of a beam of the given section considered entire, one foot long. From the whole breadth of the section, subtract the thickness of the middle part, and we get $9\cdot3-3\cdot1=6\cdot2$ inches, for the breadth of the section composed of the two portions marked by the letters **E** and **F**, of which the depth is $32\cdot5$ inches; then opposite 32 in the left-hand column and under $\cdot5$ at the top of the table, we get $401\cdot375$, which being multiplied by $6\cdot2$, gives $2488\cdot525$ tons, for the strength of a beam of the section $32\cdot5$ by $6\cdot2$ inches, and 1 foot in length; but before this strength be taken from that of the whole section previously calculated, it must be reduced in the proportion of the depths; thus we have

38.7: 32.5: 2488 525: 2089.84657 tons.

Let this therefore be taken from the strength of the whole section, and let the remainder be divided by the length of bearing, and we get $(5292 \cdot 83646 - 2089 \cdot 84657) \div 36 = 88 \cdot 972$ tons nearly.

And in this way may the strength of any other beam of the same form be calculated; thus avoiding the difficulty incident to the formula and the rule deduced from it; and by reversing the operation, the dimensions may be found to sustain any required load, when certain other dimensions are given. T.

REMAINS OF THE FRANCISCAN FRIARY AT READING.

At the late meeting of the Archæological Institute, Mr. John Billing, architect (of Reading), read a paper on the history and present state of the friary in that town, the interesting ruins of which building are seen on approaching Reading by the railway. The following is the substance of the communication :--

At the north-west extremity of the town of Reading stands what was formerly the house of the Friars Minors. It was a religious foundation of the Order of St. Francis, which was introduced into England in 1224—the eighth year of Henry III.,• and was founded in Reading in 1233.

By a deed, dated that year, † July 14, Adam de Lathbury, then abbot, and the convent of Reading granted to the Friars Minors in Reading "a certain piece of waste ground near the King's highway leading to Caversham-bridge, containing thirty-three perches in length, and twenty-three in breadth, with a permission to build and dwell there so long as they should continue without acquiring any property of their own;"—but as the deed recites—"if at any time, by any accident, or by any means, it should come to pass that the Friars Minors should have any property, or any thing of their own, they have agreed for themselves and their successors for ever, that it should be lawful for us and our successors, by our own authority, to expel them from every part of our land, without the hinderance of any contradiction or appeal."

Under the same penalty of expulsion, the friars "were bound not to seek any other habitation on any part of the abbey lands; nor to extend the limits of what was already granted them; nor to request any thing but what was gratuitously and spontaneously allowed them; nor to receive any oblations, tithes, or mortuaries due to the abbey. If the friars should be expelled by the monks of Reading Abbey for any other causes than those above-mentioned, it was agreed that they should be rein-tated by the King's authority, and enjoy in their own right what had been granted them by the abbey. If the friars should voluntarily relinquish their habitation, the buildings and site of the edifice should belong to the abbey."

> * Leland's Colectanea, vol. iii., p. 341. † Cotton. Library. Vespasian, E. 25.

By a subsequent deed, another piece of ground was granted them, immediately contiguous to the area already occupied by them; the conditions are the same as in the former grant, except the addition of a clause restraining them from interring in their cemetery, church, or any other place, the bodies of the parishioners of the monastery, or of any other of the churches belonging to the abbey in the town of Reading, or elsewhere, without special licence. This deed is dated the 7th before the Kalends of June, in the year 1285.

In 1288⁺, Robert Fulco left by will to the Friars Minors in Reading, certain void pieces of ground in New-street, now Friars-street, adjoining to their former possessions. Edward I., in his thirty-third year, 1306, issued a precept to John de London, clerk, constable of his Castle of Windsor, to this effect— "Whereas our beloved and faithful subject, Robert de Lacy, Earl of Lincoln, hath given to our beloved in Christ, the friars minors residing at Reading, fifty-six oaks of the most proper for building timber in his wood of Asherigge, which is within the limits of our forest of Windsor, we command you that you permit the said friars to cut down the said oaks, and carry them wherever they please, and consult their own convenience in the same. Witness, the King at Odyham, the 11th day of January. The buildings for which this timber was required were not completed before 1311, as Alande Bannebury, who died at Reading in that year, bequeathed by will "operi fratrum minorum," to the work or building of the Friars Minors, five shilliners.

lings. We have no account of the building, nor of the number of the friars who resided in it; from the small extent of the ground, it was neither roomy nor elegant, content, agreeably to the spirit of their order, with the meanest accommodation for themselves, their principal care seems to have been to erect a house of prayer suitable to the religion they professed, which from its being more substantially built is the only part of their possessions which has withstood the ravages of time.

DESCRIPTION OF THE RUINS.

The church as it now stands consists of a nave with north and south aisles. Originally there was a chancel and a tower, as we are in formed by Dr. London in a letter to Thomas Lord Cromwell, dated Sept. 17th, at Reading, in the 30th year of Henry VIII., that "as soon as he had taken the friars surrender, the multitude of the poverty of the town resorted thither, and all things that might be had they stole away, insomuch that they conveyed the very *clappers* of the *bells*." All that now re-mains of the chancel is the arch and pillars, and this is partly bricked up in the wall of an adjoining house. There are no remains of a porch, but it is not probable that so large a church could have been destitute of this essential feature. The south doorway is of two orders, deeply recessed, and consists of a suc-cession of deep hollows with two members of what has been called the "pear-shaped moulding." There are no jamb shafts, but the mouldings continue down the jambs and die away on the plinth.

The walls are built of flint with stone quoins, and plastered inside. Externally the flint work is laid in regular courses and the flints split and squared. The skill and ma-nagement of the old builders, and the ease with which they made the most rugged materials bend to their purpose, was never better displayed than in the construction of these walls; the thin, narrow joints, sharp surface, and beauti-tiful appearance of the flint work far surpasses the best attempts of modern days, and proves, whatever else the church might have been, that it was at least the school of sound architects and good workmen. The aisles are separated from the nave by a stone arcade of five compartments, the two nearest the chancel being narrower and more acutely pointed than the others. The mouldings of both pillars and arches are very well worked and in tolerable preservation, and belong in common with nearly every other part of the church to the style of architecture prevailing in the early part of the fourteenth century, now perhaps better known as the "Decorated." The west window is by far the finest part

‡ Cotton. Library. Vespasian, E. F. fo. 55,

of the whole edifice, and even now, worn and dilapidated as it is, presents a beautiful appearance. The tracery is of a flowing character, simple but elegant, and when the west front was in its original state, the east roof complete, and the lofty tower in the back ground completing the picture, must have been as perfect a composition as any of its kind.

The aisle windows are of three lights with segmental heads; the mouldings are remarkably plain, but in this style we frequently find very beautiful and sometimes intricate combinations of tracery, with but mesgre and shallow mouldings; the heads are divided similarly to the west window, feathered and cusped. The label mould to these windows, to the west window and arcades, is precisely the same in contour, differing only in size.

The aisles terminated with the nave, and were pierced with one east window in each; of what kind we can scarcely tell, one end being so completely covered with ivy, that it defies penetration, and the other bricked up, shews nothing but the mere outline of the window, which differs from the aisles, inasmuch as it is longer and acutely pointed. There do not appear to have been any west windows to the aisles. No traces of the floor are visible, neither could we on digging discover any remains of pavement or tiles—the floor probably was taken up when the church was converted into a bridewell, the nave being divided off into airing yards.

It is to be lamented that this fine relic of ancient art is devoted to no better purpose than that of a prison. The present acanty church accommodation would be an ample reason for restoring it to a somewhat more decent state, and as the walls and arches are undisturbed, a small expenditure would render it at once fit for worship and an ornament to the town. As before remarked, the style is "decorated." The building was commenced in the reign of the first Edward, during whose dynasty, and that of the two succeeding monarchs of his name, Gothic architecture having worked itself free from the Norman, and the somewhat stift hough still elegant characteristics of the Early English, attained a degree of beauty and splendour univalled either before or since.

After existing for rather more than two hundred years, this friary, in common with the possessions of the monks of this place, fell a prey to the rapacity of Henry VIII., to whom, according to the deed of surreader, bearing the date of September 13th, 1539, the monks gave up the house with all its advantages, and finally relinquished their order.

After the surrender, Dr. London, in a letter to Thomas Lord Cromwell (Sept. 17th), said that the "honest men of Reading" had no place for properly administering justice, and begged that they might have part of the friary for that purpose :--- " Ther town hall ys a very small house and standeth upon the ryver wher is the comyn wassching place of the most part of the town, and in the session dayes and other court dayes ther ys such betyng of bateldores as one man cannot hear another, nor the guest here the chardg gevyn. The body of the home here the chardg gevyn. I he body of the house of the grey friers, wich is seyld with lath and lyme, would be a very commodious room for them, and now that I have ridden all the fasschen of that church in parcleses, ymages, and awltars, it wold make a gudly town hall. The mayer of that town, Mr. Richard Turner, a very honest gentill p'son, wh many other honest men hath exp'ssyed unto me ther gref in thys behalf, and have desyred me to be an hu'ble sutar unto yor lordeschippe for the same. If it sholde be solde the wallys besyde the coyn stones be butt chalk and fynt and the covyring but tile. And if it please the king's gr. to bestow that house upon any of his a vants he may spare the body of the church wich standeth next the strete very well, and yet have rowme sufficient for a great man." This application of Dr. London met with success in opposition to a request of his brother commissioner, Richard Pollard, who in a letter dated "Oron. ultimo Auguste," had thus written to Crom-well :-- "A frynde of myne, the warden of the grey friers in Reading, hath also desvred me to be an humble sutar for hym and his brothren, that they may, with your lordeschippes favor, also chainge ther garments with ther papistical manner of livinge. The most part of them be very agede men and be not of

strength to go much abrode for their livinge, wherfor ther desyre ys that yt myt please yr lordschippe to be a mediator unto the king's grace for them, and that they myght during ther lyves enjoy ther chambres and orcharde, and they would assuredly pray unto almyetic godde long to p's've the king's gr., and yr lordschippe to his most blessed pleasur." The king, in the 31st year of his reign, granted to "Robert Stanshame, one of the grooms of his chambre, and to his heirs and assigns for ever, the whole house and the site of the house of the Friers Minors, commonly called Grey friers, in Readyng, in the county of Berks, the whole burial place, houses, buildings, orchards, gar-dens, lands, tenements, trees, woods, lakes, vineyards, with all and singular the appurtenances there unto belonging, and also the site, extent, and precinct walls and ditches of the aforesd house of the friers minors, late so called, being round about and adjoining to the same, and the site and precinct of the house, including and containing in the used. same, and the site and precinct of the house, including and containing in the whole by esti-mation six acres." The body and side aisles of the church were granted by Henry VIIIth, by letters patent bearing date at Westminster, the 24th day of April, in the 34th year of his reign, 1543, " to the then mayer and burgesses of the borough of Reading and their successors in future," with liberty " to have, possess, use, and enjoy a competent and auficiant way to future," with liberty " to nave, possess, use, -and enjoy a competent and sufficient way to the said body and side isles of the late church aforesaid, rendering and paying yearly on the feast of St. Michael, the Archangel, the hun-dredths part of one knight's fee, and one far-thing into the revenue of the late augmentation court of the crown for all services, levies, or demands whatever to the intent that the mayor and burgesses of Rcading aforesaid might, at at their own proper costs thereof make and At their own proper costs thereof make and build, or cause to be made and built out of the same, one sufficient house there, commonly called the Guildhall." This grant is con-firmed by Queen Elizabeth's charter, with authority to the mayor, burgesses, and their successors, "to give, grant, alienate, convey in fee, exchange, or yield up the aforesaid body and side aisles of the said late church, and the way aforesaid belonging to the same to any way aforesaid belonging to the same to any person or persons whatever, or to convert, alter, and dispose of them to any other use." Some part of the building was probably con-verted into a Town-ball, and another part was made an hospital, or workhouse for the reception of children and old persons.

: =:

235 57 (62 -) It is now used as a house of correction for the town.

We cannot avoid repeating Mr. Billing's suggestion, that the building should be restored as a church, the more so, because accommodation in this respect is much needed by the town.

We shall shortly put before our readers some notes on other buildings in Reading, the results of a recent ramble there.

HISTORICAL ART AND FRESCO PAINTING

SIR,—You have taken a pretty considerable liberty with me, for you have actually chopped off my head and clapped on another that does not belong to me; at least, it is so that you have treated my name, making it begin with an R instead of a B; you must therefore now Bhead, and then it will be right. And pray is not Budownik a name honest and good enough for you? methinks it might be, since it is nothing more nor less than that of your journal, viz. THE BUILDER, only a little polished ap by being dressed à la mode de Pologne.

Tor you? methinks it might be, since it is nothing more nor less than that of your journal, viz. THE BUILDER, only a little polished **ap** by being dressed à la mode de Pologne. By your treatment of my poor head you have nearly put out of it what I had intended to say—n importe—I have pen in hand and must say something, any thing, so that it be not about railroads and shares. That awful epidemic of the day,

epidemic of the day, "When infants learn to lisp 'bout railway trains," I leave to others. But besides that, there is another mania which we are now endeavouring to rear up to the state of full-grown popularity. I mean that for historical art and fresco painting. Your correspondent B.'s scheme for perambulating exhibitions of cartoons, is, no doubt, a mighty pretty one, and might answer very well for a few seasons; yet what would be the consequence even supposing the requisite talent were to come forth at bidding? if after going so for a while in such preparatory exercise, both artists and the

public were afterwards to discover, that further and permanent employment could not be furnished for the followers of fresco? What buildings, either public or private, have we at present that are at all calculated to admit of fresco painting on a grand scale? Are there half a dozen mansions in all London, is there a single one among our political club-houses, suitable for the display of such decoration? There is, indeed, the Hall of Commerce, in Threadneedle-street; yet whether Mr. Moxhay would allow any of our *frescanti* to exercise their pencils upon its walls, may be questioned. Sir Robert Smirke, too, has taken especial good care, that they shall not think of contaminating with their brushes the purity of his own architecture, under the pretence of adorning the façade of the British Museum with "storied" compartments in fresco, as at the Berlin Museum, since he has made his colonnades far too shallow for shelter, and further, cut up the surface of the walls behind the columns with wiedows, though he might so have planned his building as to have no occasion for any at all in that front.

If we are even to have edifices adorned with frescos, we must rear the buildings themselves first. Or is it, after all, only a miniature sort of fresco painting that is contemplated for us P works on no larger scale than what would be suitable for panels in superior-sized drawing rooms. Wure such to be the case, fresco would not rise at all above the level of mere decorative painting; neither would such mode of embellishment at all be relished by our professional decorators, who find their account better in a constant succession of new fashions for rooms. Unless they were owners as well as occupiers, few even of the opulent would care to adorn the walls of their residences with works of sterling art, so circumstanced as to be incapable of being removed from one habitation to another. And as to mediocrity, mere namby-pamby figure-painting in fresco, neither taste nor art would be benefitted by our adopting it instead of fancy paper or silk hangings. Large historical subjects in fresco are fit only for exceedingly spacious apartments, and they should be anfurnished ones or nearly so, and not intended to be occupied as permanent sitting-rooms.

As to the beneficial influence likely to be exerted upon public morals by the cultivation of high art amongst us, I must confess that I am exceedingly sceptical upon that point. Was Italy a pattern-land to all countries for morality during the palmy days of art? History certainly does not favour any such a notion. On the contrary, the love of art has almost invariably tolerated a very great deal that is repugnant to correct moral feeling, and sometimes to decency. And though the more exceptionable productions of art, may not be injurious to those who can separate art from the impurity mixed up with it, the public are not yet arrived at that stage of exalted mental refinement which is requisite for such innocence.

Do, too, what we may, high historical art is not to be secured by any forcing process. Unless it is to be no more than an exotic hothouse plant in this country, it must have time to grow up naturally, and that will be work not of a few years, but of generations. It is true a beginning must be made, and the present period may seem a tolerably propitious one; but it is idle to talk as if, so we be but resolute, the desired consummation cannot fail of immediately following the mere beginning.

Now that I have scribbled thus far, I recollect one matter connected with the subject of architectural publication, touched upon in my first epistolary communication. It is probably supposed that the British Museum is well stocked with architectural literature, that there, if no where else, almost every work of any note or merit at all, foreign as well as English, in that department of study may be consulted. This is so very far from being the case, that that department is most shamefully defective,— I do not mean as regards scarce books of the kind—some of which, by the bye, are quite worthless, except as curiosities, but such as are procurable. I have sometimes made out a list of a score, or thereabouts, and on going to the museum, have not been able to find even one of them. To give you merely one instance, and if you are not already aware of the fact, you may be inclined to set me down for "a liar of the first magnitude,"—though the mile-long shelves of the British Museum, our national repository of literature, groan with loads of the veriest trash that ever issued from the press, it does not contain a work—an English one too—that made some noise in its day, and which was of no small influence in the regions of fashion and taste;—it does not contain — but no, you won't believe it, I don't believe it myself—I can't believe either the catalogues or the museum people, when they assure me that their library does not contain Thomas Hope's publication on "Household Furniture," a work of exquisite taste, and chef d'œuvre of outline engraving. Alas ! poor British Museum ! verily, thy condition is literally Hope-less ! BUDOWNIK.

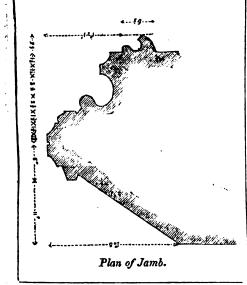

THE STUDY OF GOTHIC ARCHITECTURE.

A WRITER in the last number of the Athenæum, referring to the question lately mooted in our journal, as to the present exclusive study of Gothic architecture, has the following remarks :--

In the present rage for Gothic churches there is too much of ecclesiolatry-of a maudin sort of devotion towards the buildings themselves as edifices mystically sanctified, and which require to be mystically planned, in as which require to be mystically planned, in as strict accordance as may be with the religious fancies of our forefathers. Now if this imita-tive folly is to be persevered in, then instead of attempting to revive defanct architectural mysticism, we should study the general character and spirit of the style itself, whereas in modern Gothic churches we seldom obtain more than poor, tame, flat copies of good originals, and our modern Gothic architects are in general all the more prosaic in proportion as they attempt the poetry of the art. They have got into a wrong, perverse and unnatural course, inasmuch as they strive to substitute re-pro-duction for production, and pique themselves on fidelity, or what they take to be fidelity of imitation; which unlucky ambition may render them clever mimics, but never great performers. So long as they imitate, their works must remain not only in the rear of, but also at a considerable distance behind models whose artistic excellence arises in a great degree from the geniality of treatment which they display; whereas in imitations there is always something forced and artificial; and though individual parts may be all and each ac-cording to precedent, the *ensemble* will betray ignorance or neglect of the real idiom of the Gothic style. And such is too frequently the case with our modern mediæval churches: in scarcely any of them do we discover the mani-festations of a taste not only formed upon, but inspired by, a sincere study of the great works of the middle ages, and an intelligent appre-hension of their merits. The barren and passive taste that will serve for the antiquary becomes little better than artistic impotence in the architect; while the one can give himselt up with a sort of busy indolence and do-nothing industry to implicit admiration of what-ever belongs to the olden time, the other has to look upon the mediaval edifices not as express models, but as studies which may help him to the attainment of rival power and mastery of his own. Instead of so doing, our architects seem content either to hobble along upon antiquarian crutches-possibly very good crutches in themselves, yet merely crutches after all. In art, antiquarianism is like fire, -a good servant but a bad master; and unluckily, as we think, for architecture, anti-quarianism seems just now to be arrogating to itself a control over it-certainly the eccle siologists display a degree of enthusiasm, and of policy also, that contrasts very forcibly with the apathy of the architectural profession, who seem nearly deficient in that generous attachment to their art for its own sake, which would impel them to consult its best interests by encouraging the study of it. The opposite course of policy has been adopted by anti-quaries and ecclesiologists, and so far with success that it has given them a *status* in the literary and artistical world. Not only have they formed a public for themselves, and dif-fused a taste for studies hitherto regarded as either very trifling or very dull, but they anxiously minister to and cherish that taste.

THE BUILDER.

502

PERPENDICULAR WINDOW FROM BIR-CHINGTON CHURCH, THANET.

THIS church (which is dedicated to All Saints) contains little worthy of notice with the exception of the perpendicular windows, which are of good design. The best of these, the east window of the chancel, is the subject of the present illustration and by far the finest window in the church: the mouldings are better than those in many windows of even greater pretensions. The illustration consists of an exterior elevation of the window, with an enlarged plan of the jamb.

SUGGESTIONS FOR THE IMPROVEMENT OF SEWERS.

BY JOHN PHILLIPS.*

PREVIOUS to the commencement of the present century many miles of sewers, which are designated old in contradistinction to those which have been built since, were constructed with wide horizontal bottoms formed of bricks laid flat, or on edge, with thick upright sidewalls and semicircular arched crowns; and both the materials and the workmanship are of the worst possible description, and they are in a state of great dilapidation. Nearly the whole of these sewers, however, were put in at a time when the authorities did not exert much if any influence over their arrangement and construction, and when the subject was not considered to be of such paramount importance to the public as it is now held to be. Moreover, when these sewers were built, a system of good and efficient drainage and sewerage, based upon sound principles of science, seems not to have been understood or practised, consequently many miles in length have been put in without the least attention being paid to placing them in a proper position at their outfalls, or reference being had to their extension to the more distant parts of the districts. Indeed, it is manifest that many of them have been placed in the ground merely for the purpose of suiting their own immediate localities requiring to be drained; and even then (from their form being the worst that could possibly be devised), not with a view to providing good and proper facilities for assisting the discharge of the drainage and sewage carried into them from the surface and premises contiguous; besides they have been built so carelessly and irregularly, that the falls in many instances are arranged contrary to their discharge. The

extraordinary large eise and improper form of these old sewers are the cause of much of the great evil which still exists, for nearly the whole of them retain the matter discharged into them instead of affording means for carrying it off, consequently they are a vast system of stagnant cesspools, and a great pest, naisance, and expense to the inhabitants.

Although some improvement has taken place in the formation of sewers during the last thirty years, still many miles have been constructed, both as to arrangement and form, nearly, if not quite as bad as the old flat-bottomed sewers themselves, for vast numbers of those that are termed new are actually in the same abominably filthy condition as the old ones. The inverts of the form which superseded the old are curved, yet from these curves being exceedingly flat, the very diminutive and slender streams become spread over their surface, and therefore have, not sufficient velocity or power to lift up and carry off the matter: consequently, these hollow channels very soon become filled with soil, the flat surface of which as it accumulates, forms the artificial beds for the water to run or lie on.

Regurgitations, eddies, and retardations are caused in all streams which flow or strike into each other, where collateral channels are formed at right angles to recipients, and this irregularity produces considerable deposits of heavy matter and silt at those parts. Whenever the channels of sewers are formed in this manner, the deposits which will accumulate from the improper arrangement entirely destroy their efficiency, and that too for some distance on the up stream sides, according to the height of the accumulations, and the inclinations of the channels. Nearly all the old sewers, as also house drains, are connected with each other at right angles or nearly so, and indeed so are many sewers which are com-

Digitized by Google

See p. 475 ante.

aratively of modern construction; it has, however, been the practice during the last few years, to form the junctions with cants, and in some instances with curves, both being in a direction in accordance with the flow of the direction in accordance with the flow of the streams. From the very frequent opportu-nities I have of examining the condition of sewers, I have found vast numbers, in-deed I may say, as before observed, whole districts of them more or less choked with decomposed matter, and this naturally led me to inquire into the probable causes of their inefficiency; and from having well ex-amined into the causes of these deposits and accumulations, I am convinced that they are produced almost entirely from the improper form, arrangement, and exaggerated sizes of the sewers.

the sewers. It has been the practice to build what are termed first and second class sewers; and it would appear that precisely the same size and form of sewer has been laid down in numberless instances for draining short streets containing from twenty to fifty houses as have containing from twenty to fifty houses as have been built for the purpose of receiving the whole of the drainage from collateral districts. The great absurdity of this regulation has long been apparent and has frequently formed a proper cause of complaint. This system has been the cause, by the great and unnecessary expense, of preventing many densely popu-lated localities from being properly drained, many persons being led to seek drainage either surreptitiously or by cesspools, and the persurreptitiously or by cesspools, and the per-meability of the adjacent ground. Nearly the whole of the water which is discharged into these whole of the water which is discharged into these disproportionately large and short sewers, from the number of drains being few, passes off very slowly, leaving the soil behind, which, as it accumulates from time to time, ultimately stops up the sewer and the private drains as well; consequently the soil has to be removed from them at creat traville and expresses this from them at great trouble and expense ; which process has again and again to be repeated as they become choked up. It has been a regulation never to build sewers of less a regulation never to build severe of reso size than is sufficient to allow a man to pass freely along them; and it would appear that this has been the cause in a very great degree of the large sizes which have been adopted and continued for so long a time, consequently the form which would have accelerated the flow and prevented soil from accumulating within them, has not been generally adopted. Now, by judicious arrangements, a proper size can always be retained for that purpose, and, at the same time, the form and width of the inverts may be enlarged or contracted suitable to any exigency or discharge of water and sewage that may be required for

of water and sewage that may be required for any particular locality. Much controversy has arisen at various times respecting the best and proper transverse form for a sewer, and several forms, both rectan-gular, elliptical, and circular, with sometimes portions of these shapes blended together, have been suggested and used accordingly. But it would seen that the main question as regards strength and efficiency for discharging the sewage, has been by many persons, either misunderstood or entirely overlooked. Now it must be manifest to all that sewers should be arranged and constructed so as to facilitate the rapid passage of the soil to their outlets, it should therefore always be a question, when-ever a sewer is required to be put in, whether its arrangement of size, form, and fall, is calculated to impart sufficient velocity and scourculated to impart sufficient velocity and scour-ing action to the water so as to carry off or prevent the soil from becoming deposited upon its bed. Now, if the data for the proper size, form, and fall for a sewer be not ascertained, and these properly proportioned to the volume of water likely to find its way into it, the chances are that the force of the stream, from heaving extended will not be sufficient to remove being extended, will not be sufficient to remove the soil, consequently it will accumulate, and the sewer will ultimately become choked, and close up each house-drain.

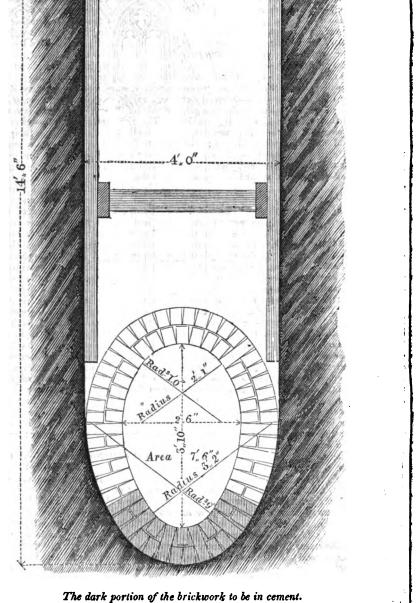

Economy combined with the utmost effi-eiency are the principal considerations which should be observed in the formation of sewers; should be observed in the formation of sewers; and it is remarkable that the best form that can possibly be adopted is not only the most economical and durable, but is also the most efficacious in carrying off the sewage matter. Besides it combines in its formation the greatest strength with the least consumption of material, and is at the same time strictly conformable to best strict and hydraulic princonformable to both static and hydraulic prin-

I strongly recommend for adoption ciples. the annexed section for sewers, being per-suaded from a strict examination of the prin-ciples of such structures, that it combines in its form great strength and power of resisting vertical and lateral pressure, economy of labour and materials, and facilities for ensuring labour and materials, and facilities for ensuring good, sound, and durable workmanship; but above all, and which is of the utmost im-portance, it affords great advantage to the velocity and scouring action of water, even when its quantity may be small; and with-out which advantages no structure of this nature can be effectual for the purpose of carying off the drainage and sewage. Al-though this shape is an approximation to the form of sewer now in use in the Holborn and form of sewer now in use in the Holborn and Finsbury divisions, still 1 believe it is rather

the water. From being subjected to considerable forces, and in order to sustain them, sewers should always be of the annexed form, or arranged upon similar principles. I shall now proceed to examine the nature of those

now proceed to examine the nature of those forces and their mode of action. When an upright cutting is made in the ground, the adjacent earth at the sides is de-pendent for its stability upon the nature of the soil and the power of cohesion which binds the aggregated particles to each other, as also on the dip or natural inclination which each succeeding underlying joint and stratum take with the horizon. The particles of ground from the surface downward differ more or less in their relative sizes and shapes, and are upborne and supported by those which lie directly underneath and contiguous to them, Finsbury divisions, still 1 believe it is rather better calculated to sustain pressures from the ground, and to impart greater velocity and inciting force to a given body of water; for the quently the hydraulic mean depth of the water would be greater than is afforded by that form; and, according to the principles of hydraulics, the velocity and power to scour increases in proportion to the square root of the height of

IMPROVED FORM OF SEWERS.

503

away, or slide down into the cutting, and the static line or slope formed by the fracture varies with the strata, and according to the nature and cohesion of the particles of earth; for all soils will stand at some angle or inclination peculiar to their character or formation. And when ground is cut into and left unsupported, that at the sides will not cease to crumble and slip until the lateral forces become destroyed, or until the power of cohesion and friction of the ground be in equilibrio with the forces acting upon it, the soil having then attained its natural slope, which is the angle of repose. The earth contained within the triangular

The earth contained within the triangular prisms on each side of the trench of a sewer, becomes detached in consequence of the natural or re-acting support being withdrawn by the cutting, and by the force of gravity each prism has a tendency to slide down the planes of natural inclination. These bodies of earth, therefore, in all cases require to be supported, for which purpose it is essential that the resisting force be somewhat greater than the pressure, for if the latter predominate, the structure will either be displaced or thrown down. From it being necessary to construct sewers at considerable depths in the ground, it is essential that they be of a form capable of offering a powerful and efficient resistance to both lateral and vertical pressures; but these are liable to much variation, being dependant upon the nature and compactness of the earth, and the angles at which they will stand.

It is desirable, therefore, that the walls of a sewer be arranged so that the lines of pressure fall within their substance, and not to touch the intrados; for if the pressure from the ground at a side be so great that its direction touches the interior surface of the wall placed against it at any point, nearly the whole of such pressure becomes concentrated, and acts at that point, and if the resistance of the wall be not greater than the pressure it will yield, and be forced from its position. For when a body is subjected to the pressure of another body, the conditions of equilibrium require that the reaction afforded by the former be equal and in an opposite direction to the pressure of the latter, otherwise motion will ensue.

Reclining curved walls, whose bases abut against each other, are considerably stronger for the bottoms and sides of sewers, and afford greater resistance to lateral pressure than walls that are built upright, at some distance apart, and parallel to each other. For according to the well known principle of mechanics, that when a body at rest sustains another body by one or more forces acting at given points, the re action of the forces will be in directions perpendicular to those points, or to the surfaces of contact, and these perpendiculars must meet either at the centre of gravity of that body, or in the vertical line which passes through it. Now, according to the foregoing principle,

Now, according to the foregoing principle, it is easily ascertained, by trigonometry or the composition and resolution of forces, that the rectangular wall, compared with the curved wall, has nothing like the same resisting power to counteract the pressure from the ground, consequently it would be from the ground, consequently it would be overturned or slide off its hed where the other would remain uninjured. Hence the necessity for adopting the curved form for the side walls of sewers in order to ensure strength, durability, and adequate resistance to lateral pressure. And where ground is of a clayey or slippery character the greatest pressures arise from that adjacent to the sides, therefore it is at those parts the greatest resistances should be placed, otherwise the walls must of necessity give way and be forced off their seats into the sewer. The quick off their seats into the sewer. The quick curved form of the ground itself under the invert and sides, assists very considerably in preventing that above from becoming displaced, and when the ground is liable to slip, this form keeps the line of fracture of the ground much higher, or causes the force from it to act where the sewer has the greatest power of resistance, namely, across its broadest part, or where there is most curve; and the inclination of the ground, as also the side walls, should be as obtuse as possible, as then these are better able to resist the lateral pressure. pressure. The greater external periphery of curved walls prevents them from being

lateral pressure is so great that the wall is liable to be displaced, that portion of it above the line of fracture must be lifted upwards off its bed, while a rectangular wall, under the same pressure, would be forced forwards.

From their superior strength in resisting adopted for retaining walls where stability and sound construction is sought for. And there being a direct similarity between ground pres-sing laterally against a sewer and that pressing against a retaining wall, it is evident that in order to afford the greatest resistance with the least consumption of materiais, curved side walls for sewers are of necessity the best and strongest ; besides, the arch thrown across them form abutments which afford forcible counteracting resistances to the pressures from the ground at the sides. Another great advantage of battering curved walls is, that when the ground at either side has a tendency to slip, be-fore it can do so it must upheave the side wall and the arch, with the ground upon it, the whole mass turning round like a hinge at the point of fracture, while a rectangular, or slightly battering straight wall would collapse or be forced forwards off its seat with much less pressure.

The ground adjacent to sewers, as well as that on the top of them, forms their natural abutments, for the pressure from one side re-acts against the pressure from the other, and the super-imposed weight on the crown counteracts the pressures from both sides, and thus the lateral pressures prevent that on the arch from forcing it downwards, and the side walls outcoards ; and the pressure of the arch and the load upon it prevents those from the sides forcing the side walls *inwards* and the crown *upwards*, and, therefore, when the sewer is of a proper form it is then capable of effectually resisting those pressures; provided the ground be properly excavated for the bed, the brickwork soundly executed and built to the proper curvature, and the walls efficiently protected by the returned ground being well and soundly rammed down around them, as then the sewers and the earth adjacent to them will be in a state of equilibrium with each other.

Under scarcely any circumstances should rectangular or straight battering walls enter into the construction of sewers, because, from being exposed to very great external pressures they are liable to be forced off their seats and to crack or collapse at the points of fracture, that is where the lines of pressure touch the inside of the sewer; and the resist-ance afforded by rectangular walls is de-pendent upon their own weight, the load upon them, and the cohesion and friction of the joints where the pressures act, consequently the effect of pressure at any point would be to cause the walls either to slide or turn round on an axis; and their power of resistance is merely that of extension only, whereas curvilinear brick walls are made up of a series of wedges, which tend to a central point, and contain outside the neutral axis a greater amount of material than there is inside of it, and which must be compressed, whilst the lesser quantity of material inside the neutral axis must be rent asunder or extended before the walls can give way, that is when the external pressure is equal at every part. Therefore the curved form not only affords greater resistance but bears trans-verse strains much better than rectangular walls, and consequently are better adapted to support earth, and that too with much less quantity of material because the perimeter of a circular wall is much less and contains within its circumference a greater area than that of any polygonal or rectangular figure. It would add much to the strength and durability of sewers were radiating bricks used in their construction instead of rectangular bricks, as bond could then be produced which would tie the walls together transversely much better than is done with half brick rings and heading courses, when these can be got in. The expense of making and burning this description of brick would not be more than 3s. or 4s. per thousand above the cost of common rectangular bricks, and were a large order given, the cost probably would not be more than 2s. 6d.

walls, should be as obtuse as possible, as then these are better able to resist the lateral pressure. The greater external periphery of curved walls prevents them from being fractured by the pressure of the ground acting against them; for as the radiating joints form an angle with the horizon, when

sufficient to prevent the pressure at the sides from upheaving or disturbing it; but when the arch is too flat the pressure upon it will force the side walls outwards if these be not properly protected. And again, if the arch rise too much, the lateral pressure will cause it to collapse at the sides or springings, and it will crack and rise upwards at top, but the pressure upon the arch is almost always sufficient to prevent this from occurring. A semicircular crown for a sower appears to be a mean between that which is too flat and that which is too bigh. But the semicircle is not the best form for supporting vertical pressure, for it has a considerable tendency, when the ground is not sufficiently firm or compact, to sink at the top and rise or spread at the haunches; and I have noticed that a great many arches of sewers of a semicircular form have gone exactly in this manner. Under these circumstances, there-fore, I think it is desirable to make the arch or crown of a sewer somewhat of an elliptical shape, with the longer axis upwards or approaching to the form of the equilibrated arch, as then the lines of pressure from its weight and the load upon it, are distributed more equably within its substance, and the resistance that this pressure affords is then thrown where it is mostly required, namely, across its broadest part; besides, by giving the urch this form, an opportunity is afforded for making the side walls more obtuse and of greater curvature, which greatly improve their power of resistance.

It is considered that a form of sewer which is suitable for one locality is not adapted for snother. This principle holds good only where ground differs considerably in its character; and attention need not be paid to it except on extraordinary occasions. Greater width and lateral resistance is needed where ground is very soft, clayey, or of a slippery nature, when it is desirable to conform to the shape of the circle; for a cylindric ring under every condition is the strongest form for resisting transverse pressure when it is equally divided around it. But the circle, although it is the strongest, is not the best and most efficient form for a sewer, as other conditions besides strength are connected with the subject; for the whole object of sewerage is to effect in a speedy manner the discharge of the drainage. Whatever may be the character of ground through which a sewer has to pass, its form should never depart from the principle of the arch whose properties should be the genises on which to design every hollow structure that is to have pressure acting around it.

In performing the practical operations of sewer work, it is essential that great pains should be bestowed upon the excavation of their bottoms. For in order that the brick work of the invert may be constructed to the proper curvature, it is extremely desirable that the bed of the sewer should be brought as near to the form of its outer periphery, and as correct as it is practicable to make it.

The discharge of drainage and sewage is wholly dependant upon the velocity, inciting force and energy of flowing water, which must in all cases have sufficient power to overcome the inertia or force of gravitation of the sewage matter, as also to sweep and carry it forward in mechanical suspension. Now the greatest amount of velocity and impelling force to which a descending stream, with a given inclination, can attain, depends on the least width of the development of the surface of contact; it is therefore of the greatest im-portance always to make the channels of sewers of a shape conformable to that which produces the utmost velocity and the least amount of friction or rubbing surface for the water to flow in. I shall bereafter proceed to examine the forms, arrangement, and construction of sewers with reference to this allimportant point.

THE WROUGHT NAIL TRADE.—The workmen of this trade, upwards of 15,000, made a stand last week for an advance of 10 per cent. upon their wages. Messrs. Caddick, of Coseley, at once told their workmen they would give it to them, and that they must not stand a single hour. Messrs. Caddick paid them the advance on Saturday last, and stated they hoped in a short time to be able to give a further advance.

EFFLUVIA FROM SEWERS.

SIR,-Despite the importance of the subject, I fear you must begin to nauseate the very name of, much less the effluvia from, sewers. I can only hope the old proverb vulgarly condemning too much stirring, will be reversed as regards our present subject; and as a proof thereof, I would fain hope some one of the Metropolitan Sewers Commission will at once take up the subject of sewer purification-and test the value or otherwise of the various propositions which have recently been put forth. With respect to the plan proposed in your number for the 4th instant, I cannot believe that any apparatus with gratings in connection with the carriage-way would be found to answer the purpose practically; and as respects the modus operandi of the machinery itself, I confess that, to my mind, the scheme lacks practicability, or, at least, a more lucid expla-nation, and I must still think that the air-flues or columns, with whomsoever the idea originated, are infinitely better calculated to ensure a permanently satisfactory result. And while on this point, without wishing to detract from "Mr. J. P.," or "Mr. J. L.," I would just ob-serve, and it appears to have been overlooked by the writers on these matters, that there seem to be no good reasons (especially if a draft be created in their favour) why these outlets for the gases should be confined to the site of the sewer itself, when branch pipes or drains might conduct them to any available spaces, such as court-yards (for which a rental might be paid), the blank sides of houses situated at corners of streets, public mews, and the like situations.

Before dismissing the subject of sewers, I would hazard a few remarks on a point which I believe has in some measure escaped our rather too zealous reformers. "J. L." tells us not to fear the bursting as resulting from the pent-up gases, and assures us that this re-oults rather from bad engineering and defecexist in our sewers; but, verily, I believe, this tune has been harped upon too loudly, and to a certain extent, unfairly (perhaps because the tune is popular); and we should bear in mind that when explosion takes place, no work (or it of the most cyclopean chamaterial), be racter, can altogether resist its force. I am at the same time free to admit that due attention should be given to the shape of the sewers; and there can be no doubt that the less straigh work be admitted into their form the better will they be enabled to resist pressure. I think, however, that many of the complaints would not be heard of if greater care where taken in building the sewers; such as doing the work in its place, instead of on a bench in the street, and paying due attention to the perfect bonding of the work, using hoop-iron pretty freely, and above all, giving the green work some-thing like a chance of setting, before either the contractor or the director of the works, proceeded to overwhelm it with the earth covering and backing. This earth backing should, in my opinion, be most carefully filled in and I am, Sir, &c., Oct. 14th, 1845. Συνεργος. .

FURNITURE WOODS .- The Lords Commissioners of her Majesty's Treasury have recently ordered that a parcel of partridge wood im-ported from Antigua be admitted free of duty as furniture wood. Their lordships have also ordered that a parcel of cherry wood recently imported from New Orleans be admitted duty free. These decisions, which are of very con-siderable importance to the importers of and dealers in wood used in the manufacture of furniture, have been communicated to the revenue officers at the various outports throughout the United Kingdom for their information and government with respect to future importations of these articles.

TABLEAUX VIVANS .---- Herr Keller with a number of models, male and female, is exhibitnumber of models, male and remain, is exhibit-ing at the gallery of Painters in Water-colours, Pall Mall East, a series of living pictures of extraordinary beauty. We advise all artists to see them; effects of light and shade are pro-duced which will give them hints of no mean ralue. Keller is evidently an artist himself value. Keller is evidently an artist himself and sets his figures with a power rarely seen.

AMENDMENT OF METROPOLITAN BUILDINGS ACT.

Sin, — The announcement in your paper of last week, the 11th instant, headed "The Offi-cial Referecs," must, I think, be gratifying to the building world; inasmuch as you state that it is intended to bring in a bill, early next session, to amend the Act,-that a third referee will be appointed, and that Mr. Higgins has consented to resume his office pro tem.

The necessity for an amendment of the present Act is more than generally admitted, and I trust a less vexatious, inquisitorial, and "Paul Pry" law will be enacted.

The original purpose of a Building Act was simply the prevention of extension of fire, and the framers of it may do well to bear in mind the legal adage, " de minimis non curat Lex." and not legislate on trifles, or interfere beyond what a wholesome care for the public weal requires, so that a man really cannot do what he likes with his own.

That a third referec is desirable, will, I dare say, be admitted, when we consider that two persons very frequently and fairly, differ in opinion; and a third person is required to de-cide. And as one of the understood advan-tages of the new Act was, that building matters would be referred to, and decided on, by per-sons professing that art, namely, surveyors, and not magistrates or lawyers, the necessity of calling in the registrar, who at present seems prominent, will not be required. The official forms, notices, and fees, may possibly also be abridged and lessened; they are now multifarious and heavy, pressing hard on the building public and all connected with the Act; who appear to have exchanged the rule of King Log for that of King Cormorant. At the same time it must be admitted, by the modifications that have in several instances been made, a right spirit seems to prevail. That Mr. Higgins remains is, I think, gra-

tifying, for a man more practically conversant with the subject, or fit for the duty, can hardly be found. He is not one of the mere Bureaucracy or martinet school, and his plain good sense and freedom from crotchets may tend to render the administration of the Act more practicable and less vexatious. He is also well known, and has so little

official hauteur—" Proceed hine ? proceed este, profini"—that his continuance in office will probably be hailed with satisfaction by all

whom it may concern. To whom, Mr. Editor, and yourself, these To whom, Mr. Eanor, and yourset, observations are respectfully submitted, by C. your obedient servant, October 13, 1845.

ON THE HISTORY OF STAINED GLASS.

At the archæological meeting before mentioned, a paper by Mr. Winston, on the painted glass in Winchester Cathedral and other local buildings, was read. The writer remarked that the design and execution of glass paintings are as capable of convenient classification as architectural peculiarities, and that he should refer throughout to the three great mediæval styles of glass painting, by the terms Early English, Decorated, and Perpendicular, each style being nearly contemporaneous with the several styles of architecture as designated by Rickman. The term Cinquecento he should apply to any glass prior to 1540, which exhibits in its details the peculiar style of ornament known by that name. The earliest specimens of English glass that he had met with at Winchester, are the two fragments probably of a border, worked in with other glass, in the west window of the nave of St. Cross, and two other fragments of a border over the door leading into the refectory. All this glass is of precisely the same character; and to be referred, he was of opinion, to the beginning of the thirteenth contury. A few small fragments of *later* Early English are at present contained in the cloister of the college. wo circles of Early Decorated glass are over the door of the refectory of St. Cross, and two or three more in the west window of the Cathedral. They are composed of plain pieces of coloured glass, disposed in a geometrical pattern, and prove how much of the *effect* of early glass is owing to the texture of the mate-He would add here, that it appears to rial. have been the practice formerly to glaze the windows according to the progress of the

work. Thus at York, the decorated glass in the aisles is earlier than that in the west window of the nave; and the Perpendicular glass in the aisles of the choir is earlier than that in the great east window. All the present glass in the side windows of the College Chapel is modern, as well as that in the east, with the trifling exception of two small figures, the head of an angel, and four other little bits of glass in the tracery of the window. Con-sidering the time when the glass in the east window was executed, it must be admitted to be a very good copy of the old. The art of making coloured glass was not so well understood then as now. Had the glass been copied now, it would only have been one degree better than it is. Its effect would still have been that of painted glass, exhibiting the drawing of the early part of the fifteenth cen-tury, and the colouring of the nineteenth instead of that of the sixteenth. The texture of all modern manufactured glass, uncoloured as well as coloured. is identical only with that of the sixteenth century, and is totally different from the texture of earlier glass. The prin-ciple of adapting the execution to the material pervades all ancient, and indeed all original manufactured work, and it is vain to imitate the drawing without also imitating the mate-rial in which the work is to be executed. Hence it is that modern encaustic tiles, whatever may be the date of the pattern impressed upon them, always appear to be of the date of the manufacture of the tile. The east window of the college library is of the time of Edward IV., and was moved to its present position from the south side of the college chapel. The arms in the refectory of St. Cross are of the latter part of the fifteenth century. Those of Cardinal Beaufort are uncommonly fine. The glass in the east window of the cathedral choir is perhaps a little earlier than 1525, and is the work of Bishop Fox, whose arms and motto, "*Est Deo gracia*," are introduced into it. This window must have been a magnificent one; but it is unfair to judge of it in its present state, when so little of the glass occupies its old position in the window. The top central light is filled with glass of Wykeham's time, and all the rest of the window with glass of Fox's time. In point of execution he apprehended the painted glass in this window was about as perfect as glass could well be. The library at perfect as glass in this window was about appendent the deanery contains some excellent specimens of heraldic glass of the time of James I., and Charles I., in which, however, the decline of the art of glass painting is very apparent.

FOREIGN ARCHITECTURAL AND COL-LATERAL INTELLIGENCE.

Schinkel's Works .- The writings and designs of this great defunct architect (member of the Council of State of Prussia), are now publishing in a form' worthy of his great genius. They are as follows:--1. Collection of all architectural plans and projections of Schieldel (Samplung architecturischer Ert Schinkel. (Sammlung architektonischer Ent-twürfe.) It consists of one hundred and forty-nine plates, which, in the *cheap* edi-tion, cost about 10*l*. Supplement thereto, twenty-six plates with text, about 3*l*. But this is still surpassed by a really splendid work entitled-2. Works of high architectureplanned and designed for execution. (Werke der höhern Baukunst.) The first portion of the work contains-Plan of a palace for the Acropolis of Athens. Ten plates of the largest size compose this portion of Schinkel's work. The second portion contains - Plan for the Imperial Palace of Orianda in the Crimmea, with fifteen plates of equal size.— No library of any public institution ought to be without these works.

The Scientific Congress at Naples is progressing well. Persons of the highest rank (dukes and such like) vie in rendering every assistance and service, a thing quite unusual with the hitherto Italian grundczza. On the 28th ult. took place the festival inauguration of the meteorological observatory on Mount Vesuvius—one of the most *original* institutions in the known world. The next will be the inauguration of the colossal statue of Religion (! !) on the new Campo santo at Poggio Reale.

On the 2nd Oct. the men of science will be gratified by the unusual sight of two excava-tions, which will be made at different places at Pompeii. Of the memoirs read we cannot state, at present, more than that, that of Pro-

fessor Thiersch, of Munich, on a MS. codex found at Bamberg, contains the conclusion of Pliny's natural history, hitherto considered lost.

Undermining of Streets at Paris.-Subterraneous Structures. — About a year ago, the district of Montmartre was thrown in great consternation, as on its east side several buildings seemed more or less menaced by a sinking of the ground. It was asserted, that the slope of the hill of Montmartre had been undermined by the works for quarrying stones, which are carried on to a great extent in and about the French metropolis. The affair be-came so serious, that the Préfet de la Seine, assisted by the chief engineer of mines (!) assisted by the chief engineer of mines (!) the chief inspector of quarries (!!) went on the spot to inquire what was to be done. The inquiry, however, shewed that the sinking of the soil was ascribable to the unsyste-matic quarrying carried on at a previous period. Still, several proprietors received orders to execute immediately some works for staying the damage done. During this and other implicit inquiries the actual state of the Carta similar inquiries, the actual state of the Catacombs (this subterranean Paris) has been ascomos (this subterranean Paris) has been as-certained, the details of which are very curious. The greatest length of these excavations, counting from their entrance at the Barrière d'Enfer, is one kilometer (two miles.) But from this main line branch off a great many other shafts and quarries; and extend under a large portion of Paris. Some of these works are 5 or even 600 years old, and for ventilating them pits are pierced into the open air. This quarrying is now (very properly) under the surveillance of Government, and no quarry can be abandoned, without proper measures being taken for the safety of the superincumbent earth. In places where there are no houses, the quarry is sunk into itself, if we may say so, by the supporting pillars being cut off, when the roof falls down, and then only the soil thus disturbed is smoothed and planned. If houses exist above, then, of course, the pillars are to be strengthened. The budget of the city of be strengthened. The budget of the city of Paris bears every year a sum of 100,000 francs for these works of consolidation. This applies only to quarries, which lie underneath pub-lic roads; but if any sinking of soil is to be apprehended on the spot where houses are built, then the proprietors must bear the expense. To find one's way in these galleries, is rather difficult now although they how the expense. To find one's way in these galleries, is rather difficult now, although they bear the namescorresponding to the streets, and numbers similar to those of the houses above. But their is now a plan in preparation which is exwhich will faithfully represent all the ramifi-cations and ganglia of the huge network of

subterraneous Paris.—Gazette des Tribundar. Street-cleanliness; Regulations at Paris.— Although we know full well, that to lay down regulations and to have them observed, are very different things—still, we believe, that the following notification, issued at the beginning of the present month, by the Prefet de Police of the French capital, will shew what attention is paid to these matters by the French authorities. The Ordonnance begins by stating, that the sweeping of the public thoroughfares has to take place from the 1st of October to 31st of March—between seven and eight A.M., and at no other time. The footways are to be scraped, swept, and washed; and the conduits to be kept free from all impediment for the efflux of water, &c. After some other points of usual purport—the Paris authorities so contrary to cleanliness and decency, the administration has authorised or caused the construction of urinals in several public thoroughfares, especially on the Place de la Concorde, the Boulevards, and many of the Quays."

Public Recognition at Berlin.—On the retirement of the actual privy councillor, Beuth, the professors and teachers of both the institutions, which owe him their creation, at least vigorous re-organization—viz., the general building school (allgemeine Bau-Schule), and the industrial (artisans) institution, have resolved on presenting to that worthy statesman and man a token of their respect and love.

Ancient Canal and Tunnel of the river Kuran, in Persia (Susiana).—The design of those stupendous hydraulic works,—derived from Oriental authors and a minute personal observation by Major Rawlinson (as contained

in one of his communications to the Royal Geographical Society), seems to have been the following. It would appear that Andeshir the following. It would appear that Andeshir Bábegán, or his son, excavated a deep and wide canal to the east of the city of Shuster, and thus divided the waters of the river. The artificial stream was derived from the Kuran immediately above the town; but the city, situated diately above the town; but the city, situated on rising ground, between the two arms, could have been but indifferently supplied with water, and a further undertaking, therefore, was necessary to remedy this evil. A massive was necessary to remedy this evil. band or dyke, accordingly, was thrown across the original bed of the river, at the distance of about half a mile from the mouth of the canal, narrow outlets or sluices being left for the passage of a certain portion of the water. The consequence of this was, that the great body of the river was forced back into the artificial derivation. Another band was then thrown across the mouth of the canal, forming, as it were, a continuation of the line of the original bank, and raised precisely to the same height as the lower dyke. Here, too, the passage of the water was regulated by sluices; and the entire bed of the stream being now formed, as it were, into a vast reservoir, the mouth of a tunnel was opened into it (!), which had been excavated directly through the hill of sand-work forming the left bank of the river, between the two bands, and below (!) the level of the water thus artificially elevated. A copious stream, of course, immediately ran into the tunnel, and sufficient water was thus obtained for the supply of the town and the cultivation of a vast tract of country. Before either of the bands, however, were undertaken, and when the whole body of the river must have flowed in the artificial canal, the mouth of which had probably been deepened for that purpose, that part of the original bed between the two dykes which was intended to form the great reservoir was paved throughout with massive hewn stones, fastened with metal clamps, to prevent the further deepening of the river, and to give additional strength and security to the whole work. Such was this great work in its original conception. But as the course of the river has constantly changed, as either of the dykes became impaired and yielded a free passage to the water, the level of water in the great reservoir must, in that case, have fallen below the orifice of the tunnel, and thus, of course, it has become entirely useless.

CAUTION TO WORKMEN.

A journeyman copper-smith, named Evans, was summoned before Mr. Hardwick, Marlborough-street, for breach of contract with his employer, Mr. Styles, copper smith, Lisle-street, Leicester-square. Mr. Styles proved that the defendant entered into a written contract to engage himself for six months at the wages of 23s. weekly. The defendant came to work two or three days, and then left him entirely. The nephew of the complainant proved that he was the means of procuring the defendant employment at his uncle's place of business. He had met the defendant accidentally one morning; the defendant had applied to him to get him a job, alleging that he had left his situation at Messrs. Pontifex's on account of disagreement about money matters. He had taken the defendant to his uncle's shop, and the defendant had obtained an engagement at advanced wages. Mr. Pon-tifex said the defendant had some time previously engaged himself to him for some months. He had been at work at his shop, and had only gone away for a periodical "fuddle," which generally lasted a week, and it was while on his drunken ramblings that he had been apprehended by Mr. Styles.

Mr. Pontifex said the railroads made the trade so busy, that it was of importance not to lose the services of even one man. He hoped the defendant would be obliged to fulfil his original engagement. Mr. Styles said he had no vindictive feeling towards the man, who was otherwise a good workman, and, when not drawn away by liquor, a steady man. But it was important to teach journeymen that they must not, after having engaged themselves to an employer for a stated time,

* Such of our readers as may study these matters, have to observe that Major Rawlinson says, that the courses of the river and canal are *receised* in the otherwise accurate map of Kinneir. leave their work and upset business with impunity. Mr. Hardwick said the plea of intoxication,

Mr. Hardwick said the plea of intoxication, even had it been established, would not have excused the defendant's reprehensible conduct in forming engagements and breaking them at his pleasure. In order to teach him that he must not enter into engagements and break them capriciously, to the great injury of employers, he (Mr. Hardwick) would send him to prison for one month. The solicitor said Mr. Styles would of course pay the man his wages all the time he was in prison. Mr Styles said he would do whatever the magistrate required. Mr. Hardwick looked over the Act, and came to the determination, instead of directing Mr. Styles to pay a proportionate amount of the wages, of cancelling the contract altogether. The defendant was then committed to hard labour for a month.

Correspondence.

BUILDERS' TENDERS.

S1R,--I beg to submit to you the following tenders which were opened on Saturday morning, the 11th inst. at the architect's, Mr. Isaac Bird, 72, Scymour-place, Bryanstone-square; they are for alterations at the White Hart, Walworth-road, for Mr. Wm. Williams; the difference is surprising in so small an amount, especially when you consider that the plateglass will cost 50%.

| Lawrence | 188 |
| Whitaker | 138 |

You see the difference between highest and lowest is 87*l*. and the *accepted*, as he intends doing the job, is 50*l*. under the next lowest.

Would it not pay builders generally, to employ competent persons to make out their estimates rather than guess at their amounts? Oct. 13. A CONTRACTOR.

The following letter on the same subject is almost beyond belief: we have, however, received the same figures from four different quarters, so that we cannot doubt their correctness.

S1R,-I take the liberty to forward you the amounts of tenders delivered for finishing ten houses at Mile-end: Mr. Single, architect.

| Croast. | £1.477 |
|-----------|--------|
| Knight | 1,305 |
| Smith | 1,250 |
| Rivett | 1,194 |
| Johnson | 1,192 |
| Simmons | 1.150 |
| Cooper | 1.129 |
| Hughes | 1,124 |
| Cliff | 1.060 |
| Keeth | 1,060 |
| Symons | 1,050 |
| Hume | 905 |
| Reed | 847 |
| Hawkins | 595 |
| Westbrook | 589 |
| | |

The tenders were opened in a private room. Mr. Westbrook was called, and, fortunately for him, he was not present; Mr. Hawkins was then called, and told his tender was accepted, leaving him to guess whether he was 3*l*. the lowest or 300*l*.; the other tenders were then returned to the several contractors, who, like men of business, opened them amongst themselves. So much for competition.—I remain yours, &c. W.

ORNAMENTAL PLASTERING.

SIR,—In reply to your correspondent, on this subject, he is referred to a work "Practical Musoury, Bricklaying and Plastering, both plain and ornamental," published by Mr. Thomas Kelly, Paternoster-row, London.

The letter-press and drawings for the plastering portion, were supplied by one of the practical stucco workers engaged at Windsor Castle, and therefore can be relied on, the information having been obtained from an experience of several years.

Your correspondent will find, under the head of "materials used for internal finishings," in the work alluded to, the information he required regarding a good composition to work foliage in by hand.—I am, Sir, &c.,

ork foliage in by hand.—I am, Sir, &c., FRANK TYRRELL. Newcastle-upon-Tyne, 10th Oct. 1845.

[Advertisement.]

TO THE EDITOR OF THE BUILDER.

32, Kirby-st., Hatton-garden, 15th Oct. 1845. S18,-Being fully aware of the interest you take in every invention that appertains to the advancement of science, and particularly at a time when your columns are strongly advotime when your columns are strongly advo-cating a pure and efficient system of ventila-tion, it may probably not be considered too intrading my soliciting you and your readers' attention, to a newly invented and patented Stove. My practical experience in the formation and superintendence of pub-lic and private gas works, as well as fire places and flues, combined with ventilation, wherein a strict attention to the generation of calagic, its distribution, &c., has applied to caloric, its distribution, &c., has applied to heating and its various purposes, warrants me in a great measure to state my opinion, that Mr. Allen's stove for public and domestic purposes excels every other I have seen, or I believe has hitherto been produced. I am convinced, that it only requires to be inspected, to be properly appreciated; it may be seen, with all its various ramifications, at the paten-tee's residence, 21, Worship-street, Finsburysquare, at any time, but in operation from two to four o'clock daily.--I remain, Sir, &c., S. H. BROOKS,

Author of "Cottage and Villa Architecture."

Miscellanea.

EXPERIMENT WITH FIRE-RESISTING TIM--On Monday week, Mr. James B. Reay, RFR of Dublin, the inventor of a preparation for rendering timber, to a great extent, fire-proof, tested the experiment at the Commercial Hall, Gloucester-street, in the presence of the Mayor, Mr. D. Hodgson, Mr. H. Booth, Messrs. Milner and Son, and other gentlemen. Two piles of timber, the one consisting of pitch pine, which had undergone the process of preparation, and the other consisting of memel which was unprepared, were elevated in the form of the rafters of a house. Shavings were placed underneath, and fire was com-municated. In a few moments the memel was in flames, and very speedily it was consumed. The pitch pine, which was three several times exposed to the action of 800 degrees of heat, stood the test admirably. Some of the tim-bers were more or less charred, but very little injury was effected; and a remarkable little injury was effected; and a remarkable part of the experiment was, that the prepared timber upon which the lighted shavings were placed was very slightly damaged by the fire. The mayor, and other gentlemen present, ex-pressed themselves satisfied with the experi-ment so far as it had gone.—Liverpool Times.

FREEMASONS OF THE CHURCH.—Oct. 14th, Mr. J. W. Archer in the chair; Mr. John Soane was elected a vice-president; Mr. W. G. Whitehead, of Paris, was elected a corre-spondent delineator for that city; and Mr. S. C. Hall, F.S.A., was elected a member. Mr. Archer presented a rubbing from a brass executed by him, and placed in the church at Wargrave, near Reading, by the officers of the Enniskillen Dragoons, to the officers of the Enniskillen Dragoons, to the memory of their late commander, Lieut. Col. Raymand White. Mr. W. H. Rogers then delivered a discourse on illuminated books, wherein the bistory of illuminating manu-scripts was both theoretically and practically treated of, and giving a preference to the East for its origin; Mr. S. Woodburn exhibited a small and delicate missal of the fifteenth century, with gold borders; Messrs. Hunt and Co., of Bond-street, a French MS. of the and Co., of Bond-street, a French MS. of the fifteenth century; Mr. G. Isaacs contributed an extraordinary reliquary, called a "Rota," of the thirteenth century; The Rev. H. Crowe, Vicar of Buckingham, contributed a psalter of the twelfth century, and Mr. Leake a curious printed book of the fifteenth century, being one of the ancient choral books of Salis-bury Cathedral. Capt. V. Anson laid upon the table two Egyptian deities, taken at the siege of Amoz in 1842; and Mr. W. Barton exhibited an engraved book of prayers of the seventeenth century. The next lecture was announced for the second Tuesday in No-vember, being a continuation of the same subject.

OPENING OF THE NEW HALL, LINCOLN'S-INN.—It is understood that her Majesty has fixed the 30th inst. to open the New Hall, Lincoln's-inn, at 2 o'clock p.m.

CITY OF WESTMINSTER LITERARY, SCIEN-TIFIC, AND MECHANICS' INSTITUTION general meeting of this institution was held on Wednesday evening, when the chair was taken by Wm. Page Wood, Esq. (Queen's Counsel), vice-president. It appeared from the com-mittee's report, that much attention had been given to the evening classes, as offering pe-culiar advantages to the mechanic, and that these comprised several especially adapted to his wants; as those for writing and arithmetic, geometry and its practical applications, and archimetry and its practical applications, and archi-tectural, and ornamental, and general drawing. A very interesting series of lectures was an-nounced for delivery during the quarter. A discussion ensued as to various proposals for reducing or liquidating the balance of the debt incurred for the erection of the premises, and a committee was appointed to examine and a committee was appointed to examine and report on their several merits. Thanks were voted to the chairman, and the meeting adjourned.

IMPORTANT USE OF INDIA-RUBBER.—At an inquiry held in Galway a few days ago, by Captain Washington, the Tidal Harbour Com-Capital Washington, the I day Harbour Com-missioner, one of the Town Harbour Local Commissioners stated that the Board of Works had been allowed 100% for India rubber, to keep out the tide when the docks were undergoing repair.

FOR RAILWAY INTELLIGENCE, &c. SEE SUPPLEMENT.

NOTICES OF CONTRACTS.

We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our readers, however, they are entered in a book, and may be seen on application at the office of "The Builder," 2, York-street, Covent-garden.]

For the execution of two contracts on the Manbeing respectively of the lengths, 11 mile and 73 miles, including a viaduct of 1,000 yards in length. For the execution of the entire works (with the

exception of Rails and Chairs) of the Cockermouth and Workington railway, being about 10 miles in length.

For supplying her Majesty's Dockyards with Lift Pumps, for pumping water out of ships' holds.

For supplying the London Dock Company with Bent Wood Hoops for the year ensuing. For the execution of Works on the East Lanca-

shire Railway, being the Burnley contract. For the supply of 90,000 Sleepers either Larch

or Baltic Timber; also of 380,000 lineal yards of Larch Railing, and about 28,000 Larch Posts, to the East Lancashire Railway Company. For the supply of Railway Sleepers conformable to specification, to the Liverpool and Bury rail-

For supplying the London and Birmingham Railway Company with twenty Passenger and ten Goods' Engines of the greatest power that may advantage-ously be employed, being not less than 1,000 square feet evaporating surface. For the execution of the Works on the Hull and

Selby railway, between Hull and Driffield, being a distance of about 19 miles.

ADVERTISEMENTS.

ROYAL POLYTECHNIC INSTITUTION, REGENT-STREET.

STRET. FOLTECHNIC INSTITUTION, REGENT-STRET. IN ITE'S PATENTED VENTILATING and SMOKE-CURING SYSTEM is daily ex-plained by Mr. Phillips, the practical engineer, illustrated by models and a great variety of experiments, at a Quarter past Twelve and Halt-past Seven precisely. Architects, Buil-ders, Ironmongers, Gas Fitters, and the Public generally, are invited to investigate the merits of this new and scien-tific invention, the application of which may be seen in prac-tical operation as applied to street lamps, at the entrance of the above Institution. All letters addressed to the Patentee, New North-road-bridge, Hoxton.

ROYAL POLYTECHNIC INSTITU-TION.-Lectures on the Music of Spain, by Don Jose de Cicbra, with Guitar and Vocal Illustrations, on Tues-days, Thursdays, and Saturdays, at Half-paet Two o'clock. Dr. Ryan's Lecture on the Process for making Ice by Artifle-cial Means, illustrated by Masters' Patent Apparatus, Daily, at Half-past Three o'clock. Also, Mons. Boutigny's ex-periment of making Ice in a Red-hot Crucible. Professor Bachhoffner's varied Lectures, with experiments, in one of which he clearly explains the principle of the Atmospheric Railway, a model of which is at work Daily. Coleman's New American Locomotive Engine, for ascending and descending Inclined Planes. A magnificent Collection of Models of Tropical Fruits. A new and very beautiful series of Dis-solving Views, new Optical Instruments, &c. Experiments with the Diver and Diving Bell, &c., &c.-Admission, One Shilling; Schools, half-price.

BIELEFELD'S PAPIER MACHE. The superiority of the Papier Maché for the purposes of ARCHTECTURAL DECORATION'S is now so gene-rally admitted, that it is needless to argue it. The introduc-tion of Papier Maché into most of the public and private buildings in the country is the best proof of its merits. Or-naments may be had in almost every style, and patterna-books, containing more than a thousand executed designs. Price 10.

Price 17. PICTURE FRAMES and other Articles of Furniture, either gilt or in imitation of the finest carved oak. An illus-trated Tariff forwarded on the receipt of eight post-office

trated Tariff forwarded on the receipt of eight post-office stamps. PATENT QUAQUAVERSAL GLASS-STANDS for the toilet, on an entirely new principle, of great elegance, and free from all the practical inconvenience of ordinary Glass-stands.

At the works, 15, Wellington-street North, Strand.

WALLIS'S PATENT LIQUID WOOD WALLIS'S PATENT LIQUID WOOD KNOTTING. — This newly-discovered Liquid Composition which Messrs. Geo. and Thos. Wallis have the satisfaction of introducing to the trade, possesses the im-portant qualification of effectually stopping Knots in Wood, however bad, and preventing them eating through and dis-figuring the paint above. Many substances have been used and much time spent in endeavouring to find a cure for a bad Knot, but hitherto without success. Messrs. Wallis therefore feel much plea-sure in offering to the public an article so long and anxiously called for.

called for.

called for. In the application, skill is not required; a boy can use it as well and effectually as the best workmen: it is put on to the work with a brush like common paint, can be used in all climates and situations, and does not require heat. Sold wholesaie and retail, by Measra. G. and T. Wallis, Varnish, Japan, and Colour Manufacturers, No. 64, Long Acre. Price 20s. per gallon.

VARNISH.—It has long been a desideratum VARNISH.—It has long been a desideratum amongst the consumers of Varnish to obtain a good and genuine article; brilliancy, facility of drying, hardness, and durability are the qualifications necessary, but these are seldom if ever found united. The experience of a life-time devoted exclusively to the manufacture of this article, the great and important discoveries of modern chemistry, and the daily improvements in machinery, have enabled Messra. George and Thomas Wallis to produce Varnishes (both oil and spirit) unrivalled in every respect, and they confidently reconsuend them to the trade, as deserving of notice both in price and quality. Builders, Coachmakers, Painters, and others may depend on being supplied with a genuine and unalulterated article. Fine Oil Varuish, from 10s. per gallon; best White Spirit Varnish, 21s. ditto; Best Spirit French Polish, 20s. ditto; White Lead, Oil, Turps, and Colours of every description at the very lowest prices.—WALLIS'S Varnish, Japan, and Colour Manufactory, 61, Long-acre, one door from Bow-street. Established 1750.

BUILDER. THE

TO ARCHITECTS, BUILDERS, UPHOLDERS, BLIND MAKERS, &c.

Orders by post, with measure between beads and length window, will be executed, and sent to any part of the of window kingdom.

GRAINING COLOURS AND LIQUID WOOD STAINS. HENRY STEPHENS begs to call the attention of Architect Builders LINK X STEPHENS begs to call the attention of Architects, Builders, House Decorators, Puinters, Cabinet-makers, and all those engaged in the erection of churches where the appearance of oak is desir-able, and those also who are employed in the revival of old carvings, faded furniture, or other ornamental wood work, to his GRAINING COLOURS and LIQUID WOOD STAINS.

to his GRAINING COLOURS and LIQUID WOOD STAINS. The graining colours are prepared in a damp state, and upon so true a principle, that the workman exmoot fail in obtaining the natural colour, nor of giving to the work the same effect and appearance at all times. The difficulty of producing a true colour and of preserving the same unifor-mity with the admixture of earths and oxides, which are the ingredients used in graining, has long been asknow-ledged. This difficulty is at once removed by these prepara-tions, and the grainer is enabled to confine his attention to his art in graining, without being perplexed is proportioning and mixing bis colour. The LIQUID STAINS are solutions of colours which not only carry additional stain on to the various woods on which they are employed, but when used on the particular wood whose object it is to revive, it combines with and heightens avaluable acquisition to the DECORATOR and to the RENOVATOR of old oak or other carvings. They are also capable of giving colour to the sappy and defective parts of venears and fine woods used by cabinet-makers and others. In the decoration of churches, castles, baronial halls, and massicons, in which are often found beautiful specimens of and staded, these liquid stains will be found particularly ser-viceable.

They also impart to woods of inferior character and of soft taxture, such as beach, birch, pine, deal, &c., the colour and appearance of such woods (whether oak, maho-gany, rosewood, &c.) as it may be designed to imitate, and thus save the expense of more costly materials.

The above preparations for graining and staining for pur-poses of imitation and of revival, are prepared by HENRY STEPHENS, and may be obtained at 54, Stamford-street, where specimens of their application may be seen, and also at the Office of "The Builder."

HOLBORN AND FINSBURY SEWERS, MIDDLESEX THE COMMISSIONERS of SEWERS THE COMMISSIONERS of SEW ERS for the LIMITS give NOTICE, that their Office, Hatton Garden, is open daily between the hours of Ten and Four, where information can be obtained (gratis) by persons about to Purchase or Rent Houses or Property, or take Land for Building purposes, of the situation and level of the public Sewers, capable of affording sufficient Drainage, and which they recommend all such Persons to sply for at the above Office. By the Court, STABLE and LUSH, Clerks.

COURT OF SEWERS FOR WESTMINSTER, AND PART OF MIDDLESEX, No. 1, Greek-street, Soho-

TO BUILDERS and Others interested in

TO BUILDERS and Others interested in buildings or in ground for building upon, within the district under the jurisdiction of this Court, drained by water. courses falling into the river Thames, between the city of London and the parish of Fulham. The Commissioners hereby give notice, that by an Act of the 47th Geo. III. (chap. 7, local) it is required that, pre-viewely to the making of may new sewer in any attreet, lane, or public way, or in any part intended to become a street, ane, or public way, or to ccarry or drain off water from any heuse, building, yard, or ground, into any sewer under their management, or within their jurisdiction, a notice in writing shall be given to them, or to their clerk at their office, and int any new news or severe shall be constructed and made in such manner and form as shall be directed by the said Commissioners, and not otherwise.

Commissioners, and not otherwise. And, in order to prevent the serious evils and inconveni-ences that must arise from ground proposed to be built upon being excavated at too great a depth, the Commissioners hare directed that, upon sprificatik no being made at this office previously to the excavation of such ground, information shall be given as to the lowest depth at which the same can be drained.

can be drained. And the Commissioners do also give notice that, when-ever the lower floors or pavements of buildings shall have been laid so low as not to admit of their being drained with a proper current, they will not allow any severs, or drains into severs, to be made for the service of such buildings. It is recommended to all persons about to purchase or take houses, or other premises, to ascertain whether such premises have separate and distinct drains into common severs. All artitizes must be delivered at this office at least three

All petitions must be delivered at this office at least three elear days before they are presented to the Commissioners; and all such petitions will be called on in the order of their appli-cation, and the name of any party not present when called on to support the application will be struck out, and the pro-ceedings must in consequence be commenced de novo.

All communications made with any sawer without leave of se Commissioners will be cut of, and the parties making be same will subject themselves to a fine. tł

the same will subject themselves to a fine. The provisions of the Metropolitan Buildings Act (7 and 8 Victoria, c. 84) do not supersede the authority of the Commissioners of Sewers in the above respects, but their powers are expressly reserved, and their regulations made subservient to the purposes of that Act. The execution of such works, under the superintendence of the district sur-veror alone, cannot therefore warrant the making of any severs on drains within this commission, nor reliver the parties making them from the penalties above mentioned. By order of the Court, LEWIS C. HERTSLET, Clerk.

DORTLAND CEMENT of best quality manufactured by J. B. WHITE and SONS, of Mill-bank-street, Westminster. To be had at their Warchouses ; Druce's Wharf, Chelsea ; Bell's Wharf, Paddington ; and Karl-street, Blackfriars.

TO ENGINEERS, ARCHITECTS, AND CON-TRACTORS. REAVES'S LIAS CEMENT GROUND BLUE LIAS LINE and GREAVES S LIAS CENENT an GROUND BLUE LIAS LIME, at 2, South Whar Paddington, London, and Works, Southarn, Warwickshire Agent for Liverpool, Mr. WYLIE, 56, Gloater-atreet; dift for Manchester, Mr. J. THOMPSON, Back King-atreet ditto for Chester, Mr. J. HARRISON, Linen Hall-atreet. harf.

KEENE'S PATENT MARBLE CEMENT

THENNE'S PATENT MARBLE CEMENT. THE PATENTEES of KEENE'S CEMENT beg to draw attention to the use of this material in the works recently executed at the COLOS-SEUM, Regent's-park. The POLISHED COLUMNS in the Hall of Sculpture, the ornamental paving in the corri-dors and conservatories, and much of the stucco on the walls, are specimens of the very successful application of this cement. Patentees and Manufacturers, J. B. WHITE and SONS, Millbank-street, Westminster.

TKINSON'S CEMENT .- The public is A respectfully informed, that the price of this vary es-cellent Cement, which has now been in use for Architecture and Engineering works upwards of thirty years, is reduced to Ss. Sd. per bushel, and may be had in any quantity at Wyatt, Parker, and Co.'s Wharf, Holland-street, Surrey side of Blackfriars-bridge.

N.B.-This Cement being of a light colour, vequires noarti-ficial colouring or painting, and may be used for stucco with three parts its own quantity of sand.

MARTIN'S FIRE-PROOF AND ORNAMENTAL CEMENT.

CEMENT. CAUTION. — Messrs. STEVENS and SON, Patantees, beg to caution their friends and the trade generally against confounding this invaluable Cement with others, erroneously said to be of the same description. S. and S. pledge themselves, that MARTIN'S CEMENT is totally dissimilar in composition and manufacture from every other, and, being a neutral compound, is not only free from chemical agency upon any substance with which it may come in contact, but completely resists the action of the strongest acids. They feel it a duty to direct attention to the following properties, which it exclusively posesaes:— 1. It results acounty in the strongest in the store in

1. It rapidly acquires the hardness of stone.

2. Unlike other internal coments, its hardness is uniform throughout its entire thickness.

3. Its surface (which may be made equal to that of the finast marble) never throws out any salt, and will receive paint in four days, without peeling, when put upon dry work.

It is peculiarly adapted as an internal stucco for walls, skirtings, architraves, mouldings, and enrichments of all hinds, to all of which purposes it has been extensively ap-plied by Mr. Thomas Cubitt on the Grosvenor estate, &c. .1

For the above purposes, it possesses great advantages over ood, being more economical and durable, reaisting fire, amp, and vermin.

For the floors of hall and fire-proof warehouses, its light-ness, durability, and uniform surface give it an imma cness advantage over stone, being, at the same time, much more economical. The most satisfactory references can be given. To be had of the Patentees, Plaster of Paris and Cement Manufacturers, 196, DRUBY LANE.

Agent for Liverpool and Manchester, Mr. R. PART, 28, Canning-place, Liverpool.

O ARCHITECTS, ENGINEERS, CONTRACTORS, Builders, Masons, and plasterers, mer-Chants, Shippers, and the public in Genera: то CHANTS, GENERAL.

JOHNS and CO.'S PATENT STUCCO GENERAL. JOHNS and CO.'S PATENT STUCCO CEMENT.—The following are the positive advantages possessed by this Invention over every Cement hitherto in-troduced:—It will effectually resist Damp. It will never regetate nor tarm green, are otherwise discolour. It will never crack, blister, nor peel off. It will form a complete Stone casing to any Building covered with it. It so closely recembles Stone that it is impossible to detect it. It would recemble Stone that it is impossible to detect it. It would recemble Stone that it is impossible to detect it. It would recemble Stone that it is impossible to detect it. It would recemble Stone that it is impossible to detect it. It would recemble Stone that it is impossible to detect it. It would recemble Stone that it is impossible to detect it. It would recemble Stone that it is impossible to detect it. It would recemble Stone that it is impossible to detect it. It would recemble Stone that it is impossible to detect it. It would recemble Stone that can be depended upon for export. It is the only Cement that can be used with confidence by the seasons. It will adhere to any substance, even to Wood, Iron, or Glass. It will carry a larger Proportion of Sand than any other Cement. It matures by age, and be-comes perfect when other Cements begin to perish. It may be worked through the Winter, as frost has no effect upon it. It may be used on the Inner Walls of new Houses, which may be papered over or painted directly. Roofs laid or pointed with this Cement will remain undamaged by the severest Storms. Any Plasterer may apply it, the Instruc-tions for use being very clear and distinct. The first cost of this material does not exceed that of the cheapest Cement now in use; but with all the above-named extraordinary and valuable advantages, nothing can approach it in pennt of commy. Arybitest and Ruilders who have used this Cement have omy.

