castle Howard; and it certainly is extraordinary, that there are not good and accessible illustrations of them, for the use of the student and the admiration of the professor.

NEW WORKS AT WINDSOR AND ETON.

RESTORATIONS are going on gradually at St. George's chapel. The open-work parapet, which is at present of compo, is to be rein-stated in stone; Pratt's carving machine is to be employed on it. By the way, Hollar's print of the chapel (1663) shews every one of the ninnecles surmonized by a vene: these the pinnacles surmounted by a vane; these should be restored. Additional stained-glass windows have been recently inserted in north and south aisles. Henry VIII.'s gate-way opposite the chapel is under repair, and "Solidbury Tower is being rebuilt. Locke and Nesham are the contractors. Caen stone is used. A new sewer has been constructed in Windsor by the Government; the course of it is, from Frogmore to Sheet-street, and thence to the cavalry and infantry barracks, with a branch to the castle. It was proposed at fir -st to construct a more extensive line, and that the town should contribute a portion of the cost. At a public meeting, however, which was called on the occasion, the inhabitants unwisely, as it seems to us, refused to co-operate in the matter.

At Eton College great alterations have been adc. The noted long dormitory has been made. divided into separate apartments, and extensive ranges of chambers built in Werton's yard, so as to afford a separate sleeping room to each scholar. The new rooms are all heated by hot water. An apartment has been built to serve as a library for the use of the pupils, and is a handsome room with a large stained-glass window by Willement containing the arms of ther Majesty, the Prince, the Duke of New-castle, the College, &c. The fittings are of deal,—they should have been of oak. Mr. shaw is the architect, Mr. Burton the con-tractor. The selected drawings for the re-storation of the chapel are exhibited with the

view of inducing subscriptions. The design doe not present suy remarkable features. If the rejected designs had fewer points of value thin this, they must have been very "Indifferent untits indeed." According to the propused new arrangement, the organ is to be propheted new arrangement, the organ is to be propheted in an apartment on the north side of the building near the east end. The chapel is les be valided with month and the body of it "Alled with scalls' and other sixings." "The old chirch ist Upton, near here, re-mative in the same deplotable and disgraceful the set availed with the same the it so A an

since as it was when we described it." A sum of money, however, has been promised in the way of subscription, so that we may hope before long to hear of some steps being taken to restore it's being the being taken

-----...... 1121 THE NEW COURTS OF LAW.

THE report of the select committee appointed to consider the expediency of erecting a building in the neighbourhood of the inns of courts of law, in lieu of the present courts adjoining Westminster Hall, together with the minutes of avidence, is now before us, but from press, of matter we can only allude to it briefly at this moment, and must return to it next week. The, witnesses, scammed were Mr. Burry, Mr. B. L., Jenen, Mr. William Cadogan, Mr. J. Parkipson, and Mr. R. Maugham. The chief point, ini, it is, the resommendation by Mr. Barzy, of, site that, might be obtained by the clearance of a low neighbourhood between the Strand, and Carey-street, a little to the sense of St. Glement's Church, and which he justly considers, would of itself, irrespective of the fature appropriation of the site, he a great public, improvement. The area con-semplated would be 700 feet from east to west, and 480 feet from north to south; bounded press, of matter we can only allude to it briefly and 480 feet from north to south ; bounded and 489 feet from north to south; bounded on the north by Carey-street, on the east by Chargery-lang, on the south by the Strand and Riggt-street, and on the west by Clement's-lang and Plough-court. The actual cost of the site, deducting ground-rents, which might be obtained from part of the space let for ghandbare, is estimated at 258,2244.

THE BUILDER.

BATHS AND WASH-HOUSES IN ST. PANCRAS.

THE committee of the society for establishing these baths and wash-houses have, during the past week, invited inspection of the works in progress. An excellent site has been ob-tained, both as to extent and situation, consisting of the greater part of the vacant ground at the base of the reservoir of the New River Company, in the Hampstead road. The directors have generously let the ground at a nominal rent, and offered the necessary supply of water, without charge for the first six months of the society's operations, and afterwards at the lowest possible cost. The space of ground to be occupied is about 7,000 square feet. The entrance is in George-street, leading from the New-road to the Hampstead-road. It is intended to provide thirty single baths (twenty for men, and ten for women), five vapour baths, and two large plunging baths. In the washing department there will be sixty-four washing-tubs, with coppers for boiling such articles as may require it, a drying-room, ironing-board, and irons. To a poor man or woman the charge for a separate cold bath, containing sixty gallons of water, will be one penny, and for a similar bath, warm, two pence. Fresh water and a clean towel will be supplied to each bather. A few higher priced baths, differing only in having more expensive fittings, are to be provided. The use of a double washing-tub, with an ample supply of hot and cold water, of the coppers, drying-room, and ironing apparatus, will be allowed at the rate of one penny for three hours.

The subscriptions amount to about 600%, and it is estimated that an additional sum of 300% will enable the committee to bring a part of the establishment into immediate use. Among the contributors we notice 1001. from Lord Southampton, a similar amount from the Commissioners of Woods and Forests, 501. from the Duke of Bedford, and numerous other sums, varying from 251. to ten shillings each.

- The Morning RAILWAY BALANCES. -Herald states that Messrs. Masterman and Co., the bankers, have had a million sterling of railway deposits lodged in their hands for some time past.

CARL HEIDELOFF AND GERMAN ARCHITETURE,

Tas Art-Union journal of the pres month contains, anongst other valuable matter, an interesting hotice of Professor Heideloff's most recent, work, "The Architectural Ornaments of the Middle Ages, in the Byzantine and Gothic Styles,"" illustrated by a humber of engraviligs made from the Work. By the liberality of the excellent conductor of the journal in question, we are enabled to lay these specimens of German Cothic practicit before our readers ; and to close the description of them with a biographical notice of the professor.

Fig. 1 (on p. 472) is a Byzantine ernement over a church gate at Neissin, in Satony, and apparently of the eleventh scotury. excetited: moltownic." And adversity is the festeremether of excellence ; and the proverb is most strikingly mempilies in the life of an artist, when a period ged struggie appliest apponent chromistances tends only to support the main which wister superior to misfertunity. By the dist of the filturities with an energy be mind which wister superior to misfertunity. The field of the filturities men who have at the dist of the filturities men who have at the dist of the filturities men who have born at Statignethies in spite of difficulties may be midded the near of Carl Heideloff. He was born at Statignethies of which dutted, in 1714, the kingdom of Hanover, and settled in England. His father, Victor Heideloff, who was educated as an artist in the same institution which reckoned among its, pupils Schiller, Cuvier, and other confined then, succeeded, on his return from making the tour of France and Italy, to a professorship of painting in the same city. The subject of our notice became a student of this celebrated school, and remained so until its deplored dissolution. In addition to the valuable precepts of his father, he enjoyed also the instruction of Atzel Thowfet, the architect--the sculptor Scheffauer---the celebrated Danmecker--the engraver Conthard Muller-of

Instruction of Alzel Thomset, the architect— the sculptor Scheffauer—the celebrated Dan-mecker—the engraver Gotthard Müller—of Alois Keim—and the painter Von Seele. But Heideloff was naturally gifted with a deep love of mediæval att, which, being fos-tered by the study of history and archæology, was cherished by him in direct opposition to providing to the study of prevailing tastes ; - he thus acquired a strong aversion to the styles of his masters, who, for the most part, eschewed all patriotic allusion-glorifying in their works the character of other nations. All his efforts were exerted with a view to contribute to the honour of the genuine art of his own country; and he was sustained by the hope of raising it to consideration, even at a time when German mediæval art was utterly neglected, and even ridiculed. En-thusiastic in the prosecution of his views, the young architect began his career by frequent-ing, much against the will of his parents, the ancient churches, monasteries, and abbeys of Old Wurtemburg—a country rich in relics of this kind—and visited successively all that had so long been left unexplored. The results of these expeditions were a series of drawings, of a style perfectly new in the ateliers of his masters. When Germany was convulsed by the wars of the French Revolution, the arts of that country necessarily suffered, and con-tinued to be cultivated only by those who were so fortunate as to secure to themselves an un-molested retreat. Heile off was at this time busied in collecting all kinds of old pictures, wood-cuts, carvings, and antiquities, which were then held in little estimation. He thus

became possessed of specimens of German art which fully described the chivalrous and religious feeling of the middle ages, and, at the same time, acquired a store of information which qualified him to take a distinguished part in the efforts of those who had resolved upon the restoration of German art; and it has long been acknowledged that Heideloff is one of the most famous champions in the cause of the rights of ancient German art. His exer-tions have won for him the illustrious title of restorer of the art of his country; and the many sacred edifices which have been confided to him for restoration proclaim the honour of the man who has thus raised himself to distingtion as the vindicator of the early art of Germany, which had been trampled upon by foreign invaders, and repudiated by a native fashion which prevails in art as in all else. In accordance with the usual routine, he visited Rome and Paris; but nothing that he saw at either place could in anywise shake his resolution of devoting himself to the style which he tion or devoting nimself to the style which he had embraced with such fervour. Dannecker spoke of him is such terms, that his father de-spalled of ever stelling his son acquire even the name of an artist. But calamity is someine hame of an artist. But calamity is some-times the first step to prosperity; and so it was in the tase of Heideloff, for his father having suffered injury to his eyesight, inso-much at 10 incapacitate him from the ex-ercise of his profession, he relinquished to his son and to Herr Keim his appointment as deworator of the royal theatre of Stuttgardt. And now it was that an opportunity was presented of shewing talent of a kind very different from that assigned to him by Danseker. This branch of the profession requiring a perfect kinowidene of history and antiquity, the young artist enjured upon a field which had been lying faint for centuries; but, with the in-valdable stores of which he had made himself perfectly acqueinted, so that never before were the draman of Schiller, Goethe, and other ce-lebrated authors brought forward with such effect. Heideton, in addition to the reputation which this employment procured for him, had which this employment procured for him, had also opportunities of displaying his superior powers on the occasion of the many festivals at which Frederick I., King of Wurtemburg, entertained his numerous illustrious guesta. entertained his numerous illustrious guests. In grand ideal composition he was inex-haustible—each successive essay declared his deep learning in matters of German antiquity, and for the execution of these designs he was amply provided with all negessary means. Although abundantly occupied in this way; he was nevertheless not diverted from fre-quently visiting the ancient architectural monuments of his country; and he indulged the more in these wanderings as they enabled him to enforce upon the avaricious and ignorant desecrators of sacred remains, a due respect for the beautiful of past ages, and to rescue from destruction many valuable relics which are now regarded as among the most precious in the country. But by such efforts he raised against himself a host of enemics—the most influential of whom, Dannecker, on the death of his blind parent, deprived him of his occupation and means of existence-a barbarous injustice which Heideloff endured with equa nimity and forbearance; and, uttorly heedless of all that was said and done against him, he sought the best opportunities of again raising the spirit of German architecture, and at the same time of basing its theory on a solid foundation. But his native land was not fitted for his purpose-of this he was at length convincedthe spirit of the Hohenstaufen had departed, or existed only in the records of the past; and -so persecuted, ridiculed, and deprived of all succour-he quitted his native land, shook the dust from his feet on its boundaries, and pro-ceeded to Wiesbaden to consult his friend the ceeded to Wiesbaden to consult institution architect Zais; and went thence to Mayence, for the purpose of studying the interesting works of art and architectural monuments of that place. This was in the year 1814, when the then reigning Duke Ernest of Saxe Coburg came to Mayence, as commander of the 8th Corps of the Grand Army. This great patron of art, on his visit to the cathedral, met lleideloff there in the act of drawing portions of the edifice; and, having at once seen the powers of the artist, he requested his portfolio for a few days for inspection, the result of which was an invitation to Heideloff to settle at Coburg ; the prince, at the same time, expressing a wish to have about him an artist

who had taraed his steading the may be the second styles of early therman, dirth, Signat sey was the jay of Heideloff, it was less on his was as count than on that of his belowed, at b thus was he urged on ward in his studies, wild, in-creased energy. It was, and with the year 1816 that he could avail simple with his friend Zais did not expise until that time. If his draw was the more disagreeable as the order of his friend Zais did not expise until that time. If his draw was the more disagreeable as the order of his friend been commenced, and now would only for the skill and knowledge, of the architect whom the duke had selected for its completion. Itsideloff ramained for year in the early priod his appointment to a French architect of the name of Regnter, who had succeded in inwho had tarned his attention to the megleoted name of Regnier, who had succeeded in inname of Regnier, who had succeeded in in-troducing the French ave of architecture in opposition to that of Germany. Heideloff, therefore, quitted Coburg in 1821, and pro-teeded to Naremberg, which abounds with splendid monuments of medickal art. He there aplendid monuments or accurate an accurate established a private institution for the cultiva-tion of ancient German Gothic architecture; but bic ondeavours were not favourably met, either his endeavours were not favourably met, either in the capital or in the city in which he lad settled, until after the accession of Logis T. to in the capital or in the city in which he lind settled, until after the accession of Lock's The othe Bavarian throne, when "# givitions' era 'df old German art compenced;" bot outper in Ba-varia but throughout 'all 'Gerpouny?" Such in prince could not consign to 'hereet' such an artist; his first act of paronage "Such an artist; his first act of the such as a artist; his first act of the such an artist; his first act of the such as a of the sncient montarist of the city" of Nuremberg; and the 'enthesiant' such and 's be and the discharged the white "Soft the first" with which he discharged the white "Soft the first" with all to the erection of the most and 's the 'hold' has be resulted the 'enthesis' the 'hold' has been and the paronage the 'hold' the 'hold' the entitled "Alt Dettscher Mistel back wher brief Baudenkmale" 'Nathbergs " (Old an Celland Model book; 'or, "the 'Artistication' of the 'hold' and Nuremberg, while be ablighted of the 'hold' act toring 'relics, 'n, which " be 'displayed outp skill and accuracy of style that the 'hold' such skill and accuracy of style that the restoration portions cannot be distinguished from the ancient works; on which account the restoration of Bamberg Cathedral was intrusted to him, as of Bamberg Cathedral was intrusted to him, as also that of the ancient Imperial Castle of Nu remberg. The former work he conducted for three years; but at the end of that time he was supplanted by architects of higher pretensions supplanted by architects of higher pretensions who terminated the work in a manner to dis play their utter ignorance of the proper style of the structure. Notwithstanding the man difficulties with which he had to contend Heideloff persevered in the exaltation of tha style of architecturing to which he had so early donested bindelite and it was some cratification devoted himself; and it was some gratification to him to see that already, of the numerous rulers of Germany, many acknowledged Ger man art; for among the promoters of his view man art; for among the promoters of his views were—the King, of Bavaria, the late Duke Ernest of Saxe Cdburg, the Duke of Saxe Coburg, the Duke of Saxe Meiningen, the King of Wurtemburg, and Count William of Wurtemburg. Of his public buildings, either as restorations or wholly constructed by him, may be mentioned:—the Castle of Reinhards-brunn, in Suxony; the Castle of Hohenlands-berg, in the same kingdom; and also a church at Sonnenburg. He has produced drawings berg, in the same kingdom; and also a church at Sonnenburg. He has produced drawings for many projected edifices, in which his su-perior talent is sufficiently manifest. One of these, his design for the Church of St. Ni-cholas, at Hamburg, is of extraordinary power; as also is another for the Roman Catholic cholas, at Hamburg, is of extraordinary power; as also is another for the Roman Catholic Church at Leipzig, which is to be executed by him. With these may be mentioned his drawings for the erection of a palace at Cintra, for the King of Portugal. Of his restorations, those in Wurtemburg are the most remark, able :--as the Church of the Holy Rood, at Rottwell, in the Black Forest; a portion of the Cathedral of Stuttgardt; and several other churches-those of Schöneich, Mergelstetten, Heidenheim; the beautiful and highly pictu-resque Rock Castle of Lichtenstein, a perfect example of the old German. At Nuremberg he has restored the Churches of St. Sebald, St. Laurence, St. Gilés, the Holy Spirit, the Holy Virgin ; and many restorations of private Holy Virgin ; and many restorations of private residences—for Nuremberg is celebrated for the number which it contains of houses of this style of architecturer

SUPPLEMENT.

HABITATIONS FOR THE WORKING CLASSES.

S18,—The miserable accommodation, with some exceptions, the lot of the great majority of the working classes, induces me to submit for insertion in your valuable journal a few considerations on the subject.

There can be no doubt from the abundant evidence brought forward, that disease and death to an immense extent ensue from the filthy state of the houses of the poor, their defective accommodation, want of sewerage and ventilation.

Sir, if dirt in the atmosphere were visible, or could be rendered visible, as it is on our persons, our garments, and in our dwellings, it would astonish and appal the most apathetic. No one, not even the most degraded human being, willingly or knowingly, eats or drinks ordures, but ordures of the worst, most offensive and dangerous description, are continually inhaled into the lungs, when we respire impure, because unrenewed air. The physical constitution of the atmosphere, commonly only permits colourless substances to be drawn up into it. Such are the poisonous effluxia of small-pox, scarlet fever, typhous fever, and other infectious diseases. These effluxia are colourless, but irrespective of these, there are many other sorts, animal, vegetable, and mineral, alike destructive of life or of health, at all times circling in ill-renewed air, and more especially in the dwellings of the working-classes.

colourless, but irrespective of these, there are many other sorts, animal, vegetable, and mineral, alike destructive of life or of health, at all times circling in ill renewed air, and more especially in the dwellings of the working-classes. By means of a different and superior description of houses, all this might, in a great measure be prevented. It is not necessary to erect expensive dwellings, but they should be clean, light; cheerful, and with an invariable provision for the renewal of air. I hope to shew that houses of this superior description could be built, and yet afford an excellent return to those who might embark their capital therein. And I will add, that, while every scope should be given to individual humanity and enlightenment, it is the duty of the legislature to see that no more dens are erected, and that those which are unfit for human occupation, should be pulled down and reconstructed.

those which are unit for human occupation, should be pulled down and reconstructed. In towns, the necessity of the case, with the paucity and dearness of ground, will always render it necessary to construct dwelling on the top of dwelling, otherwise floor on the top of floor. In the country the case is different, and houses may be built according to the convenience and inclination of those concerned. I do not, however, think it is too much to say that throughout Great Britain and Ireland, the vast majority of human abodes are only fit to be pulled down. In crowded localities it might be expedient

In crowded localities it might be expedient to have flat roofs, covered with asphaltum or otherwise. Bordered with a cornice and railing or balustrade, or even a simple brick wall, they would prove rather ornamental than otherwise. The inclosed space would make a tolerable substitute for a playground, safe from the contamination and casualties of the streets, and in vastly purer air. It would also be easy to establish school-rooms and readingrooms in a comparatively salubrious locality. Houses for the working-classes should be of

Houses for the working-classes should be of a substantial, permanent character, with Memel or iron joists, and walls impervious to moisture. The stairs and landings should be of stone, the balustrades iron, with a painted iron rail. After every consideration, I think it would be preferable to have iron joists and flagged or tiled floors, with the ground floor somewhat elevated, of asphaltum. It would render the houses fire-proof, like those we observe in Paris, and further serve as a preventive of vermin. The loss accruing from the latter in the houses of the poor is very great.

Neat and cheap window-frames of iron are now to be had of any dimensions, made to open in part, and with comparatively small panes, so as to save expense in breakage. The large portions of the window and door-posts, also the chimney-pieces, should be of stone or some hard composition. The apartments I would have not less than ten feet high. Less than this would not be enough, more would be perhaps superfluous. Each living room, as the late ingenious Mr. Loudon used to term it,

I would supply with a neat cooking range, with boiler, oven, and hot hearth, all kept up from the same fire. If the oven could be constructed of fire-brick it would perhaps be desirable. I have seen excellent and economical cooking-stoves in the Netherlands, but they are not perhaps adapted to the usages of these contries. Below the fire-place I would have a tray to pull out, and each fire-place should be supplied with an iron fender. Above every boiler there should be a cold-water cock, supplied by a cistern in one of the upper corners of the apartment, or communicating with a cistern common to the whole range of dwellings. The loss of time, comfort, and even health, particularly during cold, wet weather, in having to send for water, sets very heavily on poor families. Over or beside the fireplace I would have one gas jet, and I would also light up the common passages, say till ten or eleven o'clock, when the gas might be turned off. Over the fire-place also, I think a hot chamber might be constructed large enough to admit a clothes' horse. The important matter of vantilation would

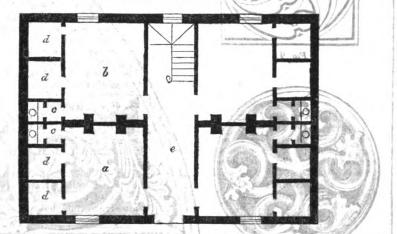

.1

Т

The important matter of ventilation would be thoroughly secured by having at the period of the construction of the houses, flues built into the walls contiguous to the chimney-flue. The heat of the latter would create an effective draught through the former, and night and day the apartments would be thoroughly ventilated, better even than are the houses of the opulent, and that too, without any further care on the part of the occupants. It would probably be expedient to have a sliding valve, so as to regulate the amount of the draught. As for the outlet of the flues, I would have it within the passage between the coved ceiling and the roof, but if the roof were flat, air-conduits, with proper openings, might be left near the eaves or the chimney-stacks. The ventilating flues of all the apartments would open in the same direction, and the ventilation would be perfect. This mode of ventilation is in part that adopted by Mr. Walker. If his mode of heating could also be followed up, the process would be perfect.

473

In towns, the houses might be from two to four stories high. The latter elevation would be comparatively cheaper in the erection. For the same reason, if there was a suitable look out behind, I would have the houses double, extending backward, as well as laterally, as thus :---

If, however, the locality would not permit this, another arrangement would have to be adopted. The front elevation if of four stories, would be about 40 feet, allowing the basement floor to be a foot or so above ground. Four families would be accommodated on each floor. The arrangement is an 8 feet wide hall, (c) which would give plenty of air and scope to the inhabitants. Four doors opening from the hall and the landing-places on each floor, give access to four living rooms, $(a \ b)$ one to each family, 12 feet by 14. From these rooms open two sleeping-closets $(d) \ 5\frac{1}{2}$ feet by 6, large enough to accommodate each, an iron hedstead 3 feet 6 inches broad, by 6 feet long, affording room for a chair, and a few pegs for clothes. There is also a third, or water-closet, $(c) \ 3$ feet by 6, to which there is access by two doors, the first enclosing a kind of vestibule, useful for mops, pails, brushes. A shaft communicating with the ventilating flue, should open from the top of the water-closet, by means of which and the addition of the double door no foul odours could escape, a consummation not always realized even in the best houses. The draught should be conveyed off, by means of iron tubes, to the main sewer. The contiguity of the water-closets of the different living apartments to each other, would render one main iron tube available for four distinct water-closets.

I cannot but think that this arrangement of the water-closets would be very desirable. Foul smells would be completely avoided, dirty slops would be rejected, while the convenience and decency as regards women and children, as well as invalids, would be obvious. Some, indeed, might condemn it, but surely on insufficient grounds. As it is, the limited existing houses of the poor are continually used, to say nothing of cases of illness, to satisfy the wants of nature in, to the great deterioration of the air and discomfort of the inmates. For men, indeed, I would establish public necessaries, sufficiently numerous to accommodate every locality.

The partitions between the living-rooms and sleeping-closets I would have six feet six inches high, except between the closets themselves, where I would continue the partition to the ceiling. By this arrangement, the air of the sleeping-closets would be equally well ventilated with that of the living-room itself, while they would be sufficiently lighted up and warmed. Arrangements of no mean importance as regards health and comfort.

The partitions should be of brick, or some other fire-proof material, and in the corner of each apartment, I would have a stone bunker or box, for containing fuel. Spaces might be further left in the walls for shelves, for which slate would form a good and enduring material. The water that supplied the kitchen range might be derived from the same cistern that supplied the water closets, or the rainwater might be accumulated in separate cisterns for the use of the latter. These cisterns, of course, would be supplied with overflow pipes. Each house, or block of houses, should be further provided with a lightning rod, which, according to the lattest improvements, should communicate laterally with each mass of iron in the building.

should communicate interary with each interof iron in the building. I think the preceding details as regards habitations for the working-classes will be sufficient to illustrate my meaning. They would answer, I conceive, pretty well for most large towns. At the same time, if the principle were approved of, it would be open to any one to modify or improve upon it at pleasure. It will probably be conceded that the habitations here described would prove very much superior to the ordinary abodes of the working classes in any part of the three kingdoms. They would be at once warm, wellventilated, comfortable, and convenient. The dimensions which I have stated are the smallest that could be given or economy dictate. If such buildings were undertaken, the dimensions and proportions might be conformable to the ideas of the projector. It strikes me that those which I have mentioned, would answer as well as any, and prove most suitable for families in humble circumstances.

The shelves, kitchen-ranges, iron-bedsteads, gas-fittings, should be fixtures, and it would further be desirable that a paid and responsible person appointed by the landlord, should see after the cleansing (daily) of halls and stairs, the lighting of passages, the safe keeping of the houses generally, the closing of outer doors at proper hours, the daily delivery of ashes and refuse, and the collection of the rents weekly in advance. All rates, taxes, Digitized by repairs, chimney-sweeping, gas, and water charges should be liquidated by the landlord or proprietary, and added to the rent. Fire-

proof houses would not require insurance. It is conceived, that houses such as these might be let on remunerative terms by landlords, or companies undertaking their construclords, or companies undertaking their construc-tion, and bearing the charges which I have above enumerated, and yet at rents as low or lower than what is now charged for dwellings miserably insufficient. They would be hand-some as to their exteriors, and admit of every decrement and propriety a records the interior decency and propriety as regards the interior. I am, Sir, &c., HENRY M'CORMAC, M.D.

Belfast, Sept. 15.

SUGGESTIONS FOR THE IMPROVEMENT OF SEWERS. BY JOHN PHILLIPS.

"Devouring pestilence hangs in our air."-Rich. 11.

THE healthful condition of every population is dependant, in a very great measure, upon good and efficient sewerage, and from the manner in which this question is being taken up, as well as from the publicity which has already been given to it, I consider it has already been given to it, I consider it behoves every one who is acquainted with the subject to give attention to its improve-ment and amelioration. Therefore, taking this view of the case, and believing that many great and glaring evils require speedy and effectual remedy, I am induced to offer the fol-lowing observations and propositions relative thereto. thereto.

During the last century science and art have made more than rapid strides, and almost every subject has received great and important improvements; but it is manifest that the "science of sewerage" (certainly with some exceptions) is nearly in the same unimproved, drawling, and backward state that it was a century ago. It is presumed, therefore, that it can be no less the desire of the proper authorities to adopt, than it is the duty of persons to suggest improvements; and I hope and trust that the time is not far distant when good, sound, and practical suggestions, having for their object the general improvement of sewers will receive that due and proper consi-deration, from whatever source those propositions may emanate, that its nature, magnitude, and importance demands.

It has long been a subject of grievous com-plaint, and justly so too, that filthy and ma-lignant streams of air are continually emanating from the gully-holes in the streets. Now, the cause of much of the stench and effluvia from sewers is owing to their extremely large sizes. the inefficiency of their form, and the slug-gishness of their falls. For the quantity of water which is usually discharged into them, is so very small when compared with their magnitude, that it becomes extended and ad over a wide surface; and the height of the streams being, therefore, very dimi-nutive, their motions are generally so feeble and slow, that they have not sufficient velocity and power to raise up and carry off the soil, consequently the matter becomes deposited upon their channels; and, as it decomposes, it generates foul and malignant gases, which, by escaping through the untrapped gullies and private drains into the streats and houses conprivate drains into the streets and houses, con-taminate the surrounding atmosphere with nauscous and pestilential impurities.

It is extremely desirable that this great and growing nuisance should be prevented if possible. Many methods have at various times been suggested accordingly, some of which are certainly very ingenious, but it would appear that they more or less bear the impress of impracticability. Streams of air must be continually allowed to pass into and out of the sewers, in order to keep them pro-perly and efficiently ventilated; and this can only be done by direct communications or passages being made between the sewers and the atmosphere. And in consequence of proper means never having been devised for the purpose of preventing the effluxia from es-caping, and at the same time maintaining the circulation of air, without the facilities afforded by the gullies and private drains, the authorities under whose care the sewers have been placed, have always had a strong aversion to the system of trapping. But in this case, as in numerous others,

prevention is a great deal better than the cure for it, and if means were adopted to prevent deposits from accumulating in sewers, the stench then, even if most of the communicating adits were left open, would be nothing com-pared to what it now is; and surely whenever a sewer is found to retain the matter discharged into it, one would suppose that steps would be immediately taken to impart sufficient velocity and power to the water, so that it might be able to carry off the matter, and thus prevent a re-currence of deposits and accumulations for the futare.

I am not aware if it be generally known that streams of running water communicate to the air immediately contiguous to them mo-tions which run in the same direction as the streams. That this is the case may be proved by holding a blaze of light, or any fine light substance, just above the surface of any stream. Now, if sewers were properly arranged, so that water could be continually flowing through them, much of the foul air that is produced by the decomposition of the matter would be carried off with the running water; and, therefore, it would in some measure assist their ventilation.

There are two modes which present them-selves to my mind as being the best adapted for the purpose of keeping the sewers free from deposits and accumulations of matter.

The first is the well known process of damming back the water flowing down the sewer, until it accumulates to a considerable height, and then suddenly letting it off, the im-petus and force of the descending stream carying away with it all the substances discharged into the sewer, and with which it comes in contact. This method of cleansing the sewers is now, and has been for some time, in suc-cessful operation in the Holborn and Finsbury Commission of Sewers, and is found to be, as I understand, and which I am satisfied must be the case, from the great power and scour-ing action of the water thus obtained, not only a more effectual, but also a much cheaper way of removing and carrying off the deposited matter, than the ordinary dirty and antiquated method of raising it to the carriage-ways, and then carting it away, with all its attendant annoyances.

Now the old sewers, and many of the new ones also, cannot by any possibility keep themselves clean and free from deposits with the present quantity of water which is dis-charged into them, in consequence of their extremely large sizes, the injudicious form of their bottoms, and their inadequate falls, as before referred to; for when one of them is cleansed, the matter which is immediately afterwards discharged into it becomes depo-sited upon the bed (its wide, expanded border causing the liquid mass to spread), and the sewer again becomes in a short time wholly inefficient for the purpose of removing and carrying off the soil. The matter again accumulates until the private drains are prevented from acting, when the soil has again to be lifted to the carriage-ways, and this process of cleansing and recleansing must ever be continued so long as this form of sewer exists, and remains unimproved. From the filthy condition in which very many of these sewers now are, the means which have been proved to be highly efficacious for the purpose of keeping them clean, ought not I think to be longer de-layed; and I feel assured that were the authorities fully acquainted with the condition of the sewers under their jurisdiction, there being whole districts where sewers are more or less choked with decomposed matter, not another day would be lost without taking advantage of so simple and ready a method of improvement.

It must, however, be admitted that the method of flushing the sewers is only an expedient to be resorted to when the sewers cannot be kept clean by the simple means of proper construction and efficient fall; I would, therefore, beg to suggest another distinct method of proceeding, which, in the end, will prevent the matter discharged into the sewers from becoming deposited upon their channels. I propose that all the secondary, or collateral sewers, those which branch out of the main lines, as also those which com-municate with and discharge their contents into these secondary lines, should be *strictly* examined and properly surveyed; the relative levels throughout each of these collateral dis-

tricts should also be carefully taken and laid down with a view to an improvement of their falls, and whenever improvement can be obtained, and whenever improvement can be obtained, either by a re-arrangement of them so as to dis-charge into each other by different directions if found possible, or by their present course, it should be effected by taking out (where found practicable, and this would arise in nine cases out of ten) the present wide and flat bottoms and of ten), the present wide and flat bottoms, and putting in others of a narrow, elliptical shape, at a lower level, or at a higher, as found requiat a lower level, or at a higher, as found requi-site, and atproper inclinations previously deter-mined on; and where the old sewers are found in a bad or dilapidated condition, the interior of them should be strongly and entirely cased with good sound brickwork, taking out the old bottoms as before mentioned, and cutting away half a brick in thickness on each side, making the form of the casing either that of an egg with the narrow end downwards; or with a semicircular bottom having upright sides and a semicircular arched crown; contracting the widths of the sewers by making the brickwork one brick thick at the sides and bottoms, and one orick thick at the sides and bottoms, and half brick thick at the crowns, the whole being properly underpinned and soundly executed with good hard stocks and hydraulic mortar, whose ingredients should be well compounded; and their junctions should be formed with a ounder the should be a lowner formed quadrant, whose radius should be as long as found convenient. It should be distinctly understood that no more work should be commenced until the sizes and falls of all the sewers have been determined on, and re-arranged according to a determined on, and re-arranged accusting to a regularly graduated scale, commencing at the lowest point of each collateral district, and following them up from time to time, either with new bottoms or casing, as they might require, until the whole of the sewers in the there is the sewers in the might require, until the whole of the sewers in each particular level were completed; they would then keep themselves clean, and be in a state of completeness and efficiency without either flushing or cleansing, the whole ex-penses of which would be saved: and I have no hesitation in saying that until either this be set about and done, or they be entirely rebuilt. set about and done, or they be entirely rebuilt, there are very many lines which will never be any other than elongated and filthy reservoir or cesspools, the matter in which will be con-tinually contaminating the atmosphere with its deleterious products. These great evils require immediate reparation, which should not be done piecemeal, but upon a well organized system of arrangement; and if the matter be taken up, as I trust it will, the cost of putting the whole of the badly formed sewers into a state of comparative efficiency could be as-certained without great difficulty. The practical operations of this mode of execution can be effected in a most expedi-tious and simple manner by the following process:—Shafts should be sunk over the sewers (say at from two to three hundred feet set about and done, or they be entirely rebuilt,

sewers (say at from two to three hundred feet apart) or the present ones used where found; agging of workmen would then commence digging out the old bottom, or cutting away the half brick at each of the side walls up to the half brick at each of the side walls up to the springing of the upper arch, the rubbish being taken a head up the nearest shaft; and thus the work could be prepared ready for the bricklayers, who would put in the new work as fast as the men beyond got it ready for them; the materials should be let down from the shaft next behind, and thus the two opera-tions would not interfere with each other Of tions would not interfere with each other. OF uons would not interfere with each other. Of the practicability of this proceeding there can be no doubt, and were it adopted it would be a vast saving of expense, besides, it could be done with more despatch than the ordinary process of opening the streets and blocking up the carriage ways to the prevention of the business of the public.

Now, in order to prevent the stench and effluvia, which under the present system most necessarily rise through the gullies and drains where these are untrapped, it is desirable to where these are untrapped, it is desirable to purify the air in the sewers themselves before it is allowed to escape into the streets, by dis-engaging from it, if possible, all the impure compounds with which it is charged. And of all the propositions which have yet been put forth for that purpose, I believe the following will be found to be not only the most effectual, but the most practicable also; and if I can succeed in shewing that it is so, I should think there will be no difficulty in obtaining sanction to an experiment for the purpose of testing its efficiency.

Decomposing substances emit foul gases, which, mixing with the atmosphere, contami-bigitized by 8

کسی ا

nate it with filthy rancorous products. Now, when pure clean water is made to shower upon or over those substances, it throws down, condenses, or disengages from the atmosphere the effluvia and stinking odours as they rise; and this is remarkably evinced during the time rain this is remarkably evinced during the time rain is falling, where there are lay-stalls, or where filth has been deposited, for the air at such places being loaded with foul odours, the showers or drops of water, as they fall, free the atmosphere of the deleterious and nause-ous compounds, making the air feel quite fresh. In the first place, *all* the drains and gulleys should be effectuelly transad and the guilleurs

should be effectually trapped, and the gulleys should be made entirely of cast-iron, with a strong moveable grating fitting in at the top of each of them, for the purpose of cleansing it out, having also a deep wide box at bottom, with a nozel formed at the outer side opposite the pavement for the water to flow through, and that side descending in the box to about one and a half or two inches below the bottom of the nozel, which should fit into a good strong Stourbridge clay pipe leading directly to the sewer, in the wall of which the pipe should have a circular elbow for the purpose of discharging the water in the direction of the stream flowing down the sewer. The discharg-ing ends of the drains should also be made in the same manner; their traps being placed in convenient and accessible situations, and always under special supervision, as, indeed, all drains ought to be, in the same manner as the sewers are. the pavement for the water to flow through, are.

Now, after all the gulleys and drains had been properly trapped, shafts should be formed over the sewers, about three or four feet long, and the same width as the sewers, and in such situations as found most convenient. These shafts should be made to taper regularly up-wards to about twelve inches wide and twentywards to about twelve inches wide and twenty-four inches long at top, on which a good strong, deep, cast-iron grating should be fixed, level with the carriage-way; or these shafts could be made of sufficient size to admit a man to descend and ascend through them, small stirrup irons being fixed in the brickwork. In the lon-gitudinal sides of the shaft, and just above the top of the crown of the sewer, I would have fixed, final with the wells two small estimates the sever. flush with the walls, two small cast-iron cisterns, finsh with the walls, two small cast-iron cisterns, one at each side; they should be about a foot high, two inches wide inside, and the same length as the shaft at this part. From the water-main in the street a small pipe should be Inid, communicating with the cisterns, the front faces of which should be perforated with one or more tiers of very small holes, about one-tenth of an inch diameter, inclining in an up-ward direction. ward direction.

Now, it is obvious that the cool fluid, while Now, it is obvious that the cool fluid, while flowing into the cisterns from the water main, would pass through the perforations in small streams or jets, and as they descend would atrike the opposite sides of the sewer just above the crown of the arch, and the sewer at this part should be built with good, hard, sound, and durable stocks, laid, and rendered inside with nearby all cement. These jets would inside with nearly all cement. These jets would appear from above like a series of thin bars, or a grating of water lying across the shaft, and they should be arranged so that there be from a quarter to half-an-inch space between each of them. These little streams of pure cold water would detach from the currents of air as they issued upwards from the sewer, the effluvia and foul gases with which they would be loaded, and thus the air escaping would be loaded, and thus the air escaping into the streets would be nearly purified of its deleterious contents by this simple process. From the jets being exceedingly small, the consumption of water at each shaft would be very little, and it would answer a further pur-pose of keeping the sewers free from deposits of matter; the water mains should always be charged, as probably in a few years they will be. Several modifications of this system present themselves, which experiment and practice would rectify. (To be continued.)

BATHS FOR THE WORKING CLASSES IN BATHS FOR THE WORKING CLASSES IN EDINBURGH.—A correspondent sends us the following statement: — "Some thousand pounds were some time ago subscribed for the above purpose, ground was purchased, and the foundation-stone laid with great cere-mony. The ground has now been sold, and all idea of the baths abandoned."—Scotsman. —[We should be glad to learn the cause of this proceeding.]

FOREIGN ARCHITECTURAL INTELLI-GENCE.

The "Archæological Society"—of Rome. This seems a year of epidemics with this sort of societies. That of Rome has been, of late, in a state bordering on disruption. The secretary, P. C. Visconti, had first become embroiled in a lawsuit, on account of some share broked in a lawsuit, on account of some share transactions for the acquisition of antiquities, and another antiquary of distinction, Mr. Achilles Genarelli, had received orders to de-cide thereon. As the judicial press of Rome is not under censorship, Mr. G. seasoned his dictum with some unpleasant phrases—as, in-deed, every one perceived, that Mr. Visconti has placed himself in such a position, that he must be dis-placed from the secretaryship. And has placed himself in such a position, that he must be dis-placed from the secretaryship. And then came a general medley, in which the president, cardinals, Prince Borghese, etc., are concerned—the details of which, however, cannot interest our readers. *The Dome of St. Peter.*—While the old basilica of St. Paul on the Ostia road, which had heen burnt down some years ago is deily

had been burnt down some years ago, is daily progressing in its restoration towards pristine beauty and grandeur—the signs of decay and deterioration in St. Peter's are becoming more visible and obvious. It is known, that in succession ten iron rings of the weight of 120,000lbs. had to be employed, to keep to-gether the huge cupola, which exhibited several cracks. Of late, it has also come to light, that the *lanternino*, under the ball of the cross, supported by thirty-two double columns and ornamented by sixteen candelabra — erected by dint of the gold of Spanish America, is full of fissures. It is impossible America, is full of histures. It is impossible to think, that lightning has caused this disaster, as this part of the building has been already protected by several conductors under Pius VII. It is rather to be supposed, that the weakening of the supporting columns of the cupola, which have been excavated by stair-cases and places for the reception of holy relice hes mainly brought on this demage relics, has mainly brought on this damage. Several hundreds of hands have been of late

Several hundreds of hands have been of late employed, to chain and fetter together the lanternino, and thus to prevent, if possible, a further spreading of the cracking. Influence of State's protection on Art in France.—The assistance which arts receive from Government in France is spreading its beneficial effects throughout the whole social fabrics collections increase movuments are fabric; collections increase, monuments are restored, amateurs afford occupation, and en-couragement to every talent. The liberality restored, amateurs afford occupation, and en-couragement to every talent. The liberality of the legislature is first to be adverted to. The secretary of state of the public *culte* has an annual item of one million and a half of francs for the preservation of churches, but last session two millions more were destined for the restoration of Notre Dame at Paris, and 600,000 francs for the building of a vestry, a small Gothic building, which has to be erected aside the old church. When Notre Dame was last viewed by a commission, it ap-peared that nothing had been done to it for the last two hundred years but to paste over the last two hundred years but to paste over the fissures and crevices with paper. The cham-bers also vote every year 600,000 francs for "the preservation of historical monuments," of

bers also vote every year 600,000 francs for "the preservation of historical monuments," of whatever kind or period they be. Last session however, the ministry had obtained two millions and a half for building a new front to the church of St. Ouen at Rouen, for restoring the chateaû of Blois, and the ancient amphi-theatre of Arles. Aside these great restora-tions, minor ones are equally attended to, and the churches of St. Germain l'Auxerois, St. Mery, and St. Germain, will receive large em-bellishments of paintings. The grand discoveries of Mr. Botta, at Niniveh, have been assigned by the king to the galleries of the Louvre, and on this occasion, the whole ground-floor adjoining the square, where Marochetti's statue of the Duke of Orleans is to be placed—has been laid out for a Greek museum, containing the sculptures of Sardes and Magnesia; an Egyptian, con-taining the monuments collected by Drovetti, and never before exhibited; to which the Assyrian, containing Botta's collection is to be added. The atteliers of the artists are becoming peopled by a crowd of well-instructed, zealous men. Many are employed by the Duke de Luyncs, who has the great saloon of his chateau near Versailles, called by the Duke de Luynes, who has the great saloon of his chateau near Versailles, called Dampierre, painted by Mr. Ingrés. The latest work ordered by his Grace is a correct imita-tion of the statue of Minerva of Phidias as it Nontrose, last week, sold eight thousand fine rate of 1s. 3d. per foot.

stood in the Parthenon. It will be executed by Mr. Linart in ivory and metal, and a model of clay is finished according to the description of Pausanias and the researches of M. de Luynes.

Pausanias and the researches of M, de Luynes. It will be seven feet high. The Queen's Subscription towards the Re-building of the Cathedral of Cologne.—Although the misconception which exists, it seems, on the Rhine, on this head, is very palpable, a few words may be said to set the matter at rest. A sovereign of Great Britain is not absolute, but restricted by constitutional laws and enactments—amongst which a fixed civil list is the most prominent. If we come to know, that the income of the King of Bavaria is one-fifth of the whole revenue of the realm— his Bavarian Majesty may certainly appear at is one-nyth of the whole revenue of the realm— his Bavarian Majesty may certainly appear at times proportionally liberal. In Austria and Russia there is not even the shadow of a regu-lation in this respect, and the sign manual of the autocrat may call forth millions from out of the autocrat may call forth millions from out of the caves of the treasury. Moreover, most of the Continental monarchs do a *little* business in the public funds, and there is not an Aus-trian archduke dying who does not leave twenty millions of florins, or thereabouts. All this is not the case here. The income of an English sovereign is fixed, while their liberality have to extend our an empire where the un has to extend over an empire where the sun never sets. The subscription of her Majesty the Queen, therefore, was such as it could have been, and as it ought to have been. Absolute monarchs give orders on their treasury, her Majesty gave out of her own pocket. Sapienti sat. J. L.

BALLE KHAL SUSPENSION BRIDGE.

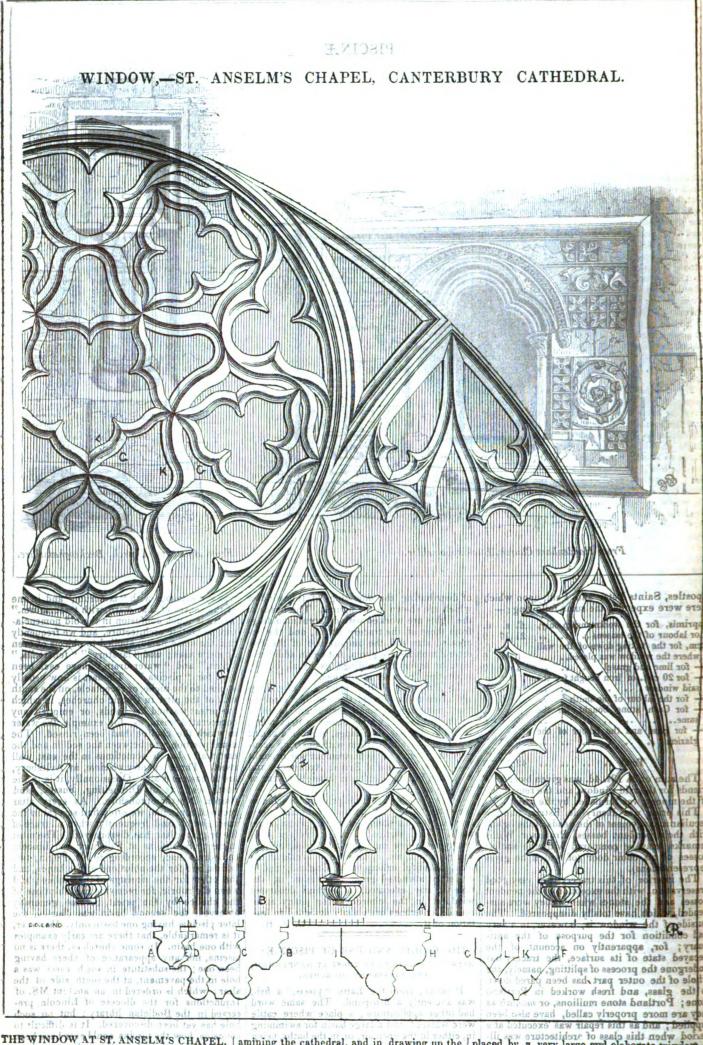

In our impression of the 30th of Augsut, we announced the fall of this bridge, which had just been erected about four miles from Caljust been erected about four miles from Cal-cutta. It consisted of a single curve of 250 feet span, with 18 feet of platform. The height of the points of suspension above the plank level, which was equal to the deflection of the chain, was 20 feet or $\frac{1}{y_{s}}$ the chord line nearly. The angle of suspension was therefore about 19° 51′. The platform was supported by two main chains, one on each side of the bridge, composed of links of round bar iron 1 3-eighths inch in diameter, and 10 feet long. There were 15 of these links resting on the towers at each point of suspension, and from thence at each joint the number was lessened one link till at the centre the sectional area of the chain was reduced to 2 was lessened one link till at the centre the sectional area of the chain was reduced to 2 bars 1-eighth inch in diameter. The oblique suspending rods depended from the chain at each joint in pairs, they were a quarter of an inch in diameter, and the angles at which they were attached to the platform varied from $67^{\circ} 42'$ to 10°, becoming more and more acute as they approached nearer the centre of the bridge. There were three pairs of these sus-pending rods at each point of suspension. the bridge. There were three pairs of these sus-pending rods at each point of suspension, which supported 23 feet of the roadway at each end of the bridge, taking the weight thereof immediately to the tower link without affecting the curve of the chains. Thus $250-23 \times 2 = 204$ feet = the length of platform supported by the chains. Those platform supported by the chains. Those who desire further information on the subject will do well to consult the Mechanics' Maga-zine, for October 19, 1844, which contains a detailed account illustrated by plans, sections, and elevations.

NEW BUILDINGS, LONDON DOCKS. — A substantial range of ten warehouses has been recently completed at the west end of the docks by Messrs. W. Cubitt and Co. They are 300 feet in length, 100 feet wide, and 68 feet high, and capable of stowing and working 120,000 chests of tea. There are five floors rising one above another: the roof five floors rising one above another; the roof of each is supported by strong cast-iron pillars, and each floor is divided into four rooms, well-lighted, and divided by thick walls and double iron doors, rendering the whole com-pletely fire-proof. The vaults below the tea warehouses are appropriated for the reception of wines.

THE NAPOLEON COLUMN AT BOULOGNE .-The Napoleon column at Bothooks.— The Napoleon column at Boulogne has just been terminated; the first stone was laid by Marshal Soult on the 9th November, 1804. PRICE OF LARCH WOOD.—The Duke of

The sum of 84. 138. 4d. was given by certain friends for the said window, and the remainder of the money was furnished by the prior." This prior was Henry de Estria, and the peculiar management of the heads of the lights, with their pendent bosses, Professor Willis remarks, may be compared with the similar bosses of his choir door (of which he gives representations).

representations). The interior of this tracery is in very good preservation, with the exception of the pendent bosses and the stones whence they were sus-pended, which have totally disappeared. The butside of the window is, however, in a very bad condition for the purpose of the anti-quary; for, apparently on account of the decayed state of its surface, the tracery has undergone the process of splitting, namely, the whole of the outer part has been pared down to the glass, and fresh worked in Portland stone; Portland stone mullions, or *monials* as they are more properly called, have also been supplied; and as this repair was executed at a portland stone in properly called, have also been period when this class of architecture was ill-understood, ³¹ the monifices are very badly wrought; which, in conjunction with the colour of the Portland stone, has given the window a of the Porland stone, has given the window a most ungenuine air. However, the interior is as good as ever it was, and it is on account of its date; as well as for its beauty, a most valuable examplesind

There are some peculiarities in the manner

of distributing the mouldings of this window which are shewn in the figures. The heads of the lights are worked with different mouldings from those of the tracery above, and the in-creased size and the importance of the two central moniple are sized. central monials are given, not by an additional layer or order of mouldings, as usual, but by separating the other mouldings." In Professor Willis' print the mouldings are given reduced from the outlines made by the gymegraph a small instrument invested

are given reduced from the outlines made by the cymagraph, a small instrument invented by the professor, which causes a steel point, running over the mouldings, to move a pencil point, and give their form with unerring accu-racy on paper. This instrument was brought before the Institute of British Architects, and described by the professor himself a year or two since. two since.

It may be added that the print of the window presented above is a portion of the head only, for the great advantage of giving it to a larger scale. The section of the mouldings is as nearly like those made by the cymagraph as can very well be. The window is one of the most beautiful examples in England, and it evidently attracted great admiration at the time it was executed, as several decorated windows in the churches for many miles round Canterbury are plainly designed in imitation of it. C. J. R.

THE ORIGIN AND USE OF PISCINÆ: WITH ILLUSTRATIONS OF THOSE AT HADDENHAM, AND AYLESBURY CHURCHES.

PISCINA, from the Latin "piscis," a fish, was anciently a fish-pond. The same word had other applications; a place where cattle were watered, and a large basin for swimming in, either in the open air, or in the baths, being likewise so denominated. The term has also been applied to the basin, near the court of So-lomon's temple, in which cattle was

was synonymous with "lavacrum," and, in one of the senses of that word, with "sacrarlum." There is much confusion in the old nomencla-There is much contusion in the old nomencia-ture of Gothic architecture, and we frequently find the same name, applied to objects of even opposite uses; and "havatory." "fenestella," "font," and "water drain," have each been used for "piscina." The last is now usually applied to the nicke, or receptacle, on the south side of the altar in Gothic churches, in which the price trached has hands, or emptide any the priest washed his hands, or emptied any consecrated waste, as, for example, the water in which the chalice had been rinsed. The usual position was between the sedilia and the usual position was between the sedilia and the east wall; but is sometimes in the east wall itself. Three chantry piscinae, at Aylesbury, are in eastern walls. Occasionally, it is in the north wall, as at Ditchelling, Sussex, and Castor, Northamptonshire. As every altar required a piscina, we *often* find several in the same church, and, frequently, when all trace of the original altar has disappeared. The most ancient piscinae, as at Salisbury and Lincoln cathedrals, had, according to Mr. Pugin, two basins, one for the ablutions of the chalice: and the other for the rinsings of the chalice; and the other for the rinsings of the enance; and when the rubric, for receiving the ablutions of the chalice by the priest, became generally observed, the second basin was disused, the later piscing having one basin only. However, it is remarkable, that there are early examples with one basin. In some church es, there is no piscina, nor any appearance of there having been one; the substitute in such cases was a hole in the payment, at the south side of the hole in the pavement, at the south side of the altar; which is ordered in an ancient MS. of Injunctions for the diocese of Lincoln, preserved in the Bodleian library; but no such hole has yet been discovered. It is difficult to were watered, and a large basin for swimming in, either in the open air, or in the baths, being likewise so denominated. The term has also been applied to the basin, near the court of So-lomon's temple, in which cattle were washed previous to the sacrifice; and Mr. Britton (Dictionary of the Architecture and Archaeology of the Middle Ages), says, that the basin, which contained the water in a baptistry, was also formerly called a piscina. In later times, it

washed, the carrying off of water, rather than the supply, being the object in the piscina, the bowl of which, in deed, is hardly large enough for any other use. "Piscina," and "lavacrum" are used, as

synonymous, by Durandus; but the latter word synonymous, by Durandus; but the latter word is sometimes applied to a basin for washing of any kind; as in the inventories of Finchale, in 1354-5, and in 1411, printed in the "Monasticon Anglicanum." "Lavatory" is more commonly used for the trough, or basin, in which the hands and facewere washed, examples of which remain at York, Salisbury, and Durham, but is used for the piscina, in the contract for Catterick Church, and in the catalogue of furniture for the royal chapel at Eltham, 6th Henry VIII. "Sacrarium" is the term used by Mr. Pugin; "Sacrarium" is the term used by Mr. Fugin; it formerly signified a receptacle for any thing sacred, as "sacrarium piscinæ," "sacrarium baptisterii," and applied frequently to an apart-ment, or sacristy. "Water-drain," was used by Mr. Rickman, as well for the drain, as the niche, which contained it. "Fenestella," the Letin word for a little surveyork Latin word for a little window, was formerly, and, by the Cambridge Camden Society, is now applied to the recess, or niche, in which the basin was usually contained, "piscina" being retained for the last-mentioned. To our previous mention of the term "font," we may add, that it is adopted by Du Cange. Though the custom of washing the hands, before the communion, was one of very high antiquity, piscinæ are not often found of earlier date, than the thirteenth century. Norman piscinæ, where they do occur, are of the rudest form : there are two at Romsey Church, Hants, and one in the crypt of Gloucester Cathedral. Piscinæ are found in every imaginable form; the most common is that of a recess,

about a foot in width, with foliated head, ogee, crocketted, or otherwise; with a basin at the bottom, six or seven inches in breadth, with a drain leading into the ground. Piscinæ with round trefoiled heads were not uncommon, at the beginning of the thirteenth century, and they are found at Haddenham, St. Lawrence's Church, Ramsgate, and Coggeshall, Essex : about 1250, they were superseded by the pointed trefoil. At Long Wittenham Church, Berks, is a very remarkable piscina, illustrated in the Archæological Journal, vol. ii. p. 134: it is of a trefoiled form, with a small cross-legged figure in armour, lying along the front of it, on the edge, with the basin at the back: in the head of the piscina are two angels, as if hovering over the figure below.—There is generally a shelf of stone, or wood, across the middle of the fenestella, and sometimes a recess, running inwards, on one or both sides, which the use is unknown. At Christ Church, Hants, there is a niche in the interior. Church, Hants, there is a niche in the interior. Thepiscina at Jesus College Chapel, Cambridge, of transition character, probably of the date A.D. 1200, has a central shaft, two basins at half the height of the shaft, and intersecting arches; the whole inclosed within a square border. The piscina at Rothwell Church, Neutrophysica is tight a computer Northamptonshire, is triple, a very unusual form. Some piscine have no recess or fenestella, but project on brackets, others are half projecting. The recess at Hexham Church, Northumberland (A.D. 1200), is a simple, trefoiled arch-head: some have rich canopies, with pinnacles; others are supported upon a shaft, as in the example from Aylesbury. A piscina at Stoke Golding Church, Leicestershire, has two bowls in the same niche, and the large piscina in Tiltey Church, Essex, has one basin octangular, and the other circular. Two of the most remarkable examples are those at St. Alban's Abbey, and Cobham Church, Kent; the former is of early date, but enriched, and occupying a large space; the latter, of perpendicular date, is very elaborate. "The orifices of Early English piscine," says the "Few Hints on the Practical Study of Ecclesiastical Antiquities" of the Cambridge Ecclesiastical Antiquities or the Camorage Camden Society, "are generally either shallow and circular, or deep and reversed pyramidal," The the piscina from Aylesbury. "In Decoas in the piscina from Aylesbury. "In Deco-rated, they are four-foiled, five-foiled, &c., up to seventeen-foiled ; which last is very unusual, but occurs in Ardingley Church, Sussex. Other forms are square, semicircular, eight-foiled within a raised rin, covered with a pierced flower, or with a dog or lion keeping guard over the orifice."

The use of the shelf, before-mentioned, is not known with certainty. When it is of large size, it may have formed the Table of

Prothesis, or Credence, on which the elements were deposited previous to their oblation; but, it is usually much too small for this purpose, and the credence table was generally placed on there is this quotation :---" Farva campanula, ampullæ, &c., in fenestella, seu parva mensa ad hac preparata"-- "Missale Romanum" -- which might lead to the belief, that the oil and the bread and wine occupied the same place. At Aylesbury Church, in a chapel attached to the north aisle of the nave, is a piscina with a shelf across the middle, and a smaller shelf above that. We are not aware that this peculiarity has been noticed. In the same church, near the piscina, now illustrated, is a second, but of different form : there is also a niche.

The piscina at Haddenham Church, Buckinghamshire, which forms the subject of one our illustrations, is a singular example, and has the appearance of being composed from pieces of some other work. It has a roundheaded trefoiled arch, with the dog-tooth en-richment, and may be considered as early English-the style of the thirteenth century. The several leaves are very well executed, but the whole has suffered from neglect, and half its beauty is concealed by green mould, and whitewash. There is no appearance of a basin, but this is probably shallow, and filled up with the whitewash, or cement, which is remained on the bottom. The piscina stands in the south wall of a chapel, which is on the north side of the chancel; and it is the only part of the original chapel, which has been preserved, the present one being of late date. The church itself is a small edifice, near the road from Aylesbury to Thame, about seven miles from the former place. It appears to miles from the former place. It appears to have been commenced about the year 1200. The font is of decided Norman character; it is circular upon an octagonal base, and has some grotesque carving. The church has had many alterations during the fourteenth, fifteenth, and sixteenth centuries, but the main building belongs to the early part of the thirteenth. It contains one or two small brasses, a rood screen, parcloses, and open benches of late date. The latter are curious; being placed far apart, and having two seats in each compartment, so that the faces of some of their occupants would not be towards the east. The tower is square, and finished with a plain parapet; the Early English arcade, which surrounds it, at the belfry, is of excellent character, and has been engraved in the Glossary of Architecture. There was formerly a chapel, or aisle, on the south side of the chancel; the arch and responds, corresponding with those on the north side, being built into the wall.

St. Mary's Aylesbury, is a large cross church, with aisles, and north and south chapels to the nave, with which they are now united. The tower is at the intersection, and is ascended by a turret stair, at the north-east angle; the stairs commencing on the west side of transept. There were eastern aisles to the transepts; that on the south has given place to a school-room in a late style, and that on the north, to a sacristy, and room adjoining. The arches, by which the transepts communicated with the aisles, are now remaining, they are early English, the original style of the building, of the best character, and have lately taken part in the general restoration, which at the time of our visit, the church was undergoing, under the superintendence of Mr. Plowman, of Oxford. Several of these arches are built into the walls, and the church had greatly suffered from the defective construc-tion of the tower; one of the piers of the nave had been thrust out of the perpendicular, in an alarming degree, and enormous, and unsightly counteriorts had been built up, at different times, to prevent the falling of the tower. The roofs of the transepts are of timber, with rich tracery, but those of the chancel, and nave, were concealed by modern lath and plaster ceilings. These were jointed, and coloured in imitation of stone by the parish plasterer; whose merits seemed to have made some impression upon our cicerone, the clerk.

* "A Few Hints," & c., &c.

The old benches may be seen, amongst the modern pewing, and also a few panels from the roodscreen, with figures painted upon them. There is a fine door to the south transept, perpendicular, enriched with panelling between the label and the four-centred arch, as in the example at Witney, Oxfordshire, figured in the last edition of "Bloxam's Go-thic Architecture." The west door is early The west door is early English, with shafts, and a trefoil headed arch on each side; and it is singular, that, in each arch, the capital, which is farthest from the door, is raised above the level of the other. A good early decorated monument is in the north transept. There is a piscina in each of the chapels of the nave, and two in the morth transept, one of them being that now en-graved. The font is a remarkably fine one, circular upon a square base, of Norman cha-racter, of beautiful form, and highly enriched in the double cable, which surrounds the stem, and the channelling of the bowl. When we saw it, it stood in the north transept, but, probably, once stood at the west end, where a modern one had usurped its place. It would well repay a journey to see it. The piscina well repay a journey to see it. The piscina above is in the east wall, and is in the style of the transition from early English to Deco-rated. The shaft is clustered and elegant; it stands in a recess :- the fenestella is square, and recessed in a greater degree; and the basin is souare.