Architects and Builders who have used this Cement have declared that it requires only to be known, to be universally prefarred

Specimens may be seen, and a Prospectus fully describing the Cement and its mode of application, together with a volume of Testimonials from every part of the Kingdom, may be obtained on application to MANN and CO., SOLE AGENTS for the Patentees, 5, Maiden-lane, Queen-street, Chespside, London: of whom also may be had,

Cheapside, London: of whom also may be had, JOHNS and CO.'S PATENT STONE-COLOUR STUCCO PAINT, expressly intended for Painting over ex-terior Walls of Houses that have been covered with Roman or other Cements, and which have become dirity and disco-loured. It is in every way better suited for this purpose than White Lead Paint, which will frequently come off in fakes, being in direct chemical opposition with Cement; whereas MESSRS. JOHNS and CO.'S PATENT PAINT having an affinity for Stucco, binds itself with it, stopping the auction, thereby rendering the swall proof sgainst weather, and in the finish producing a pure stone-like effect, produceable by no other Paint whatever. It is cheep in its application, -- and may be used by any Painter, in any climate, even in the most exposed Marine situations.

DOLONCEAU'S BITUMEN PAVE-MENT for paving Foot walks, Terraces, Garden walks, Stables, Coach Houses, Granaries, Corn Stores, and Salt Warehouses. For the exclusion of Damp and Vermin in Basements it is particularly adapted, and for Boofing Dwell-ing Houses, Porticos, Balconies, and Sheds. Price 3s. 6d. per square yard.

FIGE 38. 02. per square yard. BITUMEN for covering the Arches of Bridges, Culverts, &c. &c. on Railways and other places (with instructione for laying it down), may be had at the rate of 45s. per tou, by applying to JOHN PILKINGTON, 15, Wharf-road, City-road.

TO ARCHITECTS.

IN CONSEquence of many complaints having been made to the Company, by Architects, of a spurious material having been used in the execution of Works where the SITSEL ASTRALTE had been specification, the Directors, with a view to ensure the fulfilment of any such specification, have authorised CERTIFICATES to be granted to Builders where the SEVSSEL ASPHALTE

SEYSSEL ASPHALTE

SEYSSEL ASPHALTE has been used. For the purpose of securing the use of the Genuine Article, Architects and others are recommended to insert in their specifications the "Seyssel Alphalte, Cla-ridge's Patent," and not merely "Asphalte," or "Bitu-men," as in many cases where these terms have been used, gastar and other worthless and offensive compositions have been introduced. . I. FARELL, Secretary Stangate, near Westminstor Bridge, Jam., 1845.

Books of Instructions for Use may be had at the Office of The Builder," and of all Booksellers in Town and Country, price 1s.

price is. e_{0}° In proof of the necessity of the above siverilisement, may be mentioned, that it has come to the knowledge of the Directors, that in certain works which have been executed by Messrs. CURTIS, builders, of Stratford, a spurious material has been used by them, contrary to the spatiactions, which expressly mentioned, that " Claridge's Asphalts" was to be used.

Also in the case of a work at Lewishnan executed by Measers. ROBERT and DANIEL YOUNG, of 10, Crown-row, Walworth-road, where Seyasel Asphalte was specified for, a spurious article was nevertheless laid down by them.

RAIN WATER PIPES, Heads, Shoes, weights, Railing Bars, Sink and Stable Traps and Gratters, Sasth Air Bricks, Coal Plates, &c.; Gas and Water Pipes from 14 in. to 12 in. in diameter, with Bends, Branchez, Syphona, and Lamp Columns; also Hot-water Fipes, with all the usual connections. A large Stock of the above Castings at JONES'S Iron Bridge Wharf, and No. 6, Bankside, South-wark. wark.

NOVEL PLAN FOR CURING SMOKY ROOMS.

NOVEL PLAN FOR CURING SMOKY BOOMS. THE SMOKE ELEVATOR, secured to the Advertiser by Act of Parliament, can readily be attached to any old or new pattern room atovc, without dis-figurement or removal of the stove, at a less cost than any patent chimner pot, and with a certainty of auccess beyond comparison.—Sold by C. RICKETS, patentee of the calori-fere gas stoves, for warming churches, halls, rooms, shopa, or any other kind of building, without a chimmer, -No. 3, Agar-street, Strand, opposite Charing-cross Hospital.

TO ARCHITECTS, BUILDERS, BRICKMAKERS &c.,

TO ARCHITECTS, BUILDERS, BRICKMAKENS SC. DUMPS of Superior CONSTRUCTION, bored perfectly true by improved mechinery, in urisens plain and ernamental patterns for Conservatoriae, Semann. Market Places, Roads, Gardens, and for Liquid Manuers. BRICKMAKERS' PUMPS, in Wrought and Canalism, HYDRAULIC LIFT PUMPS, and ENGINES for Wells of any depth. SATURDAY, OCTOBER 25, 1845.

ANY bad measures are carried, and good measures kept back, by the mere spirit of party. Men are often led by ssprit de corps to vote with reference only to the

triamph of the section with whom they act, and not to the merits of the main question at issue. In numerous instances, improvements of the greatest consequence have been rejected, simply because they were brought forward by parties opposed to a majority,—unwillingness to aid the views of one they disliked, envied, or feared, serving to close their eyes to the merits of a proposal, which under other circumstances would have had their earnest support.

It is much to be hoped, that no such feelings will be allowed to operate in the Westminster Court of Sewers at the present moment : still we have fears on the subject, as is evident from the expression of the hope. That the sewers within its jurisdiction are sadly Inefficient, has already been made manifest in our pages. They are little better than one huge cesspool, filled with decomposing matter (tending materially to injore public health), and many of them, moreover, are in a state of great dilapidation, in consequence of the badness of the form employed, and other circumstances. Some of them are so chaked up with solid matter as to be almost impassable; and we have heard of an instance (but can hardly believe it), where a new sewer, built to accord with what was nsidered the level of the sewer into which it was to discharge itself, was of necessity taken down and reconstructed, on discovering that what had been supposed the proper bottom of the old sewer was simply the surface of the necumulated soil, and was more than a foot above the right level.

A writer who addressed us last week, with a desire to say the Westminster Sewers were not in the deplorable state set forth in our pages, and in the commissioners' own "Book of Infirmations,"*-but who evidently knows that they are,-remarks :--

" One of the greatest evils now existing, and which is continually the cause of almost innumerable cesspools, is the large, old-fashioned grates over the gulley-holes in the public streets. The large divisions between the bars of these grates are continually admitting into the sewers great quantities of stones and rubbish, which immediately fall into the sewers, and form dams or obstructions to the passage of all the light soil, in some instances to the depth of two feet; this defect might be (and I hope will be) soon remedied by substituting new grates of smaller divisions, which would almost datirely prevent a recurrence of this intolerable nuisance, and ultimately would be a saving of very great expense, as all these obstructions are obliged to be removed by opening the sewers, and bringing up the stuff into the streets to be carted away: an annoyance most desirable to be practised as seldom as possible."

Any, we can mention another cause of obstruction still consequent deposition, and that is, the liesp of gravel and rubbish, too often

See p. 493 anie,

THE BUILDER

left on the bottom of the sewer by the workmen when putting in the connecting drains from houses. In one long sewer an eminent builder informs us, the houses in the street above, may be counted by these little hillooks, which dam back the water, and necessarily induce deposition.

These, however, are but local causes, and if prevented, which most certainly they should be, would not remove the whole difficulty. The general cause is the shape and level of the aewers. A form of sewer with upright sides (as bad as can well be imagined), was in use in the Westminster division for many years; it has, however, been recently abandoned, and another substituted for it, yet this new form is but a slight improvement upon that which it superseded. The greater curvature given to the invert certainly somewhat confines the stream to a narrower channel, and so increases its velocity and its cleansing power, but the increased velocity thus gained over that afforded by the old form, under the most favourable circumstances, is so very slight, that it is of little or no avail in preventing deposits and accumulations of matter. The inefficiency of the form is admitted by the commissioners, and proved collaterally by the evidence published with the first Report of the commissioners for inquiring into the state of large towns; and in the report of the proceedings at the last court of sewers, which follows our present article, it will be seen that a day was then set apart to examine various new forms that had been submitted to them, including, after a struggle against it, the form proposed by Mr. Phillips, which we laid before the public last week.

Of the excellence of this latter we have no doubt; and what is of very great importance, its cost is much less than that of the present form; taking for example the No. 2 sewer, the cost as now executed is 17s. and 6d. per foot lineal; whereas the cost in accordance with our engraving is estimated at 11s. and 6d. per foot.

The opinion formed of it by practical men is shewn by the following document which was read by Mr. Leslie at the court on Friday, in support of a motion to the effect that this form should be adopted :--

London, 16th October, 1845. DEAR SIE,—At your request, we have examined the annexed lithographed sections of sewers, signed "John Phillips."

We are of opinion that sewers so formed would be most efficient as regards drainage, and durable and economical in their construction.—(Signed)

THOS. CUBITT, JOSH. & CHAS. RIGBY, GBISSELL & PETO, ELGER & KELK, WILLIAM HERBERT, HUGH BIERS.

WILLIAM HERBERT, HUGH DIERS

This certificate *must* enforce the attention of the commissioners; they cannot easily poob, pooh! any project thus accredited. Un-

• The following table shews what would be the cost, according to the depths, for one foot lineal of three several vises of egg-shaped sewers proposed by Mr. Phillips. The first size is 3 ft. wide, and 4 ft. 8 in. high inside, and the walls one brick thick all round; the quantity of reduced brickwork in mortar is 7 ft. 14 in., and in cement 2 ft. 8 jin.; one rod together will exceute 27 ft. 8 in., run. The second size is 2 ft. 6 in. wide, and 3 ft. 11 in. high inside, the walls one brick thick; the quantity of reduced brickwork in mortar is 5 ft. 9 in., one rod will exceute 29 ft. 8 in., run. The third size is 2 ft. wide, and 3 ft. 5 in. high inside, the walls one brick thick; the quantity of reduced brickwork in mortar is 5 ft. 2 in., and in cement 2 ft. 4 in. for ord will exceute 39 ft. 6 in., run. The third size is 2 ft. wide, and 3 ft. 5 in. high inside, and the walls one brick thick; the quantity of reduced brickwork in mortar is 5 ft. 2 in., and in cement 2 ft. 4 in. and in cement 2 it.; one rod will exceute 38 ft., run. The digging, including timber, strutting, 6 e., is calculated at 18. 8 dd. a cube yard; and the walls one trick thick; the set are ta 14. 14s. 8 d. a rod.

fortunately, however, such a captious spirit prevails at this moment, and so many commisaioners have expressed opinions perhaps too hastily taken up, or have acceded to views proposed by others, to which they consider themselves bound, that we can hardly anticipate such an unprejudiced discussion of the question as its importance demands and the metropolis has a right to expect. Weseriously urge the commissioners to put saide every other object but that of attaining the best and cheapest form of severe; and if any, from fresh evidence now before them, are satisfied that the egg-shaped sever must be better than one with straight sides (and we respectfully submit that this cannot be denied), it is to be hoped they will not fail to act in accordance with that opinion, even though they may have previously expressed themselves differently.

509

It is not our intention at this moment to comment on the general management of the Westminster Commission, although it is unquestionably open to animadversion. We trust, however, it will not be woweidered impertinent if we hereafter revert to the subject. With so important a trust, a revenue of from 20,000% to 30,000% a year, or more if they please, and great powers, it is of the unnost consequence that the duties of the commission should be efficiently discharged, It is not a party question, not a mere parish question, but one of national importance (as can easily be shewn), and if any improvements are necessary, they should forthwith be attended to, or the public will themselves interfere, and see that they are made. The time has gone by for legislating from behind a' curtain, unquestioned.

WESTMINSTER COURT OF SEGURES.

ON Friday, the 17th instant, a semerous meeting of the court took place, and some very important business was transacted. It being on the business paper to pay Mr. Jay, the contractor, 3,000/. on account, Mr. Leslie objected to it, and called for the report of the committee of accounts on the subject. It appeared that the committee had had a meeting on the 7th instant, and the report stated that "the assistant surveyor, Mr. Doull, having presented the bills of the contractor, Mr. Jay, for the quarter ending Midsummer 1845, with the abstracts complete, resolved that the said bills, amounting to 1,4457. 2s. 9d., be approved and recommended for payment."

Mr. Leslie said Mr. Jay had received 2,500/. which he considered more than paid the whole bill, and stated that the committee of accounts were putting the public accounts of the commission into almost inextricable confusion, for while Mr. Jay had received 2,000/. on account in April, and 1,000/. on account in May, it was not until the 20th of June, he received 270/. 2s. 1d. balance of his bills to Christmas 1844. Mr. Leslie stated that the whole amount of the bills to Christmas 1844, were only 270/. 2s. 1d., and that it was utterly impossible for Mr. Hertslet to keep these accounts while such proceedings were suffered. The chairman and Mr. Hawkes both contradicted Mr. Leslie, urging that the 2,000/. in April, was on account of works generally, and the 1,000/. in May, on account of the restoration of the sever in the Gloucester-road, Paddington, as were the remaining sums mentioned by Mr. Leslie, in June 1,000/., and August 1,500/., on

Mr. T. L. Donaldson then moved, and was scconded by Mr. T. W. Marriott, "That 1,000/. bepaid to the contractor on account of the works of the eastern division, and 2,000/. on account of the Ranelagh division, and that it be referred to the committee of accounts to direct the clerk to apportion to such districts as they think most proper the sums already advanced." The following thirteen commissioners voting for Mr. Donaldson's motion, viz. Messrs. Baylis, Biffin, John Boodle, jun., Clowser,

Thos. L. Donaldson, Gutch, Harrison, Harvey, Hawkes, Le Breton, Marriolt, Willmott, Wood; and the four following commissioners against it, Hon. F. Byng, Messrs. W. Farlar, Fuller, Leslie, The order was then signed for payment of 3,0002. to Mr. Jay, Mr. Leslie stating that there was not enough money at the bankers on

...there was not enough money at the bankers on the eastern division to pay the 1,000/., but that it must be borrowed from the western diviit must be boarrowed, from the western divi-sion, the inhabitants in which had contributed this year already above 16,0002, although the contractor's (Mr. Jay's) four quarterly accounts to Michaelmas were only 1,2887.78.11d. The next business of importance was a motion by Mr. Hawkes, seconded by Mr. John Guoter, to delay the building of ~500 feet of sever in Gloucester-road, Kensington, until Mr. Alexander and Mr. Broadwood have

until Mr. Alexander and Mr. Broadwood have agreed to improve the line of the Gloucester road in front of their land."

Mr. T. L. Donaldson moved, and Capt. Begue seconded, an amendment "That the sewer in Gloucester road be built upon the gearantee offered by Mr. Alexander in his ommunications to this court."

The arguments against the amendment were, that the whole proposed expenditure was illegal, as it was to build a new sewer, at the expense of the district, where none had before existed, and that Mr. Alexander and Mr. Broad-wood should be at the expense of the sewer. The amendment was carried.

Mr. Allason then brought forward his mo-tion; seconded by Mr. Hawkes, "That the several diagrams submitted to this court, for al-tering the forms of sewers ordered by the court, 17th Sept. 1844, be referred to a committee for their opinion, and report thereon, together with the several diagrams furnished by the other commissions." Upon which Mr. Leslie moved an amendment, seconded by the Hon. Frederick Byng, "That the forms of sewers proposed by John Phillips, be adopted." Mr. Leslie read a letter in support of his motion, which uppears in our first article.

"The amendment was lost, as was another to "refer all the plans to an eminent civil engi-ineer; but a third amendment was carried, moved by Mr. Farlar and seconded by Mr. John "Gunter, to consider all the plans at a special bourt, on Friday, the 24th October, at one o'elock.

PROJECTS FOR THE NEW EXCHANGE ne diw boregAT MANCHESTER

El Tampresent Exchange, standing at the botthe of Market-street, was erected from the de-legge of Mr. Harrison, of Chester. The principal front is semicircolar in the plan, with Grecian-Dotic columns, and is remarkable only, as an carly instance of the revival of Grecian architecture. Internally, it is surmounted by a sound dome, rising from an order of Ionic columns, reeded in the shafts. Some few years ago, this portion had become so inade-quate to the object, that an addition was made quate to the object, that an addition was made by taking in 'the area, occupied by the Post-office; that building being removed to the op-posite side of the narrow street at the back, but subsequently to the market in Brown-street, altered for the purpose. The space thus gained added an accommodation, equal to thus gained added an accommodation, equal to two-thirds of that previously existing, and the new room was itself a very handsome ad-dition. The building now occupied the whole area inclosed by Exchange-street, Market-place, Ducie-place, and the narrow street above mentioned. We believe it was pre-vious to this alteration, that a competition for the subtration of the building was decided in who is to this alteration, that a competition for an extension of the building was decided in favour of Mr. A. W. Mills, architect, but which was suspended in favour of the arrange-ment adopted. Notwithstanding this increase, the area is still inadequate to the wants of the town, and on Tuesday, the "market-day," it is not easy to more short and ware discrete is not easy to move about, and very difficult for persons to meet. These inconveniencies led the committee some time back to consider whether, with the consent of the town, and by appropriating certain ground extending to St. Anne's-square, and intersected by streets, the accommodation could be afforded. The accommodation could be afforded. The authorities were favourable to the improve-ment, and the Exchange Committee allotted a number of new shares to raise the requisite funds. Mr. Mills modified his design in cer-tain particulars, and a model of it is now ex-hibiting in the Exchange room. We have

also seen the plans, and though the design is not what would have been produced, had the architect been unrestricted by the necessary adaptation to the order of the old building, it displays considerable skill. The present area is 700 square yards, being larger than that of the news rooms at either Liverpool or Glasgow, and were the extension completed, it would give a room containing nearly 1,400 square yards. On each side of the extension would be rows of shops, and rooms above. The semicircular part was to be raised, and towers erected to light the staircases, and ventilate the building. At the end towards St. Anne's-square, in Bank-street, a Doric portico 70 feet wide was contemplated, the building itself, 100 feet wide, being joined to the rounded by portico corners. The original entablature and order were to be preserved. One great advantage in this plan was, that, by taking in the shops, the area could at any time be enlarged one half. The contracts for the purchase of the property having been entered into, possession of apart was obtained, and some few months since, it was the intention of the com-mittee to commence taking down part of the buildings forthwith. Matters were in this state, when a question as to the fitness of the present site was revived. Within the recollection of many persons, Cannon-street, High-street, and others in that neighbourhood were occupied by houses. They are now, however, filled with warehouses, and during the last ten or fifteen years, the neighbourhoods of Mosley-street, George street, and Portland-street have become simi-larly occupied. Thus the tide of business has been gradually removing farther from the original centre; and the arguments in favour of the old locality were reduced to vested rights, the vicinity to the retail establishments, to the places of business of many, who made the greatest use of the Exchange, to the town of Salford, and to the railways, which were con-stantly bringing persons from the country, who attended the "Manchester market." But the number of mercantile houses, at a distance from the present site, was now so numerous, and it being even doubted by many proprietors of the old building, whether the property could not he leid out to being advector of the solution of the not be laid out to better advantage, several plans were suggested by various parties. Some of these individuals, having applied to Mr. (fregan, of Manchester, that architect auc-ceeded in producing a design of a highly me-ritorious character, which led to the formation of a company for carrying it out. The pro-jectors contemplated a building, which should rival those of Europe, to be erected at a cost of upwards of 150,000%, and wisely left their architect entirely untrammelled by any obsta-cles, such as, in the other case, had alone in-terfered with the production of a completely successful design. They fixed upon the site enclosed by High-street, Market-street, Pa-lace-street, and Cannon-street, including the present Marsden-square; the project was warmly taken up, and the consent of all the boldom of the property except they below warmly taken up, and the consent of all the holders of the property, except two, obtained. The building was intended to comprise a large exchange room, a music hall, a stock-ex-change, and a commercial library. A litho-graph of the design is now lying before us. The end of the building next Market-street, containing the news room, has a colonnade, of the Containing the news room, has a colonnade, of the Corinthian order twelve columns in length, standing upon steps, and surmounted by a balustrade. The same order runs round the building, which, in the High-street front, is recessed in the centre a considerable depth; the wings being united by steps, and balustrades. The whole is surmounted by a dome. The windows, which are in two ranges, and all the other parts shew considerable taste. The exchange room is entered by three doors under the colonnade; it is lit from the top, and has a gallery round it for the library .- It was now a matter of doubt which project had the best chance of success, and two others were talked about. One was to remove the infirmary to the outskirts of the town, where the advantages of salubrious air would be attainable, and to erect the exchange upon the site; the other to take the site of the late theatre in Fountainstreet, along with the assembly rooms in Mosley-street, and other land adjoining. The former proposal was never fairly before the public, but had the advantage of the co-opera-tion of an eminent medical gentleman, who tion of an eminent medical gentleman, who has lately rendered important services in the Hill, Greenwich.

investigations, carried on by the Health of Towns Commission. The general opinion seemed to be, that the site was not sufficiently central. Within the last few weeks, an gr-rangement has been entered into, by which the absended in the old huiding and the the shareholders in the old building, and the company for the building at Marsden-square unite, for the erection of a wew building on the land in Mosley-street and Fountain-street, the land in Mosiely street and Foundain street, and there is now great reason to believe, that this proposal will be carried, out. It is said, that a public competition will be advertised immediately; and there is some talk of er-tending King street, so as to open a view of the building. We trust that so fine an oppor-tunity, will not be thrown away. The site is perhaps not equal to that at Marsden-square, but has great advantages. Meanwhile, the owners and occupiers of property, in the neighbour-bood of the present building, are signing a petition against the intended change.

. The progress of stt mi Mattchester, during one or two years past, has been so prosperous, that we have made arrangements for giving a notice of several of the most im-portant buildings in a fature number.

MEMOIR OF GEORGE BASEVI, ESQ.

THE daily papers have already informed most of our readers of Mr. Basevi's melau-choly death in Ely cathedral, on the 16th inst. It appears that Mr. Basevi arrived at Ely from It appears that Mr. Basevi arrived at Ely from Wisbech, on the previous Tuesday, in com-pany with Mr. Fardell, the vicer of that parish, and took up his quarters as usual at the deanery. On Thursday morning Le purposed leaving Ely for Cambridge, but before doing so, he went with the Dean and the Rey. D. J. Steward, one of the minor capons, to examine the works now in progress in the great west tower of the cathedral. The party were in the old bell chamber, when the deceased gentle-man advanced towards one of the recently-opened windows, along a broad beam. from opened windows, along a broad beam, from both sides of which the flooring had been re-moved. He was cautioned as to certain nais moved. He was cautioned as to certain nails sticking up in the beam; but scarcely had the words dropped from Mr. Steward's lips, when Mr. Basevi tripped and fell through an aper-ture in the floor, upon the vaulting over the arch under the tower, a distance of above f0 feet, the plank upon which Edward Hall, stone-mason, was working, saving him from going through the ceiling and falling into the cathedral. His hands were unfortunately in his great coat pockets (a customary position with him), which prevented his making any effort to recover his balance or to catch hold of the adjoining beams, which he could not effort to recover his balance or to catch hold of the adjoining beams, which he could not otherwise have failed to have done, as the opening is very narrow. He was immediately raised, but never spoke more; indeed, he dicd almost immediately, having received most ex-tensive injury upon the head. The Dean hastened for medical assistance: immediate restoratives were applied, but in vain. The deceased was conveyed to the deanery where he had been staying, and an isquest was shortly afterwards holden before a jury of high respectability, who, after a patient investiga-tion, returned a verdict of "accidental death."

tion, returned a verdict of "accidental death. The unfortunate gentleman whose death in the midst of life we deplore (Take heed, ye who stand), finished his school education under the Rev. Dr. Burney, at Greenwich, and entered the office of the late Sir John Soane in December, 1810. Here he remained nearly six years, during which time he became a student of the Royal Academy, and when he served his articles, started for the continent be served his articles, started for the continent in the middle of 1816. He pursued his studies in the middle of 1810. He pursoes nussessing in Italy and Greece, and returned to Regland in 1819. In the following year he exhibited, at the Royal Academy, a view of the remains of the Temple of Theseus, and commerced practice on his own account in the Albany. His first works were the Church at Stock port. in Cheshire, built under the Church Commis-sioners, in 1822,* and a mansion at Summing Hill for Mr. Ricardo, with whom he was connected. In the year previous to that last named he was chosen surveyor to the Gasardian Fire Office, on its formation.

Belgrave-square was designed by Mr. Ba-sevi, 1825, for some of his connection when

al a ez (Norr) ⊅Nus at Vitien (

And taken the ground. He exhibited a Grawing of the north side at the Royal Acadeny, in 1826, and others in 1827-28. In 1838, he was called before the Select Committee appointed "to consider the possibility of making the House of Commons more commodious and less unwholesdme," with various other srelitects (Soane, Smirke, E: Blore Wystville, Burton, 'Allen, Hopper, Deering, Goodwin, and Savage), and submitted a model and plan for a new House of Commons. In 1885, Mr. Busevi submitted a design for the Pitzwilliam Museum, at Cambridge, in competition. Thirty sets were sett in, and, on the Source of December, at a meeting held in the Senite the gave a single vote for one of the four, and Mr. Basevi splan obtained themajority of votes. This building, which is but just completed, must be regarded as Mr. Basevi's chief work, and entitles him to a high rank as a classic architect. The Conservative Clubhouse, executed hy bim, in conjunction with Mr. Sydney Smirke, and but recently completed, has further served to establish him in public opinion.

. •

To Gothic architecture it does not seem that Mr. Basevi has paid much attention; a little church (St. Saviour's,) near Hans Place, Chelsea, designed by him in that style, has little to recommend it. This structure is on land belonging to the trastees of Smith's charity, for whom Mr. Basevi acted as architect. Pelham Crescent, Sydney Place, the new part of Brompton Crescent, and several other ranges of buildings on the same estate at Brompton (mostly carried out by the energy and enterprize of Mr. Bonnin, builder of that place), were designed by Mr. Basevi, as was also Thurloe Square, on adjoining land belonging to Mr. Alexander. He was a good draughtsman and had a cul-

He was a good draughtsman and had a cultivated mind. In his manners, Mr. Basevi "Was cold and somewhat haughty: he was "however scrupulously just, as between his emproper and the tradesmen, and though the "hitter" night never find affability or kind "words," they were certain that no undue advanitage would be taken or meanness practised.

Architects from its foundation, and once of Architects from its foundation, and once filled the office of vice-president, but never contributed to its transactions. He was also a fellow of the Royal Society, and the Society of Antiquaries; he was elected to the former on May 11, 1843. His father is still living, and be leaves a widow and eight children to deplore a great loss. Cut off hastily, at a moment when he was about taking a much higher place in public opinion than he had previously held, and when as he thought things looked most smiling, the death of our contemporary should induce in us reflection, and lead us to consider in what we can amend.

HISTORICAL PAINTING.

1.11

SIB, — Among many interesting articles in THE BUILDER of the 11th inst., I have been particularly pleased with that headed "An Kffort to Advance Historical Art." Though probably the production of a disappointed freero candidate, it is written with a moderation and temper that claim respect, and it is very much to the purpose at a moment when the fine arts fix so much of the attention of an intelligent public, and their capability of cooperating efficiently in the civilising progress of mational education, has become a leading question.

The writer of that paper is, perhaps, not aware that a proposal nearly resembling his own, was about the year 1838, entertained by the Central Education Society. A committee was appeinted to consider in what way the fine ants would best assist the objects of the sonicity of nomprised Mesars. Haves and Wyse, both members of the present Royal Commission nut the Fine Arts; Mr. W. S. O'Brien and the members of the present Royal Commission nut the Fine Arts; Mr. W. S. O'Brien and the members of the proposed plan was a pertorial history of England with tabular stasistice of the condition of the people and the progress of clvillimiton, law, and freedom, with an account of inventions or improvements

* See page 229, ante.

by importation, &c. Mr. Walters, the publisher, was present at the meetings, to suggest or receive hints as to the mode of publication.

The discussion of the plan of the work and of the practicability and expenses of the work were very satisfactory. But the whole was suspended, in consequence of one member of the committee, who had not attended that discussion, proposing other subjects to his colleagues of a less national character. The death of Mr. Duppa subsequently led to the extinction of the society and most of its useful projects. Fortunately, Mr. Knight's publication (on a somewhat different plan and vastly more extended and costly), begun about the same time, shews the necessity there was for drawing the people's attention to the history of their country; and the exhibition of cartoons in 1843 at Westminster Hall, tested and proved the taste of a British public for historical compositions.

I need not at present trouble you with all the details of the plan above alluded to, but will endeavour to apply to your correspondent's proposal, such modifications as experience indicates as practical and suited to the success of the enterprise, and to the educational wants of the people.

As to the merits of the subject proposed, all who have any experience must approve it, and I quite agree with your intelligent correspondent that the objections to costume and other technicalities, contained in the Third Report of the Royal Commission, are insignificant, the difficulty of overcoming them being very slight to artists skilful in composition and well informed of the varieties in each period. His proposal to invite criticism and advice from antiquaries, poets, historians, anatomists, &c. is highly commendable. Such a course would enlighten the artists and save them much trouble and uncertainty; it would also accustom men of science to the charms and capabilities of the arts; it would help to bring about that connection between knowledge and sentiment that orght surely to form the basis of historical art. Under such auspices, the history of our country, in a language impressive to the sight and feelings of all men, could not fail to be successful in its appeal to the public. The exhibition should be made to attract vast multitodes; that would be the beat advertisement for the publication of engravings with historical explanation.

The Boydell Illustration of Shakspere, and Bowyer's History of England shew that a vast outlay may be more than replaced by such an undertaking. They are beacons to direct us, and so have been in recent times the annuals and art-unions. The vast improvements in antiquarian knowledge and in every department of science collateral to the painter's art, give to the artists of the present day immense advantages over the unassisted talent of the time of Boydell and Bowyer.

The practice of cartoons has already drawn out some of the qualities in which British artists were considered most deficient. A continuation of that practice can alone confirm their talent for composition, drawing, and other essentials in high art. Fresco painting will help to wean them from conventional effects, horny tones, and too much reliance on meretricious qualities, injurious to simple pathos and refined perception.

will help to wean them from conventional effects, horny tones, and too much reliance on meretricious qualities, injurious to simple pathos and refined perception. Agreeing so far in all the principles connected with your correspondent's plan, I question the practicability or desirableness of one or two of his proposals. Ist. How far is it advisable to produce cartoons and freecos of the dimensions proposed, i. e. from 16 to 22 feet, for an exhibition of two or three months, and for the especial purpose of engravings of as many inches? This might be all very well if easily attainable, but the demand on the artists' exertions and expenses, the difficulty of exhibition, the necessity of calling for help from Government, and that of destroying the freecos, however fine some might be, are insaparable objections which would be felt and urged if such a proposal were made by the Royal Commission, and remain so under any eircumstances before us. Why not limit the curtoons to half proportion?—figures of three feet and a balf or feet feet : and freecos of one or two figures; life size, or half figures of colioasal proportions; with studies of heads and hands similar to the splendid cartoon studies of Raphael, or of Leonardo da Vinci, would cer-

tainly suffice. To follow their example rather than that of Louis Philippe may save is from the perils to which the peruquier would have exposed Yorick's wig. By this pradent modification, instead of 400 feet of wall; 200 would be sufficient, and that qualifier is forty times more procorable. What the people of England and good tasts require to not acres of painted walls, but "sufficient, is fortes, contion, expression; in fact, well told stories." A WARM ADMIARE OF HISTORICAL

THE SCHOOL OF DESIGN, MANCHESTER; AND PROPOSED MUSEUM OF ART.

Some five or six years ago, at the meeting for the establishment of the School of Design, we recollect, that an extensive museum of art was one of the most important objects, contemplated by the projectors. It was to include works of interest in every branch of art and works of interest in every branch of art and science, and to be open freely to all persons. It is, therefore, no new project, and, has only been delayed through the comparatively slender patronage and success. of the school, during the first years of its existence. But, under the present efficient management, the school promises soon to exercise the infinence, demanded from the intimate connection, between manufactures and art, and it has already made a great advance in resources and impart-ance. Much of the credit for this flourishing state is due to the council, and more expectably to their active honorary secretary, Mr. George Jackson. He has laboured long and sealously to sid the infusion of tests in determine and to aid the infusion of taste in decorative ant, was one of the earliest promoters of the school, and is unquestionably a very fit person for the important office he holds. In a paper "On the Means of Improving Public Tests,"" printed last year, Mr. Jackson has urged the importance of cultivating the industrial arts, and of preserving the connection between or-namental and fine art. He says, "the false notions that exist in the public mind, as to what constitutes or may be considered as ant, may be assigned as one cause of its present state. What a powerful distinction existen in their estimation, between a carver in wood and a sculptor of marble! The former may pro duce the most splendid effects of form and grouping; but what share of the public spplause does his skill obtain compare d with an inferior production in marble fine The site is considered as a mere, mechanic, interferite convincing the public, by axamples, that share are difficulties to overcome, and talent arquired in the practice of any department, however in-ferior its application may at first sight appeter; and that perfection can only be attained by persevering industry and constant study. May not the present state of the model arts be traced to the fact, that a young man manentering upon this practice, ambitious and desirous of fame, soon discovers that no praise, no sclas, is awarded to their productions; and to obtain this he must bend his mind to the ideal? May we not also trace to this want of discriminating judgment, the complaint that is made by the professors of high art, -- of the want of pe-tronage for their efforts? It is not likely, or to be anticipated, that the public, whose seth-mation is regulated by comparison, —if they cannot appreciate heauty in the things of mecessity and common use, can have a mind suffi-ciently alive to the beautiful in those creations of faucy which are beautiful only to the edu-cated eye. Extensive patronage must not be anticipated for the ideal of art, ontil the useful is more generally appreciated., The industrial arts must be made the means not only of edu-cating the public taste, but of teaching the elements of art to those who would soar to its highest end., How could such a course depre-ciate the practice of high art, or reader its

* A papier read at a conversatione held at the Royal Institation, Monday, Neronder Stat, J. W. Frasor Eq., in the chair, and repeated, by request, sta public position et all Athenneum, Saturday, November Soin, B. professors less competent to produce great work? Being made acquainted with its more extended application and utility, would not fail to increase their ardour and expand their influence.

"This would shon produce powerful effects; "This would shon produce powerful effects; "the useful arts would attain a degree of excellered that would render us eminent as a nation; and high art would be relieved from tubse attempts to reach it, which, by their multiplicity and inferiority, now depreciate it if public estimation." "We have never been able to understand why

"We have never been able to understand why painters, sculptors, and architects, should restrict their pursuits to conventional limits. Not to mention the identity of these arts during the best days of art in Italy, it is certain, that once no object was deemed too mean for the display of art. Every production, a vise, a candlestick, or a door-handle, was elevated to the rank of a work of art, under the treatment of the most eminent artists. Now, if we except the designing for silversmiths by some of our sculptors, who would not consider if a loss of caste to prepare designs for such things as carpets and hangings, or for furnitine burgers.

Mr. Jackson goes on to say-" It is those means that would insensibly educate the eye to the perception of beauty, that we stand in need of, and the perception for which I am anxious to impress upon your consideration; and, if possible, induce a spirit of activity that will avail itself, not only of that noble desire for the promotion of good that is now so active in the town, but also of the desire I have alluded to, on the part of the Government, to promote such institutions. . That there is talent amongst us as a people, cannot for a moment doubted." The important question is,-H ĥe The important question is,-How can this talent be developed and best directed? Certainly, no means are likely to be so effective, as opening to the view and constant study use, as opening to the view and constant study of the people, examples of art,—the relics of other ages,—in contrast with productions of the present time. I think the day is not far distant when the Government will find it ne-cessity is multiply facts invites of those splendid remains of ancient art which are in their possession, in the British Maseam and in London (the millionce of which is now confined London (ife influence of which is now confined of that locality, and of use only to a fraction of the community), and deposit them in the lead-ing provincial towns; thus forming centres in wardous parts of the kingdom where these es-sential helps to study may be seen, and the principles of sirf learned. Who can calculate the enclose the facilities would have upon art, or the results, in a national point of view? Out of the metropolis, where are the examples the metropolis, where are the examples-The of elevating public taste? Our thorough-fares present no beauty, --- no statues --- no foun-tains, and but little that is good in archited tures. There is nothing to excite emulation! pething to arouse a feeling for, or perception of excellence in the mind!

"Allowine to contrast this state of things ith that which exists amongst our rivals road. With them, art is made a leading with th abroad. feature not only of every system of instruction, but its examples are continuelly exposed to the public eye. Every public object is graced by its performance, and all events commemorated by its efforts ; -- the most common-place neces-sity is made subservient to its influence. Who, that has wandered through the streets of Paris has not been struck with the thought, that if the supply of water is not conveyed with as much facility as to our dwellings, it is turned into a powerful means of educating the eye; and instead of the common-place machines used in this country, with levers of graceless form, requiring much animal strength to put into motion, has there seen that the vessel cannot be filled with this necessary condiment until it has educated the eye and taste of the recipient,-that the water has been thrown high into the air, and descended from basin to basin until it reached the grand reservoir from which it issues, through some ideal or chimerical form. What must be the effect upon the juvenile minds of the lower classes who are sent, as soon as nature has im-sputed strength, to these fountains of com-bined necessity and beauty? This is a Apple, illustration of the way the things of necessity are made subservient to and become the means of public instruction. I shall not,

delay you to go through their public streets, walks, and gardens, where art is made a conspicuous and leading feature, always exposed to observation, and cannot be passed unobserved. There are also their museums and palaces, which are open and free of access to the people, and are places of constant and general resort, particular on feast-days and holidays."

"The effect of such exhibitions on the public taste is not the only important result that would arise from them. It is not merely as it regards their influence on art that I would advocate their establishment; I would also plead for them on account of the moral effects they would produce amongst the mass of the people. I think it will be readily admitted, that if such places of resort were opened and frequented by them, they could not fail to elevate their notions and purify their actions. At present we are deficient in those means of instruction which are adapted to the wants of the upgrown man. The institutions that exist are either above his means, or too elementary in their character, for him to find his enjoyment in them. I have long thought this an essential defect in all schemes that have been proposed to allure his attention. They propose to him to give up his present habits, but offer nothing in exchange; at least not that which is suited If we investigate character, we find few that have arrived at the age of maturity, that like to acknowledge or that feel their ignorance, and there is a disinclination to resort to the first elements of knowledge as a means of instruction. Age has begotten its conceits and accumulated prejudices, and there is an aversion to adopt any course which they conceive will increase their labour; they think that after their daily labour is performed, the time is their own. There is some point in which they fancy they excel others, -on which they their fame; this is enough to beget in their minds a prejudice to abstract learning, and keeps them aloof from those excellent institutions that have been originated for their benefit. How, then, are you to teach them their ignorance, or induce them to come within the meshes of those nets you spread to win them to their good ?- Again, we have at present no place of resort or means of iustruc. tion which does not require the separation of the man from his family; there is little that is done in them that allows of their assembling together; and I cannot but look on any means originated with the intention of elevating the character of the working classes, that does not include the moral elevation of both seres, as well as all ages, as defective in their plan. From this hasty sketch, I think it will be evident that the means of instruction that I am advocating will not only remedy many of the defects attached to those institutions that exist for the promotion of the welfare of the working classes, but be the means of placing their importance in that powerful light before their minds, that they will be led to desire to realize the advantages arising from them, not only for themselves, but their families. It does appear to me, that the most powerful means of teaching these people their true state, will be through the eye, - by setting before them, and giving them constant access to emporiums where the beauties of nature, art, and science are open to their study,where they may see the splendour and perfection of the first, the imperfect yet noble attempt of the other to reach it, and the state of those productions in which they have

a personal interest. Let us have a museum of art and nature, whose ample stores will educate the public eye — enable it to detect and appreciate beauty !— where, by contrast, we may elevate and purify our knowledge, and, from the works of other ages and other climes, learn our own standard at the present day.

The plan I would suggest is, that a respectful but earnest memorial be presented to Her Majesty, setting forth the commercial importance, and the dependance of the manufactures of this district upon a right understanding and application of the principles of Art, the deficiency that exists of any means of acquiring this knowledge, and the influence that such means of instruction could not fail to have on the welfare of all classes, together with the moral effects that would be likely to follow the adoption of such a course; and praying her that she be pleased to order this the competent authorities may be put in possession of the duplicates of overy department, and a safe of casts, from the suspany department, and a safe of casts, from the suspany department, and a safe of here. Then about two be unabled, not only to elevate the public tasts is improve the predections sof: industrial art, but found a schooly which I would fain hope would not fait to develope that takent, and will into accorde the new ional character, but reflect the brightest "says of how our on the town of Machester."

Mr. Jackson's suggestions arem to bave m with some attention, and copies of the pap were extensively circulated. Subsugaratiy, Mr. Brotherton determined to prepare a Bill to enable town councils to raise the funds requisite for museums of ait, and a Bill, with similar objects, was at length passed through Parliament by Mr. Ewart. The present plan, in Manchester, is to build an extensive edifice, which might contain the museum, the school which might control the motion, it is is a colleging, and perhaps afford the motions of a collegint institution. The probable summent of expenditure upon the building is supposed to be 100,0004. It is expected, that Government would supply fac-similar and duplicates for would supply yes summer and dupicated for the museum, and that there would be and difficulty in obtaining emoney in the test source. There is little doubt state the scorporation would aid by the grant of indic The proposed site is in Cooper-street, oppositethe dischanich Institution, and extending back a considerable depth, including the area of the wown's yard, which it is intended to arch over; the a saka ground may be retained for tits; present pe poses. At an interview between ourtain nions-bers of the council of the School of Design, and the mayor, that gentleman expressed tim self highly favourable so the plan, and and, the the town council were provented from untark - ini vigorously into the arrangements, wolsty by the very onerous daties at that moment q ing upon them. He, however, requested the council of the school to consider the prelimi-naries, and said that when they had not be arranged, the town council would not be fide one moment. of the permanent 60.1

An architect is at present ofcupied'in table plans of the land and buildings, prepinstory to pulling down; and we may hope to satisfy first fruits of the new Billy and as ship excess tions of the council of the school, carried out in the best manuer in the town of Man

NEW ROYAL PARK AT BATTERSBA

In one of the earliest numbers of our present volume^{*} we drew attention to Mr. Theme Cubitt's proposition for converting Batteviets fields into a park, and pointed out at some length the many and great advantages that must accrue, not alone to the immediate iscality, but to industrious London is targe by the conversion.

Within the lest few days a notice has appeared in the London Gazette to the effoct, that application will be made to Parliament in the next session for leave to bring in a Bill to empower the Commissioners of bur Majesty's Woods and Forests to make a royal park, and for that purpose to take cortain lands, &c., containing about 330 acres, situate in the parish of St. Mary, Battersen; bounded on the north by the river Thames, on the south by the public road leading from Nine Elms to Wandsworth, and on the cast and west by various portions of land belonging to private persons. We understand that it is intended to embank the Thames, and the the new park will have the advantage over all others in the metropolis of commanding the interesting river transit and scenery:

THE BRITISH MUSRUM.—OPENING OF THE NEW WING.—The trustees of the British Museum have recently opened one of the large rooms in the new wing erected at the west end of this building. It is stated that this wift be called the Chinese room, from the circumstance of the Chinese bell, which has becauresented by her Majesty, being deposited here. THE MADELEINE, PARIS.—The consecra-

THE MADELEINE, PARIS.—The consectation of this costly edifice and deposition of sertain relics have given rise to ceremonics which will last several days.

AGA CALCULATION OF CAST-IRON GIRDERS, Sec.

hTux section that we employed to illustrate the use of the table at page 499 of the last member of Tan BOILDER, is a very common and a very useful one, being now simost asi-venually employed in the construction of railversion of the properties of equal attempts of rate-ways and other works, where great strength is an object of consideration. If the dontour be monified into the figure of equal attempth, and due attention by paid to the proportions of the parts, so as to equalize the shrinkage of the match in colling this form in much he the metal in cooling, this form is probably the very best that could be adopted, a remark that is in some measure confirmed by experience, and the extent of its application in all beavy structures. But although the form of section here alluded to is good, and very gene-rally adopted by the most skilful esgineers, there are some other forms which, on account of their convenience on certain occasions, ought not to be altogether neglected, espe-cially as they present a very graceful appearnee to the eys, and are by no means deficient in strength acronding to the quantity of mate-rial employed; we here allude to the open forms of beams, whether plais or feathered, and in order, that our labours may be rendered as useful and instructive as possible, we shall have coasider both these forms, and prove the utility of the table by applying it to the calca-lation of the load, that ought not to be ex-contend in any permenent bearer, where safety is an object of selicitade. I Let ABCD, fig. 1, represent the transverse contend of a plain rectangular beam, and let the middle part E; skewood by the lighter shade be left out along the length of the beam, with the acception of cross stays to prevent the upper and lower A B parts: AB and CD, distinguished by a derkar shade, from coming to-gethen, and these cross stays may be made arouncets, in the form m useful and instructive as possible, we shall

-made ernemental, in the form afiatehes or otherwise, according touthe facey of the architect or C a rí

shifting regard to the calcula-tion of the permanent and safe faid, with which a beam of this init, with which a cases or saw form aught to be charged, on the supposition that it is supported at the ends, and loaded at the middle of the length, we have only to con-sider the whole section ABCD as being entire, and to calculate its strength on that supposition, after the manner already exemplified at page 499. Do the same with the middle part E, considered as a separate rectangular section; then D

Reduce the strength of the section B thus computed, in the proportion of the whole depth to the middle depth, and the difforence between these two results will be the strength of the beam sought, including the affect produced by its own weight. From the mealt deduced in this way, subtract half the weight of the beam, and the remainder will he the load, beyond which the beam ought not to be charged, when intended as a permanent support.* • Example 1. -

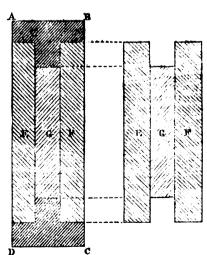

- An open plane rectangular sition on two walls, at the distance of 44 feet from each other; what load will it bear at the middle of its length averaging it. sen is loosely supported in a horizontal suiddle of its length, supposing the breadth to be seven inches, the whole depth four feet, and the depth of the middle part or opening three feet?

In the table opposite 48 inches in the information column, and under 0 at the top of the page, we find 875.52 tens for the load portresponding to the whole depth of the secsourcesponding to the whole depth of the sec-tion, when the breadth is one inch, and the length one foot or 12 inches: but the strength is directly as the breadth when the depth is given; hence we get 875.52 × 7=6128.64 tons, for the strength of a beam seven inches in breach, 48 inches in depth and one foot in length. Again, opposite 36 inches in the left-hand column of the table, and under 0 at the

will calculating the second example at page 400, the effect preduced by half the weight of the beam was inadvert-ently omitted, the omission, however, is very easily supplied. Yor the sectional area is 186°41 square inches, and half the lenge, we have 158°41 × 3°2 × 18 + 2,240 - 4°073 tons, half The weight of the beam; therefore, by subtraction, we have 98°072-4°073, 88.999 tons, the permanent load monght. It is whose stated in the question that the depth of the middle part is 3°5 inches; it empht to be 58°5 inches. tons, half

top of the page, we find 492.48 tons, for the load corresponding to the depth of the middle or open part E, on the supposition that it is an independent rectangular section of the an independent rectangular section of the same breadth as the former; namely, seven inches; consequently, multiplying by the breadth, we get $492 \cdot 48 \times 7 = 3447 \cdot 36$ tons, for the central load on a beam 36 inches deep, seven inches broad, and one foot between the **points of support**. But this, by the laws of mation muct be advand in the parameters of provides of support. But this, by the laws of tension, must be reduced in the proportion of the whole depth to the depth of the middle part; that is, 48:36: 3447.36: 2585.52 tons; let this be subtracted from the strength of the whole beam, and we get 6128.64-2585.52=3543.12, which hence divided by the length whole beam, and we get $512554-2585\cdot52=3543\cdot12$, which being divided by the length between the points of support, gives $3543\cdot12+44=80\cdot53$ tons very nearly, for the central and safe load, including the effect produced by the weight of the beam itself. Now, the area of the whole transverse section is $48 \times 7 = 336$ square inches; and that of the middle or open part, is $36 \times 7m252$ square inches; half the length of the beam being 22 feet; hence we obtain $(336-252) \times 3\cdot2 \times 22 = 5913$ 6 lbs. for half the weight of the beam, which being nait the weight of the beam, which being reduced to tons and subtracted from the load as calculated above, gives $80.53-2^{\circ}64=$ 77.89 tons, for the permanent central load which can be safely sustained by the given beam, without any danger of destroying the elastic force of the metal; and twice as much, or 155.78 tons, may be equally diffused over the length of the beam.

Another very elegant and useful form of section frequently employed in buildings, and to which our table is equally applicable, is that which has a web or flange on the upper and under side, with a portion of the middle part left out. This form of beam has a decided sidventage over that which we nave just con-sidventage over that which we nave just con-sidered, both as regards its stability and its strength; and it is besides particularly pleas-ing to the eye, for which reason it is well adapted for ornamental erections in places that the drawing fig. 2 denotes the section here alluded to, and the manner in which we may conceive it to be constituted. The rectangle ABCD is the section considered as entire, and the rect-angular portions E and F in lighter shade, are supposed to be taken away to form the flanges on the upper and under side of the beam along its whole length; the middle rectangular por-tion marked G being taken out to form the opening, which is understood to be braced with arches, or some other ornamental devices, for the purpose of preventing the upper and lower solid parts from coming together. The whole abstracted portions will therefore be as

represented by the detached part of the figure, and may, as regards the strength, be considered as three independent rectangular beams: this circumstance leads us to the method of calculation.

Example 2.--Anopen double flanged cast-iron beam, is 44 feet in length between the points of support, and 48.8 inches in the whole depth, of support, and so o mones in the whole deput, the distance between the flanges being 42.4 inches; with what load onght the beam to be charged at the middle of its length, the greatest breadth being 9 inches, the flanges projecting on each side to the extent of 34 inches, and the depth of the central opening 38 inches?

Here then, we have first to calculate the strength of the whole section, on the supposi-

tion that it is entire, as represented by the rectangle ABCD. This done, we have next to calculate the three abstracted portions, E, F. G, considered as independent rectangular sections; or the portions E and F may be consections; or the portions E and r may be con-sidered as one section, and calculated accord-ingly. Therefore, in the table opposite, 48 inches in the left hand column, and under 6 at the top of the page, we find 904 9472 tons, for the strength of a beam of the given depth, 1 inch broad and 1 foot long. But the whole burddith according to the question is 9 inches breadth, according to the question, is 9 inches, and by the principles of mechanics, the strength is directly as the breadth when the depth is given ; therefore we have, $904.9472 \times 9 = 9144.5248$ tons for the whole

section.

The flanges project 31 inches on each side ; this gives 64 inches for the breadth of the two projections; but the distance between the flanges is 42.4 inches; therefore, in the table opposite 42 inches in the left-hand column and under '4 at the top of the page, we find 683'1488 tons, corresponding to 1 inch in breadth and one foot long; hence, multiplying by the breadth, it is, $683 \cdot 1488 \times 61 = 4440 \cdot 4672$ tons for the

strength of E and F, jointly. But by the laws of tension, this must be re-duced in the proportion of the whole depth. to the distance between the flanges or profes-tions on the upper and lower side of the beam; that is, 48.8: 42.4:: 4440-4672: 3858-111 tons nearly.

Again, the whole breadth of the section is. Again, the whole breadth of the section is. 9 inches, and the joint breadth of the projec-tions 6 inches; consequently, the breadth of the middle part, or opening, is 2 inches; but by the question, its depth is 38 inches; there-fore, by the table we have 548.72 tons for the strength of I inch in breadth and I foot in length; and by multiplying by the breadth or thickness, we get $518.72 \times 21 = 1371.8$ tons. for the tabular strength of the portion G, which must be reduced in the proportion at the whole depth to the depth of the opening; that is,

48-8 : 38 :: 1371-8 : 1068-295 tous meanly

The reduced strength of the three parts, E, F, and G, taken conjointly, is therefore equal to 3858-111+1068-205=4926-316 tons; which being subtracted from the strength of the whole section, gives 9144-5248-4926-316= the whole section, gives 5122 040 - 2040 - 2040 - 4218-2088 tons for the strength of a beam of the section 1 foot long; but by the laws of re-sistance, the strength is inversely as the length, when the breadth and depth are given; bence by division it is,

4218-2088 + 44 = 95-968 tons; 1 15400

including the effect produced by the weight of the beam. Now the sectional area of the solid portion of the beam is 68.6 square inches, and half the length is 22 feet; hence it is,

68-6 × 3-2 × 22 + 2240 == 2-156 tons.

and allowing one-tenth of this for the weight and allowing one-tenth of this for the weight of the ornamental stays or braces, weight $2\cdot156 + \cdot 2\cdot156 = 2\cdot37/16$ tons; so that the per-manent safe load on the middle of the beam is $25\cdot868 - 2\cdot372 = 93\cdot496$ tons. T.

SINGULAR ORIGIN OF A FIRE .- The Worcestershire Chronicle says: On Sunday last, about two o'clock in the afternoon, a fire was discovered in the house of Cornelius J. Phil-brick, Esq., surgeon, Mill-street, Worcester. It appears that in a bed-room with a southern aspect, a watercroft foll of water, standing on a dressing-table, concentrated the calorific rays of the sun to a focus on an embroidered mat, which ignited, as also did another which adjoined it. The smell alarmed the inmates, and caused a search, which led to the discovery of the burning materials, and the timely preven-tion of further mischief.

tion of further mischief. THE NEW HOUSES OF PARLIAMENT.—An immense quantity of the slate from the guarries on the estate of the Knight of Kerry, Valentia Island, has been ordered for the new Houses of Parliament. It has been also ordered in large quantities for public buildings in France and other parts of the continent. So veined and variegated is it, and so succeptible of a high polish, that it is capable of being wrought into tables and other domestic articles. It is only a few years since that this guarry was disonly a few years since that this gatrry was dis-covered.—Limerick Reporter.

EARLY FONTS.*

.....

EXAMPLE AT DEARHAM CHURCH, CUM-BERLAND,

"Tris curious font (there is every reason to suppose) is a Saxon work. As an architectural composition it evinces more elegance than Baxou work is generally supposed to present. Lysons, in the fourth vol. of the "Magna Britanuia," gives an elevation of this font, and states that there are several other fonts in the churches of Cumberland which may be referred to Saxon times : he mentions those at Bowness, Aspätria, and Cross-Canonby, and elevations are given of some of the most curious, including that of Bridekink Church, which he considers is the most curious one in the kingdom. "It hears the following Dano-Saxon inscripmentione of the super-

tion in Runic characters :-- "Er Ekard han men egrocten, and to dis men red wer taner men brogton;" i. e. "Here Ekard was converted, and to this man's example were the Danes bronght." Lysons adds, that the scroll in which this inscription is cut rests on two pillare, one of which is evidently clustered, and of a lighter style than that which prevailed a short time before the Conquest.

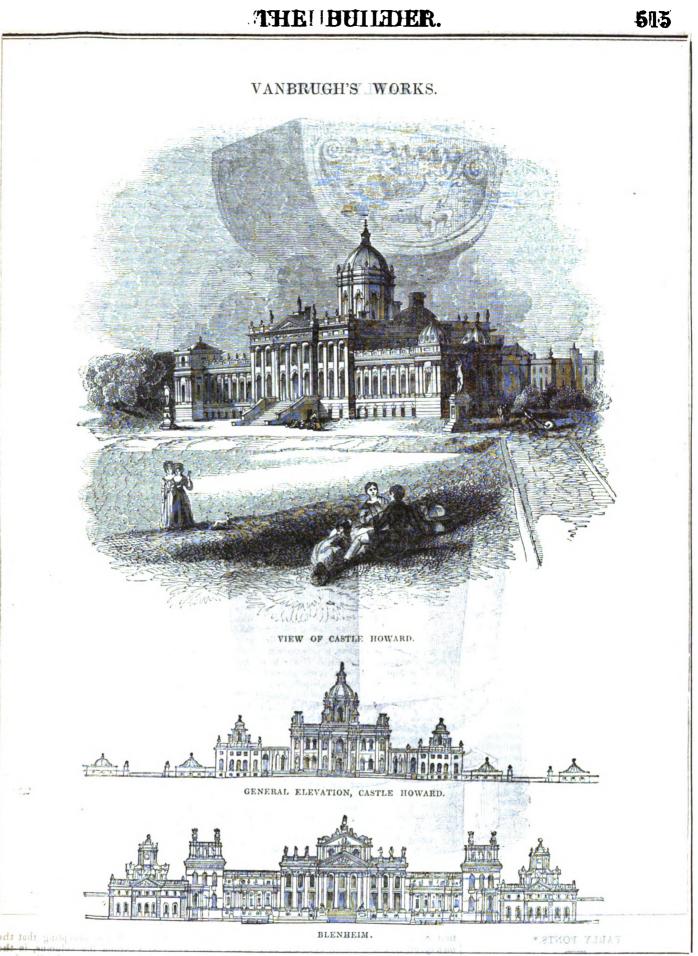

With reference to the font at Dearham church, I am inclined to think that the peculiar rope or cable moulding at the ncck, is evidence of Saxon architecture; a very curious and undoubted work of that period where it was used in conjunction with Roman mouldings came under my observation some few years since, it was the chancel of Reculver church, Kent. This chancel, the walls of which were constructed in the Roman manner, had every appearance of being a rude imita-

tion of a temple in Antis, excepting that the wall immediately behind the columns, in the centre of which was the doorway leading into the cell, had been removed.

This chancel which was the downay reading into the cell, had been removed. This chancel which when first erected was probably an idolatrous temple of the Saxons, had the columns in portico remaining; their

• That the ancient Roman and Saxon temples used by the idolatrous Saxons, were converted into Christian eturctes is well known. Pope Gregory advised Augustin that the temples ought not to be demolished, but only the idols that were in their should be removed and destroyed, and then consecrated to the service of the true God; the probability of these temples being added to, is apparent, the equipme being auffered to remain. The early Saxon writers, Bede, Alcuin, Heddhus, and others, frequently use the word for-ticus when describing the interior of the Saxon churches, thus in Bede's account of the internet of King Ethélerri, the espresse himself thus—he was buried, "in Portics Sti. Martini intra occlesian." In James Benthan's well known ersay on Saxon architecture prefaced to his history of Ety Cathedral, page 19, edition 171. rate will be found many particulars on this interventage objers.

bases were composed of two triple rows of this rope or, cable moulding, arranged similar to two torus mouldings, and beneath them were an annulet and scotia. A drawing of this chancel, made previous to the last repairs, was submitted by me a few years ago to the Society of Anniquartes, it has never, however, been published and the moulding is to be seen in

the rope or cable moulding is to be seen in other wery early examples of fonts; for instance, they at Stratton church, Cornwall, given as the second example in V ab Voorst's work on Fonts.

The style of this font is Early English. There is a great pecultarity in the shortness of the columns which support the plain and massive top; the foliated capitals and the leaves shew more flow than is usual in this style. Altogether, I have seldom seen a more beautiful and simple specimen.

OLD ENGLAND. SHILL

IN illustration of some remarks on Vanbrugh and his detractors, that appeared in a recent number (see p. 469 ante), we avail ourselves of the last part of Mr. Knight's popular work, "Old England,"* which contains, in addition to a coloured interior of Whitehall Chapel, and a host of cuts illustrative of the buildings in Oxford, &c., two yiews of Castle Howard, and one of Blenheim. Although small

Published by C. Knight, Ludgate-street.

and slight, they shew sufficiently well the picturesque outline these buildings present, and Vanbrugh's great skill in composition. "It appears to me," says Sir Hugh Price (in "Essay on the Picturesque"), "that at Blenheim, Vanbrugh conceived and executed a very bold and difficult design, that of uniting in one building the beauty and magnificence of the Grecian architecture, the picturesqueness of the Gothic, and the massive grandeur of a castle; and that, in spite of many faults, for which he was very justly reproached, he has formed, in a style truly of his own, and a wellcombined whole, a mansion worthy of a great prince and warrior." His first point appears to have been massiveness, as the foundation of grandeur; then, to prevent the mass from being

THE BUILDER

a lump, he has made various bold projections lous heights, which seem a egrounds to the main building; and, lastly, having been probably struck with a variety of outline against the sky in many Gothic and other anclent buildings, he has raised, on the top of that part where the sharing roof begins in any home of the Fallar style, a number of deco ritions of various characters.

These, if not new in themselves, have at lows been spplied, and combined by him in a new and peculiar manner; and the union of them gives a surprising splendour and magaificence, as well as variety, to the commit of that princely edifice. The study, therefore, not the imitation, might be extremely serviceable to artists of genius and discernment."

Castle Howard, in Yorkshire, was com-menced for Charles, the third Earl of Carliele, in 1702, and was completed by Vanbrugh, with the exception of the west wing. This extensive pile is 660 feet in length. The length of Blenbelm on the north front, from one wing to Blenheim on the north front, from one wing to the other, is 848 feet; the internal dimensions of the library are 130 by 32 feet. The hall is 53 feet by 44; and 60 feet high ("Gwilt's En-cyclopedie"). "The secret history of the building of Blenheim," in D'Israell's "Curi-offices of Literatare," shows the distressing difficulties in which Vanbrugh was involved by this commission. this commission.

The first volume of Twn BUILDER (p. 173) contains some observations on these structures. and a memoir of the architect. ومسمع معاملاتهم

POREIGN ABCHITECTURAL AND COL-LATERAL INTELLIGENCE.

Disproportion between the "dwellings of the rich and poor" at Berlin. If we perceive, that any inconvenience, which oppresses this country, is to be met with also in such places an we shought hithento exempt therefromstatistica ought to be the more intensively called to the remedying of three evils, which thus appear not merely national, but rather genoral evils, which oppress the present system handid manasions are raised on all sideswant at dwellings for the poor becomes every day more fait. It seems as if building was by carsied ... on for the sake of the richand the owners wou't take any one but generals, privy councillers, and baskers in their first Boors, substantial shop-keepers in the third.* What is before that, is only a nuisance for then. But now, Berlin increases every year by 10,000 scals, which, in a great proportion, belong to the working classes. The '*habita-*tional' circumstances of this class become every day more gloomy, and it seems to us, that while the authorities take care, that no light weight be used, no adulterated bread or putrid meat be sold --- they might also turn their attention this way. The rental of all houses attention this way. The rental of all houses in Berkin amounts annually to 1,101,031 rixdalsrs (at 3s. each); and the average price of a dwelling (Wohnung) is now 100 rixdalers; in 1808, however, it was merely 50, which is a very gloomy and astonishing fact. It is certain, that the number of dwellings, whose rent is fifty dollars or less, is more than half of the whole number—viz. 35,577; and even this most humble amount (about 74. a year) can't be afforded by a very great number of the labouring class of Berlin,"—Hamburg Corterrond ent.

Superrevision of Public Works in France The minister of public works has undertaken s journey of inspection of the berbourn of Sparney of inspection of the herbours of Ortte, Marseilles, &co. He is also examining the railcage of the south of France, either those in full traffic, or such as are construct-ing, or merely projected lines. The casal of Languedec, in all its details, has been meet. inntely inspected by the right honourable gentleman.

The late Carpenter's Strike at Paris (in a maked) .--- The late demonstration of the journeymon campenters can be viewed with a furtion by any lover of bis kind-as these men have brought forth their claim quite nasileyed with any admixture of intimidation or physical

In Gormany, several families of the first mark, or nearly

force. They have reasoned like reasonable beings, and it is their masters who are at fault. The rationale of the whole affair is as follows. In the year 1833 a formal convention (if we may translate thus) had been held between the masters and journeymen carpenters, by which the wages of a day's work were fixed at four france. From that period, however, a constant oscillation began to manifest itself between oboniation began to manness mean seven the latter itsm and that of five france. In asking, therefore, in 1845, that the latter sum should be made the fixed one for a day's wages, the journeymen wanted merely to have authorised formally, what already had become sanctioned by custom. The masters, certainly, had a right to refuse—but no more. Bat instead of confining themselves to this, they formed a coulition, and resolved on fixing egain the item at four france, viz., the price of labour twelve years ago. In the lawsuit, which has occupied, of late, the French coarts, it was argued, that this was merely a passive proce-dure-a point, however, on which we are not called upon here to dilate. The Cour regule will have now to decide on the appeal, interposed by the journeymen against the verdict of the inferior tribunale.

Brunswick. - At the restoration of the cathedral, some fresco paintings on the walls, have been of late discovered, which are of the period of Henry the Lion, amongst which is the portrait of this Monarch of the Brunswick They are painted on wet lime, and may line. be restored with tempore colours, and are so far preserved, that their age may be accurately ascertained. The figure of Henry (d. 1195), mach resembles his coeval statue still extant ; and the whole of the pictures, although not perfect master-pieces, possess some value for the history of art, as they may be the only ones in Germany from that early date.-Algomoine Zeitung.] [Algomoine Zeitung.] (Austria). - On the second of this course (Austria). - On the second of this

month was opened a new institution for the ed-work was opened a new institution for the ed-vancement of the working-classes, via., what is called in Germany "Real Schule," a school of realities. Here the children of workers are instructed gratuliously, or at a morely nominal expense, in arithmetics, algebra, geometry, chemistry and physic—the art of drawing and caligraphy. At the Academy of Arts young people may also learn the arts of de-sign. There is, moreover, in that city an Asso-ciation of Industry, a technical establishment joined to the Johannaum, a gymnasium (small college), and a University. Grats is a city, whose population is not much above that of Woolwich, or such other metropolitan villages. Meetings of the Académie des Sciences (R. S.)

at Paris, 6th to 13th October. - Mr. Colas, whe has made a very felicitous invention for copying (moulding) statues, even in different proportions (sizes), has solicited the academy to appoint a commission for examining his discovery and its proceedings.—Mr. Bains, the gentleman who claims the priority of inven-tion of electric telegraphs over Mr. Wheatstone, stated his new procedures for setting all the clocks of a city into motion, and to make them keep accurate time. He says, that it is by means of electric conducting tubes, that he will effect his purpose. -- Dr. Brack spoke nearly an hour on his new definition of "a straight line." The French press ridicules this attempt-still, if we consider, that not even the level of any fluid, water or any other, is, or ever can be horizontal, but (in reality) is conver, the subject assumes some meaning; which, however, can hardly ever become of a practical bearing.—An Improvement on Sir H. Davy's Safety Lamp for Mines.—As this, stheit, splendid discovery has not answered all the requisites of such an instrument, Mr. De la Rive has occupied himself with a new contrivance, by which the lamp is ennew contrivance, by which the lamp is en-tirely placed without the control of the person using it. This appears the more important, as statistical tables prove, that 400 persons loss their lives, in Europe, every year by the explosion of gas in mines and the like places. The main of Mr. Rive's discovery is a cylinder of charcoal, which is kept inca descent by an electric stream. Such a lamp oun be kept enclosed hermetically in a glass globe, as this development of light requires no oxygen, and thus every danger of explo-sion is removed; besides the light is more intense than can pass through the dense metal-wire wicker-work of Sir Humphrey's lamp. Mr. R. aoknowledges the yet imperfection of his himp, which conside in the high stanc y of the light developed, but hopes that a longer experimentalising will bring it to

a longer experimentaneur many many propiets perfections. "A hint" to the mashing clause - "of Paris."-It is reported on the best subbrity, that the Préfet de Police, has submitted to the King in council a report of great importance King in council a report of great importance: on: the dangerous -results, which would fel-low the exclusive concentration of all ourrancy, on railway enterprise. Mr. Prefet has ener-getically nignalized the grave inconvenience af-this total absorption of each in stock-jobbing and spicings. He concludes by pointing ont, that if there be no prempt remedy resorted to require this numbers, is to be anarched. accompanied by a very deplorable crisis. It is added, that the whole council (of mini sters) were struck by these observations, which they considered of the highest importance Measures are to be forthwith resorted to for obviating (as far an it is possible nose) this abnormal state of apsculation ---- or sather downright gambling by many persons, who indeed, can bardly afford such exponsive anasonent. -Gazette da France,

Foundations of this kind require great precaution to prevent subsidence of the build-ings created upon thom. The whole of the land in this neighbourhood (Beverley-road, Hell), and also of that upon which the town is Delty, and also of that upper watch and as care what-bally, is of this description, and as care what-ever is taken, with very rare exceptions; to guard against the settling of buildings; in fact, gived against the securary or unitary to use it does not been to be thought necessary to use ally means to prevent this serious svil. And the settling down of foundations is not the only evil; there is mother which is, if possible still more serious, as it effects the health of persons residing in houses built upon the soil, without any precaution to prevent the ascent of moisture through the brickwork in contact with the earth, and from under the floor of the several apartments lying immediately over the surface of the ground. The superior temthe surface of the ground. The superior tem-perature of the air within the walls of a house, always has a direct tendency to produce evaporation from the site upon which it is built, and to bring up with it the missma from the suckings of bad drains in the neighbóorhood: /

It is a common practice here in Hull, to simply excavate the ground for the foundations, and to lay them with the worst bricks and **more the set frand;** sometimes indeed, a little **more procession** is taken to provent settlement by laying York landings for the footings of the wells so rest upon, but then how are they laid P why just with the least possible trouble, and without ascertaining if the soil is of uni-form solidity, and capable of sustaining the superstructure in all parts without ainking. For want of this precaution and attention to drainage, part of a range of fine buildings has settled so much, as to involve a very serious outlay in repairing the mischief, although only excented within the last four years. In a large public building in this town, the whole of the walls, several hundred feet in length, were covered their entire breadth, when at a height of wix" incluse above ground, with sheet zinc bedded in loam, and the first course of bricks laid upon it also bedded in the same material. It was supposed that the zinc would prevent the ascent of moisture, and no doubt it would whilst it remained in a sound state, but it was found on breaking through the foundations nine months after, for the purpose of laying hot and cold water pipes in various parts of the building, to be every where pierced with beles and in a state of rapid exidation, and there can be little doubt that it has now (fourtem months since) nearly all disappeared. It was argued at the time, that the bedding in learn, instead of mortar, would prevent oxida-tion, but such was not the effect of the means here employed; moisture and the air mixed with it, appear to have been the principal sgents in the decomposition of this worthless starial, worthless at least for such purpose as the one for which it was in this case used.

In this locality, all buildings are sure to settle when built upon foundations laid in the ordinary manner, and the greater the weight of the superincumbent mass, the sooner this effect becomes visible, and it goes on impercaptibly through a series of years, until the house becomes seriously dilapidated, damp, and greatly reduced in value and rental. In smaller matters, such as fence-walls, gate-piers, dwarf-walls for iron railing, &c., the same cause is in constant operation, but with less effect; it does not so soon shew itself, but is equally certain to disturb the arrangement of every thing resting upon foundations so laid. It is a rare circumstance to find arreaded It is a rare circumstance to find any such creetions in a perpendicular position, after the lapse of a very few years.

The sottling here described, appears to be stand, first, by the compression of the clay, which is, as I have before said, everywhere more or less silty, and greatly varying in density, the latter condition being very much affected by the water it may contain. Secondly, after a house is built and supplied with drains which take off the water at a level below the foundations, the soil gradually becomes drier and as a matter of course contracts; this lets fown the foundation, and the house sinks, but not in all parts alike, as some parts may be-come less dry than others. Thirdly, the drains <u>may not be placed</u> so low as the footings of the walls, and where this is the case, and they are not soundly constructed, the leakage from

them will coak into the soil under the foundathem will coak into the soil under the founda-tion, and reduce the solidity of the earth upon which they rest. There is another cause in constant operation throughout the soil in this neighbourhood, I mean the drainage going on internally during dry seasons, when from the peculiar nature of the soil, large fissures are produced which form continuous drains in all directions tourned the means outfill the produced which form continuous scains in all directions towards the nearest outfall; the effect of such drainage is to dry the soil and cause it to contract, thereby letting down, buildings standing upon it. The same pe-cularity of the soil, causes a ready absorption of meter in met access which exclose the of water in wet seasons, which percolates horizontally and in other directions for a considerable distance under buildings, thereby reducing the solidity of the soil upon which they rest, producing the same effect from opposite C1084

The action of water or moisture in softening and reducing the solidity, and of drainage and spontaneous evaporation in contracting the bulk of the soils here described, would have no such effect on gravelly or stony foundations, as may be illustrated by filling one vessel with silty earth, and another with sea gravel : water poured into the first, will of course reduce its solidity, or if the same vessel is placed in dry air, the moisture mechanically mixt with the clay will evaporate, and the earth will contract; the effect in either case will be to render it less fitted to sustain a superincumbent pressure less fitted to sustain a supernormoundent pressure without settling; but it is not so with the vessel containing the sea gravel, the water poured into it will produce no change, the particles of hard matter being in contact, and not liable to be acted upon by the water passing through them, will remain unchanged as to solidity under all circumstances of pressure. This view of the case will shew the advantage of using concrete, in which we have, if it is composed of proper materials, a good example of the incompressible nature of a foundation so prepared, and of its other important property, namely, that of being impervious to moisture. The materials employed in concreting, should be sufficiently hard to suctain any weight placed upon them, without crushing ; the par-ticles should be in contact, and the lime used should be in such proportions, as would be just sufficient to fill the interstices betwixt them, which by adhesion to their surfaces would form a bond to the whole,--such at least is my view of the nature of concrete.

When concrete is laid in an excavation, it becomes a solid mass of uniform density, and in time so hard, as to sustain the weight of a building uniformly over the whole of the foundations; if the soil under it is less solid in one place than another, the concrete will equalise the pressure upon it, on the same principle as an inverted arch, or other well known modes of discharging pressure in the construction of walls. Concrete should be thinly spread, say from 3 to 6 inches, over the *whole* area of the space under the floor of ground floors, for the purpose of preventing the ascent of moisture.

I have noticed the settlement in many buildings in this place. In gates seven feet high, where sufficient care has not been taken to prepare the foundation, the settlement has thrown them from one to three inches out of the perpendicular, and the effect has been to produce a disruption in the iron railings, &c. attached to them. In fence walls, there is still greater mischief produced by this careless way of laying foundations, but then any be thought good enough for this thing seems to sort of walls. The settling of the walls in small two-story houses is not so readily detected, but it shews itself in a year or so, by defects in the openings of doors, windows, cielings, &c. In a range of large houses, built within the last three eres nor what was said to be the last three years, upon what was said to be dry ground, I have noticed a settlement al-ready in the front walls (and the landings under the small porches over the doorways have gone down with them) of from two to three inches. The late remarkable dry season has pro-duced a settlement in houses here, which had remained firm since 1839, caused no doubt by the contraction of the earth under them. Sp culative builders are not always aware of the circumstance, that a house does not begin to shew its defects until it becomes seasoned by

shew as detects which is below a seasoned by time and occupation. If the builders in Hall, and other places similarly situated, would reflect on the evils produced by building apon weak and un-

sound foundations, they would find oit theirs interest, and the interest of these who singley them, to pay more attention to this, the mast important of all matters connected with builds.

Important of an mattery wonnected with summery ing, There is one simple plan which I have never seen adopted here, and it seems atrange that it-is not; it is that of paying the bottom of the excavation for a foundation, with hard-burnt-bricks, on edge, filling up the interstices with a grouting of lime and small gravel, and then ramming them down with a payiour's ransmer; a man accestomed to this work (and such men may always he hired) would do the while of may always be hired) would do the whole of the foundations of a small house in one day. It is fair to suppose that the force here employed would be equal to the dead weight of the walls of a two-story house, and would con-solidate the earth as much as if compressed by the weight of the walls without such ramming, thereby preventing the settlement by compression.

It would confer a great faveur on many per-sons who build small houses, and who never think of employing any one but a common bricklayer, if some of your scientific corre-spondents would give a few examples for making concrete with different sorts of materials, and the proportions to be used; such things are known to professional man, but they never reach the ears of that description o-of persons who build houses, here and cleawhere, for the labouring classes ; it would add gauge to the comfort of the working; many if, the owners of small tenements could be made to understand that he could build his houses cheaper and better by using a fitle weiter n the foundations.—I am, Sir, Str. - Col HENRY LIDDELL

= martin frig PAYMENT TO BUILDERS FOR MAIL

.

TENDERS, STR + 100,000 SIR,-Having been a subscriber to your journal from the commissioning, 1.07 stourse for the formation to the interest of your formation of your correspondents, and an shorefore induced in correspondents, and an therefore indused to request the favour of your opinion in the fol-lowing tase. On the lith August last, Linna invited to tender for the erections of stabilings' coachhouse, and other offices for a gentlement in this village. Accordingly, Latended the surveyors' office, and saw the drawing, and in reply to a question as to who the persons were that it was to be submitted to; was caution ously told "none but these in where they had ously told "none but those in whom they had the greatest confidence." I prepared up esti-mate, and at the appointed time, August 21sts at half-past ten n'clock, attended egain at the office with my tender. After waiting up was of an hour beyond the time, and only one of the person being in attendance, the two were opened in the presence of the employer and the junior surveyor; my amount was 4155, the other, 4771, 10s. 6d.

other, 4774. 10s. 6d. The employer expressed great supprises and said he had been much misled, as the surveyor had stated a much less sum than either, and he therefore thought he had better pay mu my per centage for my estimate, and abandon the job altogether. The junior surveyor thought otherwise, and that it had better stand over until he had seen his mission and write the until he had seen his principal, and write to me upon the subject. Before I left, I put the question, would they receive any tender that might come in after we had left? to which the employer replied, "certainly not, business was business, and as they did not come to time, he would have nothing to do with them." I never received any communication whatever from either party, but on September 3rd, to my still greater astonishment, found operations had commenced. I immediately wrote for an and planation, and received a reply to the effect, "that mother person had been applied to, whose tender (3601.) had been accepted, en-closing the several amounts, as under," &c. If need not ask you whether such conduct is not most disgracefal to any professional men wishing to be thought respectable. The reply evidently implies that the latter tender had been solis cited at the same time as ours, but I am firmly convinced, both from what fell from the terms ployer at the time of opening, and circums stances that have come to my knowledge since, that the surveyore, finding they had been druton the means, and swith wishing one maintain their statement, subsequently applied to the third person, who is doing other work

Digitized by GOOGIC

under them, to assist in extricating them from their dilemma. Now am I not entitled to, and can I enforce the payment (and what sum) for my trouble and loss of time?