The churches of Buckinghamshire merit an attentive examination; in the neighbourhood of Avlesbury, they are numerous, and many of them have the old seats, and other many of them nave original features remaining. RDWABD HAIL.

TOMB-STONES AND EPITAPHS.

In a lecture on ancient and modern burial rites, recently delivered by the Rev. Joshua Fawcett, M.A., at Bradford, the lecturer made the following remarks on monuments and epitaphs :-

"Spon, whose pursuits as an antiquary, joined to his character as a Christian, well qualified him for his ecclesiastical researches, observes, 'that if the doctrine of purgatory was any where to be found, it would be particularly in the epitaphs of the early Christians. But a the ancient epitaphs you never read, before the 7th or Sth century, ' Pray for him,' nor even so much as ' Requisecat in pace,' now so often and which is nothing more than an expression of our wish, as to the state of the deceased. or our wish, as to the state of the deceased. In the early records of the pions dead, we read only, with the dates of their death, 'Obiti in pace,' 'Depositus est in pace,' 'Quiescit in pace,' 'Obiti in somnum pacis,' 'Acceptus est apsed Deum;' i. e. 'He departed in peace,' 'He is laid here in peace,' 'He rests in peace,' 'He departed into the sleep of peace,' 'He is ac-cepted of God.' In addition to this simple in-scrintion there were merely the initial letters scription there were merely the initial letters of the deceased's name.

Unhappily, we live in times when the reverse of all this is the rule. No one can frequent the sleeping-places of the dead without being painfully struck with the extreme impropriety alike of monumental erections, and monumental inscriptions.

The general tone of monumental inscriptions should be characterised by Christian humility, kindness, and by a disposition to say too little rather than too much.

Unfortunately, the choice of inscriptions is too often left with the stonemason, who, fur-nished with a small strock of trite and everyday verses, supplies according to his own taste the wished-for eulogy.

Independent of the right which the clergyman has, of admitting or rejecting any monumental inscription, it is always best to submit to his judgment any tribute of respect which it may be thought desirable to erect and engrave, as by this means any error in diction or in doctrine may be avoided.

1

The same author already quoted, observes upon the folly and absurdity of making the stonemason the reference in the want of a suitable epitaph : "And now, suppose the customer requires a few lines of poetry, and is no poet himself, the complaisant stonemsson obviates the difficulty at once. It has a book full of epitaphs; and one of these-grammar, spell-ing, and all-is, in a few weeks, transferred Digitized by

'Afflictions sore, long time I bore,

- Physickiones was in vain ;
- 'Till God did please, from deth to seize, And case my of my pain.

Or some one of these :-

- A time of death there is, you know full well, But when, or how, no mortal man can tell; Be it at night, noon, now, or then, Death is most certain, but uncertain when."
- "And thus it is with man's frail clay; His life. at best, a round of sorrow; For he who rises well to-day, May be a corpse before to-morrow.'
- ' I've lost the comfort of my life. Death came, and took away my wife : And now I don't know what to do, Lest death should come, and take me too."
- As I am now, so shalt thou be, Therefore, prepare to follow me. God takes the good, too good on earth to stay, And leaves the bad, too bad to take away.'
- "He lived and died a true Christian, He loved his friends, and hated his enemies."
- · Here lie I beside the door. Here lie I because I am poor, Further in the more they pay,
- Here lie I as well as they.
- The following is found in Wibsey chapelyard. It is an epitaph on a blacksmith :-
 - "My stithy and hammer I declined. My bellows too have lost their winde; The fire's extinguished, and my forge decayed,
 - And in the dust my vice is laid, My coal is spent, my iron is gone, My last nail 's driven, my work is done.'

From Matherne churchyard :---

"Here lies John Lee, that good old man, e ne'er shall see him more ; He us'd to wear a snuff brown coat, All buttoned up before.

Now all this, and manifold worse than this, which almost every churchvard bears witness to, may be avoided by a simple reference to the judgment of the clergyman, who would in all cases gladly give every assistance in his power either to correct the epitaph proposed, or to supply its place with one more suitable.

In Wibsey burial-yard there is, however, a very beautiful contrast in the following sententions inscription :--

| Here lies A piece of Christ, A star in dust, A vien of gold, A china dish, That must Be used In Heaven, When God | |
|--|--|
| In Heaven, | |
| When God | |
| Shall feast | |
| The just. | |
| | |

There is an absurd fashion lately sprung up of mingling Latin words with English inscriptions; as in the following epitaph :---

Here lie the remains of

P. Q.,

Late of this parish. Obit May 1, 1820. Ætatis suæ 65. Having been schoolmaster of this place for thirtytive years.

But the most ridiculous instance of this affectation is the following. It appears that a Latin epitaph was required, but a rhyme, or a jingle of sound, was deemed indispensable. Accordingly, the words 'Requiescat in pace,' having been chosen, the letter-cutter, in order to effect the latter object, modified them thus-

' Requiesce Cat In Pace."

The folly and ignorance of this needs no comment.

In a small work, entitled, 'A Tract upon Tombstones,' the following pertinent remarks appear ---- 'There remains one more offence against propriety and good taste which is very common on gravestones, and which I will therefore mention. I allude to the ornaments which are usually introduced in low relief, above the inscription ; and these consist chiefly of cherubs, doves, scythes and hour-glasses, mattocks and shorels, skulls and cross bones, urns, and reversed or extinguished torches.

I suppose there are persons who admire those conventional forms of ugliness (cherubs), with puffy faces of pink and white, black (often squinting) eyes, gilt hair and wings, which are intended as representations of one order of the holy angels. Certainly, if tawdriness of colour can attract, these things look smart enough when they come out of the stonemason's yard; but let a few months pass, and what a change has taken place! The summer's sun has faded the red of the cheeks, and the damps of autumn have covered, perhaps, one-half of the face with a mouldy green, so that the re-mains of its former brilliancy only make this ugly representation still more hideous. I do not say that a sculptured angel, keeping watch, as it were, over a tomb, would not be an ap-propriate emblem there, but cherubs, as they are commonly represented, would be much better omitted; for the work is so ill executed.

crous than solemn. In some places, a *dove* with extended wings is more common than cherubs at the top of a head-stone. If this is meant as an allusion to the Holy Spirit, I think that a more inappropriate place could hardly have been fixed upon ; for when a person has ceased to live, the means of grace are ended, and the Holy Spirit no longer strives with man. Perhaps, however, it will be said, that the dove is an emblem of the deceased person's innocence. Alas! such a symbol is unfit for even the best of us.

that the ideas suggested by it are rather ludi-

I remember seeing this ornament sculptured on the tomb of a man who had been a marketgardener. The bird was represented as hovering, with outstretched wings, the tail raised, and head downwards; but the design was very coarsely executed; the neck looked like the stalk of a plant, the spreading tail like long narrow leaves, the oval body (which was gilt) being marked over with indentations, the poor man's neighbours took it into their heads that his tomb was ornamented with a flying pineapple-of course an allusion to the profession of the deceased.

Scythes and hour-glasses, mattocks and shovels, skulls and cross-bones, being frequently intermingled, and placed, as it were, in a group, at the head of a grave-stone, may be classed together, and one condemnation passed on them all. It is not that they are unmeaning, or that their meaning is objectionable, but they are mere symbols, and not very imposing symbols, while the grave itself, over which they stand, is a stern, and awful and striking reality, awaking far more solemn thoughts than these mere types of mortality can do. Besides, they are altogether defective in inspiring the thought with which the view of a grave should always be attended; the thought, namely, of that which lies beyond the grave, and of the time when death shall be swallowed up in victory. Scythes, and skulls, and spades, might be appropriate enough for a heathen, but a Christian wants something more.

Having stated what is objectionable, it is only right we should state what is not. 'There is one emblem, perfectly unobjectionable, per-fectly appropriate, full of solemnity, full of consolation; which raises hope and dries the tear, and turns mourning into gratitude; which, while it reminds us that we are sinners, reminds us of the means of pardon; which, while it shews us the penalty of sin, and thereby humbles us to the dust, at the same time cheers us with the thought of Him who paid the penalty; who rose triumphant from the grave; who is the resurrection and the life; who will change our vile bodics, and raise them from the dust; who hath hallowed the grave and gate of death into the passage of immortality; and who, having himself overcome the sharp-ness of death, hath opened the kingdom of heaven to all believers. That emblem, I need

neaven to all believers. I hat enforcem, I need scarcely say, is the cross.' The following directions, extracted from 'Origines Genealogicæ,' by Stacey Grimaldi, F.S.A., will afford some slight guide by which the date of on project measurements much be scare the date of an ancient monument may be ascertained when its legend can no longer be deciphered :-

Tenth and Eleventh Centuries .- The coffinlid in the form of a prism, the better to shoot off the wet, because the bottom part of the stone coffin lay on the ground. In armour, the rustred, ringed, trellised, tegulated, mascled, and edge-ringed, obtained use. *Twelfth Century*—Coffin-lids improved or

welfile Century .- Coffin-lids improved, or distinguished with crosses; at first plain, then

fleury, in bas-relief. Tables, whereon effigies or sculpture. Priests had chalices in their or sculpture. Priests had chalices in their hands on their breast; prelates had mitree, erosiers, great crosses, and pontifical habits; knights had arms, spurs, and swords. The armour was in the preceding century. No coats of arms, on shields, or otherwise, occur prior to this century. The earliest known in England are those of Geoffrey Magnaville, Farl of Fraze buried in the Tenule Church. Earl of Esser, buried in the Temple Church, in the year A.D. 1164.

Thirteenth Century .- Com-stones, with heads or bodies emerging from them, and placed in walls, with arches turned over them. The first brass statue, that of Henry III. Lombardic capitals became general on tombstones. The first table monument is that of King John, in Worcester Cathedral, who died A.D. 1216; and the fashion lasted until the reign of James I. French epitaphs occur. The oldest instance of a skeleton monument is A.D. 1214. Cross-legged figures are between A.D. 1224 and A.D. 1313. They imply crusaders, or that the party had vowed to take the journey. The armour is complete mail, with only knee-pieces of plate. Fourteenth Century.-Lombardic capitals on

tombstones not used after A.p. 1361. The text, or old English hand, succeeded, and continued till the reign of Elizabeth. The inscriptions were engraven on brass, and the words abbreviated. The armour is a mixture of mail and plate, but mostly mail. Coats of arms were not quartered by subjects until this century: John Hastings, earl of Pembroke, was the first. Supporters to arms first occur, being used by Richard II. Coronets first appear: the in-stance is John of Eltham, who died A.D. 1334.

Fiftcenth Century.—Burials in chapels in-troduced. In armour, from A.D. 1400, all plate but the gorget: in A.D. 1416 all plate occurs. Henry V. was the first who bore three fleurde-lis, instead of semee. Sixteenth Century.-Inlaid with brass, altar

monuments at the beginning of this century. Monuments against the wall, chiefly since the reformation. Roman round-hand took place about the end of the reign of Henry VIII. 'Orate pro anima' was discontinued on monuments at the Reformation: Catholics (Roman) have only used it since. The first deviation from the Gothic forms of tombs is the monument of Lord Danley's mother, who died A.D. 1578. Skeletons in shrouds succeeded, and were imitated by corpses in shrouds, tied head and foot. Figures supported their heads on their right hands, an attitude taken from the Greek and Roman monuments. A kneeling attitude for children takes date not till after the Reformation; nor for parents, except to the cross; nor the infant in swaddling clothes, nor cradle.

Seventeenth Century .- The latest date o. animals at the feet is A.D. 1645. Cumbent figures occur till A.D. 1676.*

AN ARCHITECTURAL FRAGMENT.

THE dark and gloomy religion of Osiris and Isis, stigmatized by Gibbon as the most degrading form of superstition, accords with the style of their temples. It is noticeable that the Egyptians lavished ornament mostly on the interior, leaving the exterior compara-tively bare and plain, contrary to the general practice of the Greeks. The Tombs of the Kings will remain for ages to come monuments of those who built them : in their exterior no exquisite proportions, no careful adjustment of means to end meet the eye, the majority con-sist of a mass of hewn stones with just so much evidence of design as to shew that they were built by some mighty potentate. Not so the interior: radiant with beauty, uncon-taminated by the tread or the touch of the mob, it was perhaps designed to shew to the esoterica the splendour of art, the refinement of the entombed monarch : the paintings pro-bably represented his acts, his wars, his triumphs, perhaps the history of his whole life. It illustrates well the singular difference which was always maintained between the vulgar and the initiated, and which Pythagoras introduced into Greece. This distinction, which existed in the time of Aristotle, no doubt extended in Egypt further than religion and philosophy, as all learning was in the

hands of the priests, who assiduously laboured to create a reverence among the people by enveloping learning in mystery, and by continually employing certain mystic symbols or particular attitudes which they deemed it impious to depart from. This may account for the similarity in form and attitude that is observable in their statues???some great statue was perhaps chosen as a prototype, and considered the altimatum of art. It would weaken the popular reverence for the deity, or rather for the priests, if any other attitude was adopted; the one particular form having become intimately associated with the idea it embodied.

in their statues: some great statue was perhaps chosen as a prototype, and considered the ultimatum of art. It would weaken the popular reverence for the deity, or rather for the priests, if any other attitude was adopted; the one particular form having become intimately associated with the idea it embodied. In the pure simplicity, the unaffected grandeur, the bold nervousness of the early Greek writers we recognize the style of thinking, if I may so speak, that originated the Dorie order. In the more ornate refinement of the Ionic we recognize the influence of Asiatic luxury upon the susceptible temperament of the Attican colonists; and by the energy or rather vagrancy of thought that characterizes their temples, we are prompted to remember that restlessness and love of novelty that caused their emigration under Androculus and Nileus.

their emigration under Androculus and Nileus. When we examine Gothic structures, our minds revert at once to those times when the spirit of chiralry was at its height, when love and battle, revenge and heroism, were the pleasure and business of mankind,—when the power of the barons was high, that of the king feeble; when society was in endless commotion and a vindictive and martial nobility oppressed the people without compassion. What do we not owe to the soothing and gentle influence of religion, that restrained the impetuous, emboldened the timid, and harmonized, in some degree, a discordant and conflicting mass of anarchy and misrule. In these calculating days we scoff at "the supine indolence with its attendant profound ignorance of the clergy of the "dark ages," forgetting that the great churches built in those unenlightened times stand imperishable monuments of the falschood of their statements, and that at present, far from excelling, we are able only in some degree to imitate the labours of these "barbarians."

unenlightened times stand imperishable monuments of the falsehood of their statements, and that at present, far from excelling, we are able only in some degree to imitate the labours of these "barbarians." Medieval architecture is the type of the medieval ages. Gaze at the old cathedrals, dilapidated as they are by the rude hand of the Puritans, the tastelessness of the revivalists, and the abrading influence of time. The lofty windows, decorated with the most beantiful ramifications of tracery, and radiant with the most resplendent bues; the solemn, chequered, gloomy light, diffused around; the interminable length of the vistas; the lofty proportions; the scientific skill shewn in supporting and balancing the strains; the numerous intersections and complexity of the groining; the lengthened shalows produced by the deeply cut mouldings; the carefully and accurately worked ornaments, with the artistic skill with which they are copied from nature;—all these particulars together, agree in making what may be called the romantic style of architecture. The solemn devotional spirit that breathes, through the whole of the edifice, that takes the beholder out of himself; the deep feelings with which you approach the place, sanctified by ages and as the resting place of the bones of your forefathers, and compare the nuble spirit that inspired men to make such sacrifices of money and time in those days, with that ostentatious, half-mock spirit that prompts men to indulge in feasting and dancing under the specious but flimsy mask of charity. David Hume remarks* that overloaded or-

David Hume remarks* that overloaded ornaments, fantastic conceits, &c., are neverfound in the works of the early Greek writers, but that as taste degenerated, they gradually crept in, until at last they completely vitiated and infected all compositions. He then goes on to say, "On the revival of letters, when the judgment of the public is yet raw and unformed, this false glitter catches the eye and leaves no room either in eloquence or poetry for the durable beauties of solid sense and lively passions. The reigning genius is then diametrically opposite to that which prevails on the first origin of the arts." He then criticises the writers of the Elizabethan age, and condemns "the glaring figures of discourse, the pointed antithesis, the unnatural

conceit, the jingle of words," that they so much abound with. These irregularities accord with the prevailing features of those mixtures of Gothic and Italian that are called Elizabethan and Rennaissance, in which occur the unnatural and strained images of birds and beasts—stiff and twisted forms of scroll, work; and we perhaps admire the good qualities of these styles the more, for the same reason that Hume supposes we overrate Shakspear's genius, because "bodies appear more gigantic on account of their being disproportioned and misshapen." H, J. L.

THE SMOKE NUISANCE.

MR. EDITOR,-As you were kind enough to give insertion to my observations on the subject of sewage nuisances, I am tempted again to offer a few remarks on another more palpable class of nuisance, one which you have I refer to the "Smoke Nuisance," which how-ever I should rather term "The Fuel Wasting Nuisance," for a wasteful and inconsiderate expenditure of coal &c., is, in fact, the actual cause of (nearly) the whole nuisance. Having a short time since in my ramblings, met with what appeared to me a simple and reasonable, and as I was then assured, a certain expedient for the consumption of smoke, I venture to lay the same before your readers, or I should rather say, smoke consumers (for such we all are and no thanks for the liberal supply on all occasions!) in the hope that all may be benefitted thereby, and those who should feel more immediately interested, profitably instructed. Every person who is acquainted with steam machinery is fully aware in how short a time a load of coals is emancipated. The plan I have adverted to is simply this:-In front of the or-dinary furnace (which is more convenient underground), is brought out a second or extended floor of the furnace; over this extension or second furnace, an arch is turned; this arch is provided with a ring or aperture which this second or outer furby means of nace is supplied, and which, in fact, forms the floor of the coal depôt or store. The fire is lighted in the ordinary manner in this outer furnace, after which portions of the fire are moved on to the main furnace until it is sufficiently supplied. A tolerably good fire being obtained, the front furnace is now supplied from time to time with fresh fuel, the smoke from which of necessity passes towards the inner furnace and is in its passage over an extended body of fire, almost entirely consumed; any addition to the furnace in the way of substantial fuel is of course made by moving on the burnt coal from the front furnace, and thus the furnace may be said to be fed con-jointly with coke and the smoke arising from the manufacture thereof.

I believe I am correct in stating that the above process is more than sufficient for the work of the furnace itself, and is profitably employed in making coke for general purposes. I tender you these few unconsidered trifles, conceiving that any information having a beneficial tendency, will not be quite unacceptable to your readers, or without some good effect to the community at large.

I am, Sir, &c. Συνεργος.

Relative to this matter, our attention has been directed by various correspondents at different times, to the greatly increasing nuisance produced by the smoke from the steam-vessels on the Thames, which now extends far beyond the banks of the river, and causes great loss to traders in addition to annoyance to all. Some steps should be taken immediately to compel the owners of these vessels to use means to prevent the nuisance complained of. We extract the following remarks on this subject from the *Times*:—

"The great increase of this nuisance within, comparatively, a short time, cannot fail to have struck almost every person; and the vast increase in the number of steam-vessels on the river is daily adding to the evil. But it is not only from the greater number of these vessels that this nuisance has so much extended; a large proportion of it arises from the cupidity of the owners, which has tempted them to discontinue the use of those descriptions of coal which can be burned without causing smoke, and substituting in their stead

the commonest and cheapest description of fuel. Many of the steamers plying above London-bridge were formerly in the habit of using the better descriptions of. Welch coal; but the smoke fram most of the steamers now issues from their funnels in dense black clouds, darkening the atmosphere for miles up the river, and injuring the vegetation to a vast extent.

river, and injuring the vegetation to a vasc extent. If this were an evil which admitted of no remedy, without interfering with the import-ant facilities of transport afforded by steam-vessels, the case might assume a very dif-ferent complexion. But it admits not of a question that remedies may be applied without the slightest inconvenience or impediment; and those remedies mast be enforced, what-ever opposition may be made to them. It is not considered any hardship upon railway companies to compel them, by a clause in their Acts of Parliament, to burn a descrip-tion of fuel in their engines which shall not emit smoke; and if railway engines, passing tion of fuel in their engines, which shall not emit smoke; and if railway engines, passing through open and uninhabited parts of the country, are required by law to be supplied with smokeless fuel, much more ought steam-ressels to be equally restricted, when nav-gating a river like the Thames, the banks of which are densely populated in every part where steamers ply. The increased expense of fuel of this description is no valid argument against such a restriction. The question of expense is not allowed to weigh against the advantages to the community in the case of railway companies, and it ought not in that of river-going steam-vessels. Nor is the addi-tional expense of such fuel of much moment. The loss which occurs in the present mode of burning coal in all ordinary steam-ressels is immense. It has been estimated to exceed in many cases 40 per cent; the whole of which would be saved by using coke, or the best de-scriptions of Welch coal, that burn without smoke : and it is even considered by many competent and scientific men that economy would be promoted by the use of a better de-scription of fuel, and by employing improved methods of combustion. Without deciding on the relative merits of the numerous riud invertions for consuming or preventing smoke, and even putting out of the question the posemit smoke; and if railway engines, passing through open and uninhabited parts of the on the relative merits of the numerous rich inventions for consuming or preventing smoke, and even putting out of the question the pos-sibility of applying these inventions, at all in the cramped and contracted furnaces of steam-vessels, we know that the smoke from these furnaces can be prevented by mine atthe vessels, we know that the smoke from these furnaces can be prevented, by using either coke or some of the numerous kinds of an-thracite coal; and if steamers were prohibited from plying on the river unless their furnaces were constructed to consume the smoke, or the fuel used were of that description which emits no smoke, the owners would very soon discover both the best fuel as well as the best method of burning it,"ad word has the orthogon cate and in know

APPLICATION BY GOVERNMENT OF NAS-MYTH'S STEAM PILE DRIVER - This powerful engine, which is working such mighty changes in the cost and construction of works where piles are necessary, is now being patronised by Government. Mr. Nismyth has been by order of the Lords of the Admiralty to Deptford Dock to choose a place fit for the erection of one of a large size; the driving head to weigh 12} tons, and capable of giving from seventy to eighty strokes per minute; yet, so completely is this ponderous machine under the command of the engineer, that he can so regulate it that it should take a dozen taps to crack a nut, and then not crush the kernel! It is intended also to have Nasmyth's direct action steam-hammer, which is on the same principle, at all the Government dockyards, of different sizes suitable for large anchor work, and the smaller works of the smithery. Mr. Baker, who is superintending the marine works at Devonport, has had a Nasmyth's pile driver erected, by which the whole of the piles necessary will be driven in three months, which, by the old system, would have taken three years.-Mining Journal.

^{*} History of England, Appendix to the reign of James I.

THE INTELLECTUAL IMPROVEMENT OF OUR OPERATIVES

Sin, - In your excellent journal, THE BULDER, of the 27th instant, you have given a most valuable article on the improvement of most valuable article on the improvement of the intellectual condition of our artisans. If the subject matter were carried fully out, and which I trust it will be bereather, the greatest possible good would be done to that most im-portant class — the operatives of this country. There is no doubt but you have bit one of the right nails on the head, and that competition, unless subjected to a wise and salitary scratiny. is, from the seeds of mischlef contained within its system, likely to overspread and choke up the intellectual energies of our artisans. But let us endeavour to discover wherein this evil lies. For why should architects and builders lies. For why should architects and builders feel it necessary to compete, and be induced to give the work to be executed by those who have sent in the lowest price? There may be more sent in the lowest price? There may be more reasons than one for this proceeding, but the one is very certain, and that is, the ignorance and narrow-mindedness on the part of certain em-ployers; and the want of that appeal from the architects and builders to the employed, to warn them of the mischief so likely to ensue warn them of the mischief so likely to ensue from that grinding down to the very lowest price per inch, and the screwing system of aplitting faithings, in order to get the building reared for the sum proposed to be expended or subscribed—caring very little for its instability, its deformities and its inconsistencies; for as long as it appears to stand, the proprietors are satisfied with the result of their bargain.

There' is no doubt bat the strehitects and buildefs could cut this evil ; it only requires thilders civild evite this evil; it only requires the putting 'of their shoulders to the wheel, and the cure would a coordingly come. And as you justly "remark - To workmen we would say, pat your own shoulders to the wheel, become masters of your trade-artisans, not mere labourers - artists if you can, able to give a "because" for a "why, --make your work your pleasure. An upright man who will do this, cannot fail to rise, and better still, will pass a more useful and happier life." Indeed, the whole article is so true, and so match to the purpose, that I would advise all the bilders, and the operatives, to read, learn, and inwardty digest the matter contained therein, and they would soon ascertain how essentially inwarory ingest the inster contained therein, and they would sour ascertain how essentially necessity of is that each of them should take the bull by the horns, to free themselves from the migending danger.

is a most important one, and deserving of our burgement ; but the present state of things is wainst that the our me present state of things is wainst that the our present to which they allow them think to think before they execute, nor 10 receive fast which they wast from a bouring without which they wast from houring and a without the our of the our to be ble to mechanics." An operative ought to be able to construct and draw the work he is employed to execute, and to know the designer's reasons for why it is to be "so and so formed, that he may clearly cost is way and inter readily into the pairit of his wake deriving an intellectual the spent of his work - deriving an intellectual planeare on every form he produces. This source of appiness to him would be certain if his faculties for the arts were legitimately exer-cised; but this is very soldom the case, as artistas connet afford to pay for a mathema-tipal and artistical education; and, therefore, the must outer into their master's service y meted in -construction and design-the matal-qualities of sil others in building tune mental que require a sublight body to be all outers in building require a sublight body to be an outer and a sublight body to be building and builders require artisans; - the three allocations bould combine, and make a fund takespplies to the education of the sons of the sorteners, in order to fit them for that burness which they are destined to enter. Their fadulties for the arts should then be rightly more sed and directed during their ap-prenticeship, which would not only make them marchking is their calling, but more intellectrial such, said advance them in the scale of suisiony, and so which they would be entitled. Several instances have come under my notice, and the following will show the advantages gained by such cultivation. About ten years gained by such cultivation, ... About ten years ago some of my designs were being executed by some orreputers and joiners in Sussex, and as main painting some pistures in the same pictor where the carpenters were executing my designs, Larse enabled to instruct these men as the same of a start of the same in the same pictor where the carpenters were executing my designs, Larse enabled to instruct these men as the same of a start of the same in the same saturation of a start of the same in the same saturation of a start of the same in the same saturation of the same in the same in the same saturation of the same in the same in the same saturation of the same in the same in the same saturation of the same in the same in the same saturation of the same in the same in the same saturation of the same in the same in the same saturation of the same in the same in the same saturation of the same in the same in the same saturation of the same in the same in the same saturation of the same in the same in the same saturation of the same in the same in the same saturation of the same in the same in the same saturation of the same in the same in the same in the same saturation of the same in the same in the same in the same saturation of the same in the

in the construction of geometrical problems in | perspective, in drawing and design; and by shewing to them the value of natural forms in the animal and vegetable kingdom, and teaching them to become active and accurate ob-servers in the boundless field of nature, they soon felt the value of such information; and whenever they had to execute such forms as were immediately derived from nature, they would go into the gardens and fields, and ob-tain the flowers and leaves of plants, and place them before them while they were executing such portions of the designs which were made up of similar flowers and foliage. And though these artisans came as carpenters to work at 25s. per week, they were so much improved in a few months in ability, that their wages were raised to 30s. per week, and in about a year they received 35s. per week, and in two years they received 40s. per week, and in three years 50s. because they had obtained considerable talent in carying; and one, who was the most skilful, received 60s. some time after, and when he had completed all the work that his employer required, he called upon me to thank me for the instruction I had given him, and informed me that he had just had an offer of four guineas and a half per week, and which he was going to accept. Other instances of this kind I could name

that have come under my notice, but this will he sufficient to shew that a right exercise and direction of the faculties for the arts of our operatives, would be in favour of all the parties concerned, to the employers as well as the employed. And why should so valuable a class of men have so little done for them in their education? Surely the great comforts derived by every class-and particularly the higher-from their labours, ought to induce the wealthy to come forward in their favoer, and establish an institution for a due cultiva-tion of their faculties in all matters that pertain to their calling. If such a school was established I need not state what would be the result; the workmen themselves would see into the great benefits that they would derive, and the superior order of men they would become by such an intellectual training, They would no longer delight in low pursuits, or dishanestly spend their last farthing in intoxicating drinks, reducing their wives and families to the lowest state of misery. With such a state of things they would soon be disgusted, and would arouse themselves from their animal state, and enter, heart and soul, into the intellectual calture that such an institution would offer to them. I trust that 'ere long we shall see such a project carried into effect, and by the parties concerned. I am, Sir, &c.,

GEO. R. LEWIS.

61, Upper Norton-street, Sept. 29, 1845.

ANCIENT ARCHITECTURAL DECORA-TIONS.

A WRITER in the Sussex Advertiser says-"On cleansing and scraping the old wash from the walls of Battle church, previous to their being rewashed, the walls have been discovered to be full of paintings, of a very sucient and curious character, some of them very well executed, which appear to have been done during the reign of one of the Edwards, or probably before; there is also some writing, but it cannot (except a word or so) be deciphered. Only a portion of the walls has been scraped. I am fearful the whole will not be similarly treated, as one of the churchwardens appears averse to any more being scraped, and, indeed, annoyed that such operations should have been commenced." It is to be hoped the local antiquaries will give their attention to this discovery, and exert their influence to obtain an examination of the whole of the building. The Athenaum mentions a similar discovery of great interest in the cathedral at Brunswick. "In removing the plaster coating from one of the lateral walls of the nave, they have found the latter covered with fresco paintings in its entire length and breadth. These are divided entire length and breadth. These are divided into compartments — each one containing a subject from the life of Duke Henry, surnamed the Lion, born in 1129, and who died in 1195 —the founder of the city of Brunswick, and builder of the Cathedral. The paintings are of the bishest function whether any probability of the highest finish; but have, unhappily, suffered much from the removal of the plaster which overlaid them, notwithstanding the and a second second

utmost precautions used in the operation. IT he rovernment has ordered their careful re won-as also their publication by engraving. They are supposed to be of the fourteenth or freenth century. It is hoped that other probably on the opposite lateral wall, at any rate. rate.