The difference of amount in the contracts the greater proportion of materials being old, and the greater proportion of materials being old, and the present old building being pulled down to use again.—I am, Sir, &c., A. Mitcham, Oct. 17.

 $\bar{2}19$

518

If the circumstances be here correctly and fully stated, our correspondent may justly elaim payment for the time and skill employed in making the estimate, and would probably recover it. In our mmber for September 13 (p. 442, ante), a decision at the Court of Bequests, in a similar case, will be found.

Correspondence.

17

AISLES. Sir.--Can you inform me whether there is any authority for the use of the expression, entre aiste. It would appear to me, that it cannot be more allowable than to speak of the centre wing of a building, and yet by some writers it is frequently used .--- I am, Sir, &c. OMEGA.

An aisle, strictly speaking, is a wing, and the term should be applied only to the side-passages or divisions of a building. It is now, however, generally understood to apply to all the lateral divisions of a church.

AND GLASS PAINTING AT HOUSE OF LORDS.

Sin,-A letter, signed "Justice" having appeared in your journal of 13th September, containing some statements regarding us in connection with the painted glass for the new House of Lords, which we have been ap-pointed to furnish, we ber your insertion of the following in reply, adding, that we knew nothing of the existence of the article in quetion till two days ago, otherwise we should have requested this favour of you before now. The mis-statements of "Justice" are, that

The mis-statements of "Justice" are, that we are glass cutters merely, and not glass painters. That we obtained the order to supply the painted glass for the House of Lords entirely through interest. That we have no practical knowledge of glass paint-ing; and, fourthly (this conjectural), that we will impose foreign glass on the Commission and the public, for home manufacture. With regard to our being marsly glass

With regard to our being merely glass rutters, and not glass painters, we beg to senter "Justice" that we are not glass cut-Agres, but that out firm has always been known in Edinburgh and elsewhere as glass painters Sui house 'Securators. - We) do not see that stan say more on this point, or that more Is necessary.

"Again, as to the charge of our having obtained the order for the painted glass for the House of Lords, through interest, we do most powitively and distinctly assert, that we did not employ, nor indeed could command, any interest whatever in the matter. We trusted entirely to the result of fair and open competition,competition in which we had to contend with vivals already in possession of high reputation, while we were comparatively unknown, and, consequently, without the influence which attaches to celebrity.

As to our having no practical knowledge of glass painting, we can only say that we have been at much pains to proving out been at much pains to acquire a thorough knowledge of both the theory and practice of our art, making the best existing examples of the middle ages in this country and on the continent our study. On this point it will not be considered slight evidence, we should think, that we do possess the practical knowledge which "Justice" would deny us, that the highest premium, offered during two consecu-tive years by the Board of Manufuctures for "Scotland for the best specimen of painted

glass, was on both occasions awarded to us. With regard to "Justice's" gratuitous assor-tion, that a pressure for time will compel us to have recourse to the importation of foreign glass, instead of using home manufactured, we heg to say, that "Justice" may keep himself perfectly easy on that head, as we have a suffiexigency of the kind he alludes to, should such exigency arise, which we do not at all anticipate.

"Justice" closes the paragraph in his letter that applies to us with the assertion " that there are not many more than fifty journeymen glass painters to be found," in the world, we presume he means to say. If this really be "Justice's" belief, it will rather surprise him to learn that we, ourselves, employ, chiefly of our training, more than half the number he mentions, and can at any time double that number, if required.—We remain, Sir, &c. BALLANTINE and ALLAN.

Aliscellanea.

MELROSE ABBEY.-DISGRACEFUL PRAC-TICES OF TOURISTS.-The mischievous propensities which individuals often manifest on their being permitted to visit public buildings, works of art, and other objects of interest, have often been alluded to as a subject of just reproach. It is indeed melancholy to think that, notwithstanding reiterated complaints and warnings against these practices, there should still be people who are insensible to the disgrace they incur in destroying such objects, whether out of pure mischief, or from the equally reprehensible desire of appropriating fragments as relics. The liberty of access to the monuments of antiquity which adorn the country, is a privilege which must be highly prized by every individual of any degree of taste and information; and the culpability of those who abuse it in the manner referred to is greatly enhanced by the consideration that, independent of the actual damage done, they inflict a grievous injury upon the public at large, who are necessarily visited with the consequences of such misconduct in being excluded from the precincts of these structures. A very striking proof of the prevalence of these shameful practices, and of the consequences to which they lead, appears in an advertisement which has just appeared announcing that, in consequence of the chipping and defacing which the beautiful carved stone-work of Melross Abbey has undergone, that edifice will henceforth be shut up from the public. We understand that his Grace the public. We understand that his Grace the Duke of Buccleuch has of late years been at great expense and trouble to preserve this venerable structure, perhaps one of the richest monuments of antiquity of which our island can boast, and now rendered interesting to the whole world from its association with the imperishable name of Sir Walter Scott. It can scarcely, under the circumstances, be won-dered at, that the noble proprietor should adopt this step for the preservation of the abbey,a step which we know his grace deeply regrets, but to which he has been impelled by these frequent depredations, and by feeling, as he ought to feel, not only a *personal*, but a national responsibility in the custody of this so valuable a relic of Scotland's history.—*Edin*burah Courant.

PROVIDENT ASSOCIATION FOR CIVIL EN-GINEERS AND LAND SURVEYORS. - A party of influential gentlemen are attempting to found in the metropolis a Provident Association for the benefit of aged and decayed members of the above professions. Mr. J. Bailey Denton, of 9, Gray's Inn Square, has con-sented, during the initiatory proceedings, to perform the duties of honorary secretary.

THE FINE ARTS .--- It is singular that all the courts of Europe have, for more than two centuries, been earnestly engaged in forming public galleries, a national benefit and honour which England had beglected with her great wealth, and with opportunities singularly favourable, until within a few years; and even now we are making but very slow progress, and works of art of the olden and golden time are becoming more rare, and immensely rising in value. Had we as a nation, collected, even 50 years ago-speaking of the transactions as a money speculation, in which view, according to the taste of the day, we must look at every thing-our purchases would now have been worth treble the first cost in money. The unhappy fate of Charles I. was most adverse to the arts here. It not only scattered the collec-tion made by him, but, by the triamph of Puritanism, plunged the country first into a dislike of, and, for long subsequent periods, into an indifference for art. We even doubt if this gross feeling has altogether subsided. We do not yet take a national pride in works of genius, unless they immediately bear upon the art of living. No country is so rich as ours in private, and none so poor in public collections. And if we progress so slowly in our National Gallery we can scarcely wonder that public m. of in the provinces. We sincerely hope that the movement Mr. Ewart is making will be crowned with success, and that in time " collections" lections" in our cities and towns will be the result.-Blackwood's Magazine.

THE GRAVE-YARD QUESTION, -Mr. Atkipson, a surgeon of Westminster, has addressed a letter to the Lancet, shewing by circumstances within his own knowledge the dreadful state of St. Margaret's churchyard, Westminster. Describing the performance of a funeral there, he says :--" The mute, as the service advanced, staggered, was unable to keep himself erect, and became deadly pale; he was removed to the vestry-room, suffering from pain in the bowels, which ended in diarrhœa; his health was deranged during the two subsequent days; on the night of the funeral, the undertaker was seized with diarrhoea and faistness; and continued in a debilitated state for some days after; one of the mourners on his/return home was affected with the same symptoms, and rendered unable to follow his employment for an entire week; and it may be as well to observe here, as a remarkable coincidence, that the wife of one of the mourners, was, late on the night of the funeral, or early next morning, attacked with apoplexy, and expired in two or three days." These facts strongthen the preconceived impression, that illness of a serious nature may be produced, and even death in many instances ensue, by attendance at the burial grounds of this metropolis, which are known to be more than commonly charged with human putrefactions, and must be read by those who are seeking to with interest discover tangible sources of disease, and to employ preventible means of suppressing its operations.

EFFECT OF COMPETITION IN THE PRICE or GAS .- The British Gas Light Company, which supplies Stratford and its immediate vicinity with gas, have within the last week reduced their charge for that article from &s. to 6s. per thousand feet. A few years ago the charge was 10s., but in consequence of a rival company undertaking to supply it at a less rate, the above reduction has taken place. PLANS ON PARCHMENT.—To tint plans on parchment one correspondent says, "Take a

piece of *rough* paper, or very fine glass paper, and therewith rub the surface of the parchment until there is no grease remaining on it. Then proceed as on ordinary paper." A wash of diluted gum-water over the skin, before colouring, stops the pores, and tends to produce an even tint.

GLASS TILES .- In reply to numerous inquiries, glass tiles of the size and shape of ordinary pan-tiles, may be obtained of Mr. Jackson, 15, Duke Street, Lincoln's-Ian-Fieles. They vary in price from 11s, to 16s. per dozen, according to the thickness and weight.

lighthouse is to be raised on the coast at Fatouville, near the mouth of the Seine, in place of the wooden one now existing. It is to be 96 mêtres above the highest equinoctial tides. The cost will be 145,0004.

HIP TILES to suit slate roofs in colour; Ridges, with plain or rebated joints, roll tops, and vertical ornaments; drains, many sizes, with plain or socket joints; paving in squares, hexagons, octagons, &c., dif-ferent colours; roofing, in Grecian or Italian styles, other devices also, or plain; conduits, which do not injure pure water; fire-bricks and tiles; clinkers, and out-door paving; sundry wall-coping, garden-borders, ehinney-tops; also tubular and other flues of peculiar material. No agent, but a depôt at 22, WHITEFRIARS-STREET, FLEET-STREET, LONDON, under Mr. PEAKE'S personal care, to supply genuine TERRO-METALLIC goods at fair prices as per quality; also, additional Stock at No. 4 Wharf, Mac-clesfield-street, South, City Basin. The TILERIES, TUNSTALL, STAFFORDSHIRE, are mear the centre of England, whence boats are sent direct to any inland place; or to the Mersey for the coasts, the colo-nies, and elsewhere.

WALLIS'S PATENT LIQUID WOOD KNOTTING. — This newly-discovered Liquid Composition which Messrs. Geo. and Thos. Wallis have the satisfaction of introducing to the trade, possesses the im-portant qualification of effectually stopping Knots in Wood, however bad, and preventing them eating through and dis-figuring the paint above. Many substances have been used and much time spent in endeavouring to find a cure for a bad Knot, but hitherto without success. Messrs. Wallis therefore feel much plea-sure in offering to the public an article so long and anxiously called for.

called for.

called for. In the application, skill is not required; a boy can use it as well and effectually as the best workmen: it is put on to the work with a brush like common paint, can be used in all climates and situations, and does not require heat. Sold wholesale and retail, by Messrs. G. and T. Wallis, Varnish, Japan, and Colour Manufacturers, No. 54, Long Acré. Price 20s. per gallon.

Acte. Frice 2vs. per gauon. MARNISH.—It has long been a desideratum amongst the consumers of Varnish to obtain a good and genuine article; brilliancy, facility of drying, hardness, and durability are the qualifications necessary, but these are seldom if ever found united. The experience of a life-time devoted exclusively to the manufacture of this article, the great and important discoveries of modern chemistry, and the daily improvements in machinery, have enabled Messrs. George and Thomas Wallis to produce Varnishes (both oil and appirit) unrivalled in every respect, and they confidently recommend them to the trade, as deserving of notice both in price and quality.

recommend them to the trade, as deserving of notice both in price and quality. Builders, Coachmakers, Painters, and others may depend on being supplied with a genuine and unadulterated article. Established 1750.

GRAINING COLOURS AND LIQUID WOOD STAINS. H ENRY STEPHENS begs to call the attention of Architects, Builders, House Decorators, Painters, Cabinet-makers, and all those engaged in the erection of churches where the appearance of oak is desir-able, and those also who are employed in the revival of old earvings, faded furniture, or other ornamental wood work, to his GRAINING COLOURS and LIQUID WOOD STAINS. to his G STAINS.

to his GRAINING COLOURS and LIQUID WOOD STAINS. The graining colours are prepared in a damp state, and pon so true a principle, that the workman cannot fail in obtaining the natural colour, nor of giving to the work the same effect and appearance at all times. The difficulty of producing a true colour and of preserving the same unifor-mity with the admixture of earths and oxides, which are the ingredients used in graining, has long been acknow-ledged. This difficulty is at once removed by these prepara-tions, and the grainer is enabled to confine his attention to his art in graining, without being perplexed in proportioning and mixing his colour. The LIQUID STAINS are solutions of colours which not only carry additional stain on to the various woods on which the natural colour inherent in the wood, and is therefore a valuable acquisition to the DECORATOR and to the RENOVATOB of ol oak or other carvings. They are also capable of giving colour to the sappy and defective parts of veneers and fine woods used by cabinet-makers and others. In the decoration of churches, castles, baronial halis, and mansions, in which are often found beautiful specimens of and faded, these liquid stains will be found particularly ser-iceable. They also impart to woods of inferior character and of

and faded, these liquid stans will be found particular, ticeable. They also impart to woods of inferior character and of soft texture, such as beach, birch, pine, deal, &c., the colour and appearance of such woods (whether oak, maho-gauy, rosewood, &c.) as it may be designed to imitate, and thus as we the expense of more costly materials. The above preparations for graining and staining for pur-poses of imitation and of revival, are prepared by HENRY STEPHENS, and may be obtained at 54 Stanford-street, where specimens of their application may be seen, and also at the Office of "The Buildet,"

THE BUILDER

SATURDAY, NOVEMBER 1, 1845.

N Thursday last our gracious
 Queen and his Royal Highness Prince Albert opened
 formally the new Hall and
 Library at Lincoln's Inn,—
 a structure remarkable alike

for the rapidity with which it has been raised and its great merits as an architectural achievement. It is unquestionably one of the most successful buildings of our day, whether regarded as a whole for the general arrangement and grouping of the masses, or in detail for elegance of parts, variety, and completeness, and will hand down with honour to distant times the name of its architect,-Mr. Philip Hardwick. In the present wavering state of public opinion as to what style should be adopted in buildings not ecclesiastical, this successful adaptation of late Tudor architecture (the style of the period which immediately preceded the decline of pointed architecture, when the arch was flattened, and the horizontal line was acquiring precedence over the perpendicular), will doubtless tend to increase the use of it.

In the buildings of this period, and indeed of the pointed style generally, the elevations grew out of the plan and was subservient to it, and this was arranged with a view to convenience and the purposes of the building. A door was placed where a door was wanted, a turret where a turret was required (always, however, with judgment), and each was left to produce what effect it might in appearance. In classical architecture the positive sacrifice of convenient arrangement to regularity in elevation is often unavoidable; in Gothic architecture the distinctive merit of the style is the growth of perfect adaptation to convenience. The earliest revivers of Gothic architure arranged their Gothic much the same as their Italian buildings, where "grove nods at grove," each alley has its brother, and the result was unsatisfactory. Their successors in the present day seem to have made a discovery that irregularity should be the main characteristic. Their aim is to make no two things alike, to set a steeple in any place rather than the middle of the west front, in fact,-in direct reverse of the other mistake,and actually to make convenience subservient to irregularity.

To see errors is easy, to describe what Gothic architecture should be is difficult. Instruction in the practice of art has never yet been embodied in words; excellence is to be felt; the road to it hard to demonstrate. The whole theory of the causes of the emotion of beauty, more difficult of analysis in architecture than in any other branch of art, is involved in the question. Thus far, however, we may venture to affirm, that in every division and subdivision of the structure, convenience is made the framework, out of which every form is created without attempt at concealment; that, consistent with the attainment of this, there is, in the management of masses, a leaning towards regularity, whilst, in subdivisions and details, there is a very striking love of variety. Regularity, co-existent with the attained object of the building, we find in the plan of the cathedral; irregularity, the result

THE BUILDER.

of a similar sim at convenience, in the addition of the cloisters and chapter-house, and often in the position of buttresses and doors; ornament was the application to this framework.

Now, we are most pleased with the building under notice, because it evinces almost the first successful application of the principles which we have endeavoured, we fear inadequately, to indicate; it displays a perfect acquaintance with the principles of Gothic design, with those principles, which, being founded on truth, are destined to last many centuries.

Our purpose is to give a general description of it. The first stone of the structure was laid in April, 1843. It consists of a ball, arranged north and south, and a library, arranged east and west; the two buildings being connected by a vestibule of a lower elevation. It is erected in the gardens of the inn, and has, perhaps, greater advantages of site than any other building in the metropolis. Externally, the edifice is in two stories, the principal rooms being raised considerably above the ground level, and reached by long flights of steps from the exterior. The materials employed are red bricks, intersected with black brick in patterns. and stone dressings. The stone employed externally, is from Messrs. Peto and Grissell's quarries at Anston; for the interior, Caen stone is used. The south end, towards Newsquare, exhibits a lofty gable, flanked on each side by a square tower. These towers project slightly at this end, though in a greater degree at the sides of the building. They have small square-headed windows, three one above another, and are surmounted by battlements. Beneath the battlements are shields placed in square compartments. The angles have stone coins; and here, as well as throughout the building, we may notice, that the brick and stone are combined with the greatest propriety, decoratively and constructively, the irregularity not appearing too studied. Between the two towers is the great window of the hall. This is of seven lights, transomed; the head, which has a four-centred arch, being filled with very beautiful tracery. The design sppears to be original; and the small quatrefoils, which are introduced, add much to the effect of the whole, which is a little heightened by the red curtain that hangs on the inside. Beneath this window are three small openings, to light the basement.

On the apex of the gable is a canopied pinnacle, containing a statue of the Queen. This pinnacle has some very beautiful parts, yet from its peculiar plan, which appears to be triangular, and from the projection of its gurgoyles, in some points of view, seems to be broken and out of the perpendicular. There is a small window, above the large one, in the gable. In this elevation, the two stacks of chimneys, which rise in the angle, formed by the towers and flanks of the building, have a very beautiful effect. The whole of the chimneys are of red brick, moulded into a great variety of patterns, and in general design resemble those at Eton College, and Hampton Court Palace. In the gable, just described, the letters P. H., and the date 1843, may be discerned; they are formed in dark bricks. The whole base of the building is of stone, of which material are the walls of the esplanade on the cast side, as well as the walls of the steps of ascent. At the sides, the hall con-

sists of seven divisions or "bays" in length. Taking the side, next the Inn, the first division is occupied by the square tower, which except in the lower stage, is the same as in front. At this point, in the tower, is an entrance to the building. It is reached by granite steps from the esplanade, and from New Square, the ascent being well planned for effect. The door has a four-centred arch, with square label head, the spandrels being filled with quatrefoil tracery. In the jambs are small shafts. Immediately above the door, in a square panel, is a shield, bearing the arms of the Inn, and above that the clock. This is one of the most beautiful objects in . the building, and is perfectly novel in design. It is surmounted by a pedimental projecting canopy, in metal work crocketted, and containing tracery executed with great delicacy, and having the true metallic character. Indeed, throughout the building, the metal work must be considered a great step in advance in the treatment of the material. The fingers and figures of the clock, without being less easy to read, are also converted into beautiful objects. The remaining six bays are occupied by the windows of the hall and offices in the basement, the last bay-on each side-projecting as an oriel. The lower range of windows are of two lights, and square headed; the upper base moulding going round them as a label.

At a considerable height above are the windows of the hall; the bays being divided from each other by the buttresses, which project in three stages. The hall windows are squareheaded of four lights, with each light arched, without cusps, and transomed. They are close under the cornice, which has a row of grotesque and foliated bosses. Above this is the parapet and battlements, with the coping running horizontal and perpendicular. The buttresses are surmounted by octagonal pinnacles, with ogee caps. The oriel, which occupies the last bay on each side of the building, is square in the plan, with angular buttresses. It has a lofty five-light window in the front. divided by transoms, and a similar window of one light, on the return. The roof is leaded, with rolls at intervals. The north gable of the building is finished with a large stack of chimneys, which are well grouped, and highly ornamental. In the angles of the flanks, with the square towers, are staircases, and the stacks of chimneys before mentioned. In the centre of the roof is an elegant louvre. It is of wood, in three stages, with two heights of small windows, which are square-headed, cusped, mullioned, and transomed, and is surrounded by slender pinnacles, bearing vanes, attached by flying buttresses. The capping is ogee-headed, with crockets and gurgoyles, and is surmounted by an elegant vane, with direction points in gilded metal work : the whole of this part of the design displays very great taste.

The central building, which forms the entrance corridor to the library and great hall, is much lower than the two other buildings. On each side is a projection, with angular buttresses, from which again projects a square oriel of six lights, transomed. From the different angles project gurgoyles. The whole is surmounted, in the centre of the plan, by an octagonal embattled crown, each side having a window with pointed arch and rich tracery. The angles are strengthened by buttresses. The effect would have been improved if this crown had been raised higher; at present the windows can hardly be perceived. On the east side, that next the inn, is the main carriage

[•] There can be no reason why the architect's name should not be inscribed on every building, in some unobtrusive position; just as the sculptor places his name on a statue; unless architects are ashamed of what they execute. It would be looked upon as an interesting, and valuable record.

entrance, which is by a broad drive up to the steps to the esplanade. Thence, the ascent is by another flight of steps to a porch of en-trance. It has a simple four-centred arched door, and a gable, with an animal holding a vane, upon the apex. On this last side, the end of the library has

522

a very rich and beautiful effect, mainly resulting from the elaborate design of the oriel. This is octagonal, with slight projection, with much panelling in the angular buttresses, and in the parapet. The whole of the carving in this part, indeed throughout the building, is well executed; and the proper depth, on which so much of its effect depends is given to the panelling. The principal division of this oriel is of four lights, with a four centred arch oriel is of four lights, with a four centred arch head, and spandrils enriched; the splayed sides have one light. They are transomed. The buttresses are crowned by pinnacles, and above the lights are quatrefoils and bosses with machicolations above, the whole displaying considerable variety and richness of effect. The oriel is surmounted by a leanto covering of stone. Above the oriel is a small window and the raking mouldings, which are finished be grotesque carvings. The apex of the gable be grotesque carvings. The apex of the gable has an elegant pinnacle; it consists of a cir-cular shaft, fluted spirally, supporting an animal holding a vane. Bound the base of the shaft are pinnacles clustered together, the whole being supported by a grotesque corbel. On the south side of the library are several chimneys of good design. The north side of the library is five bays in length, the buttresses and lower range of windows being similar to those in the other building. The angles have oblique buttresses, excepting at the northwest corner, where there is a belfry turret. The windows of the library have their lights in two stages, separated by armorial bearings. They are of three lights, and the mullions being continued through, the spaces just contain the shields and supporters. The pinnacles in this building have animals instead of ogee capping, and the cornice has a greater number of bosses. In the west side, next Lincoln's-ian-fields, the arrangement differs from that on the opposite side mainly in the ubsence of the doors and porch. It is inclosed by a long brick wall, with stone capping, There is an stepped down in long distances. oriel to the library, differing from the other only in the cornice, which has larger battle-ments, and is varied in the panelling. The beauty of the enrichments, and of the ornamental chimneys is here more apparent. The bell turret, at the angle, is octagonal in four stages, divided by strings. The angles have stone coins, and there are small openings to light the staircase. The belfry is of stone, to light the starcase. The beilry is of stone, with long openings in each face, cusped and transomed; it is united to the stage below by a weathering, and in place of horizontal louvres has a perforated panelling. The pa-rapet is of brick, with hattlements capped with betone. We thick that had leas how the heap stone. We think that had less height been given to this upper story, by increasing that beneath it, the effect would have been even better than it is, but the turret is well placed. At the back of the angular buttress, on the south side, there is another stair turret. Attached to the library, on the north-west side, is the residence for the steward.

Entering the pile by the central doorway, a vaulted corridor with two short flights of steps, leads into the vestibule, a rectangular apart-ment 56 feet long and 22 feet wide, having at the south end the door into the hall, at the north the door into the library, and east and west a door to the council-room and the drawing-room. Nearly in the centre of the vesti-bule four insulated, clustered columns, with others attached to the side walls, and connected by obtuse pointed arches, form an octagon, and carry an elegant lantern of the same shape, with a window in each of its sides ornamented with painted glass. The ceiling of the lantern is groin-vaulted, and has sculptured bosses at the intersections, which are illuminated and gilt. The ceiling of the triangular spaces, cut off by the octagon, is left open as a skylight in each case, with a single plate of glass in it, to give light by means of corresponding glass slabs in the floor, to the corridor below. The other parts of the vestibule, north and south, are ceiled in panels, with deal, varnished.

Eutering the hall from the vestibule, the visitor finds himself on the raised platform or

dais, one step above the general level of the chamber, aud, if we mistake not, will say it is one of the noblest apartments he has ever seen.

The illustration in our present number will serve to give a general idea of its appearance, as viewed from this end, to such of our readers as may not visit the building. The length of the hall is 120 feet, the width 45 feet, and the height to the apex of the roof 62 feet.* On either side of the dais is an oriel (as is usual in halls of the period), about eighteen feet wide, with a stone seat round The windows of both are ornamented it. with stained glass, chiefly brought from the old hall. Six other large windows on each side, as described when speaking of the exterior, and one at the south end, light the apartment. The upper part of the side window is filled with the arms of the benchers, in stained glass, executed by Mr. Willement, and the lower part with small panes, marked alternately L. and I. to form a diaper. The walls all round are lined with oak panelling, about twelve feet high, terminated with a cornice containing a carved running enrichment. The oak screen and gallery front at the south end are very original in design. As may be seen in the engraving, the screen consists of a centre doorway, with glazed panels, and two openings of similar form and size on each side under arched recesses, with oak mullions and tracery also glazed. Projecting buttresses divide them, and are continued up to form pedestals for six figures, over which are carved canopies connected by arches, so as to form five openings in front of the gallery, corresponding with those beneath. The figures are not yet carved, but are now in the hands of Mr. Thomas, the chief carver at the new Houses of Parliament, by whom also the statue of the Queen in the

south gable, already mentioned, was executed. There is much decorative carving about the screen, which is well executed. Under the gallery is the southernmost entrance door, already mentioned as having the clock over it outside. The bolts, hinges, latch, and escutcheon, are admirably designed and executed, and this is the case we may here mention throughout the building. Every lock, every knob, is different, and is full of the right feeling. So too with the stone spandrels of the various door-heads, every one is varied, shewing there has been no lack of pains to produce a perfect whole. Returning to the hall,—the roof, a fine piece of construction, is formed wholly of oak, and is divided by trusses into seven compartments. Each truss comprehends one large arch springing from stone corbels attached to the walls, and has two carved pendants (as in Wolsey's Hall, at Hampton Court), at the terminations of an inner arch that springs from hammer beams projecting from the walls on either side about one-fourth of the whole span. These pendants are illuminated blue, and rcd, and gilt, and they each carry a chandelier japanned in the same colours. Between the trusses, against the wall all round, is a machicholated cornice with a range of small panels under it, also de corated with colours. The louvre described externally, is in the fifth division from the south.

Against the wall, over the door, on the dais, is Hogarth's picture, "Paul before Festus," in a new oak frame, designed to accord with the hall. The heads of the windows being square and wide, great care was required in the construction to make all sound. A bond-stone was brought through the whole thickness of the wall at each angle of the head, and one in the centre, and these carry the longitudinal stones by means of a "sccret joint" and

joggling. The library, which is 80 feet long, 40 feet wide, and 44 feet high, has also an open oak roof: it is in five divisions formed by trusses, with pendants, and a series of arches placed longitudinally on each side, with a corresponding series against the side walls, termi-nating on stone corbels. The book-cases jut out on each side to form separate apartments for study, and have an iron balcony running round them about midway, and another gallery over them against each wall, the whole length of the room. There are five windows on the north side, and two large oriels of very elegant

• The length of the hall at Christ's Huspital, London, is 18/ feet, the width is 51 feet, and height 17 feet.

designs, all ornamented with stained glass and

circular embossed panes, The council room and drawing room are each 32 feet by 24. The walls are lined with panelling : they are ceiled with deal in panels, panelling : they are ceiled with deal in panels, stained and varnished, with deal in panels, the intersection of the ribs, and each is lighted by a large window, in six lights and two stories. They have both handsome, carved stone chimney-pieces : the bell-pulls, here are also worth examining.

Relative to the kitchen, which is beneath the hall, we have only left ourselves space to say, it is a lofty vaulted apartment, with a noble fire-place, and all proper appliances

In connection with the new buildings, the square of Lincoln's Inn has been inclosed with iron railing, and stone posts of similar cha-racter. The square is entered from Lincoln's-Inn-Fields by a large Tudor gateway, of which we shall probably give an engraving hereafter. It now only remains for us to say, that

Messrs. Baker and Son were the builders , and have well sustained the high reputation they enjoy. The works are all admirably executed; much more so, we will venture to assert, than they could be at this moment in any other country in Europe, notwithstanding our as-sumed inferiority in one or two respects. The amount of the contract was 55,000%, but of the total amount spent we are ignorant. Mr. Buvin, the architect's clerk of the works, on whom the whole local management has dewhom the whole local management has de-volved, deserves especial mention, for the energy and zeal with which he has carried out his principal's views. The carving in some was executed by Holmes, and the wood carving by Witman, of Marsham street, Westminster. They have both shewa them-solves to be able workmen. Of the single-Westminster. They have both snews them-sclves to be able workmen. Of the smiths work we have already spoken; it was executed by John James, of the York-road, Westmin-ster, who deserves to be known. The skill and artistical feeling shewn by him in this work, are, unfortunately, now rarely found in craft. John Asiton was the foreman of the masons. Caldecott, of Great Russell-street, made the furniture, and fitted up the hall for the reception, with throne, & and Strade and Ledger made the chandeliers,

IMPORTANT PROCEEDINGS IN WEST-MINSTER COURT OF SEWERS.

On the 24th ultimo, a mamerous Court of Commissioners was held, it being special, "To consider the various plans for improve-ment of the sewers hereafth to be built inder the authority of this commission!"

Mr. Edward Willoughby, the 'chairmun, made a few preliminary remarks us 'introductory of the business of the day, reminding the Court of the extreme importance of the subject for their decision, and considering that they had only twelve months ugo altered the forms that had been in use for many years, and that the one substituted had not given satisfaction, he called upon them to proceed with caution. There were one or two points he deemed it necessary to mention. The Court must bear in mind there was a marked distinction between this and the Hotborn and Dinshurt Commission. Finsbury Commission. The latter had no outlets of their own into the Thames, but were dependent upon other commissions; on the contrary, this commission had its own outlets directly to the river, hence the form of sewer that might be well adapted to the circumstances of the Holborn division might be not at all suited to the requirements of this com-mission; the Westminster division mended more basin, more reservoir, to meet the consequences of the tidal waters closing the outlets; and an increased capacity: of sowers was necessary as reservoirs for the upland waters during the period they were shut out from an entrance to the river by the tidal closing of the outlets.

Mr. Leslie then rose to propose a motion which he said would bring the antagonist principles to an issue, and which he hoped would secure to the large districts under their jurisdiction an efficient drainage, durable and economical in its construction. Ile had tried

* The library contains about 28,000 volumes; the most rare amongst them is a volume of Pryon's Mccords, pab-lished in the year of the great fire, and now very scarce, the greater number being then burnt. Mr. Bottes, who was unfortunately killed on a railway recently, was the official Master of the library. Mr. Spilsbury is the acting libraria.

on his property, and on that of some friends, the principle he now advocated, and with the most beneficial results. In the house he lived in he had destroyed six enormous cesspools. His procedure was thus : he sent to the Sewers His procedure was thus: he sent to the Sewers office, asany other person might do, to ascertain if any improved depth of insertion of his house-drain could be obtained, and having found that he could give an increased depth, he had the whole depth of his premises made one uniform inclination. As the most easily pro-cured material nearest to the form he wanted, and hadded cured material nearest to the form he wanted, some drain tiles were purchased, and bedded in cement; all the side drains into the princi-pal one were made with curves, and so effi-cient was this small economical drain, that even large McAdamized stones were swept away by the action of a very small quantity of water concentrated in this approximation to the egg form. Stones would not have been removed by four times the quantity of water in the house-drains built under the direction of the Westminster Commission heceuse in of the Westminster Commission, because in them the water-force was weakened by diffusion, and the friction of a much increased area. Having thus demonstrated the value and economy of the narrow channel as a selfcleansing drain, he proceeded to remark on the statement by the chairman, that there were two great obstacles to be considered, the tidal waters coming down during these periods. These were imaginary difficulties. Nearly every outlet of the sewers in the Westminster Chamission, from Temple bar westward to Whitehall, discharged its waters at all times of the tide, and it was even doubtful whether or no, so high westward as the Causeway, at Whitehall Stairs, the sewers were flapped or not. The main Ranelagh sewer, and also the Counter's Creek Sewer, discharged at all times

The surveyor, Mr. Dowley, was appealed to by the Court to ascertain if these statements by MF. Leslie were correct, and he at once con-

firmed their accuracy. Mr. Leslie proceeded to inform the court that originally the Regent's park-tunnel sewer, 'under the jurisdiction of the Commissioners of Woods and Forests, was trapped at its outlet into the Thames, and great damage was thereby occasioned to the inhabitants in the neighbourhood of Charing-cross; but subse-quently the outlet was left open, and the house-drains were trapped instead of the main channel, whereby the inconvenience was removed. That as to the egg form of sewer, with the parrow end downward," in addition to thesix eminent building firms who had approved of the lithographed sections exhibited last week, ho was now authorised by Major General Pasley, whom he had consulted on the subject, , to declare his approbation of those sections ; and he had, received an additional testimony since he came into court. This he would read : it was as follows :

1 . . forms of severe submitted in a drawing signed "John Paillips," which I inclose, and I am of opinion that they are in every way better adapted for their purpose than the old form of sewer with a flat invert and upright sides ; they are cheaper in construction, stronger in form, less liable to choke, as the current is concentrated upon a small area, instead of being spread over the invert: in fact, as regards form, they are the best I have seen.— I am, Sir, your obcdient servant, W. DENISON, Captain Royal Engineers.

bus Mr. Leslie then proceeded to state that he had another document to lay before the Court, a namely, a letter, received also since he came into the room, from Mr. Roe, of the Holborn and Finsbury Commission, the chief introducer of the modern improvements in sewers. Having been requested by an influential commissioner to go to King's-road, Gray'sform of sewer that had created such a chasm .. in the street, he thought it would be as well to beer Mr. Roe's version of the story, and at the same time elicit his opinion as to the litho-graphed sections by John Phillips. The fol-blowing communication, which he read, was the result :-

"October 24th, 1845. DEAR SIR,-In the hurry of business yesterday, Plorgot to answer your remark on King's-road,

* As first published in THE BUILDER.

Gray's-Inn-lane: there has been no fall of any sewer or part of sewer of the egg shape (or any other shape). The cause of the remark may have arisen from a slip of earth, caused by the running out of sand at the bottom of the trench, but this was before any brick-work was put in.

Mr. Phillips' form of sewer is such a one as I submitted, together with the egg shape, to our court some years since, when the commissioners chose the latter for general use, for reasons they then assigned; but some thousand feet of the form Mr. Phillips advocates have been built in these divisions.

At Southampton, I have encouraged, and the commissioners are now building and are about to build several miles of sewer, whose form presents less amount of friction to a small hody of water, than even the form named by Mr. Phillips. I am pleased to see the manliness with which Mr

Phillips comes forward to corroborate facts, which the mere naming of caused heretofore such a hur-ricane.—I am, dear Sir, yours truly, JOHN ROE."

The speaker then read to the Court some extracts from the annual report of 1845 to the Holborn and Finsbury Commissioners by Mr. Roe, from which it appeared that the adoption of the improved forms of sewer, including the periodical washing out of sixty-one miles of sewers by the flushing apparatus, have ef-fected immense advantages with a total saving in three years of 22,461?, to the rate payers of those divisions. He considered that within the last four years alone, the loss to the public by the bad form of sewers under the Westminster Commission amounted to between 70,0002 and 80,0007, money worse than uselessly thrown away; while the forms be advo-cated would, at a very moderate calculation, effect a saving of between 20,0001. and 30,0001. per annum.

He concluded, by moving that the egg form of sewer, with the narrow end downwards, be the general form of sewer to be adopted by this commission for the public and private sewers, to be built within the jurisdiction of the Westminster Commission. The Hon. Frederick Byng rose to second

the motion, and stated that he considered Mr. Leslie had so exhausted the subject, that it would only be a repetition of the statements already made were he to occupy much of their time in the discussion; the motion had his most hearty concurrence. He could not sit down, however, without reminding the Court, of his previous objections to the unlimited power over the proceedings of the Court which the appointment of an annual chairman gave to an individual commissioner; and the court had before them another proof of that fact, inasmuch as the very able plans of Mr. Phillips, their clerk of the works, had been received by the chairman and returned to that officer; and but for the exertions of Mr. Leslie, the Court probably would not have had them at this moment on their table.

Mr. Allason objected to the motion, and said, that if carried it would only be affirming a general principle. What a situation was the Court placed in, that they could not rely on the advice of their own surveyors, but must have the opinions of six builders, together with General Pasley, Captain Denison, and Mr. Roe. He was satisfied that there must be different forms of sewers for different localities. He would ask the honourable mover of this question, would he build a sewer in the egg form if the sewer was required to be of the capacity of 10 feet by 10 feet? He should pose the motion. Mr. Hawkes followed on the same side. opj

He said he had not heard a single argument in favour of the egg-shape sewer with the narrow end down; it would only ob-struct the water, and overflow the houses. He considered that his friend Mr. Allason had given the knock down argument to the egg shape sewer with the narrow end down, and

Mould oppose the motion. Mr. Mayhew said, notwithstanding the mover had so frequently been severe upon the professional commissioners, he, as one of them, would on this occasion most cordially support his motion. It was impossible to have a better form for rapidly removing the soil and cleansing itself; he would cheerfully support the motion. Mr. William Donaldson would oppose the

motion, being firm in the belief that the up-right sided sewer with inverted bottom and arched top was the best form that could be

adopted; he thought the matter should be delayed until the Court heard a report from their surveyors

Mr. Cumberlege, as a professional member of the Court, would support Mr. Leslie's mo-tion; the Court had been for thirty-six years using a most extravagant form of sewer, with a broad base downwards; and he hoped the period was now arrived when the principles of common sense would guide them. The division was then called for; the mo-

tion was declared to be carried by 16 to 5. For the motion, Honourable F. Byng; Messrs. Baylis, Branscombe, Cumberlege, Fitch; Ful-ler, J. Gunter, R. Gunter, Hall, Harvey, Le Breton, Leslie, Marriott, Mayhew, Moss, and Wood; against it, Messrs. Allason, Wm. Do-naldson, Gutch, Hawkes, and Kendall.

Mr. Leslie then rose, and expressed a hope that the Court would not be like the cow which that the Court would not be like the cow which had given a good pail of milk, and then kicked it over; he trusted they would concur in the motion he had now to propose: ---" That the forms for general purposes, as in the annexed lithographed sections, by John Phillips, second clerk of the works, be adopted by this com-mission." This was seconded by Mr. Cum-berlege, and carried *nem. con.* The Court then adjourned to Friday, the 31st of October.

We congratulate the public on the result of this meeting with much carnestness, being entisfied of the great advantages that will be gained by the change. Moreover, we cannot avoid taking to ourselves some little credit for our share in effecting it. We have received an able, but somewhat intemperate commu-nication, from one who signs bimself a comof the views of a particular member of the Court, and at the same time praising the tone Court, and at the same time praising the top-of the remarks in our last number, which, al-though ostensibly not published till Saturday, was in the hands of the commissioners, pre-vious to the discussion above reported. We vious to the discussion above reported. beg leave to assure the worthy writer (and wor-thy he evidently is, notwithstanding his spleon) that we pay no regard to persons in matters such as this. We owe a duty to the public which we will perform to the best of our ability, and will advocate what we consider wise measures, and assist in obtaining necessary reforms, without reference to the party proposing them.

FURTHER REMARKS ON THE ORIGIN AND USE OF PISCINÆ.

THE present vagueness of our terms, "rela-tive to Gothic architecture and ecclesiology," must have presented itself to every one, who has attended to the study of antiquities. It leaves us in difficulty as to the meaning of many old authors, in whose works we find the greatest want of precise phraseology. The importance of a good nomenclature is in no respect so evident as in the science of chemistry, which has made rapid strides, probably due mainly to the better knowledge of its previous facts, which the infusion of a correct and ex-pressive system induced. As we have before said, it is the more systematic study of Gothic architecture in this day, over that which has passed by, which has led to the present com-paratively accurate knowledge of principles and facts. But the difficulty of applying a new nomenclature to a science which deals entirely with the past, is great, and would indeed tend to restrict that investigation of old autho-rities, on which much of our present knowledge must be based. All we can hope to do will be carefully to analyze, and arrange in tabular form, the several apellations, in order that it may at once he seen which are synony mous, or in what different senses each word is to be understood.

In no particular is this difficulty more evident, than in the various names attached to the piscina and the font, and it would be well should every writer who attempts to unravel such an intricate matter, have the advantage of the supervision of so able a commentator as Dr. Bromet.* The "piscina at Hadden-ham" t was so stylied after some consideration. It was thought that it could not have been an aumbry, because it does not occupy the place where that receptacle is usually found, and because there are no hinges; nor any signs of

* Vide unte p. 489. † Illustrated, ante, p. 477. Digitized by Google

themes: It was not likely to have been a confessional, because it was clearly a niche, and not an opening; and not a hagioscope for the same reason, and for this, in addition, that such opening would have been inclined in the direction of the high altar. It was assumed to be a piscing, because it *did* occupy the place which that appendage generally occupies, namely, a south wall. There being no basin was not deemed a sufficient objection, as, when we saw it, the bottom of the niche was covered with stucco and whitewash, -- quite suffi-cient to fill up a very shallow basin, such as we have frequently seen. It may be said, that there is no piscina in the chancel—which part of the church is of the same date—and, therefore, that it is anlikely that there should be a piscina here, but examples of chantry piscinæ, when there is none in the chancel, are frequest. It is also to be admitted, that a door may not have been a necessary appendage to every depository for sacred vessels. The question, therefore, is, was this an aumbry in the usual position of the piscina, and without the usual position of the piscina, and without doors, or turns on the former existence of a water-drain? The writer balanced the pro-babilities, and he is still compelled to decide in favour of the piscina. In reference to the "pensile piscina," re-specting "which a quotation from an ancient or diate prior the superior by Boscher

ordinance was given, as quoted by Fosbroke, from Da Cange, it may be well to give the from Da Cange, it may be well to give the exact words in question, along with others un-der the heads of "Piscina" and "Font":--"Piscinx;--Locus in quo manus Sacerdotes lavant; et qui ablutiones Sacerdotis, missam celebrantis, injlciumtur;"-- "Fons, -- Vas, in quo squa ad Missæ sacrificium ponitur.-- Ordo Romanus : "Subdiaconus accipit Fontem de manu Archiparaphonistæ, et defert Archi-diacono; et ille ex amula infundit, faciens crucsm in calicem." • • Fontem aureumcum gemmis, pavonem auro, et margaritis distinc-

"Fons,—Piscina, ubi Sacerdotes lavant manus antequam sacra faciant. — Synodus Valent. an. 1590 : 'Præcipimus Fontem ad abluendas Sacerdotum manus, qui se ad Mis-sam celebrandam accingunt, præparari, qui vel parieti infixus, vel pensilis aquam præbeat cum linostina palla!"" According to Du Cange—in one sense of the word "piscina"— that appendage was a place in which the priest washed his bands, and into which the vater was east, after he had washed—perhaps in some other place. The interpretations of the word fond seem to be precisely similar to each other, being in each case a vessel of conse-crated water used at the sacrifice of the mass, for washing the hands. All that the extract seems to us to prove is, that somewhere near the altar, pensile, or affixed to the wall, was a vessel containing water, and called a font, in abluendas Sacerdotum manus, qui se ad Misvessel containing water, and called a font, in which the priest washed, the water being afterwards drained down the piscina. † Whether the wards drained down the piscina.† Whether the piscina was ever large enough for washing the hands, for in most examples it has a very shallow basin — the pensile vessel being omitted, —is the point to be ascertained; if that is found to be the case, then the term "font," which was applied to the pensile vessel, may also have been applied to the piscina, as the words "parieti thixus" might lead us to sup-pose. "But it does not necessarily follow, that the term piscina was applied to the penthat the term piscina was applied to the peneile vessel; and in fine, it seems to us, that "font" was a word used for several vessels, in which there was a *supply* of water for ablution of for baptism, which was either only a vessel; or also provided with a drain; and that a piscing sometimes was that particular description of "font," attached to the altar, which was fixed to the wral, and was provided with a drain. So that the word " font " had at least three significations :-First, as applied

Ideast three significations :—F Ifst, as applied
• Which may be thus rendered :—'' PIRCINA,—A place in which the bands of the pricst are washed, and where the ablutions of the priest celebrating the mass are cast.''—'' FORT,—A tessel in which water is placed at the sacrifice of the mass ''—'' For band of the chief singer, and brings it to the archdeacon, and he pours into it out of the anala, making the sign of the cross over the challes; '—' A golden font set with gens, a peacock in gold, and set with pearls.''—'' FORT,—A pisce in which water is placed at the secrifice of the mass ''—'' FORT,—A pisce is washed in, which is the secret be preased a font for the hands of the pricets wash their band before they make the sacrifice. ' We order to be prepared a font for the hands of the pricets to be washed in, who prepare the male into the wall, or pensile, may afford water with a linen cloth.'' Du CANGE: flows and afford water with a linen cloth.'' Du CANGE: flows and a first be word font refers to another vessel in which the hands were washed, the carrying off of water, which, indeed, is hardly large enough for any other use l''—Anle, p. 477-8...

to the baptismal fost in the nave; second, to the pensile vessel, and, when the second was wanting, to a fixed vessel. The "font," when the pensile "font," never so. Lastly, the ne-cessary adjunct of the piscina was in all cases the drain.

the drain. The word "piscina," applied to the bap-tismal font, was mentioned in the previous article (at page 477). In the extract from M. De Caumont, given by Dr. Bromet, it cer-tainly appears to apply to that kind of font which had a drain, or to the "baptismal font." The meaning is very obscure; "piscina" may refer to the drain of the font, or more pro-bably the two words may refer to yeasal enbably, the two words may refer to vessels en-tirely distinct. The most obvious impression might be, that baptism was performed in the chancel, or chapel, the water being brought " in a small vessel" from the font in the nave, were there not certain considerations rendering such an opinion untenable. It seems most probable, that in the particular administration in question, the rite was performed at the "baptismal font," the water being brought from other vessels, and probably the chrismatory-oil, as suggested by Dr. Bromet. But the whole subject is still open to discussion, the whole subject is still open to discussion, and it would be rash to express any decided opinion upon it. The difficulty would perhaps be cleared up by the discovery of another drain, in the neighbourhood of the baptismal font. E. H.

AS TO THE USE OF OLD SOUND PARTY-WALLS OF INSUFFICIENT THICKNESS. AWARD UNDER BUILDINGS ACT.

THE following being the first of a class o very important cases, we report it at some length :-

Mr. Lee being engaged to superintend the Mr. Lee being engaged to superintend the taking down and rebuilding the house No. 61, Pall Mall, which it is proposed shall be a first-rate building, submitted to the official referees the following question that had arisen between him and Mr. Mayhew, the district surveyor for Saint James's, Westmin-

ster. "On the west side of the said house, be-tween it and No. 62, there is a sound and efficient party-wall, which was erected a few years ago, on the rebuilding of No. 62. This party-wall was built as a first-rate party-wall in conformity with the Buildings Act 14 Geo. III., cap. 78, and it is 1 ft. 101 in. thick in the basement floor, 1 ft. 6 in. thick in the next three floors, and 14 in. thick in the upper floor, and to 18 in. above the roof.

As it is proposed to build No. 61 seven stories in height, this wall, in accordance with the present Act, is 42 in. too thin on the ground floor, and Mr. Mayhew is of opinion it should be taken down.

I take the liberty of stating that I differ in opinion with Mr. Mayhew, and maintain that it was never contemplated by the Act 7 & 8 Victoria, cap. 84, on rebuilding a house, that a first-rate party-wall under the late Act, if sound, and built with proper materials, should be pulled down; I admit I do not find this in the Act, neither do I find the contrary. I believe Mr. Mayhew principally depends on the 12th section, but I submit this section to be operative only when the wall is rebuilt, and not in condemning it." Mr. Mayhew urged, that section 5 re-quires, that whether "Buildings be built,

quires, that whether "Buildings be built, or rebuilt, on old, or new foundations, or partly on old, and partly on new foundations, notwithstanding any thing contained to the contrary in any Act of Parliament now in force, every such building shall be built, rebuilt, &c., in conformity with the several par-ticulars, rules, and directions in Schedule C," &c., "subject, nevertheless, to any other rules and directions in this Act contained in the same behalf."

That the conditions of Schedule C, part 2, determine, that if the building contain seven stories, it is to be of the first class, and the thickness of the party walls must be at the least 211 inches from the top of the footing up to the underside of the floor, next but three below the topmost floor, which in this case renders the wall 41 inches too thin on the ground floor, as stated by Mr. Lee. That section 27 enacts, with regard to any

party-wall, so far as relates to the rebuilding thereof, that if the owner of one of the build-

ings, parted by such party-wall, rebuild such building of a higher rate, and do not pull down such party-wall, and build a proper wall in liou thereof, then it shall be the duty, and be is hereby required to build up an external wall against such party-wall. That section 12 is imperative as to the party

and external walls being of the required thickness.

He considered, "that the building owner in this case must either relinquish the seventh story, or pull down and rebuild the party-wall of the required thickness ; or build an external wall against it, for I appreheud, whether the wall were a new wall, built under the present Act for a second-rate house of the first class, or whether it be the present wall (for which the second-rate is the highest rate, that the prenor sent wall is thick enough) neither the one, the other can or could be used for a first-rate building. The 31st section, which permits buildings already built to be raised 10 feet if the walls be sufficiently secure to allow of the raising thereof, might perhaps admit of an ar-gument as to its applicability in this case to the wall only, but I apprahend that this section can only apply where the building erected before the passing of the Act to which the wall belonged is in existence, and canoot, apply to a party-wall only, after the building itself is wholly pulled down." In a reply to these points, Mr. Lee remind-

ed the referees "that section 82, under the head of 'Matters of Reference,' gives to the referees the power to determine all matters of doubt, difference, or dissatisfaction, and that-there was nothing contained in the Act to take from them the power of permitting the partywall in question to remain, and he thought a very strong argument in favour of this organion was, that in schedule D, part 2, under the head of 'External Wall used as a Party-wall,' the Act directs if an 'external wall to asy building already built be at the least 13 in. in thickness in every part, and be of sound and proper materials, and in good condition, then such wall may be used as a party-wall;" if, there-fore, an external wall 13 in. thick may be used as a party-wall, there could be no reason why a good party-wall 18 in. thick, should not re-main, when the want of thickness exists only on one floor. He further remarked, " If I am wrong in my opinion, most serious inconvenience must arise from the operation of the Act, in the old districts, more particularly in the city and west-end of the town, where from the increased value of ground, the houses must be built with an additional number of stories bringing them by that means into the firstrate of the present Act, and then in all cases of re-building both party-walls must be taken down, even when the houses on both sides of the party-walls have been built within a year or two; because in all cases the party-walls were only built as first-rate party-walls, under the Act of 14 Geo. III., cup. 78, or 213 in. thick to the underside of the ground floor, which there is no doubt is sufficient, whereas the first-rate party-wall under the present Act, must be 21 j in thick to the underside of the one pair floor."

Mr. Hosking, the referee, found on survey, Mr. Hosking, the referee, Loana on surrey, that "timber appears in several places in the east face of the wall, laid into the work, and brick on edge courses, which affect the thorough bonding of the wall, occur wherever bond timbers have been placed in the wall. In other respects, the wall is a sound structure, and is for to be used again as a party-wall. and is fit to be used again as a party-wall, though in doing so, it should be made as far as possible conformable with the provisions of the Metropolitan Buildings Act, by the removal of all timber from its structure, and by taking out the brick on edge courses, and restoring with proper and sufficient materials, such as bricks, or brick and plain tiles in cement."

The award, after reciting the premises, was as follows :

"Now, although the proposed building will, by reason of the number of stories thereof, be of a higher rate than a building to which the existing party-wall in question would be applicable, in reference to party-wall in dostion would be appli-cable, in reference to party-walls built with buildings, after the passing of the Metropolitan Buildings Act; yet inasmuch as the said party-wall is, in the opinion of the official references, a proper and sufficient wall to serve as a party-wall with reference to the built in the transwall with reference to the building to be rc-...built, 'except as to certain timber laid in the same otherwise than the said Act permits, and ;

except as to the brick on edge courses, which lie upon the timber :---I, the said William Hosking, with the assent of the said Arthur Symonds, do hereby certify, determine, and award, that if the timber in the said partywall, on the side next the proposed building, and the brick on edge courses thereon, be re moved, and be replaced by brickwork pinned in and properly coursed and bonded to the satisfaction of the district surveyor, it shall not be necessary to pull down such party-wall, or to build up an external wall against the same; and that the said wall may be raised to an ad ditional height, not exceeding ten feet, so that such raising be done to the satisfaction of the surveyor of the district, and in every respect according to the provisions of the 31st section of the said Act."

The costs to be paid by Mr. Lee.

FOREIGN ARCHITECTURAL AND COL-LATERAL INTELLIGENCE.

New Library at Berlin .--According to a late royal decree a new building for the large royal library is to be erected-and thus in a few years, when the British Museum and the library of Paris (whose new site and erection is also decided) will be completed, Europe will possess three such structures of first magni-tude. The Berlin library is to be erected on the banks of the Spree, and will extend over a vast space. The site is most felicitous, as the vicinity of the river will diminish every danger by fre-while its close proximity to the university is most desirable. Stall-street, where it is to be erected, will then form one line with University-street (by the demolishing of a few military stables), and an uninterrupted sight will be afforded along the latter street from the monument of Frederick the Great to the new library. In the lower compartments of the old Bibrary, which have been used, of late, as a repository for the astonishing increase in books----the dry rot has shewn itself to a great extent.

Scientific Congress of German Naturalists at Nurnberg .- This association (the prototype of all aimilar ones) has just concluded its meet-ings. Dr. Kastner, of Erlangen, delivered a discourse, " on the influence of natural science on the ennobling (Veredlung) of mankind." He pointed to its paramoent connection with all other branches of human ken-and stated how by their adaptation to arts and trades, the examination of the laws of nature, conveyed to the people a momentum of reflection, thought, and elating sentiments. Drugist A. Frick-inger, from Nordingen, read a paper on his experiments on the influence of sal amoniac (salmiac) on metallic iron. He stated that an aqueous solution of this salt, under the free access of the atmospheric air, considerably accelerates its oxydation, which, however, begins with a conversion of the metallic iron into a chloride, under considerable development of ammonia.

Cheip Instruction at the Polytechnic Schools of Germany.-The rectorship of the Royal Polytechnic school at Munich (one of the best in Germany) state, in their late circular, the following terms for the pupils of the school. The matriculation fees are from 10s. to 12s. Persons who do not belong to the states of the German Confederation, pay 11. sterling for attending all courses-during a whole year. Persons who have not entered the college as regular students, but merely wish to hear one or another course of instruction, pay for each a fee of 10s. [We should say-that any young mard, with his wits about him can study at Munich, at the rate of from 30%. to 50%, per annum, without meanness.] Naples : Excavations at Pompeii.--- These

took place under the controul of Mr. Carlo Bonucci, before 1,200 savants. The results were, in the main, satisfactory, as some golden ornaments, several marble statues, a great many bronzes, vascs, and some tubes of an aqueduct, were found. After a visit and in-spection of the whole of Pompeii, the return-ing members had occasion to see these things again properly arranged. It was an interest-ing sight-although some (of the 1,700) were foolish enough to think, that it was a colluded affair. Mr. Bonucci, by a long experience, might well be supposed to know where lay

Public Work and Buildings in the Brazils: A New Versailles.—This is, after all, a great

epoch, when reports one any department have extend over the while globe. Тре Brazils are vigorously stricting on the path of civilization. The first is the con-stant opening of splendic roads through the mountain chain, which surrounds the bay of Rio de Janeiro, for connecting the fertile, nay luxurious in land, with this great emporium of South Americas. On this high table-land, in fine, in the most felicitous situation, near the old road to Minus Geraes-the Emperor is erecting a magnificent palace, around which (in imitation of Versailles) a new town is to be laid out, which will bear the name of Petropolis, after the name of the present Em-peror and his father. It is to be regretted, that merely French and German builders are employed on these works, and called to these settlements.

Musée d'Alyer (Algerine Museum in Paris). Before leaving Atrica, Mareshal d'Isly has published a decree in the name of H. M., cnjoining the collecting of specimens for the formation of the Musée d'Alger in Paris. Although many things collected by people not quite ail fait, are to be expected, yet the idea is felicitous. The frieze of the Diana Temple of Magnesia has not yet been exhibited, and these relievos, uppertaining to the very worst period of decaying Roman art, scarcely de-serve this distinction-not to be compared even to those of Lycin, lately brought to this country. Much is it to be regretted, in fine, that while something novel like the above museum is in contemplation, the sculptures of Olympia and Assos are not yet accessible to the public view. The same spaces, where the latter are deposited, are also encumbered with the most cious Égyptian relics, statues, sarcophagi, pr and stelas of most perfect preservation-which lay forgotten here since the death of Champoillon. Next spring, however, the ornaments of Niniveh are expected to arrive in Paris, which will absorb public attention, and place overy thing else in complete shade.

Employment of English Engincers on the Continent.-A discussion has been carried on of late between the senate and the burghesses of Hamburg, about the utilising of the Gras-brook, an open place, situated at the Elle, between the city and the Upper—and Nether Haven—which if converted into a new dock, would be most useful to the increase of the shipping of Hamburg. Last week the com-mission of professional gentlemen, especially appointed for that purpose, laid an extensive plan before the competent authorities. The commission consists of the Water-building-Director Hübbe, and Messrs. Walker and Lindley. The speedy execution of this undertaking is the more to be wished for, as it would be the means of a communication between the harbour and the chief station of the Hamburg-Berlin railroad.

Draining of the Zuiderzee in Holland.— This vast bight of the sen-equalling in its area the largest province of the kingdom, is spoken of as likely to be drained in a very short time, by which a considerable increase of artificial territory would be gained. According to actual survey, this gigantic pro-ject does not present such great difficulties as might have been anticipated. There exists, already, at low water, a dyke at Medemblick, which, if a proper enlargement thereof would take place, might be so far extended as to check entirely further influx of the ocean. It is clear, however, that for effecting this, a canal ought to be made through this dyke, for facilitating the efflux of the sea.—Journal de la Haye. New York and Pittsburg.—Most of the con-

tracts and even preparations for the rebuilding of the former city, are now completed, and Pittsburg has nearly risen (much improved) from its ashes. It is to be hoped every precaution will be taken against the recurrence of such calamities.

Prospect of an "Overland" Railway to India and China (St. Petersburg, 6th Oct.)-The Russian government is actively engaged in the project submitted to it of a railway from St. Petersburg to Adessa, and the public may be convinced that if there be a possibility of realizing this project, Europe will see its realization, which will have an immense influence not only on the destinies of this part of the globe, but clean on the innermost parts of Asia. As it is intended, in the first, to unite the Baltic with the Black Sea, branches will soon start for Isphahan, and the inte-

rior of Persia. Thence, to the East Indies, di and even China is but one step. A railwayes: will 'run over 770 French leugues (nearly or 3,000 English 'miles), and will be, therefore, or the longest line of communication ever conceived by man, leaving far behind all conceptions and works of Roman or other ancient genius. May it be built with a solidity and stearlingness worthy of such a thought. 11 . 1 - J. Ľ-

THE GRAVE-YARD QUESTION.

N <u>-</u>

SIR,--I was greatly concerned, and may say , horrified, on reading your account of what appeared in The Lauget, of the state of St. Margaret's church yard, Westminster, from the a over-crowding of the graves, most of them **ч**р being filed up to the surface; and I was not at all surprised at the very serious and alarming effects likely to be produced by interments where such is the case. But what surprises me the most is, that you have a House of Commons and Lords close to this mass of pestilence, with scarcely a member in either who have courage enough to grapple with the question. And why? Because it. is said the interests of the elergy are involved $y_{0,1/2}$ and thereby their fees interfered with $y_{0,1/2}$ is this a sufficient/reason why, then lives of non-the those whose melancholy duty calls them to at $y_{0,2/2}$ tend the last office of a departed relative our who

It has been stated over again, that in crossr our ing this spot the effluxia accasionally arising off from the graves is sensibly felt; surely after that such facts being known, another interment Lie ought not be allowed in such crowded places, particularly when there are ample and efficient are repositories for the dead, for at least a centhe Westminster Cemetery, Kensal Green, Norwood, and other establishments within a reasonable distance of this great city. I am, Sir, &c. Out 27, 1845

Oct. 27, 1845.

📼 ្នុងកាត់ អាចន័ ELY CATHEDRAL, STARS SUBSC

The manner in which the circumstances attending the melancholy death of Mr. Basevi" were stated in the newspapers, has led to the erroneous impression that the unfortunate gentleman in question was the architect employed in the restorations there. This, howproyed in the restorations there. This, how-ever, was not the case, Mr. E. Blore is the ar-chitect. Mr. Basevi being a personal friend of the dean, who devotes much time to the works, was accustomed when in Ely on other business to go over the cathedral with the reverend disnitary and size the data with the reverend dignitary, and give him the benefit of his suggestions simply as a friend, without in any degree trespassing on the province of his brother architect. Mr. Basevi was buried." in the cathedral on the Elst inst., where, we understand, a monument will be ererted to his memory. und we have been dealer

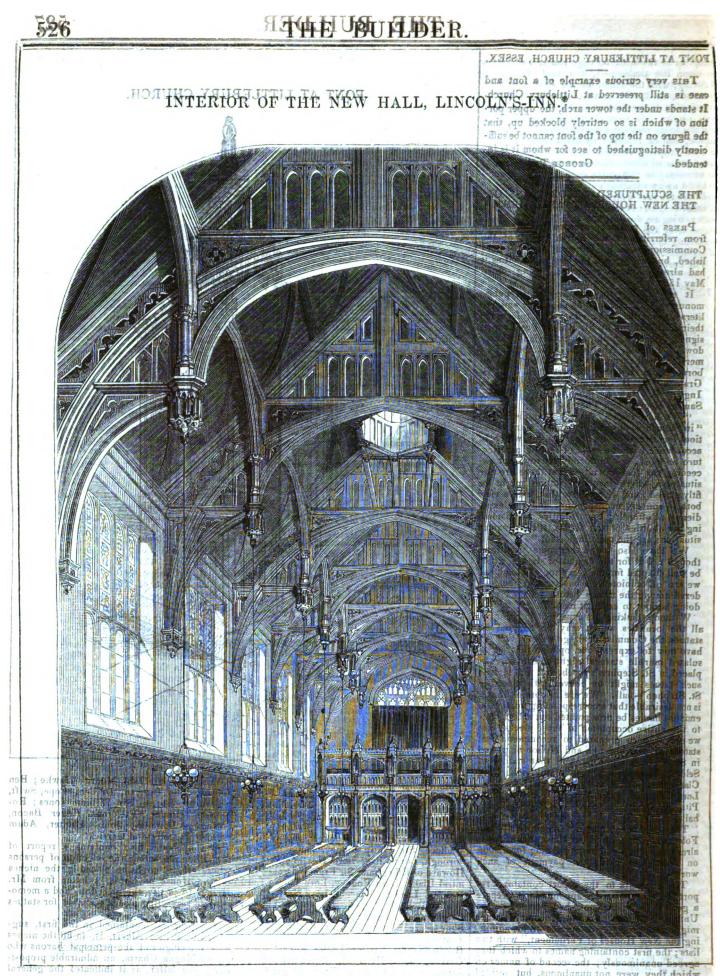

PATENT WOOD CARVINGS

WEALE is publishing in parts, a series of lithographed representations of decorations in wood executed by the Patent Wood-carving. Company, and which are practically useful to, architects, builders, and decorators. They, consist for the most part of examples in the. French and Elizabethan styles, to the execu-tion of which the patent process is more par-ticularly adapted. The carving is effected as our readers are mostly aware, by first burping the pattern into the wood, and then complet-ing it by hand. By this means the proprietors profess to supply fine specimens at one-fourth of the expense formerly incurred. We lately visited the offices of the company (Henriettastreet, Covent garden), and were much pleased with some of the works recently executed.

ARCHITECTURN AT THE SCHOOL OF DE-SIGN.- Mr. C. J. Richardson, with whose works as an artist our readers are well acquainted, has been appointed teacher of architectural drawing and perspective, at the London School of Design. Furniture, decorative ironwork, painted glass, and chasings, are to be within his province. His attendance is given only in the evenings.

ROOMS FOR LARGE ASSEMBLIES.

"THE Manchester Athenaum Soirée" is

"The Manchester Athenaum Soirée" is now recognised as one of the most brilliant gatherings of literary talent annually recurring in England, and around the galaxy of in-telligence there to be found, are assembled, thousands of charmed auditors, and would be thousands more if covered space could be found to contain them. The intention of the writer is not to give a description of the meet-bing of 23rd mismod that, duty will be well performed by other bands, but some remarks from the leffects of the building, admirable as 11 the Free Trade Hall is in many respects, will

* See p. 521,

not be out of place in THE BUILDER. It has long been a common remark, that the doorways of rooms of extraordinary dimensions are rarely proportionate in size or number; still the defect is as great as ever in many of our newest buildings, although it is found an intollerable grievance on such occasions as that which calls for these observations. There was an elegantly drossed throng, a majority of the fair sex, and in all amounting to three thousand five hundred, to be passed through thousand five hundred, to be passed through one entrance door, with the exception of three or four hundred, consisting of stewards; ladies, and invited guests; who enteredual the other end of the buildings of the pressing was unavoidably great, so too hust on acebeen the daraneement of attice tide diffe Hule remeted. derangement of attire ; and the lime occupied

ich they extremely inconvenient, as there was not time for the wast assemblage to settle in their places for the wast assemblage to settle in their places completely before the opening of the intel-lectual treat; and had all the tickets been properly serginized by the receivers; a very considerable number would not have been within the walls at the appointed hour. No doubt, many are deterred from attending large meetings by their dislike to such a prelude, and as there is no absolute necessity for the continuance of such a mistake ove recompend architects to apply their minds to this point, feeling a strong conviction that have meetings feeling a strong conviction that large meetings of various descriptions will increase in number, and that the time required for admission and departure are considerations of growing im-EMabeth, Robert Bruce; LordonBatrog

FONT AT LITTLEBURY CHURCH, ESSEX.

This very curious example of a font and case is still preserved at Littlebury Church. It stands under the tower arch, the upper portion of which is so entirely blocked up, that the figure on the top of the font cannot be sufficiently distinguished to see for whom it is intended. GEORGE TRUEFITT.

THE SCULPTURED DECORATIONS OF THE NEW HOUSES OF PARLIAMENT.

PRESS of matter prevented us last week from referring to the fourth report of the Commissioners on the fine arts, then just pub-lished, but this seemed the less important as it had already kept five months, being dated May 15th May 15th.

had already kept five months, being dated May 15th. It refers solely to the question of public monuments to men distinguished for eminent literary, scientific, and civil services, referred to their cousideration by Sir Robert Peel, and is signed, Albert, Lyndhurst, Sutherland, Lans-downe, Lincoln, Aberdeen, J. Rassell, Pal-merston, Melbourne, Mahon, Ashburton, Col-borne, C. S. Lefevre, Robert Peel, J. R. G. Graham. T. B. Macculay, Robert Harry Inglis, B. Hawes, jun., Henry Hallam, Samnel Rogers, and Thomas Wyse. "We have found," say the Commissioners, "in the course of our inquiry that many situa-tions forstatures consist of niches only, which, in accordance with the style of Gothic architec-ture adopted, are uniformly narrow, not ex-ceeding two feet in width ; that there are also situations where insulated statues might be fitly placed ; and we conceive that, with a view both to convenient inspection, and the expe-diency of affording opportunities for display-ing the abilities of the artists, the fast-named situations are the most important." We have also found that some situations, though not fit for the display of statues, would be well adapted for the reception of busts ; and we are of opinion that busts might be consi-dered among the means before referred to of doing bonour to eminent men." Without thicking it expedient to point out all the localities which may be adapted for

R

doing bonour to eminent men. Without thinking 'it expedient to point out all the localities which may be adapted for statues, the Commissioners go on to say, "We have now to express our opinion that six in-sulated marble statues might be conveniently placed in Sci Scholor's porch and that sixtee placed in St. Stephen's porch, and that sixteen such statues might be conveniently placed in St. Stephen's-hall. We are of opinion that it is not desirable that a corresponding number of eminent names be now pointed out with a view to the entire occupation of those places; but to the entire occupation of those places; but we are at once prepared to recommend that statues of Mariborough and Nelson be placed in St. Stephen's porch; and that statues of Selden, Hampden, Lord Faulkland, Lord Clarendon, Lord Somers, Sir Robert Walpole, Lord Chatham, Lord Mansfield, Burke, Fox, Pitt, and Grattan be placed in St. Stephen's-hall."

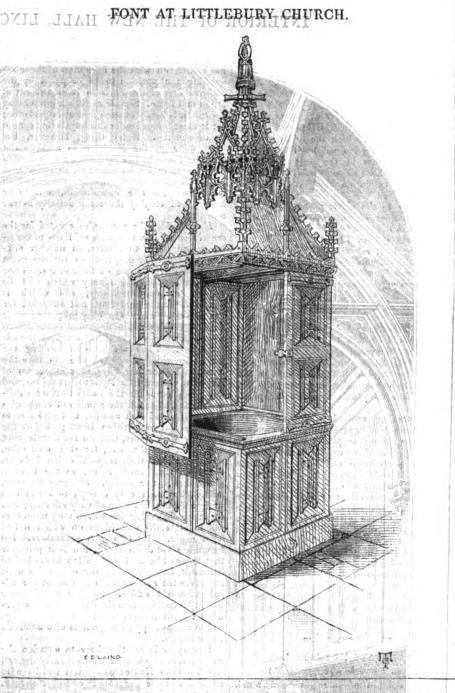

They then recommend Marshall, Bell, and Foley to execute three of these statues (as is already known), and end by asking for 2,000/. on account, towards the payment of such works.

The appendix to the report contains a re-port of a sub-committee appointed to " prepare a general list of distinguished persons of the United Kingdom to whose memory statues might with propriety be erected in or adjoin-ing the New Houses of Parliament," with two lists; the first containing names to which they agreed unanimously; the second of names on

 agreed unanimously; the second of names on which they were not unanimous, but decided
 "by greater or smaller majorities; and this is
 "signed, Mahon, 'T. B. Macaulay, Robert Harry
 Tuglis, Henry Hallam, Samuel Rogers, Thomas Wyse, and B. Hawes, jun.
 "The report says, "The aggregate of these
 "two" lists consists of 121 names, which may
 "probably afford scope, not for indiscriminate" adoption, but rather for choice and selection "bon the part of the commission at large;" a re mark which appears to have been overlooked

Digiven it and have found fault with the manes and At the risk of telling a twice told tale, we think it necessary to print the lists, if it be backfor the sake of reference hereafter.

" "The names agreed to unanimously :- Alfred, Elizabeth, Robert Bruce; Lord Burleigh,

John Hampden, Earl of Clarendon, Lord Somers, Earl of Chatham, Edmund Burke, C. J. Fox, William Pitt; Sir Thomas More, Sir Edward Coke, John Selden, Sir Matthew Hale, Earl of Mansfield, Lord Erskine; Ve-nerable Bede, Bichard Hooker; Sir William Wallace, Sir Philip Sidney, Dake of Marl-borough, Lord Clive, Lord Heathfield; Lord Howard of Effingham, Sir Francis Drake, Ad-miral Blake, Lord Rodney, Lord Howe, Lord Duncan, Lord St. Vincent, Lord Nelson; Sir Walter Raleigh, Captain Cook; Sir Thomas Gresham; Chaucer, Spenser, Earl of Surrey, Shakspeare, Milton, Addison, Richardson, Dr. Johnson, Cowper, and Sir Walter Scott; Bacon, Napier, Newton, Locke, Robert Boyle; Caxton, Watt, Herschel, Cavendish; Inigo Jones, Sir Christopher Wren, Hogarth, Sir Joshua Reynolds, Flaxman; John Howard, William Wilberforce; Harvey, Jenner. Names agreed to by a majority: --Richard

Names agreed to by a majority:-Richard Cour de Lion, Edward I., Edward II., the Black Prince, Henry V., William III., George III.; Cardinal Langton, William of Wickham, Cardinal Wolsey, Earl of Straf-ford, Lord Falkland, Sir William Temple, ford, Lord Falkland, Sir William Temple, Lord Russell, Sir Robert Walpole, Earl of Hardwicke, Earl Camden, Grattan, Warren Hastings; Speaker Onslow; John Wickliffe, John Knox, Cränner, Archbishop Usher, Archbishop Leighton, Jeremy Taylor, Chil-lingworth, Barrow, Bishop Butler, John Wesley; Sir John Talbot, Sir John Chandos, Marquis of Montrose, Cromwell, Monk, General Wolfe, Sir Eyre Coote, Sir Ralph

Abercrombie, Sir John Moore; Hawke; Ben

Abercrombie, Sir John Moore; Hawke; Ben Jonson, John Bunyan, Dryden, Pope, Swift, Goldsmith, Burns, Sir William Jones; Ro-bertson, Hume; Fielding; Roger Bacon, Smeaton, Brindley, John Hunter, Adam Smith; Parcell; and Garrick. The appendix also contains a report of committee respecting the selection of persons whose efficies might be placed in the niches in the House of Lords, a letter from Mr. Hallan to justify the selection, and a metho-randam respecting places available for statues in the Houses. The proposal contained in the first, sug-gested by Prince Albert, is, to fill the niches with the efficies of the principal barons who signed Magna Charta, an admirable proposi-tion; the latter, as it indicates the general arrangement, we give nearly entire.

entrance to the houses of Parliament by St. Stephen's porch will contain statues of distin-guished statesmen, warriors, and other eminent ubjects, the entrance by the grand staircase, the landing-place, guard-rooms Victoria gal-lery, and lobby to the House of Peers, should contain the statues of sovereigns.

The statues of Eghert, Edgar, Canute, and Edward the Confessor might be fitly placed on

Laward the Confessor might be filly praced on the first fanding prace of a ni in strain of "That" the "principal "landing place should contain the Conqueror to Edward IV!" That the statues of "Edward V of Richard III; might be placed in the more ream might be placed in the guard-room.

That in the Victoria hall the series should be continued, beginning with Henry VII., and ending with Queen Anne. That the lobby to the House of Lords should

That the lobby to the House of Lords should contain the statues of the sovereigns of the house of Brunswick, beginning with George I., and ending with her most gracious Majesty.

In this proposed arrangement it appeared that one pedestal in the lobby to the House of Lords would still remain unoccupied. A regsolution was referred to (recorded in the minutes on the 21st of April, 1843), to the effect that a statue of his Royal Highness Prince Albert would be appropriately placed in the Victoria gallery (of which the lobby in question originally formed a part), -Thus-the situations for statues in the state apartments and the approaches to them would, in the event of the above resolution being confirmed, be entirely occupied.

According to the above proposed distribution, the number of statues on the landingplaces and in the guard-room would be 22; in the Victoria gallery 12 (William III. and Mary being both represented); in the lobby, including the statue of her Majesty, seven.

It was considered that the statues in the robing-room might, according to a resolution proposed by Mr. Gally Knight, with reference to another locality, consist of allegorical figures.

It was further proposed that the lower waiting-hall should contain eight statues of celebrated scientific men; that the apper corresponding hall should contain eight statues of celebrated poets, and that the panels in the latter should be adorned with paintings. The lower hall has no panels available for paintings."

ings." The report has excited much controversy, as might have been expected, and has received much abuse from the press generally. We will not say that there are no names omitted to which precedence ought to have been given,—we should have been pleased to see a more lengthened list of men, distinguished for their *literary* services or their skill in the *arts*, but are nevertheless satisfied that the ub-committee have given the subject very serious and unprejudiced consideration, and that the assertion of one of our contemporaries, that "some paltry fear or incepscity has prevented their going straight to their tusk," cannot be justified.

We trust to hear of further commissions to sculptors before long: if the statues are to be executed three at a time, a century will not fill all the miches.

less is the

RAILWAYS IN FRANCE. (From our own Correspondent.)

PUBLIO opinion of late has been much alarmed at the prodigious number of com-panies-from fifty to sixty - which have formed themselves for the five lines of railway authorised by the Chambers, and of which the adjudication has been almost duily expected ever since the month of July last. These com-panies, notwithstanding the slight hopes of success that many of them could only entertain, succeeded in placing their respective shares, and in obtaining the first deposit thereon. and an optaining the first deposit include Those deposits amount in the aggregate to about 540,000,000fr.(21,600,000/, sterling), and have been withdrawn from the tills of shopkeepers, the funded property of public creditors, the cash boxes of merchants of every grade, and the saving banks of artisans and workmen; and they have been permitted to accumulate and remain idle in the hands of bankers; so that great prejudice has been caused to com-merce and much inconvenience to the public in general by the scarcity of money. But a measure recently taken by the government will remedy, at least to some considerable extent, the harm that has been done, and will prevent further inconvenience. Notice of the adjudi-cation of the Tours to Nantes, and Paris to Strasbourg railways has been given for the 25th of November next-a measure that will have the effect of setting at liberty several millions of capital. It is to be regretted, no doubt, that the Paris to Lyon, the Lyon to Avignon, and Creit to St. Quentin lines have not also been annonneed for adjudication; but the Minister of Public Works does not merit the censure to which he has been subjected for not advertising them, for it really does not de-

pend upon him. He has employed all due zeal and activity, even spending several weeks in tedious voyages, to examine the works in progress, decide upon disputed bracés, study projects, and settle local squabbles as to the positions of stations, and such like important questions. If he has not succeeded in settling all of them, it is not his fault; but I believe he has settled all with the exception of those respecting the position to be occupied by the *embarcadères* of the Paris to Lyon railway at Dijon and Lyon. Simple as such a matter may appear, it is really of the greatest importance; for it closely touches local interests that cannot be overlooked. Every thing, however, has been done by the Minister to arrange the question; and he has instructed a commission to view it in all its bearings, in order that he may decide with all that knowledge which is necessary. The commission, it is to be hoped, will employ the same activity as the minister.

minister. En attendant, the companies created for the soumission of the two lines of Paris to Stras-bourg and Tours to Nantes, in number six-TEEN, make their preparations for the great day which will decide on their offers. They are consting one the money which will be are counting out the money which will be needed as caution-money, and which is 500,000% for the first line, and 120,000% for the second. They are busy preparing their statutes, which must be deposited at the Minis-tère of Public Works ten days before the adjudication. They are also calculating the period for which they shall offer to take the lease, which the law fixes at a maximum of forty-five years for the Paris to Strasbourg, and thirty-five years for the l'ours to Nantes railway. But, after all, the number of companies is so great, and that number will give rise to such dreadful competition, if all go before the minister with offers, that no reasonable man can doubt that they will, for their own sake, and the sake of their respective shareholders, effect an amalgamation, or, as the French phrase has it, une fusion. Madame Rumour, indeed, has been busy enough to assert that such a fusion has been already effected; and the same chattering dame even took upon herself to state the conditions on which it had been made. But this was premature. No fusion has yet been made, nor is it probable that any will be made until a few hours before the 15th, on which day the companies must announce their intention to appear at the ad-judication of the 25th. To effect a fusion now would be nothing less than holding out a premium for adventurers to get up a new company, and to menace opposition, unless also admitted to the fusion.