STATUE BAISING

Scorprons abroad have been busy lately as it seems, they night have been busy latery subjects. At Dunkirk, for example, a colossal bronze statue of Jean Bart was recently inaugurated, who was nothing more than a suc-cessful privateer that flourished 150 years ago. The statue is 16 feet high, and is considered masterpiece of the celebrated David a masterpiece of the celebrated David (d^AAnger). He appears in the act of boarding a vessel, brandishing a sword in his right hand, and a pistol in the left, and is attired in the costume of Louis XIV. To decorate the streets on the inauguration day, the pretty practice, common enough on the continent, was followed, of letting into the earth on each side of the pavement, large branches of elm and oak, so as to transform the streets into groves. We remember seeing all Gheat into groves. We remember seeing all Ghaot thus rendered into gardens a few years ago on a much worthier occasion.

A statue is to be raised to Claude Lorraine at Epinal, and one at Aurillac, to Gerbert, afterwards Pope Sylvester II. The monument to William Pope Sylvester 11. Ine monument to william the Conqueror, at Falaise, in Normandy, is being proceeded with. In Germany no opportunity is lost to commemorate a great man. A statue of Erwis von Steinbach, the architect of Strasor Erwis von Steinbach, the arctitles of Sum-burg cathedral, has been raised at Steinbach, in Baden. Beethoven's statue, by Hahnel, of Dresden, innugurated at the late festival, is a fine work. The features are boldly sculptured, and bear an expression of profound and esrnest . thought, mingled with the wildness of inspi-ration, which is seized to its fall extent at the ration, which is seized to its full extent at the first glance. The figure is clothed in a coatume which is a compromise between the modern dress and the classical robe, and the attitude, which represents him with a pencil and note-book in either hand in an interval of reflec. tion, is easy and natural. The fault found with the statue is, that its vigour approaches too much to coarseness, and that its appearance is somewhat squatty. The pedestal, which, as well as the statue, is of bronze, bears four bas-reliefs, representing four allegorical figures of fancy, symphony, sacred music, and dramatic music. It was obtained by competition. The cast-ing is admirably well done. At Nuremberg (Ba-varia) some statuary has been set up at the entrance to the new Louis Canal, uniting the Maine with the Danube. It conaists of a group, representing the river gods of the Maine and Danube, and bearing an inscription signifying that the canal, which was begun by Charlemagne, but abandoned, had been faished by Louis King of Bavaria. The other pieces consist of two columns, surmounted by Navition, is easy and natural. The fault found with asist of two columns, surmounted by Navifemale statues, with appropriate emblems. At Skanderborg in Copenhagen a marble eques-trian statue of King Frederick VI., from a model by Thorwaldsen, has been set up. In England, amongst the new propositions is a statue of Sir Thomas Fowell Buxton, to be set up in Westminster Abbey in honour of his efforts up in Westminster Abbey in honour of hisefforts to extinguish the slave trade. Wyatt's figure of the Duke of Wellington is nearly cast. The statue of the Dake of Sussex, ordered from Mr. E. H. Bailey by the Freemasons, is nearly finished. The whole figure is eight feet high, including a six-inch plinth; its weight is about six tons, and it is formed of one solid block of white Italian marble, from the quarries of Carrara, the original cost of which was 280 guiness: the price to be paid to Mr. Bailey is 1,800. When completed, it will be placed on a five-feet podestal, to be erected on the dais in Freemasons'-hall, which is at present being embellished and decorated. The public subscription statue of the Duke is poend subscription statue of the Dake is intrasted we believe to the same sculptor. A bust of the late Admiral Sir F. Maitland has been put up in the dockyard chapel at Ports-mouth.

The shief honours of the Belgie University had been takes at the ensatisation by three sons of constance; and all the inhabitants went out to most them, and easist three, be their homes in triumph.

THE GUILDER.

REPAIR OF TIMBER BUILT HOUSES. AWARDS UNDER METROPOLITAN BUILDINGS ACT. ed model to see - 17 - 5

MR. ROBERT WADE, builder, was doing the following tenains to a wooden house in Bailey's Rents, in the district of St. Nicholas, Deptford, and refused to give notice to the

Deprived, and refused to give notice to the district surveyor, MN Murtyn, viz. :----Calling 'away the decayed dustrering, and 'Weather boarding of the external walls, to the Height of one foot from the ground, and rais-ing the present brick foundations one foot, to broather and survey the at the diminished receive and support them at their diminished height; also taking down about four courses of the brickwork of the chimney-stack, and rebuilding and pointing ditto, and setting new chimney pots thereon; also repairing the ex-ternal weather: boarding, which was in a very bad and rotten state; —and mutually they re-quested the award of the official referees, as to whather or not the said repairs " come within the jurisdiction of the Act

The referees awarded (May 28th, 1845): "That a mere superficial repair, such as pointing, is not within the operation of the said Act, but that a structural repair is within the and Act, and with respect to the building in question, that inasmuch as the works in question involve structural repairs, the same are within the operation of the suid Act, and that although the building in question may not have been built according to the present or any previous statute for the regulation of buildings, yet.it.is the duty of the district surveyor to see that such building is not made more combustible than it may have been hitherto.

Fees of the office, 17. 8s. 9d., and 17. 1s. to the district surveyor, to be paid by the builder. referees, and as a sort of appeal against this award, Mr. Francis Edwards, architect (on the pert of Mr. W. J., Evelyn, the owner of the heuse in question and nine others, similar), in conjunction with the district surveyor, subsitted the following inquiries :

William-John (Evelyn, Esq.) proposes to repair ten several timber-built houses covered with deal weatherboarding, situate in Bailey's Rente, in the parish of St. Paul, Deptford, upon which the following questions arising thereout; are proposed to be submitted for the decision of the official referees under the Metropolitan Buildings Act.

. Withe quarters and boarding (forming the "external inclosure ") are partly decayed ut the bottom, so as to require the brick foundation to be carried up less than one foot in height, is it not a repair permitted by the Act, without requiring a notice to, and supervision of the district surveyor ?*

If a notice, is requisite, is any fee payable thereon ;, and if so, what amount?

2.2. If the said quarters and weather boarding are simply repaired with the same materials, the portion taken out being less than "one-fourth of the whole surface," is any notice to the district surveyor requisite ?+

" If so, is any fee payable, and what amount? B. If the chimney tops are taken down three or four courses, and reinstated to the same height, 'and the common pots reset, is any notice to be given of this, and is any fee to be paid for it; and what amount? There are two chinney-stucks to each house.

4. The privies to these houses are built of timber, and weather boarded; cannot they be repaired without a notice, and if so, is any fee paid for it?

If the privy is taken down, cannot it be rebuilt with timber, if detached from the house? and is a notice to be seut to the district survevor 26

Whether any fee is to be paid for the same, and what amount?

Or, if the privy he rebuilt with brickwork, is it requisite a notice should be sent to the district surveyor; and if so, is any fea to be paid him for the same, and what amounta

On the 21st of Angust the parties were heard, Mr. Dawson, barrister, appearing for Mr. Evelyn, and Mr. 3'. Ohambers for Mr. Martyr, and on the 13th day of September, the referees made the following invard :-On the first and second questions, and on

the first part of the fourth question-that inas-

Privica.

much as the Metropolitan Buildings Act requires every district surveyor to cause all the rules and directions of the said Act to be well and truly observed, and inasmuch as the said Act makes provision in schedule D, part 2, with regard to the 'old external walls or other external inclosures of any building already built,' in reference to materials to be used in the repair thereof; and inasmuch as the said Act also requires the builder to give notice to the district surveyor before any matter or thing placed by the said Act under the superof the district surveyor shall be done. vision And inasmuch as the operations supposed in the first and second questions, and in the first part of the fourth question are works within the meaning of the said Act, notice should be given to the district surveyor as provided by the 13th section of the said Act. And inasmuch as a service is required to be performed in respect of such works, the surveyor is entitled to a fee, but as no fee is specifically assigned to such service, the amount payable must be determined by the order and appointment of the official referees, with the consent of the Commissioners of Works and Buildings.

And as to the third question, inasmuch as the operation therein described does not affect the structure of the building on which it may be performed, and is not specifically provided for in the Metropolitan Buildings Act, the said official referees hereby certify, determine, and award, that such operation is not to be deemed a work within the meaning of the said Act.

And as to the second part of the fourth question, the said official referees do hereby further certify, determine, and award, that the rebuilding with timber, of any building not being an insulated building, within the meaning of the said Act, would be contrary to the provisions of the said Act, unless any such building be included in the conditions stated in the modification, as it regards certain small office buildings directed by the order of the Commissioners of Works and Buildings, dated September 5th, 1845.

And as to the third part of the said fourth question, the said official referees do hereby further certify, determine, and award, that if any building of what nature soever be rebuilt within the limits of the Metropolitan Buildings Act, notice thereof must be given to the district surveyor, and a fee will thereupon become payable according to the rate thereof." Fees of the office (51. 5s. 3d.) and 31. 3s. to

the district surveyor, to be paid by Mr. Edwards.+

Correspondence.

STAINED GLASS WINDOW IN ST. JAMES'S CHURCH.

MR. EDITOR,-Having read various articles, letters, and paragraphs on this subject, I, as a subscriber to the fund, naturally feel a great interest in the result. It appears evident and conclusive that a very great blunder has been committed, and an act of injustice to the subscribers, as well as to the artists applied to,-to say nothing of the misfortune of providing an eminently bad precedent by the adoption of an unseemly discrepancy.

Your remonstrances have no doubt, mainly contributed to the arrest of its progress, and this is gratifying; but as in your last you state that you " learn the committee have sent especial instructions to Mr. Wailes, that he is to take out of his design every thing that is to Gothic," which is impossible without entire obliteration, it must, I think, be a clear admis-sion on the part of the committee that they have (even though inadvertently) committed an act of great injustice to all the parties concerned.

As you, Sir, remark " they know they are in error, yet fear to retrace their steps." It seems clear that in *honour* and *justice*, the committee ought to recal all the designs (allowing the person who has been so untowardly chosen to produce another). This, it seems to ne, would get the committee out of a dilemma, in which they have inadvertently placed themselves; would be more honourable to them than to

* Noe BUILDER, p. 446, antc. † We repeat our suggestion, that parties finding awards reported by us applicable to their own cases, should consult the whole of the papers connected with them, at the Begin-trar's office. They will find Mr. Newall, the keeper of the papers, attentive and obliging.

persist in an error, and more fust to the sub-scribers and to the public. Those who have persist in an error, and more just to the sud-scribers and to the public. Those who have the care of public works are deeply responsible, as their example becomes a bad or good pre-cedent in future works. I am, Sit, &c., Sept. 20, 1845. THE ORDERS OF THE ROYAL COMMIS-The results of the late exhibition, as regards the orders given to the competitore, do not seem to have been rightly understood. Mr. Dyce is to execute his cartoon of "The Baptism of Ethelbert" in fresco, in the centre compartment of the House of Lords, over the throne; the commissioners desire to see one fresco done, that they may rightly judge of the effect; but they have guaranteed to Messis. Maclise, Horsley, and Cope, that these gentle-men shall execute their several subjects (with such revisions as they may consider expedient), in the event of fresco painting being decided on, after the completion of the work by Mr. Dyce. It is also open to the two other urtists Redgrave and Mr. Thomas-to revise their designs; at least it is so understood;"for no other artists, treating the same subjects, have been preferred to them. With respect to the other works, Messrs. Horstey, Cope, Herberg, Severn, and Tenniel are chamissioned to execute five frescoes in a haff a bere it is proposed to place statues of the poets-each artist having to select a subject to illustrate the poet who may be allotted to him. "I Six" of the poets are Chaucer, Spencer, Shakspere, Milton, Dryden, and Pope; there are to be other two, but they are not yet determined upon! The compartments in the Poet's Hall are 8 feet high by 5 feet 7 inches wide.' Mr. Blechse was offered a compartment in the Poet's Huil, but he declined the commission, being desirous of completing his freeco in the House of Lords-for which he reserves himself.-Art-

ESPECIAL DUTY OF A CLEBGYMAN TO PROMOTE SANATORY IMPROVEMENT.--Ín the present SANATORS TAPROVEMENT.—In the application of these remedies, it is to be hoped that all classes will gladly bear their part. But it is especially desirable that the clergy should take their full share of this arduous labour. In a case where many prejudices will have to be contended with, they who have the best opportunities of knowledge must be the first to adopt and to promote an improved system. They who are the most conversant with man and with his interests in a spiritual aspect, must be forward to turn into this direction the prevailing taste for physical pursuits.

Dispersed as they are every where throughout town and country, resident in every clime and guarter of the realm, acquainted with the higher clusses, familiar with the lower, and having recognized authority as the teachers of both, to reprove them in evil, and to exhort them unto good, they cannot but he respon-sible, more largely than most others, in the exercise of these precious talents, for the pro-tracted continuance of any evil of this kind, which is once well proved to exist, and also to deit of once well proved to exist, and also to admit of remedy. It is to them, therefore, that one of their brethren appeals, in conclu-sion, with the expression of his earnest hope, that they will co-operate cordially in removing these plague-spots of unhealthiness and indecency from the homes of the labouring classes cency from the bomes of the labouring classes; and will never rest until the abodes of all around them are as cleanly, as wholesome, and as compatible with habits of decency as their own respected dwellings. There is no more insurmountable barrier, we may rest assured, to the communication of the moral and religions impressions familiar to ourselves, than the diverse; and alien; and repugnant babits of life forced by adverse circumstances, whether sgainst their inclination or not, on those whom it is bur duty and desire to instruct. Nor would any outward means do so much to forward the success of our teaching as the extending to every family that which, as shewn in these letters, is at present out of the reach of teany, but might be imparted to all, namely, the possibility of living if they are so disposed, in a beaking and decent home. The unhealthy Condition of Divellings, &c. : by the Rector of Alderley.

'TAUNTON AND ITS IMPROVEMENTS .- We drew attention a few weeks since to the great spirit and judgment the inhabitants of Taunton were displaying in rendering their town more attractive to strangers, as well as more pleasant and healthy to themselves, and suggested the desirableness of other towns similarly circumstanced following so excellent an example. It has been highly gratifying to observe several provincial papers copying the paragraph into their columns, with the evident view of arousing a similar feeling on the part of those in their respective neighbourhoods who have the power, and only lack the inclination to act in a similar spirit. A correspondent of the Hull Packet, who signs himself "Not an Archi-tect," quotes the entire paragraph as "an ex-ample worthy of being followed in most of the towns of the kingdom," at the same time loudly towns of the kingdom," at the same time loudly calls upon those who possess power in his own locality to units the ornamental with the useful in all future works, which apparently has been sadly neglected of late.

WESTMINSTER IMPROVEMENTS. -- These long talked of improvements are about to be commenced. The line will begin in Floodcommenced. The line will begin in Flood-street, pass through the Almonry, Orchard-street, and Duck-lane, by the chapel in the Broadway, pass Mr. Carter Wood's Brewery, Palmer's Village, to Shaftesbury-terrace, Pim-lico, and is to be called Buckingham-road. Yesterday week notices signed by Mr. Downes and Mr. Taylor, two of the commissioners, were served on those persons who have any interest in the property along the line, to the effect that they are ready to treat for the purchase of such property, but should no claim be sent in within twenty one days from the be sent in within twenty one days from the 23rd of September, the commissioners will proceed to a valuation of it according to the terms of their Act of Parliament. It is said that Mr. Elliott, the brewer, has received 22,0004, for the meadow in front of his brewery, or at the rate of about 4,0002, per arrel. He had himself laid it out for building on but the rood preside through it he was on, but the road passing through it, he was obliged to sell it to the commissioners. It is obliged to sell it to the commissioners. It is believed that the works will commence at the Pimlico end, but nothing positive is known.

IMPROVEMENTS IN THE CITY OF LONDON. -At a Court of Common Council held last week a report of the Coal, Corn, and Finance Committee was brought up and unanimously agreed to. From it we learn that the committee having considered the subject of the city income generally, with the view of ascer-taining if any, and what sum can be applied towards the city improvements, certified that a sum of 20,000 may be applied annually out of, and charged upon, the city's coal duty during the next twenty years.

Cenders.

HIDDING R AND CO. ARCRIST

HE main object of the Cottage Improvement Society for Northumberland, found-

tage Improvement Society for.Northumberland, founded. October 1841, and remodelled 18th October, 1844 (Lord Howick in the chair),

is." to diffuse information as to the progress which shall be actually made in erecting an improved description of cottages in Northumberland, to point out their localities, to circulate, by means of the reports, useful plans and elevations, and, above all, to show the importance of providing at-least two habitable rooms, in those new cottages which are gradually replacing the old ones as they fall into decay."

The report of the committee for 1845 is just published, and containe plans, sections, and elevations of three different pairs of cottages erected on the estate of the Duke of Northumberland; of three cottages, and of six cottages at Swinhoe (Mr. Tewart's estate); and of a pair of cottages and a single cottage on the Minsterarce estate.

Se far as "providing at least two habitable rooms," the object is certainly attained by the plans published; but beyond this they go a yery little way. They add nothing to our previens knowledge on the subject, no new mode of husbanding warmth, improving the ventilation, or ensuring good drainage; no good method, of forming, a floor, at once cheap. strong, warm, dry, easily cleaned, and that would not romain damp long after washing (a great desideratum); no advantageous fresh "deptation of materials, efficient casement, or fal suggestions as to the supply of water. The fact, as to the most important points here alloded to, namely, ventilation, drainage, and sapply of water, as reference whatever is made to them in sny, one of the descriptions accompanying the plans. In some of the cottages given, the firs places are in the external walls, rithout any necessity for such an unwise arrangement, and in nearly all of them the floor the int of the ground.

The publication of fresh suggestions and new, arrangements, even if not found advantageous ultimately, induces discussion, elicits facts, and advances of the ancient dens for labourers, there is positively nothing to discuss; and we cannot see that, one good and will be served by the publication of them. In speaking thus strongly of these plans, we

do not desire in any way to impeach the judgment of the society. In one of their regulame, the committee invite the perochial clergy, ti ad fail ministers of religion, to afford them notice of any remarkable improvement that may have been effected in cottages under their svations," and offer publicity to "commumications from landowners and others, as to any improvement in cottages, cottage-gardens, or other matters bearing upon the comfort of the labourer, more especially as to the plans wirich may have been followed; and the outlay incurred :" and we may safely conclude, that they have published the best examples they could get. The inference that should be drawn our remarks is simply, that much attenfr tion to the subject is yet wanted in Northumberland. We trust the efforts of the society

to induce this attention will be successful. The following remarks on the improvement desired (from the "Postscript" to the Report), written by the Rev. E. Feilde, of Rennington, may be usefully quoted :--

BUILDER.

"The present period appears decidedly fa-vourable for a movement of this nature. We are, now in the enjoyment of a national peace. In the agitations of warfare, when the struggle is for existence as a nation, it is difficult draw public attention to what are regarded the secondary subjects of convenience and embellishment. But opportunity has been afforded for cultivating the arts of peace ; and the upper and middle classes have extensively profited by them: for their accommodation chiefly, hills have been levelled, valleys filled up, and the roughest places made smooth, and exclusive roads constructed at an almost fabulous expense. As these gigantic undertakings advance through Northumberland, it is hoped that the new dwellings for the officers and servants connected with them will be constructed on the commodious and decent model of *two* rooms, which it is the object of this society to recommend. As the country is opened to successive trains of travellers, it is consoling to reflect, that fewer one-roomed tenements will meet their sight, and that many hovels which offended the eye some ten years back, are transformed into becoming and convenient hahitations.

A dingy and barbarous cottage may suit a dark and barbarous age; but in the present days of improved knowledge, a wider diffusion of domestic comfort, something a little beyond bare walls and perforated earth floors, and patched windows, may reasonably be looked for at the hands of those who can afford the indulgence."

"The present generation is a *reading* one, and must, therefore, be more or less a thoughtful one; and it is well for a people, when beginning to relish the charms of contemplative life, to find kindly natures disposed to meet, as far as possible; their new-born tastes and wishes. Little opportunity is offered for fireside reading during our long winter evenings, in a confined room, where every conceivable operation of domestic economy is carried on, and which is not impervious to the weather from above, from below, and around. Is it to be wondered at, that the well-sanded floor of the beer-shop and public house (with all their evil concomitants), are sometimes sought in preference?

Proofs have been given of the advantages to human life which have followed sanatory regulations in towns and cities. These latter are, through legislative interference, beginning to eniov the resources of science which have been applied with success to the dwellings of the upper classes. It is idle to suppose that the mere fresh air of the country is all-powerful to prevent epidemics in villages, and to remedy of a confined locality. Besides, the defects the summer breezes blow but for a very limited period in the north, and the cottager requires defence at all times against the prevailing damp of this district. These requirements made good in the shape of a well-drained and weathertight cottage, added to the blazing fire, will impart a relish to the homeliest fare, and a sense of comfort which will brighten the countenance.

The reverend writer, in concluding, refers to the establishment of the "Society for the improvement of the condition of the Labouring Classes," whose first work when commenced, namely, the model-houses near Bagnigge Wells Tavern, Pentonville, was mentioned by us with reprehension in the first page of the present volume.

These houses are now nearly finished, and we deeply regret to say, without any attempt to remedy the egregious mistake committed a mistake that appears perfectly extraordinary when we read the names of the gentlemen composing the committee. We fancied at first that the arrangement of the model houses must be unknown to them, but inasmuch as it is stated in the committee's. report almost in a congratulatory tone, that the new buildings "are in the form of a courty" we are no longer permitted to think so. The following is the whole passage in the report that refers to the houses in question :--

"With respect to the improvement of the dwellings of the poor, the special committee on that subject had held thirty-six meetings, and their results demanded the serious attention of the public. It was not in the power of the committee to say that they had determined on the most convenient and best form on which to model the cottages of the poor, but they had encouraged the publication of designs for that purpose, and from the information thus collected they were prepared to construct such cottages on a very improved plan. The report expressed a hope that happy results would be derived from the erection of cottages in the neighbourhood of London. The evil effect upon the working classes of their present accommodation was most conspicuous in the lodging-houses of the metropolis, where they paid 4s. 6d., 4s., or 3s. 6d., and never less than 2s. per week. In the buildings which were being constructed by them, the comhad mittee would not presume to say that they fully attained their object, but they believed their experiment would be attended with the best effects. The buildings were erected in the form of a court, on the one side of which The buildings were erected in were eight buildings containing three rooms each, and two double houses capable each of containing two families. Of the single houses with three rooms the rent would be 6s. per week, rates and taxes included; and for tho two double houses the rent would be 3s. 6d. per week. On the opposite side of the square there were four houses, each accommodating two families, offering on two floors' room, thirty rooms for widows and single women of a mature age, at 1s. 6d. a room per week. Thus twenty families and thirty single persons would become the tenants of the society. The contract for the works amounted to 3,916... and they were situated at Packenham-street, Lower-road, Pentonville."

We sincerely hape that in future works, we shall have no more *courts*.

THE OFFICIAL REFEREES.

WE have avoided mentioning the arrangement made for filling the vacancy caused by the retirement of Mr. Higgins, because it seemed to us after all, uncertain and indefinite. As, however, it has now become matter of conversation in particular circles, we consider it right to put our readers in possession of the information. It appears that the duties of the Metropolitan Buildings Office render the appointment of a third referes desirable. The present Act, however, only empowers the elec-tion of two, and it has been determined therefore, at least so we are informed on good authority, to make no change at present (Mr. Higgins having consented to resume his office, pro tempore), and to bring in a bill early next session, to amend the Act in this and other respects. The appointments are premised to Mr. Tite and Mr. Ambrose Poynter, but so reapacts. many things-may occur before these appointments can be confirmed, that, as we said before, we should not have considered it right to mention, the arrangement, if we had not found it generally spoken of. We hope no undue hasts will be used in framing the amended Act, and that parties who have given consideration to it in its present shape, and have suggestions to offer, will have the opportunity of doing so afforded them. A recent modification of the Act will be found on another page.

SANATORY CONDITION OF LANGASTER.— The Metropolitan Health of Towns Association are anxions to select Lancaster as a model town, and with this view Mr. Chadwick has instituted inquiries there with so favourable a result, that it is intended in the course of a few days to bring down emment engineers to survey the locality, &c. "We," says the Lancaster Guardian, "understand that the company's terms are, that one-third of the requisite capital shall be contributed by the town, and the remainder by them, on condition of being secured in the possession of the liquid refuse, and other fertilizing agents which the waste pipes and sewers may yield."

THE NEW COURTS OF LAW.

WE mentioned last week, the report of the committee appointed to consider this matter, and pointed out the site suggested by Mr. Barry for the new building. Recurring to this document, we should first mention that the report itself is very short, being nothing more nor less than this :- That the Select Committee appointed to consider &c., "Have ex-amined evidence on the subject of the matters referred to them, and have agreed to report such evidence to the House."

Mr. Barry considers it impossible to re-construct the present Courts of Law so as to provide sufficient accommodation, and does not know of any other site in Westminster that could be set apart for the new courts. It was suggested that the south side of Bridgestreet might be removed, and New Palaceyard converted into a quadrangle, by extending the present clock tower of the Houses of Ing the present clock tower of the Houses of Parliament along the present site of the houses removed, so as to afford accommodation therein for the courts, but Mr. Barry did not consider they could be efficiently arranged there. The removal of the old courts would promote very meterically the affort of the new promote very materially the effect of the new building; and the quadrangle was desirable though the new courts could not form part of it. "At the present moment," said Mr. Barry, "there is no principal or striking entrance to the new palace for the public. The only great entrance is the state entrance to the House of Lords, reserved exclusively for the use of her Majesty. There is no situation in which a main public entrance could be so convenient, or have so good an effect as at the north-west corner of the proposed quadrangle enclosing New Palace yard. If the quadrangle were added to the building, it would be only necessary to secure this entrance gateway, in order to render the building more secure from external attack in case of public commotions. The building, as now designed, could be effectually protected towards the river, but it will be very much unprotected on the other sides.'

The Victoria Tower, it is found, will not be sufficient to accommodate the public records, and the Master of the Rolls objects to their being placed in the roofs, which have been in

some degree prepared for them. The plan of the building to be erected on the gits in the Strand (described in our last) would http://initia.strang.(near-med in our iss) wonn be weny, much dike what he proposed some years, ago, when the scentre of Lincola's-Ian Fields, was talked of as the site, now put guite out of the gentwelve or fourteen courts, and would be for twelve or fourteen courts, and hit a subject some a clarke' room and asch with, a. judges' 100m, a. clerks' room, and wate-room, darristers' goom, ...and... solicitors' room,; and da the common law courts, in ad-dition to this scommodation, a. room for the jury, if It, would, include; also, a room for the grand jury, a, law dibrary, consultation rooms, a refreshment room, a great central hall, com manicating with the whole of the courts and their appurtenances, for the accommodation of the public; and private lobbies, and communications for the convenience of the judges and the bar in The courts would be arranged around the great central hall, and towards the exterior of the building, surrounding the coarts, would be arranged all the private accommodation connected with the courts respectively." The style of the new huilding would be al-

together different, from that first proposed. "I should say that it would be desirable that it should be in the mediaval style of architecture, and that the loftier the building is made, provided no practical inconvenience re-oults from the height, the better will be the external effect. In the exterior of the buildang I should propose four, stories in the centre of the building would be idowers, and the great hall and surrounding, courts, would be lighted entirely from above ""

The cost Mr. Barry estimated at 300,0007. The cost Mr. Barry estimated, at 300,0004. The Strand would be wideped to 100 feet. Part of the building would be in the city. Temple Bar would be detached and not in the middle of the road, but might remain. Mr. R. L. Jones in his evidence, described

some improvements contemplated by the city. 5. It is proposed to commence from the overer of Cheapside, at the west end of Cheapside, and to take down the whole block of building and to take down the whole block of building anothe north side of St. Paul's, and thence going, scross utbe Old Bailey, through the site, scube skies, strissmen, crossing darringdom

street, up to Little New-street, and thence up to Fetter-lane, which joins the Rolls estate, taking another diagonal line into the wide part of Holborn, which would be the means of relieving Holborn-hill, as to which a loud complaint has so long been made, be-cause we have ascertained that the acclivities from the point at the west and of St. Benut from the point at the west end of St. Paul's churchyard will be no more than Ludgatestreet or Fleet-street, about one in thirty.

He thought the city would insist on boundary gates, but did not consider they would object to removing the present gates (Temple Bar), and substituting others.

Mr. William Cadogan, surveyor, had made the estimates in conjunction with Mr. Barry. "The sum required for the purchase of this property is 675,074%. The value of the frontproperty is 675,074*l*. The value of the front-age of the ground that will be to be let, I have estimated at 316,500*l*, which will leave, of course, to be provided for, a sum of 358,574*l*. Then, as a set-off against that, as a deduction from that sum, there are a great a deduction from that sum, there are a great many houses now used by Government as being their property, which will sell for a large sum of money, and will go in reduction of this last sum; because if these courts are built, those offices that they now use would become unnecessary."

The valuation was made house by house: some were taken at twenty-five years' purchase, some at twenty, and some as low as eighteen, As to the ground-rents to be obtained for frontages attached to the new courts, to be let for chambers, witness had put from five guineas a foot to three guineas.

DIVIDING-WALLS IN BUILDINGS OF THE WAREHOUSE CLASS.

MODIFICATION OF METROPOLITAN BUILDINGS ACT

UNDER the clause in the Buildings Act which gives her Majesty's Commissioners of Woods and Works power to modify its rules, already referred to in our columns on other occasions, the following (the third) alteration has been made : -

"Whereas the official referees have by their report in writing, bearing date the 4th day of August, 1845, certified to us that it is their August, 1945, certified to us that it is their opinion that the rule of the said Act, in sche-dule C, part 4, videlicet:— With regard to any building of the second class hereafter built or rebuilt, in reference to the capacity or contents thereof within the same inclosing walls. :-

If such building contains more than 200,000 cubic feet, then such building must be divided by party-walls, so that there be not in any one part of such building more than 200,000 cubic fect without party-walls,"—is inappli-cable to many warehouses, workshops, and manufactories, and to certain sheds or covered places; and that in respect thereto, the objects of the said Act will be as effectually attained by the adoption of the modification of the said rule hereinafter directed.

And whereas the official referees have also stated in such report the grounds of such their opinion, and on the investigation thereof it appears to us, the said commissioners, that such opinion is well founded. Now we, the undersigned, two of the Commissioners of Works and Buildings, pursuant to, and in ex-ercise of the power in that behalf given to us by [the said recited Act, do direct that the modification so recommended, may be made in the rules prescribed by the said Act, by insert-

the rules prescribed by the said Act, by inser-ing after the first rule of schedule C, part 4, above quoted, the following words, videlicet :---'Provided always with regard to ware-houses, workshops, and manufactories, or to parts thereof, used exclusively for the storing, marking or manufactoring of iron, brass.lead working, or manufacturing of iron, brass, lead stone, or other incombustible materials, and containing one story only (except any brick or stone' vaulted cellars) and having no timber floor, and having no celling in or under the roof thereof, in reference to the capacity or contents thereof within the same inclosing walls :-

And with regard to sheds or covered places, And with regard to sheds or covered places, used for uploading, transferring, and reloading goods in course of transit, and not as ware-houses for the storing or warehousing of goods, in reference to the capacity or contents thereof within the same inclosing walls;—

A Berpi stylasof, topsraituse of De Acceld's ventilating raing , and prof & a for construction of annul huidings.