It may be interesting here to mention the condition to which the Paris to Strasbourg and the Tours to Nantes companies will have to submit. For the line from Paris to Strasbourg, with two embouchments (on Rheims and on Metz and Saarbruck, a length altogether of nearly 700 kilometres), the company will have to disburse, for the purchase of land and the putting down of two lines of rails (the government having only at its charge the earth-works and works of art, to be finished in six years), about 5,000,000%. The profits of the line will reach about 340,000%, after making a deduction of forty-five per cent. for expenses. For the Tours to Nantes line, 195 kilometres long, of which the government will have to execute the earth-work and the works of art, the company will have to incur an outlay of about 1,450,000%. The annual profits will be about 100,000%, after the deduction of forty-five per cent. for working expenses.

These calculations will leave good interests to the companies for their investments; but it must be borne in mind, that a reduction, perhaps a considerable one, will be made in the period of concession or lease of the line, which will lessen its value.

Such was the fury to which speculation and gambling were carried last year, that the Chambers considered it necessary to pass a law, declaring that dealings in promises of shares issued by different companies should be illegal, and that any *agent de change* negociating such promises should be fined, as also should any person publishing the prices obtained for them. Nevertheless, numberless speculators, of both sexes, all ages and conditions, decided to tempt fortune in dabling in the aforesaid promises, and there were not wanting men of the Bourse to charge themselves with the conduct of the

negociations. Informed by general rumour, and incited by the brawling of some of the opposition papers, the authorities resolved to prevent such violation of the law. They caused to be arrested two persons, regarded as the principal agents in the illegal traffic; but they were im-mediately afterwards set at liberty, though their papers and registers were detained. It was said, that several companies had mixed themselves up in this sort of business, in a way any thing but oreditable to themselves. But they, or at least one of them, deny it indig-nantly. This one has been en masse to the juge d'instruction, and has sent letters to the newspapers, to protest against what they call-calumnies. Malicious people, however, say, that their protestations remind them of the story of the schoolmaster who had his garden robbed : he assembled all his scholars, and de-manded, "Who robbed the garden ?" con-vinced that the first who cried, "Please, sir, J didn't," would be the culprit; and so it turned out.

The company of the Great Northern Railway appears to have at last coded to the impatience of the public, by doing all that is possible to hasten the opening of the line. Since the line has been adjudged to it, the works advanced very slowly on the first section from Paris to Amiens. The locomotives, twenty in number, commanded nearly a year ago, arrived slowly, one by one; and the carriages and waggons were not ordered at all. But thanks to powerful remoistrances, an *clas* has been given to the persons employed, and the opening of the whole line is not oxpected to be far distant. A trip was made upon it, for the first time, a faw days ago, hy some members of the Council of Administration, but not, as the *Times* announced, by the Baron de Rothschild. The station at Paris is nearly finished, and workmen are actively engaged on the other stations—seventeen in number—bos tween Paris and Amiens. Eight locomotives at the Belgian extremity.

The first annual meeting of the Amiens to Boulogne railway company took place last Thursday. The report of the directors was very satisfactory, and represented the preparation for the commencement of the works as in a very forward state. Part of the line will be opened in about twelve months, and the whole in two years.

The Bourse has not freed itself from the panic which seized it some days back. Yesterday the report that a convention had been entered into between the banks of England and France to prevent a convercial crisis, increased its alarm to such a degree, that it was almost impossible to sell ruilway shurse. Almost all the principal lines-Northern, Harre, Rouen, Orleans, Bordeaux, and Brulogne-declined 15 to 20 fr. on the prices of the previous

day. Paris, October 28.

THE VALUE OF RAILWAY SHARES.

Ir needed no prophet to tell that the palmy days of share-jobbers were numbered, even at their commencement. All who entered into the speculation, simply as a speculation, must have done so with their eyes open to this fact, that as the time approached for lodging the plans, and otherwise complying with the Paraliamentary standing orders, the character of many projects, started simply to meet the demand for shares, no matter in what, and the weakness of other *bonâ fide* schemes, as compared with rival lines, would appear; and that those who held the shares at the moment this did become apparent, would positively lose the money they had paid.

Men wrote for shares, not because they considered the scheme sound and likely to pay, but because they anticipated the demand would put upon them an adventitious value at which they might sell to realize a profit; others, with the same feeling, bought them at a premium, when unable to obtain allotments, expecting that a higher price still would afterwards be obtained, and in many cases, enormous sums of money have been made by those who did so. Some one, however, must hold these pieces of paper last, and fear has already fallen on those in whose hands they now are. November is here; the *Times* has opened its batteries on the speculators, and pours a daily fire into their. ranks; and the result is, other circumstances concurring, that something very like a panic has occurred, even earlier than might have been anticipated.

If the effects of what has been said and done "In the energy and enterprize will be were confined to schemes without foundation -the lawyers' babbles of the day-all must have rejoiced at the result. Unfortunately, however, it has extended, in a degree, to rail-road property of every description; and al-though it will, doubtless, recover speedily, it is possible that energy and enterprize will be checked, and many really good underbidgers checked, and many really good undertakings inju**sed.**

To our readers who possess shares, and doubt what course they should take, we would say, examine well the character of the lines, if you have not done so before; and if they have two good termini, respectable directors and solicitors, an efficient engineer, and a reaand sonctions, an encient engineer, and a rea-sonable prospect of obtaining an Act, hold on. And if the shares be in lines for which Acts have been obtained, hold tighter still.

The real value of railways is not altered by any existing circumstances. The fact that the lines now at work are making large returns for the money invested, and will pay more as the system becomes perfected (and which fact led in the first instance very naturally, to the demand for shares in new lines that ultimately caused the late mania), must still have its effect. Railways, as we have often said, must take the place of common rouds, and the capital wisely expended in their construction will produce a good return, in-crease the national resources, and tend to the general good.

RATING OF RAILWAYS.

SALFORD QUARTER SESSIONS, Thursday, 22nd. GRAND JUNCTION RAILWAY COM-PANY, Appellants. OVEUSEERS OF SAL-

FORD; Respondents. This was an appeal by the United Grand Junction Railway Company, against an as-sessment made by the overseers of the poor of the township of Salford, in respect of 2 miles and 364 yards of the Liverpool and Manchester Railway lying within that township. From the statement of Mr. Brandt, who appeared for the appellants, it appeared that they had been rated at 2,400%, per mile for the railway, and 951%. 3s. for the stations and warehouses, and 9517.35. for the stations and warehouses, and it was the rate per mile which was in dispute. The net produce of the whole line, between Manchester and Liverpool, was admitted by both sides to be 150,3917. From this the ap-pellants claimed certain deductions for tenants' profit (20 per cent. on the net produce), inter-est, depreciation, rent of stations rated sepa-rately in other tempthics and months of tende rately in other townships, and profits of trade, as engine, carriage, and waggon-makers. The total deductions so claimed amounted to Solution of the second contended that this was not the proper rateable value for that portion of the line within the township of Salford, as it contributed to the earnings in a less proportion than other parts of the line; and that, taking into account the amount actually earned in Salford, the rate-able value of that portion of the line was only 1518%. A still further deduction was claimed from the gross amount at which the appellants had been rated, on the ground that 173 yards of railway had been included, which was merely used for conveying goods to and from the old station in Liverpool-road. Mr. Charles Parker, an officer in the service of the Grand Junction Company; Mr. Edw. Woods, engi-neer; Mr. John Hawkshaw, engineer; and Mr. Thos. Makin Fisher, valuer, were called in support of the appellant's case. Mr. Hulton addressed the Court on the part of the support data the

of the respondents. He contended that the 20 per cent, deduction claimed for tenants' pro-fit, had been wrongly calculated upon the net produce, instead of being calculated upon the capital which the tenants had to lay out; and that some of the other deductions claimed, especially one of 35,462% for rent of stations, had

The magistrates relied for three quarters of an hour, to consider the case. On their re-turn into court, the chairman said the result of their deliberation was, that the 2,400%. which

had been mentioned as the rateable value of the line per mile, must be reduced to 2,2002 and the calculation made upon 2 miles and 191 vards .- Munchester Guardian.

WORKS IN THE PROVINCES.

A PROSPECT exists of Liverpool becoming ere long a cathedral (?) town. Mr. Pugin has already submitted plans to the Roman Catholic authorities, who, it is said, have approved of them. The building is to be 460 feet in length, and to have two lofty towers, and a steeple of great height. It will stand on two-and-a-helf acres of land, and the cost will ex-ceed 130 0000. The purchase of Heaton ceed 130,000/. ____ The purchase of Heaton Park and mansion has been completed by one of the four rival railway companies projected between Manchester and Bury, a distance of eight or nine miles. The Earl of Wilton is to eight or nine miles. The Earl of Wilton is to receive the sum of 500,000% for this property. The park, which is about three miles north of Manchester, is to be laid out in sites for villas. The new corn exchange, at Romford, is fast approaching completion. The new build-ing is about 60 feet by 34 feet; the side walls ing is about 60 feet by 34 feet; the side wails are 22 feet in height; the roof is nearly all covered in with glass. The stands are ar-ranged as follows:—each desk is placed on a temporary platform, raised about 9 inches from the floor, and is inclosed (except in front) by a panelled partition, extending a few feet in front of the desk, so that each stand is secluded from the observation of others. A subscripfrom the observation of others. A subscription-room and other apartments are attached to the exchange, the floor of which, being boarded, renders it suitable for every public appropriation. There will also be show-rooms opening from the northern end of the exchange, for the public exhibition of agricultural implements, and a sale repository for the disposal of property generally.——Last week two persons were killed and several more or less injured, by the falling in of the floor of a methodist chapel at East Waldran, at the very time that a meeting was being held for the purtime that a meeting was being held for the pur-pose of considering the plans of erecting a new chapel, the present building being in a dilapitated state. — The foundation-stone of a new church was laid in Preston-street, Whitehaven, on Thursday se'nnight. — It has been found that the cost of the neces-sary works in restoring and enlarging Swin-don church, has considerably exceeded the estimate. — We lately gave currency to a re-port that a railway company had made pro-posals to the faculty of the University of Glasgow to purchase the buildings and grounds of the college, and convert them into a great of the college, and convert them into a great railway station. We have since learned the following particulars :-- The Glasgow, Airdrie, and Monklands Junction Railway Company, in order to become possessed of the property belonging to the college, have offered to erect and complete suitable buildings, at an expense variously estimated at 70,0002, to 100,0002. The company has, for this purpose, purchased Woodlands, consisting of 22 acres of land, situated on the crown of the height on which Woodside and Claremont-terraces are built, and extending thence down to the banks of the Kelvin. This property has cost nearly 29,000%, and is subject to a duty of 190%, per An architect has been instructed annum. prepare a plan for the proposed college, to be submitted to the university authorities for their submitted to the university authorities for their approbation. The Scottish Guardian in no-ticing the proposal says, "Doubtless an offer so advantageous in every point of view will be accepted. The university is at present situated in one of the worst districts of the city, and the one to which it is proposed to be removed in certainly most choice beth forbe removed is certainly most choice both for situation and salubrity. — At the quarter sessions for the North Riding of Yorkshire, held last week at Northallerton, a report was read from the committee appointed for building the New Lunatic Asylum for the North and East-Ridings. After stating that the pur-chase of the land of Earl de Grey, for the purposes of the asylum, was completed on the 8th of August, and that the conveyance had been executed by the Archbishop of York, who had enfranchised one acre of leasehold land, proceeded to allude to the progress of the works, which had been so slow as to cause the committee to have the contractors sum-moned before them, and to adopt stringent measures to compel them to execute the works,

in compliance with the tenor of their several contracts. The report concluded by stating that there had been received from the North-Riding the sum of 7,718/. 15s., and from the East-Riding the sum of 5,281/. 5s., and that there had been expended the sum of 8,017/. 13s. 1d.—A monument has just been erected in the church of Goathurst, Somerset-shire, near the family vallt of Halswell, to the memory of the late Lieut. M. Kemyss Tynte, of the 4th Dragoon Guards (unfortu-nately killed by a fall from his horse in Marchlast), as a testimony of their regard, by Colo-nel Chatterton, K.H., and the officers of that regiment.

METROPOLITAN BATHS AND WASH-HOUSES.

TENDERS have been received for the erection of the new baths and washhouses, proposed to be built in Goulston-square, Whitechapel, from Mr. P. P. Bally's designs, already men-tioned on several occasions in our pages. The

and go baods ABOHROLOGICAL ASSOCIATION AT TESK " wich .- A branch society has been established at Ipswich under the title of the East Anglian 201 Branch of the Archæological Association. information, and to forward it periodically, to the parent association in London; and there is no doubt that it will be well supported. The remaining business of the meeting was to ap-point an honorary secretary, and Mr. Pawsey was elected to perform the duties pro tem. The periods for the meetings of the society were then fixed, after which the parties separated under the conviction that, when the existence of the society is known to the public, and the rules are matured, there will be a large accession of valuable members. We wish the society all the prosperity its promoters can desire; for such an association is calculated to do much good, by using its exertions to pro-tect antiquities from the hand of spoliation, and by fostering a taste for archeological re-search in East Suffolk, where many monuments of antiquity impress us with the importance of former times.

CARBONIC ACID A MOVING POWER. -- Expectations have from time to time been raised to the effect that carbonic acid in a liquid or solid form might be safely and economically em-ployed as a moving power. Sir Isambard Brunel, some time since, and Mr. Fox Talbot, more recently, have turned their attention to the subject, but thus far without any useful Its dangerous properties have been results. Its dangerous properties nave been the chief difficulties to contend with, and to-wards the surmounting of which much inge-nuity has been directed. Dr. Murray, of Hull, after granting that metallic materials of sufficient strength may be found to control the results. terrific power called into existence, imagines that the constant and continuous chemical action of the carbonic acid on the metal will prove an insuperable obstacle to its adoption.

PUBLIC EXPENDITURE FOR RELIGIOUS BUILDINGS .- A parliamentary paper has just been issued containing returns of grants of public money for the building and repair of churches and chapels of all demoninations churches and chapels of all demoninations' from 1820 to 1829. In England, the total was for churches, 1,588,401%, 195, 7d.; in Scotland, 68,564. 158. 6d.; and in Ireland, 633,7454. 14s. 2d.; of which 2,1137. 3s. 1d. was granted for building and repairing Roman Catholic chapels. The grand total applied was 2,290,7127. 9s. 3d. GAS.—Hamburgh has just been lighted with

gas for the first time, with apparatus upon an entirely new principle, lately patented by Mr. James Malam. The works are stated to the largest in the world.

PRICE OF GAS.—The Bath Gas' Company: have given notice of a reduction in the price of gas from 8s. to 7s. per thousand cubic feet, to all consumers by meter,' after.' Christmas . 11 next.

INTERESTING DISCOVERY AT HARTLE-POOL, IN TAN COUNTY OF DUBRAN, - (Figh append the site of an ancient append Hardepool, dedicated to St. Helen, wis last week discovered by Mr. James Yeal, if the above fown. If had low the second wis last week discovered by Mr. James Yea, if the above town. It had long been supposed that the ruins of his chapel were buried under a large mound in the Farewell field, and in 1813 an attempt was made, bad without suc-cess, by Sir Gathbert Sharp, is d discover some remnant of the building. Mr. Yeal, however, directed some workmen to remove the earth mear the centre of the mound, beneath which was discovered the base of a most beautiful Gothic pillar. This baving placed the matter beyond a doubt, howas directed by the corpo-ration of the town to pursue for researches, and exhume, whatever gottion roight rymain of and exhause, whatever particul might remain of this ancient and interesting building. The base of three other columns a portion of the of the chapel, and a magged pavement at the west cod, have already been brought to light. A very considerable quantity of beautifully carved stone, in a state of excellent preserva-tion, and two mutilated images, have also been dug out. From these it is evident that this dug out. From these it is evident that this was at one time a Gothic building of great ar-chitectural richness and beauty. It is impos-sible as yet to accurring the form and dimen-sibles of the third of the form and the sible of the third of the form and the formation. The building, of which only the rules remain, is believed to have been erceted be William de Bras, who died in the rules of William de Bras, who died in the reign of William de Bras, who died in the reign of The John, and who is said to have given this obspection a light to be burnt at the great or Many other similar buildings in the time of Henry the Eighth or Elizabeth, or was pre-Fighry the Eighth or Elizabeth, or was pre-Figure 1. States of the sta Autiquarian gentlemen to witness the operatiou.

BROUGHAM CHAPEL.-The outward ap-BROUGHAM CHAPEL. The outward ap-perance of this intercenting place of worship, which stands in a beautifully secluded situation at the top of a woody bank on the north-east side of Brougham. Hall, shaded by fine old frees and thriving evergreens, while the green inverceps up and elings to its molent walls, billion but a faint their their to its internal compactness and beauty of finish. The ceiling is most tastefully emblazoned with the coats of stras of a loose emblas of ancent and noble of arms of a large analyse of ascient and noble finities, which are glued and coloured ac-cording to the sples of heraldry. Amongst them are the arms of the Cliffords, Vetrithem are the arms of the Cliffords, Vetri-ponts, Pembrokes, Crackenthorpes, Wyberghs, Broug borres, Sou, from the carliest periods. The pulpit and pewsure near but not gaudy. The chapter is most heautifully decorated with gwaral actipized, figures at ancient carved works. During the time that Lord Brougham is flocated at Brougham Hall, divine worship a performed in this chaptel by the incumbent of Set. National Charch, to which it is a chapt of case, every Sunday afternoon. - The Patrietan.

NEW PTER AT BLACETRIARS' BRIDGE. This structure, which has been for a considerable time in progress, was opened to the public whards the close of last week. It is 140 feet towards the close of last week. It is 140 feet to leogth, with a dumb lighter placed at a right angle to the siver of 130 feet. Two waiting-rooms have also been built, which, with the pler itself, is lighted wild gas. It is the most commodious and substained structure of the Fluid in London, but interferes somewhat with the castoon view of the bridge.

LARGE CONNITTRES - Among all the long LARGE. MON NILT, BES. - Aluang an the long lists of provisional committee men published, that of the Great Northern and Southern Di-rest milway, from Huddersfield to Derby seems to be the he longest. NO "less than 300 names are structized as a new source route

CALCUTTA CATHEDRAL .- The Lord Bishop of Calcutts" has "presented to the Bodleian library, a beautiful alabaster, wodel, executed at Piss; of Str John's outbedral, Calcutta

THE BUILDER.

Discoveny of Relies. — The workmen employed in experiation the railroad by Tho-mas Salmon, Esq., at South Shields, for the conveyance of Ballast, from his wharf at the Type, to the place of deposit at the Lawe, have struck upon what is upprestionably the ancient military way, called Wreken Dyke, leading from the Roman station discovered in the same field, near the Lawe, by the late Nicholas Fair-less, Esq., in 1798. The bones and antlers of deer have also now been dug out, being, pro-bably, the remains of animals consumed as probably, the remains of animals consumed as provisions by the Roman soldiers; but though Mr. Fairless, when the former discovery of a Hypocaust of Sudatory took place, became pos-sessed of a beautiful gold coin of Marcus Au-relius, and several of brass, from Claudius Gothicus to Valentinian, yet the only coin which has now been discovered is a Danish one of brass. Lawe is, we believe, a Saxon word, signifying a fortified eminence.- Tyne Mercúrý.

ASYLUM FOR DECAYED FISHMONGERS AND POULTERERS.--- A meeting of the friends and subscribers to this undertaking was heldlast week at Anderton's Hotel. A committee was appointed and empowered to purchase a site of ground at Woodgreen, near Tottenham and Hornsey, represented as being perfectly suited with respect to size, price, &c., for the con struction of an asylum for twenty-four aged and infirm members of the two trades; also to collect plans and estimates, &c., from which to select several, and lay them before a subsequent general meeting.

WIDENING PICCAPILLY. -- Workmen have been busily employed during the last two weeks in putting back the wall and iron railing from opposite Park, lane, to about the end of Bolton-street, so as to increase the width of the thoroughfare. From 20 to 30 ft. of the Green-park will be taken in. In consequence of the inequality of the ground, this alteration will involve a larger expenditure than appears at first sight. It is to be hoped that the trees which, by the removal of the wall, will be placed "out of the pale," may, nevertheless, be allowed to remain.

FURNITURE WOOD .- We recently noticed the sanction of the Lords of the Treasury for the admission of certain descriptions of wood used by cabinet makers, duty free. Within the last few days the same authorities have issued an order that teak wood imported from the river Gambia under the head of furniture wood shall also be admitted, duty free. In the latter case the revenue officers must be satisfied that such wood is imported solely for making articles of furniture, and that it is inapplicable for other purposes.

THE NELSON MONUMENT IN TRAFALGAR-SQUARE.—Can any obliging correspondent in-form us what has become of the celebrated man and hoy formerly employed on this ill-used monument? It is whispered about, that the statues for the New Houses of Parliament are to be confided to their gentle bands, but we do hope for the sake of "the finest site in Europe,' that they may be permitted to finish their work here first, so that some, at all events, of the present generation may hope to see the steps and the lions. RAILWAY BANK.—The Iron Times says,

We have it upon undeniable anthority, that in consequence of the recent procedure of the bank, and the conduct of the *Times*, a public meeting will be held at the London tavern in the course of a few days, for the purpose of establishing a railway bank.

M.P.'s AND RAILWAYS. - It is said that some M.P.'s have taken one or two shares in each of the new lines of railway simply with the view of avoiding to serve on committees; we can't wonder at it. Last year must have fagged many, and this year the prospect is worse.

DOVER .- The formation of the new docks is proceeding rapidly. Hundreds of working are employed. The well known Xark Hotel is about to be pulled down. Serious doubts are entertained by those whose opinion is worth consideration whether after all it can ever be made a harbour of refuge.

COLONIAL TIMBEB .- The practice of thereveoptimizers in London with respect to British colonial timber, viz, ho record the number and contents only of each pisce, and not the lengths and sides, as in the case of foreign timber, is about to be adopted generally throughout the kingdom. Same 12 ici.

STATUE OF SIR THOMAS GRESHAM.— This statue was installed last week in the niche which has ad long stood varant for it in the clock-tower of the new Royal Exchange. The figure is erect, 14 feet 6 inches in bright, and is formed out of two blocks of Partland stone, weighing jointly between glayth and stone, weighing jointly between efertin and twelve tons.

. NOTICES OF CONTRACTS.

[We are compelled by the interference of the Stamp Offer to opit the names of the parties to whom tenders for, are to be addressed. For the convenience of vin renters, however, they are intered in a book, and miny be set on application at the office of "The Builder," 2, Virt. attect, Covent-garden.]

For executing the different Works required to be done in the alterations and repair of the Guildhall, Lichfield.

For the execution of the Works connected with the improvement of the Crown-street station, II-verpool, including a Tunnel of about 128 yards long, and a Bridge or Viaduct, &c., for the Grand Janction Company.

For the execution of the entire Warks of the Cockermouth and Workington railway, being about 10 miles in length, For the execution of Works on the Witterford and

Kilkenny Railway, forming the first contract, viz, from Kilkenny to Bennett's Bridge, being a distance of about six miles.

For the execution of Workston the Bast Lancashire Railway, forming the Bichley Contract. I iacludes the execution of all the newskiry Excert tions, Babankments, Bridges, Oulverst Widder It &c.

For the execution of Works on the Hull and Selby Railway, being a distance of about thirty long miles.

For the execution of Works on 'the Dublin and For the execution of Works on the Dublin and Belfast Junction, and Navan, Hearch, Railway. PAYNE'S PATENT PROCESS FOR THE PRESER. VATION AND IMPROVEMENT OF TIMBEB, &c. PAYNE and LODER beg to invite the at-

ALINE and LODEK beg to invite the at-tention of Engineers, Railway Companies, Architects, and others to the above process, and to state that they are prepared to erect the necessary apparatus in any part of the United Kingdom where the quantity is sufficiently large to cover the outlay of its removal. Farther particulars can be obtained at Whitehall-Wharf Cannon-row, Westminster, or at their other stations, Fleet-wood-on-Wyre, Lancashire ; Wisbeach. Cambridgeshire; Union-Wharf, Souttampton; and Guildford, Surrey.

IN Warming Churches and Chapels, DAY and JOYCE'S PATENT STOVES have been found to answer the purpose where others tried have failed of their efficacy: will be forwarded by post, or otherwise. These stoves will render the atmosphere of a church, or chapel, or other large building, most agreeably warm, without pro-ducing unwholesome vapour, or injuring the vital quality of the air. The Patentees are prepared to supply them on the shortest notice. They may be inspected at the manufactory, 113, London Wall.

PATENT PORTABLE SUSPENSION STOVES.

MORE than FOUR THOUSAND of these STOVES were sold during the first season-the winter of 1844-45—so decidedly did the public sanction their distinguishing principle, by which a genial heat and a pure atmosphere are secured and combined.—They are now ready for delivery, of all sizes, from 19s. and upwards, at GEORGK and JOHN DEANES, opening to the Monu-ment, 46, King William-street, London-bridge.

WILSON'S PATENT VENTILA-TING SPIRAL CHIMNEY POT, for the cure of smoky chimneys (manufactured by J. PORTER), is the ONLY article for the purpose which assists the draft of the chimney by an external propelling power. Upwards of fifty have been recently fixed on the chimneys of Bucking-ham Palace, and several on Windsor Castle, with great suc-cess. This Chimney-pot is not only the best and most ef-fectual ever invented for the purpose named, but stands un-rivalled in its ornamental appearance. The public may be supplied with the above useful article by any of the respect-able iron Roofing Works.

VENTILATION.

"A most ingenious, simple, and effective plan." Mr. Reid's Lecture on Ventilation, delivered Jane 7, 1845, before the Mechanics' Institute, Liverpool.

Accourse on venuiation, delivered Jane 7, 1845, before the Mechanics' Institute, Liverpool. The channes' Institute, Liverpool. Market Space Strategy and Strate

ø

HEN the Common Council of the City of London decided, a few weeks ago, on appropriating 20,000% a year for twenty years, out of the coal duties, for improve-

ments in the various thoroughfares of the city, and other public works, the best mode of applying this sum was discussed out of doors. One party urged that the total amount should at once be made available, and improvement be effected on a grand scale; and the other, that so far from absorbing the sum obtainable by the mortgage of this 20,000% a year, in some immense achievement, steps should be taken to prevent the committee from spending more than the year's income in any one twelvemonth. " Everybody," said the Morning Herald, taking the latter view of the question, " can understand the difference between splendour and comfort. We are not saying that the metropolis of England should not aim at magsificence; but we do say, that if every thing that can be raised is to be spent in the main thoroughfares, so as not to leave an available shilling for the clearing away of a noisome alley, or the widening of an impassable lane, the result will be-that which we all lament without being able to cure-that magnificence and misery, laxury and equalid wretchedness, will be for ever found dwelling in the nearest neighbourhood."

"" It need not be feared that in this way improvement would proceed at a tardy pace. A sum of 20,000*L*, in minor improvements, would do a great deal. One year's income would probably complete the improvement lately commenced in Fetter-lane. A second would break through from the site of the Fleet-prison into the Old Bailey. A third might open a road from Farringdon-street into Fetter-lane; and a fourth would carry that road on into Chancery-lane."

The writer then asks the members of the corporation to look round their own neighbourhoods, and see whether each ward in the city did not require some minor, but important, impreveneent; which a grant of 10,000%. or 20,000% would easily effect. "And if they feel this to be the case, let them determine, not to lavish the whole capital away (by a mortagage) on some one new street; but to keep the income always in hand, yearly accraing, never forestalled, but always disposable for real practical use, in those many nescenary improvements which every part of the eity requires."

The committee, to whom the question was referred by the common council, brought up their report on Monday last, and from this it would seem that the course urged by the journal'in question is to be pursued. The report states that the committee "thought it desirable that some improvement should be carried into effect in the next year, and they had selected two plans which they considered would be great improvements and beneficial to the inhabitants of the city of London-one for forming a street from the south end of Waterland, now called Blackfriars-street; and the other in the Old Bailey, from the south side of the New-inn to the south side of Prujean-

THE BUILDER.

square; and they recommended that they should be empowered to give the necessary notices of an application to parliament for an act to carry the same into effect."

Now, with the greatest respect for the common council, we are compelled to dissent, in the strongest terms, from such a mode of commencing the discharge of the trust committed to them. If the improvement of London be attempted in this way, it must inevitably prove a failure; half the money will be wasted, and discredit, instead of glory, be the result.

They have now the opportunity of rendering London the grandest and most convenient city in the world,—of cleansing, opening, connecting, and adorning its thoroughfares, of improving the arts, and handing down to posterity proofs of the opulence, knowledge, and taste of the nineteenth century. This, however, is not to be done by bit-by-bit, chandler'sshop dealings,—opening a back street here, taking off a corner there; knocking down one house in the north, and two in the south, without reference to some general plan, and a view to the ultimate result of the whole.

We see no reason to urge, the immediate realization of the whole sum proposed to be expended by the city in twenty years, but we do most strenuously call on the Committee to proceed as if this sum were in their hands for immediate disposal; to view the subject in a comprehensive manner; to see that every thing that is done be a part of a whole; and, overlooking merely local demands and personal claims, work out steadily a well-considered and settled scheme of improvement.

To obtain this, they should call to their assistance the first talent in the country; careful surveys should be made, and a general plan laid down, to which all private projects should be made to conform. At present there is not even a correct map of the metropolis, although Sir Robert Peel admitted its necessity several years ago, and promised that it should be made forthwith by the proper department. If this were now called for by the Common Council, it would probably be proceeded with forthwith; its paramount importance will be admitted at once, by all who have given attention to the subject.

In an "Account of the proposed improvements of the western part of London," by Mr. J. White, published in 1815, a copy of a treasury minute, dated July 1793, is given; wherein the surveyor-general of Crown lands recommends, that "before agreeing to any proposal for the alteration or disposal of any part of Marylebone Park, a general plan should be formed for the improvement of the whole of it, lest such partial alteration should afterwards be found inconsistent with what should be deemed most for the benefit of the Crown." He further proposed that certain plans should be lithographed and sent to architects, and some "considerable reward" given to the person who should produce such a plan as may be adopted. The Lords agreed to the report, and directed the offer of a reward not exceeding 1,000%. for the plan. To what extent the offer was made known, and what was the result, does not appear.

Surely, however, this minute should be an admonition to the city authorities. In the discussion on the report that has led to our reports, and which, it must be mentioned, was ultimately sgreed to by a large majority, it was insisted that the improvements referred to in it, could be effected without any considerable autlay, " and would be the most judicious precursors of the extensive changes which must rapidly take place." Why, who in the court

will venture to deny, till the whole question of city improvement has been competently investigated, that the two streets now proposed to be formed, may require to be pulled down within five or six years, in order to carry out some general plan, or worse still, through dislike to removing what has been recently put up, may prevent the consummation of a comprehensive and efficient scheme? Indeed, remembering the decision to which the court came on the same day, as regards railway termini in Farringdon-street, it seems nearly certain that this must actually be the case.

OPENING MEETING OF INSTITUTE OF BRITISH ARCHITECTS.

ON Monday evening last the members of the Institute assembled to commence a new session; Mr. Tite, vice-president, in the chair. Amongst numerous donations annoanced were some works on Norwegian Antiquities, from the University of Christiana (with a very nice letter), and the concluding part of Mr. Owen Jones's fine work on the Alhambra—a work unequalled for beauty and costliness.

unequalled for beauty and costliness. The chairman said it was customary for the president of the first meeting, to allude to the circumstances connected with architesture that had occurred during the recess; and hewished the duty had fallen into abler hands. He was glad to say they were commencing the scassa well, the funds were increasing, and their em-The principal difficulty, nections extending. The principal difficulty, as they were aware, was to obtain papers and induce discussions, ---- a difficulty, however, which was not confined to them, but was found in all the societies. The latter he considered of great importance :--- "Iron sharpeneth iron, so doth the wit of man his friend." It was desirable for men to rid themselves of mauvaise honte, and afford others the benefit of their ex-He would ask all to contribute a oerience. little ; if they would do this, every evening of meeting would be spent not merely pleasantly bat usefully. Since he last met them, he had twice visited the capital of France, and he considered it his duty to say how much they were doing there, not only to increase the elegan the city, but its comfort, particularly by the construction of broad open streefs, and good drains. The magnificence of the modern ardrains. The inightened of the model at chitecture was very striking, and was not confined to churches, but extended to the dwelling houses. The French architectu had an advantage in the custom which prevailed there, of several families living in the same building, on different stories; this gave them larger masses to deal with than architects in England had. He then alluded to some of the principal public buildings lately completed there, the aburch of St. Vincent de Paul, Notre Dame de Lorsette, and the Hotel de Ville. Of the former building, slready described in THE BUILDER,^{*} he spoke at some length. On this 163,000L had been sport. The stained glass there, was the best modern glass he had ever seen. The remembrance of hese churches led him to express a desire felt by many of the elder members of the profes-sion, that during the prevalence of the present fashion, as he would call it, for Gothis architecture, we should not overlook the effects may be produced by classic architecture. The then alluded to the melancholy death ker of Mr. Basevi, and sketched the principal events of his life, as already put forth in our

pages. Mr. Poynter, in continuation of the chairman's remarks on works in Paris, described the coloured decorations of the Sie. Chapelle, now completed, as the most perfect he had ever seen. In England, some detestable effects had been produced by the use of heavy colours, but there, from the manner in which all was detailed and relieved, the appearance was admirable. All the multions and shafts, of versaillion or green, was conside with fine Nnes of gold, besutifully embossed. Every leaf and piece of folding and a sharp black line round it, by which the effect was greenly improved. The vanking (a deep blue, coversed with stars) was not so attractory; still they had authenity for all. It was worth remembering, that, when first constructed, this and St. Stephen's Chapet, London, were decarated

GGG

in rivery. Of the stained glass at St. Vincent we Paul, it was impossible to speak too highly; it was better than any old glass he had ever seen, combining the ancient effect with really good art. The stained glass at St. Denis was detestable. The speaker then described the monument for the Orleans family, recently erected at Dreux, in Normandy, of which we gave an engraving in Tak Buitass, in June last. It was originally of Italian character, and was afterwards made Gothic, — and al-though the details were bad, and the connection of the two styles not made artistically, the general effect was good. The exceution of the sculptured decorations was beautiful; it was in this respect the French far excelled us. Mr. E. Trotman then read a very able paper on the *economical* application of Gothic archi-tecture to modern domestic purposes, illus-trated by a large number of sketches. No one, he said, had yet fully urged the proposi-tion included in the title of his paper. A few years ago the Gothic style was looked at as too averanize even for churches; he felt satisfied the in ri Of the stained glass at St. Vincent ally.

years ago the Gothic style was looked at as too expensive even for churches; he felt satisfied the years ago the Gothic style was looked at as too expensive even for churches; he felt satisfied the more closely it was studied, down to the time of Wolsey's fall, the more clearly its econo-mical application would become evident. He did not mean what he would term "Watering-place Gothic," of gables, pinnacles, crocketts, and decorations without meaning or purpose, bat the actual architecture of our Gothic pro-genitors. He justly reprobated many of the Gothic buildings of a few years ago, espe-cially some of the colleges, where the back and froat, the outside and the in, were per-fectly dissimilar, simply a Gothic facing being thrown on. The negligence, if not ignorance epparent, shewed that the architect had not thought with a gothicised feeling. All should be in the same spirit, even to the garrets and cellars. In the buildings of the period imitated, the same feeling was apparent in the palace and the cottage. For domestic archi-tecture, he would not look for earlier models than works of the late perpendicular period; than works of the late perpendicular period; and these were not understood as they ought to be, as regarded construction, character, and ornament. He would point them out for study. The progress of decay and the ravages of fire were fast diminishing our authorities, and no time should be lost in obauthorities, and no time should be lost in ob-taining memorials of those that remain. All seemed to think in initiating Gothic works that much ornament should be used; parts were broken up merely to produce an effect, and the greatest pains taken to appear ir-regular. If we compared such modern gew-gaws with an old English cottage, the difference was striking. The pitch of the roof deter-mined the form of the gables; superabundance of wood produced the half-timbered houses; one story overhung the lower in wooden constructions as protection, and throughout, picturesqueness was guided by common sense. For every-day practice the desideratum was, cheap details. Some architects had taken their notions from *church* details; he him-self had done so, but would then recant and self had done so, but would then recant and

self had done so, but would then recant and retrace his steps. Beginning with doors, — they did not require to be arched headed; even in chancel screens they were often square headed, indeed usually so. In some, there was no other moulding thin, a champher down the outer edge. At the main external entrances, however, he had never found square heads. In modern win-dows, we always looked for stone mullions; hat in ancient examples, of about 1500, plain but in ancient examples, of about 1500, plain lights with deal uprights were general. Where stone was scarce, moulded bricks were often stone was scarce, moulded bricks were often used; the Rye-house, near Hoddesdon, gave used; the Kye-house, near Hoddesdon, gave examples. In copings, cheapness and good effect were constantly combined. He then proceeded to illustrate internal fittings, and concluded his paper by urging the importance of secondary matters in building, which are too often disregarded.

The Chairman, in conveying the deserved thanks of the meeting to Mr. Trotman, said, the results of the investigation that had been brought before them shewed the good sense of our ancestors. Nothing was done without a good reason; all decoration grew out of construction. It was difficult now to adapt an-cient forms to modern usages. It was no loncient forms to modern usages. It was no lon-ger sufficient to copy merely, we must *think* in the style adopted. With reference to the ne-cessity for making things seem to be what they

THE BUILDER:

are, the Chairman expressed an opinion, that if the ornamental gothic tower, at the Croydon Atmospheric Railyay, had been made to look like a chimney, as it was, the effect would have been better

like a chimney, as it was, the effect would have been better. Mr. Donaldson followed with his usual plea-santness, and urged, that if every member would send one example of a door or window, or other detail, easily obtained during their rambles, a valuable collection would be formed. In examining ancient buildings, even of the simplest class, it was impossible to avoid no-ticing the extremely good taste, without affec-tation, that prevailed ; in modern times, the converse was often the case. He was satis-fied that good taste depended on good sense. The meeting was then adjourned till the 17th inst.

17th inst.

THE PRESENT STATE OF THE ART-MUSEUM OF NAPLES.

THIS Museum surpasses, in many of its de-partments, the great expectations entertained of it. The collection of large works in bronze fills a whole gallery, while other museums are satisfied if they possess single specimens of that magnitude. The dancing Faun, the sitting Mercury, the two youths reclined for-wards, and who have been taken for discthrowers, but are surely wrestlers, in the very attitude of the beginning contest; the four socalled Herculanum maidens, shew what an-tiquity could accomplish in this its manliest and most noble branch of art-real Plastic. A short time ago, the collection was en-riched by a Venus found at Nocera ; about half natural size, dressed, up to the hips, arrangeing her hair with one hand, while arrangeing her hair with one hand, while the other held, undoubtedly, a glass. She sir-passes in correctness and gracefulness of form, and sweetness of expression, every thing else in this, albeit richest collection. The smaller bronzes are endlessly rich in ancient utensils, less so in figures.

The collection of marbles contains, amongst a great completeness of specimens, about twenty, which can doubtless, range amongst the works of first rank-the very ancient combating-Diana, with traces of red painting in the Diana, with traces of red painting in the drapery and gilding in the tresses; the com-bating Pallas in a more advanced, but still archaic style; a group, hitherto supposed that of Orestes and Electra, but perhaps represent-ing Venus and Mars, in which from out of the compactness of limb of primordial art, the already complete perfection of Plastic is pierealready compare purposes the wonderful figure or ing. Then follows the wonderful figure or the Venus of Capua, a later copy of that of Melos, of the same beauty, but more finely worked than the latter — spoiled as to ef-fect, however, by the Amor made of Paris-plaster, which, instead of the Mars, properly belonging to her, has been placed by her side; incomparable Torso of a Bacchus; a Minerva, the finest we have ever seen :* the Faun who carries a Bacchus-lad on his shoulders ; a Venus formed after that of Knidos, almost equalling that of Medicis ; the lad encompassed and carried by a dolphin; the group of Pan and the young Satyr, whom he teaches to play the flute[†]—the latter, in the cabineto reservato (the reserved room). Then follow the relievos of Orpheus and Eurydice, of Paris and Helen, and the three famous works of the Farnese collection,-Flora, Hercules, and the group of Dirce. This élite also has been of late of Dirce. This *élite* also has been of late enriched by a new acquisition. It represents a Nereide sitting on a sea monster, found at Puzzuoli-the figure is of extreme graceful-Puzzuoli—the figure is of extreme gracetul-ness and fineness of form. It has most pro-bably belonged to an array of Nereides, which were represented carrying the arms of Achilles – a representation recurring on several other relievos, which exhibit a figure quite re-sembling the above. According to those relievos, she ought to be restored with her hand holding up the helmet of Achilles, which relievos, she ought to be restored wun ner hand holding up the helmet of Achilles, which The collection of terracottas was found

much under our expectation, as far as figures are concerned, and most of the delicate things. may have been dispersed. The integlios, on the other hand, have been surprisingly enriched by the *Cameos* of the Farnese collection. It

* Our apology for copying this long list of statues is an asy one. Few casts, if any, of these splendid figures are be found in our national collections, although they bught

to be. † Most of our readers know that the National Gallery possesses a splendid little picture on the same subject, by Poussin,

is here also, where is to be seen that gr famous cup of, one piece of sardonyx, on i outer side of which the head of Meduas, the inner a hitherto not quite explained see are engraven—still, we think, that it symb-izes the occupation of Egypt by Alexan-the Great. The diameter of this splen show-piece is a full span, and hearly two incl deep. A few years back a vase of blue g and white encausted figures; was added, if Pompeil, which represents a very pleas Bacchic scene of a vintage, and a repast Amorines—the delicacy of execution, hower is inferior. is here also, where is to be

Pompeii, which represents a very pleasing Bacchic scene of a vintage, and a repast of Amorines—the delicacy of excettion, however, is inferior. In the collection of modern plastic works, we were surprised by a specimen of the greatest importance of Michael Angele. It is a buts of Pope Faul III., of exceedingly spirited character and life-full excettion— from whose form hursts forth the comprehen-sive, deep-minded, and at the same time subte and cunning character of this combination senile. The worth of the bust is still increased by the pontifical garment, which descends on the neck and shoulders, ornamented by allegore relievos, representing the achievements of the Pope in clurch and polities, and which breats the very mind of M. Angelo—although very aged at that period. We shall not diate on the treasures of the Picture Gallery, which, besides an array of real art-specimens, paintings? Gian Bellini, Pietro Perugino, Raphart, Cor reggio, and Titian—contains also the master of the old-Neapolitan school, and those subse quently issued from that of the great Trip inte, all in great number and significance of specimens. A Madonna, *marked* as a work Pietro Perugino, seems to point at Rapharf. In the Milan Sposalizio, and those little figures shortly after his leaving the publicg Perugino. We like also to mention an other Madonna of Raphael, as it shewed rises shortly after his leaving the publicg Perugino. We like also to mention an other Madonna of Raphael, which we foun in the Palace of Principe Terranuo. The picture contains, besides the Virgin and Christ-child, two other lads, John the Bapta and Evangelist, and it belongs to the secon Florentine epoch of the great matter, which he master of Maphael, which we foun in the Palace of Principe Terranuo. The picture contains, besides the Virgin and christ-child, two other lads, John the Bapta and Evangelist, and it belongs to the secon Florentine epoch of the great matter, which he impressed on his creations fithe which he impressed on his creations fits the highes

ni to BATHS AND WASH HOUSES FOR THE LA BOURING CLASSES IN ST. PANCRAS.

A NOTICE of the establishment of the A NOTICE of the establishment of these baths appeared a short time since in this jour-nal (p. 470, ante). The building, which is one story in height, occupies nearly three sides of the square, at the foot of the reservoir of the New River Company, in the Hampstead-road. It stands immediately behind the old blank wall, the entrance being in George-street, Euston-square; and the cost will be little short of 2,000*l*. The range of buildings is about 12 feet in width, and 800 in extent. The entrance is by a long passage, at the side of which is a committee room and five vapour of which is a committee room and five vapour baths. The passage leads into a receiving-room. To the left of this are twenty-two com-partments for men's baths, each of which may be either cold, warm, or shower, at the option of the bather. The baths are made of slate, with which each room is floored and liked. The rooms are well ventilated by a small conical light, working by pillies and weights. At the end of these will be two swimming baths, 60 feet by 21 feet, with separate en-trances: they will be charged two-pence and six-pence. To the left of the receiving room are the women's baths, some of them being fitted up in a superior style. Beyond these, having a distinct door of en-trances, without passing through the bath room, is the washing department. This room is divided into compartments by state parti-it. This stems to be a pendent to un Portland uses 1 This seems to be a pendant to our Portland states | bis tropely compressed air is admitted into this,

will entirely destroy the means of contamina-tion. In examining this building, we saw with some regret, that a mode of construction was adopted in several respects injudicious. In a building to cost 2,000%, indeed in any building, sound construction is always the cheapest. We believe, there is no architect at present en-gaged, the committee deeming his superintend-ence would entail unnecessary expense. Poor people always live at the dearest rate, and half the people who build, achieve it at a similar expensive onligy. Unstable building, and future annual disbursement are not thought of at the commencement, but are soon painfully evident. In the present case, we regretted to find, that the framing of all the partitions was not constructed in the best manner, that joists, which support them, were bedded upon blocks, or bricks — instead of continuous sleepers, and that they were at one end in-serted in a wall, without any continuous sup-port; a bit of slate under each joist is a miserable substitute. The joists are of old ship timber, and areabout 2 feet 6 inches apart, or the width of the slate flooring, which they or the width of the slate, flooring, which they support. The provision for draining, the ground, behind the wall placed against the foot ground, behind the wall placed against the foot of the hill, is scarcely satisfactory; every pre-contion should be taken on such a site.—It only remains to be stated, that the different rooms are lighted by windows in the ceiling, or close beneath it; that ventilation is provided for by openings in the roof, and that the timbers are open, and stained with asphalte, as a protection from the steam, and that the whole is slated. The place is open to inspec-tion. The range of building

NEW APPLICATION OF AIR AS MOTIVE

A PATENT mode of working a railway, deemed so safe by its conductors, that the company who adopt it, propose to make every taket issued a policy of insurance upon the life of the passenger, so that in the event of accident, or death, he or his representatives will have a claim of so much a year upon the company for life, demands consideration. The project alluded to is the invention of Mr. Vichels, and is a new application of air as a motive power. A model has been laid down on Messrs. Keene's premises in the York-road, and is in daily operation. It works by means of condensed air, instead of an ordinary amosphere against a vacuum, and the arrange-ment is novel. A tube, with air tight com-pressible sides, and a partition down the middle of it, so as in reality to form two tubes, is hid in the centre of the time between the rails. Brongly compressed air is admitted into this, Strongly compressed air is admitted into this,

which suddenly inflating the pipes, their sides impinge upon two drums, or large wooden rollers, pressing upon them, which are by that means set in motion, and these being fixed by simple mechanism to the carriage above, carry it off with astonishing velocity, the conductor at the same time retaining a control of the

THE BUILDER

at the same time retaining a control of the movement. The action, it will be seen, is that of the wedge; two or three superficial objections to the mode of applying power occur to us at the moment, sufficient to prevent us from express-ing any opinion upon it at first sight, but cer-tain it is that by the model exhibited, great speed is obtained, and very little air used.

THE INTELLECTUAL IMPROVEMENT OF OUR OPERATIVES.

SIR, Your correspondent, of the 4th inst., *A Journeyman Carpenter*, makes the following request :---"What are we to do?" As he has alleded to my remarks, of the 4th inst., in THE BUILDER, I will endeavour to offer an answer to his request. In the first place, I an answer to his request. In the first place, 1 will make a few extracts from my 19 Address to the Manufacturers, &c., 2 which I published in 1838, to induce the manufacturers and the legislature to establish schools of arts on a true foundation. Now, as there is no true ar-tistic school established, in is evident that neither the one nor the other have that knowledge of the subject-the due cultivation of the faculties for the arts-which they ought to have, or they would have established, long before this, such schools for artistic instruction as the artisans of this nation should and are entitled to have; and if both parties knew their own interest, they would not have negleeted the important duty they were long ago called upon to perform; the master manu-facturers would have had more skilful ar-tisans, and have stood unrivalled in every extisans, and have stood unrivalled in every ex-cellence that mind, handicraft, and machinery could produce, and the legislature would have made, by its wisdom, an intellectual and grate-ful people, capable of appreciating its-legislat torial labours. In the first page of my address above alluded to, are the following remarks "We know that no two human beings have ever, been seen exactly to resemble each other in holy or mind, and yet we conclude that

ever been seen exactly to resemble each other in body or mind, and yet we conclude that mankind should think and act alike, and equally agree on all subjects whatsoever. In the belief of this, we are continually establish-ing schools of education for the purpose of making all equally informed; but what is the result? Any thing but what it ought to be;³⁵ and, in page 2: "Throughout the whole of nature, variety is a striking feature. In plants and flowers, as regards their forms and colours, how often is it stated, in those qualities there is no difference. No one ever saw two roses or is no difference. No one ever saw two roses or two bludes of grass alike; or one yea perfectly corresponding with another. Knowing this, and that the highest of animated beings in the scale of intellect vary as much as the lowest order of the animal kingdom, we ought not to be surprised at the failure of the present educational systems, as they do not embrace a legitimate exercise of the faculties for the arts, and are consequently unsuited to the nature of the human mind," &c. Pages 3 to 11:--"How often has it been said that genius is buried in cellars and attics, and yet no one found to relieve it from that thraldom. But if a mational system of education be soundly established, and based entirely upon a thorough knowledge of human nature, we should then have no genius wasted, no faculty lost, and have no genus wasted, no faculty lost, and the whole power of the human mind turned to good account. We should then see this na-tion rise in the greatest of all her resources— manufactures—and which it is at present so much in need of. Our manufactures have long been defective, through the arts being at such an immeasurable distance from them. The designs which constitute the ornamental part of our models being imitative instead of invendesigns which constitute the ornamental part of our goods being imitative instead of inven-tive, keep us in the back ground, and lower us into the degraded state of servile imitators, of which no nation in the scale of intellect should ever allow itself to be. To raise ourselves, then, from this state of degradation, schools of arts should be established in every city and manufacturing town, throughout the United Kingdom, that the rising generation may no longer be excluded from that source out of which so much valuable knowledge springs. which so much valuable knowledge springs.

534

535

Such schools of art should be formed for the purpose of opening the wide field of nature, that the true foundation may be laid in the youthful mind, when the only materials for forming new arrangements and combinations will be received quickly, and permanently held, and so an endless store of information will be laid up in their minds for design—original thinking and invention. To bring youth of different capacities to the fullest development of their peculiar powers will be more or fess successful, according as their instructors are men of intelligence, of enlightened minds, and well informed on that part of creation that they undertake to demon-strate. Artificialists will be worse than use-less, is they will worry the minds of their hearers with worn out, hackneyed notions, instead of bringing to view nature's ever-vary-ing features, which she is always ready to bestow.

heaters with work out, and heat the students, instead of bringing to view nature's ever-varying features, which she is always ready to bestow. The supposition that men who have been active observers of nature, and well able to demonstrate that which they undertake to do, will be appointed, the mechanic will be raised in the scale of art, and have the power of delivering naturally all that he may contemplate constructing, and become a produces of good forms, instead of those of composition that it is a stransformer and the superinted of the second se

from, as that would be sure to hiss the mind, and dispose it to copy, instead of gathering new materials for original works, and of gathering new There is one point, above all, that I con-sider to be of the utmost importance in the instruction of youth, as regards design, and that is, the greatest care should be taken by the instructors not to enforce their notions, or any others, of design, on their pupils, as that would have a tendency to destroy, the peculiar combinations, arrangements, contrivances, and would have a tendency to desiroy, the presultary combinations, arrangements, contrivances, and other, qualities, of the varied minds of the students, and thus arrest the progress of origi-nality. There is nothing more mischievous than to endeavour to ingrait the peculiarities of one mind on that of acother, which may no one mind on that of another, which may no

only be dissimilar, and guite unfit to receive them, but may be so differently organized as they may be, but if wisely directed would pro-duce, by its own original ideas, designs equally duce, by its own original ideas, designs equally as beautiful and extraordinary as those of its instructors. The instructors should shew how far natural forms and colours may be ar-ranged, combined, and contrived, in every variety of way, to accomplish the design re-quired; and when those of the ancients may be quired; and when those of the ancients may be thought necessary, to refer to for a principle, and to ascertain the use they made of the like materials, so far it would be well; but they should not be brought forward for imitation. On this part of artistic instruction much more work that that the the the the the second second may be said, but that must be hereafter and elsewhere.'

.: .: .

536

The journeyman carpenter's inquiry of "What are we to do?" is in some degree answered by the above extracts from my address. He and our artisans will see what ought to be done for them; and I would further state, that the school which should be established for them ought to be upon the soundest foundation, and the most efficient instructors should be obtained, if possible. It will be of no use to set up such artificial concerns, for so valuable a class of men as our operatives, as we have already. They are attended with too have slready. They are attended with too great a loss of time and mind for artisans to great a loss of time and mind for artisans to endure; for they want not to be entertained or amused, they want to be really instructed, and nothing less than the best of instruction should be offered to them, and even that should be gratuitously, for an artisan's wages will never allow him to pay for artistic instruc-tion for himself and his children; and those who reap the benefit of his labours should not be behaviored for the second of the second of the be backward in their benevolent assistance for promoting their intellectual cultivation, for the end of such aid would be sure to be in favour of the supporters of the artisans' artistic institution.

I trust that your valuable journal, THE BUILDER, will not lose sight of this important subject, but keep it alive before that part of the public who are able to appreciate and to further its purpose; when in the interim I will, as occasion may require, offer some further remarks upon artistic instruction in connect tion with the development of the intellectual facilities of our artisans.

GEO. R. LEWIS. am, Sir, &c. Upper Norton-street, Oct. 14, 1845.

THE GRAVE-YARD QUESTION.

SIR,-It is with great pleasure I have no-ticed in your columns frequent remarks and letters relative to the grave-yard nuisances, a subject which has forced itself into notice by its very monstrosity, breaking through every obstacle which careless indifference on the one hand, or interested motives on the other, could bring forward to " pooh ! pooh ! " and ridicule the question. The agitation (which, by the way, is the only legitimate means to induce reform of abuses) has, I am happy to find, extended itself to the provincial press, and it now only requires to be zealously followed up by the leading London journals, to enforce the attention of the legislature to a reform of the present system. The pertinent and practical present system. The pertinent and practical remarks of your correspondent Z., in THE BUTLDER of Nov. 1st, deserve the most serious attention. Can it be, for one moment, held a sufficient reason for non-interference, "that the interests of the clergy are involved?"—that a section should be greater than the whole? I cannot think so disreputable a motive can have one weight with the great motivity of have any weight with the great majority of our clergy, it is possible that a few worldly-minded men, as in all other classes, may fatten upon the miseries of others, but they can be only blots and blemishes of their order, and should be swept away without compunction or pity. Sir, it is not with the clergy the diffipity. Sir. culty lies,culty lies,—it is rather with the inert mass, the public; they, in the toiling, stirring scenes of busy life, have, as a mass, little time or care to consider such questions, and, unless you can interest them by some profitable scheme or speculation, it is vain to hope for reformation in what, if they think at all about the matter, they would call a mere abstract speculation.

It may be thought, from this view, that all attempts were useless; far from this being the case, we are now in a fair way for success.

The (press ever in the van of improvement), Ine (press ever in the van of improvement), have already taken their position, a position creditable to themselves, and which will eventually call for the warmest thanks from the public. During the last session, they wrung from the unwilling commons an admis-sion " that the frequent mode of interment in the metropolis and other large cities and taken the metropolis and other large cities and towns. was injurious to the public health, and de-manded the serious attention of parliament." This is the first introduction of the wedge, and it now remains, by a judicious application of blows to drive it home and compel attention. No columns can be more suitable for the purpose than yours; a reform of the present system necessarily requiring the selection of other sites as burial-grounds, &c. The pe-culiar talent embodied in your publication, could more skilfully point out the most appro-priate positions and plans than other journals

THE-BUILDER:

of a more general character. I trust to your praiseworthy efforts, and I, for one, have little fear for the result.—I am, Sir, &c. H. C. H.

DECORATIVE ART SOCIETY.

Nov. 4th, 1845.

Oct. 29.-Mr. Crabb, V.P., being in the chair, read an address, on opening the third session of the society's meetings, setting forth the advantages already derived from free and friendly communications between practical men on matters of taste, or in connection with decorative art.

Mr. Bailes read a paper "on Marquetrie;" be explained that he had been recently in-duced to devote his attention to the manufacture of Marquetrie, from the success of some experiments he had made as an amateur, and that his processes were essentially different from those generally adopted. He then re-ferred to various descriptions of inlaying with wood of different colours, and the inter-mixture of ivory, pearl, tortoise-shell, precious stones, or metals, producing ornamental com-binations upon furniture, &c., as known by the name of buhl marquetrie, mosaics par-quetrie, Florentine, or Tunbridge manufac-ture. He assumed that marquetrie applied to the production of an imitative object by inlaying with wood in natural or dyed colors, the ordinary mode of doing this is to and attach in a slight manner to each other veneers of various colours (from four to seven), as may be required by the design, an outline upon paper is pasted on them, and the whole cut through with fine saws—the vencers are afterwards separated, and the parts inter-changed, so as to produce varied arrangements of greater or less perfection—no two being alike—they are then glued down on a larger piece of wood, worked to an even surface, the with hot sand in parts that require shadow, and finally polished.

This method, by using wood of different growths, causes in time, through their unequal contraction, &c., an imperfect surface and defective joinings, as is evident in nearly all old marquetric. Mr. Bailes then explained his own method of using a white vencer, which, own method of using a white veneer, which, after cutting through the outline of the device, he separates, and dying each part to the re-quired colours, restores them to the places they originally held in the veneer, and finishes the whole in the usual manner. He has also discovered (accidentally), a mode of discharging the colours in any part, so as to heighten the effects of light and shade; and he expects to acquire a skill in this, which will enable him to produce pictorial effects never before equalled in wood.

His process, besides possessing advantages on an even surface, and having more colours, is less costly than the usual method; and he believed, that as it afforded a fair field for cultivation by patrons and lovers of art, marquetrie would soon become more generally esteemed.

CHURCH LOOKS .- We have recently examined with much pleasure a door-lock, of Gothic patern, manufactured by Messrs. Chubb, for the "Industrial Schools" at Liverpool. The steel bandings and escutcheon are made to take an ornamental character; and the key is in accordance with the style. For a churchdoor we have seen nothing better ; the workmanship is excellent.

THE BROAD AND NARROW GAUGE.

THE commissioners are still taking evi-dence. Mr. Brunel, in his examination said, be first formed the idea of changing the gauge during the progress of his surveys in the years 1833 and 1834, not considering the gauge of 4 ft. 81 in sufficient. He looked to the speed which would take place. He thought the machinery too small, and required to be made more commensurate with the mass and velocity of railway transit. The trains at that time used were comparatively lighter than they are at present. The impression in favour of the broad gauge grew gradually upon him; he proceeded to carry it into immediate effect after the passing of the Act in 1835. He must have mentioned it before that time to the directors, as he had made great efforts to have the clause which fixed the gauge omitted from the Act. He should rather be above than under 7 feet, upon the principle that the ma-chinery upon the 4 feet 84 in. gauge was too small. Considering the work which was required to be done, he thought it would be better done with a still larger machinery, not only with regard to the engines, but the machinery of the system generally. There would of course result economy with regard to stokers and drivers. There must be economy, when with one engine they did the work of two. He, however, looked rather to the result of the system, than to any specific economy. They were required to take from 70 to 80 tons weight on passenger trains, and 900 tons on those for goods. Taking then these masses, and the speed at from 50 to 60 miles an hour for passengers, and 20 miles an hour for goods, he considered it better for such traffic as that to have larger carriages and more powerful engines than those they formerly paed. He engines than those they formerly pass. The thought that all the important lines in Eng-land, as the railway system extended, would be worked at a much greater speed than at present. Railways would eventually take the place of the turapike roads throughout the country. There would be of course great traffic upon them, and consequently the appli-cation of larger machinery would be desirable. He did not consider the difference of expense great. There was but little difference between the expense of the longitudinal and transverse sleepers. With longitudinal sleepers there was more timber required, but the rails were was more timber required, but the traits were a lighter. He thought the cross sloepers were a little cheaper. He considered the system ap-plicable in Ireland. The principal lines in that country would have nearly as large a traffic as those in England. The Irish are becometing nearly locomotive people.

RAILWAY JOTTINGS.

LAST week at a Court of Common Council, Mr. Anderton presented a petition from James Moon, architect, proposing the formation of a railway terminus in the city on the site of Farringdon-street, &c., and suggesting that a new street should be constructed from Holborn opposite Hatton Garden to 6t. Bride's church, and that a viaduct should be made from Hatton Garden to Sea Coal-lane. After some trifling opposition, the petition was referred to the improvement committee. On the same day, and at the same court, Mr. D. W. Wire presented a petition signed by between 600 and 700 merchants, traders, wholesale, and retail dealers, and others connected with the trade and commerce of the city, praying that requisite facilities might be given for establishing a terminus for passenger traffic in Far-ringdon-street. This petition was also re-ferred to the Improvement Committee. Preparations are now making for com-mencing the stupendous work of the High Level Bridge across the Type. As a pre-liminary step the engineers have lately been boring in the bed of the river for the foundations boring in the bed of the river for the foundations of the piers. In view of these and other ex-tensive operations Mr. Hudson, M.P., and Mr. Robert Stephenson, have paid fre-quent visits to Newcastle.—Last week, one of the large brick arches, in the con-tinuation of the Glasgow and Garakirk railway, now forming in Cowcaddens Quarry, gave way and came down with a tremendous crash. The arch had been finished, but suffi-cient weight had not heen laid on what are crash. The arch had been norman, what are cient weight had not been laid an what are technically called the "haunshes," and the effect was that it sprung. Fortunately no person was hurt,-----Last week the directors of the Mid-

Digitized by GOO ð THE BUILDER.

land rallway assembled at the Derby station for the purpose of receiving tenders for the construction of railways from Peterborough to Stamford, and from Syston to Melton, and for a junction from Sheffield to Manchester. The contract of Messrs. Mawson and Co., of Spitial, near Doncaster, to complete the latter in eight months for 12,7621. was accepted; and the tenders by Mr. William Worswick, rail-way contractors, of Sileby, Leicestershire, to form the line from Peterborough to Stamford, a distance of twelve miles, for 47,000*l*.; and a branch from Syston to Melton, a distance of nine miles and a half, for 48,000*l*., were both accepted, and the two lines are to be The Thames Embankment and Railway Junccontemplated the purchase and offered 0004. The width of the bridge is only 42 tion 150.0004 -Last week an accident occurred on feet.— Lest week an accident occurred on the Midland Railway, near Barnsley, which caused the death of William Boteler, Esq., one of the commissioners of the Leeds Bank ruptcy Court. Its origin is thus described in a local paper:—As the Leeds and London mail train, which is due at about five o'clock in the morning, was running between the Mas-boroagh and Cudworth stations, some part of the engine became out of order, awing to which the train was unable to travel beyond the rate of eight or nine miles an hour. In consequence of this, messengers were sent back to the Masborough station in order to procure another In the engine to carry the train on to Leeds. meantime the train proceeded at a slow pace, with the usual lights fixed behind, and when passing between the Wath and Darfield stations, the assistant engine came up behind at arapid pace, and ran with immense force into the train. The concussion was of course a tramondous one. The last carriage, which was second class, was forced up from the rails, and the buffers were driven through into the first prevailing speculative mania warping the pro-bity of sound and honest men, the following ving anacdota is given in the Railway Chronicle :-A friand, not stall of a speculative turn, has become a director of a good and substantial project, the execution of which would certainly be a great metropoliten if not a national bene-fit... Meeting him, the following colloquy took place betwees us :--- 'You haven't applied for azy shares ?'' 'f No; I have studiously avoided every new project.'' "But mine will be a great every new project." "But mine will be a great improvement to London; you know it is one of my hobbies, and that is the reason why I have joined the direction." "Well, viewing the matter in that light," I said, "I have no objection to having five shares." "Five shares?" inquired the director, with an air of surprise, not to say contempt. "Yes, five surprise, not to say converge. shares; that is as much as I care to have, for of convers I should keep them." "My good marce; tagt is as much as I care to have, for of course I should keep them." "My good fellow, it's of no use your asking for five shares; nothing less than fifty will be heeded." "What am I to do with fifty?" "Dol sell them as a premium, which they are sure to bear." Of coarse I declined. Now, Sir, here was a man who I believe had become a director chiefly from patrietic motives, so bitten by the plague that, though I made him a real offer to help his scheme to a small extent, he re-jected my offer, or at least thought contemp-tuously of it, unless I converted it into a piece of unreality and of speculation.

FOREIGN ARCHITECTURAL AND COL-LATERAL INTELLIGENCE.

Nevoly-discovered Mural Painting by "Raphael."—(Florence, 21st Oct.)—A surprising discovery has been made here of late—viz. a picture al fresco, representing the Last Supper, on the wall of the refectory of a monastery in the Via Faenza, Florence. The place had been used as a coach-house, and it was known that some old painting existed there, but a large envering of indurated dust prevented any further insight into the matter. Generally, it was considered a work of Perugino, until M. Zotti tried is cleause it, when the very first attempts shewed a far superior style to that of the above unstery and shortly after, the initials of Ra-

and the

1. . 1

phael's name, and the date 1505, left no doubt as to its authorship. The picture, full of the youthful buoyancy of Raphael, and in the style of his first Florentine period, is very important for the history of art—the more so, as it will be easy to restore it completely. It belongs to the owner of the coach-house, who has had it already protected by a wall, but it is to be hoped, that such a splendid performance will pass into the hands of Government for the general use of the public.

nopeo, that such a sprenduperformance win pass into the hands of Government for the general use of the public. Statuary embellishments of Brussels and other Citics of Belgium.—Statuary, like other arts, received some impulse at the late declaration of Belgian independence — as W. Geefs obtained a great name by the monuments he erected, commemorating the late political struggle; for instance, the imposing structure on the Martyr-place of Brussels; the statue of General Billiard in the Park, &c. This impulse was still more fostered, by Government deciding on erecting monuments to all their great; the expenses of which were placed on the rolls of the budget. Thus Antwerp obtained its monument of Rubens, Luttich Gretry; while it is certain, that the statues of Godfrey of Bouillon, Charles V., and Froissart, will soon adorn the public squares of Brussels, Ghent, and Chimay. The return, moreover, of religious liberty, has allowed the spirit of mediaeval architecture to move unshackled in any direction. Thus the choir of the Holy Virgin church of Antwerp has been of late ornamented with carved stalls; which have not their equals in Europe, executed by Geerts, professor of sculpture in Löwen. He and Bouré have also been amongst the best late exhibitors of sculpture at Brussels. This art will now have the more scope in Belgium, as the Government and the Common Council (1) of that city have come to the resolution of having executed the 150 or 200 statues, which are required for the ornamenting of their Town-hall. M. Bouré has received orders for executing eight, st 800 francs each⁶ — the price of the marble not included. It is said, that by the middle of next year, the new restored façade of the Brussels Guildhall will be ornamented with about twenty statues of their sovereigns and chief megistrates.—(Allgemeine Zeitung.)

and chief magistrates.—(Allgemeine Zeitung.) Railway through, and "over" the Alps.—In these "times" of railway disappointment, we may as well say in the way of preface, that there is nothing adventurous or unsound in the financiel of the above gigantic plan-as the first nobility (landed proprietors) of Genoa, Turin, Milan, and Chur are amongst the originators and shareholders of this undertaking; Marquis Giustiniani (chairman) of Genoa, Barboroux and Co., of Turin, &c. 164,000 frances (the 120th part of the whole sum) have been, in fact, already put aside for the preparatory plans and other business. The line of this stupendous undertaking is the following. From Rorschach to Chur; it is to go over Rheineck and Ragaz. Up to this place, and even further up to Reichenau, neither the slope, nor other circumstances of the land, present any considerable difficulties. More difficult will be the further tract, either land. brough the Vorder-Innthal, or the Bundten Oberland. Here, in a direction of E.N.E. to W.S.W. the slope is 3,400 feet in a distance of about sixteen leagues. On the north side, there are few valleys between the Vorder Innthal and the main tier of the mountains. Then follows the Medelser valley in a southwest bent, and reaches up to the Lukmanier pass. Most intelligent surveyors assume, that it will be over this mountain that the passing of the Alps (!) will be most easy, as it is the lowest of all in this part of the country, viz. 5,600 feet absolute height. The Mons Lucumanius was known in very ancient times, and constantly used as a transit point into Italy. (Another project independent of the present, of a railway from Lyon to Turin, is to pass Mount Cenis.) The exact place where the rails are to be laid here for meeting those of the Valley of Blegno, on the other side of the tier, is not yot decided upon. Other tracts also, for instance, over Bellenz to Locarno do not present insurmountable difficulties. It is calculated that ten years will suffice for connect-ing the lake of Constance with Turin and Genoa. It may be the case, that the first rails

• A very moderate price, indeed - even if the chcapness and greater simplicity of Continental living is considered.

wilt be hid next opring, pushing the work in two directions, towards Chur and Olivone, and Locarno.

Locarno. The Working Classes in Holland. — The educational system of that country is placed on a universal basis, as it affords to all children, of whatever condition or creed, the opportunity of learning to read, write, and arithmetics. It is now intended, that one step more should be made in this direction, and besides these schools of literal education, schools of industry are urgently called for, where all poor children are to be instructed in some or other branch of technical skill. The latter, very truly, is considered even, under actual circumstances, the more important, as this is the only way of vigorously combating pauperism; and until this second more important desideration is accomplished, the state has done only half its duty.

Great Helvetic Railroad Companyat Berne. This company projects an important addition to the railway net of the continent, by connecting the Lake of Constance with that of Geneva. It will start from Constance, and after passing through the cantons of Thurgovia, Zuric, Zug, Luzern, and Berne, have its other terminus at Freiburg and Vevais. The society claims all metallic or other useful mineral substances laid open by their operations, and the free importation of eightes and materials from foreign parts of fride be necessary.

MUSEUM OF NATIONAL ANTIQUITIES.

OUR anxiety on this subject is known to our readers, and many of them will participate with us in the wish that a report to the effect that Lord Prudhee has offered his collection of national antiquities to the Britch Misseum, on condition that the trustens will satapart a proper place for, the reception of rediscions bearing on the same subject, may be true. The committee of the Archicological Institute are said to be the parties to the propender.

the second s

USING NAMES WITHOUT PERMISSION. --Mr. Barry Baldwin, M.P., abtained summonses at Bow street, last week, against the projector and solicitor of a railroad for using his name in the list of provisional committee without first obtaining his consent. They were granted under the 7th & 8th of Viotoria, chap 110, the 65th clause of which enacts, "That, as great injury has been inflicted upon the public by companies falsely pretending to be patronised, or directed, or managed by emined to opulent persons, now, for the gurpose of preventing such false pretences, be it enacted, with regard to every company, or pretended company whatsoever, whether registered or not, and whether now existing ornot, that if any person shall make any such false pretences, knowing the same to be false, in any advertisement or other paper, whether printed or written, and whether published in any newspaper or handbill, or placard, or circular, then every such person shall forfeit for every such offence a sum not exceeding ten pounds." NEW WKST-KND POST OFFICE.-Several houses on the south-side of Pircadilly, near St.

NEW WEST-END POST OFFICE.—Several houses on the soath-side of Piccadilly, near St. James's church, have been sold for the purpose of being immediately razed to the ground, on the site of which is to be erected a capacious new Branch General Post-office.

ligious emblems and inscriptions mean it, and from the well known character of its first owner, it might have been a chapel, used for the practice of, at that time a prostribed re-ligion, and a place of shelter for its persecuted ministers.

The lodge is situated at one extremity of the park, in which stands the fine old building Rushton Hull. At the period of the crossion

of both buildings, the estate belonged to She by queen Einzabeth to the Earl of "Determent," (* 2 at Kehilworth, received the honour of knight, 23 mail frood.' of the first Sir Thomas Tresbam, who was beheaded at the commencement of the reign beheaded at the commencement of the reign of Edward IV., the property was subsequently restored to the family, which during the illus-trious reign of Elizabeth, reams to have the tained the height of its greatness, possessing large estates and several residences, and having formed connection with the principal families of the county, whose armorial bearings may still he seen upon the market house at Roch well, an unfinished monument, among others, of the taste which Sir Thomas Tresham dis-played in architecture. The succeeding reign worked a melancholy change in the fortunes of the family; their extensive possessions were again confiscated, and the head of it being at-rder plot, the downfal of several other fapow powder plot, the downfai of several other ta-milies, and in which Francis Tresham, Esq., the son of Sir Thomas, was deeply implicated. This person was, netwithstanding, the cause of its discovery, and from his hand proceeded the well known letter addressed as an anosy-mous warning, to the Lord Monteagle, who had married Elizabeth Tresham, his sister.

Northamptonshirs appears to have been a retreat for the disaffected Jesuits and the Papal reign of Elizabeth, Baker, the historian of this country during the reign of Elizabeth, Baker, the historian of this county, informs to that Sir William Categ-by was on the 15th November, 1581 (23-Eliza) cited before the Court of Star Chamber, with by was on the 15th November, 1561 (25-4118.) cited before the Court of Star Chamber, with Lord Vany, of Harrowden, and Sir Themas Treaham, of Rushton, for harbouring the Jesuits in their houses, and being product at celebration of mass; of which offended, ren-dered punishable by statutes recently inacted, they were convicted principally do the cha-fousion of Campion, one of the other other, who was shortly after executed for freasonable practices. Amongat the Harleian MSS in the British Museum, is a detailed account of his trial, supposed to be drawn up by Sir Thomas Tresham, in which he states the reasons why a Christian abault refuse a saver upon oath in matters of a states the reasons why a Christian abault refuse a saver upon oath in matters of a states in the reasons why a Christian abault refuse a saver upon oath in the 300 states and and a states the reasons why Billis Mr. Budde and the states of the former y Billis Mr. Budde and the states of the states the the haps more accutately a non-conforming Ro-man Catholic, until the string of Campion

haps more securately a son-conforming Ro-

haps more accurately a non-conforming Ro-man Catholic, until the atrival of Compion and Parsons; by whom he was fixed in the church of Rome. South of the triangular lodge, it is evident that the religious charac-ter of the building was not considered at its first commercement. The grosses in the lower windows did not form part of the original design, as they are cut or formed so roughly, that the mouldings round the small circular openings are injured by cutting through., In the wood-cut, this is not shewn as I was de-sirous of exhibiting, rather the architectural character of the window, than its history. The cross was certainly inserted after the window was finished." There can be little doubt that this lodge served as a shelter to Campion. that this lodge served as a sheller to Campion. That like places of consealment were very common we learn from Butler, in "Memoirs of English Cathedrals," iil. 193, who tells us that a tangled dell, in the neighbourhood of Stonor park, in Oxfordshire, is traditionally said to be the place in which Campion hay concealed whilst he wrote his "Ten Remons." The means of Mr. Brune is conference.

The paper of Mr. Bruce is so interesting, and elucidates so completely the probable history of the building now illustrated, that a xtracts from it may be excused.

few extracts from it may be excused. "The papal bull by which Elizabeth was excommunicated and deposed, and her subjects were absolved from their allegisnce, was issued on the 25th February, 1570. Following immediately upon the great Roman Catho-lic rebellion of 1569, this bold exercise of papal authority could only be regarded by the Protestant Government as a most dangerous incitement to such of the queen's subjects as were disaffected towards the reformed faith, to renew;thgir revolt with, better hopes of m cess, and with a more certain assurance that, in having recourse to arms, they were playing the part of good subjects to the pope, if not to the queen. The Government met this daring the queen. The Government met this during attack upon the safety of the sovereign and the peace of the state by various penal ensot-ments, which produced their desired effecty for, although the public quiet was for a time disturbed by the effrontery of Felton, and the conspiracy of Ridolfi, the Papal agent, in which the Duke of Norfolk was implicated, these troubles arow newsel, over and a fiber he these troubles soon passed over, and, after is few years, the bull began to be 'slighted,' says one of the translators of Camden, 'as a vais crack of words that made a noise only." one of the translators of Camden,

"To stay the progress of this growing defec-tion was the great object of the priests sent into England by the foreign seminaries. They strenuously opposed occasional conformity of the 'protesters' (so called because they thought that they might go to church provided they secretly, and in their own minds, protested against the doctrines they heard there), and themselves supplied the places of the old 'Queen Mary's priests.' Their labours pro-duced a very great effect; and in 1579 they received the assistance of a new hand of coadjutors, the English college at Rome being, in that year, taken from the secular clergy and In that year, taken from the secular clergy and delivered over to the Jeanits, then a recently instituted order, full of activity, and endued with a fiery zeal which, even in the annals of missionary enterprise, has perhaps never been surpassed." "Of the general course of the proceedings of the missionary and have information

the missionaries we have information from members of their own body. They were dressed in strange antic dresses," sometimes as soldiers, sometimes as gallant gentlemen, sometimes as roaring-boys or roysters, some times as clergymen of the national church,+ sometimes as apparitors, or summoning officers of the Ecclesiastical Courts, and these various contumes they changed continually, as they also did the names by which they passed. In the morning they generally preached, and afterwards wrote, beard confessions, and determined controversies or cases of conscience. After dinner they removed to some fresh place, studying, whilst on horseback, the sermon of the following day, and escorted by some trustworthy persons who served as guides and guards. It is worthy of observation, and

The old manor-house of Bushton, fully il-lustrates this account by Mr. Bruce. We are told by the historian, that the most ourious and undoubtedly the most ancient part of the building, is a small oratory, leading from the great staircase, containing a representation in basso-relievo of the crucificion, composed of numerous figures, and a Latin inscription in gilt characters; the date 1577, appears above it, and underneath are the arms and motto of

it, and underneath are the arms and motto of the Tresham family viz: --sable, six trefoils slipped or, between two flanches argent. The above date (if correct), is against the opinion expressed by Mr. Bruce, of Sir Thomas Tresham being fixed as a Jesuit by Campion, who only arrived in England about the middle of the year 1580. But he adds in a note, that Sir Thomas speaks of himself as being liable to be suspected as a well-known Roman Ca-tholic. tholic.