That if it be found necessary or convenient for the purposes or uses of any such warehouse, workshop, or manufactory, or of an such shed, or covered place, that the same 807 should not be divided by party-walls, so as that there be not in any one part thereof more than two hundred thousand entire without partywalls,-Then so long as the same shall be used for the purposes aforesaid, and no longer, it shall not be necessary so to divide the same by party-walls, but every such warehouse, work-shop, or manufactory, and every such shed or covered place, shall be subject as to its external and party-walls, and as to its internal divi-sions, and as to the application of iron doors thereto, and as to its arrangement and con-struction in every respect, to the special approval of the official referees, in the same manner as is required in respect of the walls and other constructions of buildings of the third class, and the said official referees are hereby required to have regard to the circum-stances of each particular case, as to the locality and neighbourhood thereof.

Which modification being made in such rules will in our opinion give effect to the purposes of the said Act, as witness our hands this 26th day of September, 1845.—(Signed) Lincoln, Commissioners of Works A. MILNE, and Buildings."

AWARDS UNDER BUILDINGS ACT.

CUTTINGS INTO CHIMNEYS.

THE provision in schedule F, that no chimney-shaft, jamb, flue, or breast, shall be cut into for any other than two or three specified purposes, caused unnecessary inconvenience to many parties. Some time ago we published an award by the referees on this point," which served to shew that when the cutting which served to shew that when the cutting away was securely done, was not dangerous as regards fire, and the wall was antirely within the same premises, they would permit it. Since then, they have made several other awards in the same spirit, the brade of which we sublim we subjoin.

We subjoin. Mr. Stutely, on the part of Mr. Robb, was about to rebuild 79; St. Martin's lane, and wished to form a mezzamine over the shop, whereby the chimney opanings of shop, upwards would become above the level store respective floors: " The district service. Hr. Kendalk, woneidered himself anishler to a to such alterations in the brunk; all were required to bring the chimbley opthing level with the respective floatstarts, TRUCE In 24

The award was post That It is to dipeter to the stid: Martin Josephi Gtuteley 160, and the level of the respective topenhere he the und chimney brants of the part doubles but an to doing, the backs of the rexisting olimney openings or fire-places chusting of the edristic nor the withes of any of the fies cura of, except where the mew frequence will be formed, nor the backs of unit of the fluge te cut into for any quopose quarke that the total of all the new chiminey of guing or find places must, where the prior work shall be if dend to must, where creation on the share for the sound to be less than 84 montes, un this during the sound to be that the best in d that they not all new work must be built with seand bricks laid in and with rementy and that the alterations in question mist ben made cobiorsiably with the rates in schedule (Eyef Abedlenope litan Buildings Ast. Wrens of years), nonear The costs to be paid by Mr. Bobb, D.S. 911

Again :--- Mr. May of 66, Oafird street, de sired to enlarge his housed by yearboing the chimney-breast on the shop stury, and to yap-port the superstructures by simon columns, and breastainmers in a secure and first proof man-ner. The award, was not first proof manthe wall ding which the said we with may at which the said we with may at which the said we with a said we way on the said of chimney-stack is proposed to be carsied by chimney-dtack is proposed to be chimney-sufficient iron girders, supported on sufficient iron standards of the full width of the chimney-stack, that is to say. I foot and I i hockes; and as the bearing of the said standards is to be upon York stone blants, distributing the weight over the old brickwork of the chimney-stack in the first or basement story, which is not of less width or thickness than use chimney-icate stones width or thickness than use chimneynot of less width or thickness than the children stack above, the same will bot be contary to the said Act, and may be denern accordance with the (said shore of) drawing tharked C. The costs to be paid by Afr. May

e un ei ta in Pier mittadt test a bu z

In another case, Mesors. J. and W. Bennett had cut away two chimney-breasts in the party wall of a house in Bloomsbury-street. The Chimneys " in schedule F of the said Act, but Chimneys "in schedule F of the said Act, but inasmuch as it appears, that having regard to the rates of the baildings respectively parted or to be party wall is of the full thickness in every part thereof; and inasmuch as the district sur-veyor useents to the truth of the allegation, that the said chimneys were carefully cut by; and have been made good in the most 'aw substantial manner, and that the said wall forms a good and sufficient fire-proof construc-tion; I the said William Hosking with the assent aforesaid, make no direction thereon." The costs to be paid by Messrs. Bennet.

WIDTH OF ALLBYS

Mr. Suter on the part of the Fishmongers' Company, submitted an application for per-mission to continue Stew-lane straight into Thames-street, of its present width, 8 feet 24 inches; it move comes into Thames-street by menes; it now comes into Thames.street by an elbowy through a plot of hand belonging to the Company on which they wished to build. They had agreed provisionally with adjoining landower for the purchase of a slip of land to effect the change, but considered they were unable to proceed without consent of the reference. Latt, d states of the states of t

AN EFFORT TO ADVANCE HISTORICAL ART.

Sin,-Several inquiries having been made respecting the proposal to be founded on the suggestions thrown out a few weeks since upon the subject of fresco painting, and to which you were good enough to give publicity through the medium of your valuable work, I beg to offer a few additional hints which, by entering more into details, will be found to answer the various queries.

The royal commission has caused many ertists to abandon portrait painting and other lucrative branches of art, and to devote their energies to historical painting and the practice of fresco. Three years of experiment have proved a great amount of talent to exist in this country, and which owing to many cir-cumstances, such as change of style, awk ward shapes, restriction of size, and choice of subject, has never had a fair opportunity of developing itself. The royal commissioners have selected the artists to whom they intend to confide the decorations of the new Houses of Parliament: that being done, and the premiums and expenses being nearly all paid from the 4,1377. received from the exhibitions at Westminster Hall, all the rest of the artists who have been practising fresco, numy of whom distinguished themselves (although not among the selected few), are now left to their fate, not the least hope being held out to them, unless they may be fortunate enough to obtain emment in assisting to carry out the designs plo of the selected artists; so that original talent in composition, and continued efforts in fresco painting, appear to be no longer required by the royal commission. The postponement of the exhibition of bistorical painting until 1847, is another instance of that uncertainty which is destroying the confidence of artists, and para-lyzing their efforts. Even in 1847, it is very doubtful if the Hall can be available, as the addition of thirty feet to its length, and the work necessary to forward so important a feature in the new buildings, will in all probability require it to be occupied by workmen. In this state of uncertainty historical art cannot long exist, for there is no place wherein his-torical works can be exhibited.

When the King of Bavaria found German artists could produce cartoons and paint frescos, he gave them the Hof-Garten for practice, and then proposed great national works to give encoursgement to those artists who dis-tinguished themselves. A series of honourable, employment extending over twenty five years, has raised a school of art celebrated throughout Europe. In France, the Government, with its immense public galleries, and an annual expenditure on art of more than 40,000%, has in the course of thirty or forty years erected a school of art disputing excellence with Ger-

many. In England, the Government in three years has distributed 6,000*l*. with the same purpose, has distributed 6,000%; to pay which, they received in shillings at the exhibitions, 4,137% 13s.; the balance thereexhibitions, 4,1371. 13s.; the balance there-fore gives an annual patronage of 6214. In London there is no Hof-Garten. The Royal Exchange (a court and the formation of the for

Royal Exchange (a grand opportunity lost) has been bedizened by Germans; cloisters and churches are closed by clerical objectors. The Royal Academy—the British Institution, are certain to reject large historical works even in oil. In this deplorable state of things no other course appears open than to erect at the least possible cost some temporary place dedi-cated to the reception of cartoons and works in fresco. A large surface of wall which could be extended right or left according to the amount of surface required, and which would then be available on both sides for freaco painting, naturally suggests itself, and would in an inexpensive manner meet the great want complained of. I would propose an associa-tion of British historical painters, composed of such artists whose works would entitle them to become members. Such association should solicit, and would readily receive, the advice and assistance of poets, historians, an-tiquaries, architects, and anatomists, . They should arrange to execute a series of subjects illustrative of the manners, institutions, customs, and events of a particular period of British history, not by pampering false notions by the representation of mere pageantry, or by depicting the destruction of their fellow (men, but by asletting points illustratives of the virtues of our English worthles, and treating

them in such a style, that historical events and biography may be judged of according to the spirit of the age in which the events took place, or the persons lived. The first series might illustrate the ancient

British period. Ancient bards and chroniclers supply rich materials, which, although some-what fabulous, might be found available. But Rnt the Druids, their temples, religion, sacrifices, laws; the ancient British warriors, their patriotic conflicts with the Roman invaders, furnish innumerable subjects for the pencil. Of this innumerable subjects for the pencil. period it would be no exaggeration to say, that subjects might be found amply sufficient for subjects might be found amply sufficient for the first series, and if a catalogue raisonné were published, in all probability great public inter-est would be excited. This series could be followed by the Saxon period, by the Danish, by the Conquest, from which time the history might be treated in separate reigns or accord-ing to different houses to the augment time ing to the different houses, to the present time. Any objections respecting costume can be an-swered, by referring to the large pictures in the Hall of Battles, at Versailles, which include that of all periods, successfully treated.

The cartoons might be hung opposite to the frescos, and each artist should engrave in trescos, and each artist should engrave in outline his own subject; a series of outlines if published under the patronage such a work would deserve, would be highly esteemed as an illustration of our history, and might be so managed as to be an ornament to the libraries of the wealthy, an educational acquisition to public and private schools; and might also be adapted to the means of the humble classes. When the exhibition had concluded, the

rooms would be available for an exhibition of industrial art and manufactures, similar to those opened in Paris, The cartoons could be all packed and sent for exhibition to either Edinburgh, Dublin, 'Liverpool, Manchester, Birmingham, Bristol, 'or' in succession to any large city desirous of affording their population so great a gratification. In this way a love of art would be diffused over the "whole kingdom, and if public good is to be produced by the pictorial representation of such virtues as adorn munkind, and which are recorded in our history, this would be the most effectual method of accomplishing an objects o desirable. The same temporary accommodation for the exhibition of cartoons might be adopted in the exhibition of cartoons might be adopted in the provinces, and afterwards applied for exhibi-tions of industrial art, 'or 'the matiansetures'of the particular district, or for the matiansetures' for ception of objects of natural "history and are collected towards the "establishing" of focal museums, according to the recent effectively. The next series of instorical subjects could be printed on the order would apply the of the set painted on the same well, the previous freinge heing: destroyed, "bit the composition of the drawing preserved by the outcon." Whether this exhibition should be amount on bitler wild would depend upon the artists; or to what extent fresco practice should be carried ; but if it were possible to fine any anothe exhibition, what a store of history would be opaned i what a powerful educational spear would thus be afforded!

"Toi the royal commission is confided the rating with pictures the Houses of Parliament, and of promoting historical art most effectually in this country. Some provision similar to in this country. Some provision similar to that now proposed is positively necessary, for the royal commission having concentrated upon historical art the powers previously displayed by British artists in portraiture, minia-ture painting, and small fancifal subjects, are bound by their office not to allow that talent for history, proved to exist among other artists besides those selected, to remain aseless or to return this former channels. It may be objected that, after a three years' struggle, and having contributed at least 20,000%, to the wathowal' experiment in art; artists are unable to continue so ruinous 'a course, -- that of indulging, in the faxory of historical painting ! but it inust be borne in mind, that when articles combled for the purpose of exhibiting their works at a charge for admission, they *Aereby* create a valuable property. Artists, by contri-buting their works to the Royal Academy, British Institution, Sci; maintain these bodies, At Westminster Hall their works have blog duced above 4,0004. In these years. With these facts, and with the patronige of royalty, the nobility, gentry; and the public, a self-support ing exhibition of historical art infigur beliests. bliefed, and which would afford some setura

(488

for the artists' labours. To carry into effect these great national objects, all that is wanted is a little money, great space, and a good locality. The new drive in Hyde-park presents easy access to a portion of this public property, where a well might be built up of sufficient extent to allow freecos of the size .perty, of the pictures in the Hall of Battles, at Versailles, to be executed. On each side of the wall shed-work, such as we see extensively wall shed-work; such as we see extensively shrown up croand public buildings, might be inserted, cruaning parallel to the pictures. Such an accommodation has been formerly afforded to J. S. Copley, R.A., to exhibit his large picture of the Siege of Gibraltar. Also, for the picture of the Battle of Waterloa; and though last not least, for the exhibition of the skeleton of the whale!

When the importance of the proposed ob jects, and the necessity which exists for great efforts to be made, (so that England may assert her equality in art as well as in letters and science, with France or Germany) be consi dered, it may be hoped that no difficulties would be presented by the Government in the way of allowing a space of national property to be temporarily covered for this purpose. But if the authorities should be deaf to the entreaties of artists, no doubt a sufficient love of artuand its ameliorating influence upon society, wald be found in wealthy individuals, willing to devote to this purpose a few hundreds from the millions of pounds now subscribing to railways.

This proposition appeals as forcibly to the intelligence and wealth of Liverpool, Man-chester, Birmingham, or Bristol, as of London; for a travelling gallery of British historical art is one of the objects; and every one who feels the necessity of diffusing education through the attractive and refining medium of art, or wishes to see high art successfully cultivated in this country, is called upon to aid in the accomplishing of so important an end.

I beg to apologise for the length of my detter, and will only add, that any information will be gladly received upon the subject (a subject peculiarly deserving the support of all literary; scientific, and educational establish-"snews; also, of cosposate bodies throughout the United Kingdom), and that before long the proposal will be submitted, in a more maintured form of the consideration of the proafersion; iand the support of all such bodies athronghoutgthe kingdom, I remain, Sir, &c. R

"InTHE imaniles in which our recent remarks with building have been second the response and sympathy elicited, have given us much satisfaction and pleasure. We have received satisfaction and pleasure. above twenty letters on the subject from men of all chasses, -- thanks from operatives them-selves, and expressions: ofta desire to aid in effecting an improvement from persons of some influence. "We do not mention this in any degree boastingly; but as an evidence that the decline over which two grieved, is universally felt, and that us a strong desire to raise the condition of the class in question exists, there are grounds for hope that something may be done in this behalf.

Great anxiety is especially manifested by several who have addressed us, to obtain cheeply, a knowledge of architectural drawing. One, who may be taken as an exponent of several, writes as follows :---

"MR. EDITOR,-I have been a reader of your valuable paper almost from its commence-ment, and have studied the articles it has contained from time to time with pleasure and profit; but I have never felt so much inter-ested as when I read the remarks in your ested as when I read the remarks in your leading article of the 27th ult. Although you have selected only two trades to confirm your position, your statement will equally apply to that class of operatives to which I belong, viz., the journeymen carpenters.

I feel my position, and hundreds more, keenly feel it, and desire to be delivered from their ignorance. "What are we to do? Drawing-schools are scarcely to be heard of, architec-tural lending-libratics there are none! I have finquired and cannot find any comprehensive work on architecture; they all treat on distinct parts of it, and are so very expensive, that they are out of reach to men of my station. Your correspondent of the 4th inst. hus shewn the good resulting from his taking by the hand two or three workmen; but men thus kind are few and fur between. Artisans, however, would not mind paying if they were likely to have instruction for it. Pray lend your in-fluence, Mr. Editor, to the establishment of a school: I need scarcely assure you there would be plenty to avail themselves of its benefits, and "wherefore."—I am, Mr. Editor, &c., A JOURNEYMAN CARPENTER.

Something more is wanted than cheap draw ing-schools and architectural lending-libraries desirable as it is that these should be provided and wo will endeavour, when opportunity serves to express some opinions on the subject. It is feared, notwithstanding that our correspon dents and others feel differently, that the desire to excel has been so depressed by circumstances, that even when opportunities to obtain instruction are offered, the operatives are not sufficiently disposed to take advantage of them.

IMPROVEMENT IN BRISTOL.

WE mentioned some time since several projected improvements which were occupying the attention of the inhabitants of Bristol,* and said that a fresh spirit seemed to have been awakened in that ancient city. The proposal to establish an Athenaum for moral and intellectual improvement seems to have received censiderable support. At a public meeting held a fortnight ago, Mr. Haberfield, who was in the chair, stated that 2,000/. had been raised for the purpose, and 527 annual subscribers octained. Dr. Budd, in moving the adoption of a report brought up by the committee said':-" In all that regarded the accumulation of wealth, Begland was in the advance of other countries ; it was in fact one great hive of bees, but in much that related to the embellishment of the lives, and the culture of the intellects of the people, it was far behind other nations. He had just returned from a short tour in France, and in passing through Havre and Rouen-the Liverpool and Manchester of France-the first object which struck him in the "former | place was a splendid building which far out topped all the others, and on the front of which was insoribed "Library, Ma-seem, Scellpture, Psinting," He was still more struck, when at mid-day, he saw crowds of all classes throughng the wide portals, and entering the building freely without fee or payment. The same was the case at Ronen, where there was a hbrary of 4,000 volumes, a beautiful gallery of paintings and sculpture, and a museum of natural history. He did not mention these things to extol France above his own country; there was that in Bagland which they all knew how to appreciate the moral worth of its people, which raised them above all others-such was not the lesson those things taught him, but when he looked at such institutions abroad and recollected Bristol, the contrast was a humiliating one, and the lesson he was taught was, to make every effort that she might outstrip her neighbours, and obtain possession of a library museum, a gallery of paintings, and make the same provision for the intellects and the minds people, which so much rejoiced liberal of her persons travelling abroad to see there made. He was sure it was greatly to the interest of the people of this country to provide for the intellectual and moral development of the po-pulation. From that all civilization sprang. Were not all the gifts which science had bestowed the results of the exercise of the mind and the stady of the closet? Were not the railways, which now covered the land and turned out such sources of unexpected wealth, the gifts of two or threemen of genius? Ha had often lamonted that in some of their splendid termini was a single niche left for a att;'a Stephenson, a Black, or a Gay Lussac the men who had given to them the steam-engine which rushed over the face of the land,

minilating time und space. Mr. W. D. Bushell said, that much had seen done for the moral and religious education of the people, but still there was such an

• See p. 399.

amount of ignorance and sensuality on every hand, that shewed there was a vast amount of hand, that snewed there was a vast amount of mind in the country' paralysed, writtwere, lost and buried, he' might say in the tomb. The raise the depresed thind by wise coltare was the highest end of the social state. They wast teach men to think: "Thought was unteredent to action, and no man would act well until 'tie thought well. "Education' was not only of is-superable value to the individual, but it went form 'the whole character of the nation. 10 Education sifted, as it were, the very gravel for gold, and held up every problet to discover 16 at were the reface of nature, or continned within it'the germs of brilliancy and worth. Puestablishing such institutions' as that now proposed, 'they should 'recollect' that they were not intended 'to'be confined "to" the higher not interaced to be commed to the highly classes. They should rather seek to raise ap those who were below them. "Let them con-template the pages of their own history, and they would find that their greatest men had sprung, not from these who were bred in ulage and nursed is mind downed by the pulaces and nursed in splendour; but who had been born in cottages, and weated in poverty, but whose innate worth, fridomitable energy, and tulent, had made them the lights and beacons of the nation. "And who would say that amongst those who would incomer inbibe knowledge in the Bristol Athen element i Ele nice knowledge in the isvistor A themeins, there might not arise some young many who is time to come, should guide the domines of the hes of the native land?

The projected establishapent of baths and wash-houses has not yet met with the uners that it deserved; bot which wow thisk painty partly be ascribed to the pablic attention not being sufficiently attracted to the subject. At a recent meeting of 'the consulties, it was sesolved to make another appealott the public, and in the meantime, to sickets in free these gentlemen who have subcribed, whether they consent that the amount of their subcription should be applied to the erection, or biring of suitable wash-houses for the poor in deine localities the subject of public baths person suspended until more adequate funds for ushed

[&]quot;THE WANT OF EFFICIENT ARTISANS.

ON THE EARLY USE OF THE POINTED

7. . J. A. the lats meeting of the Archeological Institute of Great Britain,* Mr. Edmund Sharpe read, a paper, "On the early use of the Pointed arch," or the period of transition, as the afterwards expressed it, between the first and second great eras, of Christian Architecture, for a notice, of which we avail ourselves of the columns of the Athenaum, Mr. Sharpe confined his observations to a period between 1130 and 1180. Of all the new elements instroduced during this transitional period, he pobserved, the earliest, and certainly the most important in all its bearings and results, was the pointed arch, which, if it did not originate, seriainly inspired, and controlled the rest. He would not enter into that fortile field of learning and conjecture, the " Origin of the Pointed but would restrict what he had to say Arch. to the causes which led to its first introducition into Christian architecture, and to its rapid and universal adoption ; and these causes the was disposed to look for rather in some real advantage in point of construction than in any supposed appeniority in point of dece gation. No one who has examined with any ettention the arobitecture of the transitiona period could fail to observe the remarkable seircumstences; that in these buildings, the principally, in the vaulting, the pier-orches, and the arches of the crossing ; in other words toner the large opmings only, whilst in all pieceings of the newsly, in the doors, the windows, the ardades, and over all the small peringe the circular, form is preserved unal sered The pointed areh was not introduced melore, for the make of decoration or effect Ahe struction - and he would, therefore, adopt the shappy designation shready received of salling the one Arches of Construction and tthe other Arabes of Desoration. The builders sof ble wellth contury discovered that the pointed anch possessed, in point of con-intraction, contain advantages over the sircular aareh ; they, therefore, introduced it into all schoon:particofic structure where strength was met unod o while, from a predilection for the deantier form, they retained the circular arch in all other pute where the astety and stability of ing were not involved. Nothing is tathe aboil more causion in the large straular vaniting of the Romanesque style than to find the crewn of the transverse arch considerably depressed. This occurs constantly in the long barrel raultings of the south of France, as welles in . The gundripartics yaultings of the north. De-pressed circular arches are not uncommon in . Rangland, and whether, the depression took mlage, immediately after the completion of the moste, or, at some subsequent period, the deshere was a liability in a circular arch of large apan to lose its form at the crown. It must bave been a matter, worsover, of common observation to every one acquainted with the architecture of the transitional period, that the pointed, arch, in its earlier stages, was generally very obtuse in form, and that the variation from the circle is at times so triffing, an scarcely to be peresplible. In the church sof Alstadt, in Bavaria, the arch he had found. from actual admeasurement, constructed from "One centre only. One discovery led to another uand be was now enabled to assert, from actual sadimeasurement, that many of the obtuselypointed arches of the stransitional period are chot constructed upon the same and acknow dedged principles of a pointed sarah-that is, strom two distinct centres; but are to be considered simply as slight alterations of the semiteciscular: form. ... He was of opinion that the pointel arch first made its appearance in the aulting suches, the arches of the crossing, and the pier arches. He had observed in set unches in the south of France, that whilst sall their suches of construction are pointed, sell their anches of decontion are circular. But harmust he understood, to confine his obsecond and to a period between the years 1130 made 1180. ... An important inquiry yet remained -8 ed arch first des its appearance in the arches of goastrucstion? Over what length of time did this disresimination in the use the two forms of arch tentend? How long did the pointed arch thus

* See pp. 442, 446, 459, and 465, ante.

1 01101

remain the servant, and the circular arch the master? And at what precise point of time did the pointed arch obtain that ascendancy in the decoration of buildings, which enabled it to accomplish that revolution which its admission in construction had already com-menced? There is perhaps no building of the transitional period which better illustrates what he had been advancing than the church of Kirkstall Abbey; it also fortunately happens, that there is perhaps no building which an authentic date can be more satis-factorily attributed; for we know that the whole of the convent migrated, in the vear 1148, from the place of its original establishment to a spot on the banks of the river Aire. where it now stands, and that in the year 1452 the church was already commenced. The building may, therefore, be looked upon as representing the prevailing character of the architecture of the very middle of this tranational period; and it is, therefore, particu-larly fortunate that the entire shursh is pre-served to us in its original state, the only insertion being that of the east window, and the only addition that of the pinnacles on the gables. He referred to this church as gonfirmatory of the view he had laid down.

The Marquis of Northampton directed attention to the church of St. Andrew, at Vercelli, in Italy, built by Cardinal Guala, Cardinal Legate in England, during the reign of King John, in which all the exterior arches were rounded, all the interior pointed. This he brought forward in illustration of the theory of Mr. Shappe.

THE ORIGIN AND USE OF PISCINÆ.

Sin,—With-all due respect for the learning displayed by the writer on "The use of the Piscinee," in your hast number, and his description of a "piscina at Haddenham, on the south wall of a schagel which is on the north side of the chancel," I beg to suggest that this so called "piscina" may have been either an aumbry, a baginacope, or a confessional opening from the chappel to the chancel; and for this plain remon, wiz, beause he cays, that it has "no appearance of a basis."

Not, however, ito remark (on the present vagueness of our terms relative to Gathic arabitecture, and ecclesiology, parmit me to state—as to the difficulty experienced by percorrespondent in conceiving how picture correspondent in conceiving tow picture correspondent in conceiving tow preresult over have been suspended,"-that in every Remish church which it have yet examined, there haves insite secristy, cornear its altar, a were containing sandtiked water for the ablation of the prise's that previously to his celebrating mass. This is the pensile pissina, spoken of by Ducange, and generally is a copper vessel of three or four quarts cancety, with a rounded bottom and a basket-like handle, by which it is supported to a peg or book near to the secrity door.

I may also observe that, in addition, to its several applications mentioned by your corre-spondent, the word piscing is still occasionally applied by the French to denote what we call a font, as in the following extract from an ecount of the administration of baptism in M. de Gaumont's sixth volume of that very useful body of archeeology, his "Cours d'An-tiquités Monumentales," viz. "le parrain et viz. "le parrain et la marraine après avoir rèpondu pour lui, inclinant sa tête sur la piscine ; le prêtre prend de l'esu des fonts dans un petit vese et en verse trois fois sur la tôte du nouveau né," åc. åc.,--" the godfather and the godmother after having answered for the child, incline its head over the piscina, and the priest then takes, in a small weesel, from the fonts, a portion of the water therein contained, which he pours at three times on the infant's head.' &c. &c.

But I am trespassing on your meeful columns, and will therefore conclude by remarking that, in the application of the terms, above, pointed out—although these may be some reason, for so employing the term font is employed (as it commonly is) in the plural number—unless possibly with allusion to the vessel containing the chrismatory oil which is used in baptism according to the Roman Catholic risual, and yet used by us Protestants at the coronation of our sovereigns. W. BROMET.

ST. MICHAEL'S CHURCH, SOWTON.

THE church of St. Michael, at Sowton, near Exeter, was consecrated on the 19th inst. by the Lord Bishep of the diocese, attended by a large body of clergy and gentry; a part of the cathedral choir assisted in the service.

The neighbourhood is indebted for this edifive to the munificence of Mr. John Garrett. of Bishop's-court, at whose expense the whole has been rebuilt on the site of the old church. The style selected is that which prevailed in the fourteenth century. The plan is, nave with south porch and north alsie; chancel, 20 by 12, with priests' door and vestry, and a tower with entrance at the west end. The material is a stone from the neighbourhood, the mouldings and dressings in Caen stone. The timbers of the roof are open to the interior, and with the ribs and carved bosses have a good effect; there is accommodation for about 200 persons in seats of appropriately carved oak. The reading-desk, &c., are well arranged. The pulpit is of Caen stone, and is to be further enriched by Thomas, the scalptor employed at the new Houses of Parliament, who is also preparing a figure of the patron saint for a niche in the Tower. The windows are all filled with stained glass; the Grucifixion, with the three Marys in the altar window; Moses and Aaron in the side windows of chancel; St. Michael, St. Gabriel, and St. Raphael in the west window. There are four windows with figures and Christian, emblems, erected to the memory of deceased members of Mr. Garrett's family. The remaining side windows are filled with ornamented quarries, with labels bearing the Apostles' oreed; the whole are by Willement, except that in the of aisle, which was removed from west window the old church, and is the work of Messrs. Ward and Nixon. The chancel is paved with enand Nixon. caustic (or more properly ornamental) tiles of good design. On the south side of the chincel within the rails are two sedilia on steps. The "railing is constructed partly of iron bronzed, and partly of brass. Under the east window a string course is carried, supporting two carved panels with the Goamandments painted on porcelain. Below the string course the wall is covered with parcelain tiles of a rich pattern. The table is elaborately carved in oak, with panels painted a sich saltramarine volum, a sacred emblem being supportent panel.

The mode of heating by hot air is somewhat novel, and appears to approve wells if The belfry is furnished by Mears, of Whitechapel, with an excellent peak of reight bells, TMr. Haywerd, of Exsters, was, the architect, and Mr. John Mason, the builder a contract of Qy

ROVAL DESCRIPTION OF BRITISH AROHIwEOTS .---- The first meeting in the ensuing session will be held on Monday evening, the ard of ment month, ... It depends on the members thenselves to provide instructive and sgreenble matter, and if each of then would consider it his duty to forward something,-a notice of an ancient building, the resolution of a question in architectural jurisprudence, description of a new material, or of new mode of construction, the end would be fully strained. A committee was appointed last session to decide on various points of every day practice, and to report thereon. We consider this one of the most important inquiries instituted by the society, and look with interest for the result: extent of an architect's responsibility, the scale of charges, power of recovery, obligation to contractors, &c., are questions of extreme importance, and require to be set at rest.

to be set at rest. Building AT Cove, Messrs. Grissell and Peto, the builders, are said to have purchased of Mrs. Stubbs, of Cove, a spacious extent of building-ground, on which they mean to erect bathing villas, which, it is expected, will have a most material effect in increasing the prosnerity of Cove.

BAILLEH ARCHEOLOGICAL ASSOCIATION-We hear that the third congress of the association will be held next summer, at Gloucester, under the personal support of the Duke of Beaufort, Earl, Fitshardinge, and Lord Ducie. Lord Albert, Conyngham, the president, will preside.

THE BUILDER.

CARVED OPEN DOOR PANELS, IN A HOUSE, ANGEL COURT, CITY; BY INIGO JONES.

Any person having a taste for the style of our early English Classic Architects, who could devote some time to ferret out what at present remains of their works in the City, would be well rewarded. Besides the ancient buildings belonging to the city companies with their princely halls, rich with carved screens, and gorgeous ceilings, the elevated dais and large with-drawing parlours, their quaint furniture and their store of plate of the reign of Henry VIII., Elizabeth, and the Stuarts,—he would find that many of the old residences of the great London merchants had been refronted, and that while their exterior exhibited no ancient appearance, their interior remained without material alteration. The great fire must have swept away a large portion of antique buildings, but improvement has probably done more to rid the city of some of the best works of Inigo Jones, and of the still earlier architects, in those localities which the fire did not devastate.

Inre did not devastate. Inigo Jones, as an architect, was, with the exception of Sir Christopher Wren, the most extensively employed in the cities of London and Westminster,—to his admirers even a fragment, such as is represented in the print, is worthy of consideration. My late master, Sir John Soane, very early acquired a taste for his works, having in youth, when trying for the silver medals of the Royal Academy, made drawings and measurements of the water front of old Somerset House and Whitehall Chapel. Of the former building, the principal front of the County Fire-office, in Regent's Street, is said by Mr. Gwilt (see Chambers's Treatise on Civil Architecture by Gwilt, pp. 234 and 371,) to be an indifferent copy. Mr. Gwilt remarks, "that the loss of Jones' building at Somerset House is much to be regretted. It was not only, perhaps, the most elegant of the works of Inigo, but contained fewer abuses than most of his other buildings."

During Sir John Soane's long life he never lost an opportunity of obtaining measurements and delineations of any work, either supposed or known to be Inigo's; and at a late period, at a considerable expense, we, his pupils, were sent in the country for that purpose; and in this way he formed a very large number of drawings, some of which were exhibited to the students at the Royal Academy during his lectures: they are now preserved at his Museum in Lincoln's-inn-Fields. Of this collection I have copies, and the BULDER has already had reduced drawings of a few of them. The present subject represents two carved open door panels in a house in Angel Court, near the Bank of England, and Sir John, who inspected the building, put it down as a work of Inigo's, and had drawings made from it. Of course considerable difficulty must exist, in erretly fixing any isolated example in the full rich foliage, disclosing a profusion of fruits, amongst which Cupids and animals seem to sport, and which remind one so strongly of the friezes in the Baths of Dioclesian and the Torre di Nerore, is certainly that of his day, before the elegant, slight carying of Gibbons came into fashion.

The house in Angel Court, at the time the drawing was made, probably thirty years since, was occupied by Mr. Lear. I have not seen the building myself; any person who would now venture into the immediate neighbourhood of the Stock Exchange, during the present railway excitement, after purely antiquarian purposes, would probably be mistaken for a madman. It is not my intention to enter into a long catalogue of the works of this great man, nor to give an account of his life.

There is one remarkable fact, however, connected with his productions, which I must notice. In spite of the changes of time, and the caprices of fashion; in spite of the envy of contemporaries, and the self-complacent conceit of many of his successors, though taste may have been depraved, and some of the spoilt children of fortune have given laws to better men than themselves,—still the works of Inigo Jones have compelled the unfeigned admiration of his successors. Even the hypercritical Walpole has given a warm and hearty tribute to his genius; it is at once so characteristic and so true, that I quote it: "Jones, if a table of fame, like that in the Tatler, were to be formed for men of real and indisputable genius in every country, would save England from the disgrace of not having her representative among the Arts. She adopted Holbein and Vandyke, she borrowed Rubens, but she produced Jones. Vitruvius drew up his grammar, Palladio shewed him the practice, Rome displayed a theatre worthy of his emulation, and his king was ready to encourage, employ, and reward his talents. This is the history of Inigo Jones, as a genius." C. J. RICHARDSON.

THE BUILDER.

BENCH END FROM MINSTER CHURCH, THANET.

In continuation of the series of bench ends drawn by Mr. Truefitt, which we gave a short time ago (page 330), we now present a fine example from Minster Church, in the Isle of Thanet, from a drawing by Mr. Caveler.

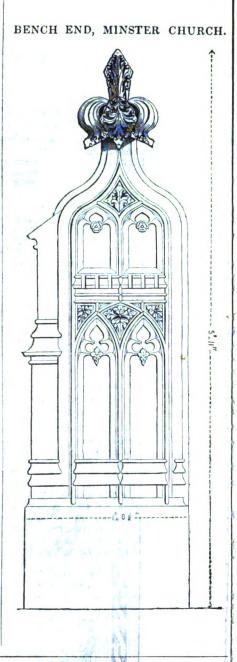

The Church of St. Mary at Minster is built in the form of a cross, the nave having side aisles; it is of very great antiquity, and contains some excellent work. The interior of the chancel is particularly worthy of notice; it is of that style now generally known by the name of Early English. The other principal portions of the church are Norman. The late estimable Mr. Gage Rokewode was of opinion, as he on more than one oc-

The late estimable Mr. Gage Rokewode was of opinion, as he on more than one occasion mentioned to us, that there is much Saxon work in the church, and we would direct the attention of such of our antiquarian friends as live in that neighbourhood to this point, in the hope of inducing an investigation of the building. The chancel contains some ancient stalls, or

The chancel contains some ancient stalls, or seats of oak, carved in a bold manner, and having under the seats grotesque figures and various devices. The ends of these stalls are different in design, but that represented by our engraving may be considered the finest.

NORMAN DOORWAY, LITTLE BARFORD CHURCH.

THE annexed engraving represents the doorway of the parish church of Little Barford, in Bedfordshire, closely adjoining Huntingdonshire. It is of the Norman period, and is remarkable for the singular want of uniformity,—the studied irregularity in the ornamental compartments on the face of the arch. The scale is three-eighths of an inch to a foot. Bond-street. T. C.TINKLER.

THE BUILDER

- THE CONIC SECTIONS 2 4 244 TONELBER IN BEPRENCE TO THEIR PRACTICAL APPLICATION 1.16 The Parabola.

THE Parubola, according to the definition given at page 462 of the current volume, is formed by a plane passing through a cone in a direction parallel to the slant side thereof; it is therefore a curve of such a nature, that if any number of points be assumed in the axis, and through these points perpendiculars be drawn to meet the curve in either direction :-

The distances between the vertex or origin of the axis and the several assumed points, are respectively proportional to the squares of the corresponding perpendiculars.-Or, in other words, the abscisses are proportional to the squares of their corresponding ordinates.

From this proposition the general equation or characteristic of the curve is derived, and the manner of its derivation may be illustrated as follows :-

Let ABC, 6g. 2, be a section along the axis of a right cone, of which C is the vertex and AB the diameter of the base, and let DVE be a parabolic section, made by a plane passing through the cone in a direction perpendicular to the plane ACB, and parallel to the slant side CB; then is VF the line of common intersection of the two planes ACB, DVE, and DE the line of common intersection of the cutting plane DVE with the base of the cone, so that $\hat{\mathbf{V}}$ is the vertex of the parabolic section, VF its axis parallel to CB, and DE its base, FD and FE being ordinates to the axis in the point F.

Through any point I in the axis VF, and scallel to the base DE, draw the straight line parallel to the base DE, draw the straight line GH meeting the curve both ways in the points G and H; then are IG and IH ordinates to the axis in the point I, GH being a double ordinate corresponding to DE, the base

or anate corresponding to 22, and of of the section. "Through the same point I and parallel to AB, the base of the cone, draw the atraght line KL, meeting the slant sides (GA and CB) in the points K and L; then the circular sec-KRE the diameter of the circular secdon through the point T, any how as-sumed in WF, the axis of the parabola. "Ndw;"since the ordinates FD and IQ 'meet' the direumferences of the circular sections "ADB and KGL, as well as the parabolic curve DVE in the points D and G, they are respectively perpendicular to the diameters AB and KL, and, consequently, they are ordi-mates to these diameters, as well as to WF the axis of the parabola; for he-cause the planes ACB and DVE are perpendicular to one another, size to one another, size to one from the principles of solid geometry, that DE and GH are also perpendicular toAB and KL. From this construction, therefore, we are to prove, that, the abscissa VI, is to the abscissa VF, as the square of the ordinate IG, is to the square of the ordinate FD; because

by construction the straight line KI is parallel to AF, the triangles KV land AVF are similar to one another, and, consequently, by the property of similar triangles, we have

but by the nature of proportion, if the con-

sequents of an analogy be both multiplied by the same quantity, the ratio is not altered in Semequence of such multiplication. Now, since VF the axis of the parahola, is parallel to OB, the still of the one, and KL parallel to AB, is follows that IL and FB are equal to one another, being opposite sides of the purallelogram ILBF; hence it is

VI: VF:: KI X IL (AF X FB;

but by the property of the circle, the rec-tangles or products $KI \times IL$ and $AF \times FB$, are respectively equal to the squares of the ordinates IG and FD; therefore, by substitu-tion, we get as follows,

VI: VF :: IG2 : FD2, which was to be proved. If this apalogy be converted into an equa-tion, by making the product of the mean terms equal to the product of the extremes one form of the equation to the parabolic curve becomes

 $VI \times \overline{FD^2} = VF \times \overline{1G^2}....(A.)$

Now, in this equation, if any three of the quantities be given, the fourth can always be found, by simply disengaging the required quantity from that with which it is combined, y division and the extraction of roots according to the combination.

If it were required to determine the ordinate IG from the abscisses VI, VF, and the ordinate FD; we have only to divide both sides of the equation by VF, and extract the square root of the quotient, and we get IG=FD

 $\int \frac{v_1}{VF}$ And in like manner, each of the vī other quantities in terms of the rest may be expressed as follows, viz. :- abscissa VI= $\frac{VF \times \overline{IG^2}}{ID^2}$; abscissa $VF = \frac{VI \times \overline{FD}^2}{IO^2}$; and finally, IG* RD*

ordinate FD=IG $\sqrt{\frac{1}{VI}}$

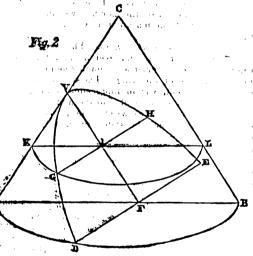

From these equations the following practical rules are deduced, according as it is an ordi-nate or abscissa that is required; when it is an ordinate, as in the first and fourth of

required ordinate by the other obscissa belong. ing to the given ordinate; multiply the square root of the quotient by the given ordinate, and

the product will be the ordinate required. This rule for the ordinate is very concise and easy of application; but when an aherises

RULE.—Multiply the square of the ordinate belonging to the required abscissa by the given abscissa, and divide the product by the square abscissa, and divide the product by the square of the other given ordinate for the abscissa required.

By these two rules all questions respecting the ordinates and abscisses of the axis can be resolved, and the following examples will shew the manner in which they are to be applied.

Example 1. If the ordinate corresponding to an abscissa of 48 in thes be 18 inches, what is the ordinate corresponding to an abscissa of 14 inches?

By a reference to the figure, it will readily wapear, that we have given the abscisses VI, VF and the ordinate DF, to find the ordinate IG, corresponding to the lesser abscissa VI. Therefore, by the first of the above rules, it is

 $\int \frac{14}{48} = 0.54006$; and $0.54006 \times 18 = 9.7211$ in.

Example 2. If the abscissa corresponding to an ordinate of 12 inches, be 17 inches, what is the abscissa corresponding to an ordinate of 27 inches?

Here again, by reference to the figure, we find that the given quantities are VI, VF, and IG, to find FD the ordinate corresponding to the greater abscissa VF; and for this purpose, the second of the above rules gives the follow-ing processes $\frac{2}{2}$ Suppose of given ordinate $\frac{2}{2}$ ing process: —Square of given ordinate, $27 \times 27 = 729$; square of the other ordinate, $12 \times 12 = 144$; then $729 \times 17 = 12393$; and $\frac{12393}{144}$ 144 =86 ... inches.

And in precisely the same manner are the rules to be applied to any other example, taking particular care to apply the ordinate or abscina given, courseponding to the abscissa, or ordinate required exactly as directed, other, wise the process will lead to a very false rein the application, of the rules; but a very little attention and practice will be sufficient to guard against the liability to fall into error on this point.

If we return to the spalogy from which the, general equation (A) was derived, and divide each consequent by its antecedent, we shall find that the expression $\frac{\overline{1G^2}}{\overline{VI}}$, or $\frac{\overline{FD}^2}{\overline{VF}}$ is a con-

stant quantity for the same parabola, to what-ever point of the axis the quantities may be referred; but as each of these terms expresses a ratio by the nature of proportion, they may be converted into an analogy, as follows:— VI: I(4:: IG: $\frac{IG^2}{VI}$; and VF: FD:: FD: $\frac{FD^2}{VF}$

from which it appears that in each case, the fourth term of the analogy is a third propor-tional to the abscissa of the axis and its corresponding ordinate; but by the definitions page 463, the third proportional to an abscissa and its corresponding, ordinate is equal to the parameter of the axis, or to the double ordinate which passes through the focus. Let this ele-ment be denoted by the symbol p, and let it be substituted for the terms $\frac{\overline{IG^3}}{\overline{VI}}$ and $\frac{\overline{FD^3}}{\overline{VP}}$ in the

above proportions, and they become VI:IG:: IG: ** , and VF: FD: FD: p. Let each of these analogies be enversed into an equation, by making the product of the mean terms equal to the product of the extremes, and we shall have 9800, 00 2 200 the

$p \times VI = IG^2$; and $p \times VF = FD^2$;

so that generally, to whatever, point of the axis the ordinate may belong, its square is always equal to the rootangle of the corquantity p. Therefore, if sube-part to descent any abscissa estimated from the vertes, and s th corresponding ordinate ; then the gener characteristic of the curve, on which its serent properties are dependent, becomes mout-rabaz

p a=y2.....(B.) Protection 2010

But for the convenience of practical men we shall express this equation in a specific form, as follows :--and the shiring an

Parameter × abscissa = ordinate × ordi

nate (C.)

Now this is a very simple and elegant expression for a curve of such extensive applica-tion in practice as the parabola is, and the rule which it supplies is thus enunciated.

RULE.-Multiply the given abscissa by the parameter, and extract the square root of the product for the ordinate required

Example 3. What is the ordinate corre-sponding to an abscisse of 24 inches, suppos-ing the parameter of the axis to be 6 inches? Here, according to the rule, we have $24 \times 6 = 144$, the ordinate squared; therefore, by taking the square root of 144, we get 12 for the ordinate required the ordinate required.

From the same general equation (C), we may determine the abscissa corresponding to any given ordinate, when the parameter is known; for we have only to divide both sides of the equation by the parameter, and the quotient will be the abscissa sought; thus we have

abscissa = ordinate × ordinate + para-

meter (D.)

The practical rule derived from this equation is expressed in words, as follows :-

tion is expressed in words, as follows: RULE.—Divide the square of the given ordi-nate by the parameter of the acis, and the quotient will be the abscissa sought. Example 4. What is the abscissa corre-

sponding to an ordinate of 12 inches, sup-posing the parameter of the axis to be 6 inches?

Here, by operating according to the rule, we have $12 \times 12 = 144$; and $144 \div 6 = 54$ inches, the abscissa required.

It frequently happens, however, in the ap-plication of the parabola, that the parameter, or constant quantity is not given; indeed, in almost every case where the curve is to be delineated, the parameter requires to be found ; but in every instance cush data wast be proposed as will enable us to determine what that element is, for we must either have given two abscissas and one ordinate, or two ardi. nates and one abscissa, and from an ordinate

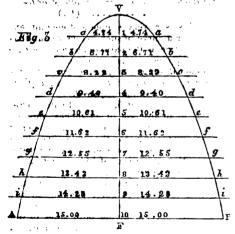

and its abeciase, the parameter of the aris can always be determined, since by the deflations page 465, and from what has been shewn above, it is always's third proportional to those two quantifies." It is not, however, absolutely two quantities." necessary to determine the value of the parameter for the purpose of delineating the curve, as that can be done mechanically by means of a series of ordinates calculated by the first (A); it must, however, be understood that the parameter is (involved in that process also, although not exhibited as an independent term. We shall now proceed to shew how the para-bola is to be constructed mechanically, by a series of ordinates calculated in the manner here mentioned.

Problem. Let it be required to delineate a parabola of which the base is 30 inches, and the axis 30 inches.

In order to obtain a series of ordinates, it becomes necessary in the first place to have a series of corresponding abscisses, and for this purpose, we must divide the axis into a certain number of parts or intervals, through which the ordinates are to be drawn; it matters not the ordinates are to be drawn; it matters not whether those intervals are equal or anequal, but it is most convenient; both for the calca-lation of the ordinates and for the graphic de-lineation, that the intervals should be equal. Now, if we divide 30 into 10 equal parts of 3 inches each, the series of abscisses which the ordinates are to be computed will be 3, 6, 9, 12, 15, 18, 21, 24, 27, being 9 in all, the last, or tenth ordinate, being equal to half the

Inst, or leath ordinate, being equal to half the given base. Consequently, the series of ordinates corre-sponding to these abscisses as calculated by the rule for that purpose, are 4-74, 6-71, 8-22, 9-49, 10-81, 71-62, 12-55, 13-42, and 14-23 inches respectively; therefore, if indefinite right where be drawn through the several points of divisitin on the axis parallel to the base, and on each of these time both ways, the show we include the first of from a scale of slove ordinates be set off from a scale of equal parts, the surve that passes through the extremities of all these ordinates will be the parabola required; but this will be best understood by carefully tracing the steps of construction an follows,

Draw the straight line AB, fig 3, to represent the base of the parabola, which make equal 10'30'inches from 'a' scale of any' convenient magnitude at pleasure. Bisect AB perpendi-

cularly in F, and make FV also equal to 30 cularly in F, and make FV also equal to 30 inches from the same scale as before; then is FV the axis of the parabola according to the example given. Divide the axis FV into ten equal parts of three inches each, in the points numbered 1, 2, 3, 4, &c., and through the several points of division thus obtained draw the straight lines *aa*, *bb*, *cc*, *dd*, &c., parallel to the base, AB; then from the same scale of equal parts from which the base and axis were taken, set off both ways from the points of di-vision on the axis the several calculated ordivision on the axis the several calculated ordinates as shewn in the scheme, and the curve which passes through the several extremities of the erdinates will be the curve of the parabola required; and in this way may any other partitions be constructed mechanically by means of a series of computed ordinates, without of a series of computed orannaces, where a series of computed orannaces, where a series of the paenmeter.

MANCHESTER ATHENEUM. — A second grand soirée will be held by the members of this institution on Thursday evening, October 23rd. 2314.

FOREIGN "A BOHITECTURAL AND COL

Embankment of the Nile. -- For' several ears past it has been stated, that Mohemed-Ali contemplated those stupendous works, which now appear near their realization. A French engineer, Mr. Naugel, is charged with the execution of this plan. The dredges and steam-engines have already been ordered in some of the manufactories of Paris. Mr. Naugel has also just purchased, by order of the Viceroy sixteen brick-machines, made after the plan of Mr. Carville, and which have occupied a conspicuous place in the late exhibition of French industry, each of which can produce every day more than 10,000 bricks, almost without any expense. The chief engineer will also

The Houses of Luther and Mehanching attention, like Luther's chamber on the Wartburg. The King of Prussia has given orders to p archase the former and to convert them into public schools. The renowned gates of the Wittenberg Cathedral also, where Luther boldly affixed his "positions," and which are nearly decayed, will be replaced by new ones made of s, and richly ornamented with emblems.

The Present State of Cologne Cathedral .-The work of restoration has progressed most prosperously during this season, and the King of Prussia, who had occasion to see it during his stay at the Rhine, has addressed a very flattering note to the Directors of the Dome-Building Association. The two lateral portals have so far proceeded, that the arch over one of the entrances (richly decorated) is nearly completed. In fact, the building grows under the eyes of the beholders, but few can have an idea of its difficulties. The south aisle is now opened to the public, and if we consider, that its ceiling has been completed within the fast two years, that new casements of the windows, etc., have been added, we may expect, that by 1848, the main nave also, up to the second gallery, will be completed. It is supposed, that by this time also the north tower up to the finishing of the main forth to ill will be comthe finishing of the main portal will be completed.

-This meet-Scientific Congress at Naples. ing —the first of the kind ever held in that capital—has been opened with much solemnity in the presence of the king. The number of gentlemen presence of the king. The winder of gentlemen present, was an unprecedented one, wiz. 1,500, from all parts of Europe and even America. What comes within the province of this Journal shall be stated on a future occasion.

THE SANATORY CONDITION OF THE WORKING CLASSES IN PARIS.

MR. ALPHONSE BRAUMONT-the Irish traveller, and brother to Elie Beaumont, the great geologist, has put forth an article on the above subject, from which we extract as much above subject, from which we extract as much, as comes within our province, and mey be useful to the English worker. We agree with the noble French philanthropist, that "Indus-trial Hygiene" and its practical and legislative application, is a field scarcely trodden—if we except the late efforts of Lord Ashley and a few others. Mr. Gay Lussac in France, and the Health of Towns Commission here, have fixed public attention on the murderous (meurtrier) condition of many of the manufacto-ries and workshops. Still, the hitherto laws relating thereto, have entirely left aside that paramount care for the worker occupied in the interior of buildings—and have not attended but to the inconvenience which may result to the neighbourhood of such establish-ments. The laws regulating the work of children and females (here and in France) can be called only preparatory, and regulations for the protection of the health of the adult worker are to be added to the statute of industrial enactments (!). The law of 1841 has given to the Government of France the power of regulating the operations of manufactories where children are employed, and Mr. Beau-mont wishes that this power should extend to all establishments where the health of the

establishments (pbbr houses), it is bot the in-dividual mansfastaren. mbo, bears shere, ex-penses, but the public at barge. Mr. Gendrin, physician of the Hapital de la Pitić, in Paris, has addressed the Minister of Commerce on the subject of saturnine affections (poisoning by lead), and has; besides the imede of streat ment, put forth the means of preventing these disease

But the subject which comes most within the limits of this journal are the diseases to which the workers in paper hanging manual factories are exposed. . Dr. Blander has hately copper and arsenicated acid. Most of the operations of those workers bring on cutano-ous diseases. Many of these accidents, however, could be obviated by the care of 'the workmen, who, nevertheless, refuse to this the precautions indicated to them by some of their humane masters. Mr. Beaumont cites examples, where the men had disobeyed the injunction of using especial garments in their bours of labour, and others who would not avail themselves of the tepid bath, which intra effor-fered them gratuitously every, evening, Gloomy samples, indeed, of the recklessness and atheism of our age; and Mr. Beaumour says very traly, that in 'this instance's No.⁴ the material welfare of the humbler classic sites. timately connected with their mental or mind's, umatery connected with their mental organid's, development. A course of Hygiene, in fine, is recommended by our talented contemporary, as one of the most essential agenetics for the future welfare of whole generations. Mr. Be-respectfully addresses himself to the Minister, of Commerce, Mr. Cunin Gridaine, to effect such a praiseworthy object; which, if applied to this country, would mean the Board of-Trade. Trade. HL. Q

STATE OF THE WESTMINSTER SEWERS

THE following entry has been made in the, "Book of Informations" at the Westmissing Sewers' office, by Mr. Phillips, the clerk of she, works, with whose views on the subject of sewersge our readers are acquainted in It jis, perhaps, desirable we should say that our day formation was not obtained through him "Oct. 3, 1845.— In obedience to the order of Court, as expressed in bye law No; 60, many si 'That each clerk of the works do endow on b to obtain every information on the state of the sewers within the district placed ander this superintendence,' and 'that in the course of trict, and report his baying to identify the intermeters with his remarks and observations in the Bone, of Informations, in addition to such markes and have been usually made therein intermeters "Therefore, I beg most respectfully to state thet there are a wat number of sewery

under my superintendence that, are similar to Mongated ceeppools, that, is, they retain nearly, all the sawage matter that is discharged into them. instead of affording efficient means for speedily currying it off; and the stanchand. effluyin from the decomposed filth, thus ascumulated, escape through the untrapped gullies and drains, and contaminate the surround-ing atmosphere with neusoous and deleterious gases, to the great injury of the health of the public: consequently they should net only be cleaned forthwith, but some ready and effectual means should be adopted in order to prevent the matter discharged into them afte wards from becoming deposited upon their bottom:"

At the last meeting of the sommission held on the Ord inst., Mr. Hawking resign nead on the ord away, one shawkhe respect the appointment of surveyor, on which dir. Losie, fooling that Mr. Phillips, in hashies, yours to obtain an improvement of the second ander his charge, and displayed a degree of moral correge way often found, and had superior moral correge way often found, and had superior consideration stilly, proposed him as a proper person to receive the vacant appointment. We trust the commissioners generally will think so tog.

SHORT DEEDS. the fail the AT ANTANY TO FACILIRATE THE GRANTING OF THE

07- 11 CRATAIN LRASES, 8 & 9: VIC. CAP. 124-1974-

"Thus, Act, which received the royal assent on the 5th of August last, came into operation on the 1st inst. The preamble simply asserts it to be, "axpedient to facilitate the leasing of lands, and tenements, and the first clause enacts that certain short forms of words (which are given in a schedule) shall be taken to have the same effect and to be construed as if other and longer forms (which are also given in the and longer forms (which are also given in the same schedule), had been inserted in any deed drawn, up as, follows, or to any other deed which abail be, expressed to be made in pur-

guarce of, this Act. This indenture made the day of one thousand eight hundred and [or other year], in pursuance of fortyan Act to facilitate the granting of certain lanses, between [here insert the names of the parties, and Recitals, if any witnesseth, that the said [lessor] or [lessors] doth or do demise unto the said [lessoe] or [lesses], his [or their] executors, administrators, and assigns, all, &c. [percels], from the day of

for the term of ... thence ensuing, yielding therefore during the said term the zent of [state the rent and mode of payment]. ... In witness whereof, the said parties hereto

have hereinto set their hands and seals. [The segond clause enacts "That every such deed unless any exception be specially made therein, shall be held and construed to include all outhouses, buildings, barns, stables, yards, gardens, cellars, ancient and other lights, paths, passages, ways, waters, watercourses, liberties, privileges; teasements, profits, cominderties, providges; essements, pronts, com-modities, emoluments, hereditaments, and ap-purtenances whatsoever, to the lands and tene-ments therein comprised belonging or in any-wise appertaining." "The third clause relates to remuneration for

The third clause relates to remuneration for preparing and executing any deed under the Act, and enacts that in estimating the proper sum to be charged for such transaction, the taking officer shall consider bot the length of such deed, but only the skill and labour em-ployed and responsibility incurred in the pre-paration thereof.

"The fourth clause enacts, that any deed falling to the effect by virtue of this Act, Shall nevertheless be as valid as if the Act

had not been made. The construction claase enacts, that for the purposes of this Act "unfess there be some-thing in the subject" or context repugnant to such construction, the word clands ' shall extend tol'all'tenements and hereditaments of tend "to" all "tenements and nereunsments of freehold tenure, and to'such customary lands affwill pass by dead or "deed and surrender, and not by softender atone tor any undivided part or share therein respectively.

to be rear pression to be of areted EFFLUVIA FROM SEWERS.

Signation of the subject be-fore your readers. I am happy to say, that since the appearance of my former letter, I have received one or two communications from persons especially interested, offering me their assistance in more fully placing before the public opinions of, and remedies for, this prest: unnecessary evil. As a prelude, I the public opinions of, and remedies for, this great: unnecessary evil: "As 'a 'prelude,' I would mention as a fact, that to such an ex-tent has the practice of "venting" severs been carried of late, that those gulloy-holes which were trapped 'formerly, 'have been opened, and in some cases, even in the centre of the roadway; holes have been 'made in con-nection with the severs, the filmes afford the shade any comparison with the worst cesspool. "In referring to your correspondents 'letter in your number of the 20th September, Twould beg to offer a few observations' on the com-ments. First, as regards the originality of the plan in point of " trapping," I only lay claim to, and advocate its introduction, when it com-ination with my system of aewers, "When it is four south to diverse its introduction," to his fears as to the bursting of aewers. "When 'this beckers, it is not owing to the pent-by gases in the south of the bursting of aewers. "When 'this beckers, it is not owing to the pent-by gases in

becars, it is not owing to the pent-up gases in the sewers, but chiefy to their unsound, as

⁶ We are compelled, in justicerto a former scaverpendent, to refer "J. L." to p. 199, este, where he will find columns for the scape of the vitilized sin, proposed by "W. Row-land."

THE BUILDER.

well as unfit construction, many of them being satirely destitute of the form calculated to withstand the immense hydraulic pressure, to which the sewers of London are continually subject. Again, with regard to the effluxia; I think the application of windguards or draft-creating machinery, would be found quite un-necessary, from the volatile nature of the gas, and the ever-evisting draft in severe adand the ever-existing draft in sewers, ad-bering at the same time to the idea, that it would be better to destroy the effluvia, if possible, than to allow it to float in the atmosphere.

I have now brought myself to that portion of my letter most interesting to your many able readers, viz., as to what sort of trap I should propose. I have revolved many ideas should propose. I have revolved many ideas in my mind, and have now prepared a tran, the construction and applicability of which may induce comments from those not merely "theoretically," but (I hope) "practically" acquainted with the subject. I feel convisced that as the vast accumulations of mud in all the streets of the metropolis, will render the cleansing of the cistern, or lower part, an act of frequent occurrence, it is necessary that any trap that may be brought forward, should be so constructed, as to be removable with the

utmost facility on any emergency. Before concluding, I would say a few words on the varied application of the "columns," to render which ornamental as well as useful, to render which ornamental as well as useful, the addition of gas-pendants in large thorough-fares would prove of great service to night traffic, while the introduction of doors at the bottom might serve as an easy communication in all parts with the bowels of the metropolis.

Although in introducing the subject before you I venture to anticipate the cordial good wishes and support of your correspondents in forwarding its introduction, yet I almost de-spair of its adoption till the strong hand of the legislature interferes to put a stop to the erroneous ideas and actions so conspicuously manifest in the present system of sewerage.

151, New Bond-street. J. L. *•* We have not engraved the drawing of the trap seot, as it dees not appear to have any advantages over a trap figured in the second volume of THE BUILDER, p. 594, and is less

Double Entry Elucidated, an improved method of teaching Book keeping. By B. T. FOSTER. Souter and Luw, Fleet-street.