As Northamptonshire was a retreat for the Jesuits, it cannot be matter of surprise that it formed the nursing place where the gunpowder plot was first conceived.

Historians point out the triangular lodge at Rushton, and a summer-house at Newton, be-longing to another branch of the Treshams, as longing to another branch of the Treshams, as the places where the conspirators used to meet, to arrange their plans. Baker states, that Ro-bert Catesby, Esq., the son and successor of Sir William, of Ledgers Ashby, is "damned to averlasting fame," as the projector of the dia-bolical gunpowder plot in 1605. He was a man of considerable talents, insinuating man-ners, and inflexible resolution; daring and fertile in expedients, but subtle and circum-spect in the development of his nurnees: and spect in the development of his purposes; and ready to sacrifice his life, his fortune, and every ready to sacrifice his life, his fortune, and every feeling of humanity, in defence of the Roman Catholic cause. Towards the close of the reign of Elizabeth, he and Francis Tresham, Esq., son of Sir Thomas, engaged with Garnet and Tesmond, two Jesuits, in secret intrigues for the overthrow of the Protestant establish-ment. It was Catesby who conceived the diabolical idea of accomplishing the restoration of popery by ingulfing the king and both houses of Parliament in one common tomb----it is needless to state the history of the plot. it is needless to state the history of the plot, which is so well known, except that Francis Tresham contributed 2,0001, towards carrying

the plan into execution. The plan of the lodge is triangular; it ap-pears to have been designed by Sir Thomas with some reference to the commencement of his own name. It will be seen that the upper windows are mostly triangular openings, and that all the finials are three-sided.

The building contains one room of hexa-gonal form, with a table corresponding to it in the centre. As the door to this room has several steps in front, there must be a valled apartment beneath. I regret that at the period of my visit no access whatever could be obtained either to the lodge or the manor-house,the estate being in charge of an agent noto-rious all over the county for his boorish, rude disposition. The exterior of the lodge con-tains on its three sides the following inscriptions-over the door :-

TRES-TESTI, MONIV. M. DANT. 5555.

In the centre of the gables " Visita mentes, In the centre of the gables "Visita mentes, non mihi: 3898, respicite, 3509." In the frieze round the building, each side having thirty-three panels, with a letter in each — "Aperiatur terra, et germinet Salvatorem: Quis separabit nos a charitate Christi:—Consi-deravi opera tua, Domine, et expavi:" In the different fronts of the building are the follow-ing dates, 1580, 1593, 1595, 1626, 1640, be-sides various religious emblematical designs, and thirty-six shields of arms. The date of and thirty-six shields of arms. The date of the completion of the building is probably shewn by the iron ties in the three fonts, which are, T. 15. 93. The turret at the top has the date 1595, the year that part was änished.

The manor-house on the estate is a much better specimen of the talents of Sir Thomas

as an architect than the triangular lodge. The interior of this building is said to be very curious; the hall has one of those fine open roofs which are such masterpieces of ancient carpentry. Besides the market house of Rothwell, previously noticed, as a work of Sir Thomas Tresham, and which is now in ruins, in Farming woods, near Northampton, in the heart of the forest, are the unfinished remains of Liefden house, probably his last work. This is a very regular architectural composition, well worth inspection; it is now only occasionally seen by the sportsman while in C. J. R. pursuit of game.

, The cut at the head of page 539 represents one of the lower windows at large. 'W e shall give two windows from other sides of this very singular building, next week, so as to illustrate more fully an architectural caprice which is almost unique.

WILLIAM THE CONQUEROR'S DAUGH-TER GUNDREDA.

MANY of our readers have heard by this time, of the discovery by railway workmen, of two cists amidst the ruins of the old Priory at two cists amidst the ruins of the old Priory at Lewes, in Suffolk, containing the remains of Gundreda, fifth daughter of the Conqueror, and of her husband, William de Warren, the first Earl of Warren and Surrey, and founder of the monastery. Ancient records prove that Gundreda died in 1085, and William de Warren in 1088, and that both were interred in the Chapter-house of Lewes Priory, the latter being, as is stated, "buried in the Chap-ter-house, in a tomb adjoining that in which ter-house, in a tomb adjoining that in which his Countess Gundreda was laid."

The priory was destroyed with the other monasteries by Henry VIII., and so complete was the destruction, that, as Horsfield observes in his history of Lewes, "the very site of the chapter-house could not be ascertained." This point howarar the present discovery will clear point, however, the present discovery will clear

up. In Southover church, hard by the site of the discovery, the monument that originally covered Gundreda's remains is preserved. According to the author already named, it was discovered about the year 1775 by Dr. Clarke, of Buxted, in the Shirley Chancel of Isfield Church. "It formed part of a burial monument of Edward formed part of a burial monument of Edward Shirley, Esq., by whose father probably it was preserved at the demolition of the priory, and conveyed by his directions to Isfield. Dr. Clarke obtained permission of the represen-tatives of the Shirley family to remove the stone from the changed where it had hen so how prefrom the chancel where it had been so long preserved. It was the intention to replace the stone over the spot where the body of Gundreda had originally been deposited ; but as the very site of the chapter-house could not with certainty be ascertained, the stone was placed in Southover Church, that being the nearest ascertainable site of its original station."

site of its original station." It is a coffin-shaped slab of black marble sculptured with foliage in bold relief: a very interesting remnant of Anglo-Norman art. The cists, which are of lead, and about 3 feet in length, 1 foot wide, and 10 inches deep, have been removed to Southover Church: their contents will probably be transferred to the monument already men-tioned. The discovery is one of great interest. Nearly eight hundred years have passed away since these bodies were interred, a period which may be said to embrace nearly the whole history of our country. the whole history of our country.

WESTMINSTER COURT OF SEWERS.

A SPECIAL court was held on Friday, the 31st ult., "To consider the steps necessary to be taken in consequence of the resolution, sanctioned by the court on the 3rd of October, with regard to contracts, and as to execution of jobbing works. In the absence of Mr. Edward Willoughby, Captain Bague, R.N., was appointed chairman; and a form, on the basis of the form in use in the Holborn and Finsbury divisions, was ordered to be prepared. The chairman then called on Mr. Leslie, who pro-ceeded to state that he had always objected to the vague and uncertain information put forth to parties about to contract, as to cleansing of gully-drains, and the all but entire want of check on the cleansing of sewers, as also of the nuisance to the inhabitants of having the

soll lifted up from the sewers, deposited on the carriage ways, and carted away without, my real check at so much perioad. The cleansing of open and covered sewers and gully-drains cost annually, notwithstanding the imperiect and objectionable manner in which it was done, about 2,000%. He was of opinion, that this sum could be more advantageously applied, and that for all the works not comprehended in the resolution he had previously carried, to be done by public contract for each separate work, that the remainder, including the cleanwork, that the remainder, including the clean-sing of the sewers and gullies, should be done by a small establishment of workmen and labourers; and that the cleansing in every practicable case should be done within the sewers, thereby avoiding one of the greatest possible nuisances in the metropolis. Mr. Dowley and Mr. Doull, being called on, both stated to the court that they thought the plan

well worth trying. Mr. Leslis then proceeded to propose, seriatim, the several motions to carry out the object; the whole having been seconded by Mr. G. N. Cumberlege, were carried *neme. con.* the few objections being as to detail.

"That the cleansing of sewers and gully-drains, and all works not publicly contracted for, be done by the establishment now proposed to be commenced.

Proposed plan for works under 501., includ-

In cases of emergency, an extra number of workmen must be employed, but must be spe-cially reported to the next court.

That the daily accounts be kept in the most since the daily accounts be kept in the most simple and intelligible way, so that each dis-trict may be charged with the correct accounts. That the workmen and labourers be paid on Friday in each week the certificate of the clerks of the works and surveyors be, affixed thereto."

thereto.'

The surveyors were ordered to prepare a short report of the quantity of materials, water-boots for the labourers, &c., that would be re-quired when cleansing the sewers; and the best site for a shed in the vard, wherein the brick-layers could be employed; in spare time or wet days, in preparing blocks of brickwork in ce-ment, for future use.

ASSERTED FAILURE OF SEWER IN GRAY'S INN-LANE.

To the Commissioners of Severs in the West-minster Court.

GENTLEMEN,-My attention has been called to a report at your meeting on the 24th illimo, relative to a slip of earth at the end of the Queen's Road, Gray's-inn-lane.

I beg to state that no part of the sewer was built. The workmen were levelling the ex-cavation ready for the blocks to be put down: that operation being finished, one of the men incautiously struck one of the struts about three feet from the bottom of the excavation, three feet from the bottom of the excavation, so as to enable the bricklayer to carry up the side walls, and turn the arch for a ten feet length. All being gotready for the brickwork, a heavy fall of rain came, and also at that time the engine was at work at the new river head, and one of the mains runs through the excavation. This caused the fall of earth be-fore alleded to, and not the giving way of the sewer. Finding more difficulties approaching, timber was instantly procured, and placed across the street from curb to curb on the paving: all hands were put to work at this spot, and all hands were put to work at this spot, and the fallen earth was removed with all dispatch, the men worked both night and day, and again got ready for the bricklayers. They then again got ready for the bricklayers. They then got up the side walls, and turned over one-half the centre, which was ten feet long, leaving five feet not turned; another slip took place, and broke off quite short, the five feet of centering, and left the remaining portion under the sewer. No part of the brickwork was at all damaged, but all was perfectly sound when the centre was taken out.—I am, Gentlemen, your oledient servant. Gentlemen, your obedient servant, GKORGE SNITH.

Newton Road, Bayswater, Nor. 1, 1845.

ALL SAINTS' CHURCH, WESTMINSTER ROAD.

A CHURCH is how nearly completed, situated in York-street, Westminster-road, which claims attention on the score of novelty. The tower, a slender structure, stands at some little distance eastward from the body of the church, and is in a line with the houses in the New Cut. It will be connected with the church by means of a corridor or cloister, not yet built. Both the tower and the body of the church are of brick, but the upper story of the former has stone dressings, small shafts and arches on the face of it, coping, pinnacles, &c., and is surmounted by a stone spire, in the whole 135 feet high, from the ground. The main doorway too, is of stone. The church itself is spacious, being as we were informed on the spot 125 feet long and 56 feet wide, inside. It consists of a nave and aisles, separated by a range of lofty cast-iron columns of small diameter on each side, which carry semicircular arches adorned with the "open-heart" cement. There are galleries all round the church supported on cast-iron girders, rather eleverly arranged at the east end, there is a semi-circular absis with a lofty semi-circular arcade against the wall, corresponding with the main arches.

There are no windows in the absis, but there is a small opening filled with stained glass in the apex of the half dome that covers it. The church is lighted by semi-circular headed windows in the sides, and a rose window (the tracery of which is formed outside wholly of bricks) at the west end. The roof is open, it consists of a common queen post truss, with small open brackets against the walls at each foot, and being of small scantling has rather a mean appearance. It is of deal, stained. The pews, pulpit, &c., are also of deal, varnished. The style of the structure can hardly be cha-

The style of the structure can hardly be characterised, but may be called Byzantine for want of a better term. It reminds the observer of some of the Rhine churches; like them it has small arcades on the outside running up the line of the gable. Although there is much that may be cavilled at by a rigid ecclesiologist, we cannot refuse praise to the architect, Mr. Rogers, for some skill and boldness. Mr. Wilson of the Borough is the builder.

DESIGNS FOR LAYING OUT THE PUBLIC PARKS AT MANCHESTER.

2

+1

"The three sites to be laid out, are—No. 1. The Bradford property, containing about 31 acres; No. 2. The Hendham Hall property, containing about 30 acres; No. 3. The Lark Hill and Walness Vale property, containing about 31 acres. Nos. 2 and 3 are partially laid out and planted. The sum which the committee contemplate laying out in planting, fencing, draining, &c. &c. (including the provision of sents), for the three sites, is in all about 4,000*l*. This sum does not include the costs of lodges, for which, and for other erections, a sufficient sum will be provided. The committee, having but limited funds at their disposal, will be obliged to consider *facility* and *cheapness* of execution in their adjudication. Each plot must have play-grounds, with due appropriation for archery grounds, quoit, skittle, and ball alleys; a refreshment room, officient lodges; and the places for these must appear on the plans. The houses on Nos. 2 and 3 will be used as refreshment rooms, and the outbuildings may possibly be rendered available for some of the games contemplated. The utmost regard must be paid to giving ample room for the promenading of large numbers of persons; and the designers must keep before them the practical usefulness of the scheme, remembering that they are sketching *a park* for the *public*, to be constantly accessible, and not a private pleasure-ground. A carriage drive round the parks would be desirable, but no carriage drive to intersect them. Footpaths or promenades will, of course, be

suggested to the taste of the designers. • • Competitors desiring to append designs for lodges, &c. are at liberty to do so, should they think fit."

E BUILDER.

About thirty plans for each park were submitted, and these have been publicly exhibited at the Town Hall, the charge being one shilling each person for the two first days, sixpence the two next, and threepeace for the two last.

The following observations are extracted from the Manchester Guardian :-

⁴ Having had an opportunity of seeing the various plans about to be exhibited, we may offer a few general observations upon them, without the slighest desire to recommend or condemn any particular plan. As we have said, there are ninety different plans, thirty for each park, and these are numbered in the order of application, and, (for the reason stated) not consecutively. As to the estimates furnished with each, of the probable cost of carrying out these designs, they take a very wide range indeed, some being as low as 2,000/., and one as high as 9,800/.; the limit stated by the committee being 4,000/.

There must be considerable difficulty experienced, especially by non-professional persons, in coming to a decision in preference of any one plan or set of plans over the others, from following amongst other reasons :the -The plans are drawn to a great variety of scales; some are delineated in pencil or faint tracing, others in Indian ink, others again in Sepia tint, and some are coloured, and hence made exceedingly attractive to the general eye. While most of the plans are strictly ground plans, others represent trees, hedges, &c., in elevation ; and in one or two instances we have very pretty birds'-eye views of the parks, shewing all their "alleys green," their groves, and arbours, in full and luxuriant verdure. Some of the plans seem to us very jejune performances, and in several instances, one great consideration seems to have been overlooked. About 30 acres being the average area of these parks, it becomes important to make the most of this extent of ground; to plan the walks so that as much space as possible should be gained within those limits. Hence straight lines, intersecting each other at right angles, should be avoided; and winding curves, or what are called " serpentines," seem naturally to suggest themselves. Yet, some of the plans look like the laying-out of the streets of a city, rather than the walks and places of exercise and sport in a park.

In one or two of the plans, artificial lakes are the chief features; in others, the fountains are made prominent objects; while in some, the planting is so close as to resemble a maze. Only one or two furnish elevations for lodges, refreshment rooms, shaded seats, &c. Or point seems to us worthy of consideration, Òne the retaining in one or more of the parks in one place, a large extent of green sward, on which to congregate on particular occasions of festivity, a considerable number of persons for a short time, as, for instance, to hear a short address from the civic authorities, or an open air concert, or to witness some display or exhibition suited to the scene. Some of the plans have left some such space, especially in the Walness portion of Lark Hill park ; others of the plans have filled up every portion of the area with walks and hedges, leaving only small patches of grass between the windings of the walks. Some of the plans resemble the figures seen in a kaleidoscope, all the curves being made to converge to a common centre; others again, retaining the centre, have radiating straight walls, somewhat like the spokes of a cart wheel. Some of the candidates have sketched their designs on the small lithographic plans issued by the committee, and it is much to be regretted that all the competing plans have not been drawn to one scale. When plans have not been drawn to one scale. these variations have been duly allowed for, it appears not to be very difficult to reduce the number of plans to some eight or ten, and then it will require a little more care, circumspection, knowledge, and judgment, to make the final election. We presume that it is quite open to the committee to adopt a plan of each of three different competitors for one park, or even to combine in one plan such portions of several as may be deemed most suitable or desirable in carrying out the object in view, as expressed in the instructions issued by the committee."

Rette Books. And the la

A Treatise on Painted Glass; shewing its applicubility to every Style of Architecture. By JAMES BALLANTINE. Chapman and Hall. London, 1845.

Thus very nice little book may be read by all with advantage, although it cannot be said to carry out the subject to the full extent of which it is capable. The chief point urged by the writer is, that while decorative art must be guided in her leading features by geometric proportions; she must also imitate in her details, the productions of Nature; ----that Nature and art must go hand in hend in every artistic effort, or failure will be certain.

The writer objects to the imitation of bad ancient examples, simply because they are ancient: "As if in penance for former transgressions, the national taste has prostrated itself before the spirit of antiquity, and is now offering it a homage at once abject and indiscriminating. This folly has been most injurious to several of the decorative arts, and to glass-painting in particular, in which the good, bad, and indif-ferent have been all copied, and repeated with equal fidelity and zeal. Several glass-painters have acquired an extensive and profitable re-putation, simply by pandering to this vitlated taste, and by anticipating the effects of time in their imitations of antique glass. The conse-quence is, that, even in new churches, we find painted glass windows deformed with mower-ous black spots, in order to produce the "e-quired antique appearance; a deception some-what skin to that practised by needy artists, and swindling picture-dealers, when they ma-nufacture and sell smoke-dried imitations of Teniers and Rembrandt as genuine originals. Defective drawing, meagre design, and anskilful composition, have been laboriously copied, while, in order to stamp the work with the features of genuine antiquity, and to imitate the awkward workmanship of the old speci-mens, the pieces of glass have been purposely fractured, then clumsily soldered together.

Glass manufacturers, too, taking advantage of the prevalence of this ridiculous taste, have of late years realized large profits by imitating the sandy texture and wavy uneven surface of the old windows. In several recent instances, laboriously executed designs, replete with 'appropriate meaning, and carefully adapted in form and character to the architectural style of the edifice for which they were intended; have been set aside for service transcripts from old windows of these stereotyped figures, the repetition of which saves the trouble of 'invention. In the department of painted glass; art 'has been decidedly retrograding ; and should the public suddenly awaken to a sense of 'its folly, in admiring and encouraging the deformities thus perpetuated, there is a danger that the art may be left without sopport, when it may both require and deserve it."

He afterwards refers to some recent altempta to make the imitation of nataral objects appear a minor part of ornimental composition, and endeavour to refute the association, that little more is required in this department of art than graceful geometric combinations of lines, and harmonicusly balanced combinations of colours.

"The advocates of such opinions seem to forget, that harmonic proportion forms but the pedestal on which the triamphs of genus are to be exhibited—the foundations of the temple of art. They would substitute the alphabet of æsthetics for the alpha and omega of art, and having discovered that, by a systematic arrangement of colour and form, without reference to sympathy or association, it is quite possible to produce an agreeable effect, they forget, that while the artist seeks to please the eye, he ought also to address himself to the feelings and fancy of the spectator.

Man is not a creator, he is a mere adapter. The most wonderful inventions of modern times are based upon discoveries made by diligent observers of the operations of nature. Those specimens of art, which have been transmitted to us from a remote antiquity; excite pleasurable feelings, proportioned to their approximation to the beautiful in nature?

"If the greatest triumphs of art be felicitous imitations of nature, and if it be its chief sim to achieve such imitations who can doubt it is—why should we not have the walls and windows of our apartments decorated with

architecture that work place; painted glass changed its character; and this change, so far as relates to foliage and geometrical forms, the author endeavours to trace. The following

pilated plass of the stavents and twelfth cen-turies, like the Norman architecture, of which it formed a part, was stately, and of a megnia additional states, which clours were no the maste wirded and positive cloar were no the wirds state the post of the eye to repose the no-neared duce were introduced. The while of the production of the were filled with intenses edited duce were filled with intenses edited the same develop which it is and state of semicle the state of the invariably inclout inter-ing not the windows of that period, and the generative windows of that period, and the generative method in the state of semicles the state of semicles the windows of that period, and the generative method in the semicles of the generative method is prive of the semicles and the generative method in the semicles of the generative method in the semicles of the semicles and the semicles and method is prive of the semicles and the generative method is the semicles of the semicles and the generative method is prive of the semicles and the generative method is prive of the semicles and the pelated glass of the deleventh and twelfth cen-

romantic and martial spirit of the age of abi-yary . The realing forms, also, were at asce-massive and aimple, sithough they were starses in a spirit and a simple, sithough they were starses being and Roman friezes and capitally." Many and the second second second second second planty, both in solout, and form. The post-My, both in colour and form. The post tive coloars were now used more sparingly, and, indeed, were almost entirely confined to repreteis bandas central points chiefly quarter foils, and borders outstinued round each online window "The general prounds or liter mediate spaces mere of a basisful tint of seutral grey, spaces were of a basifiel tint of neutral grey, produced by dimes interacted at right angles, fridd which were followed, by bold black lines, sould be to be a start of the second start of the great To the way the bring and the second start of the big way the bring and the second start time to the big second start of the second start to of simple geometric figures gave it an entirely new forther, and evinced an adaptive power not formerly us big to be dealed to the power not formerly us big to be followed of the two way the forther and of classic architec-ture way the start of the followed of the ture was abasely initiated in the fulinge of the gentral ground and During the fourteenth

century, which the secondary pointed or decorative style of architecture prevailed, the architells in galaxies and the have advanced still further in bit and the have advanced still further in the aff of alleptation or invention. Thus, we find that, in accordance with certain fixed rules of proportion, they elcagated, intersected, di-versified, and arranged; rectangular, triangular, and curvilinesh figures, and made these har-monious geometric combinations their leading points for colour. They were thus enabled with vertainty to produce a pluasing general effect, and to fill up the detail according to eustry and to un up in energian according to their own famoy with an initiation of the com-mpli where, in weith an initiation of the com-growing around them. The ornamental glass of this period is therefore, schemeterised by a rich, joir of features, as well as an easy play rich; yorcy trestmess; as well as an easy play of characteristic and a praceful propertion. In mark instance, who, the rev background produced by littlessetted lines was abandoned, and a time of gray becare abasineted; which inter the statistic transmission of the first, and gave a laster third to the outlaned foliage, of which the line rate to the outlaned foliage, of which the line rate of group becare. There were now at adaptations, from any other nd adaptalions from, thy other sources than nstore and geometry." Perpendicular.-" During the period of per-

DUTIES OF PAROCHIAL OFFICERS IN CON-RECTION WITH THE REPAIRS OF THE CHURCH-Such evils, then, it is ours to repair; and that in so many places you have so well and cheerfully begun the work, I heartily rejoice. But, if these evils are to be thoroughly removed, we must first form a just estimate of the disgrace of their continuance, and the duty of abating them. And this is the more neces-sary, because their existence is, I believe, in ad, slight degree to be traced to the action of false principle of honour, which has attached special praise to those parochial officers who have kept the church-rates lowest in amount. Now, such an administration of a common fund is worthy of all honour, if it is the result of a care, watchfulness, and prudence which have first secured the objects for which it is created : but if a low church-rate is obtained by the neglect or penurious reparation of the church, ne such honour can belong to its appointed justifiant ; rather should it be his object, as it is his daty, to stir up his co-parishioners to willing, and united offerings, until their common house of God is a worthy expression of their hearty thankfulness for all their common blessingsuntil its decent fabric, ornaments, and fittings bear some due proportion to their common means. Surely he who acts in this spirit will best consult the welfare and honour of a parish; he best provides for the real wants of its poor; he best provides for the real wants of its poor, he will gain for himself the enduring preise of being "the repairer of the breach, the restorer of paths to davell in." THE BUILDER.

HOT WATER APPARATUS. HOT WATER APPARATUS. — The attention of architects, builders, and others, is respectfully requested to BENJAMIN FOWLER'S superior method of heating churches and chapeh, halls, stair-cases, conservatories, forcing and green-houses, manufactories, and warehouses, klins, rooms for drying timber, &c., and every variety of purpose for which artificial heat is required. Within the last twenty years some hundreds of buildings have been heated upon this plan, and the parties for whom they were exocuted are constantly expressing their satisfaction, also their willingness to vouch for their efficiency. An improved wrought-iron boiler, which requires no brickwork, may be seen in action upon the premises. ENJAMIN POWLER, ds. Dorset-street, Fleet-street. - The

PROSSER'S EXPERIMENTAL RAILWAY AND BURNETT'S PATENT. THE attention of Railway Companies, Public companies, THE attention of Railway Companies, Builders, and others, is respectfully called by the Proprietors of Sir William Burset's Patent to the Wooden Rails laid downest Prosset's Experimental Railway on Wim-bieden-common; part of which, having heen prepared by Steir process, in addition to being effectually preserved from Dry, Roi, will be found to exhibit all the characteristics of theorogally seasoned timber, although only cut down in the month of May last, and prepared while in a perfectly green state. Hydraulic apparatus and Tanks. Millvall, Poplar, party opposite Greenwich; Offices, 53, King William-singe, London-bridge.

DOLONCEAU'S BITUMEN PAVE-MENT for paving Foot walks, Terraces, Garden walks, Stability, Coach Houses, Gramtrics, Corn Stores, and Salt Warehouses. For the exclusion of Damp and Vermin in Basements it is particularly adapted, and for Roofing Dwell-ing Houses, Forticos, Balcories, and Sheds. "Price as: 6d. per square yard." "BTDMEN for covering the Arebes of Bridges, Culverts, fc, Ec. on Railways and other places (with instructions for laying it down), may be had at the rate of 45s. per ton, by applying to JOHN PILKINGTON, 15, Wharf-road, City-road.

TO ARCHITECTS.

TO ARCHITECTS. In consequence of many complaints having material baving been used in the execution of Works where the Sursel Applaints had been specified for, the Directors, with a view to ensure the fulfilment of any such specification, have authorised CERTIFICATES to be granted to Builders where the Surveys Applaints

SEVSSEL ASPHALTE

SEVSSEL ASPHALTE has been used. For the purpose of securing the use of the Generica Article, Architects and others are recommended to insert in their specifications the "Seyssel Alphalte, Cla-ridge's Patent," and not merely "Asphalte," or "Bitu-men," as in many cases where these terms have been used, generar and other worthless and offensive compositions have been introduced. I. FARELL, Secretary. Bridge, Jan., 1845. Books of Instructions for Use may be had at the Office of "The Builder," and of all Booksellers in Town and Country, price 1s.

"The Builder," and of all Booksellers in 10wn and county, price is. "s" in proof of the necessity of the above advertisement, it may be mentioned, that it has come to the knowledge of the Directors, that in certain works which have been executed by Mesers. CURTIS, builders, of Stratford, a spinions material has been used by them, contrary to the specifications, which expressly mentioned, that "Claridge's Asphalte" was to be need. [Also in the case of a work at Lewisham executed by Messrs. ROBERT and DANIEL YOUNG, of 10, Crown-row, Walworth-road, where Sepsel Asphalte was specified for, a sputions article was nevertheless laid down by them.

LUMBER'S BRASS WORK, WATER-CLOSET PUMPS, &c.—These articles require the grantest attention and care in the manufacture, and will be frund superior and cheaper than at any other manufactory. Established 1750.

BIELEFELD'S PAPIER MACHE. The superiority of the Papier Maché for the purpos of ARCHITECTURAL DECORATIONS is never on the rally admitted, that it is needless to urgue it. The intredue tion of Papier Maché into most of the public and prive buildings in the country is the best proof of its merits. Of naments may be had in almost every style, and pattern books, containing more than a thousand executed design PICTURE FRAMES and other Articles of Purnisur either gilt or in imitation of the first carved east. An illustrated trated Tariff forwarded on the receipt of eight past-first stamps.

stamps. PATENT QUAQUAVERSAL GLASS-STANDS for the toilet, on an entirely new principle, of great clagmac, and free from all the practical inconvenience of ordinary Chas-stands. At the works 15 Wellington atomic North. Strand.

At the works, 15, Wellington-street North, Strand.

THE EIDER DOWN QUILT is the warmest, the lightest, and the most elegant Covering : it is suitable for either the Bed, the Couch, or the Carriage, and from its extreme warmath is per apted for invalids. Also goose Down Quilts, very comfortable at half the price of Eider Down. List of prices over, and also every description of Bedding, sent free by post on application to HEAL & SON, Bedding Manufer 5, opposite the Chapel, Tottenham Court Road.—November 8, 1845. eculiarly a of the 196, opposit

THE LONDON PATENT HYDRAULIC COMPANY invite the attention of the Nobility and Landholders, and all classes having PROPERTY TO PROTECT FROM FIRE, to their PATENT FIRE ENGINES, which being constructed on scientific principles, work lighter, throw more water, and are less than half the price of and a half tons of water per minute. THE FARMER'S FIRE ENGINE, so occasionally applied to lifting liquid manure, is found invaluable. Also the RATEWAY STATION PATENT FIRE ENGINE must become universal when knows.

BUILDERS' AND CARPENTERS' IRONMONGERY WAREHOUSE.

THE Proprietor of this Establishment has, by his connections with the most extensive Manufactories, selected the largest and best-suited Stock of Builders' Ironmongery yet offered to notice. It includes fittings, finishing, and decoration; also Rain Water Pipe, Sash Weights, and all kinds of Castings, and combines (being entirely new) all modern improvements in principle and design. The Prices throughout, even in the most minuta article, nave been the object of the strictest conomical consideration, the profit of the undertaking being anticipated only by a large return. From this Stock every article may be selected, eractly adapted for its intended use, of any required quality or quantity, at a moment's notice, and Catalogues of Prices had, per past (on prepaid application, exclosing posting-stamp), at 18, BLANDFORD STREET, MANCHESTER SQUARE, LONDON, leading from BAKES JOHN YOUNG, Jun., Proprietor.

SATURDAY, NOVEMBER 15, 1845.

CONTRIN & Larger amount of contain a larger amount of information, connected with the Metropolitan Buildings Act, than is to be found in any other work. They have

been open always to communications on the subject; and we have from time to time laid before the public the more important awards and directions issued by the official referees, and all the modifications of the Act, ordered on their recommendation, by the Commissioners of Works and Buildings. Our anxious desire has been to render the operations of the new Act as extensively known as possible, to explain any doubtful points as they arose, and so prevent litigation : to induce the expression of public opinion with a view to an early improvement of the Act, and, by a vigilant surveillance of those who were in authority, to aid in securing a proper administration of it. Our efforts in this respect, we say it with gratitude, have been favourably viewed on all banda.

* right honourable lord, interested officially in the administration of the Act, has been pleased to offer his approbation of the conduct of THE BUILDER, and to express an opinion of " its practical utility;" and from the public generally, we could give many gratifying proofs of confidence, if we thought it right to do so. Even at the risk of a charge of egotism, however, we cannot avoid availing ourselves of this opportunity, of mentioning one unexpected testimonial, recently received from a class of our readers, for whom, though humble, we have much respect, and whose interests and progress we desire, with all earnestness and sincerity to advance. We allude to a letter from the Institution of Builders Fememen (signed W. Allard, secretary), which we should print, if it were not personally flattering

We have been led without wishing it, away from the simple object of the present notice, which was to say, that from this time forward our opportunities for illustrating the workings of the Buildings Act, will be much greater even than they have been. Every AWARD AND CERTIFICATE PUBLISHED BY THE RE-FERRES, WILL COME BEFORE US THE MO-MENT IT IS ISSUED, and the gist of all that are important, will be immediately laid before our readers, Careful references to these cases will be given in the index, so that the volume when completed, will be found of the greatest importance, indeed, we may almost say, indispensable, not merely by architects and builders, but by all who are interested in house property, as owners and holders.

The following are amongst those recently issued :-

CHIMNEY-BARS, CURB-ROOFS, DRAINS, AND COPING.

Mr. T. H. Wyatt gave information against Mr. W. Bellamy, that in building various dwelling-houses in Hackney, he had "done certain matters or things contrary to the provisions of the said Act, namely, having formed certain chimney openings, the jambs whereof project from the face of the wall more than 41 inches, and the front on either side is less in and further, that the said building has been

TIELDITTINE

width than two-thirds of such opening, without inserting proper iron chimney-bars; and having built the walls of the said houses to a height of 10 feet, without having properly built and made good the drains thereof; and having built the party-walls between the said houses, so as not to project 18 inches in front of the curb-roof; and without being coped with brick on edge in cement, or stone, or being plastered with cement,"

The referees, by their sward, ordered, " that the said William Bellamy do forthwith provide and let in an iron bar over the opening of every chimney in the said houses (not already provided with the same), as directed by schedule F of the said Act; and that the said William Bellamy do forthwith pull down and replace, by a proper external wall, of the thickness of 13 inches at the least, all the lower and nearly vertical portion of the curbed roof in the back of each of the said four houses, or do make the same conformable to the said Act by adding, upon stone corbels, and to the satisfaction of the surveyor of the district, so much to the party-walls between such roofs as that the said party-walls shall project, at the least, 1 foot and 6 inches beyond every such roof, measured at a right angle with the back of the rafters of such roof, or do in some other way make the same conformable to the said Act; and that the said William Bellamy do forthwith finish the top of each of the said partywalls, with some properly-secured and sufficient water-proof and fire-proof covering, as directed by the third part of schedule D of the said Act.

As regards drainage, the award sets forth what may be important to many of our readers : it states, that " upon the express understanding that it is intended to make sewers, and that the same are now about to be made, and that the said William Bellamy has paid, or has engaged to pay, seven shillings per foot towards the expenses of the said sewers or part thereof, and that it is his intention to form proper drains, from all of the said houses into such sewers as soon as the same shall be made, and inasmuch as many instances have occurred, in which buildings are commenced in streets and roads, in which sewers have not been built, but in which it is the declared intention of the parties immediately to build sewers ; and inasmuch as the said official referees are of opinion, that the intention of the said Act to promote the improvement of the drainage of buildings would be defeated if, in such cases, cesspools were made, and the buildings drained to such cosspools instead of sewers, and have therefore determined to recommend to the Commissioners of Works and Buildings a modification of the said rule, to the effect that it shall be lawful in such cases to defer the making of such drains, with the special consent of the official referees first had and obtained,"-they will make no direction thereon, until the result of such recommendation be known.

TEMPORABY WORKSHOPS.

Mr. S. Fowler having erected a workshop at Bermondsey for temporary use, not in accordance with the Act (through ignorance), received notice from the district surveyor to that effect, and appealed to the referees.

It was admitted that the external inclosures were not wholly formed of brick or of stone; "that the said Building is detached from any other building, and that it is separated from the next adjoining premises by a brick wall; that the roof is covered with pantiles, and that no fire-place has been built therein;

built as a temporary workshop for the execution of a pressing outract, and that it will be pulled down in the CUP. months from the date of hearing four or five

Mr. Hosking determined " that the building in question is not conformable to the said Act, but I defer to make any direction thereon for a period of six months from the 22nd day of September last."

INSULATED BUILDINGS.

With reference to an application from Mr. Lee, for leave to crect smiths' and coopers? shops (of timber and wood-work) at Wandsworth, at the distance of 22 feet from one building, and 25 feet from another, both in his own occupation, the referees awarded, "that if the buildings be in the same possession and occupation with the proposed building, and be themselves insulated within the meaning of the said Act, and if the proposed building he so situated that there he not within 30 feet therefrom, any land or any building not in the same possession and occupation therewith, then such proposed building will be an insulated building within the meaning of the said Act."

Wood construction was therefore permitted.

SLAUGHTER-HOUSES.

With regard to a request by Mr. Weymouth, to know, amongst other things, whether a small slaughter-house, at Crouch End, Hornsey, was a building of such a nature that, in accordance with the 55th section of the Act, no structure could be erected nearer to it than 50 feet, the referees decided, "that if the slaughter-house be used for the slaughtering of animals for human food only, and be not used for the business of a general slaughterer, but in connection with the trade of a retail butcher, and particularly with the trade of a butcher's shop thereto adjoining, then the said slaughter-house is not to be deemed to be a building used for the business of a slaughterer, or for a business noxious or offensive within the meaning of the said Act."

OBSTRUCTION OF LIGHT AND AIB.

Messrs. Elger and Kelk, being about to eract premises at the back of No. 16, St. James'ssquare, which Mr. Howell, the owner of No. 15, considered would obstruct the light and air of his premises, applied through his architect, Mr. Marsh Nelson, for the interference of the official referees to prevent the builders from proceeding. The opinion of Messrs. Barry, Hardwick, Tite, and Penner thorne confirmed his view as to the obstruetion. An area was to be left as prescribed by the Act. It was contended for Mr. Howeld that if the referees were called on by the Act (as is the case) to prevent any projections from wall which would obstruct the light and air, orbe injurious to the adjoining houses, the Act could not permit the wall itself to be built or raised, so as to effect in a greater degree, that which the projections from it would do in a smaller degree.

The referees determined that so far as related to the interruption of light and air, they had no jurisdiction in the matter referred to them.

THE ROYAL SOCIETY .- The session will commence on Thursday next, the 20th instant. The anniversary meeting will be held on Mon-day, December 1st.

Schools AT CARDIFF .-- A building for a day-school on the British system is now being erected in Cardiff by subscription, principally of the Baptists in that town and the vicinity. The style is Tudor. Mr. Clinton is the architect.

_ CLAY SOILS AND CONCRETE.

.....s 10 No. 142 of THE SIR,--The observ Liddell, on the dangers o buildings erected on clay soils, BUILL Without cue precautions being given to the foundations, and the instances which he brings forward of the fatal results exemplified in the buildings about Hull, are of serious impor-tance, and merit the consideration of all practical persons. I will venture to make a few additional remarks.

In all foundations, but especially in un-certain soils, a great degree of security is obtained by making the footings and lower obtained by making the footings and lower part of the walls of increased thickness. The foundations, from the better bond thus obtained, are less liable to fracture and are more capable of bearing heavy weights by the greater spread of surface over which they are diffused. In illustration of the security thus obtained, the use of snow boots in Canada has been referred to, which extend, almost like sledges, under the feet, and thus effectually prevent the impression which the small extent of the bearing surface of a foot would inevit-ably make. By the diffusion of the weight scarcely any compression takes place, and the same result may be obtained by similar means same result may be obtained by similar means in soft or clayey soils, by extending the width of the footings.

In clay soils, another point to be attended to, is that the foundations be of sufficient depth, to prevent the soil on which they are constructed being affected by the changes of the weather, from wet to dry, or otherwise. The cracking of these soils by the heat of summer, and their swampiness in winter is well known. If it is necessary for an architect to take into consideration the effect of the dilatation of iron by heat, how much more should he consider the effect which such changes have upon a soil, the very foundation of his building. In clay lands, I think the bottom of the footings should never be less than five feet below the surface, to avoid the effects of temperature. The drainage for buildings also on these soils should not be made *below* the level of the foundations, as great injury is likely to arise from withdrawing the natural moisture of the ground beneath them. I have known serious injury to arise, and a building to be fractured in all directions, from the sinking of a well in a clay soil, whereby the under soil was drained of its moisture.

Your correspondent alludes to concrete, and doubtless it is a most efficient means for securing good foundations, but I apprehend its beneficial effect arises, in a great measure, from its enabling the builder to effect the two conditions above named, at a moderate expense; viz. of extending the width of the footings and increasing the depth of the underground work : -for it must be remembered that the concrete itself is only an artificial wall, and subject therefore to all the contingencies which may affect the soil on which it rests. In addition to concrete on clay soils, I have adopted the plan (and with much success) of building all the footings four or six courses in height of brickwork in cement, each course strongly bonded with iron hooping, laid both longitu-dinully and diagonally. Iron hooping has been looked upon so much as a mere substitute for wood bond, that its advantages of being a connecting tie to the individual bricks, and the increased mutual strength which they thereby obtain, are not sufficiently appreciated. I make this observation, as the use of iron hooping in footings has been objected to as unnecessary and useless by several practical builders; but I hold that the footings thus constructed of sound stocks and cement, linked together by iron hooping, form a stronger and more compact bearing surface than could be obtained by Yorkshire landings. The con-necting bond is in no part broken throughout

the footings, as must be the case with landings. I should have supposed the use of concrete was too well known to need your correspondent's inquiry, had I not myself found a difficulty sometimes of getting it executed in the country. In London, the ballast from the river bed is invariably used, but in the country, any clean pit gravel, fragments of stone and brick, the hingle from the sea-shore, and broken flints, may all be advantageously used, mixed with coarse, rough sand sufficient to fill up the interstices. Six parts of this material with one of ground lime is recommended; or, if

is strong and hydraulic, a smaller the lime portion of it may be used. As it is difficult in the country to obtain ground lime readily, a labourer can be set to pound it into powder. To slake it with the other material is wasteful. I subjoin a translation from one of the chapters in Philibert de L'Ome's work, published in 1568, giving an account of the use of concrete in his time, which I have not seen noticed in any publication on the subject.

2nd Book, Chapter 2 :-- " How foundations are to be made, when large stones cannot be obtained, for building bridges across rivers, harbours on the sea-coast, and other works in marshes and in water.

"The excavations being made, whether for houses, harbours, bridges, or buildings, in a marshy soil, or even on land, and if being deep and wide, stones of a large size cannot be obtained for the foundations, the best and surest method is to prepare a mortar, composed of quick-lime recently burnt, as described in the first book, mixed with a river sand, which contains a quantity of pebbles of all sizes, provided the largest be not larger than the fist, or the size of an egg, and that the whole be also interspersed with smaller pebbles and gravel, such as are usually found in rivers. This material, moistened with water and mingled with lime, serves both for mortar and stone, and mixed with a sufficient quantity of sand, must be thrown at once into the excavation without any labour from the mason's trowel. It is only necessary to dress it with the spade. Having thrown in a layer, about half a foot in thickness, large single stones may also be thrown in, and mixed here and there with it as may be convenient, but without touching each other; after this, you will again throw upon them the mortar of pebbles and gravel as before done, and this must be repeated till the excavation is full, throwing the whole from above with all sorts of small pebbles. This composition thus executed hardens and solidifies so firmly in the foundation, that being heaped up in a mass, and bound together, it becomes a uniform body or rock, such as Nature forms, of a single block, and it is so strong and hard, that when dry, it cannot be broken either by piles or any other instrument, nor can the pebbles be separated from it without breaking them in pieces. The reason is, that the excavations, retaining their hu-midity dissolve the mortar and prevent its drying for some time, so that the large gravel and pebbles during this period imbibe and draw in the fatness and power of the lime even to their very centre, as I have myself observed; for on examining the pebbles thus employed, and breaking them, I have found them white to their very centre, and of the same colour as the lime. Quarry stones can do the same, for they attract the fatness and power of the lime. A foundation of small size cannot be executed in this manner, as the stones or pebbles would dry too rapidly, and before they had time to absorb the virtue of the lime. Lime made from hard stone or marble is the most pene-trating and proper for this purpose, but ob-serve especially that soft free-stone lime is useless.

It is needless to continue the extract, and your readers will probably not understand the old architect's philosophy; but the chapter is interesting as evidencing the use of a material three centuries ago, which we are inclined to consider a modern discovery. I am, Sir, &c. October. 1845. T. L. October, 1845.

••• In the prize essay on concrete, published in the first part of "Transactions of Institute of British Architects," 1836, numerous in-stances of the use of concrete in very early times are cited. In reply to our first corre-spondent, Mr. Liddell, we give the following

brief extracts from the essay in question. "The concrete now generally employed is compounded of Thames ballast and Dorking lime, in certain proportions, varying, according to the opinion of the user and goodness of the materials, from one of lime and four of ballast, to one of lime and twelve of ballast. They are sometimes mixed together, slaked as mortar, and thrown into the foundation from a certain height; sometimes the ballast is laid on the site of the intended erection, and the lime poured over it, in the shape of grout; while at other times the spaces to be concreted are filled with water, and the lime and ballast, having been first mixed in proper proportions,

are thrown 4. are thrown into it day. Instead of granit, Kentish-rubble and broken pieces of granite, properly grouted, have been extensively em-ployed, more especially by Sir John Soans, who has used a preparation of this sort for most of the public buildings in Westminster executed under his direction; viz., at the Lay Courts, the additional buildings to the House of Lords, the library of the House of Com-mons, the Board of Trade and Privy Councal Offices, the State-Paper Office, and others The foundations of these edifices were formed of granite, or other hard stone, broken in small منعن it. 11 of granite, or other hard stone, broken in small pieces (none exceeding the size of an ordinary hen's egg) and laid in layers, closely rammed. and grouted every third layer, closely latin the composed of Dorking lime and sharp river-sand; other layers of similar pieces of stone were then laid, and rammed and grouted as before; and so the operation was repeated, until the required thickness was attained.

"In order properly to apportion the quantity of lime necessary to be used with the ballast, it will be well that you ask yourself this ques-tion: What are you in reality doing when forming a mass of concrete? or rather, what ought to be done? To this the answer must

ought to be done? To this the answer must, be, that you are building a stone wall. The pebbles, then, are the materials with which it is to be built, and must be regarded only in that light; so that in considering the ought of lime necessary to be added, in order quantity of lime necessary to be added, in order to form a proper mortar wherewith to unite, them, regard must alone be had to the sand them, regard must alone be had to the sand contained in the ballast, and according to the quantity and quality of that ingredient must be apportioned the lime. It is true, that opon the proportion borne by the pebbles to the mortar, the strength and goodness of the con-crete materially depend; but this, except under, peculiar circumstances, must but little interfere with the preparation of the mortar: it is another onestion separately to be considered. question separately to be considered.

Now, practice and a variety of experiments have shewn that Darking stone lime, being ordinarily good, will form a most excellent mortar when mixed with three times its own mortar when mixed with three times its own quantity, by measure, of sand; and although it is quite certain that if it be well burned, ground, and used hot—and thus it must alcosy be for concrete—it will make excellent mortar when mixed with four of sand, even better, if the lime be powerful than with less, this may serve us as a generally admitted good. proportion.+

With respect to the amount of stones essential to a good concrete, it is generally main-tained by those practical men who bave thought mon the subject—unfortunately but few-that upon the subject—unfortunately but few—that it should be double that of the sand by measure; and my own experience fully bears out this belief."

Various experiments shewed that two parts of stones and one of sand, with sufficient time-dependant on the quality of the material-to make good mortar with the latter, formed the best concrete.

Thames ballast, of the best sort, consists, nearly, of one of sand and two of stones; in ordinary practice, one of lime to seven of ballast is used, and found amply sufficient.

the second second ARCHITECTURE AND ART IN ME 1 death MANCHESTER.

AFTER a long period of depression, art in Manchester has sprung into vigorons existence. The tide of prosperity in trade has influenced ar-chitecture, and the town is now a striking example of prevailing good taste. An increased want of buildings of every description, churches, houses, warehouses, manufactories, and public buildings; the formation of several new and large streets, and the widening of old ones, have created a demand for the services of architects, such as we do not recodlect any other instance of. A new school of architects has sprung up, including a large number of individuals, many of them very young men; modi it is greatly to the credit of the merchants of the town, that they have had the judgment to use the services of architects, in buildings, in which they are seldom appealed to, and to the credit of the architects, that these appeals

* It was usually thus compounded by the lake John

etter supporting the

111 THE BUILDER.

*** ***

have been replied to by them, almost universilly, in the best manner, and so as to confirm the impression of the advantages to be derived from professional assistance. The speculative mania has infected Manchester, probably in a greater degree than any other place in the higdom; and it would be easy to name several remarkable instances of good fortune. Tradesmen, attorneys, surgeons, dentists, and many more needy adventurers of one time, we DOW find metamorphosed, every man of them, into share-brokers. They are the monarchs of the day; note-book and pencil in hand, they crowd the Exchange, and reap all the advantages of the lucky game. The quondam shop-boy, to whom a yard-stick was the familiar instrument of success, and who sped from his ill-digested dinner punctually to the bour of two, now books the name of a new client, and whistles as he books it, or alights at the door of the stock-exchange, in all the consciousness of well-appointed horse-flesh. The man of lint and bandages, whose early career was brightened only by an occasional tooth, now invites you to dine at his countrybouse, and calls for you in a carriage, which people look at, as it runs by. Amidst all this good fortune, in which all, for the present, step: to be partakers, there are many who condemn, and who talk of impending ruin, yet none who show the influence of example; few to recollect a time when shares were at a discount, and scrip could be had for asking. People consider the questionable issue out of the approaching climax, but, with the infatua-tion of the hazard-table, hope, that one more cast may yet yield gain. In drawing attention to the prosperous state of architecture in Manchester, we have thought it necessary thus to allude to the causes, which might soon there, as well as elsewhere, produce a state of things the exact reverse; and should the scarcity of money be felt for some period to come, as seems too probable, the arts will be affected to a disastrous extent. But to return

to our more immediate object. It is not only in the *art* of architecture, that great progress has lately been made; an equal advance is apparent in the arts of construc-tion. The railways have brought excellent stone from the immediate neighbourhood of the quarries, at so low a rate of carriage, that its cost is often exceeded by brick work, and conits cost is often exceeded by brick work, and con-sequently it is much used for whole fronts of buildings. That bad substitute, stucco, gene-rally unsightly, and often entailing an annual expense, is seldom made use of, and we could wish that everywhere, where stone is ex-pensive, people were equally aware of the superior advantages of good brickwork. The stone most used is known as "Yorkshire highsuperior advantages of good brickwork. The stone most used is known as "Yorkshire pier-points "it is a sandstone of good yellow colour," and according to one architect, is nearly as cheap as the best red facing bricks, and quite as cheap as what are called in Man-chester. "seconds," and much cheaper than chester "seconds," and much cheaper than brickwork, according to another. It is used with the natural fracture for the beds, and is rough dressed on the face; it is generally laid in blocks, averaging perhaps, 9 inches by 6 inches on the face. It is generally backed with brickwork, but sometimes with the red sandstone of the neighbourhood (Collyhurst stope), of which the Gollegiate church is built, but, which is only adapted for parts protected from, the weather. Collyhurst stone is, at irom ine weather. Collyhurst stone is, at present, much cheaper than brickwork. For mouldings and for finer work "Summit stone" is still used; it is a very good stone, and is highly, crystalline. The use of iron is still greatly extending in Manchester, where the principles of its application are well under-stond and all the costing articlicherts. in schive operation. The most novel appli-oation of this material is in the Independent chapel, erecting in Salford, near the Broughton-bridge, from the designs of Mr. Richard Lame. The roof is framed of cast iron principale, ourved, and meeting at the top in a Gothig arch. Each half is in two pieces firmly bolted segether, and the principals are con-nected by the rods. The feet of the principals are apread out, and rest on blocks of stone, but mare further supported by iron columns, built into the wall, which stand upon stone corbels at the ground level. There are shoes, cast on the principals, to receive the purlins. There are two heights of iron columns, the upper supporting the iron girders for the

galleries. These girders are curved in form, sate of the galleries. The roof may be so as to approach nearer to the section of the steps of the galleries. The roof may be made a very effective feature; and that a similar treatment of iron work in Gothic ar-chitecture is desirable, has been pointed out in a former number of this journal.* The style adopted in this building appears to be "per-pendicular." The windows are in two heights, and the roof spans the whole width of the building. The principal front will have a building. The principal front will have a window with crocketed canopy over the en-trance door, and is divided into three com-The principal front will have a partments by canopied buttresses, surmounted by crocketed pinnacles. The style is not well treated, and the mouldings are exceedingly

treated, and the mouldings are exceedingly meagre, and spiritless, but the constructive effort is worthy of some praise. St. Simon's Church, Springfield-lane, is not far from that just described. It is on the Salford bank of the river, in a very favourable situation for the display of archi-converted the state of the second state. tectural skill. It is also by Mr. Lune, and is certainly an improvement upon the Independent Chapel, though neither much better, nor much worse than the general run of cheap early English churches. It consists of a nave, and aisles, a short chancel, with octagonal east-end, transepts, a south porch, and a western tower. It is built of Yorkshire stone, backed with Collyhurst stone. The tower will support an octagonal spire, rising to the height of 150 feet. The chancel will be groined, and will have three windows to the east. At the ends of the transepts will be windows of three lights, with quatrefoil tracery, and the aisles east. At the will have windows of trefoiled tracery, with two lights. There will be cusped windows in the clerestory, and a window of three lights over the western door. The tower is ascended by a turret in the angle formed by the tower, and the north aisle. There will be open benches.—Near the Norman church, built about four years ago, near Broughton Bridge, are some schools in the same style, and though we are not usually inclined to commend its adoption, we must allow, that it has here been adoption, we must allow, that it has here been rather effectively made use of.—St. James's Church, at Birch, is a very elegant structure in the early English style, and is, in every respect, a striking instance of the present tendency in church building. The estimated cost is 3,500%, but this is exclusive of the spire. It will accommodate 700 persons, 400 of the sittings being free. The design is by of the sittings being free. The design is by Mr. Derick, of Oxford. The plan consists of a nave and aisles, with the tower at the south-west angle, a chancel, a chamber for the organ in the position of a north aisle to the chancel, and a sacristy, north of the chancel. At the west end will be a large double window, sur-mounted by a quatrefoil, and in the aisles will be double windows. At the east end will be a triplet, and a rose window. The clerestory will have windows and arcades. The proportions of the parts, throughout the whole church, are excellent, especially in the piers and arches The roof is an open timber one, of very good design. All the arrangements of an old Gothic church will be here reproduced; and there will be sedilia, credence table, and piscina (?) When quite completed, there will be a consi-derable amount of decoration; and it seems a judicious proceeding to provide for future de-coration, by leaving blocks of stone, which may be carved into bosses, and corbels, as may be carved into bosses, and corbels, as opportunity may arise. Subscription lists have been opened for different objects of detail, and these are filling rapidly. — St. John's Church, at Longsight, is in the early English style, and is from the design of Mr. Gregan. The plan consists of nave and aisles, tower at the south-west angle, and chancel with short aisles, and a sacristy, on the north side. The church has no great amount of decoration, but is effective in outline, and highly creditable to the architect, who had many difficulties to con-tend with, from alterations in his design. The three chancel arches are effective. There is a stair turnet to the tower, a south porch, and a north door. There are two lancet windows at the west end, and an eastern triplet. The aisle windows are plain lancets coupled. The roof is of plain open timbers. It seemed, that the capitals of the pier arches would have been more effective, had their mouldings been a little bolder.—A church, now building of terra cotta, at Plat, we must reserve for future de-

• Vide "Gothic Ironwork," ante p. 397.

scription .- The church of the Holy Trinity, in the Stretford New-road, is in the early English style, and is a good composition, with a considerable amount of decoration. It has a square tower, with detached shafts, arranged at the various stages in a very effective manner. It is a cross church, with a western tower, a north porch, and short chancel. There are aisles to the nave. The porch is inclosed with gates of wrought iron, which are in good taste. In this porch there is a benatura, or stoup for holy water. We suppose it is not used, and see no reason why it should be there. The inclosure wall and gates are excellent. The interior of the church is of lofty proportions. It is fitted up with open seats, and has a row of candelabra, in the form of floriated crosses, down each side of the nave. The font is a copy. The pulpit, which is of stone, stands on a short pillar. At the opening of the church, it stood on the north side of the chuncel arch. In this porch there is a benatura, or stoup for it stood on the north side of the chancel arch, in the angle, formed by the responds of the chancel, and transeptal arches. It was soon found, that the clergyman could not be heard, and it was therefore brought out to the western face of the transeptal respond, and there is now no difficulty in hearing. This alteration, which was one demanding some constructive and artistic skill, has been very ably managed by Mr. Travis, architect, of Maochester. The architects of the church are Messrs. Scott and Moffatt, of London.

The church at Red Bank is one, which we are sorry we cannot speak of in terms of commendation. It consists of nave, aisles, and chancel, with porches in the usual position of the chancel aisles, the east end being next the street. The aisles are very lofty, with coupled lancets of enormous length. These aisles have lean to roofs, with sham gables towards the street. The style intended is Early Eng-lish, but has some mixture of "perpendicular," and much of a style, not to be associated with any thing previously known in architecture. The porches have each two gables, and in the centre a door with square label head. The buttresses are surmounted by pipnacles of most attenuated form. The enclosure wall and gates might pass for meagre imitations of those of the Holy Trinity Church. The gable crosses, the triangular window, with its vo-lutes, or twists at the angles, the bell-turret at the end of the south aisle, are all points which a certain contemporary, who is less given to encouraging criticism than THE BUILDER, would do well to notice. There There does not seem to be any sufficient reason for placing the entrances at the cast end. They are designed in what some one called the two and two principle, though, inside, one of them. is a vest p. Certain chimney-pots are to be seen on the roof. There is an open timbered roof, and some very bad stained glass. The church has pews. The proportions of the interior are very ill arranged. The chancel roof is of steeper pitch than that of the nave.—The Catholic church of St. Wilfrid, Hulme, of which views have been published by Mr. Pugin, the architect, in the two papers in the Dublin Review, is a plain structure of red brick, with very little stone, and is in the Early English style. The chancel has lately been decorated in colour and gold, and has a very splendid appearance.† Approached from the nave, which is extremely plain, it is strikingly effective; and is not less so by night, when we saw it, lit up with numerous candles, than it is by day. The stained-glass windows of course require the effect of daylight. The diapering, in red, blue, and gold, is carried or a signature part of the surface, amongst which may be dispart of the surface, amongst which may be us-cerned, the lily, emblematic of the Virgin; the monograms of the Saviour, and the letter W, for Wilfrid. In the heads of the arched compartments of the reredos, are the heads of saints, painted by Mr. Kaeling, of Manchester. The decorative printing was executed by Bandware. There is a here recording of Boardman. There is a large proportion of blue in the colouring, yet the effect is by no means cold. The roof, which is of plain rafters, is powdered with stars. All the ac-cessaries of the altar, which would require a long description, have been designed by Mr. Pugin, and evince much thoughtful consider-ation. There are three sediliu. The piscina is elaborately embellished; it has a deep bowl, and is furnished with a shelf for the cruets.

* Ecclesiastical Architecture, by A. W. Pugin, reprinted fre om the Dublin Review. † Some account of these decorations appeared, ante. p. 356. The rood screen is richly embellished with colour and gold, and supports a rood, with images of the Saviour, of the Virgin Mary, and St. John. The chapel of the Virgin is in the north aisle of the chancel, and is also embellished with colour and gold. The eastern triplet, and rose window above it, are of elegant design, and all the east windows are glazed with stained glass. The church itself, exclusive of the decorations, was erected at a cost of 5,000*l*. The font is a very beautiful one, of original design. The tower is not yet completed, it will, probably, not be as represented in the *Review*. The house of the priest immediately adjoins the west end; it contains some good fre-places and grates. A remarkable feature in the exterior of the church, is the weathering out of the base of the wall, to the extent of the projection of the buttresses. A Presbyterian church, and schools have

6,10

548

A Presbyterian church, and schools have lately been erected near the workhouse, from the designs of Messrs. Travis and Mangnall. The architects had great difficulties to contend with, which we are bound to say they have surmounted in an able manner; and, notwithstanding the restrictions of site, and the injunction placed upon them, to avoid all impediment in the nature of piers, they have succeeded in producing a highly meritorious work. The style is perpendicular; there is a square tower, and an open timbered roof. The schools are to the east of the church. The whole is built of stone, and will cost 3,400%. "Much skill is shewn in the arrangements for ventilating the school-room : the air is admitted by three apertures, which take the form of quatrefoils, and thence by perforations through the floors; being carried through other apertures into the space above the ceiling, whence it passes out by thelouvreon the ridge of the roof. A new Catholic chapel is in progress in Chapel-street, Salford. It is in the Decorated style, and is wholly of stone. The architects are Messrs. Weightman and Hadfield, of Sheffield. The plan consists of a nave and aisles, four bays in length, a chancel, a north transept and chapels. It occupies a large space of ground. The windows contain some good tracery.—A new steeple is being built to Christ Church, Salford, which is Italian in style, in accordance with the rest of the church.—The Methodist chapel at Red Bank is remarksble only from its ill-success as an attempt. It is designed by a mason, and is built of red brick and stone, with clumsy and ill-proportioned details. The roof, in part an open timbered one, is very faulty.—Some alterations are making in the seats of the Collegiate Church, under the direction of Mr. Gregan, and it is proposed to devote the western door to its original use as an entrance. There are many other churches in progress in the neighbourhood of Manchester, which we have not

here space to notice.—Amongst the schools we may mention, the Roby schools, in a street leading out of Portland-street. The style is Elizabethan, and they were designed by Mr. Walters, who has succeeded in producing a very meritorious work. The building is supported upon fron columns, being built over the play-ground. The lower story has a series of arches of different sizes, filled with iron-work. Above are lofty bow-windows, projecting

Above are lofty bow-windows, projecting chimneys and gables; the whole arranged in a very skilfal manner. The materials are red brick and stone. The Queen's Hotel, in Piccadilly, is also by

Are Greens riotel, in Piccaulty, is also by Mr. Walters. It is a large building in the Italian style. The porch is projecting, with a broken pediment. The capitals of the pilasters are original, and in very good taste, and this is equally true of some other ornamental parts.— The station of the Manchester and Birmingham Railway is a very clever design. It is considerably elevated above the street, the carriage ascent being by a long inclined road, and that for foot people by a staircase. The principal building is entirely of stone, Italian in style. The front consists of a projecting centre, with a large segmental-headed gateway, and two wings. Each wing has a door and window on each side, the mouldings, rustics and basement, being well designed. The cornice is peculiar in the stone imitations of tiles, which project to the edge, from about two feet back. There are two heights of windows, the upper ones being square. The basement in the street is of brick, the entrances to the staircase being of stone. Each entrance has an arch rusticated, inclosing a doorway flanked by an

order. The stairs are ascending and descending in the same well-hole, quite distinct, so that the two streams never meet, and as this arrangement is not common, we subjoin the dimensions. The well-hole, is 22 feet 9 inches square in the clear, and the height to be ascended 29 feet. The stairs are six feet wide, and each tread is 12 inches. There are 72 steps and landings, each riser being nearly 5 inches high.—Two wings have been added to the Manchester workhouse; they are of good plain brickwork. The offices near this building pleased us much. They are in the Italian style, of red brick, with stone dressings. The cornice, coins, and decorations of the windows are all excellent, if we except those of the upper range of windows, which are rather too meagre. The bell tower would have been improved by an addition to the height. The central doorway and porches manifest much ability, with some novelty. The architect is Mr. Dickson.

BUILDER.

The greatest change in the architecture of Manchester is apparent in the warehouses ; in many of which there is much architectural display. That of Messrs. Philips and Co., in Church-street, is of brick and stone; the The whole is of "fire-proof" construction, though its safety is interfered with by the central well-hole staircase, adopted for the advantages of light, an arrangement lately much in vogue in that class of buildings. The rapidity with which fire was communicated from floor to floor, by this arrangement, in several instances, led the insurance offices to increase the rate for that class of buildings, and they are now seldom adopted .- There are many other warehouses of red brick with stone dressings; one in the Oxford-road, with a stone basement, enriched with pilasters. Some of the warehouses have very good door-ways, particularly one in George-street. Mr. Walters is the architect of a warehouse in George-street, which has the entire front of stone, backed with brickwork. The work is rough dressed: it cost 5,500%, which is less rough dressed: it cost 5,500%, which is less than it could then have been built for in brick-work. The design is in the Italian style, plain, but expressive of the use.—Near this ware-house, we noticed another, with a stone front, finished with a pediment. There is also a warehouse, building in Falkner-street, of stone, in which there is some attempt at design, the upper efforts of freedom. upper stories having an order of Grecian Doric columns, with a fret in the freize; but we cannot report favourably of the result.— The joint station of the Manchester and Leeds, and Manchester and Liverpool railways, at Hunt's bank, is a wonderful work for any age. The line is carried across the river, and the road, by bridges, each of one arch, of great span; and as works of construction, they are, perhaps, unrivalled. The passengers' shed above is of great length, and has a roof of wrought iron. To form the road for carriages, it was necessary to arch over the river Irk, for some distance. Some new offices are building at this spot, in which fire-proof con-struction is largely used. The ground had to be excavated from 31 feet to 37 feet down for the foundations, and the difficulty must have been increased by the near approach to the river. Near the station, is the Palatine Hotel, a plain Italian building of stone, but in good taste, in which there is a staircase wholly of iron. It was executed by Bellhouse and Co., and whilst admirably conducive to its object of providing a means of escape from fire, is not in-elegant, and may be given as an example of successful treatment of ironwork. the The strengthening ribs beneath each tread are ar-ranged, so as to intersect each other, with good effect, when seen from below. Some gilding might be introduced with a good re-sult.—The directors of the Bank of England are erecting a new branch bank in King-street. It is from the designs of Mr. Cockerell, but is not sufficiently advanced to enable ren, out is not sumciently advanced to enable us to speak of its merits. It is expected to cost between 17,000*l*. and 18,000*l*. In private houses, less progress has been made than in larger buildings. Some of the Gothic houses lately built, as for example in Broughton, are the most whimsical desires we are some We ought, however, to mention, that the Broughton rectory and schools are creditable productions; and a chancel in the decorated style is about to be added to St. John's church by Mr. Gregan.

The Free Trade Hall was lately decorated for the Anti-Corn Law Basaar, by Grieve, of London. It was styled a Tudor Hall, but had very little in common with that class of apartments, further than the character of the painted decorations. These were done on canvas and then nailed up; the coloural were red, blue, and gold. The dimensions of the hall are 136 feet by 105 feet, and on the late occasion of the Athenaeum Soirée, it is stated that 3,800 persons were present. Some meation of this meeting was made in a late number." The Manchester Exhibition, which has now closed, contained some good picture. Poole's picture, of Solomon Eagle preaching, gained the principal premium. There was also Roberts's Interior of Roslin Chapel, and Stanfield's Castle of Ischia. The architests seem to have quite given up contributing ; the only drawings worthy of praise were a design for a Gothic church by T. Worthington, and Pullan's clever design for the Queen's robingroom, lately in the exhibition at the St. James's bazaar. The last has been deservedly rewarded. In saying there were few architectural drawings, we had almost forgottes, some attempts, which are so bad, that the very porter ought to be ashamed of them. Martin had some good drawings, one of them rewarded, and, on the whole, the exhibition, which was of great extent, had several pictures of sufficient merit, to make us regret the presence of some glaring exceptions. The hall has lately been repainted, and a plentiful application of the brush, having been given to the east of the Elgin marbles, these fine works, which were presented by George the IV., have lest nearly all their beauty.⁴

THE IDENTIFICATION OF ARCHITECTS.

SIR,—That architects should affix their names to their productions as other artists, at least sculptors and engravers do, would seem to be only reasonable and proper, and had such always been the practice, we should new know with certainty, who were the architects of many structures whose authorship is either entirely unknown, or exceedingly doubtfal. For instance, it has never been clearly decided if the late Royal Exchange, and Temple Bar, ought to be attributed to Wren or not. In some few cases, indeed, the authorship of a building is of such universal notoriety, that its architect's name cannot possibly be unknown or ever fall into oblivion. One would as soon think of asking "Who wrote Shakspere?" as of inquiring who built St. Paul's, who made the alterations at Windsor Castle, or who is erecting the new palace of Westminster? But there are a great many other buildings, some of them of sufficient public note, the names of whose architects are not known either to the public or to architectural writers. In this latter class is the India House, which has all along (till very lately, when it has for the first time, I believe, been claimed for Holland, the architect to Jupp, who was, it seems, only the East-India Company's surveyor, and who certainly is not known to have ever done any thing else. If it matters not at all whom buildings are

If it matters not at all whom buildings are by, why is so much importance attached to the ferreting out from old records the names of mediæval architects, which when brought to light are mere names, *nominum umbræ*, and only so many letters of the alphabet? It is not, indeed, to be recommended that

It is not, indeed, to be recommended that architects should display their names on the fronts of buildings, as conspicuously as those of "Barclay and Perkins" meet our eyes upon many public structures, that make no secret of their publicity. But a name and date may be recorded much more modestly, and where it may not be observed until sought for; for which reason they ought to be inscribed uniformly in some one particular situation about the level of the eye, or rather below than above it. Basevi did so in Belgrave-square, where his name may be read on a plinth next one of the porches to the ho uses; and the same has also been done in one or two instances by other architects. BUDOWNIE.

LIGHTING AND VENTILATING.

.71

· #

1.1

5

٠.

Tuz lighting and ventilation of the Central Similar Court, are much, spoken against. During, a trial there on the lst inst. the Chief Baron complained that he could not see the gentlemen of the jury, and that coursel exposed to the same inconvenience. Mr. Garkson hoped to the same inconvenience. Mr. Garkson hoped to be excused if he suggested to his Lordship that he should use his influence i with the city authorities to relieve the bar, and indeed every person sitting in the body of the sepurt from the intolerable annoyance which parese from the operation of Dr. Reid's system of ventilation. At one moment they were exposed to a volume of hot air which was inexposed to a volume of hot air which was in-supportable, and at another, to currents of cold wind, forced into the court by the workmen engaged outside. He could assure the Court, that it was almost killing his brethren of the bar, two of whom were now suffering in con-sequence of their attendance in court, and consequent expasure to those varied currents, during the present session. The Chief Baron said, that he had taken a severe cold on Wedneeday last from, he presumed, the same cause, i.y. The Jury, at a subsequent period of the day, made an appeal to the Coart, to give directions that they might be relieved from the cold droughts of air which were poured upon them. Mr. Ballantine remarked that the nuisance was most serious, in its prevention of the due and proper administration of justice. The jury ware more likely to be thinking how they should escape from stiff necks and sore throats, than to be attending to the case submitted to it their equaideration.

Jam In connection with this subject we have re-

Chronicle of the 4th inst. an account of the de-fective state, or rather the complete failure, of the system of ventilation adopted at the Centrail Oriminal Court. It appears the court and jurymen were seriously affected with colds tral and sore threats, by the hot and cold air alter-nately admitted. If this is the professed system of ventilation adopted in large buildings in ²³ the great mictrapole, it is apparent, notwith-standing the various advertisements for perfect ventifiation, that there is a very great deficiency of knowledge on the subject. The scientific ventiliation, that there is a very great denciency of knowledge on the subject. The scientific gentlemen da not appear to have hit upon a simple system, by which churches, chapels, courts of justice, or any large room, can be ventilated, without subjecting those in the buildings to inconvenience. Yet it is possible to be done, by a far more simple and cheap method than by blowing in volumes of hot air or by blatts of cold at really is laugheble to or by blasts of cold : it really is laughable to read of such a system. It reminds me of an eminent medical gentleman being called in to give his advice on the best method of ventilating a large public building, containing then about 300 persons; many of whom were afflicted with fevers and smallpox; moreover, several had died. The learned gentleman, though an excellent M.D.; was entirely unacquainted with ventilation: he proposed a system which would have bazarded the health, if not the life, of every person in the building subjected to his system. It was objected to, and the opinion of an obscure country individual was asked: his plan was approved of; the building was venti-iated under his direction, and though six years have etapsed, not a single case of either fever or smallpox has occurred as yet, though the means were as simple as possible. No volumes 21 £ of hot air, nor blasts of cold, are admitted.

It appears, by the weekly advertisements in THE BUILDER, that various remedies are proposed, but they are not considered by any means perfect, by persons who have had some little experience in ventilation.

It is the same with smoky chimneys. Adver-tisement follows advertisement; but it really is astonishing that, among so many scientific men in London, there should be so few who under-stand the method. What induces me to make this remark is, having to ticed, in most parts of London, the tops of chimneys, and, conse-quently, the houses, disfigured by various sorts 1-3 a. of chimney-pots, cowls, &c., more particularly at the West-end. The noble buildings-I may call some of them palaces - in Pimlico, are, think, more disfigured than any other part. I Could not help saying, when looking at them, what a pity such beautiful structures should be

to sounding used. It is matter of surprise that of wrought iron.

THE BUILDER.

both ventilation and the curs of smoky chimneys should not be made the subject of study, by practical experienced workmen, more than they are; the difficulty surely might be sur-mounted in a great majority of cases, unless, which is too often the case, the fault is in the construction of the flues. There are many causes of chimneys smoking; the means made use of to cure one would make another worse; the first object should be to find out the cause practical experience will point out the remedy. I have known large buildings in the country, erected in the Elizabethan style, in which nearly every chimney smoked; many of the flues, which ought to have been 14 inches by 14, or 14 by 9, were not more than 7 by 7, in parts of the flues. The architects, or their clerks, forget, that the larger the fire the larger the flue is required. The practical workman, when engaged in building, knows what will be the effect, but he is compelled to work according to the plan, right or wrong. If he points out the error, he being only a workman, it is thought nothing of. This brings to my mind thought nothing of. This brings to my mind a complaint in THE BUILDER, a short time since, of the want of scientific practical workmen. There is nothing surprising in this, because few, if any, meet with the encouragement they deserve; if they see any thing going on wrong, and mention it, very likely they expetience a rebuff; they are thought to be nothing more than labourers, to be discharged when no longer required. This knowledge deters and longer required. Inis knowledge deters and keeps many ascientific man from exercising his talents to advantage. The drawing clerk in the office is generally thought more of than the best of workmen. I might have added much more on this subject; let this suffice at present; at some future period I may resume the subject, if you think this worth a place in the columns of THE BUILDER.--I am, Mr. Editor, yours, &c. A WORKING BRICKLAYER.

NEW CHURCHES AND BUILDINGS IN THE NEIGHBOURHOOD OF BRISTOL.

THE number of new churches lately consecrated, especially in the western part of the country, is very striking. In Wiltshire there have been half a dozon within a few months. St. Saviour's Church at Coalpit Heath, near

Bristol, was consecrated on the 9th ult. It is situated about seven miles from that city and is spoken of in the neighbourhood as a good specimen of modern skill. *Felix Farley's* Bristol Journal contains a description of the building from which we extract the following : "The principal parts of this church are a nave and chancel with open roof; north and south aisles; vestry situated at the east end of the north aisle; and south porch. The south porch is the only entrance for the congregation; there is a private entrance for the clergyman on the south side of the chancel, and an entrance to the vestry from the churchyard.

The mave is lofty, 60 feet long, and 20 feet wide; the chancel, 23 feet by 17 feet; the aisles 11 feet wide. The nave and aisles are filled with substantial open oak seats, with carved heads. On each side the nave are four pier arches, but no elerestory windows. The west window has three lights; in the windows of the nave are two lights, with quatrefoil heads. The chancel is entered by one step, and distinguished from the nave by a perforated wood screen, of a light and elegant design. The floor of the chancel is laid with encaustic tiles, arranged in devices. On the south side of the chancel are a piscina and sedilia, and a credence table on the north; there is an east window to the chancel with three lights and three trefoils in head, filled with stained glass. The lower part of this and the other three windows of the chancel, are also filled with stained glass. The altar is approached by three steps.

The pulpit is of stone, panelled, with cham fered base and corbel, and entered by a flight of steps from the vestry. The lectern and reading desk are of oak. The font is octagonal, with trefoil cusped panel, and surmounted by a handsome oak canopied cover. It stands sgainst the pier to the left of the south entrance.

In the vestry we observed a massive oak chest studded with wrought-iron work. The hinges and furnitare on all the doors are also 549

· Upon entoring the church, it pres than usually ecclesisatical appearance. The open and substantial oak seats with carved heads, the light piers and arches, and above them the framed timbers of the roof, the quatrefoil headed windows of the aisles, the oak lectern and font, with its canopy, the stone pulpit, and lastly, the capacious chancel em-blazoned with the rich and solemn light prooceding from its stained-glass windows, produce a good effect.

As to the exterior, the high pitched roofs of the nave and chancel, the tower pierced with its belfry windows, and terminated by a foliated wrought-iron cross, the oak doors, the decorated stone crosses on the nave, chancel, and porch gables, the geometrical headed windows and massive buttresses, and the freestone quoins and dressings, contrasting with the various grey tints of the native stone, the various grey tints of the native stone render the appearance of the exterior remarks ably picture-que. About 100 yards on the north-west side of

the church, stands the rectory-house, of similar date to the church.

The churchyard is surrounded by a nest, low wall, flanked with shallow buttresses, and is entered through a lich gate, of massive cha-racter, with stone covering."

In this description we cannot avoid remarking on the introduction of a *stiscing*, at being unnecessary in a Protestant place of worship and quite out of place.

The lich-gate, some of our readers may need to be informed, is a govered gate into a churchyard to rest the corpse under, and shelter the mourners. Its literal meaning is corpse gate. Fylton church, three miles from Bristol,

was opened publicly on Tuesday se'nnight. has been entirely re-built on an old foundation with the exception of the tower at the west end. An aisle and porch have been added on the south sides of the nave, and a robingroom on the north side of the chancel. The style is early decorated. The materials used are rag, and bath stone dressings. The structure is very small, the chancel quite a miniature, but nevertheless contains stalls, a credence table (with the outward semplance of a piscina) in the north wall of the shancel, and is paved with encaustic tiles. The roof, both of nave, chancel, and aisle, is open, the scats (without doors) are of deal, varnished. The pulpit is of stone, and is attuched to the north wall of the pave in the angle formed by the pier of the chancel arch; the reading pew, is in the opposite angle. The lower story of the tower is open to the church. The tower externally is a low square structure, with a slated pyramidal roof. The parapet of the tower projects before the face of the wals and is carried on rudely sculptured heads,

Mr. Hicks was the architect; Brown and Phillips, both of Bristol, executed respectively the mason's and carpenter's work. The hinges, locks, latches, and other iron-

work, have received attention. Throughput the country very great improvement is to/ be observed, both in church architesture , and church-building. Minute points are stiended to, and a good feeling is observable even where great excellence has not been sttained.