DR. JOHNSON, who has a sentence for every thing, says justly, "Let no man enter into business while he is ignorant of the method of regulating books; never let him imagine that any degree of natural abilities will enable him to supply this deficiency, or preserve a multiplicity of affairs from inextri-cable confusion." Nevertheless, half the cable confusion." Nevertheless, half the youths who leave school prepared, as is said, for the counting-house, know literally nothing of book-keeping, the mode of instruction adopted is for the most part so inadequate, so unscientific, and so irrational. Principles of universal application are kept out of view, and all is made to rest on a few arbitrary rules. The result is, as the author of the work before us observes in the introduction, thatwork

" It has become an established maxim among merchants and men of business, that a know-ledge of book keeping cannot be attained, except by dint of long practice in the countinghouse; and, consequently that all attempts to teach the science are useless and absurd. We are not surprised to find that deemed impossible, which, in ninety-nine cases out of a bundred, is not accompliabed; but are we justified in abandoning the pursuit of an object, before we have ascertained whether the means employed for its attainment are adapted to the end? Is there any sound reason why book-keeping should not be as efficiently taught as any other art or science? Geometry, naviga-tion, land-surveying, and the like, are subjects which require, on the part of the learner, far greater powers, of mind and thought, and a much greater exertion of those powers; and yet boys are found to obtain at school a satisfactory knowledge of these branches. How then is it that book keeping cannot be taught? I answer, because the subject is not understood; the student is left to learn instead of being

alone enable him, to prove or maintain the distinction of meum, and lumm. Let it then be taught, in every school throughout the kingdom."

kingdom." In the book before us the nuthor endeavours to develop, by means of agalysis, the principles upon which every form of accounts is based, and to force the student to think. "The instructions in it are full and clear, and well, calculated to impress the student. The following, "general principlea" will serve, as a specimen of the author's style:---

chant's real worth, yanging of first and the second ret deficiency. 2. Debtars and creditors are alwars, in oppo-sition to each other. Thus the respective items on the debtar side, at one account are credits in some different account; and those on the creditor side, are debits in some

those on the creditor side, are debits in some other account. 3. Every transaction relating to property may be virtually considered under the single denomination of barter, or the exchanging of one thing for another; hence each transaction affects at least two accounts, and must be entered on the debtor side of one, and on the creditor side of the other. The receipter account is always debtar, and the imparing account always creditor.

account always creditor. 4. To increase, or add a sum to, the debit side of an account, is in effect the same as to decrease, or subtract a sum from, its credit

side; and vice verside amount of debtors in the signegate amount of debtors in the ledger is equal to the aggregate amount of creditors, and, consequently, the debtors and creditors affected by each transaction are, in every case, equal.

The assets or debtors, and the liabilities or creditors, are at first equilibrated or man equal, by means of the stock account; and a every subsequent transaction affects an equal amount of debtors and creditors respectively amount of debtors and creditors respectively (See 5 General Principle), this equilibrium in maintained throughout. The increase of decrease of the capital is exhibited by the set gain being carried to the credit, or the net loss to the debit, of stock ; whilst an each case an opposite debit of credit, of corresponding value, is made in some, one, of the money, merchandise, or personal actionals.

cient value that, been shown to entitle and to vote...Nineteen hat heen shown to entitle and than, twelve monther. This claims were non-sequently held to be good.

and your" other correspondents on the same subject, in being of opinion that Gothic Architecture is now studied too engrossingly and too exclusively; and I am forther of opinion that it is studied more as a dead language of the It is studied more as a dead language of the art than as a living one, with more of plod-ding inquiry into its bistory, with more of the mere collecting facts and the materials of study, than of real intelligence of the artistic value of that style at the present day to our-selves. As it is now pursued, the faculty chiefly exercised by the study is memory and little more; while those of judgment and reasoning taste are suffered to lie dormant and unexercised. The fruit we gather consists for greater part, of dates only; yet it must be owned that that fruit seems to possess if not an enlivening, an intoxicating quality. not an enlivening, an intoxicating quality. Even those who can talk very fluently about styles and periods, and have all Rickman by heart, or rather at their tongues' ends, often seem quite aground—au bout de leur Latin, when they attempt to proceed a step further, and without the aid of book or other prompter, and without the aid of book or other prompter, to specify either the particular merits or the contrary of any individual example, or else of any modern imitation of the style in ques-tion. The most glaring solicism may stare them full in the face, in a modern antique design, without their being able to detect it. Glossaries and other " collections of Gothic

Giossaries and other " collections of Gothic details " are, no doubt, very useful in their way, yet they go, and can go but a very little way, since however well suited for the pro-fessed purpose, they are fragmentary in plan, and so far defective, since it affords no more insight into the constitution and coming of the insight into the constitution and genius of the styles themselves than Ainsworth's and Johnson's Dictionaries do into those of Cicero and Shakspeare.

Whether we can yet appropriate Gothic architecture to ourselves at the present day re-mains to be shewn. Those who insist upon precedent for every thing in modern build-these of the kind, assure us obliquely, if not precedent for every thing in modern build-ings of the kind, assure us obliquely, if not directly, that we cannot. According to them we "can" do nothing whatever of ourselves, neither ought to attempt it, but on the con-trary be perfectly satisfied with, and vastly proud of being domed to be initators. In-stead of studying what we ourselves now actually want," and "what would be most suitable for present purposes, we are to study how we may best ape and 'initate what was suitable many centuries ago. Nay, there are those who would even have us *Gothicize* painting, and re-burn to what they are pleased to call the *naive* manner of the 'middle-age attists-to make *naive* representations of the human figure as we behold out the court cards-which pristine mode of drawing has in them been tradi-tionally preserved to us in all its *purity*. In strong contrast to the ardour with which Gothic architecture has of 'late' years been taken up as a fashionable pursuit, and the in-dustry with which it has been ministered to in a varlety of 'publications, all more' or less of a popular nature, is the alhoust total cessation of

dustry with which it has been ministered to in a variety of publications, all more or less of a popular nature, is the almost total cessation of architectural publishing 'as 'regards other styles of the art.' As far as these last, Greco-Roman, Italian, and modern architecture gene-uu2 the architecture gene-Roman, Italiai, and modern architecture gene-fally are concerned, there has scarcely been a single, attempt to render the study of them popular. With exception of what re-lates to the orders alone—and they are treated far too drily, and merely technically, there exist at present no materials for such study, nothing to afford the non-professional public an intelligent or indeed any sort of in-eight into the principles of the styles just al-fuded to. As far as any attempts at all have been made towards furnishing the public with a theory have been most miserable failures, things apparently but together by booksellers' hacks, and made like Peter Pindar's 'razors,' only to sell. Of this kind is the treatise on architecsell. Of this kind is the treatise on architec-tare 1. Will Chambers' Information for the Provide the which the architecture notions and bettighting ignorance of the subject, that if the other treatises are of no better quality the fitle of the series should have been " Mis-Information.

"Ond "circumsumes" which 'I conceive has forded very greatly to hinder the popularity, and "nime" general diffusion of architectural works) is not only their explosiveness, but the bog do t bed ynespe

THE BUILDER.

inconvenient and frequently very unnecessary extravagance as to size, which is sometimes as to render them all but quite useless for such as to render them all but quite useless for such reference. Had Britton's cathedrals been brought out on the same scale as those by the Antiquarian Society, even had they been published at half the price they were, they would not have had any thing like the same effect in promoting the study of Gothic archi-tecture. One might almost fancy that archi-tecture, of Prussic's pression tects had old Frederick of Prussia's passion for grenadiers, and consider gigantic dimen-sions, nothing under the standard of elephant or atlas folio, to be indispensable for the pro-

fessional dignity of their publications. It is upon such absurdly outrageous scale that the collection of Gaertner's buildings has just been begun; yet a far more econo-mical size, either ordinary quarto or large octave, will in general answer the purpose just as well, since even if it does not admit of the whole of an elevation being shewn on a satisfactory scale, one-half of a regular fronttherefore, on twice the scale it would otherwise be-answers the purpose equally well; or the whole might be shewn on a reduced scale, and a single compartment of it or more, as the case may require, be shewn on a separate plate; by which means, even an octavo page might be made to exhibit buildings on a very much larger scale than is now done in ultra-folio works. Many of the subjects in Durand's "Parallèle," for instance, might be given in a less than octavo size.

Apropos to Walpole's opinion of Vanbrugh Apropos to warpore s opinion of vanorugh, Horace was but a very coxcomb critic after all—a mere dogmatizer, who scorned to deal in reasons and arguments. Shades of Van-brugh and Hawksmoor! most amply have ye brugh and Hawksmoor: more amply been avenged by your libeller's own most pitiful production—that contemptible piece of timestural bathos, ycleped "Strawberry Hill !"

Should you print this, you may hear again om Rubownik. from

SUFFOLK CHURCHES: " WITNESHAM : ST. MARY THE VIRGIN.

MANY of the rural churches of England are not a little remarkable for the retired, yet

not a little remarkable for the retired, yet beautiful situations, they coccupy, and the church of Witnesham, seated in a valley and surrounded by some fine trees may be cited as an example of this kind. "The plan of the church is not unusual in this part of Suffolk. It consists of a spacious nave 56 feet long and 261 feet wide, having a well-proportioned tower on the south, and a small sisle 231 feet by 111 feet, divided from the nave by three arches. There is little architectural embellishment, and no part ap-pears earlier than the 14th centary. The west window is of three lights, the tracery consistwindow is of three lights, the tracery consisting merely of the intersections of arches, and even these are without foliations. The pro-portions of this window are very good, but the ace is worthy of better decoration, which; though probably intended by the architect, we are inclined to think never was effected. "The other windows are generally of two lights of the same character, but there are two of huncer shape and trifoliated. A window of perperdicular date has been inserted in the wall of the aisle, and another, much mutilated, appears at the east end. The clerestory of the nave contains ten windows of plain perpendicular work, and has a fine wood roof, now much hidden and defaced with plaster. The most interesting feature in the interior is the division between the nave and aisle, which exhibits some good decorated work in the capitals of the piers. The tower is of fate date, it is built of flint and is very plain; but the battlemented wall and the battresses occathe buttlemented wall and the battresses occa-sion it to have a good effect. As usual, the tracery of the beliry windows is much dilapi-tated. There are five bells, bearing the in-scription in each of "John Darbie made me 1660;" and one further records the name of Daniel Meadows, 'a family which from a very early date has beld possession in this parish. Of the chancel little macha-be said. It was ones of decorated character, but all binament has long since disappeared, "The all ornament has long since disappeared, "The north and east walls have been rebuilt, and fragments of a fine cust window may be seen ambedded in the mortar; the chansel arch is a wretched specimen of the parsimony of the area diversion of the parsimony of the

last century. Of stained glass, in which the Suffolk churches once abounded, till the fanatic Suffolk churches once abounded, till the fanatic seal' of William Dowsing was permitted to revel in the mutilation of sacred edifices; there are two fragments left; one in a south window of the nave shews the wolf guarding the head of Saint Edmund, but the head of the waint has been removed. In the charicel; on the south, are armotial bearings; 'argent a lion semanticable over all a head office. The head is rampant sable, over all a bend gules. There is a large font elevated on steps; occupying a central position in the nave opposite the worth and south entrances.

In removing the pews in the sisle a large In removing the pews in the aisle a large vessel of Roman pottery was discovered a little below the surface of the ground, and though some bones were found close by it, there is reason, from its appearance, to suppose it was used as a vessel for culinary purposes, and not as a sepulchral vase. It was much and not as a sepulchral vase. It was much damaged in removing the soil, but it probably was not perfect when discovered.

The exterior appearance of the church has been injured by the removal of the battlements, which was done about eight years since, when the roof was repaired.

The interior was until lately disfigured with unsightly, inconvenient, and uncomfortable pews, the removal of which and the substitution of open seats, has been effected under the superintendence of Mr. Ringham, of Ipswich. Sufficient of the original seats were left to afford models for imitation, and not only is the appearance of the church improved by this al-teration, but additional accommodation is gained, and increased convenience to the congregation .- Ipswich Chronicle.

GRAINING COLOURS AND LIQUID WOOD STAINS.

The status of the state of the

to his GRAINING COLOURS and LIQUID WOOD STAINS. The graining colours are prepared in a damp state, and upon so trues a principle, that the workman cannot fail in obtaining the natural colour, nor of giving to the work the same effect and appearance at all times. The difficulty of producing a true colour and of preserving the same unifor-mity with the admixture of carths and oxides, which are the ingredients used in graining, has long been acknow-ledged. This difficult is at once removed by these prepara-tions, and the grainer is canaded to confine his attention to his art in graining, without being perplexed in proportioning and mixing his colour. The LIQUID STAINS are solutions of colours which not only carry additional stain on to the various woods on which they are employed, but when used on the particular wood whose object it is to revive, it combines which and heightens valuable acquisition to the DECORATOR and to the RENOVATOB of al oak or other carvings. They are also capable of giving colour to the sapps and defective parts of vencers and fine woods used by cabinet-makers and others. In the decoration of churches, cautics, baronial halls, and mansions, in which are often found beautiful specimens of and faded, these liquid atains will be found particularly ser-viceable. They also impart to woods of inferior character and of

viceable. They also impart to woods of inferior character and of soft texture, such as beach, birch, pine, deal, &c., the colour and appearance of such woods (whether oak, maho-gany, rosewood, &c.) as it may be designed to imitate, and thus save the expense of more costly materials.

The above preparations for graining and staining for pur-poses of imitation and of revival, are prepared by HENRY STEPHENS, and may be obtained at 54. Stanford-street, where specimens of their application may be seen, and also at the Office of. "The Builder."

A TRINSON 8. CEMENT. The public is respectfully informed, that the price of 1th very p-cellent Capent, which has now been in use he Architecture and Engineering works upwards of history years, is reduced to sa. 3d per-bunkel, and may be had in any quantitiest. Wystt, Parker, and Co.'s What, Hollend strend, hurry safe of Blackfriars-bridge. N.B. — This Cement being of a light colour, requires no arti-ficial colouring or painting, and pusy be used for stuceo with three parts its own quantity of sand.

SUBMARINE RAILWAYS.

In our impression of the 13th ult., we announced that Mr. De La Haye of Liverpool had, after long consideration, satisfied himself of the practicability of constructing *Railways* in rivers and narrow sace? Since then he has forwarded a communication on the subject to the *Mining Journal*, in which he not only explains how certain difficulties may be overcome, but also points out many advantages which may result from his project. He says: "The idea of extending railways in the liquid element will undoubtedly appear for-

"The idea of extending railways in the liquid element will undoubtedly appear formidable at first thought; we are accustomed to consider the sea as a barrier which can only be evercome by gliding on its surface, yet what is water but a fluid more dense than that which we breathe? Man has found means to enter it with facility, and to conduct difficult operations at considerable depthe; breakwaters, bridges, &c., are constructed in channels. where they are exposed to the fury of the sea during terrible gales. The breakwater at Cherbourg extends three miles in the sea, in sixty feebourg extends three miles in the sea, in sixty feebourg it not be supposed, then, that we may construct a road drawing the water, without boring under its hed? The subject may be of sufficient importance to enter into some exmunician es to its practice bility.

Munination as to its practicability. My plan is simply to construct wrought iron tunnels in separate divisions, to sink them on the bed of the water, and then to connect them, so as to zender the whole as one vast building; these few words contain the sum total of the principle of the scheme, but, of course, to enter into the minute details would occupy a great deal of space, and, in fact, would require a mumber of diagrams. At present I would wish to call the attention of the scientific world to the principle of the plan, and, perhaps, these memories may lead to the subject being discussed the program of science. In England there are the progress of science. In England there are omany rivers with towns on either side, between which a considerable importance, not, only as operationing important trailways without deviat-ing the lines. Of these towns Liverpool and Rirkenhead are, perhaps, of the greatest im-portance, also North and South Shields. Sub-manine railways would be leader are consider. minerailways would be also of very considerablansein different perts of the Severn, but it wonkl be impossible to name two places separated by es to which the construction of a subthe s marine railway would be of greater importance than . Dover and Calais; this railway would comment the two greatest countries on earth; it would also be to England the door to the Continent, and to the Continent the door to England. On that road a greater amount of traffic would be carried than on any other railway that has been or ever will be constructed; the immense treasures contained in the mines of Britain would find their way to the continent, a stimulus given to manufactures as yet unknown; commercially speaking, the whole of Europe mould become as one vast country, one part exchanging its superfluous produce for the manufactures of the other part; every thing would have its full value by finding its level.

It is probable, however, that many persons will view this scheme with scepticism; this many be expected, by its being both novel and grantic, yet may not consideration make that which appears at first thought as insurmountable, afterwards easy and plain. It will be admitted that to construct such a tunnel would be an easier matter than to build iron vanels, as it would be the same shape the whole length; then to sink it on the bed of the water would be the work of only a few hours for each division of 400 feet in length; perhaps that part of the work which will appear the most complicated will be to connect the divisions under water; to this part of the work. I have given peculiar attention, and I believe that I have so far succeeded in finding means to accompliab this object, that the operation will be attended with no extraordinary difficulty to those who can remain during half an hour in deep water. The diver yould use no other tool than a large hanmer yound use no other tool than a large hanmer with a view of diminishing the number of ionnts. several of the divisions might be joined together on the sea-shore, at low tide, and the whole, thus joined permanently, be sunk in their position. Improvements would, of course, suggest themselves as to the mode of operating to those who would direct the work in its details.

I may be asked how I would protect the tunnel from injury in a channel where the storm is often felt so violently; in answer to this question, I refer to those who have proved that the sea is never agitated in great depths; from ten to twenty feet is supposed to be the greatest depth in which the storm is felt; this seems in accordance with the laws of Nature, for if the sea was ever violently agitated below, where could the myriads of living creatures in its bosom find shelter, so as not to be dashed against the rocks; this supposition alone, if there was no other, would be sufficient to demonstrate the fact of the sea being perfectly calm below during the most violent storms; thus the water, instead of injuring the building, would be a valuable protection to it. As regards that part of the tunnel which would be near the shore, it would be sunk underground and covered with stones fastened together, so as to render them immoveable, even when the waves would roll over with the greatest fury.

greatest fury. On examining this plan, it will be seen that the practicability does not depend on a number of operations new to science ; it is only by the application of the most simple arts that I propose to attain the object of forming submarine railways, a project of considerable magnitude, certainly, when we consider an iron tunnel as one building, but which, when we examine in detail, seems only a work which an ordinary boiler-maker would undertake to execute. The divisions might be built in different sea-ports, as they could be towed to the required spot by being made to float; by these means the whole could be built in a very short space of time, and the road completed in little more time than would be occupied in constructing an ordinary railway. There is, however, anoth ler item of importance which must not be lost sight of-I mean the expense. This will be, perhaps, the greatest objection, which will be started by many persons; let, however, the probable cost of constructing the divisions be calculated, and if the price of iron at present be considered, the expense will not be so im-mense as might be supposed. The tunnel is to be merely a rough wrought-iron tube, and shaped with no other tools than those used by boiler-makers; this tube is to be placed on a spot which no mortal can claim as his ownconsequently, no landowner will pocket a shilling of the money raised by the shareholders. Then the railway will be formed in forming the tube; there will be no bills to cat through, valleys to fill up, or arches to build; in short, the sum total of the work is comprised in the tunnel itself; when complete, the road is open. and perhaps no other railway could be so easily kept in order, and with so little expense. The first submarine railways that would be

The first submarine railways that would be made would, probably, be short lines; by these the practicability of the plan would be tested; perhaps it will not be until then that the plausibility of the scheme will be evident to every one; it is only after a thing of importance has been carried out that we see its simplicity, or in the words of Bacon, "When any thing is first projected, we think it impossible; then, after, we think it strange that it was not attempted before."

I may here remark that I do not believe that steam will be superseded by any other power during the present age. Steam, as a motive power, has not been given to mortals to have such a short reign; probably it will last as long as the art of printing has already done. Improvements will undoubtedly take place, but the principle will remain the same. Nature docs not reveal the whole of her secrets at once, but only as they are required, according to the use which man has made of those en trusted to him : the history of the world will prove it. It is probable that in future ages men will discover a power which will make as much revolution as steam, but at present the business of man is to apply that power where it is possible, so as to connect the most distant places. The plan which I propose is to facilitate its universal application, and if the scien-tific world will examine the subject, the day may not be far distant when the flying locomotive will roll under the iron arch supporting the liquid element.

RAILWAY CLUB.

A MEETING of gentlemen connected with Railways was held last week at the London Tavero, at which Sir George William Prescott, bart., presided, amongst those present where the Hon. Mr. Gore, Messrs. Meteyard, T. Arnold, and W. J. Arnold. The chairman explained, that the object of the meeting (which was of preliminary character) was to adopt measures for the formation of a club to be composed of railway directors and parties interested in railways, for the interchange and record of valuable information connected with them. The proposition had already the approbation by letter of upwards of 150 noblemen and gentlemen, directors of railways. Mr. Owen, solicitor, and other gentlemen, addressed the meeting, and urged that the proposed plan would have the effect of diffusing railway intelligence generally, particularly as respects the geological state of the country, and the improvements of locomotive engines, &c.; and a resolution in conformity with the objects of the meeting was adopted. It was suggested to the Committee which was formed, that professors of geology, &c. be appointed to give occasional lectures. One gentleman observed that a new Bourse should be established, to be devoted exclusively to railways.

be devoted exclusively to railways. Mr. Edward Burbidge was appointed provisional secretary, and temporary offices have been taken at No. 1, Moorgate.

MAJOR PARLBY'S SYSTEM OF SAFETY RAILWAYS AND CARRIAGES.

MODELS and descriptions of the several inventions connected with this system are being prepared and will be ready for examination very shortly; in the meantime Major Parlby invites the attention of engineers, railway directors, and others, to the following statement of advantages which his system embraces :---

"The carriages samoot by any possibility run off the rails, or be overturned. Gurves of short radii may be used on any part of a line short radii may be used on any part of a inner without danger. The contra of gravity is brought as low as possible by the floers of the carriages being within a few inshers of the rails, and thus no steps or platforms will be required; and if an axis about dreak, ers. wheel come off, the carringe will wide slong upon the rails without further eccident. The breaks are strong sliding frames attached to the carriages, which can be brought at any time to alide upon the rais-thus acting by friction upon them; therefore the dangeroup effects of violent torsion which the wheels and axles sustain by the application of the usual breaks is entirely avoided. In the Croydon and Dalkey atmospheric lines, on Mr. Sam and Darkey attraceptive days, do attrached by a plan, the first carriage only is attached by a metal tongue to the piston of the tube, and thus the following carriages are only kept on the rails by the flanges of the wheels, which causes excessive wearing friction of both wheels and rails, and great danger in passing "The average of the set of the se curves at high velocities. The same remarks apply to Pilbrow's system; only, the first car-riage being kept on the rails by the rack running between the stationary pisions, and the remaining carriages depending on the flanges of the wheels to keep them on the rails. By the adoption of my system every carriage will be equally secure from running off the rails. The wheels have no flunges, but are perfectly aylindrical, or slightly couver, on are perfectly avinancial, or signify convex, on the edges; thus they will move with less fric-tion than flanged wheels, and can be made at less expense. The baggage of every passenger will travel in and upon the same carriage as himself, thus preventing those inconvenient separations and confusion of passengers and The rule can baggage which often occur, baggage which olden occur. The rais can be formed, especially for atmospheric lines, at the expense of about 164 lbs, of iron per yard, instead of 40, 50, 60, and 70 lbs, as now used. Several lines of carriages can atund ready, arrive at, or move from, any atmospheric station, without confusion or danger of colli-sion. No turn tables will be required at the. stations to move the carriages on or off the lines. The wheels of the carriages cannot run, over any body lying on the rails; thus the dreadful accidents of mutilsted human beings. so constantly occurring, will be prevented The carriages, having no buffers, or springs,

will cost considerably less than the present railway carriages. SAMUEL PARLBY. Kensington New Town, October 1."

Major Parlby has publicly announced that he will not protect these improvements by patent, but intends throwing them open for general adoption.

.GREAT CANAL CONFEDERATION.

A MEETING of the Proprietors of the Ellesmore and Chester Canal, who have formed a confederacy with the Birmingham and Liverpool, the Shrewsbury and Montgomeryshire, and other Canal interests in the North, for the conversion of their Canal properties into Railways, in conjunction with the promoters of the Worcester, Shrewsbury, and Crewe, and Shrewsbury and Trent Valley and Grewe, and Surewspury and Frent valley Union lines, so as to furnish a complete system of Railways to the districts west of the Grand Junction, between Chester on the North and Worcester on the South, was held at Chester towards the close of last month. At this meeting, the arrangements made by the committee for carrying out the proposed conversions of the several water-ways into Railways, by means of a Company to be called the Shropshire Union and Canal, were fully con-firmed. The Earl of Powis heads the movenrmed. The Earl of Powis heads the move-ment, and surveys have already been made by the Company's engineers, Mr. Cubitt and Mr. Robert Stephenson, for five lines, namely—1, from the proposed Birmingham, Wolver-hampton, and Stour Valley, at Wolver-hampton, by Autherley, Brewood, Gnosall, Norbury, Market Drayton, Audlem, and Nant-wich, to the Chester and Holyhead and Chester and Birkenhead lines, 'at Chester ; 2, from the Manchester and Birmingham at Crewe, by Nantwich, Wrenbury, Whit-church, Elleamere, Oswestry, and Welshpool, to Newtown; 3, from the Trent Valley at Stafford, by Gnosall, Newport, and Welling-ton, to Shrewsbury; 4, from the main line near Wem to Shrewsbury; 5, from the Birmingham and Gloucester, in the valley of Avon, passing the Severn at Worcester, and proceedings through the Bewdley and Brigd-north, over the Severn below Coalport, to Wellington—1t, may be inferred from this movement, that a general conversion into Rallways of the entire Ganal interest of the kingdom is inevitable. ment, and surveys have already been made by kingdom is inevitable.

ាម ក្រ សារ ហេ សារ ហេ 1= REGENT'S CANAL. ۲Ľ

A SPECIAL general meeting of the proprietors of the above Canal took place a few days since at their offices in the City Road, for the since at their offices in the City Road, for the purpose of ratifying an agreement concocted by the Company's committee, with the London Junction Railway Company, to purchase the entire property, with the view of constructing a Railroad on the same line. It appeared that the shares had been so low as 10%, but at this time they were worth 25%, each, and that the Railroad Company offered one million sterling for the entire interest of the Company, which was equal to double the present price in the market. The deposit to be 5,000% as caution money, which it was argued was not in proportion to the amount of the purchase, and should have been 50,000%. The principal sum to be paid by instalments. The first half million sterling to be paid as soon as the Act million sterling to be paid as soon as the Act of Parliament required should be obtained; the other half to be divided into three payments in equal parts, in three years, with in-terest at 4 per cent. If the Railway Company should fail in obtaining the Act of Parliament required in the first session, to forfeit the 5,0004 caution money; and should they not succeed in the second session of Parliament, 10,0004 is to be forfeid to the Company 10,000l. is to be forfeited to the Company as

iquidated damages. On the motion being put from the chair (which was occupied by Mr. Parker), that the scal of the Company be affixed to the agreement, there was an overwhelming majority in its favour. It was then agreed, in the event of the Gompany selling their property, that the secretary should enjoy his present salary for life, for his long and valuable services, and that the other servants of the Company should likewise be rewarded. likewise be rewarded.

Aliscellanea.

NEW STREETS .- The continuation line of street from Farringdon-street to Clerkenwell is named Victoria-street. The street from is named Victoria-siter. The other with Whitechapel to Spitalfields, to connect with the London Docks is to be called Christchurchstreet.

ANGLESEA HOUSE.-The residence of the Marquis of Anglesea, in Burlington Gardens, is one of the few private mansions provided with lightning conductors. Workmen are now fitting up an anemometer, or wind-measurer there. The music room is a remarkably handsome apartment. THE ELECTRIC TELEGRAPH.

The Norfolk Railway Company charge 2s. 6d. for de-spatching a message from Yarmouth to any part of Norwich, by the electric telegraph.

CHEAP TRAVELLING. — Passengers are now carried on the Liverpool and Manchester Railway, between the latter place and Patri-croft, the first class at 1d. and the second class at \$d. per mile.

LEEDS, FLEETWOOD, AND LIVERPOOL .-This is a very comprehensive scheme, if we look to the character of the traffic that must pass along the line. Fleetwool, a newly formed port, will receive the cottons of Ame-rica, required for the factories of the West Riding of Yorkshire, and this alone will cause a prodigious traffic. It is also favourably situated for the trade of the Isle of Man, Bel-fast, and many parts of Scotland. But per-haps one of the most recommendable points in this line is that, in conjunction with others, it will greatly abridge distances with various towns. Thus, there will be a saving between Fleetwood and Leeds of fifty miles; and in many other directions the economy in travelling, at the lowest, will amount to twenty miles. In framing independent lines, care should be taken not to isolate them, for their value will greatly depend on their combination with other lines, and it is in this respect that judgment is much required in the surveyor. From a care-ful inspection of the maps, and a personal ac-quaintance with the district, we are disposed to consider that the line now under considera-

to consider that the line now under considera-tion is planned with prudence and forethought. Mr. S. F. Griffin, and Mr. John Hooke Taun-ton, are the acting engineers. FRENCH RAILROADS. — The fact, that since the disasters on the Versailles line, so very few accidents happen with our neighbours, may be ascribed to the super-revision which is every few accidents these proves her government exercised over these roads by government officers of high rank. By an order of the Minister of Commerce, Baron de Condé (an officer of the council of state) has been just appointed Commissioner of his Majesty for the council of the milway from Orders to appointed Commissioner of his Majesty for the company of the railway from Orleans to Tours. The importance of the Bordeaux and Orleans line has appeared so great, that two king's commissioners will be appointed for this company. The second will su-perintend the section from Tours to Bordeaux.

BURY, AND NEWTOWN RAILWAY.—This Rail-way, the eastern terminus of which it is proposed to locate at or near Burton-upon-Trent, will have a direct communication with the London and Manchester, Derby and Birming-London and Manchester, Derby and Birming-ham, and all the railways verging to the north and south-east of England, as well as affording the nearest practicable route to the metro-polis. The capital required is 1,500,000*l*., which it is proposed to raise in 75,000 shares, of 20*l*. each, with a deposit of 2*l*. 2s. per share. The list of the provisional committee, which is of unusual length contains the number of is of unusual length, contains the names of several chairmen and directors of existing lines, and is headed by the Right Hon. the Earl of Rossmore.

Earl of Rossmore. LONDON, STAINES, ASCOT, AND READING JUNCTION RAILWAY.—This Railway is pro-jected for the purpose of establishing a direct railway between London and the very popu-lous districts of Bayswater, Brentford, Houns-low, and Staines. It is proposed to commence at Kensington, and after passing through Egham and within a short distance of Ascot Bace Course, to effect a junction with the Egnam and within a short distance of Ascot Race Course, to effect a junction with the already projected Reading and Reigate Rail-way at or near Sunninghill. The capital re-quired is 750,0001. The Engineer is Mr. Samuel Hughes, The Right Hon. Lord Dun-boyne heads the list of the Provisional Com-mittee.

The eldest son of the late Mrs. Hemans has een appointed engineer to the Irish Great

Western Railway, The Birmingham and the Great Western Railway Companies are providing their servants with watches.

ADVERTISEMENTS.