Some extensive barracks are in the oparse of construction in the Gloacester-road, between the church last named, and Bristol. Numerous villa residences are also springing up around the city, to which a respectable appearance is given by the use of stone facings,

there cheaply attainable. The foundations are being laid, adjoining the new Guildhall in Bristol, for a branch bank, from designs by Mr. Cockerell. Will-cox and Son are the builders.

NORTON HALL.-The Earl of Ripon's family mansion in Lincolnshire, which was destroyed by fire in 1834, has been rebuilt, and is now nearly completed. The first stone was hid by Vicentia Carl laid by Viscount Gederich on the 25th of October 1841, with some ceremony. Mr. Shearburn, of Dorking, is the architect

NOVEL PROJECT FOR LONDON STREETS. A project is said to be contemplated that would strikingly alter the aspect of Lundon; it is to cover the footways with transparent verandahs, projecting from the houses, so that even on the wettest day the metropolis could be traversed from one end to enother without an umbrella.

HAUFDWINDOWS BROM RUSHTON LODGE.

WINDOWS FROM-RUSHTON LODGE, NORTHAMPTONSHIRE.

In the last number of THE BUILDER. we gave illustrations of the very curious triangular lodge at Rushton, in Northamptonshire, built by Sir Thomas Tresham, and noticed as one of the hiding places where the gun-powder plot was concocted. The annexed engravings represent two of the windows, and are further illustrations of the punning reference made to the owner's name, throughout the structure, previously pointed out: the openings themselves are trefoils; the divisions are all triangular, and the three-leaved shamrock, in threes, appears as a decoration. Any correspondent who may be able to send us an account of the interior of this building, would oblige us by doing se.

FREEMASONS OF THE CHURCH.

Nov. 11.—The Rev. G. Pocock, L.L.B., in the chair. The minutes of the last meeting were read and confirmed. The completion of the seal was announced, and the probability of conferring the diplomas by the maxt meeting.

bability of conferring the diplomas by the mattingeting, 5:11 Rogers then read a paper on the subject of "I liuminated Books in their memorian in with Architecture," illustrated mitheless of diagrams, about thirty in numbers, enlarged from MSS. preserved in various spublic, and private libraries. The first paint insisted upon was the fact, that the miniatures of illuminated MSS. of the middle, ages, contain a peculiar style of arohitecture which has never been carried into effect, but, that ip these examples, the successive changes by which the architectural chareserve, for each century is dustinguished, are elsently traceable. They are, however, varied, from chauses which in many cases are to be meertained. The Anglo-Suxons, for example, in their edifices always gave, the columns, of which they made a most frequent use, a abors and stanted form, consistent with their idens of immense durability, but it was by no greans the case, in the architegural details which they introduced into the miniatures of their books. An these we find them in almost revery enveloped actions of the tenth sentery, we produced to pay allel lines, was found, to she significant distray allows from a linest revery enveloped action of the shaft of a sylumna. futured to ray and the pay is indeed, an enlarged, drawing from a Miss. * Ses page 538, ante.

celebrated "Durham book" the capital of a column was enlarged; in this example, as in others from the same and similar volumes, the dog was a very prominent characteristic, a circumstance which was endeavoured to be accounted for by the fact, that this animal was venerated by the Ancient Phœnicians, "and we may," remarked Mr. Rogers, "by no tortured bypothesis assume, that what was originally represented from motives of devo-tion, habit contrived to perpetuate." The dog was afterwards the customary grotesque in Anglo Saxon, and eventually in Lombardic manuscripts. From a remarkably early volume Angressian, From a remarkably early volume of the Greek Gospels, the chair of St. Matthew and a tower at the back of St. Luke were given, and interesting specimens they were of architecture of a period with regard to which so little is generally known. In MS. architecture of the beginning of the twelfth century, the columns are represented very short, much enriched, and having bases generally of a disproportionate size, but towards the eud of this century we sgain find that yearning after attenuated forms and long columns, which formed so remarkable a feature in the architecture of the early English style, which was soon so totally to supersede it. An example of this, from Mr. Holford's collection, was referred to as described by Noel Humphreys, and a curious diagram from a MS. in the British Maseum, exhibited a column of considerable length, and a lectern, in the formation of which lightness seemed to have been procured at the sacrifice of strength. A lec-tern of the early English period was enlarged from "the Chronicles of Johan de Waling-ford," in the Arandel Library, and the next volume glanced at was a superb book exe-cuted in England in about the reign of Edward I., and kindly contributed by Mr. Sedgwick from the College of Physicians. The example enlarged from this MS. was an illustration of the 79th psalm, in which men, with various instruments, were represented in the act of demolishing a temple. Some examples were next given of MS. architecture of the "Decorated" period, and to elicit the style of the fifteenth century, drawings were prepared from "The Life of Richard, Earl of Warwick," in the British Museum. Mr. Rogers next re-ferred to the discovery of the baths of Adrian in Rome, as an important crisis in the bistory of book illustration. The Italian style was exemplified by some beautiful MSS, contri-buted by Mr. Jarman. The last specimen given was from an edition of Eussbius, of the six-

served in the Harlein Library. The next lecture was nonunsed for December 9, "On Architectural Acoustics," by Mr. Richard Cull.

teenth century, beautifully illuminated and pre-

BURFORD CHURCH, SALOP, DIOCESE OF HEREFORD.

THIS church contains a nave, chancel, and tower at the west end; the chancel has been recently restored by the present rector, the Rev. J. W. Joyce, the ceiling taken down, and roof thrown open. The stained-glass window which was put in a few years ago, in what was called the modern style, siz. with a circular head, has been taken out; in doing which the arch of the original window was brought to light; the tracery had been taken out. This is now restored. In taking down the old patsonage-house, the tracery of the window was found in part of the foundation. The altar steps are relaid, and a new arch formed between chancel to nave. In this chancel are buried some noble and ancient families, the barons of Burford, owners of the mators, and, amongst others, the daughter of John of Gaunt. The toms stands in a gothic arched recease in the north wall, on which reclines a sculptured stome figure of the above lady, sopported by angels at the head, and a dog at the foot; over the figure is the following inscription :—

A new organ has recently heat given to the church by the Hon. Misses Rushout, whose brother, Captain Rushout, nephew of Lord Northwick, is patron of the living. The state ladies have presented a new carpet and ahar cloth, with appropriate figures, worked with their own hands. In the churchyard stands the remains of the stone cross, upon three steps: the top and arms are broken off. Adjoining the churchyard stand three pareings heases, which were formerly occupied by the incombents of the different portions of the parisb. Only one of the houses now remains, and this has recently been rebuilt.

NEW THEATRE AT LISBON. — The new theatre of "Donna Maria Segunda" which was commenced in the spring of 1843, was opened to the public on the 29th which a is of the Ionic order, and advreed within a portico of six columns crowned by a prediment. Its extent may be inferred from the fact that its front contains two rows of were teen windows each. The work the fact that its front contains two rows is the Lodi, brother-in-law of the scound of Refrobo. Its cost is said to be 50,000%.

STORS TO CHAMPERS IN GOTHIC ARCHITECTURE.

1.2

STOPS TO CHAMFERS IN GOTHIC ARCHITECTURE.

IN all the architectural works of the middle ages, the greatest ingenuity is everywhere apparent, producing pleasing effects even when attending wholly to convenience and usefulness. It is shewn even where the angle of a wall or pier has been cut away in part, to give room; the junction of the angular line where left, with the plain face formed by cutting it away below (or chamfer as it is termed), being eleverly made into an ornament. Figures 1, 2, 3, and 4 (sketched by Mr. Wylson), shew Norman stops to chamfers, in Sherburn church, Yorkshire. Figure 5, represents a termination to a hollowed angle in Elgin Cathedral, Morayshire. Figures 6 and 7 shew the sec-tion on line A B, and line C D. This last mode of termination is often found in buildings of the thirteenth and fourteenth centuries.

Figure 8, represents the base to pier of central tower, Kirk-Fenton Church, Yorkshire; A.church which has lately been restored by Mrl G.F. Jones, of York.

WORKS IN THE PROVINCES.

Fig. 3.

Fig. 2.

THE foundation-stone of an extensive Gaol was laid last week at Winson Green, a distance of about two miles and a half from Birmingham. The ceremony was performed by Thomas Phillips, Esq.; Mr. Hill is the architect, and Mr. Walthen the builder. — The corner stone of a New Church at Alnwic, to be built and endowed at the sole expense of the Duke of Northumberland, was laid last week by His Grace in person. A glass plate, bearing the following inscription, was deposited underneath the stone, in a cavity prepared for its reception: — "Saint Paul's Church, erected by Hugh, third Duke of Northumberland, A.D. 1845." The plan is arranged as a nave and chancel, with aisles capable of containing 1,000 persons, in open seats, without galleries. The principal entrances are by a door in the tower at the west end, and a porch on the north side. The style selected is the decorrated, of the time of Edward III; with the high pitched open roof, the clerestory, and varied windows of that period. Mr. Salvin is the architect, and Mr. Novell the contractor.——The church of St. James the Apostle, at Greensted, Essex, was consectrated last week by the Bishop of Londob. The *Essex Herald*, in giving an account

of the ceremony, says, — The design is Gothic, in the early English styles of open benches, carved, terminating in the west by a recess, formed by the tower, wherein seats for children. The chancel is onnamented with two stained-glass windows on one side, and one on the other, also one in the east end. This window forms the most striking object to the eye on entering the church; in the centre is a representation of our blessed Redeemer upon the cross, and the remainder is taken up with scrolls; containing biblical inscriptions. There are also like inscriptions in ornamental scrolls upon the

Rev.

blessed Redeemer upon the cross, and the remainder is taken up with scrolls; containing biblical inscriptions. There are also like inscriptions in ornamental scrolls upon the walls of the church, in various parts. The roof is highly ornamented; the pulpit and font are of stone, elaborately carved. The pavement is tesselated. Messrs. Scott and Moffat were the architects, and Mr. Johnstone the builder.—The long-agitated question as to the locality for a general railway terminus at Perth has lately been settled and finally decided by the award of the Lords of the Privy Counicil on Trade. The situation chosen is a part of the western portion of the South Inch, immediately in front of Marsballs-place, which is to be used for the accommodation of passenger traffic solely, and mother site provided beyond the limits of the western portion of the

represent Illustratio

> ular, an ppears who mis netior siet a

South Inch for the engine, carriage, and waggon buildings of the companies, as well as for their merchandise establishments. A new Moravian chapel has lately been crected at moravian chapei has lately been erected at Bath. A local paper says, it is a "specimen of architectural taste, highly creditable to Mr. Wilson, by whom it was designed. Mr. Aust, the builder, has astonished all observers by the rapid advancement of this substantial structure. It was commenced about the end of March, and is now complete for the use of the congre gation."——The first stone of a new quay, at Wisbeach, was laid yesterday week, by Dr. Whitsed, the mayor. It is said that the authorities, in the construction of this work, are determined to combine ornament with utility.-A new church has lately been erected at Leeds, said to be of very costly and splendid architecture, bearing many of the features of architecture, bearing many of the features of the churches prior to the Reformation. Re-port states that it is designed as a model of the churches approved by the highest puseyites. — The restoration of the Norman Tower, Bury St. Edmunds, is proceeding. The Cambridge Camden Society has lately voted the superfect the superfect to work the sum of ten pounds towards the work, "which they trust will be received as a token of their good-will, and as a proof that, did their funds allow, they would be happy to appropriate a much larger sum to so praise-bursthe matter in a supervision of the supervision of worthy a restoration."--There is a rumour modious pier to be erected by the side of Globe-lane, on the bank of the l'bames, in a direct line with Beresford-street, which leads to the Royal Arsenal, to accomplish which leave a number of old dilapidated houses, nearly fallen into decay, between Beresford-street and the water side, will have to be razed to the ground, which can easily be done, as the leases are nearly expired.—A lithographed plan of a projected dock at Sunderland has been issued. It appears that the dock will be een issued. It appears that the dock will be situated a little to the south of the harbour, having an outlet into Hendon Bay; it will having an outlet into Hendon Bay; it will embrace an area of twenty-six acres, 3,160 feet in length, and 350 in width. A sea wall will be constructed, commencing a little be-yond the commissioners' works, and, pro-ceeding to the south-east of the Dove Rock, will be partly built upon the rock, and pro-tacted he intries thrown out into the sea. Ba tected by jetties thrown out into the sea. Between the jetties an additional natural barries will be formed by the accumulation of banks of sand. In the dock 360 vessels will be able at all times to lie aftoat. The project is brought forward ander the auspices of Mr. Hudson, and excites great interest in the north ticability, seems to warrant attention. The acheme is to bring water by gravitation from Loch Katrine, by an squeduct, to one or more distributing reservoirs adjacent to the city. The plan of taking the water from so large a The plan of taking the water from so large a natural fountain reservoir as Loch Katrine does away with the necessity for artificial fountain dams, at once very expensive and in-volving considerable risk. The water of Loch Katrine is very soft, and of perfect purity, even in seasons of drought, being col-lected from a district of steep bare hills, of the primitive formations. The level of the lake is so high above the level of the Clyde, at Glasgow, that the water may be conducted . 14 at Glasgow, that the water may be conducted from it to the highest ground in the neighbourhood of the city.——At Killerton House, near Excter, the scat of Sir Thomas D. Acland, Bart., a new range of hot-houses is in course of erection by Mr. Clarke, the hot-house Builder of Exeter, who has introduced all the as in ventilating and heating. The Western Luminary, in giving a description of the house and grounds, draws attention to a novelty and grounds, draws attention to a novely which may prove worthy the notice of those engaged in similar constructions. Where engaged in similar constructions. Where vines are planted outside the house, instead of cutting the sill or bottom rail of the front suches, to admit the vines, a false sill is intro-duced on the top of the main sill, and fastened to the uprights by means of a bolt at each side. This answers the purpose admirably, and without weakening any part of the building. Notice has been inserted in the London Gazette to the effect, that application is in-

£

b

11

tended to be made to parliament in the en-suing session for an act to authorise the erection of an Exchange, News Room and other public buildings, together with approaches thereto, in the parishes of the Holy Trinity and St. Mary, or one of them, in the town of Kingston-upon-Hull, and to incorporate a company, for the purpose of carrying such ob-jects into effect.—At a general meeting of the subscribers to the Hull Cemetery Company held last week, after hearing the report of the provisional committee read, it was resolved that immediate steps be taken for securing the purchase of the very suitable site near the Old Waterworks, offered by Henry Broadly, Esq., M.P. It was stated that in case the cemetery M.P. It was stated that in case the cemetery was formed on Mr. Broadley's ground, applica-tion would be made for the Government grant for making a promenade on the spring bank, as had already been proposed.—After a long and careful inquiry into the state and capabil-tion of Hull an event beta made her the Tidel ties of Hull as a port, lately made by the Tidal Harbour Commissioners, Captain Washing-ton, R.N., and Aaron Chapman, Esq., M.P. Those gentlemen declared the capabilities of the port to be infinitely superior to Liverpool, and to be absolutely unparalleled in the country. proper attention to its fa They declared that cilities for trade during the last forty years would have rendered its trade at this moment double what it is, and that nothing but the most reckless apathy of its inhabitants can prevent its rise, within a limited number of years, to a degree of business of which few of its residents have more than the faintest idea. To their certain knowledge there was no port possessing equal natural advantages in the kingdom—none superior in the world.—— On Thursday, the 30th ultimo, the first stone of a new church was laid by Lady Adeliza Manners, at Woolsthorpe, Lincolnshire, the birth place of Newton. The estimated cost birth place of Newton. The estimated cost is 2,500*l.*, of which 2,000*l*. has been raised. It is understood that the Ecclesiastical Commissioners intend pulling down the old deanery at Lincoln, and building a new one for the residence of the new dean.—Among the projects in the north, we observe one for a the projects in the north, we observe one for a tunnel to connect the opposite shores of the Clyde, beneath its bed—the spot chosen being a little above Govan, at or near the lands of Heatherby Hall.—The new church at Wood-ford lately erected under the superintendence of Messrs. Wyatt and Brandon, was conse-crated last week by Bishop of Salisbury. The old church with the exception of the tower, which is comparatively of recent date was enwhich is comparatively of recent date, was enwhich is comparatively of recent este, was en-tirely removed.—The town of Galway has been fixed on, as the capital of the western province, for the site of one of the new Irish colleges.—A colossal status is about to be erected to the memory of Sir James Shaw, late Chamberlain of the city of London. Mr. Fillans is the sculptor selected. It will be placed conspicuously in Kilmarnock, the birthplace of Sir James.—Llanelly church, which has lately undergone a thorough repair and been considerably enlarged, was re-opened last week by the Bishop of St. Davids.

BUST OF ROBERT LORD CLIVE, K.B.-We understand that a splendid bust of the great Lord Clive has arrived at Powis Castle. It has been executed in Carrara marble, of the has been executed in Carrara marble, of the purest quality, by desire of his grandson, the present Earl of Powis, K.G. It may be men-tioned, that although several portraits of his lordship were painted, this is the first and only bust in existence being modelled from a full-length portrait at Walcot, and does infinite credit to the correct taste and skill of the sculptor, John Evan Thomas, F.S.A., of Lon-don whose chisel has imparted to this fine indon, whose chisel has imparted to this fine intellectual head, a life-like appearance, beam-ing with that benevolence and generous feelwhich characterised his lordship's life; ing while the features are strikingly formed to command, and marked with determination to carry out its resolves. His lordship represented the town of Shrewsbury in parliament for nearly fourteen years; he was elected mayor in 1762, and filled the bonourable office of recorder from 1771 to his decease, November 22nd, 1774.—Shropshire Journal.

ACCIDENT AT ST JOHN'S CHURCH, WOOLvich.—An account has reached us, of the fall of part of this edifice. As we are ignorant of the real cause, and have not yet inspected the building personally, we postpone comment.

RAILWAY JOTTINGS.

THE station at the Eastern Counties is to be enlarged by taking down the houses between the station and Spitalfields church, clearing away the whole south side of Union-street. —An attempt is being made to establish an institution at the West-end of London, for the collection and promulgation of information respecting railways, mines, &c., and to ec-operate with the several public places of meet-ing in the city by means of the electric telegraph. It is proposed to purchase the Ade-laide Gallery for the *locale*, and to alter it very considerably for the purposes required. The South Eastern has concluded contracts for the Ashford and Hastings. Within eight months the line between Ashford and Rye is to be completed.——The London and Birming-ham has decided upon immediately laying down a second line of rails between Peterborough and Northsmpton, the traffic upon the present single line far exceeded expe ėtation.——The contract for the Altrincham line, seven miles in length, was taken by Mr. Brogden, and the South Junction by Mr. David Bellhouse, of Manquester. The latter line, which will connect the Manchester and Birmingham with the Liverpool and Manchester will commence at London-road, and terminate at Ordsall-lane, Salford; the whole length, one mile and three-quarters, being car-ried on brick and stone arches, and thirteen large iron bridges, three of which will be re-spectively 105 feet, and 71 feet in spen. Mr. Nash, the prosecutor of the two railway robbers, Maynard and Garratt, terminates his preseworthy labours, by effering the following advice to travellers : --- "1. Let the passengers watch and see their leg-gage put into the luggage van or train, and not be content with seeing it on the platform. 2. As far as practicable, take small lug-gage and packages into the carriages with themselves. 3. Not to mention that their packages are valuable. 4. To have their names and addresses, and particularly the place going to, pasted on the outside (and not mercely tied on) their luggage. S. To advertise and on) their luggage. 5. To advertise and make known to the shief superintendents and police authorities (to have put in the Police Gazette) their losses, and contents and marks of property lost. Bearing in mind that it is on the platforms must of the abstractions take place, mistakes and exchapges are affected, and more will happen, until a quick and secure arrangement be made."____The purchases of arrangement be made."—The purchases of land for the Berks and Hants, which is to unite the Great Western and Bouth-Western, are nearly completed. The directors of the Great Western, also, have letthe works between Hungerford and Basingstoke to contractors. The workmen are engaged shaft-sinking. Mr. Hudson, as the representative of the Newcastle and Darlington Company, has offered to take the Durham and Sunderland Railway, with all its liabilities, amounting to 300,000%. paying the shareholders 314.10s. per share; and his offer has been accepted.—Mr. Robert Stephenson has left England for Italy and Spain, to superintend operations on various railways in those countries. He is not expected to return until the close of the year. ---- With to return until the close of the year. With the view to prevent or lessen the evils of acei-dents resulting from collision, it has been sug-gested that every passenger train should be accompanied in the rear by a carriage con-structed entirely of powerful eprings and some such material as India-rabber, of elasticity enough to act and recoil effectually under a violent collision, performing in those extraordinary circumstances the purpose that the buffers serve in ordinary.

......

ST. ALBAN'S ABORITROTURAL SOCIETY .---The object of this society is to sid in promoting a more general acquaintance with those memorials of past ages which tend to illustrate the history and principles of architecture in England. With this view, its attention will be principally directed to the Abbey Church of St. Alban's and the several churches within the country; not, however, excluding other examples of the earlier or middle ages. The society is at present but in its infancy, yet it already numbers amongst its patrons and mem-bers, the Marquis of Nothampton, president of the Royal Society, the Bishop of Oxford, the Archdeacon Burney, the rector of St. Alban's, and a considerable list both of clergy and laity.

TABLE FOR CALCULATING THE STENGTH OF CAST-IRON BEAMS.

2

2

s : L 1ŝ

1

THE STENGTH OF CAST-IRON BEAMS. WHEN the table for facilitating the compu-tation of cast-iron beams, which appears at page 499 of the present volume, was drawn up for insertion in the BULDER, it was thought sufficient to limit the argument or depth of section, to about four feet, on the suppo-sition that *that* would be found to embrace the usual range of practice. But in the supple-ment to that number in which the table is given, there is a description of a cast-iron given, there is a description of a cast-iron pression, he h bridge across the river Wharne, on the York and Midland Railway, where it is stated that the depth of the girders varies from four feet found useful. 17

eight inches to three feet three inches. On seeing this, the author became impressed with the belief that by extending the table to a depth of five feet, and adapting it to sixteenths of an inch instead of tenths, its value as an instrument of calculation would be greatly eninstrument of calculation would be greatly en-hanced, not only on account of its embracing a more extensive range, but because the com-mon foot-rules are more generally divided octogesimally, than either decimally or duode-cimally; and consequently, under this im-pression, he has with great labour computed the table which he now lays before the readers of the BUILDER, in the hopes that it will be found useful.

The principles and data on which the numbers depend are the same as those adopted for the table at page 499; and their accuracy has been ensured by the method of computation employed; they have been deduced from one another by the continued summation of the first and second order of differences, and a check was had at every eighth and sixteenth number by means of the previous table, which was computed and checked in a similar way; and in order that the checks should be rendered efficient, the decimals were maintained at their full extent throughout the operation, although they are tabulated only to four places.

254

The table is used in precisely the same midther as we have exemplified at pages 499 and 513, and need not therefore be again ex-plained, but the application to other forms of sections, now much approved of, will be the subject of another communication.

etsad≁ The Con WESTMINSTER COURT OF SEWERS.

A VERY numerous meeting of the commis-signers took place on Friday, the 7th instant. This cash at the bankers was reported to be 16:6241. Os. 5d.

On an application for warrants of distress against certain inhabitanta of the weaters di-vision, the chairman said, "not to day." Mr. Leslie, called upon the chairman to say why be would not sign the warrants of distress or to let would not sign the warpants of distress or to let the Court be informed of the reason? and then proceeded to say that the inhabitants of the western division had been made to pay apwards of 16,000. since February last, while the whole amount of the contractors' bills from Nov. 1844 to Michaelmas 1845, for the western division, amounted only to 1,288. 7s. 11d. that 1360 of the inhabitants of the western division had been summand to the Court to Kautobild with the warpant of disting so had been affew cause why warrants of distress should not be issued against their goods, and 245 warrants of distress 'Hat 'ischull' then signed by the

forms were granted to various applicants. The clerk then read a letter he had received

mithe Under Secretary of State, of which f the following is a copy.

Whitehall, 1st November, 1845. Bin, ---- V an directed by Secretary Sir James Grahum to call your attention to my Letter of the 15th Angust last, and to request that you will move the Commissioners of Sewers for Westminster and the commissioners of Severs for Westmisster and part of Middlesex to favour Sir James Graham, at their earliest convenience, with their observations on the allegations contained in the Pamphlet of Mr. John Lestle.—I am, Sir, &c. ad. (Signed) H. MANNERS SUTTON.

The chairman said the Court had appointed committee in September to draw up observations of "the pamphlet, in compliance with the request of Sir James Graham. That in consequences of the long period over which the pamphlet ranged, the committee, had required many returns from their own officers, and returns also from the Holborn and Finsbury complesioners, and it, took some time to prepare these returns; and one from the Hol-born and Finsbury, commission had only reprepare these returns; and one from the root born and Finabury, commission had only re-cently been received. At the last meeting of the committee, it had adjourned, that a draft repart might be prepared offerdraft report was prepared, and the committee would meet on Wednesday next (the 12th inst.) to settle it, and, bring their inborious investigations to a closer. He would therefore suggest that their answer to the letten of the Secretary of State

anawer to the letter of the Secretary of State be, that the committee had closed their investi-gation, and with preparing their report. Captain Bague, and atterwards, Mr. Wil-liam Ponaktwor; complained that Mr. Hertslet, the Plerk, had printed and circulated the letter from Mr. Manvers Satton without having tonsulted the chairman. The chairman also intimated his disapprobation of the course pursued; all former chairmen had been consulfed as to the printing of any paper, and also as to the business paper of the day, and it looked invitibus "that he, their present chairman, was to be the exception to the lewand the practice. Mrs Leslie defended the course adopted. The Mrs Lesile defended the course adopted. The cleik had received an important communication from the Secretary of State, requiring him to "move the commissioners," and he thought that the best way to move the commissioners, was to" let them individually, know that the Secretary, of State wished them to move. What did the commissioners know about the proceedings, of, the committee?. That som-mittee had voted itself a sorretecommittee; their minutes were riored to the even of every comminutes were cloud to the eye of every commissioner, a this was a power the compittee itself had assumed, without asking the Court. itself had assumed, without taking the Court. He thought it a dangarous proceeding i he begged in the observation he way inde on that verte committee, to be understood as feeling no anxiety. about what the committee might report price way so mirronfield by facts, that he considered, almost anvulnerable. The chairman was anxious that the officers should

have no will of their own, but this was not the have ho will of their own, but this was not the law. The general statutes authorised the commissioners to 'elect a chairman at every meeting of the Court, and during the non-sitting of the commissioners, the clerk was the only legally known authority to communi-cate with. The practice in this Court had been otherwise: here the chairman had been supreme. Many years ago a bricklayer of the name of Gray, had obtained a nomination as a commissioner; he eventually became the chairman of the Court; he contrived, to get two nephews of his of the name of Saunders nominated as commissioners; one of these nominated as commissioners; one of these nephews, George Saunders, an architect, subse-quently became chairman of this Court, and for 28 years did almost us he liked. The officers had been the more servants of the various chairmen; he felt satisfied that the commissioners generally would approve of the course Mr. Hertslet had adopted in apprising every commissioner of the letter from the every commissioner of the letter from the Secretary of State. Mr. Gunter also defended the course pursued. Mr. W. Donaldson handed in the follow-

ing notice of motion for the next Court: "That the clerk do not issue any printed circular to the commissioners without the express order of the Court, or the sanction of the cheirman,"

Mr. Farlar stated that what had been said about the extraordinary powers exercised by the chairman of the Court was perfectly true When he, Mr. Farlar, was first made a com-missioner there was no business paper at all, sent to the commissioners; the chairman brought forward any subject just as he liked, or saw by the parties present that he could carry. The former chairman, Mr. Saunders, used to say when attacked by him, if you had known the Court, Mr. Farlar, when Mr. White was chairman, when his relatives where doing the work, then indeed you might have said it was corrupt. He thought Mr. Hertslet had taken the wise course to print and circulate the letter from the Secretary of State.

The Court then proceeded, "To consider the steps necessary to be taken in consequence of the resignation of Mr. George Hawkins, assistant surveyor. Mr. Leslie to move, that the vacancy in the office of assistant surveyor he filled up by the appointment of Mr. John Phillips, now second clerk of the works,"

Mr. Leslie called upon the Court to support the motion, and he thought they would do so without a dissentient voice, when they considered the course theseveral recent Courtshad adopted. The forms of sewers which Mr. Phillips had pade, and which had been so strongly urged upon the Court by the eminent testimonials in their favour, were now the forms adopted by the Court: so large a number as nearly 4,500 feet of sewers of these forms had been applied for and granted this day: who, then, so likely to see them carried out properly as the author of them? Mr. Leslie thought it right to put Mr. Phillips' abilities to the test as to his powers of surveying, levelling, and laying down s section : he had asked Mr. Dawley to allow Mr. Phillips the use of the necessary instruments and labourer for the purpose, which Mr. Dowley readily complied with, and on Monday the 3rd inst. the task set Mr. Phillips was performed. The survey selected was from the outlet of the sewer at the bottom of Northumberland-street, up that street along the Strand, Cockspur-street, Pall-mall, Cleveland-row, and disgo-nally across the Green-park to the Man-hole, opposite White Horse-street, where nearly all the northern drainage of the metropolis de-scended. The distance between the two points was about 5,400 feet, the fall was about 31 inches per 100 feet. But the bottom of the outlet at Northumberland-street might he lowered to low water-mark, whereby an increased fall of 8 feet might be gained. The result of the task 8 feet might be gained. The result of the task selected for Mr. Phillips was the drawing he then held in his hand, and which he would pase round the Court, that every commissioner might judge the sort of man he wished, for the public interest, to see placed in a situation of io-creased usefulness, and to be enabled to aid in carrying out those great improvements which the votes of recent Courts had made their OWD.

Captain Bague, R. N., had the greatest po sible pleasure in seconding Mr. Leslie's motion. He thought Mr. Phillips had schubited so much talent, that the Court would act imost wisely in securing his services.

Mr. Gunter very warmly supported the mo-tion. He had not the pleasure, of knowing Mr. Phillips, but, from what he had seen of his abilities as a clerk of, the, works, he felt

confident the appointment would, be one most beneficial to the public. He understood Mr. Phillips was almost a self-educated man with considerable talents, which he assidupted well-tivated. It would be impossible, after seeing the admirable manner in which the task Mr. Leslie had set Mr. Phillips, had been ; accomplished, to deny his shility. There was out circumstance connected with Mr. Phillips' history which gave him (Mr. Gunter) great plea-sure, and it was, that Mr. Phillips, in those sure, and it was, that Mr. Phillips, in those hours which many gave to pleasure, idle re-creation, or the public-house, had devoted himself to the instruction of others; he had a large class, which he was teaching weekly practical geometry. Such a man deserved encouragement, and he would cheerfully vote for his appointment.

Mr. Le Breton rose to move an amendment, " That the office of assistant surveyor, now vacant by the resignation of Mr. George L kins, be not filled up until the whole question q and the expediency of making a change therein," be considered at a special meeting, to be held." to consider the same."

Mr. Allason vary briefly seconded the amend of ment, which was supported by Mr. Häwkes" and Mr. Harrison, who avowed; that if the chairman in favour of the améndment. The names of the commissioners voting were, for the amendment—Messre, Allanon, Boodle, jun., Beachcroft, Cantwell, Crace, W., Doneldare, W. B. France, Harrison, Hawkes, Le, Bre-H ton, and Willoughby; against the barged are ment—Hon. F. Byng, Capt. Bagues, Meseri. Branscombe, Cumberlege, Farlars, Fuller, Gunter, Leslie, Moss, and Weed. A subject for The Court then ordered a Special Court on I Friday. Nov. 14th, st. one of Meseri.

Friday, Nov. 14th; at one solors precisely, "To consider as to the efficiency of the two veyors' department, and is to the expediency of making a change there is (20012) at 200 gard wob. 7 2 6 ° 🚽

Correspondence.

(1, 2, 2, 3) = f(1, 2, 3)THE EGG SHAPED SEWER.

-I feel much gratified with my fellows, SIB,rate-payers, at the result of the decision of the soft commissioners of sewers for this division; the sixteen against five will, I hope, settle the point in dispute, as to the mud-bailding sever with in dispute, as to the mud-belding sever with perpendicular sides, and the egg-shaped sever. One half the sum collected for rates within the last twenty years would, if it had been expended upon the new plan, have made the drainage perfect. I am sure the public will feel indebted to THE BUILDER for the assistance

it has afforded in the good cause. I am not looking at this as a local question only; the subject of proper drainage is now mooted throughout the nation, and wo may hope to see the egg-shaped sewer introduced universally. As the egg-shape now in use in () the Finsbury division will, I have no doubt with in time come into general use, it would be wellif THE BUILDER could ascertain, who was the inventor of this shape, as I cousider it into the portant as an historical fact. Probably Mr. -Role, if applied to, would state whether it may this invention, or whether he received the the from any other person.—I am, Sir, &c. Westminster. E. E. E.

CONVEYANCE OF WATER.

Sin,-Your correspondent who inquires on this head, may obtain at small cost, terro-me-tallie pipes for " conveyance of water," at Mr. s, Whitefriars. Peake

Peake's, Whitefriars. Peake's, Whitefriars. Perhase pipes do not injure pure water; they are exceedingly durable; socket pipes have been used to convey water long distances over ondulating ground, terminating in one in-stance in a perpendicular rise of 40 or 50 feet to the tops of buildings. For such purposes each pipe is proved by hydraulic pressure. The plain or dead joints will do for your cor-respondent's purpose provided the soil is respondent's purpose provided the soil 18 clayey. + +

NOTICES OF CONTRACTS.

We are compelled by the interference of the Stamp Office to omit the names of the parties to whom tenders, &c., are to be addressed. For the convenience of our readers, however, they are entered in a book, and may be seen on application at the office of "The Builder," 2, York-street, Covent-garden.]

For building a new church at Tetbury, Gloucestershire.

For repairing or new paying the footways and carriage ways of certain streets and places in the parish of St. John the Evangelist, Westminster. For the supply of 40 fathoms of yellow Deal

ends to the Guardians of the Kensington Workhouse.

For the execution of the work forming the second division of the Dundalk and Enniskillen Rail-

Cond division of the Dundalk and Enniskillen Rail-way, being a distance of 10 miles.
 For the supply of 1,027, of 15-inch cast-iron socket pipes, measuring 3,080 yards, to the Com-mercial Gas-light Company, Stepney.
 For the execution of the works forming the Burnley contract of the East Lancashire Railway.
 (Extension of time.)

were, for . ROULLIAGNOD Boodle, jun.

Plans for the enlargement of the Suffolk General Hospital, and tenders for the execution of the work,

Hospital, and tenders for the execution of the work, are required by the Hospital Committee. Plans, specifications, and estimates are required by the committee for the erection of the South Staffordshire General Hospital, Wolverhampton. The sum of 1004, will be given for the one selected. The Provisional Committee of the National Glass

Company of Ireland require plans and specifications, &c., for the erection of all the necessary Buildings, comprising an extensive manufactory for making crown (window) glass; also plans for an extensive manufactory of plate glass. 251. will be given for each plan selected, or 501 for both if to the same individual.

APPROACHING SALES OF WOOD, &c.

At the Railway Tavern, Wallingford-road sta-tion: 2,000 clean Beech trees, of good growth; also a few lots of Ash and Cherry-tree timber, all now standing in Unhill-wood, four miles from Wallingford.

At Haselgrove, Queen Camel, Somerset : Up-wards of 1,000 maiden Oak, Elm, and Ash timber

At Garraway's Coffee-house, Cornhill: 628 logs and curls of St. Domingo Mahogany, being the entire cargo of the *Diadem*, just landed.

MOREWOOD AND BOGERS' PATENT GAL-VANIZED TINNED IBON.

W. BEALE begs to acquaint the pub-corrugated, fix pipes, guiters, &c. Also chimney-tops and ventilating cowls of every description; also water and oil cisterns, of this incorrodible and fireproof metal. He manu-factures all kinds of baths, as hip, shower, Roman, open, slippef, sponging, foot, children's, and self-heating baths; also tofist-cans and pails, slop-pails, coal-scattles, cash and deed-baxes, and fire-proof safes of every description, 10 per cent. cheaper than any house in London. The PATENT GALVANIZED TINNED IRON is ap-plicable to the following uses: -The Lining of Ships' Shore. Roomp, Ships' Water Buckets, Water Jucks and Receivers, and for almost every purpose to which sine, tin, copper, brass, or any other metal is now applied; is more durable, and manufactured at much less expense. An experienced workman sent to any part of the kingdom. All orders punctually attended to. For particulars, apply to T.W. BEALE, 40, Bridge House-place, Newington Causeway. W. BEALE begs to acquaint the pub-

MOREWOOD and ROGER'S PATENT GALVANIZED TINNED METAL. — This article the Patentees finding that the public, in some instances, over-looking the word Tin, confounded thearticle with Galvanised Iron, and that the glaracter of their metal has thereby sus-tained injury, are deaffous of giving it a name so distinctive as to prevent such mitakes, and Cousequent disappointment to purchasers in future. They therefore respectfully request to prevent to inquiryfor MOREWOOD and HOGER'S PATENT GALVANIZED TINNED IRON. In order to enable the public readily and at first sight to distinguish between the two sheats, it may be well to inform them, that Galvanised. Iron has a plain inc-like appearance, while M. and K's Patent Galvanised Tinned Iron has a smooth crystalline surface. MOREWOOD and ROGER'S PATENT GALVA-NIZED TINNED IRON, Patronised by the Admiralty and the Honourable Board of Ordnance, being extensively used in her Majesty's Dock-yards, at the Tower, and elsewhere, for wery waity of Roofing, and other purposes, where a strong light, cheep, and durable material is ze-quired. It has been found by experience that this article is beyond

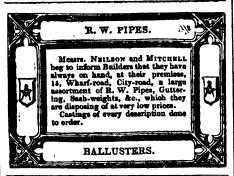

where a strong light, cheap, and durable material is re-quired. It has been found by experience that this article is beyond all comparison superior to sinc; possessing, as it does, all the advantages arising from the strength and firmness of iron, combined with perfect immunity from rust; whilst it is free from the very serious objection which applies to sinc, vis. its contraction and expansion, consequent upon every change of temperature, and from which circumstance leakage must of course gesult. This material is not likely to be destroyed by fire, as is the case with sinc ind lead, which melt and run down, thus freely admitting free hair to the fire, and causing it to burn more fercely. It is, therefore, obviously well adapted for all the purpose above-named, and most importantly so, when there is the gesubbility of fire. It is also peculiarly suitable for chinney-tops, gutters, spouting, and out-door work generally, possessing the strength of iron, without its liability to chromon. It is by far this ond iron, whon the is strength, and which a strength, and upon the lightest rations.

REDUCTION IN THE PRICE OF BUNNETT AND CORPE'S PATENT BEVOLVING IRON SHUTTERS.

PATENT REVOLVING IRON SHUTTERS. THE validity of this Patent being com-pletaly established, the Patentees have much pleasure in staing that the very extensive demand, and the suploy-ment of improved machinery in the manufacture, have given them an opportunity (of which they gratefully avail them-selves) of making a considerable reduction in the price of this well-knowmand tried invention, thereby rendering them is the cheapest as well as the best iron shutters in use. Every improvement suggested by practical skill and most exten-vice application has been adopted, and no effective RE-VOLVING IRON SHUTTER can be constructed without infringing B. and C.'s patent. These shutters can be ap-plied horizontally, either above or below the window, or vertically, as introduced by BUNNETT and COBPE, in some of the largest establishments : they are made with best or corrugated laths, if required. BEVOLVING WOOD SHUTTERS.

REVOLVING WOOD SHUTTERS.

REVOLVING WOOD SHUTTERS, with their patent raising machinery, or with counterbalance weights, and with proper metallic hinges, without which no shatters can be safe or durable. ·r·

ARLIAMENTARY stand-.ing orders require that plans of railways, with books of reference, must be deposited with the various clerks of the peace, on or before Sa-

turday next. Without this step, a project can have no status this session ; moreover, to maintain this status, and get an opportunity to try to prove the preamble of the Bill, the plan and Book of Reference must be correct, and in accordance with certain regulations. Ponder this, ye peeudo-surveyors at seven guineas per day ! reflect on it, ye unwise hirers of such,ye men of much haste and little speed. The "flock of rising barristers, recent products of the railway system, -hatched and bred in the ovens, 'yclept committee-rooms, already look forward to the easy triumph which your expected errors, omissions, and impracticabilities, will yield them; knowing, well as they dq, that the slightest grounds for declaring standing orders not complied with," will be eagerly seized by the committee, in their anxjety to lessen the number of schemes before the House.

i ... Scores of the parties employed in surveying, levelling, and mapping, are utterly incompetent, and yet are paid immense salaries for their services. We know youngsters, hardly able to tell the right end of a theodolite from the wrong, who are receiving two, three, and four gaineas a day and their expenses. The supposed necessity for going to Parliament immedistely, and the insufficient number of surveyors, as compared with the number of projects, have induced an expenditure so lavish and reckless, as to prove that the parties making it, are wholly unfit to direct the schemes of which they are the heads, and dispense money balonging to others. A non-prefessional acunintance of ours, who has a tolerable knowledge of surveying and levelling (in theory), was called on by a solicitor who had heard of his attainments in these respects, to know on what terms he would undertake to map a certain portion of a line. "I am not disposed to do it at all," said our friend. "We will give you three guineas a day," urged the solicitor. "That would not induce me," was the reply. "Well, four then,-nay, five, if four won't do; a map we must have within four weeks from this time." Our friend still shook his head; but ultimately said, simply with the view of getting rid of the applicant, that he would make the attempt, if they would pay him twelve guineas a day for two months certain. The proposal was immediately accepted ; and, before he left town, he received intimation that they should not object to pay for the seventh day of the week; and he is now positively at work on these terms.

None of our readers will consider us opposed in any degree to railways : every line properly carried out will improve trade, call labour into employment, and advance both the intellectual and commercial power of the nation. To the textent of our ability we have encouraged and will encourage, the investment of capital in their construction, satisfied further, that it will and net only to the good of the community, Bit the pecunicary advantage of the individuals THE BUILDER.

so employing it. We do, however, object to, and reprobate severely, the lavish and useless expenditure of the subscribers' money, which prevents the possibility of any return being made for a long period of time, and has the effect of checking real improvements, by driving away prudent capitalists (the most important class), who are seeking investments, and who, if they took shares, would do so to hold.

The money spent on the old lines was enormous, very much more than was necessary. But the proposed lines, if from the foot we may judge the statue, are to surpass them far in imprudence and reckless extravagance. Engineers are to be paid any sum, no matter how preposterous the amount may be, that will induce them to undertake the matter; landowners any sum that will secure their consent; and when we add to this the enormous expense to which, after all, in nine cases out of ten, they will be put, most unwisely, by the opposition of existing companies and others, to say nothing of the cost of construction, directors' fees, &c., the possibility of the line paying, even should the application be successful, is seen to be postponed for many years.

Moreover, with all this cost, the actual work (supposing preliminary errors to be got over), will not be well done. When an engineer rides once over the ground, and then settles the line in his library, either with or without a few maps, and some suggestions from local men, he may by possibility, hit on the best and most economical course; the chances, however, are wholly against it. Thousands of pounds will be spent, through the engineer being ignorant of the nature of the land over or through which the road is to pass, and thousands more, because he had not time to ascend a neighbouring eminence, which would have shewn him how, by a trifling detour, costly works might have been avoided.

"We are perfectly aware of all this," provisional committees may say,--- " but what is to be done? The time is coming on, and to Parliament we must go at once." To Parliament you must go, gentlemen, doubtless ; but why at once? Take advice; and unless your line has been thoroughly digested and canvassed; carefully surveyed and planned; and you are perfectly satisfied that you can meet all the requirements of the Legislature, delay your spplication till the following session. True, the temporary value of your scrip will fall, but your permanent interests, and those of the subscribers generally, always supposing that your project be a sound one, will unquestionably be advanced. Your scheme might lose its position as an instrument of gambling, but would gain the confideration of those who are seeking to invest their money in reasonable projects, directed by honourable and enlightened men.

MUSEUM OF NATIONAL ANTIQUITIES.

THE report, to which we referred some time ago, that Lord Prudhoe, through the Archæo-logical Institute, had offered his collection of national antiquities to the British Museum, on condition that they would set apart a proper place for the reception of other collections cearing on the same subject, is confirmed ; and, better still, the trustees have accepted the terms, and appear, at last, disposed to take up this most important matter with earnestnes In a leading article on the subject in April last,* wherein we argued the advantages that would follow such a collection, we alluded to an application made to the trustees of the Museum two years before, praying them to provide accommodation in their new building

* See page 151, ante.

for British architectural antiquities. The trustees returned for answer that they were not prepared to recommend her Majesty's Government to do so.

Since then, it appears, their eyes have been opened to its importance by the Archeological Institute, to whom all who are interested in the subject must therefore feel grateful. At At the last meeting of the Institute of Architects (a report of which will be found on the next page), the following communication addressed by Mr. Edward Hawkins to Mr. Poynter, the honorary secretary, was read :-

"British Museum, Nov. 17, 1845.

My DEAR SIR,—As the fermation of an extensive collection of national antiquities in contemplated at the British Museum, and as a room for their reception will shortly be opened in that establishment, I am most anxious as the keeper of the department of antiquities, to take every step for the furtherance of this object. The committee of the Archaeological Institute, kindly co-operating with the Mussum in the desire to form such a collection, have already taken active measures towards the awakening public interest in the matter. Much will, I am sure, be accomplished by their exertions, but they feel as I do, the necessity of seeking the aid of those who, by the experience and opportunities of their profession, are best able to carry out some general scheme for the record and preservation of antiquities found in this country. A great part of such abjects are discovered in works conducted under the control and inspection of architects, and it is to the professional knowledge of the architest that we are generally indebted for an authentic account of such discoveries, and by his influence, that antiquities thus found can be best protected. I therefore venture to address myself on this subject through you, their secre-tary, to the Fellows of the Royal Institute of British Architects, hoping that by their authority and example, an active interest in the preservation of antiquities may be created in the whole body of their profession, and may thus be gradually communicated to their clerks, and to the foremen and others more immediately set over workmen employed in labours of excavation and demolition.

The claims of archæology once publicly re-cognized, antiquities when discovered would no longer be ignorantly destroyed or dispersed, no longer beignorantly destroyed or depersed, but would be scrupulously collected together into one place; the circumstances of their dis-covery would be registered with far greater accuracy, and the result in a few years would be a most interesting collection of monuments of national art, and the development of the history of successive means as far as it may be history of successive races, as far as it wan be gathered from the evidences of arche ology, and as it is exhibited in the museums of other countries

I need hardly here remind you, that if to the archmologist hardly any comparison seems too extensive or too minate, if he seek to bring together every fragment of the works of former races, and studies not only the mobler specimens of their art, but every variety of specimens of their art, but every variety to type in the fashion of their costume, and the implements of their daily life, he decesse with the deep conviction, that in all these relics there is meaning and value, not meraly because they may singly corroborate or by chance supply history, but because when put together and viewed in connection, they exhibit with peculiar reality, the character of an age or race as it has unconsciously revealed itself in its art and handicraft.

I trust that the truly national character of the object set forth in this letter, may serve as my spology for having ventured to make this appeal to the Fellows of the Institute of Architects; if in these remarks is found no definite request or proposition as to the mode of recording or guarding discoveries of antiquities, it is because I would rather invite the sugges-tions of others, best qualified by professional experience, to decide what measures are pracicable for such a purpose. " I remain, my dear Bir, youve truly, Edward HAWKINS."

We cordially echo Mr. Hawkins' wish, that we cordially echo Mr. Hawkins' wish, that by the authority and example of the Institute, an active interest in the preservation of anti-quities may be excited in the whole body of the profession, and may be communicated to workmen and others, employed in excavations. We shall return to the subject forthwith.

558

TE FOYAL INSTITUTE OF BRITISH ARCHITECTS

The most agregable and instructive avenings apart at the Institute, are those when, two or three short suggestive papers being read, the three short suggestive papers using read, the members are led into conversation and dividus-sion." This was the case on Monday, avaning last." Mr. Rendall was in the chairs inset the meeting was numerous. Amongst the dana-tions was a theck for 20% from Ganegal Paskey, for the purposes of the Institutes, a Weitsmet the etiment will immediately, apply, it to the improvement of the library, to which, by the dividued. A good architectural library; easily increasible, is much required, much formed by the institute, will be found a sheet anchor we which to depend, hereafters should the wind at any time be less anounced that the connect hel voted the library anaounced that the Giventity Beuth, letely the chief director of the Giventity works in Prusia, on his retire-ment from office. Mr. Poppier, hos. sec., read a catalogue drawn up by inneelf and Mr. members are led into conversation, and diffus-

possession, of which he had caused to be made a small number of fac simile copies for friends and unlike libraties." Some specimens of Dr. Arastra whee were institut on and described : and led to a conversation on anoky chimneys, where sowed what very different opinions are entermined an apparently simple points. The hunovery secretary read a letter from Mr. Hawking on the proposed collection of national antiputes at the British Museum), given on the proseding page; and called on Mr. Newton, one of the officers' of the Museum, who was in the soon, to give further explanation. Mr. Nowton bedt most in the interiors to establish a Museum of Mational Antiquities, but had not felt themselver if a position to do so till now. Museum of Training Antiquities, but had not felt themselves in a position to do so till now. It was most desirable that a point of preserva-tion should be induced, and that relics, when found, should be transmitted to a public re-pository, suther that be placed in private hambered is is allowed into the

handszteyls is isotronit into it. Mis Discours glad of the opportunity which the softrody isots, its der the public right on a pastication point, in events in with anti-quisies in the site of this sort were little careablers in the with and that they looked after mothing, but suffered rail way shares. In realisystopwives this was not the case. There were make withis with way which and to be keen consthere suffered? Which and the is were wers many iters who has were most anxious to keep together such said of the mains as were found. These views were greatly interfered with by those gentlankes who kingly, were run-ning, after all the antibuities which were brought to light; sand were avoired "to buy them ... Such is course gaugestrify led to their discourse (Were the set for the to their dispanions Wilen they water excavating for the Exchanger futnessing that many relics would probably be discovered, and most anxiaus that they should talk be kept together, the

THE BUILDER.

tractor was bound, under heavy penalties, place every thing that was discovered, in the hands of the committee, and arrangements the hands of the comparison are arrangements were made, to remove any dampting particle to soft on the part of the morids, he was applied to by Mr. Roach Smith; for beive to watch the excavation, and this her readily gave; but told brin at the same time, the beauto by the perutited on, any account (it) parchase. In the first instance, nothing was discovered of earlier date than the twelfth or thirteenth centuries, date than the twelfth or thirteenth centuries, but at the western condy in a part where the ground was bady pikes were found. These being drawn, a bed of concrute was discovered, and under it a hole filled with soft peaty earth. In this was an extraordinary collection of Ro-man remains, ---remnants of Roman London; these sundals approach betwins and numershoes, sandals, amphorm, bodkins, and numerous coins; such a collection as was never seen before. It required the greatest efforts to prevent it from being dissipated, and Mr. Roach Smith had given much trouble by his efforts to elude the regulations, and purchase for his own collection. What he had to complain of, howelude the regulations, and purchase for his own collection. What he had to complain of, how-ever, was, that Mr. S. had afterwards accused them in the *Aschwologia*, and elsewhere, of the interruption they caused to his investigations. The obarge had been made publicly, and he therefore foll as delivery in mentioning the name. The collection, he was happy to say, was under his care in the London Institution; and the only question was, whether it should be placed in the City Library of the British Museum; in entry sy or the distor, it would speedily, he made public. Mr. G. Godwia, reverting to Mr. Hawkins' gratifying communication, reminded the meet-ing of an application made to the Museum

ing of an application made to the Museum some time ago, to the effect that they should establish a Museum of Architecture, which was establish a Museum of Architecture, which was refused, and further pointed to the manner in which Mr. Wyse's motion in the House of Commons, to the same effect, had been re-ceived.² He hailed with great satisfaction the present determination of the trustees, and feel-ing that they would probably, be glad to have their hands strengthened, by an expression of opinion from a body like the Institute, sugsted that the council should take into conideration how they could best convey this,suggestion which appeared to be concurred in the whole meeting. Mr. Donaldson alluded to what the French bу

had done for the preservation of antiquities. He was of opinion it was not desirable to bring all remains that were discovered, to Londes, but that separate provincial museums should be established. He alluded to the good which had been done by Mr. Britton's works (as Mr. Tite had remarked previously), and presed him for his continued efforts to induce the preservation of monuments.

Mr. Britton said it gave him sincere gratifi-cation to hear what the trustees of the British Museum were about to do. He had advogated Museum were about to do. He had advagated the establishment of such a museum as fir-back as 1800; when he advised. Sir, Richard Colt Hoare to deposit his wonderful collection in the rooms of the Society of Antiquaries. He brought the matter before the society at that time, but they showed no desire to inter-fere, and the matter dropped. When Waltham Cross, and other national antiquities, were about to be destroyed, he renewed the question, but both the British Museum and the Society of Antiquaries were careles. Now that the of Antiqueries were careless. Now that the former was about to stir in it, the provinces would doubtless follow the example. At Bath a great deal had been discovered, but more had been destroyed. Architectural remains were of the utmost importance to British History; the rectification of which, depended more on anti-quarian relics than written records. Hoare's quarian relics than written records. Hours makeum was now kept in a small spartmatt, with little attention; and there was a probabi-lity, that before many years clapsed it wight be distributed. In conclusion, he said it was gratifying to him to find, that he should probabily yet see a museum of national antiquities, before he passed off the scene,

PENBITH CASTLE.-A number of workmen are at present engaged in excavating and leveling the castle garth, near the ruins of Penrith Castle, which is the intended site of a railway station at that place, haven all which the state he more the proves.

on a ograin. day, toulivet the shores to be should nat he heard, being no lawyer. The sorgeant tery properly stated the had no authority, to, actingon a question of sivil rights unless a specific scharge was given for an act he saw datas. I then (feeling strong in the position), directed the shores to be struck, when my supployer (most illegally) was instantly collared by the police, and we were all paraded to the station-house, where the charge was entered as an offence under the " Motropolitan Buildings Aet"and thence proceeded to the Lam-bath police-effice, where the solicitor, finding he had no locus standi under the Act quoted in the information, fell back upon the police Acts, attempting to shew the shoring was an appendage, the property of the overseer. In despite, of an attempt to prevent my being heard, the hon. Mr. Norton very courtbously and attentively listened to my reasoning; that we complained of a trespuse by the shores we complained of a treppus by the shores being placed on our property (honse no ground for asserting they were as the highway) and if an appendage, must be takes as part of that we were in undisturbed possession of, vir. the houses. Mr. Norton, taking the same view of the case, stated he could afford no vericf, remarking that, with the exception of one other, it was the most unintelligible Act he had ever mat with. I will now set out the grounds of complaint in Mr. Stow's report, and the facts

THE BUILDER.

THE BUILDER.

Facts as they exist.

in juxta position.

Being in low ground, without any means of drain age, the prudent course had been adopted of merely levelling the ground, and using hard blocks of Kent-rag, the lower course 1 foot 7 inches, by 6 inches Age, the lower course 1 note / money, of o more deep, and another course 14 inches by 6 inches deep, on which the walls were constructed. In the pre-sence of the referee, Mr. Stow admitted these were the dimensions all round the buildings.

In the presence of the referee, Mr. Stow was challenged to point out, and failed to do so, that the walls were built of bets and knobs; and it was offered, for the sake of argument, to assume they were entirely so,—he had no authority over corr-struction. The pocket pieces, if the jarabe and withs are sound, the openings being only 18 inches, re-quired no chimney-bars, nor had the district-sur-vence are authority. eyer any authority.

The houses being of a very usual construction, the back rooms lower than the front, the joists had plates under the ends of each, with head and cill to wells framed. 4-inchr partition ; the referee found wpassessed "senser parateon; the refere 10000 each and of joints was aplied to plate, the front roof being u span soil, with rafters' feet notched and spiked to plate, with a ceiling joist spiked at each end to rafters; the referse asking for an admission of the correctness of the sketch alluded to, shewing the rafters' fast projections are included to shewing the rafters' feet projecting some inches before the face of the wall, and having no connection with the plate, instructions were given to knock down the ceiling; the referee very carefully investigating it, found it to be as above described, and not the least similar to sketch.

The attention of the referee was drawn to the fact, that in this locality (as it most disgracefully is in all others in this neighbourhood), there was no means of drainage except into filthy open ditches, without any fall towards them.

The referee having appointed a meeting, took an infinity of pains to plumb all the walls, which were evidenced as perfectly perpendicular (except the de-pression before alladed to), also to test the bonding of the party and external walls, and failed in his efforts the instant the main of a burnel of an evidence of the second to insert the point of a trowel at any point of junc-tion. And the answer to every allegation was disthetly proved as above set out.

covered and described by F. T. Fernbach, R. Gonservator, Munich" (gr. 8vó. 10s). He states that he has devoted σ life to this improvement of monumental decorative art, whose merits are, certainly, no more theoretical, having been carried into execution in the above gorgeous spaces, by not less a personage than Professor Schnörr. [The present works carried on in the new Houses of Parliament, make every thing connected with mural painting of importance.]

The Great Industrial Exhibitions on the Con-tinent. — The only work of public utility which the National Convention over established in France, was the Museum of Arts and Manufactures-the germ and prototype of all Minilar subsequent endeavours. Since that, time grand exhibitions have taken place in Paris, Berlin, Vienna, and Dresden, where every-thing connected with the material industry of the country, has been displayed for the in-struction and boast of the nation. The many works published on that score abroad, we have laid before our readers in other parts of our periodical, and a detailed *expose* of what is proposed to be done here, has been given previously by another hand. But as Eng-land has been late in following in the wake of foreign enterprise---we should think, that her Industrial Exhibitions could still assume a noval and original character, by combining our Colonial Industry with that of the mother perturbed in the second To speak merely of objects falling within our province, we would remind our readers of the many structural models, which could be brought from India and China, in which countries buildings exist, which in their boldness or extent, are beyond the views of European artists and artisans. Tools and implements of endless variety, may be expected from countries, where strange mechanical skill, certainly, must be possessed, when we come to know, that the Chinese can unite (solder ?) cast-iron-a per formance beyond the reach of all our practi-cal chemistry. Many things of the kind would be bought and sent to England by merchants and others, if it were known, that they were to be exhibited. It is not only the admission fees, which might pay for the conveyance and other ourrent expenses of such objects - but in Berlin an austion was held, subsequent to the exhibition, of articles selected or pointed at by the public. And why should it not be so here as well? A nation can never be ashamed of, or shrink from buying, or selling, or doing any-

thing, in fact-for the public good. Past as a Combustible for Locomotives on Railways.—The Paris Journal des Travaux Publics contains the following:—" On the railway from Milan to Monza an experiment of great importance has been made of late, which may much facilitate the means of communication in countries deficient in coal. ж substituting peat for mineral coal, it has been found that the economy in using the former 8 was from thirty to forty per cent. As it is V C known that the expense for the burning material is about one-fourth of the whole expense of the working of a railroad, one-twelfth of the entire expense would be saved. It is Sardinia especially who can avail herself of the great advantage which the using of peat may afford, as she is deficient in both coal and timber, but xery rich in peat." The above may be a use-9 ful hint to railway undertakers in Ireland, Canada, Nova Scotia, &c.

Supendous Railway Activity in Italy.—The social condition of that country is undergoing a greater change than has happened since the time of the Crusades. The two lines from Milan to Monza, and from Venice to Padua (in operation for several years past) are kept up with good success, and on the former the increase of passengers in 1844 over those of 1843 was 68,769. The line from Livorno to Pisa, opened on the 14th of March, 1844, has conveyed, during the nine months of that year, 327,992 passengers.—The line from Naples to Castellamare and Nocera has conveyed during the months of September, October, and November, 1844, 327,992 passengers.—In February last the King of Sardinia ordered the construction

the King of Sardinia ordered the construction of a railway from Turin to Genoa, passing through Novi, Alessendria, and the valley of

the Tanaro, with several side branches, one towards the Lago Maggiore, passing the Post Valenca.—In Toscany, government has authorized the planning of three new lines; one from Pistoja to the 'frontiers of Lucca, passing through the valley of Nievole; the others from Livorno to the Romish 'frontiers, passing through the Tuscan downs' (maremm); the third from Pietoja to the frontiers of the Bolognese.—In the principality of Lucca a national company has been at work for some time, and has pushed its operations so far as the 'Tuscan frontiers. The Ferdinand line in Austrian Italy is in a forward state on its whole extent, and arches, bridges, viaducts, tunnels, and termini-buildings are either finished or on the point of being so.—Journal des Travaux Publics.

James Millingen .- This renowned archælogist was born at London in 1775, and made his first studies at the Westminster school, of whose then management, however, he enter-tained no high opinion. A small collection of curiosities belonging to his father first directed his attention towards similar pursuits—and the acquaintance with men like Townley and Gracherode, decided him for the study of an-tionizing. When his father went in 1790 to tiquities. When his father went in 1790, to reside at Paris, young Millingen formed the acquaintance of Barthelemy, Mongez, and such men. The subsequent horrors of the French revolution deprived his father of great part of a considerable fortune. Such circumstances, as well as a feeble state of health, obliged him to visit Italy in 1803, where he again returned in 1806, after the death of his parents. In 1812, he published his first work on ancient numismatics, which was followed in the sub-sequent year by his great work on ancient vases, with sixty plates, exquisitely selected, and drawn under the author's superintendence He was the first, who employed a sound and comprehensive criticism in the explaining of the designs of these remains of antiquity. In 1817, Mr. Millingen published his work on the Coghil vase collection, of which, however, merely the text belongs to him. But his chief works are the two volumes, entitled "Unedited Monuments," by which he intended to convey to his countrymen a means of comprehending the choicest of ancient relics of art. With the second volume, however, this work ceased in the choicest of ancient relies of art. 1826. Millingen felt the neglect of art on the part of his fellow-citizens, and expatiated thereon in a very judicious pamphlet "On the State of Learning and the Fine Arts in Great Britain." London, 1831. His industry and labours were unrelaxed, and his last work "Coins of Ancient Italy," was published as late as 1841. He contemplated other works, when death surprised him in the middle of this year, afar from his native land; still, in a land replete with objects of his constant predilection ancient monuments of every kind.

The Secretary of State for Public Works in France-has just sent the following order to the prefets (lord licutenants), in reference to the laying out of public roads on their passing through towns, boroughs, or villages. The following are some of the chief points of this The regulation :-- "It is not always required to adhere to a strict parallelism in the laying out of public roads and thoroughfares.-- It is necessary to obviate, as much as possible, the advancing of buildings on the public roads, which would needlessly encroach upon the actual width—and if a narrowing be indispensable, to combine the alignement so, that the free circulation can never suffer by the partial carrying out of any plans.-To make widenon that side where the damage would ings be least to adjoining property; to preserve all fronts which differ little from the proposed laying out; to choose fixed and well-defined marks, and to avoid breaking the front of any building .-- Never to propose curvilinear alignments, but to substitute parts of rectilinear polygons, whose form is more favourable for construction. - Le National. (This regulation shews the attention paid to such matters by our neighbours - while, at the same time, it contains some useful hints for the laying out of railroads, especially on their passing towns, &c.)

Centralizing of Paris Railways. --- Count Bambuteau, préfet of the Seine department, (Paris), has appointed a commission for examining the project of a subterraneous communication of all the different railroads centering in the French metropolis. Several plans have been sent in, which, however, differ very little from each other. (As the distance is short, this plan seems to us prefarable to the grast bustle and *anquict*, which open-light railways would entail on already over-noised civies).] Artesian Wells in the Descript Africa.

Artesian Wells in the Beersts of Africa. The French surveyor, Mr. Fournel, is on the point of starting for Africa with a large stock of boring apparatos, by the working of which he contemplates forming artificial cases in the desert. The idea is great. BIr. Fournel further proposes to erect a lighthouse at each oasis, so that the travelling through the desert could be accomplished at night, and repose taken during the day. Mr. F. is no mere theoretician, having conceived his plan during a former residence in the Sahara of Algiers. J. L—v.

STIR IN THE WESTMINSTER COURT OF SEWERS.

The great degree of interest with which the proceedings of the Westminster Court of Sewers at this moment, are regarded by a large body of our readers, induces us to report them at some length.

On Friday, the 14th instant, a special court was held "to consider as to the efficiency of the surveyor's department, and as to the expadiency of making a change therein." Mr. Le Breton rose and said, that when the

had moved the amendment at the last court, which was carried by so narrow a majority, he hardly anticipated holding the position he was now occupying ; he had hoped some more experienced commissioner would have taken up the subject, and brought forward a plan, but as that was not the case, he should at once explain his humble views to the court. It was not his intention to call the surveyors before the court, and many of the states in be should make would at once be accepted by the com-missioners present. First, as to Mr. Dawley: it would give him (Mr. Le B.) great regrat to see him dismissed at once, because although he was not so efficient an officer as was re-quired, still he possessed valuable information about the sewers. From the way in which he answered the court about the failure of the sewer in the Gloucester-road, Paddington, it satisfied him that he was not an efficient officer. and proved that there was a want of power the surveyors' department. The honourable commissioner then proceeded to call the atten-tion of the court to the staff of the Holbern and Finsbury Commission, the particulars of which he had received from Mr. Wigg, vice-chairman of that commission. From this statement it appeared that there was only one surveyor, Mr. Roe, whose talary was 4501, and there was a retiring salary of 1004, a year to Mr. Page, a former surveyor. The result of the comparison in the two divisions of the expense of surveyors, was 690L a year against 1,050L in the Westminster, a difference in the two departments of which he thought the public had no right to complain. Mr. Le Broton proceeded to state, that in moving the amendment to Mr. Leslie's motion for the appointment of Mr. Phillips, he had no hostility to Mr. P.; on the contrary, it would give him great pleasure to vote for him, for he saw no reason to doubt the abilities of that gentleman ; but the fact was, he thought it irregular, and that it looked like amuggling in an officer. The resolutions he was about to submit would bring the whole matter before them, and he hoped that the court would cordially concur with him. He thought it of no use to go back in inquiring into certain alleged abuse s that might have occurred in the year 1829; he was satisfied no practical good could result from such an inquiry, and much valuable time would be wasted. He would now read his resolu-tions :--- "That the present surveyors' department is inefficient, and entails an unnece expense on the rate-payers; that from Lady-day next the services of Mr. Doull be dis-pensed with, and the office abolished; that from Lady-day the services of Mr. Papworth, the drawing clerk, be abolished; that a surveyor be appointed as joint surveyor with Mr. Dowley, at 250%, per annum; that in the event of any vacancy hereafter, by the death or re-signation of Mr. Dowley, then there to be only one surveyor; that as to the account, they be examined by the joint surveyors, and handed over to the clerk." The chief point in hissebens was, depriving

Digitized by GOOGLE

Mr. Poull of the office he held, but the court would recollect that they had determined, that sill works above 50% were to be done by special construct, consequently the services of Mr. Doell would not be required. The period which he woold propose for the change was at Ladydity mest.

The court then proceeded with the resoluitions; the first moved by Mr. Le Breton, and tesconded by Mr. Wood, was, "that the present surveyors' department is inefficient, and entails an unnecessary expense upon the rate-• payers.'

Mr. Donaldson said he did not understand the connection of the two questions in the proposition. Mr. Le Breton thought it was very intelligible. The department was not ef-ficient, and more expensive than necessary. He complained of the very unsatisfactory manner in which the answers from the surveyors to the court were given, and he thought it obvious to every commissioner, that both Mr. Dowley and Mr. Douth, when inefficient Mr. Dowley and Mr. Doully writing inficient officers. Besides the failurs in the arge sever in the Gloucester-road, "there with other failures, the sewer in the Harrow 2000 for "failures, the sewer in the Harrow road for example, and he thought it perfectly disgrace-ful to set the quantity of cart loads of soil, "brought up from a group close to the office in Church stress, St. Junit, seed : After a considerable discussion, Mr. Le "Breton and Mrs Wood, agreed to strike out "the words " and entails an unnecessary ez-"pense upon the rate-payers."

The chairman said he entertained very strongly the opinion, that the surveyors deupartment was very inefficient, but not on the "Dowley, he saw the progress of age, and how "frequently he was subject to fits of indisposi-"tion brought on and aggravated by exposure biand accidents on the works. Until an able, "renergetic, active officer was placed at the head of the works, who should be a properly educated engineer, they would be in an unsatiscourt ought no longer to allow their works to be in the hunde of a decayed functionary, but "it to be at once placed in the hands of a vigorous "man. At the present time, the court had no 2 reports of works required, and without dis-paraging the clerk, his opinion was, that the chief officer ought to be the surveyor, and when that office was properly filled, the court would no longer be involved in so much error and expense. He thought the court was much indebted to Mr. Le Breton for stepping forward and stopping the court. It was always de-sirable, in his opinion, to promote a skilful officer, but never to make the inferior officer to be entitled, as of course, to that promotion. He thought that se the court had not the power to grant Mr. Dowley a superannuation allowance, they might still retain him as consulting surveyor. The motion as amended was then carried

-91 "nom con. Mr. Leslie moved that the names be taken down of the commissioners who had Wiveted. The chairman ruled, that as there Swere no dissentients, the bye-law did not operate. Mr. Leslie stated, that he had taken mi down the names of the few commissioners of

"Mr. Le Breton (seconded by Mr. Knight) bathen moved his second resolution. "That dispensed with, and his office abolished." This 96 was ultimately turned into a notice of motion 16. for another court.

wind Mr. Le Breton then moved, "That a ^{11.6} Mr. Le Breton then moved, "That a ^{12.6} invreyor be appointed at an early day, to be ^{22.6} fixed by the court, to be associated with the ^{21.6} fixed by the court, to be associated with the ^{21.6} beriege seconded the motion. ^{21.6} Mr. T. L. Donaldson wished to know how the ^{21.6} for the proceed to construct a new staff

Juneourt was to proceed to construct a new staff ٠¥ł Capt. Bague said it was impossible after what ²¹¹the chairman had said of Mr. Dowley for the ¹²¹¹court to continue him; relative to his inefficidirency, a variety of observations had been made. ¹⁰ The court must therefore strike at the head of ¹⁶ the department. If Mr. Dowley heard what ing has been said of him at this court, he could ⁹⁷ not stand his ground ; why not give him a pen-^{9d} sion, and allow him to retire into the bosom of ein MS family ? He did not see how it was possible bus for the court to continue Mr. Dowley in his office. 217 Mr. R. Gunter wished to know whether the

SUDE

court had or had not the power to grant pen-

Mr. Donaldson thought that Mr. Dowley might be retained by the court as a consulting surveyor, at 2004 a year. The court would surveyor, at 2004 s year. The court would not require the whole of his services. That would be a legsl mode of rendering him some assistance. Considerations of justice to the individual must have their weight, but justice due to the public must also be taken into account; he thought the court should appoint a chief engineer, and that Mr. Dowley should be the consulting officer. They ought not to forget that his best days had been devoted to the service of the commissioners.

Mr. Donaldson then moved an amendment, seconded by Mr. Allason, to the effect " that a new chief surveyor should be appointed, but that Mr. Dowley should be retained as

the the surveyor should be retained as consulting surveyor, at a salary of 2004, per annum." Carried by 13 to 1. Mr. Le Breien then moved, and Mr. Desaldson seconded, "I that there be an other than the source descent in the surveyor is a salary of 2004 and the moved, and Mr. Desaldson seconded, "I that there be an other than the source descent in the surveyor is a salary of 2004 and the survey of the source descent way for the survey of the source descent way for was to go go. He had refused to the survey of the survey of the source descent way for the survey of the survey of the source descent to know what was to be done. The survey of the survey of the survey of the survey of the claring that the survey of the source descent on the survey of the source of the survey of the survey of the survey of the survey of the efficient, and had virguelly dismissed Mr. Dowley as head survey at 4002 per annum, and made him only a consulting survey to be had for 2005, a year. The court had also passed another order, that there should to be had for 100% a year. The court had also passed another order, that there should be no other than a chief and a consulting surveyor; they had thus summarily dismissed Mr. Doull, the assistant surveyor. He wished to know what these two surveyors, Messre. Dowley and Doull, had been doing to meet with such a punishment; what new light had so suddenly broken in upon the court? Had they said too much or too little to the secret committee, whose laborious investigations into the allegations against the commissioners contained in his pamphlet, were to have closed last Wednesday, the whole documents having been previously furnished from the surveyors' department by Messrs. Dowley and Doull, and having, as reported, been in the presession of the secret committee for some time past. What would the Secretary of State think of the proceedings? (having been informed in reply to his communication, that all the documents were received, and the report was being pre-pared) if he should hear that both the surveyors were now dismissed?

The chairman said he hoped it would go forth to the public that he said, that the object of the special court was to take the whole scope and bearing of the subject into its consideration, but that the result of the resolutions they might come to, should be brought before the court a second time for its sanction. Mr. Leslie said that that might be the opinion of the chairman, but it was not law. Who ever the chairman, but it was not law. Who ever heard of a court of record passing its orders in such a manuser. The orders passed this day were absolute. They were not mare notices of metion, and the only way the court could now get rid of them was by a notice of motion to rescind them. Mr. Donaldson then rose to move " that the resolutions now come to be sot acted upon until sanctioned at the next or-dinary meeting of the court," and in so doing complained of Mr. Leslie, who had refused to take any responsibility or vote in the matter. It reminded him of a fairy tale, which used to amuse him very much in his youth, of a fairy sprite, who patted two parties on the back and excited them on until he got them all into confusion, and then sat laughing at them. Mr. Robert Gunter seconded Mr. Domald-

son's amendment; he thought they were only this day considering the subject, and that the proceedings did not authorize them to go to proceedings and not authorize them to go to the whole extent of diamissing the officers, but that the next court should emetion them. Capterin Bague easis, although the ex-chair-man of the court wod also the ex-chairman of a Board of Guardians were against his views and a dozen other commissioners might be so too, he considered if the Court adopted the present motion it would stultify all its proceed-ings, and sender them ridiculous. The Hon. F. Byng said if that were to be the course of the solemp orders of the court all their proceedings

would become ephemeral and farcical, another would become ephemeral and farcical, another body of commissioners might come in without hearing one word of the previous arguments, and overturn the decisions. Mr. Donaldson said he stood there as a public man, for the public good. He did not think that the officers should be affected by what occurred in the committee that day. What was it they said at starting? why, that it was to be a merely deliberative meeting, still it was not to be with-out results. The motion was carried by 10 to 5. Mr. Donaldson then moved and Mr. Le Mr. Donaldson then moved, and Mr. I Breton seconded. "that the court at its ordinary meeting do revise such bye-laws and standing orders as may so require, in order to carry into affect the said resolutions." Carried neme. gon. Mr. Le Breton then gave notice that at the next meeting of the court he should move 4 that from and after Lady-day next the sarping of the present assistant-surveyor, Mr. Bould, be dispensed with, and the office abol-ished. eyor, Mr.

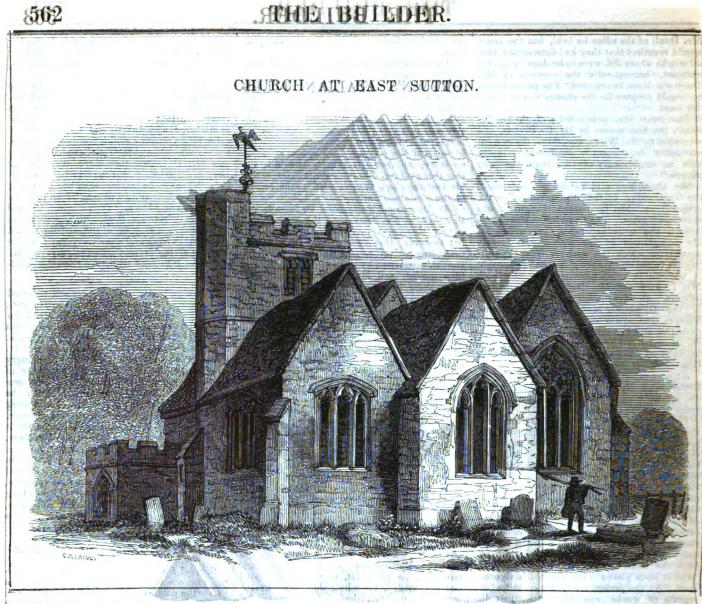

A passage in Mr. Farlar's speech, reported in our notice of proceedings on the 7th inst, has given considerable offence to Mr. John White, and that gentlemen calls upon us, with an unwise threat, to make some public *criminde*. That Mr. White should be angry with Mr. Farlar is perfectly natural; but to be surry with Mr. Farlar is perfectly natural; but to be surry with us for simply reporting if a feature of our diff, what the fatter said to be surry with us for simply reporting if a feature of our diff, what the fatter said to be surry with us for simply reporting if a feature of our diff, what the fatter said to be some property of a second of the second of a diff, what was said in "bit absende, and to imbuing him to reply, should be think it to du so, which by the way, we should not. Personally, we have all due respect for Mr. White this reputation, we have pleasure in saying it, is far above reach); the tradition of a charge brought against some of his relative, A passage in Mr. Parlar's speech, reported a charge brought against some of his relatives, something that applied to somebody, some long a cha time ago,-belongs to Mr. Farlar, not to us, who were the mere chroniclers of what was said.

THE IMPROVEMENT OF OPERATIVES.

SIR,-I am one of that class, whose intellegtual improvement you have frequently brought before the public in your valuable journal. The importance of this is ably advocated by your respondent, Mr. Lewis, in' the last number co of THE BUILDER, who suggests what seems the most direct method of instruction to affain that most desirable object, and if the funds necessary for carrying out his plan could be raised, the system would be of infinite advistage to the young artisan and mechanics "But unfortunately, the interest evinced by you 'and your correspondents on the subject, is, I fear, confined to a very small section of those, who have the power and the means, to amist in the advancement in the intellectual and social scale, of the class from whose labours they derive wealth and influence, with sill their consumi-tant enjoyments. If employers, on the ground of their own interest (and they do not sill luck selfishness), would consider the advantages which would accrue to them flom is more ge-neral intelligence amongst workmen with y might be induced to lend a helping hand in the more from the to be to the good work—but it is the bones and shows of the operative to which they appeal, without dreaming of his brain; they value more his possession of superior brute forter than his mental and intellectual attainments. We have

It is to be regretted that there is so Wittle mutual good feeling existing between masters and their workmen, but true is, that the spirit of that type of what an employer ought to be (Monsieur Hardy) is very rarely exhibited amongst us. Consequently we have little hope of assistance from that quarter. What is to be done, must be done at the cost of the working classes themselves, and 'your' paper is doing much towards improving the knowledge of the operative in the styles of ancient and modern architecture, and creating a taste for improve-ment in the several trades we follow, and the arts generally. I am, Sir, &c., Nov. 11th, 1845. Ł.