 Fleetwood will be found, by a reference to the map, to be admirably situated for purposes of export and import, presenting no difficulties of navigation, and connected by rail, river, and canal communication with Preston, Blackburn, Chorley, Kirkham, Bolton, Bury, Rochdale, Oldham, Manchester, and Liverpool, lowns of which the population varies from 70,000 up to S00,000. Fleetwood bears nearly in a straight line west from Leeds, and as almost all the lines of railway in the intervening space radiate from south to north, it becomes a matter of weighty an i absolute importance that a line should be carried transectively in accordance with the plan now laid down. The line will past through or near to the following towns:—Leeds, Kirkstall, Bramley, Horsforth, and Calverley, including Idle and Pudey, woollen amat stuff manufactures and minerals: Bingley, outon and worsted, stuffs, and cotion; Coine, cotton manufacturing and worsted goods; Barrowford, spinning and manufactures; and prin works; Cheagley, Chipping, lime and agriculture; Blackale, agriculture; Garstan, Worstond, Clitheree, illene and other minerals in abundance, cotton manufactures; and prin works; Cheagley, Chipping, lime and agriculture; Blackale, agriculture; Garstan, Worstond, a junction will be formed communicating direct by the nearest line to Liverpool, The lines from Liverpool, as those in cheagley of rechrocated activity between Fleetwood and the manufactures in the aggregate of rechrocated activity between Fleetwood and the manufacture is not those in connection with the great western metropolis, will act as feeders of the intended line; and the value in the aggregate of rechrocated activity between Fleetwood and the manufactures is and those in commercion with the great western metropolis, will act as feeders of the intended line; and theorethy is southing intervets to North Lanceshi Trade or profession Recilence. Place of pusiness (if any) Date No application for shares can be attended to unless and panied by a satisfactory reference.

According to Mr. Huskisson the amount was, in 1824-Exports £17,500,000 Home consumption 16,000,000

£33.500.000

cloths; the iron trade flourishes in its nutlet househood with ness Bowling and Low Moor iron-works. There is a ensu-shundant supply of iron case and cost, both of configure quality. The line through the Selby to Hall presents, with the pro-posed line, a direct communication between the east and west coasts of England, and as immediately in sometion with the York and North Midland, Great North of England, Man-chester and Leeds, Preston and Bolton, Preston and Cong-ridge, North Union, Lancaster and Preston, and Cong-ridge, North Union, Lancaster Ballways. The distances will be considerably abridged between impas-tant points: that between Leeds and Fleetwood presenting an economy of fitty miles, and the uninnews. aways in chars di-rections being not less than twenty miles, Accurate surveys are now in program, and the directors e-rate of expense. That it will be made conder the sweeper rate of expense. That it will be bigbly remements at 42 per centum on all calls from the time of their respective par-ments, and to limit the liability of the sharebolders to the amount of their subscriptions. A reserve of shares will be made for landowners and other parties locally interested. Topspectuses may be had of, and applications for shares, he for formany, 34, Moorgate-street; to H. R. Hill, Escl., 64, onorgate-street, London; John Shechleson, Escq., Leeks, soliciors to the Company, and of the following brekers, p-chondon-Messrs. B. and M. Boyd, 4, New Bank-buikinger; Machester-Mr. H. Woodhouse and Mr. Loweds, Liverpool-ML. Anthony Laurie, and Messrs, J. Powell and R. Lowedse, Manchester-Mr. M. Ki

£52,513,416 e than proportion since which time the increase has been more than proportion-ably great. Of woollens the total value of the exports in an average year, say 1840, amounts to 5,747.4621. For home consump-tion the value was 14,400,000. The total import of foreign wool in 1839 was 57,379.923ba, of which 16,684,6741ba, were entered for home consumption. We may gather from the how much remains to be developed, more particularly if we take as a guide the great commercial authority of the day. Macculoch, who asy, "The advantages resulting from im-proved communications are most attiking. They give the same common interest to every different part of the most widely-extended empire, and put down, or rather prevent any attempt at monoply on the part of dealers of particular dis-tricts, by bringing them into competition with those of all the others. Nothing, in a state enjoying great facilities of com-munication, is separate and unconnected—all is mutual, re-ciptocal, and dependant. Every one contributes to the end divilization." In 1839, 22,080 toms of coal were shipped coast wave from since which time the increase has been mo

THE BUILDER.

No. CXLL

SATURDAY, OCTOBER 18, 1845.

OR a long time past the church of St. Benet Fink, in Threadneedle-street, has presented a ruinous appearance to the passers-by, in

consequence of the removal of the tower that stood at the west end of the building at the time the site was cleared for the new Royal Exchange and adjacent improvements.

The present church of St. Benet, Fink, so called from one Robert Finck, or Finch, who built a previous church on the same site (destroyed by the fire of 1666), was completed by Sir Christopher Wren, in 1673, at the expense of 4,1307. The tower was square, surmounted by a cupola of four sides, with a small turret on the top, and had a large recessed doorway on the north side, of very good design.

The arrangement of the body of the church is very peculiar,-we may say unique, and although far from beautiful, affords a striking instance of Wren's wonderful skill. The plan of the church is a decagon, within which, six composite columns in the centre support six semi-circular vaults, that are carried upon architraves and cornices to the external walls. and inwardly are faced with archivolts: between these rises an oval cupola. The effect of the series of arched chapels, so to speak, around the central area is singular. Wren's power of arranging a plan to suit the site is shewn in numerous buildings, but in none more forcibly than in this small church.

The destruction of this building was threatened some time ago, and elicited many expressions of regret from the public,-so many, indead, that we had hoped the intention was abandoned. We now learn with infinite regret that the work of demolition is to be commenced almost immediately, and that the interesting structure in question will be cleared away entirely.

The destruction of a church should never be permitted without the most cogent reasons, let its architecture be what it may; and, if on no other ground, we should therefore protest strongly against the contemplated improvement; when in addition, however, the building threatened is seen to be the work of one of the greatest architects England ever had, a peculiar example of his skill, sound and likely to continue so, if not interfered with, much longer than half the new houses around it,-we feel bound to express our dissent from the intention in the strongest terms, with the faint hope that it may induce some member of the Improvement Committee to bring the subject once more under consideration before it be too late. It will be very easy to take the building down, but very difficult to replace it. Public convenience must of course be studied, and if St. Benet's stood in the way, and absolutely prevented the improvement of the thoroughfare, we should grieve at its removal, but bow to the necessity. This, however, is not the case, and we shall be forced to cry, shame on those who may be concerned in the wanton destruction of this valuable example of our great countryman's skill.

We refer our readers to a valuable and novel table for calculating the strength of castiron girders, which will be found on another page of the present number. It is prepared by a gentleman well known for his acquaintance with the subject.

THE BRIDGE-BUILDING FRATERNITIES IN THE MIDDLE AGES ON THE CONTINENT.

Тив earliest method of passing large streams in ancient Gaul and Germany, was by the means of rafts, or even large bags of skins-as is known from inscriptions and other monuments. For the sake of assisting travellers, and aiding the circulation of merchandise, regular guilds of Lenuncularii, Lin-trarii, and Utricularii were formed on the Seine, Sambre, Loire, Rhône, Durance, etc.; which, however, degenerated at times to that pitch, that they plundered travellers, and to use the expression of an ancient author, not only assisted in passing rivers, but even conveyed people into the waves of the Styr. Benevolent persons, therefore, decided on erecting at frequented places on the borders of rivers, on building bridges. These pious associa-tions were called Pontifices (Ponties), resembling the ancient appellation of a similar kind. But the deserts and the memory of this truly Christian association-because there were no bridge-builders amongst the fabri of the Roman Empire-would have been probably lost, if it had not been preserved by the legend of a French shepherd called Benezet, whom the Roman Church reckons amongst their saints. It is, however, not known, whether Benezet was the founder of this society, or merely one of its first members. The wonderful acts which are ascribed to him have been the inducement for recording this association, which still is not sufficiently known. *Benezet*, which signifies the little Benedict, a poor shepherd, born at Hauvilas, in the Vivarais, came (according to narration) in 1177 into the Cathedral of Avignon, at the time when the Archbishop consoled the people about the horror of a solar eclipse. He de-clared himself called upon by heaven to build a bridge over the Rhône—a work then considered impossible, at least stupendous. The Archbishop treated him as a maniac (!), and sent him before the civil authorities, who proposed him, in the way of derision, to begin with a stone lying on the banks, such as twenty people could hardly have moved. Benezet rolled the stone away; and whatever we may think of the occurrence, still, it is a fact, that in 1185, already a toll was levied on the bridge of Avignon! Although it has been calculated that there was no solar eclipse in the year 1177-but the year following, such inaccu racy of date can hardly militate against the truth of the leading features of that legend. It does not detract from Benezet's merit either, that at his times, and even sooner, there existed pious fraternitics for the comfort of travellers and pilgrims (Romieux)—which the holy men adapted to the building of bridges for all. Such has been the origin of that splendid monument of the middle ages—the most stapendous bridge in Europe, perhaps in the world. Its length extended to 2,770 feet, and was spread over twenty one arches, which, however, were construc ed in three different directions. There is a charter of 1187, by which Johannes Benedictus, "Prior of the Bridge," obtained for himself and brothers a chapel and cemetery, and a chaplain. St. Benezet died in 1184; still in 1185 the bridge building fraternity began the construction of the Bridge of the Holy Ghost (Pont du St. *Esprit*) over the Rhône at Lyons, not finished but in 1305. It is now the largest bridge in but in 1305. It is now the larges. This bridge Europe, being 2,524 feet long. This bridge also does not keep one straight direction, but has several bends, for adapting itself to the denth of water, &c. The bridge of locality, depth of water, &c. The bridge of Avignon was finished in 1188, and has always been considered as one of the wonders of

It is strange to observe, that most of the actual specu-lations of our times were objects of philanthropy in the middle ages. So, moreover, the business of pawnbroker, whence the Italian and French name: Monie de Pietä, Moni de Pietée-mount of piety.
Details and drawings of this stupendous construction are to be fouud in Gaulhey "Traite de Construction des Ponts; whence they have been copied into Wiebekings "Art of Water-building."

France. There, I see it lie-long reaching, and smoothly laid over the Rhône, perceived from afar as you glide down the river. Popular tradition, which often leaves unheeded the so-called great deeds of the great, has faith fully preserved the memory of Benezet, and every peasant will tell you, that it was a shepherd who planned it. The finishing of this stupendous work confirmed the fame of the bridge-building fraternity, which was con-stituted and chartered in 1189 by Pope Clemens III.

Alike as its foundation is wrapt in obscurity, its shrinking also before the rays of (so-called) modern civilization, is not properly ascertained. How they ceased in Avignon, their head quarters, or whether they merged in some of the subsequent secular guilds, is not known. In other parts of France, as in Bon-Pas on the Durance, where charters of 1270 mention their existence; at Lourmain, between Aix and Apt, &c., their very name suddenly faints away in the noise and bustle of subsequent war and butchery.

As the construction of bridges was considered, in the middle ages, amongst the works of Christian picty, -Italy, Spain, Sweden, and Denmark, possess several bridges which own the same origin, although it is not yet ascertained whether regular fraternities existed for that purpose. Still the Swedish chronicles mention one Benedict between 1178 and 1191, as a bishop and bridge-builder at Skara, who, a contemporary of Benezet, might have become illuminated from the same source. As the Templars of Spain had the duty of aiding the passing of pilgrims to Jerusalem, the old Roman road in Lower Navarra received the name of the Templar's Road. With such and similar pursuits, it cannot be wondered that the property of the bridge-building fraternity was, in many instances, surrendered to the order of St. John of Jerusalem (freres hospitaliers) and thus merged into it. The traces of analogous fraternities in Germany (England?) have not yet been properly examined. To its examination in France, two great names have chiefly contributed, Gregoiret and Millin. It was an ancient inscription near Mirabeau, on the Durance, found in the chapel near the place where the raft ordinarily starts from, which gave rise to the whole inquiry. It may be interesting for our readers to know, that the habit of the Knights of the Hospital of St. Jacques-du-haut-pas, at Paris (most probably analogous fraternity in those times), exhibits, as shewn in their sepulchral monuments, a pick on their breast-while that of the Holy Ghost fraternity of Monpelliers consists of two road bridge arches and a cross. [From German sources]. J. L.

NEW CHURCH AT WILTON, NEAR SALISBURY.

THE new cherch at Wilton, dedicated to St. Mary and St. Nicholas, was consecrated on the 9th inst.

IT is of Byzantine architecture, coeval with the Norman of this country, i. e. of the eleventh century. It is 150 feet long, 50 wide, and 57 feet high internally, and is entirely faced with freestone, the inner portion of the walls being of brick. It stands upon a plat-form running all round the church, and is ap-proached in from thy a flight of size stars of proached in front by a flight of six steps of Portland stone, the lowest steps being about 100 feet in length. The plan consists of a central porch, a nave, side porches and aisles, chancel, chancel aisles, and three apsides, with a vestry and a bell campanile connected with the church merely by an open cloister, which is very richly ornamented, and consists of double columns on each side, standing on a basement or plinth. The huilding as a whole, externally, presents an imposing aspect, standing, as it does, isolated in the midst of an extensive area, and the general effect is unim-paired by the contiguity of other and incongruous buildings. The church stands well back from the street, from which it is divided, close to the footway, by a low wall, surmounted by handsome iron railings. The elevation on this side has three rich door-ways, in recessed arches, the principal one being elaborately carved with six columns. In the centre are a series of small windows, lighting a passage

 Morini Sacram. Pœnitentiæ. Paris, 1665, p. 768.

THE BUILDER

and staircase at the back of the gallery; a rose window, 16 feet in diameter, with twelve compartments richly carved, having the four evangelical emblems at the angles, fills the centre.

The clerestory is supported on columns of Bath stone, having capitals of rich and varied sculpture, executed with most delicate skill. Semicircular arches, and a row of triforium windows lead to the windows in the clerestory. The roofs of the naves aud aisles are of open wood-work, the external covering being of slate.

The pavement of the centre aisle is inlaid in a series of ornamental crosses, and the chancel floor is covered with a mosaic pavement in rich and varied colours and design, approached by a flight of six steps from the nave. From the chancel, three Italian marbles steps, 18 feet in length, lead to the central apse, which has also a most splendid inlaid marble pavement, and is richly ornamented by marble columns, forming a reredos of seven panels, which are thus filled:—In the centre, the Cross, with the inscription, "He was wounded for our transgressions;" in the four adjoining compartments, the Lord's Prayer, the Creed, and the Beatitudes; and in the two extreme panels, the Cross, and other scriptural ornaments illuminated by Mr. Osmond, jun., of Salisbury.

The font is of various coloured marbles. The desk, from which the lessons are read, stands in the centre aisle, supported by a large carved and gilt eagle, standing upon a pedestal ornamented with mosaic panels. The pulpit, which forms a quarter of a circle, and is concentric with one of the stone pillars of the nave, is perfectly unique. Nine marble columns, with carved alabaster capitals, form its support, surmounted by a freize and cornice in Caen stone, with a row of twisted marble columns richly inlaid in curious tesselated ornamental work, partly in marble. The desk is of wood, richly carved in groups representing the Apostles, in bold

The chancel rails afford a kneeling space of sixty feet in length, and the communion-table is the one hitherto used in the old church.

One of the chancel aisles contains a choir organ, recently enlarged and altered by MT. Bevington, of London, assisted by Mr. Prangley, of Salisbury. In the apse of this chancel aisle is a large and massive parish chest of ancient workmanship; and the opposite chancel contains several large and handsome monuments of members of the Pembroke family, removed hither from the old church.

The country owes, thanks to the Right Hon. Sidney Herbert for the erection of this costly structure, and we congratulate him on the manner in which his intentions have been carried out by his architects, Messrs. Wyatt and Brandon. The builders are Messrs. D. and L. Jones, of Bradford. Mr. Edmund Spurr was clerk of the works. The coloured decorations were executed by Mr. Willement.

THE NEW THEATRE ROYAL, MANCHESTER.

THIS building, erected in Peter-street, in place of that in Fountain-street, lately destroyed by fire, was opened on the 29th ultimo. The architects are Messrs. Irwin and Chester, of Manchester, and the building has been constructed by Messrs. Pauling and Henfrey. The external dimensions are 200 feet in length, on the longest, and 171 feet on the shortest side, and 69 feet in width. Exclusive of the rooms and hotel, at the back, the theatre is about 155 feet in length. Though the area little exceeds 1,400 square yards, the space is more available than that of the late theatre, which was nearly 1,800 square yards. The internal dimensions are :- from the back wall of the centre box to the back wall of the stage, 120 feet, and between the side walls of boxes 55 Mr. Beazley has expressed his opinion,† feet. that a theatre should not exceed 50 feet in diameter from box to box, or 55 feet from the curtain to the front box, considering this size the best for sound, and scenic effect. He prefers the form approaching the horse-shoe. In the new theatre, from the curtain to the

training the second product of the Committee on Dramatic Literature. 1832.

balcony of the centre box is 45 feet, nearly 4 feet less than the old theatre; and across the pit, between the boxes, the distance is 40 feet. The centre boxes are 15 feet deep, with six rows of chairs:—the upper tiers of boxes have seven rows of seats. The ceiling of the theatre is 48 feet above the floor of the pit. The stage advances towards the house in a curved form on the plan, 15 feet in advance of the curtain, and is 75 feet from the "float" to the back wall. The form of the horseshoe is very slightly contracted at the proscenium, as in the English Opera House, and is presumed to be very favourable for the effect of vocal performances. The theatre is built of brick, with a lofty stone front in Peter-street. This consists of two Corinthian columns in antis, inclosing a recessed portico, and supporting an arch. The entablature returns round the back of the portico, in the centre intercolumn. The whole is surmounted by a plain pediment, not forming part of the order. The building, being isolated, has better arrangements for ingress and egress, than often we find in London theatres. The audience part of the house consists of four tiers, and the pit floor. On the floor, which has a fall, towards the stage, of 2 feet 6 inches, are the stalls, the orchestra, and the pit, which last extends under the boxes. There are two tiers of boxes, with the slips, and lower gallery above, and an upper gallery in the centre, formed within the roof. The supporting pillars to these tiers are placed at the back of the boxes, so that there is no impediment to the view, and it was here that all the skill of the architects was called for. Iron girders are employed to support the overhanging fronts the boxes, tailing into the work an equal distance in the opposite direction, and being firmly screwed down at this extremity, and tied by a rod of iron to the lower part of the work, and further weighted down by a pile of brickwork. Omitting the hotel, the rooms in the theatre include two green-rooms, dressing-rooms, wardrobe, and costumier's room, treasury, manager's room, and others. The carpenter's workshop is in the roof over the pit : the property-man's room, the painting-room, 64 feet long, by 15 feet wide, with its two large "frames," each 40 feet by 22 feet, are above the stage and rooms at the back: the gas-fitter's and smith's places, and rooms of the supernumeraries are in the lower floors; and beneath the green-room is a tuning-room, where the band can practise, without being heard by the audience. The building has taken longer to complete than was expected, being commenced in October 1844: it should have been completed by the 1st of July last, and even now the saloons are incomplete. Adjacent to the saloon of the dress circle, is a cloakroom for gentlemen, and retiring rooms for ladies. These apartments are to be fitted up, in a costly manner, with marble chimney pieces, with black and gold, and will be lighted by handsome cut-glass chandeliers. The dimensions of the saloon of the upper boxes are 30 feet by 17 feet, and in the centre the roof is vaulted in a semicircular arch, springing from an enta-blature, which is supported by Corinthian columns. The ceiling is panelled, and en-riched with ornaments. The accommodation in the audience part of the house is as follows:—The stalls will seat seventy-seven persons; the seats in the pit, in eleven rows, will seat 500 persons. The dress circle contains 300 chairs, and is entered by nine doors. The next tier will accommodate about 350 persons, exclusive of two private boxes, which are on the same level. Neither of the tiers have the usual box barriers. The next tier have the usual box barriers. comprises the lower gallery, and the slips: the former will hold about 450 persons, and the latter 110 persons. The upper gallery will seat about 300 persons. The private boxes are eight in number,—four on each side the house. The larger boxes are furnished with twelve chairs each, and the smaller with six chairs. Three boxes on each side are in the proscenium. One of these is the proprietor's box, having a stair adjoining, leading to near the station of the prompter, and a window, looking on to the stage. Each of the six proscenium boxes has ante-room with fire-place. Though the an number of persons able to be accommodated has been stated, as above—in the total 2,147 persons,-the number present on the opening night was 2,468 persons.

The stage has a rise of 2 feet 9 inches in

the 75 feet, from front to back; and in this part of the house are many improvements in inechanism. The side scenes or "flats," which at Drury-lane Theatre are preserved in the large space at the back of the stage, are here so contrived as to ascend or descend, and the ground has been excavated 21 feet below the level of the stage for the purpose. About 8 feet below the stage is a mezzanine floor, useful in the working of the "traps" required in pantomimes, and for the disappearance of spectres. The traps are all on an improved plan, and are worked by counterbalance weights. The largest trap is 30 feet in length, and will ascend above the stage ; - it is worked by a large windlass in the basement floor. The whole of this part of the building is ad-mirably contrived. The whole of the interior decorations were from the designs of Mr. Chester, and were executed by Mr. George Jackson, of Manchester. The style is Italian, with a character of *renaissance*. The fronts of the different tiers are enriched with scrolls of the different tiers are control pierre, of excellent design, executed in carton pierre, and gilded. There is great variety in the designs, and they are well relieved. The colours employed are almost exclusively white and gold. The proscenium is enriched with pilasters, surmounted by a circular pediment, its tympanum filled with elaborate decoration, and having on each side a gilded statue. The whole of these decorations are of the richest. description, and are in the highest degree creditable to Mr. Jackson. It is stated in the Manchester Guardian, that upwards of 2,000 books of gold leaf were consumed. The large chandelier, and the smaller ones, were all de-signed by Mr. Chester, and were supplied by Mr. Agnew, of Manchester. They are of ex-cellent design. The largest cost about 150/. As a provision against fire, a large reservoir has been constructed on the roof of that part of the building, which is behind the stage, The roof itself—by means of parapet walls, conted with a species of asphalte, termed Paraqua, has been converted into one cistern, which will hold a depth of water of 18 inches, in all about 20,000 gallons. A large iron pipe descends from this enormous tank, with openings, one on the level of the green-room, and the other on the stage, near the hall door. Each orifice is prepared to receive a long canvass tube or hose, which is suspended close

by, and can be attached in a few seconds. Thus a copious supply of water is obtained, which can at once be directed to any part of the theatre. From inquiries, from parties present in the pit, on the opening night, we find, that the warming and ventilating ar-rangements are there of the best description. From a visit to the upper and lower galleries on another evening, we can assert, that the ventilation is much more perfect, than usually found in such elevated regions. This part of the work was executed by Mr. Wm. Walker, of Manchester. Cold air, being admitted into the basement, is there heated, and admitted separately to all the different parts of the house; the vitiated air is discharged by shafts, and apertures on every floor, and by separately we have a separately we house; the vitiated air is discharged by shafts, and apertures on every floor, and by a large aperture in the ceiling.—The cold air is admitted by two window apertures into the vault, in which is placed a large furnace. Over this is a water-boiler, with connecting nines to heating boxes. There connecting pipes to heating boxes. There are five heating boxes, each of which con-tains upwards of 200 square feet of heating surface, within a comparatively small space; and to attain the same amount of heat, under the old plan, would have required a large chamber. Of this system we shall probably give some further account. From these boxes, five brick shafts proceed beneath the pit, in various directions, branching off to the different parts of the house, and by means of perforations in the floors, the warm air is distributed equally. There are internal openings, within the ceiling of each tier for the discharge of the vitiated air, and all these are connected with the main shaft, which is of considerable diameter, and passes out through the roof, above the aperture over the large chandelier.

The total cost, including land, building, furnishing, and fitting up, will reach 23,000. The work is in the highest degree creditable to the architects, who have interested themselves in all the details with **meal** and success. We are glad to hear that they were presented with testimonials on the opening night.

^{*} We have to acknowledge the attention shown to us by the architects, during several examinations of the building, previous and subsequent to the opening. We suppose that their very arduous duties prevented their supplying us with the data, and dimensions, promised, and which we nave here taken from the *Manchester Guurdian*. But, we are assured by them, that the data given are substantially correct.

TABLE For facilitating the Computation of Cast-Iron Beams ; such as are usually employed for Bearers in Buildings and on Railways.

DESCRIPTION AND USE OF TABLE.

FOR CALCULATING STRENGTH OF

CAST-IRON BEAMS.

THE numbers in the foregoing table are of the greatest use in estimating the strength and dimensions of cast-iron beams, when employed as girders or breastsummers in large and important structures. They have been computed for the limit of safety, from the results of experi ments performed on a medium quality of the material, and may therefore, be considered as better adapted for general practice, than if they had been obtained from metal approximating to either extreme of hardness or softness, and in consequence possessing a higher degree of rigidity or flexibility, according to the nature of the approximated extreme. The numbers in the body of the page are expressed in tons and decimals of a ton; those in the left-hand column are inches in the depth of the trans-verse section, and those at the top of the co-lumns, numbering from 0 to 9, are tenths of an inch also in the depth of the transverse section, so that the table embraces a depth of sec-tion for every tenth of an inch from zero to forty-nine inches, and is, consequently sufficiently extensive for every practical purpose, as it seldom happens, even in the very largest works, that a section is required exceeding four feet in the direction of the strain.

The chief advantage which this table poshave long been in use, consists in its brevity and the extent of its application; and these advantages it derives from the circumstance of being computed for one inch of thickness or breadth of section, and one foot in the length of bearing or distance between the supports; this in some respects, is a very great convenience, and more especially, where extensive calculations are necessary; but it is in some degree objec-tionable, as it requires a subsidiary multiplication and division to obtain the final result; this objection however, has very little force when placed against the advantages which are otherwise afforded by the arrangement.

The following examples will elucidate the use of the table under various circumstances, and,

being of a practical nature, it is hoped they will be found of value to the mechanic, in guid-ing him to the calculation of similar cases that y happen to present themselves in the course ma of his practice.

Example 1. - A cast iron beam of a regular rectangular form both in elevation and section, is loosely supported in a horizontal position on two walls at the distance of 26 feet from each other; what load will it sustain with safety applied at the middle of its length, or at an equal distance from each wall, supposing the breadth of the section to be 21 inches and the

depth 30 inches? Now, the arrangement indicated by this example is perfectly obvious, and therefore requires no diagram to illustrate it; and the argument with which the table is to be en-tered is simply the depth of the section in inches; consequently, under zero or 0 at the top of the table, and opposite 30 in the left-hand column we find the number 342, which is the number of tons that a beam of the same depth to the table, is use will compose the same depth as that which is given will support, when the breadth is one inch, and the length of bear-ing one foot. But, according to the laws of resistance, the strength is directly as the breadth when the depth is given, and inversely as the length of bearing; that is, multiply the tabular strength by the given breadth of section, and divide by the length of bearing for the weight which the beam can sustain with safety under the given conditions.

Hence we have $342 \times 21 = 855$, and this divided by 26, gives $855 + 26 = 32\frac{23}{23}$ tons, the load that the given beam can sustain at the middle of its length; but this includes the effect pro-duced by the weight of the beam itself, which ought always to be taken into consideration; for when omitted, as is too frequently the case on many important occasions, the omission may be attended with very serious consequences.

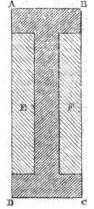

It is demonstrable by the principles of weight of the beam itself in augmenting the strain, is the same as if one-half that weight were applied to the middle of its length, and in consequence of this mechanical condition,

the calculated strength must always be dim nished by half the weight of the beam, whe that weight itself can be determined, which indeed can always be done when the dimensions of the beam are known. Now in the present instance, the area of the middle trans-verse section is 75 equare inches, for $30 \times 2\frac{1}{2}$ =75, and since the section is uniform throughout the length, the weight of one foot in length for cast iron of medium specific gra-vity may be taken at 240lbs., that is, 3.2lbs, for a bar one inch square and one foot long; consequently, for 13 feet or half the length of the beam, it is $240 \times 13 = 3,120$ lbs. or $1\frac{1}{14}$ tons, for the effect produced by the weight of the beam, therefore, by subtracting this from the beam, therefore, by subtracting this from the calculated strength, we get $32\$\frac{2}{3}-1=\frac{1}{3}$ $31\frac{1}{3}\frac{2}{3}$ tons, the sufe load on the middle of the beam.

Now, all this is perfectly obvious when a beam of the given form is supported at the ends and loaded in the middle of its length, but when the load is uniformly diffused between the points of support, the load as calculated above may be doubled without pro-ducing any difference in the effect of the straining force as referred to the central rupture, the deflection only being varied in conse-quence of the uniform load. But if the ends of the beam be firmly fixed into the walls, instead of being merely supported on them, then the load which it can safely sustain under this latter condition, when applied at the middle of the length, is one-half more than when the ends are loose, and the same thing holds when the load is uniformly diffused throughout the length.

However useful the foregoing table may be when applied to the calculation of beams of which the transverse section is simply rectangular, it becomes much more so when applied to beams of that form of section now so generally employed in flooring and in the construction of railways, viz., those which have a flange or feather on the upper and the lower side, known as the double flanged, or **I** formed section.

The formula which supplies the rule for this form of beam is of rather a complicated character, and in consequence is somewhat difficult to apply; but when we consider the section as being equal to the difference be-tween two rectangular sections, the difficulty disappears, and the calculation is performed by our table with the greatest imaginable case. The section thus consti-

tuted is represented by the dark shaded part of the marginal figure, the lighter shaded parts E and F being left out to form the feather or flanges at the upper and lower sides of the beam.

Here then it is obvious that if we consider the section to be an entire rectangle, as denoted by ABCD, the strength of that section may be calculated as in the preceding case. And, in like manner, the parts marked E and F may either be considered as forming two in-dependent rectangular sections, or they may be brought

together and considered as one section only, being of precisely the same value as to strength in either case; then, if the strength of the rectangular section, which is made up of the parts marked E and F, be subtracted from the strength of the entire section ABCD, the remainder will be the strength of the double flanged or I formed section so universally employed in the construction of railway arches. It may, however, be proper to remark, that the strength of the section denoted by E and F, must undergo some modification before the subtraction takes place, for it is a well established fact, that the metal which is to be withdrawn, is not in the same mechanical condition with respect to strength when incorporated with the mass, that it is when considered by itself, or in the state of detachment; it therefore becomes necessary to reduce the strength of that which is to be subtracted when calculated by the table, in the proportion of the whole depth of the section, to the depth shaded portions, E and F. Example 2. Let the whole depth of a double

flanged beam of uniform section throughout the length, be 38.7 inches, and the depth of the middle part, or that between the flanges 2.5 inches; what weight will it sustain at the middle of its length, supposing it to be supported on two props 36 feet asunder, the whole breadth being 9.3 inches, and the thickness of the middle part 3.1 inches?

Referring to the table opposite 38 inches in the left hand column, and under '7 at the top, we find the number 569'1222, which being multiplied by 9'3, the whole breadth of the section gives 5292'83646 tons, for the strength of a beam of the given section considered entire, one foot long.