121 217 IMPBOVEMENTS ON JOWER HILL, The commissioners of Waads, and Forests intend introducing a bill next sussion to empayer them to widen and improve Gnorge Street, Tower Hill and to make a carringe theroughtage from Great Tower Hill, and Trinity Square, to Little Tower Hill.

EAST SUTTON CHURCH, KENT.

THE subject of the plate is one of those beautiful old country churches so plentifully scattered over the surface of Great Britain, and which affords an exhaustless fund of study and

employment, to the architect and antiquary. It was said not long since by one of our most eminent reviewers, that every nook of our island had been completely ransacked and described by our tourists and topographers; that it would be difficult to name any structure of the olden time, sketches of which had not been transmitted into the portfolio or the library. This was said in 1821. What an library. This was said in 1821. What an immense mass of valuable architectural and topographical matter has since been published. Every succeeding age appears to examine and study more closely the works of the olden time. In the old Popish ages every village church was a small temple, splendidly enriched with gilded carvings paintings, and sculptures, addined with velvet hangings and embroidery, and containing stores of plate and reliquaries. Each was so tilled with these treasures of art, that it has been too difficult a task for even the eagerness of fanaticism wholly to destroy by all sorts of seekers after the remains; one goes merely to take rubbings off the brasses ; another to sketch or measure the windows, or to inspect the plan ; another visits it to take notes of inscriptions on tombs or other archæological matters, and every one finds something to his particular taste ; very little indeed some-times remains, but still there is always something to interest in an old English church.

"In point of fact, the building cannot be too carefully inspected,....one never knows how much it will yield; the temptation is strong to strip the whitewash and yellow othre from the fort, or off the walls, in search of distemper paintings, almost sure to be found underneath or to strip off the plaster itself, in search of old Norman arches, Easter separches, piscinæ, sedilio, or aumbries, frequently visible behind it.""Nearly the whole of the sketches made by our grandpapas, those advarate south-east

so carefully depicted on the tombstones, and the weathercock so prominently made out on the stumped tower, while the tracery of the windows was indicated by a nondescript convolution of lines, that it was difficult to tell whether the arches were intended to be pointed, circular, or elliptic,-all such representations are now considered very crude and unsatisfac-tory, even by a superficial reader.

To the architect, the village church may be of the beautiful style of building practised by his forefathers,—it belongs to his country, speaks home to his feelings, and so beautiful is it, that the more it is studied, the more it is admired-but why should he consent in his own buildings to be a servile copyist, or to puzzle his brains with symbolism? Is it necessary when sketching beautiful examples of piscinæ, sedilia, and such like remnants of the building, deeply to study their ancient usages, and engender a superstitious veneration for them? Certainly not; beautiful as the Gothic style may be, it has not a whit more to do with the pure principles of Christianity, than the ancient styles of Greece or Rome; in fact. scarcely so much, for after all, the Roman basilica is the true original of the Christian church.

East Sutton is a small hamlet attached to the village of Sutton Vallance, near Maid-stone, in Kent; it consists of only a few scattered farm-houses, the church dedicated to St. Peter and Paul, of which a view is now given; and the old manor house, a venerable building of the reigns of Henry VIII. and Elizabeth, the property and residence of Sir Edmund Filmer, Bart., M.P. for West Kent. At a small distance from the manor-house, in the adjoining parish, is a mansion called Little Charlton, one of the most valuable and picturesque structures of the reign of Elizabeth; it was erected by Sir Bobert Filmer, who was for twenty years prothonotary of the Common Pleas in Queen Elizabeth's reign. At a place called Great Charlton, close by, are the remains of an old building, apparently the hall of an hostelry, but they are so small, serving only for the habitation of a cottager, that it is impossible to hazard much conjecture con-

cerning them. The church at East Satton is a remarkably well-planned edifice, the interior is at once elegant and picturesque. It consists is at once elegant and picturesque. It consists of a nave and aisles, a chancel with north and south chapels, which opening into the chancel by two arches on each side, form as it were aisles to it; there is a porch and tower, the lower portion of the latter is opened into the nave by a noble arch, reaching the full height of the interior; every portion of the building is of different date and style, the nave, the Is of different date and style, the nave, the most ancient part, being of the time of Henry III.; it is quite perfect, even the tie-beams of the roof, which are of very good design, remain. The part of the building most deserving notice is the north chapel; this contains two extraordinarily for mindown contains two extraordinarily fine windows representations of which will appear in the following number. The date of this portion is probably between 1359 and 1409; the small

window appears even later, is stary warials of The building contains numerous memorials of The building contains numerous memorials of the Filmer family; among them is a fine brass (lately published by Mr. Waller), in which are represented in the superb costume of the reign of James I., Sir Edward Filmer and his lady with their nine sons and nine daughters. Admirers of old church architecture will fine several other remains at East Suiton, besides those noticed in this paper, which is merely one by an architect, that would well repay a visit to the spot; railway communication offers easy access, and in the immediate neighbour-hood of Sutton Vallance, are Holling bourne manor-house, Boughton Malherbe, Leeds Castle, Godfrey-house, and many others of equal interest.

GAS.---Application will be made during the approaching session of Parliament, to incorpo-rate a company whose object is to supply gas to the whole of the metropolis and other parts of Middle of the metropolis and other parts to the whole of the metropolis and other pare of Middlesex, together with parts of Kent Surrey, Essex, Hereford, Bedford, Bucks, Northampton, Leicester, and Derby, The company have adopted the name of "National Gas Association," and they contemplate pur chasing the entire rights and interests of all the existing metropolitan gas companies and

BROWN'S ITALIAN TILRS

and will appear in the - 1

THE STARDWING ATALIAN TILES.

A FRW years since, Mr. Brown paid much attention to the manufacture of Italian tiles, under the direction of Mr. Barry, the architect. Considerable loss and difficulty attended the Considerable loss and underly attended the inaking of them, from the tiles being made flat, as was the practice of all tile makers; in fact, the expense almost prebluded their use; he had consequently for some years abandoned making them. At last it occurred to him, that if the lower tile were curved, like a common pantific, they might be easily dried in blocks in a similar manner. After considerable attention in carrying out the details, the result has been eminently successful, as will appear from the jlles now submitted. Their appearance on a building is far superior to the flat ones.

The first superior to the flat ones. The Italian tiling, the vertical roll passes at right angles from the eaves over the ridge and hips: this forms the peculiar and interesting feature in the new tiles: much attention has been which to obtain it. Exclusive of their then hald to obtain it. Exclusive of their forming an appropriate covering for build-inget in the Italian style, they have the ment, in conten, and in winter a warmer covering than that of slates or metal. These hills word! first used by Mr. 'G. Wathen, when the building at Jumper Hall, near Dorking.' Th June, 1845, the Society of Arm

and Sciences awarded Mr. Brown a medal for his invention of the curved Italian tiles.

The smaller cuts, 1 to 8, shew the parts of which the tiling is composed, and may be rea-dily understood; figures 9 and 10 are not con-mected with the foregoing, but represent two varieties of ridge tiles for Gothic buildings, also invented and made by Mr. Brown. His ornamental plain tiles for Gothic buildings are well known, and deserve recommendation.

INTERMENT IN CROWDED QUARTERS.

Wr were horrified last week, on passing the Roman Catholic numbers at Bermondsey, to perceive that the small plot of ground in front of it, and next the street, is being rapidly filled with dead bodies! How much longer is this suicidal practice to last? Will no amount of experience teach, -- no accumulation of facts convince? Health of Towns Commissions are a farce, and their reports waste paper, or some steps would be taken to prevent the son-tinuance of a practice, admitted on all hands to be dangerous and culpable. It is to be hoped that some "business-like and resolute man' in Parliament, will take up the matter in carbest next session, and induce the House to give effect to the principle they have already initied. best localities for public buildings your coformes are poculiarly suitable, and your remarks in such matters are received and read with attention, as emanating from one whose peculiar study it is. May I therefore express a sope that you will call attention to this subject in the next number of THE BUILDER, and perhaps it may induce the inhabitaats of Fulham to consider their recent position with rethere to this matter.—I remain, Sir, &c.,

Fulham, Nov. 15. OBSERVATOR.

• We regard this suggestion, which proceeds from one of the most influential inhabitants of Fulham, with much interest, and trust it will be responded to by those who are interested. We shall take an early opportunity to address ourselves to the subject.

RAILWAY JOTTINGS.

SIR ROBERT PEEL raised the first sod of the Trent Valley Railway on the 13th inst. The spot selected was a piece of ground called Caunt's Close, about half a mile from Tam-A wheelbarrow and spade were pre pared for the occasion, which are worthy of description. The former was made of the www.shinker.com - and being any cariously carved and polished. - The body was 15 inches long, 18 inches wide, - and beinches deep. On each side were dis - pileyed the arms of the Right Hon. Baronet. Littand booped handles, and was designed by Stand looped handles, and was designed by Mr. Holmes, architest of Liverpool. The space was made of electro silver plate by Diessre, Bikington and Co., of Birmingham. Its form was that of an heraldic shield. The the form was that of an heraldic shield. The shaft or tree was of old English oak, the upper part dividing into two branches forming the handle, was carved with oak leaves, acorns, &c., and highly polished......On the 6th inst. Lord Massareene raised the first sod the of the Belfast and Ballymena line, at White-house, near Belfast......The British Museum, house, near Belfast.——The British Museum, through its principal librarian, Sir Henry Ellis, has solicited the various projected railways to send a copy of their prospectus, en-igraved plans, &c., in order that a collection may be formed and deposited in the library. Railway to Greenacres Moor. The line is to the railed off forthwith, and the borings for the a first tusuel have been commenced in the Lee on the Lowestoft and Reedham line, for which an Act was passed in the last service. The works on the Brighton and Hastings are -The rapidly hastening towards completion ; an early advanced, and the rails are laid down to within half a mile of Chichester.—The new iron bridge, erected from a design of Mr. Bidder, thelow Carrow, near Yarmouth, was swung a the low warrow; near raintouto, was strong marries the river with the greatest ease for the strattime on the 7th inst. The weight is marry 130 tuns: It is expected that the trains will pass over it in a fortnight. It is in con-minication from the town of Leeds to the instthern part of the county of York, and finally to Hartlepcol, Stockton, and Middlesborough, has now fairly commenced. The works were begun on Monday, the 20th of October. The number of railway locomotives ordered of the different engineers in Prussia is 237, of the different engineers in Prussia is 237, of which number 78 have been ordered from Memors. Rosig, Brothers, and Co., whose work-shops are near Liegnits. From 900 to 1,000 men are continually employed on these ma-chines. In Prussia, the price of a steam-engine, with its tender, is now about 13,000 thales. An trial of the Rev. Mr. Maber-ler's relivery brother block place has not be ley's railway break took place last week in Linesin's Im Fields, and caused considerable utfaction. It was stached to a common tilbury, and consisted merely of a lever working in a joint on the exletree just inside the wheel; at the end of this lever is a hook about 2 inches in breadth, which fits closely on to the tire of . the wheel; and the lever is of such length that, nh falling, it grips the circumference about 6 inches above a level with the centre of the

nave, instantaneously checking the speed, or of arresting the velocity when descending hills. This lever has a chain attached, which allows it to descend only to a certain distance on the wheel, and when not used, is turned over towards the back of the vehicle, where it is completely out of the way.—An engine-driver on the York and Scarborough railway was fined last week 10% for neglect of duty, and in default of payment was committed to Northalterton House of Correction for two months.

NEW CHURCH AT LEEDS.

LAST week, we alluded briefly to the new church at Leeds, consecrated on the 4th inst., which has excited much comment, and has long been an object of interest to many persons. We avail ourselves of an account of it in the Leeds Intelligencer for the following particulars. It is called St. Saviour's : the foundation was laid on the 14th of September, 1842. The style is decorated; plan cruciform. The chancel is 42 feet long by 16 wide. The nave is 60 feet in length, by 20 feet in width. In The the centre are four piers, from which will spring when the church is completed, a central tower surmounted by a spire, rising to the height of 280 feet. The transepts are short, in order to bring the whole of the congregation as much as possible within compass of the voice of the reader. There is a lofty porch on the north side, which contains the font. Besides this entrance, there is a western door, and a door to each of the transepts, and the small priest's door, giving access to the chancel. The chanoel is separated from the rest of the church by a carved oak screen of elaborate workmanship. There is an ascent of one step from the body of the church into the chancel, and the altar is reached by three more steps. On the elevated part, are inserted, in the wall on the south side, the sedilia and piscina, of carved stone of most chaste and elegant workmanship. stone of most chaste and elegant workmanship. The details of the former are principally chosen from the Percy shrine, in Beverley Min-ster. The piers of the nave, dividing it into five bays or compartments, are plain, but ex-ceedingly light. Above them is a clerestory, with five triple windows. The roof is of plaister coved—and consists of five compart-ments. The whole of the internal carving is not finished. The stone blocks are left, which will allow the church to receive the subsequent will allow the church to receive the subsequent enrichment. The same may be said of the exterior, which presents at present rather a naked appearance, from the absence of pinna-cles, and the long corbel tables left in plain blocks. On the gables of the chancel and transepts, are three beautiful floriated crosses ; and the western end is surmounted by a bell gable, with elaborate details, which has been finished as a specimen of what the whole of this kind of work throughout the church will be when the design is completed. The object of the founder, it is understood, was, as far as the means allowed, to do well what was limited able to be done, leaving the work purposely unfinished, to be completed either by himself, if God should give him the means, or perhaps by another generation. The doors are of massive oak. The pulpit is of the same material, and the prayers and lessons are read from a lectern, bearing upon it the emblems of the Four Evangelists. The seats are of deal, stained and varnished, and are all in the form of moveable open benches. They are secured in their places by large pieces of cork let into the feet of the bench, which by friction prevents any pushing of the bench from its position without the application of considerable force. It is intended that all the windows shall be filled with stained glass of the richest discrip-tion. At present the whole is not executed. The east window is a representation of our Lord's Ascension. In the centre is a figure of our Lord, surrounded with a halo of glory and raising his hand in the act of blessing the Apostles, who are represented in the lower part of the window, gazing with earnest attention on the figure of their Master, about to vanish from their sight. On each side of our Lord, in the side lights, are seen the figures of atten-dant angels in attitudes of adoration. Of a different conception, is the western window. The subject of this is the Cracifixion. At the foot of the cross, clasping it in her hands, is the figure of Magdalene. On either side are seen the three Marys, St. Joseph of Arimathes,

and the Centurion; and on either side of our Lord are the figures of Angels, hiding the face at the sight. The south transept wisdow is at present incomplete: it contains in the contine the figure of our Lord, as the King of Mustyw, bearing his Cross, and surrounded by the figures of those saints who have borne testimology to the doctrine of the Cross by scaling it with their blood. The north transept window is also incomplete; it is intended to represent the various scenes in the history of the Passien. Mr. Derick, of Oxford, is the architect. The painted glass was executed by Mr. O'Connor, late of Bristol, now of London; and the screet is the work of Mr. Vincent, of London.

CHARLEY WOOD CHURCH, HERTS.

THE consecration of this new district church took place on Thursday, the 13th inst., by the Lord Bishop of London, and was witnessed by a large number of the local clergy and gentry, by whose kindness and the special munificence of one or two, this great benefit has been conferred upon the district.

The church is a small structure, built is the style of the thirteenth century, to accommodate 300 persons. It consists of a nave and chancel, the former of which is completely filled with open benches; the effect of the latter, although devoid of ornament, is artistical. Over the communion table is a threelight window, the head formed with three circles filled in with painted glass; on or of olls are the following texts :- In the beginning was the Word; and the Word was with God; and the Word was God. The lower position has a border of vine leaves round each light. The tower is at the west end of the nave, through which is an entrance to the church; over this is a small gallery. There is south old of the nave; on the opposite side is the vestry room. The pulpit, reading desk, and commanion rail are of good workmanship, in Torrigan cedar, the wood having been presented to the building by a gentleman residing in India. The font is of good design, in keeping with the building.

the building. The church is constructed of faced flint, with stone dressings. The windows, with the exception of those looking east and west, are of two lights, lancet headed. The tower is finished with a pyramidal roof, covered with slate, as are the other roofs of the building.

OPPOSITION TO RAILWAY SURVEYING

WE learn from a gentleman who has lately been surveying in Lincolnshire, that so determined is Lord Harborough to prevent surveying on his estates, and if possible even in his neighbourhood, that two of his tenants, acting either in accordance with instructions, or from a knowledge that their misdeeds would be favourably viewed, last Saturday completely destroyed the theodolite and level of an assistant surveyor, who at the time was neither making use of his instruments nor trespassing. The Duke of Buckingham also forbids and stops by main force all surveys on his estates near Haddesden. Mr. Ashton Smith, of fex-huning celebrity, at South 'Tedworth, opposes in like manner the surveyors of the Manchester and Southampton line. He threatened to summon the Andover yeomanry to protect his covers.

Towards the close of last week a serious disturbance took place at Bicester, which lead to the shedding of blood and the reading of the Riot Act. A party of surveyors, engaged on the Bletchley and Oxford line, were, with their assistants, forbidden by a farmer named Dodwell from surveying across his land; notwithstanding the opposition the surveyors continued their labours. Dodwell and his men endeavoured to prevent them by force, hence the disturbance. This affair will most prebably lead to indictments on both sides.

A report is gaining currency that ministers purpose introducing a short Bill early in the next session, to legalize the entry of linds at certain times and on certain conditions, for the purposes of railway surveying. This power is already possessed by the ordmines department engaged on the trigonometrical survey.

A QUESTION IN ASSESSING DILAPL-DATIONS.

-If during a lease of seven years, SIR shrough neglect on the part of the tenant, perreissive dilapidations have been suffered to secrue, and at the expiration of the said lease the repairs consequent thereon remain unperformed, is it competent in me, as surveyor for the landlord, to make a charge for occupancy during the time necessary to complete those

repairs? If such a charge is not customary, but at the same time you consider it just, will you inform me and your readers generally, by what rule of right or wrong such a custom as the present obtains.

The liberal use that you allow to be made of your valuable publication for the purpose of correcting abuses of whatever kind, and the important decisions that occasionally appear, have induced me to submit this for your conand the publication of a precedent on the subject, will have the effect of setting this questioned point at rest.—I am, Sir, &c., Nov. 12th. SURVEYOR.

. It is not customary to make a charge for occupancy under such circumstances, and we are disposed to think such a claim, if made, would not be recoverable. The lessor is usually empowered by the covenants of the lease to enter and survey the premises, and a course to be pursued in the event of finding

repairs not done, is pointed out. The law would inquire if the lessor had availed himself of the remedy he had himself stipulated in the lease, and would consider that by permitting the repairs to remain un-done, he had tacitly assented to receive the oost of them in lieu. Still there are cases in which the refusal or

neglect of the tenant to repair during his tenancy, might press severely and unjustly on the lessor. We should like to have the opinion of some

of our legal friends on the point,

RULES FOR CHURCHWARDENS. A.D. 1810.

-

We find in the Ecclesiologist for the present month the following satirical admonitions: 1. Never let the roof of your church be too high, for it looks old fashioned; nor covered with lead, for red tiles are decidely cheaper,

and the price of the lead will cover the churchrates for half-a-dozen years; nor open in the interior, for a neat whitewashed ceiling looks more clean and snug, and hides from view the decay of the timbers, which might otherwise be rather alarming.

2. Never allow too many windows to remain, for the congregation might catch cold. Straw mixed with mud is an excellent material for stuffing the tracery; but bricks and mortar are better for the lower part. It is advisable to knock out the mullions, lest some foolish churchwarden should wish to open them again. The east window should be bourded up, to dis-The east whole should be obsided up, to dis-play the altar screen to advantage. For the latter, the Corinthian style is of course the best; but Louic will do. The interior of Llandaff Cathedral affords the best model of appropriate wood-work in general.

3. Fonts and stone coffins should be placed in the churchyard to hold rain-water. They also form convenient troughs for cattle. Their renders them extremely inconvenient

within the church. 4. If your church has any screen, it may be sawn up to mend the old seats of the poor people in the aisles, if any remain, or to make scrapers for their feet. But it is to be hoped that all the principal inhabitants are accommodated with convenient and spacious pues, in the best part of the church.

5. The communion-table should be of deal, not too costly. Carving or other ornament is decidedly objectionable. A piece of old green baize should be thrown over it on Sundays.

Three legs and a prop are sufficient to support it. 6. The village school should be held in the

shancel, which should be well supplied with a straw and deal forms. The teacher's chair may stand within the communion rails.

Disused chantries and chapels should be used for storing coals, or for dust, ropes, spades, 14 old lumber, &c., &c. They may also be boarded off for vestries.

8. The chancel and belfry-arches should be filled up with deal boards covered with canvas. This will give abundant scope for perspective paintings of classical buildings, or other appropriate devices. The commandments should be large but decidely plain. 9. Venetian windows should be substituted

for the old Gothic, where it is possible. And remains of superstitious paintings or glass may be sold to the glazier, or (if considerable)

to private collectors. 10. The pulpit must be lofty, and should stand near the west end, so that the people in the galleries may hear and see the preacher conveniently. The pues may turn any or every way, or no way at all; but the more nearly to

the pulpit the better. 11. Chimneys may be built across windows and doorways, or small portable furnaces may be erected in different parts of the interior. The flues should be as long as possible, because they emit more warmth, and as black, because they attract less attention, owing to their uni-formity with the rows of hats on the pegs round the galleries.

12. All improvements done to the church should be duly recorded on large wooden tablets, the names of the incumbent, churchwardens, clerk, sexton, and the principal contributors, being picked out in capital gold letters.

13. Monuments are best seen when stuck against the pillars of the nave. But any por-tion of the walls will do, if sufficiently elevated. A broad border of lamp-black will be found to set off the white marble in a very picturesque and efficient manner. The design should be invariably classical. An urn and inverted torches are indispensable; indeed, no monument is correct without them.

14. All brasses, freeco-paintings, carvings, crosses, and other rubbish, should be cleared away from the interior of the church. Recumbent effiges should have the heads, hands, and feet broken off, and sold for cattle medicine. The little boys may carve their names upon them, an amusement which will keep them very ouiet during long sermons. All sepsivery quiet during long sermons. All sepul-chral recesses in the wall should be boarded up.

THE SPREAD OF KNOWLEDGE.

Douglas JEBROLD, in his speech at the Manchester Athenæum Soirée, a few weeks ago, beautifully illustrated the change which has taken place in public opinion, as regards the diffusion of information,—reprobating those who had condemned knowledge, for the like reason that the owl flees the sun. "The lady-knowledge," said he, "too long pent up in her tower, guarded not only by giants, but, more provoking still, by dwarfs-and we have only to look back a few years, a very few years, to own there have been dwarfs as mischievous as any in fairy tale,—the lady-knowledge, I say, is no longer a prisoner. We have killed the giants, we have slain the dwarfs. And how have we killed them? Why, as Luther re-buked the devils by throwing inkstands at them. Her music is no longer made the idle luxury of the few, but acknowledged in the daily want of the many. It is a proud thing for you, people of Manchester, that you have a temple to her-a temple, wherein erected the humblest of your fellow-townsmen may come and listen to her, and find his nature at once softened and elevated by the magic of her voice. To say that it offered to such the sweetest solace after the day of toilto say that it imparted to him a keener con-sciousness of the dignity of his nature-to say, that whilst teaching them their own rightfuľ position in the world, it makes them respect the rightful position of others, is only to translate into the merest common-place the oft-repeated eloquence of gifted man. These things are now truisms. But human nature is apt to be ungrateful to truisms; for, let us not forget how fortunate it is for us that we live in an age when they are truisms. For truths, like oaks, are of slow growth; and it is with the early truth as with the acornshew it to mercstignorance, and it cannot conceive how that little germ should hold within it a latent power that, daly developed, shall breast the billow, and defy the thunder. And so has truth grown, but with this sad differ-ence, that it has too often been watered with the blood of those who have dared to plant it. Happy, then, is it for us, and for the blessing

ought we to render up most humble and hearty thanks, that we may to night be gathered together under its branches; for your institution is a great truth-a truth, it may be, planted is a great truth -- a truth, it may be, plantes amidst the fears of the timid, the sneers of the foolish, the misgivings of really well-mean-ing folks, who still thought that truth for the masses was the barley-sugar of children. They might have a little-just a little when very good-but to allow them to have their fill of it, was to risk a terrible derangement of the body social. With the success of your institution made as clear as the sup, it is amusing, it is more, it is instructive, to remember the prophecies of certain men, who predicted that the very light that would play about in-struction such as yours, would only herald, what to them appeared, the total destruction of what they considered the best foundations of society." And then in conclusion :--"The society." And then in conclusion :-- "The tide that carries us on in knowledge, which is power, gives to us that best, that noblest ele-ment of power-gentleness; which, in the full-ness of its teaching, will bear all men to that happy end, of which institutions like yours are

the most hopefal beginning." The Times has lately given a striking epitome of the great changes which have occurred during the last few years. "From lucifer matches, which twenty years are wern sold at 3s. 6d. a box, as philosophical toys, and have now driven the tinder-box even from the backwoods of North America, to the elastric tele-graph, which has all but literally annihilated time and space—in all our doings, in every circumstance affecting us, we can trace the finger of change ;---and as regards our mate-rial condition, it is impossible to deny that, on the whole, the progress is one of improvement. A dozen years since, it was proved, upon oath, by mathematical calculations, to a committee of the House of Lords, that it was an absolute impossibility that a steamer. could ever cross the Alantic ; the impossibility is now a matter of weekly occurrence. Ten years ago we paid eighteen-pence for the postage of a leter in an envelope carried 80 miles; it is now carried 400 miles for one penny. Fitteen years ago railway locomotives accomplished 20 miles an hour; they can now do 75. We can go to China and back in less time than 20 years since, it occupied to get to Calcutta. Who is now daring enough to assert, that we are more than on the verge of our changes ? Thirty years since, we spent scores of millions of pounds sterling in a single year, to bring the war to a successful termination; we are now proposing to spend about a couple of years' war expanditure in completing our system of railways. Fifteen years ago railways were treated as mere private speculations; but the government has already commenced the foundation for laying hands on them for national benefit."

On this same subject we find the following remarks in an introductory lecture lately delivered at the Mechanics. Institution of Ashford, in Kent, by the Rev. John Dafton, vicar of Warehorne :--- "In our times as perimental science is accessible to the many, nnd no longer the monopoly of the few 7 the hieroglyphics which perplexed their studies are blotted out, and it is the unfettered language of the honest and faithful treasurers of knowledge, that they will be happy to see those around them happy. Generally available, the literature of science is to be acquired in those important and useful schools of instruction, Mechanics' Institutes, where none need be ashamed to reap a laurel or cull s: wreath, and which, methinks, if wisely governed, and with libraries carefully selected, all who.ona, are called upon to support. I ask you of what use is science, unless it be imparted to those to whom it may prove useful, and who are likely to use it? Will it injure the higher classes of society, that the artisan is tangit to employ his implements to the best advantage, and see his way clearly? Can they experience loss if the operative manafacturer be taught principles, and is instructed in discoverie bv which he may aphold his country's rank, shear away the paim of merit from the markets of Europe, and compete with continental metions? We may remain at rest, but the world will move around us. And, can it, latime usk, weaken the bonds of society, that the spells of ignorance and seperstition should be bruken? Will the miner cut our threats because hu is instructed in his operations and taught the nature of the fire and chokedamps; and thow

these that where wher signifiet his life may be subdued? I think not." Will any one attempt to geny that if a carpenter, on a bricklayer, understands the principle of practical mathe-nation and mechanics, he will not exceute his master's orders better than the perfectly igno-rant and uninformed? will not the bleacher and dyer be better qualified to go through their work, with a little knowledge of che-mistry; And will not the sailor be improved in his prefession, why possess dome improved in his prefession, why possess dome improved in one: profession, who poisesses some infor-mation in geography and astronomy? Nay, will not the man only his ing a pot to boil, be soff to learn from science a leason which will enable him to cook his seanty pittance better, says his fuel, and both vary his dish and im-prove it? a state of a leason which will contain a state of a leason of the second second Contains and the second second second second second

Carrying out this view Sit William Moles. Work made the Tothoning remarks at the dimer recently gives to him in Southwark :-"Every, ose that has studied the history of mankind must be convinced that, during the manking must be convinced that, during the last contary, especially during the latter half of it, the arts and the sciences have advanced more rapidly than in any other period of which bidory makes mention. In every department of human knowledge careful investigations have been emiried on , and accurate observations have been recorded by pitient and laborious men, who have watched, rested, and explored men, who have watched, tested, and explored the operations of instance, by the means the old sciences have been extended, and the foun-dations of numerous, new, ones have been finity laid and the numerous, new, ones have been science, have attained to wonderful perfection. The have of instance to wonderful perfections and chemistry, have been discovered. The sciences of vegetable and animal philosophy have been created, From these sciences in-conceivable arts have sprung, tending to in-crease the comfert and the well-being of the human race. To the progress of these arts and they will become better acquainted with cach others ifellings, opinions, and interests. Local prejudices, the narrow minded offspring of ignorance and seclusion, will be swept away. mail will be more equally diffused; and mail will become more equal, not by being reduced to the same low level, but by being raised to the same degree in the scale of inteffect.²³

WHAT TO DO XND HOW TO DO IT .- Bradwhat to be and how to ho it. -- brad-shawis Rainouy dizette says! -- "We have more than 'bucke' stated thist ho 'good' could pos-sibly be effected initi the Board of Trade was altogether 'reflected of its railway duties, and the wanding of ders ambulled." The field thus made clear for active exercise, it would become the live of Government to select some five or asvenor dar emilient characters, and, clothing them with plenary powers, reter all railway matters to their consideration." The sugges-tion is well worthy of newsideration. tion is well worthy of consideration.

THELEVELDER!

"CHURCH-BUTEDING, IN WILTSHIRE."

W B have receivily allulad to the number of new churches built in Wiltshire. The last report of the "Salisbury Diocesan Church Building Association" shows, that since the commencement of the association, the sum of nearly 11,0001. had been disposed of by it in grants, which had led to an expenditure on the part of the public, during the last nine years, of 100,0001. Among the events of the past year, the consecration of Wilton church was dwelt upon with a feeling of much satisfaction. dwelt upon with a feeling of much satisfaction. That splendid structure was stated to far surpass all that had been done in modern times, and to stand in advantageous competition with the glorious works of former days. During the past year, ten new churches had been opened in the diocese. Since the first estab-lishment of the association, twenty-one new churches had been built, nineteen rebuilt and enlarged, and additional room had been afforded in forty-four others.

THE BRITISH ARCHÆOLOGICAL ASSOCIATION.

On Wednesday evening last this association held their first meeting for the season in the theatre of the Western Institution, Leicester Square. Lord Albert Conyngham was in the chair and addressed the meeting : about 200 persons were present, including a large number of well known active antiquaries.

A very interesting paper by Mr. Lower, was read on the recent discovery of Gundreda's remains at Lewis, and a letter from Mr. Corner questioning the fact that Gundreda was a daughter of William the Conqueror as asserted. Some discussion ensued, of which, and other matters brought forward, we may speak on another occasion.

LIST OF NEW PATENTS RELATING TO ARCHITECTURE, ENGINEERING, &c., ARCHITECTURE, ENGINE GRANTED FOR ENGLAND.

critished by Mr. A. Prince, of the Office for Patents of Inventions, Lincoin's inn Fields, London.

[SIX MONTHS FOR ENBOLMENT.]

Alexander Bain, of Hanover-street, Edinburgh, engineer, for improvements in electric clocks and telegraphs, part of which improve-ments are applicable for other purposes. September 25.

Alfred V. Newton, of the Office for Patents, 66, Chancery-lane, mechanical daughtsman, for certain improvements in machinery for manufacturing screws. September 26. John Reed Hill, of 28, Stamford-street.

Lambeth, civil engineer, for certain improvements in atmospheric propulsion, applicable to water as well as land carriage. October 2. water as well as land carrisge. October 2. Alfred Hall, of Ooxsackie, America, brick-

maker, for certain improvements in machinery or apparatus for making, moulding, or manufacturing bricks, tiles, and other articles, from earthy or plastic materials. October 2.

George Daniel Bishopp, of Edgbaston, in the county of Warwick, civil engineer, for improvements in certain engines or machines used for obtaining mechanical power, and for

John Simpson, of Langton Rectory, York, clerk, for certain improvements in obtaining

and applying motive power. October 2. Graziano Conte, of Regent street, Middlesex, merchant, for improvements in machinery for cutting, carving, and sculpturing marble, stone,

wood, and other like substances. October 3, Moses Poole, of the Patent Bill Office, Lon-don, gent., for improvements in rails for rail-October 3 wa ya

(Fabriel Hyppolyte Morsan, residing at No.

I de the formation of the world of the source in a source of all and the source of the source of the source of all and the source of the source of the source of all and the source of the source of the source of all and the source of the source of the source of the all and the source of the source of the source of the all the source of the source of the source of the source all and the source of the source of the source of the all the source of the source of the source of the source of the all the source of the sou

J.L or Budt of portion of its fame. His active and ardent spirit led him to make many experiments, to invent and speculate on many povelties, and by arresting the attention of the most wealthy and influential personages of Europe, to induce them to visit his museum, and to purchase many of its costly and novel manufactured goods. The demand for the productions of Birmingham thus produced, gave them a high character and distinction in public marts; and these volumes will afford a lasting explana-tion of the fact, and of the author's share in protion of the fact, and of the author's share in producing it. Amongst the medals designed and struck by Sir Edward, were one of the Town IIall, and another of King Edward's School: by the latter it appears, that Mr. Barry intended to crown the centre with a lofty, per-forated spire, in imitation of the splendid Town Halls of Belgium and Germany.

ROYAL POLYTECHNIC INSTITU-ROYAL POLYTECHNIC INSTITU-TION.—A Lecture on the prevalent disease in Po-tatoes, and the means of extracting the starch as an article of food, will be delivered by Dr. Ryan, daily, at half-past Triter, and on the Evenings of Mondays, Wednesdays, and Fridays, at Nine. Professor Bachhoffner's varied Lectures, with Experiments, in one of which be elearly explains the principle of the Atmospheric Railway, a Model of which is at work daily. Mr. Downe, the celebrated Flutist, accom-panied by Dr. Wallis on the Pianoforte, will perform a Duet Concertance, and afterwards a favourite Fantasia, at Four o'clock, on Tuesdays, Thursdays, and Saturdays, Cole-man's new American Locomotive Engine, for ascending and descending Inclined Planes. A mean and very beautiful series of Dissolving Views. New Optical Instruments, &c. Experiments with the Diver and Diving Bell, &c. &c.— Admission, One Shilling. Schools, Half-price.

NOTICE. - INVENTORS desirous NOTICE. — INVENTORS desirous of obtaining LOANS ON or of SELLING their IN-VENTIONS, or Patents, should apply to Mr. M. JOS. CELIN COOKE, at the OFFICE for PATENTS, Warwick chambers, Warwick-court. Gray's-inn, London, where English and Foreign Patents are obtained, and Designs re-gistered. An INDEX is kept for inspection of all Patents granted for the last century; also copies of every Patent of importance. Instructions to Inventors and a list of charges graties on application.

IMPORTANT TO SURVEYORS, BUILDERS, &c. GALVANIZED TINNED IRON and Cierkenwell

Clerkenweil. J. DORE begs respectfully to inform Builders and Sur-reyors, that on account of the Increasing Demand for Galva-nised Thome Iron, he has made such arrangements as will enable him to manufacture every article usually made in Zine, at the same Prices; also begs to recommend this metal corrugated for Roofing as the most Economicsi, as it can be laid without Boards upon Slight Rafters. Every Article in Zine as usual, at the lowest possible prices.

MOREWOOD AND ROGERS' PATENT GAL-VANIZED TINNED IRON.

VANIZED TINNED IRON. T. W. BEALE begs to acquaint the pub-corrugated, fix pipes, gutters, &c. Also chinney-tops and rentilating cowls of every description; also water and oil cistersa, of this incorrodible and fireproof metal. He manu-factures all kinds of baths, as hip, shower, Roman, open, slipper, sponging, fot, children's, and self-heating baths; also toilet-cans and pails, slop-pails, coal-scuttles, cash and deed-boxes, and fire-proof safes of every description, 10 per cent. cheaper than any house in London. The PATENT GALVANIZED TINNED IRON is ap-plicable to the following uses: -The Lining of Ships' Store Rooms, Shipa' Water Buckets, Water Jugs and Receivers, and for almost every purpose to which zinc, tin, copper, brass, or any other metal is now applied; is more durable, and manufactured at much less expense. An experienced workman sent to any part of the kingdom. All orders punctually attended to. For particulars, apply to T. W. BEALE, 46, Bridge House-place, Newington Causeway.

PATENT GALVANISED TINNED IRON.

PATENT GALVANISED TINNED IRON. (MOREWOOD AND ROGERS' PROCESS.) A RCHITECTS, SURVEYORS, BUILDERS, and CONTRACTORS are respectfully informed they can be supplied with this invaluable metal for building purposes, of the best quality and lowest terms. It is superior in every respect to zinc, and two-thirds less price than 7th sheet lead for roofing, no woodwork being required, but iron ratifers only. 21 inches apart, rendering the whole roof fire-proof. This mode of covering roofs is cheaper than Lead, Zinc, Tiles, or Slates, Parspet and other Gutters formed and fixed, also rain-water pipe heads, eave gutter, baths, store and funnel pipe, cisterns and water-closets fixed. The sheets are 6 feet long by 3 ft., 8 ft. 6 in. and s feet wide, and 90s. to any required weight per foot, and can be had either plain or corrugated.

Please apply to CHARLES CELL, Junior, No. 5, Quick-set-row, New-road, St. Pancras, where references and testi-monials of the highest respectability of extensive works already done can be had.

Full lists of prices may be had on application at the coun g-house; if by letter, pre-paid, inclosing postage-stamp, A large stock of well-seasoned Doors always on hand. ing-

WINDOW BLINDS ORNAMENTAL WIRE WORK, FLOWER-POT STANDS, &c.

Established 1750. .3 ...;

SATURDAY, NOVEMBER 29, 1845.

KNOWLEDGE of the materials employed in building, and the natural laws which regulate their constitution, are essential, we may say indispensable, to

form a good architect. We earnestly recommend our younger readers at once to make the acquirement of this knowledge, or rather the fitting of themselves for easily acquiring it, one of their recreations. It need be nothing more; it will not increase their daily duties, but lighten them ; and will be found hereafter a constant source of gratification and enjoyment, independent of its value to them in a professional point of view.

"Those who possess the genuine spirit of scientific investigation," says Dr. Young, "and who have tasted the pure satisfaction arising from an advancement in intellectual acquirements, are contented to proceed in their rearches without inquiring at every step what they gain by their newly-discovered lights, and to what practical purposes they are applicable; they receive a miliciant gratification from the en lorgement of their views of the constitution of the universe, and experience in the immediate pursuit of knowledge, that pleasure which others wish to obtain more circuitously by its means. And it is one of the principal advantages of a liberal education, that it creates a susceptibility of an enjoyment so elegant and so rational."

Nor will the practical purposes to which their "newly-discovered lights" are applicable, be long unseen. Mechanics, statics, hydraulics, hydrostatics, the properties of heat, chemistry, geology, -will all be found to bear greatly and immediately on the object of their special attention; and a knowledge of these aciences must be acquired by the rising architects, if they wish to practise their profession satisfactorily, and not see the body to which they belong, merge into one on either side of it now closely and unceremoniously shouldering it. This latter is not an idle fear, but of serious import, demanding the thought of every architect. We shall proceed to its consideration on another occasion; our object on the present is, to advise our student-readers to take such a course as may tend to avert it.

Every one has read the long list of attainments considered necessary for an architect, by Vitruvius, but very few seem to think that the same are as needfal now as they were then : indeed, we are strongly led to believe, that general knowledge is less sought for or attended to, by architectural students at this time, than it was ten years ago: their whole attention has been led by the fashion of the times to one particular point, to the neglect of many others. Once it would have been impossible for a man to acquire even a general knowledge of the sciences alluded to,-natural philosophy, in short, without the devotion of years; but now it is a matter of no difficulty, and for a long time has not been so. As a first step, let our young reader take Dr. Arnott's delightful Elements of Physics," and we will undertake to say, even if his attention has never been diffeted to the subject before, that by the time he has mustered its contents he will regard cipient disposition in the city to conserve its

all nature with increased heterest; every object in his walks will present a different appearance from what it before took, and he will have a glimmering of truths in connection with the practice of building to which, until then, he had been blind.

The lecture-rooms of any of the popular literary institutions will give him, at little cost of time or money, an insight to all the sciences, and shew him how he may successfully increase his knowledge of them. What we have thus briefly recommended to the architectural student is applicable to the builder and the operative, - to whom such knowledge is of equal importance. The first, however, being supposed to have more time and means, would pursue his studies further, and so maintain legitimate authority over those he would be called on to direct. If he pause on the threshold, and allow others with fewer opportunities to pass into the temple, he may expect, and will deserve, to find himself (as he assuredly will) a follower instead of a leader. Those who do not keep in advance of the crowd must expect to have their heels trodden on; and if they bad an advantage given them at starting, and failed to use it, will meet with no pity when they lose the race.

We commend these words, with all respect, to the consideration of some in the profession who have long ceased to be students.

DO THE CITIZENS REGARD THEIR ANTIQUITIES.

At a meeting of the Royal Institute of British Architects on Monday last, a report of which appears in THE BUILDER of to-day, Mr. Tite complained of my having interfered, in the year 1841, with the "City-Authorities," or with the "Joint Committee of Gresham Affairs," and obstructed them in collecting antiquities discovered on the site of the Royal Exchange. I have before me, a verbatim and authenticated report of Mr. Tite's speech, which differs considerably from that published in your paper. Mr. Tite stated that I offered sums of money for coins, &c., that a great deal that ought to have belonged to a public collection had gone to enrich my private cabinet, and further, Mr. Tite refers to my papers in the Archæologia as conveying accusations against the "City Authorities" for interfering with me and my researches, when, in point of fact, he says, it was I who interfered with them and their researches! It is rather remarkable that Mr. Tite should have allowed so many years to elapse before he adventured to rebut my assertions and to advance counter charges. especially as, during the long course of my attempts to record discoveries of antiquities made in and about the city. I have never shrunk from openly denouncing, less the apathy of the ation towards their ancient monuments, corpore than the obstacles they throw in the way of those who sacrifice their time, in endeavouring to preserve or record those doomed to destruction. Mr. Tite does not venture upon the history of the discoveries made during the last fifteen or twenty years, but he refers to what he states took place in making excavations for the New Royal Exchange. To that brief period of operations upon a comparatively small spot of ground, I will, for the present, confine

my remarks in reply to his accusations. With the hope of being permitted to make free use of my eyes and pencil during the progess of the works, without liability to encounter such offensive hinderances as from time to time, when attempting to make sketches or elevations, I had long been subjected to, I called upon Mr. Tite at his office, and asked him to favour me with a written passport, for free ingress and egress to and from the works at such times as I could make it convenient to attend. This request he courteously granted, and at the same time said he trusted I should not interfere with the workmen to obtain possession of any objects that might be brought to light, as the Joint Gresham committee wished to preserve every thing for themselves. I replied, that I was delighted to hear there was an in-

ancient monuments; that I should be quite antisfied in finding that such ancient remains as might be found would really be preserved, and moreover, that collecting antiquities for the mere sake of collecting, was a feeling unknown to me. I rigidly adhered to my promise, but, to my surprise, I soon ascertained that Mr. Tite's passport was totally useless to me, and that even in his presence, it did not protect me from abuse, and threatened personal violence from people under his authority, or that of the Joint Gresham Committee. The full parti-culars of the outrageous conduct I was sub-incted to alward upon the full partijected to almost upon my first visit to the xchange, after receiving this order from Mr. Tite, are detailed in a letter addressed to the Joint Committee of Gresham affairs, and delivered into the hands of their clerk, Mr. James Barnes, on the 16th of February, 1841. To this letter I refer Mr. Tite, as it would be too long to insert on the present occasion in your columns, and I will content myself with briefly telling the result of the order.

The first time I visited the Exchange after receiving it, was on my return to London, after a sojourn of some days in the country. Upon no previous occasion did I ever encount such gross and unprovoked abuse as upon the present, when under the protection of Mr. Tite's order. The foreman not only used the It is sorder. The forenam hot only uses the most violent language, but he also threatened to expel me by force if I delayed to leave the works. He laughed at Mr. Tite's order, and asserted that he also had his orders, and was prepared to execute them ! Willing to ascer-tain if Mr. Tite's order would be enforced, I again presented myself, and in the presence of Mr. Tite, had to suffer a repetition of the pre-vious outrage, Mr. Tite upon my appealing to vious outrage, Mr. The upon my appealing to him, coolly saying he could do no more!! This order then was perfectly useless to me; it was scouted by the menials, and Mr. Tite seemed to possess no control over them, or was himself under the influence of some superior power, for not a shadow of a pretext could with any reason be urged sgainst me for infringement of rules and regulations; on the contrary, I had already been instrumental in reclaiming and securing some articles for the collection now deposited (I understand) in the London Institution. The power of architects in the city is not always so limited. Mr. Cockerell having granted me permission to visit the excavations made on the site of St. Bartholomew's Church, the same superintend-ent, who, on the other side of the street, within the jurisdiction of Mr. Tite, was per nitted (if not instructed), to annoy me, attempted to obstruct my entrance to the premises. Mr. Cockerell, however, with manly consistency and decision, threatened to discharge any in dividual who, contrary to his orders, should dare to molest me, and, I need scarcely add, his commands were never disputed. The assistance afforded me by this gentleman was given, moreover, with such good nature and kindness, as to make me feel he was as much obliged in granting the privilege, as I in receiving it. As I was not inclined to suffer bodily mar-

tyrdom on the site of the New Royal Exchange, tyraom on the site of the New Koyal Exchange, I desisted from visiting it, until I perceived that hundreds of persons were daily indiscri-minately admitted without orders, when I oc-casionally mixed in the crowd for a few minutes, or, after awhile, was tolerated by Mr. Russell, the clerk of the works (whose polite-ness I willingly acknowledge), and thus managed to make the few observations printed in the Archaeologie, but which acents and imin the Archæologia; but which, scanty and imperfect as they are, comprise every thing that has yet been published relative to the discoveries made on this spot. During the entire period of the operations, I rigidly forbors even from speaking to the workmen, except in a few instances, when I made myself instru-mental in inducing them to take objects of antiquity to Mr. Russell, to whom I also forwarded some coins which had passed into other hands from the excavators, and subsequently were offered to me. But I regret to say, that the regulations referred to by Mr. Tite, were the cause of many interesting matters being carried off by the workmen, and dispersed b yond the hope of ever being made available to science; and I much doubt if the chief mass of antiquities collected, ever reached the London Institution. I have understood that peo-ple who had access to the room in which they were at first deposited, could not refrain, in the

ardour Witheir newly-acquired taste, from car-rying of occasionally a few specimens, al-though the abstracted fragments might render a bantiful, yaso, loss, completeir mente init renter in proponatiyn L. perfectly well, remanbar, vrae the canes of my recommending, that a batter manual ha filled with morthless adds and ends:

and cause of my recommending dates batter and the filed with serthless adds and ands; and placed in a convenient situation for the caricality sectors to purlain from to their boards protective sectors to purlain from to their boards protective sectors to purlain from to their boards protective sectors to purlain from to the boards protective sectors to purlain from the black of the protective and sitently listen to scandel and false boards and sitently listen to scandel and false boards and sitently listen to scandel and false boards and the list thy listen to scandel and false boards and the list regard for the source of the purpose is a shourd not board of the source of the base the analytic regard for the source of the purpose is a shourd not board of the source of the base the source of the source of the source of the base the source of the source of the source of the base the source of the source of the purpose is an a shourd not board of the source of the purpose should be in former times or during the list is an abound not board of the source of the purpose, and the source of the source of the purpose, and the source of the source of the purpose, as far as "City Authorities," were source of. On the copirary, is can be regronal evidence, confirmed, by dates, and indisputable facts, that for a long series of years_they, have directly constrained by dates and indisputable facts, that for a long series of years_they have directly for a long series of years they have directly countenanced a wholesale and indiscriminate eysten of deitraction. Anad they ever pos-sessed a feeling for the works of ancient art. which illustrate the history of old London, chey mante not in the year 1845 be talking and disputing, abyes fiking ap 'one 'row for their geographic of they would have apusessed it man-sion as high down with them, an entire batkling sidnosh a mulwini as might have been formed, and as had the world of the minuments now fire years ly destroyed, "demanded." be rejorted is father has invied if the flose who roomany seem to rear the plouding anti-quary may be getting rich by some method quary may be getting rich by some method bidden from their sycal and from source appar-ready within their nearb, but not divulged to

ready within, then a nearby but and diverged, to: their comprehension must parced in unged, to: "Private museums must parceds; public ones, and both, if properly collected, arranged, and directed, are of the highest value, and cannot, be too mumerous. But the mere getting to-gether, with indiscriminate, scal and capidity, loads of antigation, disconsted, from those often minute, but disconstant, circumstances which serve to (authenticate their parentage which sarve to lauthenticate their parentage and aid their channelogical arrangement, is an almost profiters labour, which to the scien-tific inquirer, generally vields, only embarrass-ment and confusion. How often do we find collections rendered comparatively useless, by a want of information of facts connected with the discovery of their contexts! And these facts are to be obtained only from the discoverers themselves, and will be the more or less complete in the ratio of their amount or less complete in the ratio of their amount of intelligence and skill. Under a truly grand system for the conservation of our national monuments, such as ere long we may hope an enlightened Government will institute, private enlightened Government will institute, private collections may in many ways be rendered more available than public ones, and local museums will be encouraged throughout the kingdom. From these, models and drawings may at a trifling expense be forwarded to the metropolitan collections, among which, it is trusted, may soon be reckoned the museum of the Speciety of Antimarica of London, the surthe Speiety of Antiqueries of London, the nucleus for which already exists, and even the being all that is required to induce her Ma-jesty's Government to consent to its appropri-

ation for this purpose. As for the "City Authorities," let them sup-gort individual research, and it will surely be turned to their advantage and honour. If the day has arrived for them to appreciate the value of monuments, which illustrate the history of the city they affect to venerate, let them shew their sincerity by engaging without more delay, scholars and literary men to decipher and arrange for them their municipal re-cords, as yet comparatively unexamined. Let these valuable documents be indexed, and let abstracts be published, to direct the researches of those whose inclinations may lead them to seek information upon the customs, usages, to seek information upon the customs, usages, manners, and social and political condition of the inhabitants in past ages. Money can easily be found for improving the physical condition of the citizens; let a portion of it be expended upon this neglected branch of their education, and the corporation may be assured, that as the outlay upon the one, even-ually increases the civic funds co will a down tually increases the civic funds, so will a corresponding liberality in providing for these intellectual necessities, be rawarded by an elevation of the moral standard and character of the rising and future generations.

I am, Sir, yours respectfully, CHARLES ROACH, SMITH, 5, Liverpool street, City, Nor. 22.

PROGRESS OF TOBQUAY, DEVON.

A CORRESPONDENT writes us that the demand for workmen here is beyond every thing ever known in this part of the country; "I mean," says he, "workmen of every descrip-tion connected with building. Between 300 and 400 houses are decided upon to be built immediately, and the cry of want of hands is general; the men are very independent, and .I several, the first are very interfacent, and i assure you it is quite a favour to get any job of joinery, stone masoning, bricklaying, or iron-work done, even at an advanced price. This place lately has nearly doubled in popu-

lation, and visitors have been numerous; in fact, I believe there is scarcely a house to be had for love or money. Several families have been obliged to leave the place because they could not obtain houses to suit them. It is no doubt the loveliest spot in England for beauti-ful and varies scenery, and may justly be called the gem of our island.

_ and have all the profession we obtain the profession we all the old event to so the second se

REVISION OF THE MUTHOPOLITAY ETTE PARTE ACT.

500

logal withority and bearing of their Actil We have sooked in voin for my thing of the sort here's if we examines the awards made by the Court we find but fow in which the principles off the Automotive the method on sooms off the Automotive terms the second soon appears, indied, sudjously worked to meet that partidefar case slowe, and catefully guarded against outer case along and carefully such as a gamards seen finined father with a new to prevent the hurden vie and inconvenience, which would arise of these cases from a strict observance of a doubtful encoment than to enumeratoprinciples, though the referees have never I believe shewn any unwillinguese to exercise their discre where an impractioable ouse has occurred. This however, duly tends to shew the futility of legislative enactments on misute building points, and the difficulties with which a profesal man under the present Act; which enters into so manay minating has to contend in ar-ranging bis plane and designs, and learning beforehand what's and what is not legal. It would not " think be difficult so to regulate the office as to evaluate this difficulty, but it would previously be accessary to clear the Act of imany of its entitinents.

-TOwe bfothe great difficulties in obtaining leg al wester and a second maich suisfaction that the building interest abserved in the Ad; the slauses by which all mutters relating thereto, should be determined by gentlemen not in the law, but educated in the strethitectural profession - I strongly believe that one of the main caused of the comparafively Hitle opposition made to the bill, arose from the feeling that this clause, which was a sovelty, and hid not been introduced into any of the other provious schemes, would effect-sally remove all difficulties in carrying out the Active to the set of the set of the set of the second sec relieved from all legal discussions and verbal hair splittings; by the business-like decisions of practical men, uncontrolled but by their own judgment of the facts. By the power given to the registrar, of refusing to all his seal to official documents, the whole control of the segulations of ubuildings in othe metro-polis, is virtually in his bands. . He is almost the sede "judge toff ull questions brought to the board accordingly. The second of the board according to the base of the the case may appear to the practical and well-wersed to great of the official referees, the registrar under the Act, is in duty bound w master all the techniculities of the case, and to require the increasing information relative thereto; to satisfy himself that the pro-visions of the Act are abided by before the referees can deciden & The Previtable result is Merefore, that a disputed point, upon however triding a matter, now presents all the "" vidence, letters, rejoinders, plans, &c., ac-ethnulate rapidly, and discrepancies on points of practice, which it was anticipated world mit been settled more quietly than under the old system, now require sheets of correspond-Darry had better at once take into donsiderawond the increased accommodation which the records of this Court will demand; that the Unportant decisions with the shop-fronts, "flues

Unportant decisions boil is http://finite, illines, chitmieys, &co; may be handed down to future flugtisities antignaries. In our court particle in the point, however, which I wish to notice in this,- architects, surveyors; and builders, are not tawyers, and though Vitterius orders they should acquire a quantum suff. of legal lore, to know when their buildings are according to Ww, I think he would have fretted and fumed mesonie of the legal building vexations of the present Act. A barrister, therefore, sitting ditthe head of a Court, becomes a formidable personage to a plaintiff or defendant, who has only bis 'own professional knowledge to act apone He could discuss the practical bearings of the case with the referees, but dreads the Wal points which may enexpectedly be raised. The consequence is, that cases have been bindected by bolleitors and even barristers, and hours consumed in arguing all the tegal quirks and subtleties looked upon as points of law, when the real gist of the case, if left to the referees, would have been seen and decided at

onde. That is would be letter had the Court more of a professional than a legal character.

Another grievance connested with this legal character of the Courf is the system which has been adopted of payment/ by fees. I am not about to characterize the charges as exorbi-tant or unjust) but chruinly as unprofessionat (architecturally speaking) and vexations. The interview phan; as separate charge for each letter, interview; plan; see, mevirably suggests the idea of making business, "I um aware that these fees puy the office expenses of clerks and establishment, but many of the charges are so unusual (for instance, the charge for reading lutters sent to the office, or for making an inquiry of a plerk), that it is much to be regretted that some other system had not been adopted. That it may not be thought I am exaggerating, and as it is to be hoped that these bills will be shortly only matter of history, perhaps you would like to preserve one as a relic in your journal. Your readers may smile at it, but the wry faces with which a circle of professional friends received it, would have been a study for Hogarth.

The above needs no comment.

Another consideration which affects the con-Another consideration which anects the con-stitution of the Court is the power which the registrar has, of allowing the duties of the office to be performed by only one of the re-ferees, under the 82nd section. The unex-pected wish of one of the referees to retire, and the delay which has compared in appointing bin the delay which has occurred in appointing his successor, have of course made it absolutely necessary hitherto, in many cases, that one re-feree only should act; and it is possible that on many occasions this must be the case; still; throughout all the portions of the Act, the official referees are spoken of conjointly. In all cases of disputes or appeals, both referees should hear thestatements, or if an option is to be given upon the subject, that option should be given to the parties litigant, and not to the registrar. It would be better, however, that there should be no option, as it might appear invidious to object. There are also many obvious reasons why these cases which are cases of appeal, should be discussed before both referees. the least, perhaps, is on account of the extra-ordinary judicial and executive powers which the board possesses under the Act at present, but which it is to be hoped will not be allowed to remain. The awards have all the power of an Order of Court of the Queen's Bench, there is, in fact, no appeal allowed to that Court, or any other Court, upon the subject, however aggrieved the party may conceive himself by the result of the award. By the production alorie of this award before a magistrate of the district, the justice is required to issue his warrant to levy the amount upon the goods and chattels; or if the party awarded against be a poor man, and his goods and chattels are not sufficient, he is ordered to imprison him till the amount is paid, or the Insolvent Debtor Court discharge him. All this too may be done even in the absence or non-attendance of the party accused. One is at a loss to understand how such arbitrary and really unconstitutional powers, could have been given by a legislature of the present day to a board, without at the same time providing some security and restriction.

'It has been stated, indeed, that there is no clause in the Act protecting the official refere from an action at law, for an injury which any person may think he incurs by the effect of an award. It would require more legal of an award. It would require more legal knowledge than T possess to reply to this, but it is 'evident the enacting 'blause give the re-ferces the preat power which I have alloded to both over persons and things." I doubt if there is any other Court furthe kingdom whose decrees are therefore so ancontrolled as this. If the Court is to us at Court of liw, let us at least have all the protections of appeal, &c., which the old customs of the kingdom throw around the suitors,

THE IMPROVEMENT OF FULHAM AND PUTNEY.

SIR,-The simple act of casting a stone into a pool, and watching the circling eddies and agitation its fall has caused in the otherand agreenon to this as caused in the other-wise stagnant water, is an universal and fa-vourite amusement of children, and is also contemplated by the philosopher with consi-derable attention; but the moral affect pro-duced by a well-directed blow at the supinebodies, is watched with much greater interest by hystanders, and its influence ranges far beyond the locality where the blow is first giv en.

I am induced to make these remarks from observing in THE BUILDER of Nov. 22nd, a letter from "Observator," on the improvement of Fulham, which, it appears, had been written on his observing in The Times newspaper, an account of improvements that have in commenced in the parish of Chelses, and

been commenced in the parish of Chelses, and are affecting parts far beyond that locality. I perfectly agree with "Observator," that "Fulkam nuch needs improvement:" from my residing at Putney I am obliged to pass daily through Fulkam on my way to town, and am forced to notice the crooked, "narrow, and am forced to notice the crooked, "narrow, and dangerous lanes (they cannot be called roads) leading from Putney bridge to the other side of the town of Fulham. The authorities at Fulkam have only one excuse to offer for their supineness, viz., "Habit is every thing," and they have been so long ac-customed to twist and turn the tortuous windings of the present approach to the river, that they cannot now see any absurdity in it; but how the proprietors of Putney bridge can be so short-sighted and blind to their interests, as not to perceive the importance and advantages to them of a straight and easy access to their bridge, I cannot conceive. Nothing would rove the town of Fulham so much as a imp straight, wide, and easy access to the river; the town would become healthier and cleaner, property more valuable, and more on a par with the improving localities of Chelsea and pr with the improving localities of Chelsea and Brompton. I hope, therefore, its inhabitants and the proprietors of Putney bridge, will take a hint from what has been done at Chelsea, immediately bestir themselves, and pull toge-ther to obtain a local Act for improvement, which ill more than the dot the improvement be, which will eventually tend to their mutual be nefit. A fam, Sir, Stor, H. Putney, Nov. 24th, 1845.

STIR IN THE WESTMINSTER COURT OF

SEWERS.

On Friday, the 21st inst., a very numerous assemblage of the commissioners took place. In the absence of Mr. Edward Willoughby the chair was occupied by Captaiu Bague. The belance at the bankers was declared to be 17.0624. 7s. 9d. After much routine business had been transacted, and an application from Mr. Peanethorne, calling upon the Court to carry out an implied understanding as to the St. Giles's improvements, granted, the impor-tant business of the day commenced,--to consider and sanction the resolutions passed at the Court on the 14th instant. (See page 561 ante.)

Mr. Doull, the assistant-surveyor, the geneman most seriously affected by the pro-dings of the Court on the 14th inst., had . had reased a letter to the Court, which was that it the clerk, 31 commissioners voting It set uld be read, and 6 against it.

appointed a that, about ten years ago, he was ceased to rech surveyor, Mr. Dowley having re-entered the that office; that Mr. Dowley and that afterwailce as assistant-surveyor, reversed by the Courtheir appointments were harassed by motions for hat after this, he was solved to tender his red dismissal, and re-this," said the writer, "I was at afrequently of the this is a statement of the solution." urged not to think for a moment st strenuously and I received, particularly from the late ehsirman, Mr. T. L. Donaldson, a most high-sounding declarations of friendship and

professional brotherhood and seteem : and was most positively assured by Mr. Allason in re-iterated terms, that the committee were bound to support me, to make a most favourable report of my services, and most honourable mention of me, and that I ought by no means to think of resigning.

The letter terminated with the following: "After having given up a beneficial and in-creasing practice and connection, not possible now to be regained, in which I had acquired, I presume I may say deservedly so, an unsullied reputation, both professional and private; and having spent the last and best ten years of the prime of my life in your service, in which, I can truly say, I have constantly used the most vigorous and unremitting exertions, in the faithful discharge of all the duties entrusted to me, it is now proposed to turn me adrift on the world, with an implied stigma on my character, and thereby perhaps cause me to be a ruined man, although not one single charge of misconduct or impropriety in any shape can be established, or has ever been attempted to be made against me."

Mr. T. L. Donaldson wished Mr. Doull might be called into court : when he arrived,

Mr. Donaldson stated, that he had taken the liberty of suggesting that Mr. Doull should be present to hear what observations he had to make upon his letter, which contained serious accusations against him; and as the character of a public man was public property, he trusted the Court would pardon him for making a few observations on that letter. He took particular objection to the words "high-sounding declarations of friendship and professional brother-hood and esteem." He had every reason to hood and esteem." He had every reason to respect the personal character of Mr. Doull: he was a man of the highest integrity, and of the most amiable manners; he and Mr. Doull and ocen for several years connected as officers of the Court, but in private matters never; and he thought it was injudicious in Mr. Doull to use the words "high-sounding declarations of friendship and estcem." More than the opinion that he entertained, as chairman of the Court, for the officers of the Court he never had been for several years connected as officers Court, for the officers of the Court, he never professed. The officers had been in the habit of coming to his house to ask his opinion, and he considered that these meetings were private and confidential communications; not that he cared personally that they were to come before the world. At the period alluded to, Mr. Doull did come to him, and said the motion was of such a nature as to induce him to resign the appointment rather than be exposed to any further molestations. He (Mr. Donaldson) said that he naturally felt for him as an officer of the Court, for the position in which he was placed, and expressed an interest for him as a professional brother. Mr. Doull then replied that he had made up his mind, and would send in his resignation; to which he (Mr. Donald-son) urged, that that would be a recognition of the charge against him; for he did not know what might be the result of the inquiry, or what modification might be made in the appoint-ment. Mr. Doull did not resign; the arguments he (Mr. Donaldson) had used to him had prevailed. But when he (Mr. Donaldson) knew the result of the investigation, he then told Mr. Doull that he thought he ought to resign. So that Mr. Doull was incorrect in saying that he had, in every case, been most strongly urged by him not to resign.

Mr. Allason, sceing that he also was impli-cated by Mr. Doull in his letter, said, that when Mr. Doull came to his house after the first meeting of the committee, it was impossible for him, Mr. A., to have used the words attributed to him. He was quite sure that it was the disposition of every member of the committee to do ample justice to him as a man, but although he was not present at the meeting, he fully concurred in their report; that as an assistant-surveyor, he, Mr. Doull, was incompetent, and that the committee was not to be found fault with for having so determined. He, Mr. Allason, was certain, that no individual could be found more fitting for the duties Mr. Doull had since that period been called upon to perform, but the resolutions of the Court, passed at the instance of Mr. Leslic, were evidently the cause of Mr. Doull's dismissal, and could not be imputed to him or any other member of that committee. Mr. Leslie thought that in the attempt at

exculpating himself and the committee from the charges Mr. Doull had brought against

that body, Mr. Allason had no right to inculpate him, who was taking no part in the extraordinary proceedings going on. The reso-lutions he had carried in that Court were for the benefit and security of the public, but not at the expense of Mr. Doull or any other

officer. Mr. Doull being asked if he had any remarks to make, said he had very few words to offer to make, said he had very few words to offer So far from there being any breach of con-fidence in the statements he had made, he felt justified in the course he had pursued. He saw little or nothing contradicted of those statements, and so far from the conversations statements, and so far from the conversations being of a private or confidential nature, he felt that they had taken place under circum-stances which left him at full liberty to make stances which left him at him howing to make any use he pleased of them. He wished to al-lude to a conversation with the present chair-man, Mr. Edward Willoughby, but the Court thought as Mr. Willoughby was not present, Mr. Doull could not do so. Mr. Doull them said he could only repeat his statements, and he challenged contradiction of a single word; he considered that not one fact in his letter had been contradicted, nor could he. It had been a matter of regret that he had been compelled to name the two gentlemen who had spoken, and many, no doubt, would consider it an act of temerity on his part; but the time had arrived when it will not do to mince matters.

On Mr. Le Breton, proceeding to move that the orders of Court be sanstioned, Mr. Hertslet being called upon, stated, that he never knew an order of Court to be sanctioned, and in reply to Mr. Donaldson, he said he could find no precedent. Mr. Leslie objected to an order of a Court of Resord requiring a sanction, except in those cases where necessary for the public security as concerning outlays of the public security as concerning outlays of the public money; but in those eases, there was a previous order of Court, compelling that safe-guard to the public; but in this instance the order of Court for sanctioning came. subse-quently to the orders having been recorded. Mr. T. L. Donaldson thought that Mr. Leslie was out of Court, he had not interferred in the discussion. The fact was a street of

in the discussion. The fact was, a string of resolutions were concatenated together i n a resolutions were concatenated together in a hurried manner, and there was no idea that the votes of the previous Court were to be con-sidered as a definite conclusion. He had no idea when he came to the previous Court, that he should have been called upon to take the part he did, and therefore he thought that appending those resolutions to the business paper of the present was a proper and wholesome regulation.

Mr. Fuller said that these proceedings were the first public acknowledgment that Mr. Leslie's statements in his pamphlet were accurate. The resolution of the last Court, now to be sanctioned, stated that the surveyors department was inefficient. Mr. Leslie, had declared over and over again in this Court that it was inefficient; inefficient in the dig-ging, by means of which a much larger quantity of digging was paid for to the con-tractors than they had executed, and that warrants of distress had been signed in this Court to sell the beds from inder the poor rate-payers to pay for this inefficiency. What would the Secretary of State say, when having sent for the answers to the allegations brought against this commission, he heard that they had dismissed their surveyors for inefficiency immediately after the promised answer was drawn up. Then, again, at the very moment drawn up. Then, again, at the very moment when the Court was to appear in a trial at law, to determine whether the contractor or his sureties, or the rate-payers of the division, were to pay for the failure of the sewer in the Gloucester-road, Paddington, that moment was selected to break up and discharge the surveyors, and a resolution come to (in order to get rid of Mr. Phillips), that there should be no assistant-surveyors at all.

Mr. Hawkes stated, that as he was absent from the preceding Court, the resolutions had come upon him with surprise. He should be glad to be informed what were the grounds upon which the Court determined the inethciency of their surveyors. He would grant, that if Mr. Dowley could not deny the truth of Mr. Phillips's entry in the Book of Informations, as to the abaminably filthy condition of the sewers, there were good grounds for de-claring the surveyors' department was ineffiHE-BULLDER.

cient; but Mr. Leslie's pamphlet had nothing to do with the matter. As to the public think-"ing they had been robbed in the manner of "faking the account of the digging, why the "professional members of the Coart thought it "was the very best bargain that could be made "for the public." Mr. Phillips's entry in the Book of Informations of the 3rd of October, declaring vast numbers of the sewers to be working better than elongated cesspools, was vien read, and Mr. Hawkes called upon the Court to require Mr. Dowley to say whether the statement was true or not.

Capt. Bagne agreed with Mr. Hawkes as to Mr. Dowley being called into Court to clear op the matter.

Mr. Donaldson objected. He thought it had nothing to do with the business before the Court. They were deficient of one sur-veyor by the resignation of Mr. Hawkins; Court. Mr. Dowley was absent for many months in the year on account of illness; reports for several months had been delayed, and on these simple grounds he contended the surveyors' department was inefficient. Mr. Bouverie said, he thought the Court

Was pursuing a very unaccountable course. "AFA Le Breton, the mover, gave them no "statements as to acts of inefficiency in any charge that could be met. The late chairman, Mr. Donaldson, did not throw any light upon "The subject, he merely informed them that "My. Dowley had frequent attacks of gout, and was behind in his reports, and on these grounds "the Court was called upon to sanction an order

²¹ Which had the effect of breaking up the whole ¹⁹ Of the surveyors department. Ne considered ⁰⁰ the Court was placing itself in a very awkward

¹² position before the public. ¹² Mr. Le Breton, as the mover of the resolu-tion, wished to say a few words in explanation of not giving the reasons why they had arrived at the conclusion now cavilled at. At the former Court the late chairman, Mr. Donaldson, and his successor, Mr. Willoughby, had both declared the surveyors' department was finefficient, and it was carried nem. con. Now when the subject was to-day brought forward for confirmation, a mero matter of form, they heaitated, although they knew perfectly well the surveyors were inefficient. Since he had had sourveyors were inefficient. Since he had had the honour to be appointed a commissioner of sewers, he had discharged his duty. He thought it was useless to go back to inquire what had been done by their predecessors in that Court, in the year 1829; no good could arise from that inquiry, and he assured the Court that as long as he (Mr. Le Breton) be-longed to their body, he would support that body (hear, hear,) and when he intended to make an attack upon them, he would go out from among them.

Mr. Leslie wished to ask Mr. Le Breton, as he had introduced the subject of his recent appointment by the Lord Chancellor as a commissioner of sewers, whether there was any truth in the report that he (Mr. Le Breton) had, as clerk to the Board of Guardians of St. Martin's parish, been sent by the parochial authorities with a list of twelve names, to the Lord Chancellor, for insertion in the commission; that ultimately not one of the twelve was inserted, but that his, Mr. Le Breton's, name was inserted by the commission.

Mr. Le Breton said it was not true.

Mr. Hawkes said it was not far from the truth.

The question as to the inefficiency of the surveyors' department was then sanctioned by thirteen votes : no one of the great number of commissioners present voted against the motion.

Mr. Le Breton and Mr. Donaldson moved. "That the Court do now sanction and conform the order of Court of the 14th inst.; that a new chief surveyor be appointed, but that Mr. Dowley should be retained as consulting surveyor, at a salary of 200%. per annum."

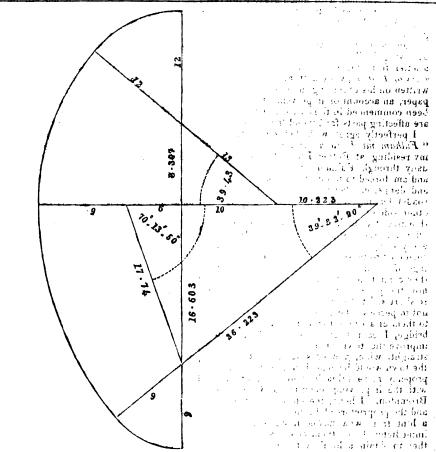

Mr. Harrison supported the motion. He assured the Court that the matter had nothing to do with Mr. Leslie's pamphlet, but arose entirely from the resignation of Mr. Hawkins. Carried by 14 to 1. Mr. Le Breton then moved "That from and

21. . jt after Lady-day, the services of the present assistant-surveyor, Mr. Doull, be dispensed with, and the office abolished." Mr. Le Breton de-clared it did not urise from any thing personal τa. - 12 to Mr. Doull, but it was a consequence of the recent alterations in the arrangements made by the Court. Mr. L. E. Wood seconded the motion, which was carried by 7 votes to 5. great many commissioners present did not vote.

Mr. Le Breton then moved and Mr. Allason seconded, "That the Court do now sanction and confirm the order of Court of the 14th inst., viz., that there be no other than the consulting surveyor, in addition to the chief surveyor, hereafter to be appointed." Carried

by 11 votes. Mr. Le Breton gave the following notices of motion for the next Court, Friday, the 28th November, "That Mr. Dowley's present salary be continued till Lady-day;" "That the salary of the chief surveyor, to be appointed in pur-suance of the order of Court of the 14th day of November, and confirmed this day, be 600% per annum; and that measures be taken to invite candidates to apply for the office."

SIR, Will you allow me to offer you a correc-tion of the figure given on page 503, as to the ont-line of the section of a culvert or sewer. The object is to construct a figure of two semi-pyhls upon the same conjugate dismeter, the length of the whole figure 46 inches, and its greatest breadth 30 inches, the radius of the curve at one extremity of the transverse diameter being 12 inches, of that at the other extremity 9 inches. For the upper half of the figure a second radius is taken, 13 inches, which gives a figure very closely resembling a semi-ellipse, the semi-transverse dismatter of which I find by calculation to be 20-307 inches. Subtracting this result from the whole length of the figure, 46 inches, there remain 25.693 inches, for the semi-transverse dismeter of the lower half of the figure : in which figure we have thus given

the two diameters and one radius. The other radius is therefore determinable, and 1 find it to be by calculation 35.223 inches, instead of 38 inches, as given in your correspondent's diagram. Five dimensions are all that are necessary to construct the figure, instead of six, as there given. I subjoin the construction with the dimensions attached. I confess I am not aware of the rule by which an oval may be constructed so as to approximate most nearly to an ellipse upon the same axis, and I should be grateful for information on that point: I am, Sir, &c. Q.

Islington, October 30.

- In the latter part of "E. E. E.'s" letter in THE BUILDER of the 15th inst., he says, "Probably Mr. Roe, if applied to, would state whether it was his invention (the eggshaped drain), or whether he received the idea

from any other person." For the information of "E. E. E." I beg to say, that a drain is now in existence through the principal street of Bridgwater (draining one of the greatest nuisances, as it once existed, into the river Perrot) of the egg shape; if it was built by Mr. Hutchins, a mason (who is now living), upwards of twenty years since; is one of the most perfect construction, and does its office with but a trifling fall, to the immense advantage and comfort of the above town - I am Sir. &c. J. G. town.-1 am, Sir, &c., J. G. Cannington, near Bridgwater, Nov. 20th.

THE GUAGE COMMISSION .- Mr. Hudson was examined last Saturday before this Commission. He is decidedly in favour of the narrow guage, on the pleas of safety, speed, economy, and convenience for traffic. GREAVES'S BLUE LEAS LIME 1974 P. O. . Sol. 1

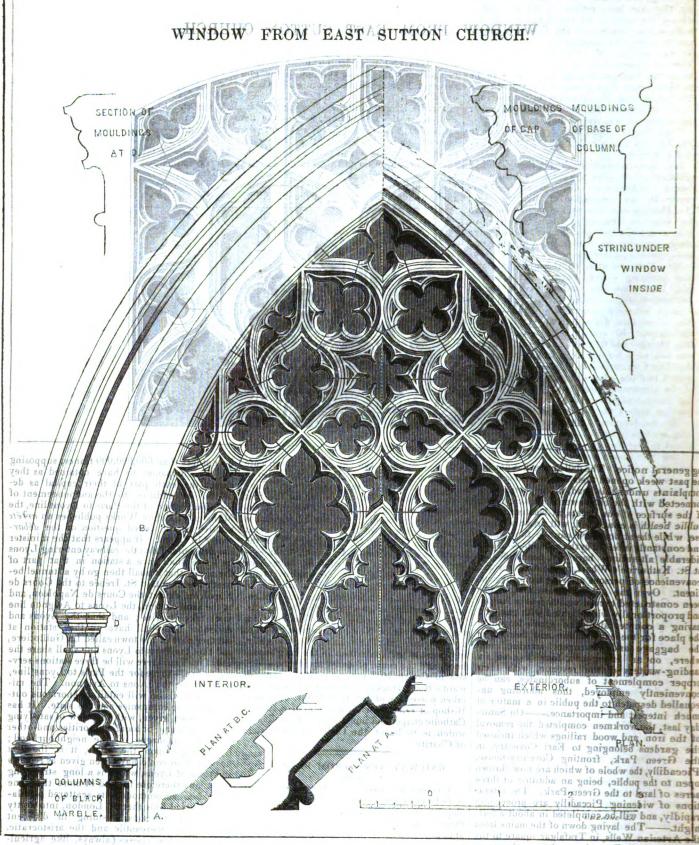

IN connection with the subject of concrete recently mooted in our pages, and the use of strong hydraulic ground lime, a correspondent has reminded us of the above material, and

has reminded us of the tove material, and having used much of it, we gladly take the opportunity to mention it, all to appld allocation It is generally admitted that blue it is lime makes the best hydraulic mortar that can be obtained, and decidedly the best converted. It is always stipulated for in the Holhorn sewert, and has been lately used as a concrete bed for a meanwhat Karing the best of the desired for the reservoir at Kensing ton for the Grand Junction Water Works, with success. We have several times used the blue lias cement also, and have found it a good material; it is self-coleared.

STANDARD HUNDRED OF DEALS. A tim-ber merchant writes, in answer to a corre-spondent last week, as follows: Y in name 120 12 feet deals as a standard hundred. The standard hundred as usually accepted, means the Petersburg standard dz., 120-12 feet 14 inch, by 11 inches. There is no standard trade hundred, except 120 of any lengths wanted; but you definition would well answer what in comron parlance would be called a trade hundred. I presume your correspondent has bought deals by standard tundred, and has received at the rate of 120 12 feet 14 inch by 11, expecting to receive at the rate of 120 12 New COAL EXCHANCE. Application will be made next session for an Act to rebuild on

NEW COAL EXCHANGE Application will be made next session for an Act to rebuild on an enlarged scale, the present Coal Exchange in Thames-street, and to improve the avenues leading thereto. -

THEIBUILDER.

EAST SUTTON CHURCH.

574

In continuation of our notice last week,* the windows at large are now given, with sections of the moddings.

The side jambs of the great window in the inside have coursents, the shafts of which are of the Kentish Bathersden marble; they are finished as shewn on the plan at A, the space between them being filled up with rubble walling: all the details are shewn on the print to a scale (three times larger ban that of the elevation of Deboard of the state of the

The windows were, in ancient times, filled with painted glass; from the small portion which remains, the glass was of the same date as the window, and of a very superior character: it did not escape destruction during the troubles in the reigns of Charles 1st and 2nd; at that time the manor belonged to the celebrated Sir Robert Filmer, author of the well known work "Patriarcha; or, a Defence of the Natural

* See page 562 ante.

Power of Kings against the unnatural Liberty of the People."—Sir Robert, as may be supposed, was a special mark for the visits of the roundheads and republicans; his house was several times plundered, and the church adjoining suffered severely from the same visits. Among the papers of Sir Robert (which are all carefully preserved at East Sutton), is one which gives the date of the destruction of the stained glass in the church. Through the kindness of Sir Edmund Filmer, the following account is extracted from a manuscript, supposed to be in the handwriting of Anne, daughter of Martin Hecton, Bishop of Ely, and wife of Sir Robert Filmer :—" July the 27th, 1643. Cornet May came to search East Sutton belfry for arms; there be tore the surplice with his own hands, took away a bible, a service book, and a book of homilies out of the church, and broke the glass window; then went into Sir Robert Filmer's house, where he would not suffer the servants to be in the rooms where he searched, so that the soldiers took divers things,

what they pleased; and had the line of every what they pleased; bad had the line of every servant in the house exceptione. It is a function the windows are at present in every bad repair; they are very much broken, and the tracery is nearly filled with white water percolates

Since the spring some program is been used in the works ROGROJ VI SITOR

The association for the promotion of impi proved paving, cleansing, and drainage in towns, have obtained permission from the City Authorities to demonstrate, at their own expense, for a period of two months, to what state of perfection the streets may be kept clean by manual labour; the same authorities have granted a similar permission to the company for cleansing the streets by machinerys Operations are to commence on the detoof December. The maisance to which we have so frequently drawn attention, vizion to possible ous effluxia allowed to escape through othe gully-holes in our streets is at length attract-Digitized by

THE BUILDER.

WINDOW FROM LEAST SUTTON CHURCH

ing general notice. The daily press has during the past week opened their columns to several complaints under this head, more particularly connected with the city sewer. The cleansing of the surface of our streets, at least so far as public health is concerned, will prove of small use, while the atmosphere can be thoroughly and constantly infected by the subsoil.—Con-siderable alterations have just been effected at St. Katherine's Wharf, principally for the convenience of persons arriving from the con-tinent. Over the old warehouse a room has been constructed exceeding 100 feet in length, and proportionally wide, lighted with gas, and having a counter along the entire length of the place for the examination and delivery of the baggage and passengers arriving, and where, on an emergency, four or even six landing-waiters of the revenue, with their proper complement of subordinates, can be conveniently employed, thus affording un-equalled despatch to the public in a matter of much interest and importance.—On Satur-day last the workmen completed the removal much interest and importance .--On Saturday last, the workmen completed the removal of the iron and wood railings which inclosed the gardens belonging to Earl Coventry, in the Green Park, fronting Coventry-house, Piccadilly, the whole of which are now thrown open to the public, being an addition of three acres of land to the Green Park. The alterations of widening Piccadilly are proceeding rapidly, and will be completed in about a fort-night.—The laying down of the mains from the Artesian Wells, in Trafalgar-square to the Bird cage-walk Barracks, and from thence to Buckingham Palace, is deferred until after March. It is a curious circumstance, that since the first use of the wells the water has risen to an additional height of 21 feet, supposed to be owing to the expansion of the pores in the strata through which the water percolates. Since the spring some progress has been made in the works connected with the Victoria Park. The whole of the wooden park paling and iron railing have been placed up, an entrance lodge on the banks of the Regent's canal in Bishop Bonner's fields has been erected, and the bridge which is to lead from the principal approaches into the park is nearly completed. On the extensive site of Bishop Bonner's fields three leading main roads of wide dimensions are laid out, connecting with the Hack-ney, "Bethnal-green," and Cambridge, roads, and on the rempty spots are to be receted a series of wills on muniform plan, subject he approbation of the Commissioners of with a strate show the strate of the show with a stract-

laid on throughout the numerons and intricate passages of the Custom House, and also in some of the offices on the ground floor. They were all lighted a few days since for the first time in consequence of the dense fog and dark-ness which prevailed, and the improvement over the old system of lighting gave very great satisfaction both to the officials and to the parties having business to transact therein. Great surprise and dissatisfaction have been felt at the omission of further improvements at the foot of Holborn Hill in the notices of the City Authorities for an intended applica-tion to Parliament for widening certain streets. The block of projecting houses leading from the west corner of New Farringdon Street to the entrance of Field Lane, is unsightly, injurious to the tradesmen in the neighbourinjurious to the tradesmen in the neighbour hood, and the cause of daily accidents.—A site of Copyhold Lane, adjoining King Ed-ward's Road, Hackney, has been purchased and taken possession of by Dr. Griffiths, the titular Bishop of Olena, for the erection of a Roman Catholic chapel and numery, the discipline of which is to be of the Order of the Sisters of Charity.

RAILWAY NEWS FROM FRANCE.

THE last few weeks have been very prolific The last few weeks have been very proline in railway events. Scarcely have four weeks elapsed since the adjudication of the Paris to Strasbourg and Tours to Nantes lines was announced, and already has another minis-terial notification been published, that the Paris to Lyons and Creil to St. Quentin rail-ways will be conceded on the 20th of the next month. The 5th of December is the last ways will be conceded on the 20th of the next month. The 5th of December is the last day allowed to companies for giving notice of their intentions to offer for the lease, to de-posit lists of their subscribers, copies of their by-laws, &c. At a subsequent period, the com-panies will have to deposit by way of caution money 16,000,000 francs (640,0007.) for the Paris to Lyons line, and 3,000,000 francs (120,0007.) for the Creil to St. Quentin. The announcement of the adjudication of

The announcement of the adjudication of these two important lines has caused general satisfaction in this city. It puts an end to the idle assertions, that the minister intended not to execute the existing law, but to demand its repeal, in order, to concede the railways to companies of his own choice; and it lessens the alarm which is universally felt at the abstraction from, mercantile purposes, of the im-mense amount of capital, in the hands of the companies, an amount which is calculated to

at the soldiers took divers things

another part of the town called La Guillotiere, and that the Paris to Lyons line shall share the use of it. Thus there will be three stations serv-ing as five, three for the Paris to Lyons line, and two for the Lyons to Avignon. The mi-nisterial decision will enter an enormous out-lay upon the companies and the state. It has clearly been given, with the view of satisfying the pretensions of local authorities and other eminent personages of the neighbourhood; but perhaps upon the whole, it is the best decision that could have been given as regards the town of Lyons, which is a long straggling place, and therefore in need of more than one station to accommodate its scattered popula-tion, divided like that of London, into pretty nearly two portions, residing in different quarters, the mercantile and the aristocratic. The mercantile classes (always, like agricul-The mercantile classes (always, like agriculturalists, a discontented set), are not altogether satisfied. The railway serves, it is true, three different parts of the town, but it does so in making a large circley which of course, will make the carriage of goods dearer. What make the carriage of goods dealer. Whato the trading, money-making speople wanted, was to have the station in the very middle of them, leaving the faraway of West Enders as the cockney would say, and the faraway "Miled Enders," if so I may express myself of Lyons to shift for themselves? On elisted of the spri-Wild and the faraway "Miled

575

With respect to the line from Greil to St. Quentin, which is to be conceded to a company on the same day as the Paris to Lyons, the Minister of Public Works has also given a decision as to the direction to be taken which has been expected for a long time with great impatience. He has decided that the line shall go by the town of Channy, and not by that of Ham or Lasfere, both of which being fortified places, were strongly recommended in a mili-tary point of view, arising from the defence of

Digitized by 000gle

Paris and the neighbouring country in case of invasion.

576

The number of companies formed for these two lines, of Paris to Lyons and Creil to St. Quentin, is so long, as to be really surprising. I subjoin here the list of those companies, as a sort of curiosity in its way. For the Paris to Lyons line: Ch. Laffitte

and Co., L'Union, Callon, jeune ; Ganneron, Lapinsonniére, Sad-Est, Decan, Messageries Royales, Ardoin-Verdeau, Chastellus, De Roulage, Maîtres de Poste, Receveurs-Généraux, Française, Des Ingénieurs, Indépendante, Des

Electeurs, Des Riverains, Du Commerce. For the Creil to St. Quentin: Cordier, Carette and Minguet, Colbert, Compagnie du Nord, Admiral Arnous, Jucherau de St. Denis, Maîtres de Poste, Compagnie de Jonction, Compagnie de l'Oise. If all these companies remain independent, the maximum of the leases of the two railways, which is fixed at forty-five years for the Paris to Lyons, and seventy-five for Creil to St. Quentin, will be very consider-ably reduced by their competition. But it is certain, that before the day of adjudication, "fusions," as they are designated, will be effected, and the nineteen companies for Lyons will be amalgamated into one, or perhaps two or three companies; whilst the companies for "Crell to St. Quentin will become one, or at the ivery outside two.

Such has been the case with the Tours to Nantes, and Paris to Strasbourg companies. Those lines have to be conceded the 25th No-"wamber ; Saturday sen'night the companies destrous to obtain the lease of them, had to make themselves known to the Ministry of Public Works. Before that day, Tours to Nantes had ninecompanies, and Paris to Strasbourg eleven. Late on Friday, these companies became re-duced to two for each line. A "fusion" annihilated the separate existence of the Nantes companies of Mackenzie, Carette-Minguet, O'Neill, Drouillard, De Raigecourt, Lefévre, Delamarre, and the Basse Loire, leaving only the Post Horse Masters' Company independent.

A similar "fusion" of the Strasbourg compa-A similar "rusion of the Strasbourg compar-nes took in the separate companies of Hin-gerlot, Ganneron, Gantil et Fol, Rothschild and the Messageries, Bechet, Odiot, Arnons de Hetl, Doudeauville, and Laforce, leaving only the company of General d'Anthouard. "These fusions have not been managed as they should have been. By leaving out a company for each line, the great amalgamated companies are threatened with opposition, which perhaps may become sufficiently formidable to carry away the prize. The most opposite statements are made as to the terms on which "fusions" have been effected. The truth is, that no one except two or three of the principal directors themselves know any thing very posi*tively* about it. However, I have good authority for saying that the Strasbourg "fusion" gave more than half the shares to the companies Gentil Fol, Gameron, and Hinguerlot, and that the other companies share the other half in various proportions. On the Nantes "fusion" the companies of O'Neill, Drouillard, Raigecourt and Lefevre, have one-half of the shares, the Mackenzie and Carette companies have nearly two-thirds of the remaining half, and the other companies the other third.

Paris, Nov. 1845

INSTITUTION OF BUILDERS' FOREMEN. One of the great objects of this association is to obtain an asylum for decayed members, their widows and orphans (a most praiseworthy desire), and we sincerely hope that the master builders may be led to aid them in realizing it. Alone, they are not likely to effect the object in view for a long time to come, but with a little assistance and advice it might soon be accomplished. More good is done by leading men to provide for themselves, thereby inducing habits of prudence and forethought, than by doing all for them at the last moment.

BATHS AND WASH-HOUSES FOR THE LA-BOURING CLASSES. We observe there is to be a public dinner at the London Tavern, on Tuesday, Dec. 16th, to celebrate the laying of the foundation-stone of the first model establishment: the Lord Mayor will be in the chair. The proceeds will of course be applied to increase the funds for the building, and we hope in so good a cause the attendance will be numerous.

THEBUILDER

ROUND TOWERS OF IRELAND.

An investigation into the origin of these mysterious remains of a far-distant age has been going on for some years past among Irish antiquaries, and many are the theories which have been promulgated with the view of elucidating their date and meaning. Our own columne have on more than one occasion contained the speculations of intelligent corre-spondents, whose personal research, both into buildings and into documents, and whose appeals to facts and actual admeasurements, bore testimony to their zeal and industry.

Mr. Petrie, an Irish antiquary of good standing and repute, and who has devoted much of his time for years past to subjects kindred to the one in question, has lately published an ela-borate and learned memoir on the origin and use of these structures. Our limits prevent us from even giving a summary, of the data on which he founds his deductions, so numerous are they, and so interwoven with each other: we therefore content ourselves with giving simply the results of his investigations, and those too in his own words.

"The towers have been all subjected to a careful examination, and their peculiarities accurately noticed; while our ancient records, and every other probable source of information, have been searched for such facts or notices as might contribute to throw light upon their history. I have even gone further: I have examined, for the purpose of comparison with the towers, not only all the vestiges of early Christian architecture remaining in Ireland, but also those of monuments of known or probable pagan origin. The results, I trust, will be found satisfactory, and will suffice to establish, beyond all reasonable doubt, the following conclusions:---

That the towers are of Christian and ecclesiastical origin, and were erected at va-rious periods between the fifth and thirteenth centuries. 2. That they were designed to answer, at least, a twofold use, namely, to serve as belfries, and as keeps, or places of strength, in which the sacred utensils, books, relics, and other valuables were deposited, and into which the ecclesiastics, to whom they belonged, could retire for security in cases of sudden predatory attack. 3. That they were probably also used, when occasion required, as beacons and watch-towers.

These conclusions, which have been already advocated *separately* by many distinguished antiquaries—among whom are Molyneux, Led-wich, Pinkerton Sir Walter Scott, Montmorenci, Brewer, and Otway-will be proved by the following evidences :-

For the first conclusion, namely, that the towers are of Christian origin: - 1. The towers are never found unconnected with ancient ecclesiastical foundations. 2. Their architectural styles exhibit no features or peculiarities not equally found in the original churches with which they are locally con-nected, when such remain. 3. On several of them Christian emblems are observable, and others display in the details a style of architecture universally acknowledged to be of Christian origin. 4. They possess, invariably, architec-tural features not found in any buildings in Ireland ascertained to be of pagan times.

For the second conclusion, namely, that they were intended to serve the double purpose of belfries and keeps, or castles, for the uses already specified :--1. Their architectural construction, as will appear, eminently favours this conclusion. 2. A variety of passages, extracted from our annals and other authentic documents, will prove that they were constantly applied to both these purposes.

For the third conclusion, namely, that they may have also been occasionally used as beacons and watch-towers :-- 1. There are some historical evidences which render such an hypothesis extremely probable. 2. The ne-cessity which must have existed in early Christian times for such beacons and watchtowers, and the perfect fitness of the round towers to answer such purposes, will strongly support this conclusion.

These conclusions-or, at least, such of them as presume the towers to have had a Christian origin, and to have served the purpose of a belfry—will be further corroborated by the uniform and concurrent tradition of the country, and, above all, by authentic evidences, which shall be adduced relative to the erection of several of the towers, with the names and eras of their founders."-pp: 4-6. We would refer those who desire further in-

formation on this very interesting subject, and a knowledge of the data, which ied Mr. Petrie to the above conclusions, to the work itself. Incidentally, it contains much valuable information on the antiquity, and general charac-teristics, of Irish ecclesiastical remains (profusely illustrated); and to this we shall hereafter refer.

AWARDS OF OFFICIAL REFEREES.

TANNERS AND LBATHER-DRESSERS' DEVING SHEDS.

Mr. J. G. HEPBURN addressed the referees in October last, on the part of persons carrying on business as tanners and curriers in Bermondsey, who, in erecting buildings for the purposes of their trade, had received notice that such buildings being of timber, &c., were not comformable to the Act. He submitted "that Buildings used by them for workshops or drying places, are included in Schodule B part 1 of 7 & 8 Vict. c. 84, under the words 'all other buildings exempted by any Act of Parlia-ment from the operation of the Act passed in the 14th year of his late Majesty King George the Third, and by this Act repealed, and that and that therefore they are by Section 5 exempted from the provisions of Schedule D, the grounds for this opinion are that by the 14 Geo. III. c. 73, such workshops or drying places were con-stituted into a class called the 7th class, and were by the same Act (Sections 20 and 21) virtually exempted from the operation of the Act, by being expressly allowed to be built of any dimensions and of any materials, whereas all the other six classes of buildings referred to in the Act, were expressly restricted and limited as to their dimensions and as to the materials of which the buildings were to be composed. It is true that buildings of the 7th class were prohibited from being covered with pitch or tar, but it is submitted that not withstanding this, they are fairly and properly considered as forming an exemption from the operation of the Act, the design and object of which was to provide for the dimension of buildings, and the materials of which they should be built.

The construction contended for, being assumed as correct, the workshops and drying places of tanners, carriers, and leather-dree will come under the provisions of Section 10 of 7 & 8 Vict., c. 84, and will be subject to survey by the official reference, independently of the restrictions imposed by Sohedule D as to walls, and the question will then be whether the intended building can be erected " with due regard to the security of the public."

It was stated, that if the referees decided that these workshops were included within Schedule D, the consequence to these trades would be so great as to compel them, for the necessary purposes of their manufacture, to locate themselves beyond the limits of the Metropolitan Building Act, although the prin-cipal manufacture of the kingdom in these branches is now carried on in Southwark and Bermondsey, and for which these places are eligible both as respects their situation and the inhabitants residing there, consisting chiefly of workmen and others employed in these manufactures.

Mr. Hesketh, the district surveyor, con-

tended in reply, "1stly. That such buildings were not st empted from the operation of the Act of 14th Geo. III. c. 78, bat only from certain of the

provisions thereof, and 2ndly. That if they were exempted from the operation of the said Act, they were so exempted by an Act which is repealed as far as relates to that part which is alleged to have so exempted them, and therefore they must be regarded in that light in which they would have been regarded if such alleged exemption had never existed."

The referees determined, Nov. 7th, 4 that workshops and drying sheds used by tanners, curriers, and leather-dressers, are not included in Schedule B, part 1, of the said Act, as being buildings exempted by any Act of Parliament from the operation of the Act, passed in the fourteenth year of his late Majesty, King George III., and by the said Matropolynan Buildings Act repealed and that the suid

workshops and drying sheds are not exempt from the ordinary rules and provisions of the said Metropolitan Buildings Act as to party-wells and external walls, or in any other re-space.

PROJECTIONS. Mr. Tufnell, M.P., of 37, Curzon-street, May Fair, desired to make a certain addition to the portico of the said dwelling-house, that is to say, to fix a zinc and glass (all inclosed) green-house or verandah, for which he had the assent of the adjoining tenants on each side; the said green-house being in the centre of the house, and at a distance from the next bouses. houses.

houses. Mr. Foxhall, district surveyor, objected to allow the projection to be made without the special permission of the referees. The award was, "that inasmuch as the proposed addition is to be built of proper and sufficient fire-proof materials, and inasmuch as it will be removed so far from the adjoining buildings on every side thereof, as not to obstruct the light and air, or be otherwise injurious to the owners or eccupiers of such buildings, and inasmuch as such addition is not to project into the street eccupiers of such buildings, and inasmuch as such addition is not to project into the street spise to overhang or otherwise to encroach upon the public way, and is not to extend disterally beyond the portico, over which it is proposed to be built, if such addition be made so that the water therefrom shall not drip upon the public way, then the same will not be con-Heary to the said Act." (Scosts to be paid by Mr. Tufnell. so With the greatest respect for the excellent district surveyor, we cannot understand on what

district surveyor, we cannot understand on what ground be thought it necessary to send this mase to the referees.

bo 1.1 OPERATION OF LOCAL ACTS.

A stone engle having been lately set up by Messrs. Baily, of Royal Exchange-buildings, Gommill, which overhangs the public way a little "beyond the extension of the coping at the top of the house," was objected to by the Gommissioners of Pavements. It was formerly (aver the door of the premises on the same site, and the district surveyor, at the rebuilding, anada no objection to its creation. Messrs. Baily, in applying to the referees on the sub-ject, first set forth "that by the 5th section of the said Actif is ensated, 'That notwithstandthe said Act it is anacted, 'That notwithstand-ing any thing contained to the contrary in any Act of Parliament now in force, every such building shall be built, rebuilt, enlarged, or altered in reference to the walls, &c., and to the projections, and to any other parts or ap-pendages of every such building, in the man-ner and of the materials, and in every other respect in conformity with the several particu-lare, rules, and directions which are specified and set forth in the several schedules to this Act anaexed.'" And then shewed under what clauses of Schedule E such a projection might be made.

clauses of Schedule E such a projection might be made. The referees awarded—"That although by virtue of the provisions of the Metropolitan Buildings Act, cited in the said requisition, general line of fronts in any street or alley, subject to the restrictions therein set forth, yet such provisions are to be deemed to be per-missive to such extent only, as any other law may not prohibit the subject matter thereof; and that the provision in Section 5 of the said Metropolitan Buildings Act, which requires that the provisions of that Act be observed, netwithstanding any thing contained to the contrary in any other Act of Parliament then in force, is to be deemed to apply to such pro-visions of the Metropolitan Buildings Act as are obligatory, and not to such as are permis-sive only." sive only.

Costs to be paid by the applicants.

ASPHALTE FOR ROOF COVERING.

Min. Maning proposed to form the roof covering of certain houses in the Fulham-road with fir joists "7 by 2," and inch deal boarding, covered externally with a coat or layer of b% Claridge's asphalte."

proper for the covering of any roof, flat, or gutter being of wood, and such material may not therefore be used in the manner described in the said requisition hereunto annexed."

DIVISION OF BUILDINGS.

Messrs. Winterbotton and Sands, being about to erect additional almshouses to the almshouses belonging to the Batcher's Charit-able Institution, at Walham Green, Fulham, were called on by the district surveyor to build proper party-walls to a height of 18 inches at the least, above the roof to which they should adiai

the least, above the roof to which they should adjoin. This they considered, would destroy the harmony and general effect of the building, the part already built being without such party-walls. They accordingly referred the ques-tion to the official referees, urging, "that the said building or buildings are not to be deemed to be separate buildings within the meaning of the said Act, but that they are to be deemed to be one building in the occupation of the trustees of the said institution, and that the inmates of the said almshouses are to be deemed to be lodgers under the said trustees. The award was, "that the separate tene-ments forming the almshouses in question, are to be deemed to be houses in separate occupa-tions within the meaning of the said Act, each tenement having a separate entrance and stair-

tenement having a separate entrance and stair-case, and as such, must be separated from one another by proper and sufficient party-walls, according to the provisions of the said Act for the rate to which such houses shall belong.

Costs to be paid by the applicants.

THE MANUFACTURE OF GAS.

SIR,—I perceive by notices in the daily papers, that it is proposed to establish extensive works for the manufacture of coal gas. Is it not surprising, Sir, that in this age of improve-ment, the present imperfect mode of obtaining an illuminating gas should be still continued. Is it by the interest of coal proprietors, or do coal gas companies consider that the sale of coke is as profitable as the gas? The mere extraction of gas from coal is simple enough, but a complicated machinery of condensers, purifiers, &c. is required to ren-der it fit for consumption; and that this is in-effectually done, no practical man can for a

der it ht for consumption; and that this is in-effectually done, no practical man can for a moment dispute. Coal gas, as now manufac-tured, contains a quantity of sulphuretted hy-drogen gas, and, should the whole of this be not extracted, produces, when burnt, the most injurious effects on the human constitution. not extracted, produces, when burnt, the most injurious effects on the human constitution. The advantages, nevertheless, of gas are too apparent ever to permit us to doubt but what its use will continue general, both for illumina-ting and culinary purposes; and the time is not far distant when every room will have its burner, every kitchen its gas cooking appara-tus. How necessary, then, would it be to have a *pure gas*. That this gas can be had is suffi-ciently proved by the experiments of scientific men upon oil and tar; but from imperfections in the apparatus employed in procuring it, it has never been extensively brought into ope-ration. Dr. Jones's "Address to Sir Robert Peel, requesting a legislative interference for the protection (both sanatory and pecuniary) of gas consumers," contains an *exposi* of many of the operations of *coal* gas companies, and should be read by every consumer. With many apologies for trespassing upon your time, I am, Sir, &c. OBSERVER. Paddington, Nov. 18, 1845.

THE ADELAIDE GALLERY. — Professor Keller and his corps of models are attracting large audiences, if we may use the word with reference to an exhibition where nothing is to be *heard*. "Pilbrow's Atmospheric Railway" is provingely explained and with the microis previously explained, and with the micro-scope, laughing gas, lectures, and music, makes an agreeable, and not uninstructive, evening's amusement.

The Law ard was, "that 'Claridge's asphalte' is not to be deemed an artificial stone or cement,"

ON CERTAIN PROCESSES FOR STAINING GLASS.

577

THE Bulletin de la Société d'Encouragement contains an article on this subject by Pro-fessor Schubarth. We make the following extracts from a version of it that sppeare in the current number of Newton's London Journal

current number of Newton's London Journal of Aris, &c. Mode of obtaining a Red Colour by means of Oxide of obtaining a Red Colour by means of Oxide of Copper, — The ancients were acquainted with the means of staining glass by the em-ployment of oxide of copper; it is mentioned by Neri and Kunckel, in their works. The art was, however, so completely lost at the close of the last century, that it was generally be-lieved that glass was always stained red by means of Cassins, purple. It was not until 1828 that M. Engelhardt, of Zinsweiler, suc-ceeded in staining glass red by means of a mixture of equal parts of oxide of copper and protoxide of tin: this process was tried with success in the glass manufactory at Hoffurmg-sthal, Silesia.

The protoxide of tin is now done away with, and the compound employed is nearly the same as that mentioned by Neri, but more simple. It is composed of a mixture of copper scales It is composed of a mixture of copper scales (which are almost entirely composed of axide), and oxide of tin (*zimaeche*) obtained, by, the oxidation of that metal in a state, of fusion in contact with the sir, to which a small quality of iron filings is sometimes added, when a sear-let tint is required to be produced. Should the colour by accident disappear, it may be brought out by again bringing the copper into the state of oxide; this is done by introducing into the vessel a small quantity of tin or iron scale. It will of course be understood that the glass to be operated upon must not contain saltpatre, nor any other oxidizing substance. Glass stained by means of oxide of copper

nor any other oxidizing substance. Glass stained by means of oxide of copper is of a very deep colour, and ean only be worked in thin sheets, and by covering it with a thick colourless glass (plate glass). Obtaining a Red Colour by means of Gold... The employment of gold for staining glass red does not appear to have been known to the ancients, and the period when it was first used, and by whom, cannot be ascertained. In the seventeenth century Kunckel employed Cassias purple for staining glass a ruby colour; this purple for staining glass a ruby colour; this was discovered by A. Caesius a short time pre-vious; but the recipe employed by Kunckel was not generally known until it was published in 1836, by M. Metzger, proprietor of the glass-works at Zechlin, on the occasion of M. Fuss' recercipe researches.

works at Zechlin, on the occasion of M. Fuss' researches. It must not be imagined from this, as, some persons have lately stated, that it is necessary to use gold in the state of Cassius purple. Neri, at the end of the 16th and commence-ment of the 17th century, stated, that is order to stain glass a ruby colour, it was only neces-sary to employ caloined, chloride of gold. At a later period, Libar wrote to the same effect, and Merret certified that he had proyed the efficacy of the process. In 1834, Golfier Bes-seyre stated, in the "Journal of Pharmacy," that Douault Wieland coloured his pasts with perchloride of gold only. Lastly, in 1836, Fuss writes, that in Bohemia all the ruby-coloured glass was prepared with chloride of gold only, and that glass might be stained, red as well with metallic gold as with oxide of gold or Cassius purple. It is therefore a fact known for some time, that glass may be stained red, without either Cassius purple or oxide of tin, with metallic gold or preparations of gold. In the glass-works of Bohemia and Silesia perchloride of gold only is used, without the addition of oxide of tin, in order to produce their fine roes or carmine-coloured glass.

of in, in order to produce their fine ross or carmine-coloured glass. If powdered gold be triturated with twenty times its weight of enamel fritt, a light red or pink mass will be produced, without any me-tallic lustre.

It is evident that at the temperature of glass-It is evident that at the temperature of glass-houses, which is more than sufficiently high to effect the fusion of the glass, the gold contained in the Cassius purple will be brought back into the metallic state, whatever may be supposed to be the nature of this compound, upon which chemists have not yet agreed. If Cassius pur-ple, chloride of gold, or gold leaf, be heated with borax or glass containing lead, to a tem-perature of 32° of Wedgwood's pyrometer, the gold will be precipitated in small globules at the bottom of the crucible, and if the heat be increased, the borax or glass will successively increased, the borax or glass will successively Digitized by

Ditaining a Blue Colour by Oxide of Copper. fine emerald green and light blue, turquoise

a fine emerato grown and the milky glass has blue, and sky blue of a white milky glass has of For some years past a white milky glass has been, manufactured. in Bobemia and Silesia, been, manufactured. in Bobemia and Silesia, The been, manufactured in Bohemia and Silesia, known under the name of alabaster glass. The composition of this glass does not differ from that of ordinary crystal. (Bohemian crystal is a glass made without lead, with potash for its base.) After the glass has been melted, it is poured off and stirred up. A second charge is then melted, to which is added, when the fusion is complete, the glass previously stirred and cooled, which cools the mass; and as soon as it is melted, it is to be worked at the lowest possible temperature. The glass will be of a milky white, while if the temperature were much raised, it would become colourless and transparent; transparent?

If oxide or suppare of copper be added to a colourless glass, and the temperature is suffici-ently high, a transparent glass of a bluish green that will be obtained of I the operation has been carried on as above stated to obtain a milky glass, it will be of a turquoise-blue colour. Lastly, if this turquoise-blue coloured glass be re-melted, at a high temperature, a transparent agua-marine blue will be produced aqua-marine blue will be produced.

THE MOBULE DER.

re destrous of receive plans, spectroations, and 't be given for the one-selected.

the Church of St. Mary Sama manual of Magaalone, Tourna Dand the Restonation thereof: together with several notices on Ecclenastical matters, Printed in gid of the fund fur the restoration, 8vo, 1845. Vize-telly and Co telly and Con the states? Invest : 19 9 2 add

THE church illustrated by this beautiful volume, is well known to all architectural students and professors, as one of the most magnificent specimens, in a part of the country ficent epscimens, in a part of the country celebrated for the splendnur of its ecclestastical edifices. The lofty tower, which forms its chief characteristic, is perhaps unsurpassed by any similar example of the architecture of the fifteenth century. In common with many other exquisite ecclesiastical edifiers of for-mer days, the church of St. Mary, Taunton, was suffered to fall into decay, by the neglect and apathy of its guardians, until, in the year 1840, the Rev. James Cottle succeeded to the vicerace of the mariab. This centleman. vicarage of the parish. This gentleman, actuated by a warm appreciation of the archi-tectural merits of the church, and feeling the necessity of prompt, and decisive measures to preserve it from further dispidation, proposed in 1842 to expend hidself a-sum of 3,000/., if the parishiosers would acopy as much more as might be in accessive completely to restore the sacred wither. This liberal offer was the sacred diffee. This liberal offer was accepted, and (as our readers are probably aware) the work of restoration was commenced, and is now nearly completed, in a manner which reflects the highest credit on all the parties concerned. The total cost, it is found, will exceed 7,0007; and the vicar has undertaken to add 1,000% to the amount he originally offered to expend. Mr. B. Ferrey was em-ployed as the architect on the part of the vicar, and the works executed by the parish, being perfectly distinct from the former, were placed under the appendence of Mr. R. Carver. under the superintendence of Mr. R. Carver,

The present volume has been undertaken by the reverend gentlemen, to whose generous enthusiasm the lovers of ancient architecture are so much indebted, as a record of the success which, in spite of even more than the aveal difficulties attending such exertions, has crowned his zeal and perseverance. Besides a minute history of the work of restoration, and a full description of the church, Dr. Cottle's portion of the volume contains much useful information on the antiquities of English churches generally, and their neg-lected state from the time of the Reformation. It comprises also some remarks on those questions of church discipline which have recently been so much agented; and to these we may direct the attention of all who are interested in the subject. His stric-tures on the objectionable "pew system," ap compared with that of open seats, are most convineing. A list, with biographical actions, of the archdeacons and vicars, and notices of the principal monuments in the church, com-plete the body of the work. But its appendices are hardly less interesting. The first of these, entitled "Historical Notices of the church, by George Cave," is a clear and discriminating essay on the dates and characteristics of the different portions of the edifice; the second, by Mr. Ferrey, the architect, is called "Remarks on the Gothic Towers of Somersethine," and is full of valuable information on the subject. In addition to these there is an historical essay on ecently been so mach saginated; and to addition to these there is an historical essay the ecclesinetical architecture of England, by Thomas Porch Porch, Esq., A.M., -a useful summary on the particulation of the second second summary on that particular topic, but without any particular novely of treatment;-and, finally, isome remarks, by the Rev; Alpony Christmas, M.A., on "The Furniture and Ornaments of Churches."

The volume is printed by Messrs. Vizetelly, in a tasteful and elegant manner, and is flus-trated by a ground-plan and eight wood-cuts and lithographs, shewing the state of the church, before and since its restoration. Though ready to award since re approval of the I hough ready to award succere approval of the spirit and energy which have actuated the worthy vicar in this ' Jabour of Jork," we can not forbear remarking, that he has carried the system of paidling, gilding, and drug including in the church rather to excess, and thereby rendered what is, and ought to be, subor-dinate in architectural character and effect, too predominant predominant.

I must leave it to those who know what I have done, to make remarks on what I have

Triends, that he still continues to manufacture the above in the same manner, and using only the best materials, that have given so much satisfaction for many years past. Every article will be made in the best manner, and the very lowers price charged. Lists may be had upon application. Drawings prepared.

FOREIGN WINDOW GLASS. THOS. MILLINGTON begs to inform his friends, that he continues to receive weekly large consignments of FOREIGN GLASS, which he is determined to offer upon the very lowest terms. Address, 87, Bishops-gate-street Without.

PLUMBER'S BRASS WORK, WATER CLOSET PUMPS, &c.—These articles require the resease attention and care in the manufacture, and will be found superior and cheaper than at any other manufactory. Best Pan Water (Cosole, 34s.; 2) Lift Pumps and Planka, 4. 10s. 0d.; 3-inch Pumps, 57.70s. 0d.; 3-inch Bill Ball and Stop Cocks, 30s. per dosen, and every article in this branch équally low. Every article warranted.—Address, THOS. MIELINGTON, 57, Bishopsgate-street.

Al Febrik Groux, 57, Bishopsgate-street. VARNISH. THOS. MILLINGTON begs to inform the Trade, Builders, Páinters, and others, that this article can be had at his Manufactory, of the best quality and at the very lowest price. T. M. has long been a manufacturer, and has devoted much time and attention to it, using only the best of guns, and sparing no expense in the manufacture. The Pale Oak or Wainscoat Varnish, per imperial gallon, 'fue, ; Fine Carringe Varnish, 12s; Copal, 18s.; Body Copal, 24s.; Gold Size, 10s; White Hard, 18s.; Brown Hard, 18s.; French Polish, 18s. per gallon. Paint, Dryers, Colours, ready and ground, and every article in the trade. If quality is taken into consideration, this will be found the cheapest house in London. Address, 87, Bishopsgate-street Without.

WARNISH.—It has long been a desideratum amongst the consumers of Varnish to obtain a good and genuine article; buillancy, facility of drying, hardness, and durability are the qualifications necessary, but these are soldom if ever found united. The experience of a life-time devoted exclusively to the manufacture of this article, the great and imporvements in machinery, have enabled Messra, the daily improvements in machinery, have enabled Messra and apinit) univalled in every respect, and they confidently recommend them to the trade, as deserving of notice both in noice and quality. rice and quality.

price and quality. Builders, Coachmakers, Painters, and others may depend on being supplied with a genuine and unadulterated article. Fine Oil Varnish, from 10s. per gallon; best White Spirit Varnish, 21s. ditto; Best Spirit French Polish, 20s. ditto; White Lead, Oil, Turps, and Colours of every description at the vary lowest prices.—WALLIS'S Varnish, Japan, and Colour Manufactory, 64, Long-acre, one door from Bow-street. Established 1760.

WALLIS'S PATENT LIQUID WOOD W ALLIS'S PATENT LIQUID WOOD KNOTTING, - This newly-discovered Liquid Composition which Measrs. Geo. and Thos. Wallis have the satisfaction of introducing to the trade, possesses the im-portant qualification of effectually stopping Knots in Wood, however bad, and preventing them eating through and dis-figuring the paint above. Many substances have been used and much time spent in endeavouring to find a, cure for a had Knot, but hitherto without success. Measrs. Wallis therefore feel much plea-sure in offering to the public an article so long and anxiously called for.

without success. sure in offering to the public an article so long and analysis, called for. In the application, skill is not required; a boy can use it is well and affectually as the heat workmen: it is put on to the work with a brush like common paint, can be used in all elimates and situations, and does not require heat. Sold wholesale and retail, by Mesars. G. and T. Wallis, 'Warnich, Japan, and Colour Manafacturers, No. 64, Long Acre. Price 20s. per gallon,

THE BUILDER.

PATENT GALVANISED TINNED IRON.

(MOREWOOD AND ROGERS' PROCESS.) A RCHITE CITE, SURVEYTORS, BUILDERS, aid CONTRACTORS are respectfully informed they can be supplied with this invaluable metaf for building purposes, of the beat quality and lowest terms. It is superior in every respect to zinc, and two-thirds less price than I the steet ised for roofing, no wood work being required, but iron rafters only, 21 inches apart, rendering the whole roof fire-proof. This mode of covering roofs is cheaper than Lead, Zinc, Tiles, or Slates, Parapet and other Gutters formed and fixed, also rain-water pipe heads, and s feet wide, and 90s, to any required weight per foot, and a feet wide, and 90s, to any required weight per foot, set-row, New-road, St. Pancras, where references and testi-monials of the highest respectability of extensive works already done can be had. RCHITE CTS, SURVEYORS.

MOREWOOD AND ROGERS' PATENT GAL-VANIZED TINNED IRON.

T. W. BEALE begs to acquaint the pub-lic that he is prepared to law moder -**T**. W. BEALE begs to acquaint the pub-corrugated, fix pipes, gutters, &c. Also chimney-tops and ventilating cowle of every description; also water and oil cisterna, of this incorrodible and fireproof metal. He manu-factures all kinds of baths, as hip, shower, Roman, open, slipper, sponging, foot, children's, and self-heating baths; also toilet-cans and pails, alop-pails, coal-scuttles, cash and deed-boxes, and fire-proof safes of every description, 10 per cent. cheaper than any house in London. The PATENT GALVANIZED TINNED IRON is ap-plicable to the following uses: -The Lining of Ships' Store Rooms, Ships' Water Buckets, Water Jugs and Receivers, and for alloset every purpose to which sinc, tin, copper, brass, or any other metal is now applied; is more durable, and manufactured at much less expense. An experienced workman sent to any part of the kingdom. All orders punctually attended to. For particulars, apply to T. W. BEALE, 46, Bridge House-place, Newington Causeway.

MOREWOOD and ROGER'S PATENT GALVANIZED TINNED METAL. — This article was at first sold under the name of Galvanised Tin Plates, but the Platentess findings that the public, in some instances, over-looking the word Tin, confounded the article with Galvanised Iron, and that the character of their metal has thereby suu-tained injury, are desirous of giving it a name so distinctive as to prevent such mistakes, and consequent disappointment to purchasers in future. They therefore respectfully request purchasers to inquire for MOREWOOD and HOGER'S PATENT GALVANIZED TINNED IRON. In order to enable the public readily and at first sight to distinguish between the two metals, it may be well to inform them, white Galvanised Iron has a plain sinc-like appearance, while M. and R.'s Patent Galvanized Tinned Iron has a smooth crystalline surface. MOREWOOD and ROGER'S PATENT GALVA-NIZED TINNED IRON, Patronized by the Admiralty and the Honourable Board of Ordnance, being extensively wat die henourable Board of Ordnance, being extensively wed in her Majesty's Dock-yards, at the Tower, and elsewhere, for every variety of Roding, and other purpose, where a strong, light, cheap, and durable material is re-quired. It has been found by experience that this article is beyond

quired.

It has been found by experience that this article is beyond It has been touch by experience that this actuit is beyond all comparison superior to sinc; possessing, as it does, all the advantages arising from the strength and firmness of iron, combined with perfect immunity from rust; whilst it is free from the very serious objection which applies to sinc, viz, its contraction and expansion, consequent upon every change of temperature, and from which circumstance leakage

change of temperature, and from which circumstance leakage must of course result. This material is not likely to be destroyed by fire, as is the case with zinc and lead, which melt and run down, thus freely admitting freah air to the fire, and causing it to burn more fiercely. It is, therefore, obviously well adapted for all the purposes above-named, and most importantly so, when there is the possibility of fire. It is also peculiarly suitable for chimney-tops, gutters, spouting, and out-door work generally, possessing the strength of iron, without its liability to corrosion. It is by far the most economical metal roofing that can be obtained, in consequence of its strength, as it may be laid without boards, and upon the lightest rafters. rafte

rafters. This mode of preserving metal from rust does not only ap-ply to sheet-iron, but also to manufactured iron in any form, as bolts, nuts, hinges, nails, &c. &c. For full Particulars apply to 8. HOLLAND, 34, Gracechurch-street.

DORTLAND CEMENT of best quality manufactured by J. B. WHITE and SONS, of Mill-bank-street, Westminster. To be had at their Warehouses Druce's Wharf, Chelsea; Bell's Wharf, Paddington; and Earl-street, Blackfriars.

TO ENGINEERS, ARCHITECTS, AND CON-TRACTORS. GROUND BLUE LIAS LIME, at 2, South Wharf, Paddington, London, and Works, Southam, Warwickshire. Agent for Liverpool, Mr. WYLIF, 56, Gloster-street; ditto for Manchester, Mr. J. THOMPSON, Back King-street; ditto for Chester, Mr. J. HARRISON, Linen Hall-street.

THE PROJECTED RAILWAYS.

NALYSIS of the PATENT ME-

Arsenic and Carbonate of Copper... 2 ¹ Price in Swansea, free on board, 6d. per bushel, or sup-plied in London at 1s. per bushel. Used as an external Stucco the Metallic Sand Cement is unaffected by frost or wet; in appearance it resembles the best Portland Stone, requires inether colour nor paint, and is entirely free from vegetative cracks and blisters...Further Particulars on application to Mr. C. K. DYER, 4 New Broad-street, London; and at the Metallic Sand Whas, King's-road (opposite Prati-street), Camden Town,

KEENE'S PATENT MARBLE CEMENT.

HE PATENTERS MARKERNE'S CEMENT beg to draw strengton to the use of this material in the works recently executed at the COLOS-SEUM, Regent's-park. The POLISHED COLUMNS to the Hall of Sculpture, the ornamental paving in the cerr dors and conservatorics, and much of the stucce on the willing are apecimens of the very successful application of this cement. Patentees and Manufacturess, J. B. WHITE and SONS, Millbank-street, Westminster.

A TKINSON'S CEMENT. The public is respectfully informed, that the price of this very ex-cellent Cement, which has now been in use for Architectural and Engineering works upwards of thirty years, is remarked to ys. 3d. per bushel, and may be had in any quantity at Writty Parker, and Co.'s Whar, Holland-street, Curray and the Blackfringe-bridge.

N.B.-This Cement being of a light colour, requires us arti-ficial colouring or painting, and may be used for stappe, with three parts its own quantity of sand.

MARTIN'S FIRE-PROOF AND ORNAMENTAL. CEMENT.

AUTION. - Messrs. STEVENS and CAUTION. — Messers. SIEVENS and SON, Patentees, beg to caution their friends and the trade generally against confounding this invaluable Comsant with others, erromeously said to be of the same description. S. and S. piedge themselves, that MARTIN'S CEMENT is totally dissimilar in composition and manufacture from every other, and, being a neutral compound, is not only free Train chemical agency upon any substance with which it may come in contact, but completely resists the action of the strongest cids. They feel it a duty to disset attention to the following properties, which it exclusively passesses :—

For the above purposes, it passesses great edvantage wood, being more conomical and durable, restin damp, and vermin.

Camp, and vermin. For the floors of hall and fire-proof warehouses, its light-ness, durability, and uniform surface give it an immense advantage over stone, being, at the same time, rasch googe economical. The most sufficiently references can be given. To be had of the Patentees, Plaster of Paris and Conset Manufacturers, 186, DRURY LANE.

Agent for Liverpool and Manchester, Mr. E. PART, S. Canning-place, Liverpool.

O ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERBRS, MER-CHANTS, SHIPPERS, AND THE PUBLIC IN CHANTS, GENERAL.

CHANTS, SHIPPERS, AND THE PURIC IN GENERAL. MASONS' PROVIDENT INSTITU-TION.-A PUBLIC MEETING of the Trade will be held at the London Mechanics' Institution. Southrampton Buildings, Chancery Lane, on TUESDAY, December 2nd, 1845, at Seven o'clock in the Evening. THOMAS WAELEY, Esq., M.P., in the Chair.

Esq., M.P., in the Chair. The Provisional Committee have much pleasure, after a protracted and arduous task, in bringing the matter to its present shape, to be enabled to convene a Meeting of the Trade, for the purpose of establishing an Institution for Trade, for the purpose of establishing an Institution for Trade, their widows and Orphana, and for the erretion and permanent maintenance of an Asylum, to be supported by Donations and Answell Subscriptions. Several infraesized gentement ennected with the Trade will attend. Entenances to the Thestre, Northamberland Cont, Scoth-hampton Buildings, and Tennis Court, Middle Row, Hofboar JOSEPH T, WHITEHEAD, 1, Johnson St., Westminister

SATURDAY, DECEMBER 6, 1845.

E wish to direct attention to one or two important points in the structural arrangement of STABLES. We have often had occasion to speak of the alowness with which

the practical man adopts the deductions from scientific investigations : the tendency to continue taking an old path, although a new one, to shorten the distance considerably, may be close at hand. What has done, will do again : and so we go on year after year in error, without troubling ourselves to reflect on the pomibility of improvement, or even looking right or left to see what others are doing. Worse; bowever, than this :- even when the evile of a course are known, and instructions to obviate them are given, timidity, apathy, or obstinacy induces the majority to continue in it. The want of scientific arrangement in residefices and workshops has killed thousands of human beings, and has produced an appalling est of discemfort, distress, demoralization and misery. This wholesale elaughter is still guing on, and the great mass of the people think little about it, and care less; it is so common far people to be ill, and to die when young that they look upon these occurrences as matters of course, and, rather than take any rouble, persuade themselves that nothing can be done to avert them.

This being the ence, it is not greatly to be wondered at, that they condemn their horses to the same casualties, by constructing stables for them pregnant with diseases. To arrange them etherwise, in the first instance, would cost little or nothing, and save us, say, five-andtwenty per cent. in horseflesh. But what of that. To effect it we must do something new, and we don't like new-fangled notions; besides, it might fail after all; and, moreover, new things give trouble. No; we will go on in the old way, and if our horses fail ill we are no worse off than our neighbours; and if they die, why it is what happens to every thing.

There are some, however, who may think it worth while to try if this said dying cannot be postponed for a time, and may be willing to give themselves a little trouble, to retain for some additional years, the services of a faithful servant. To such we would point out the impertance, latiy, of properly ventilating the subles, and, 3ndly, of insmediately getting rid of all traces of the droppings from the horse, with which end in view, a floor imperviews by magisture is absolutely necessary.

B.oudon suys, in his " Encyclopsedia of Cottage and Farm Architecture,"-" The stable in which the horse is lodged should have its doors and windows to the south-east, as the meilshowt aspect, and in general have all its openings on one side, and in the roof, to prevent cross drafts of air. It ought to be on a dry soil, or, if on a wet one, it should be raised it by a hollow floor, or by materials of a kind which will contain interstices of air between the natural surface and the artificial floor. All stables should be large, cool, and capable of being well weatilated. The proper tempersture for a horse is 50 deg. in winter, me from 60 deg. to 65 deg. in summer. The berst. made of ventilating a stable in winter is

THE BUILDER.

by trunks or tubes of boards, about a foot square, forming openings under the eaves, or carried up through the ceiling, where there is one, so as to pass through the roof, their tops being covered in such a manner as to exclude the rain, without impeding the ascent of the heated air. The inside openings of all these tubes should have small sliding shutters to regulate the ventilation. In summer, this is best effected by having the windows filled in with hinged luffer boards, or by having glass windows, with outer laffer blinds. In the latter case, the quantity of air admitted, both in summer and winter, may be very accurately regulated by the degree to which the glass windows are opened."

The arrangement for ventilation here pointed out is insufficient; it is simply an improvement on none at all, and even this is not provided in half the stables used. Air should be obtained in controllable quatities, by openings independent of the doors and windows; and, in large establishments, the removal of the vitiated air should be aided by mechanical means, by the creation of currents irrespective of mere levity and the state of the atmosphere, such as by heat or the Archimedian screw.

In a range of stables for forty horses, recently erected by Mr. Dickinson, in Carzonstreet, May Fair, great pains have been taken in this and other respects. An air-flue communicating with the external atmosphere, opens into each stall in two places, full in face of the horse (just above the bottom of the rack), the openings being masked by two pieces of perforated zinc, each about two feet long, and one foot wide. The air, in its passage to these openings, is made to pass over some pipes filled with water, which can be heated, so that in very cold weather, the fresh air admitted to the stables is first raised to a proper temperature. Immediately under the ceiling, are openings into a flue which communicates with a chimney where a fire is constantly burning, by which means the vitiated air is rapidly drawn off. The ordinary means of ventilation, windows and openings over the doors, are likewise provided to meet extreme cases. For closing each of the latter, a sash is used, divided into small squares, whereof every alternate one is left open; a second sash behind this, and about four-fifths of its length, has the corresponding squares glazed, and the others open ; and thus, by shifting the latter backwards or forwards, admittance is given to the air either in large or small quantities. Mr. Dickinson assured us that one stall in some old stabling, which we saw (it had a skylight immediately over the hind quarters of the animal), produced more sick horses in the course of the twelvemonth than the new range for forty-one borses. It is right to say, that the system of ventilation to which we have referred was arranged by the proprietor, and carried out for him by Mr. Sylvester. As regards stable floors, nothing can be much worse than those commonly laid down, consisting of boulders, or bricks, in a bed of sand. The liquid manure penetrates the interstices, and is rapidly decomposed, giving off large quantities of ammoniacal gas, and vitisting the atmosphere to a great extent.

The object to be attained is, a floor impermeable by liquids, and so arranged that all which is thrown upon it may immediately run off. The writer of a useful article on the subject, in a recent number of the Ayrshire Agriculturalist, says : — " Let the centre of the cancewayed stall be removed two feet in breadth and five feet in length, measuring from the croup end of the stall. Flags of sandstone pavement, of one foot in breadthy three inches

thick, and of convenient length, having the inner or central edges beveiled to such an ! angle as that, when the two are brought together, there will be a space or central gutter formed like a V, one inch and a half in breadth at the surface, and two inches deep at the apex of the inverted cone, (the bottom of) which space must be filled with cement or pitch,---a slight downward and backward inclination must be given to the paving stones, so that whatever liquid may be dropped upon them, shall be rapidly conducted towards the hind quarters, and from thence conveyed, on the surface, to the point in the exterior found most. convenient for a tank or reservoir, where it may be stored till required as manure.'

Gutters, of the sort here described, could, however, hardly be depended on. Small castiron gutters, covered with a close grating fitted loosely into the top of it, are easily obtainable. In each stall there should be, in addition to the gutter behind, a branch up the middle to the extent of half its depth. In each loose box there should be three or four of these gatters in parallel lines, or they may be extended from the centre of the compartment in four directions, like a right-angled cross. Granite pitching, or paving bricks, in asphalte, have been used for stable floors, and seem to answer the purpose well. To avoid irregularities, when expense is not cared for, a concrete foundation should ! be prepared for the paving : to keep back the rats, a layer of broken glass in the centre of the concrete will be found efficacious.

In making arrangements for carrying off expeditiously the whole of the urine, it is desirable to recollect, that if collected in a tank, it is exceedingly valuable as a manure. We saw recently, a fourth cutting of grass from the same field, obtained through the use of it.

Racks are less used than they were, and wisely so. The manger should be divided into. two parts, and one of them be made deeper than the other, to contain hay or green meat. In Mr. Cubitt's stables at Thames Bank, each horse is supplied with a lump of rock-salt, placed in a compartment of the manger. In this same establishment, with the view of preventing to the utmost the vitiation of the air, plaster of Paris, saturated with sulphuric acid is sprinkled periodically over the floor to absorb deleterious gases.

We terminate our present remarks with an assurance, that by attention to the ventilation of their stables, and the construction of the floors, all persons who keep horses may effect a considerable saving. A well-drained, impermeable floor, is, as we have already said, of the utmost importance.

COMPETITION CARTOONS FOR THE ART-UNION OF LONDON.

In order that the committee may determine, what accommodation will be required for the exhibition of the cartoons to be submitted in competition for the premium of 500% offered by the society, artists were each requested to send to the office on or before Monday last, a scaled letter containing his name and address, and having on the outside the title of his intended painting, and a motto or device, by which the estion must also be distinguished.

In compliance with this request, twenty-six letters have been forwarded to the office, and the committee are now seeking a fitting gallery to receive the designs. It may be well to mention, that artists who have not sent intimation of their intention to forward a cartoon are not thereby disqualified; this was simply a request, not a stipulation.

582

THE ABCHITECT OF THE LATE ROYAL

Siz,—In your number of the 17th of this month, in a communication "On the Identification of Architects," your correspondent suggests that "it has never been clearly decided if the late Royal Exchange and Temple Bar waght to be attributed to Wren. or pet?" I never knew the latter doubted, but about the former building, there is generally a misapprehension, which I shall be happy of the use of your valuable pages to clear up. There is fortunately no difficulty in doing this, because the Records of the City and the Mercers, Company upon the subject of rebuilding the Exchange after the great fire in 1666, are perfect and complete. All the more interesting portions have been extracted with great care and skill, and were printed for the use of the corporation in the year 1838. From a copy of these extracts now before me, I obtain the following facts.—

surveyors. On the 9th of November, the committee speak of some "distast," amongst the surveyors, as retarding the work of preparing a design and estimate for restoring the ruined Exchange of Sir Thomas Gresham; a Mr. Hooke, also one of the city surveyors, gives a report and estimate on the 10th of November, on the same surgect.

"The committee, concluding it very necessary at this meeting, to make choyce of a surveyor for directing and overseeing the building of the Royall Exchange, and assisting them in the carrying on that designe to the best advantage, as to substantiallnesse, ornament, and frugality; and forasmuch as Mr. Milla, the city surveyor, bath declared that hee cannot perform that worke alone, and the committee being very sensible of the greate burthen of businesse, lying npon him for the city att this time; and considering that Mr. Jerman is the most able knowns artist (besides him) that the city now bath: therefore the committee unanimously made choice of Mr. Jerman to assist the committee in the agreeing for, ordering, and directing of that worke; and, haveing deelared the same unto him, hee after much reluctancy and unwillingness (objecting, it might bue thought an intrenchment upon Mr. Mills his right), at length accepted, being assured first by the Lord Mayor and the committee, that it was no intrenchment, that this wholls committee, at all times, would acquit him from any scandall in that behalfe; then the committee about the said uniding."

huilding." (After this appointment Mr. Mills's name does not occur again, and the works evidently proceeded with great rapidity, for they were finished within three years and a half from the period of Jerman's appointment. From another entry it appears the same of the architect was Edward, and that a brother, Roger Jerman, was carpenter at the new works. The name is spelt variously, and it occurs as German, Jerman, and Jerman.

At a committee, on the 20th Sept., it was resolved, "That as his Majesty bath much concerned himself with the building of the Royal Exchange, and apprehending it to be the duty of the committee to present him with a view of the drafts thereof, before they proceed to the maine worke," "they desire the lord mayor and four members of the comm., and Mr. Jerman, to wait upon his Majesty with the same."

On the 27th this committee report that "The drafts have been presented to and viewed by his Majesty and Sir John Denham, surveyor-general of his workes, and his Majesty declared his approbation and good liking thereof."

On the 9th Dec. occurs the following entry. "The committee considering that Mr. Jerman, who was chosen surveyor for rebuilding the Exchange in April last, hath not yet re-

A. I. C. D. Mary

THE BUILDER.

ceived any gratification for drawing drafts and directing the building; they therefore ordered that 504, shall be payed him upon account until further consideration of his merits." These extracts I think you will agree with me, prove that Edward German was the sole architect. In these records Sir Christopher Wren is spoken of, under date of the 7th Jan., 1670, as "Dr. Wren, surveyor general of his Majesty's workes."

The clock and chimes were made by Edward Stanton, under direction of the celebrated Mr. Hooke, at the cost of 1204.

"The bells, which were to be ten in number, 'sound and durable,' were cast by Wm. Wightman, founder, at the rate of vj4. vs. for every hundred weight the said bells shall weigh."

I beg to apologize for having occupied so much of your valuable space, and am, Sir, &c., 25th Nov. 1845. W. T.

DO THE CITIZENS REGARD THEIR ANTIQUITIES?

St. Helen's Place, December 1, 1845. Mr. TITE presents his compliments to the editor of THE BUILDER, and with reference to an article by Mr. C. R. Smith, entitled "Do the Citizens regard their Antiquities?"—which appeared in THE BUILDER of Saturday—would be obliged by the insertion of the inclosed correspondence. Mr. Tite would only desire to add one remark; viz., that in the statement he made at the "Institute," he intended no reference whatever, to the very respectable gentlemen, whose names are most unnecessarily introduced into Mr. Smith's communication:—

(Copy.)

5, Liverpool-street, City, Nov. 19, 1845. S1R,—I have before me a report of a speech made by you at a meeting of the British Architects on Monday, in which occur the following passages:—

lowing passages:— 1. "In this, however, they were thwarted by private collectors, who went about amongst the men offering sums of money for coins and other articles. They had been attacked in the public press by one of these, and he would not parry the question, but mention the name of Mr. Roach Smith, as he had been mentioned by him."

2. "Every care was taken for the preservation of this collection complete; in which they, however, were foiled, from the activity of these collectors. Amongst the most active was Mr. Roach Smith, who secured many, and particularly a bell which rang, after which there was a regular chase, but Mr. Smith had the best, and got possession."

I believe the above extracts from your speech, are verbatim as they were uttered. Reference has also been made by you to remarks made by me some years since; but mention of page, volume, and work, does not appear to have been added. Whatever observations I have felt myself called upon to make, with respect to the treatment of their antiquities by the "City authorities," I have made openly, and where they could have been refuted, if incorred. After a lapse of some years, you have chosen to give utterance (if the report be true) to most gross misrepresentations of my conduct, in a place where you must have known I was not present to refute your assertions.

I lose no time in protesting against the injustice of the course you have been pleased to take, as well as against the misrepresentations and concealment of facts, which, by the report, it appears you have made; and I assure you, I shall omit no opportunity of contradicting your statement, and of laying before the public facts which I can substantiate by full and undeniable evidence. I am, Sir, your obedient servant,

evidence. I am, Sir, your obedient servant, (Signed) CHABLES ROACH SMITH. William Tite, Esq.

(Copy.)

17, St. Helen's Place, Nov. 24, 1845.

S1R,—The extracts in your note of the 19th are, in the main, correct; not, indeed, as having been uttered by me in any set speech at the Institute of British Architects, but as a part of statements made in a slight discussion which followed the reading of the letter of Mr. Hawkins, informing the Institute of the intention of the trustees of the British Museum to open a department for the reception of British antiquities. In that letter the following sentence occurs :- "The claims of archeology, once publicly recognized, antiquities, when discovered, would no longer be ignessantly the stroyed or dispersed, but would be nexupalously collected together into, one place : the circumstance of their discovery, would be intergistered with far greater accuracy, and the result in a few years, would be a most interacting collection of monuments of intoined arty and the development of the history of seconsiss races, so far as it can be gathered from the evidences of archeology, and as it is exhibited in the maneums of foreign countries." The wards the end, the fellows of the lasting after addressed through this public announcement, and a hope is expressed " that, by their, author rity and example, an active interest in the preservation of antiquities; may be created in the whole body of the profession, and may gradually be communicated to their clerks, and to the foremen, and others more immediately set over workmen employed in labours of escawation and demolition."

In congratulating the menting, in commenwith other members, on the gratifying announcement of this letter, I took excession to say, that the object having now been made a national one, I did not doubt of its mecaning that the attempts make by the arrange anthorities of the city of Losdon, to collect a Museum in connection with the City-Library, had been very much threated by the *arrayous* of private collectour, that the inducactive was Mr. C. Rocet Smith, who, not wantented with securing by every means in this power, the possession of curiosities of this acture, had, most ungratefully, attacked these-who were anxious to forward his public zematched, but not willing to encourage his public zematched, jects. That this gentleman had, then the committee, and myself, information is the doubt architect, in an article published in the dorchaslogia, and, subsequently, in: citizer sports, and that, as this was the first public set.

That it was always expected from the sife of the Old Exchange-in this way heart of ancient London -- and from the deep and ex-tensive excavations required for the new build ing, that many interesting relines would be discovered ; and, as wrehitest of the building, discovered; and, as urchisent: of the doubling, and a Fellow of the Antiquarian Society, of some standing, I was most anticus that no pains nor expense should be uparent: to follow out those researches; to identify there incom-stances under which any curidsities might be found, to keep them together, wither in the to keep them together, either City-Library, or to deposit them in the New Gresham College; as the nucleus of a college tion, and in connection with a mew dibrary, which I hoped would one day rival these destroyed in the Fire of London 7 To this end I made the following recommundations to the committee :---That the hoarding round the site should be made perfect and sound, to mable the excavators to work uninteruptedly, and to secure a certain control over them : That the contractor should be bound to deliver ap to the committee any article which might be found, and to take every possible care of such und-ters: That the clerks of the works should be desired to watch with the greatest stientle and that the foreman of the contractors show have the same charge : That a large room in one of the houses in Freeman's court, eccapied by the clerks of the works, should be appropriated to the reception, arrangem and custody of all antiquities so discovered : and, further, to prevent the workmon being bribed to dishonesty, that they should be in-formed, by a printed notice delivered to them, and extensively circulated, that an account would be kept of what each man might find, would be kept or what each man might find, and that they would be liberally compensated; but that, on the contrary, every attempt to secrete any article, and to sell it, was illegad, and would be punished. That the Gresham committee adopted these suggestions most will lingly, and, with the chairman, were personally anxious, and took much interest in the result.

That some short period after the adoption of these regulations—having entirely for their object the suggestions and recommendations of Mr. Hawkins' letter—I was waited upon by you, requesting an order to enable you to visit

he Phut for some time, and antil the excavation approached the west end of the Old Ex-Simple, indthing of importance was found; Just that on taking up the eastern end of the old merchants, area, the pit, described in the *Archaelogia*, and in my report to the com-mittee, printed by the city, was found, contain-ing the most abundant collection of Roman remains yet discovered in the City of London. That your anxiety to obtain possession of some of these curiosities overcame your obvious That notwithstanding every exertion power, you did obtain powersion of some, duty. usy. I has notwinstancing every exertion on tour part, you did obtain postession of some, and one of great interest, a bell which was conficiently perfect to ring; and that there was a billiously perfect to ring; and that there was a new an active pursue mans, not arer you, but after this belt, which, however, found its way into your hands. I did not tell the meeting, has I might have done, that the clerks of the quirks and the contractor's foreman, were constandy complianting to me of your interference with the technical, until it came to an actual guarrelt. That on receiving a letter from you, a had a mosting on the ground of all parts when you were excessively violent, and chreatened to shoot the creak of the works; but that you asspred me that you had not en-deninged the men to abstract the curiosities, ifinitiyes had even refused to buy them, and thad sont their back when offered. That after mad-sent then back when offered. That after theatring all parties; I told you in their presence, -that they involve to continue to give you, as a they declared they had done, every facility for -paquing your archaelegical researches; but that do: there were three withesess to your intefference with the workmen, I expected, on your part, an abandonment of all such intererendi. o

Instated further to the institute, that all the our focilies thus collected, referring generally furtheir character, were, as you well knew, miringed with great care by the clerks of the works, and that they were then in my posses-mins in erspare room at the London Institution, under the charge of Mr. Brayley, jun., with had been simplayed by the committee at some expense; to examine, classify, and report spea: th 10. · · That there was a differen epinion in the committee, as to their being served in the City Library or the Gresham prete Gulle Gullege; but that it would be my duty to bring Mas Hawkins' letter before the Gresham Comilten i 🖓 🖓

From this statement, which exhibits the setual circumstances of the case, I now turn to some of your interspresentations. At page 270, of your article in the Archaelogi seather was one, as I am informed, stamped with the leftern S. P. Q. R.; this I did not was and i believe it was lost soon after it was id ble possension of the Joint Greeham Com-mittee, a fast that has also befallen other an-bigaities collected for that body." And at gauge 279, this :---"I regret that the regula-tions under which I was permitted to make my on the site of the Exchange, did not tolerate such free and minute examinations as the impertance of the subject required."

a If yos will refer to your own manuscript of this communication, you will see how much more offensive and unjust this latter sentence driginally stood. I was not present at the source when your paper was read, but my at-sention was called to it by a friend, who sention was called to it by a friend, who pointed out to me also the report of it in *The Manutemen's Magazine*; and a reference to proge 79, vol. xvii. new series, of that work, will give the character of your charge as it entipically was made. The words are these :-We were sorry to hear the writer state, that his exertions to rescue these objects, so illustrative of the ancient arts and manners, were **Represented to the statistic arts and manners, were represented to to a by persons who alleged they were in-persented to do so by the United Greensm and Sity improvement Committees, to the great obstruction of his researches."**

The sentence in the Archeologia itself, was

changed on my strong representation, in the proper quarter, and by the authority of a much-lamented and amhable friend of the Indentiamented and analytic friend of the society, then one of the directors. After what I have stated of your perfect knowledge of all my arrangements, and their object, you will permit me to refer with some astonishment, to page 198 of the same volume of the Gentleman's Magazine, where, in a report of the proceed-ings of the Antiquarian Society of the 13th of January, 1842, I find that you, Mr. C. Roach Smith, produced to the society a very carious "Medalet, struck in lead, found on the site of Smith, the old Royal Exchange: - apparently," as you are made to state, " deposited there on the you are made to state, " deposited there on the occasion of the memorable visit of Queen Elizabeth, at the inauguration of the original building," having "the inseription ANGLIZ. REGINA 'VBIQUE 'HONORATA. Surely, I need not tell you, that the only proper place for such a very remarkable curiosity, could not be any private collection.

I shall not pursue this subject further, nor follow you in your favourite and repeated attacks on "City Anthorities." In your latter to me, you threaten some very violent course is an you threaten some very violent course is an appeal to the public; perhaps, when you do so, you will print this statement; if not, it will be my duty to de so for you. I am, Sir, your obedient servant, (Signed) W. TITE.

C. R. Smith, Beq., F.S.A., etc.

ANNIVERSARY MEETING OF THE ROYAL SOCIETY.

THE Royal Society met, according to ancient custom, on St. Andrew's day (Monday last), to receive the auditor's report, and elect officers for the ensuing year. The meeting was numerously attended.

The president, Lord Northampton, was in the chair. The balance in hands of the trea-surer was declared to be 2,076. 11s. 10d. The total number of members is 831, of whom 61 are honorary or foreign. After the presi-dent had delivered his address, an admirable composition (ordered to be printed, on the motion of Sir Robert H. Inglis), and the so-ciety were about to ballot for officers, Mr. Gassiott, Fellow, whose name appeared in the letters signed "A Contributing Fellow of the Royal Society," which were published in The Times, rose to direct attention to them, in order that the author of them might not be elected into the new council. Mr. Gassiott, chosen terms asserted, that as a merchant, which he was (and nevertheless he came into the society with the recommendation of a Farraday and a Herschell), the manner in which public attention had been drawn to his name, might have injured him fatally, in proof of which he appealed to some of the leading merchants of London, who sat near him. Mr. Gassiott read a letter from the solicitor to The Times proprietors, stating that Sir James South was the writer of the letters referred to, and another from Sir James South, in reply to an inquiry if he acknowledged them, saying the question was such that one gentleman had no right to ask another, and that he should not answerit. He, Mr. Gassiott, condemned strongly the conduct of the writer, in which he seemed to be supported by the meeting, and did not hesitate to call the letters slanderous. The President said he would venture to state, that no one gen-The President tleman present required any defence from Mr. Gussiott. With regard to the inquiry made of Sir James South, he hardly knew whether or not it was a fair one. A man either had a or not it was a fair one. A man either had a right to send anonymous letters, or he had not. If he had, he had a right to remain anony-mous. If he had not, it was asking him to criminate himself. He (the President) would consider that Sir James South felt himself to be wrong, and did not feel bound to acknow-ledge it. He differed even from Sir James South's general proposition, that Fellows should not write F.R.S. after their names, to advance their own interests. It was a great honour, and every man who was a Fellow had a right to say so.

self unable to fulfil the duties; and Colonel Sabine, to be foreign secretary, the office held by the late Professor Daniells.

The Society afterwards dined together at

the Orown and Anchor, when a large number of totats were ably and pleasantly proposed by the noble Marijus, and were responded to by Sir John Lubbock, Colonel Sabine, Captain Smythe, Mr. Amyott, Dr. Roget, Mr. Godwin, Mr. Greenhough, Mr. Samuel Warren, who hinstourously defended the "non-contributing" follows, Dr. Parris, Mr. Sheepshanks, and ath ani. 1

ASSESSMENT OF DILAPIDATIONS.

BIR,-Sin,-In the gaery proposed by "a Sur-veyor," in your last number but one, whether in the assessment of dilapidations as against a tenant under covenant to repair, be cap "make a charge for occupancy during the time necessary to complete those repairs," your correspondent appears to have fallen into the correspondent appears to have failed use the common error, of confounding repairs with dilapidations, whereas these two things are altogether dissimilar as well in their wronga as in their remedies,

A tenant under covenant to repair, is entitled to a certain notice (usually of three months), detailing the repairs required. Should he neglect within the specified time to complete such repairs, your remedy is by ejectment for a breach of covenant.

Dilapidations are actual damages done to a

Dilapidations are actual damages done to a property by waste or otherwise, beyond fair wear and tear. The remedy for dilapidations is by an action for damages by waste, misuse, &c. Rent can be taken of a tenant only under his own covenant to pay such rent. Dilapi-dations are damages which no covenant can reach, otherwise their remedy would lie in ejectment, and can be claimed only on expira-tion of all covenants. Hence it is evident that no rent can be claimed under a covenant which no rent can be claimed under a covenant which does not exist; and rent can only be claimed under covenant. There is no case upon the books in which a loss of rent during repairs has been allowed in enhancement of damages by dilapidation. For my own part, I should not think it likely that such a claim was ever made, seeing that it is at once met by the reply-" If you were discontented with the state of the property during the existence of the lease, why did you not give notice of repairs? in which case no loss of rent could have accrued, and if such notice had been disregarded, you might have brought your action in ejectment, and by recovering possession of your property, pre-vented all the waste of which you now comphin."

Nor woold it be a sufficient answer on the part of the landlord that he was not cogni-sant of the want of repair during the term. Because he has reserved to himself a right of entry to view and survey, and therefore it will be supposed that he has 'exercised such right, and has how as therefore work with during the lat and has been 'satisfied with the date' of his

and has been satisfied. This is the set of the property. Again, it must not be forgetten, that a tenant whose term has expired, has to legal posses-sion of the premises, and consequently is un-able to perform repairs required of him as dilapidations. How, therefore, could a loss of rent be charged to him, when he at least can exercise no occupation, and when, for all he may know to the contary, shother party may be

may know to the contary, and when, for til he may know to the contary, another party may be actually in possession, and paying rent. Property has its duties as well as its defights, its drawbacks as well as its advantages. Loss of rent during repairs of dimpidations, must be considered as a charge which it imposes. Lucky indeed is that landlord who has no greater grievance to complain of.

I am, Sir, &o. GRO. TATTERSALL. 42, Pall Mall, 26th Nov. 1845

CAMBRIDGE ANTIQUARIAN SOCIETY .---- We learn that the council of the Cambridge Antiquarian Society have called a meeting to propase various argangements for the promotion of its efficiency as a society for the study of history, architesture, and sutiquities, and that as favourable to such object who are not persoi members of the society are requested to attend. In looking at the list of the council as given In looking at the list of the council as given on the cover. of its has, publication, we see that Professor Willis is the president, Mr. Bahington treasurer, Mr. C. (Men Goodwin, secretary; and that smoogst the council are the names of the Masters of Clare hall and St. John's college, Professor Gorkie, the Vice-Provost of King's college, Rev. J. J. Smith, Sir H. Dryden, Rev. Jas. Goodwin, &c. &c.

WESTMINSTER COURT OF SEWERS.

ON Friday, the 28th of November, a Court ON Friday, the 28th of November, a Court was held. The cash at the bankers was 17,0931. 7s. ld. An application from the Holborn and Finsbury Commission to join in the expense of a new sewer down Shire-lane, Temple-bar, was declined, on the ground that large improvements were in contemplation in the locality, and that it was unaccessory to use the city outlet, when there was one in the Wastington commission guite continuous Westminster commission quite contiguous.

Mr. Dowley brought up his report as to "the materials, &c., required for the new es-tablishment of labourers and bricklayers, by whom all works under 501. and the cleansing of sewers and gullies, are to be performed.³ Mr. Leslie moved that the report be printed, and taken into consideration at the next Court. Mr. Marriot having seconded the same, Mr. Donaldson objected to printing the report; he was satisfied there must be different yards to deposit the materials; there must be yard foremen to book the materials as they came in and went out. Although he felt convinced great confusion would arise from the change, still he thought that it should have a fair trial. The report should originate with the honour-The report should originate with the honour-able mover, to prevent him from hereafter saying the plan had failed from the want of foresight. He ought to have the money, whe-ther it were 1,000. or 2,000%, but the Court must be assured that he approved of the plan, Mr. Baylis, Mr. Hawkes, and Mr. F. Crace concurred in throwing cold water on the plan, and fixing the responsibility of carrying it out, on the proposer. They objected to print the report. Mr. Le Breton thought this course unfair, and Mr. Cumberlege expressed his determination to take his share of the re-sponsibility attaching to the general scheme he had helped to carry. Mr. Allason thought the subject one of the most important that had ever been before the Court. The plan might succeed, or it might

Court. The plan might succeed, or it might fail. He thought the honourable mover and seconder ought to be held fast as to responsibi-lity. The Court, no doubt, would be inclined to give them all the aid in its power. He would confess that he was unfavourable to it, but at the same time he would render every assist-ance to carry it out. The Court must look to Mr. Leslie that the way in which he proposed to carry out his plan was a reasonable, proper, and judicious one. Mr. Dowley's mind was not Mr. Leslie's mind, and, therefore, the honourable commissioner, and not the surveyor, ought to be held responsible.

to be held responsible. Mr. Leslie felt grateful to the gentlemen who had proferred kind assistance in carrying out his plan; but with all their kind expres-sions, they had not had the ingenuity to con-ceal their deadly hatred to it. It was the final blow to the forty years' monopoly of the contractors in that Court, and it was to be expected that much vexation on that account, would exhibit itself. The real state of matters would shew that he (Mr. Leslie) did not come down to the Court with crude and ill-digested would shew that he (Mr. Leslie) did not come down to the Court with cryde and ill-digeated plans, but plans that could be carried out. The friendly freeling towards the plan could not be better evinced than, by looking at what the Court had been doing since the plan had been twice approved by the Court. Why they had dismissed the two surveyors, and declared that there should be no assistant surveyors at all there should be no assistant-surveyors at all and this immediately after the Court had twice wisely resolved to do itself, without contractors, all works under 50%, and the entire

cleansing of the sewers. Mr. John Gunter thought the Court was bound to assist Mr. Leslie, and not to allow any parties to frustrate that which the Court had promised to do, by ordering and sanctioning his proposition. The Chairman said, the simple question wa

as to printing an imperfect document. The whole figures being in pencil, it was clear to him that it had been hastily prepared by their officer. It was then resolved to refer the report back to Mr. Dowley, and that he should submit it to the mover and seconder of the plan. A long discussion then ensued as to the power of the Court to build sewers where none had before existed; Mr. Le Breton contend-ing that the Court had the power, and Mr. Marriot declaring that the most minute triff-ing surface drain, when it passed the property of favoured commissioners, was a sufficient of excuse to put the district to the expense of

building a new sewer; and he instanced a recent expenditure in Brompton-road as a proof of what he said. There was no clear principle. laid down, and consequently no security to

property. Mr Donaldson loudly complained of Mr. Marriot'a statement, "We are all involved Marriot'a statement. "We are all involved (said the bonqurable commissioner) in his attack, and I, for one, defy him to prove his assertions." Mr. Marriot said he was sorry if he had gone too far, for he intended to cast no individual reflections, but it was for the honour of the Court and its credit with the public, that there should be some regular plan laid down, and then the public would know what could be done and what could not, at the public arpense. The chairman, without dis-puting his friend Mr. Le Breton's law, stated, that it would be unjust to call upon the that it would be upjust to call upon the public to pay for the advantage which was solely to private property. The matter then dropped.

** We cannot understand honourable com-"a" We cannot undersuad appourance com-missioners, who would throw noon the mover of a resolution passed by the Court, the re-sponsibility for its success or otherwise. A motion when carried, becomes the resolution of the body, and with that bedy, not with any individual rest the remonsibility.

of the body, and with that bedy, not with any individual, resta the responsibility. On Wednesday last, the committee appointed to prepare a reply to Mr. Lealie's pamphlet, in compliance with Sir James Graham's letter, brought up their report to a special Court. It was adopted, and is by this time in the Secre-tary of State's office. Of this, hereafter.

THE MORAL AND INDUSTRIAL TRAIN, ING SCHOOLS AT SWINTON.

THESE schools, which are new nearly com-pleted, are sufficiently important from their abject, and their extensive scale to require some They have been erected at Swinton, notice. near Manchester, for the education of the pau per children of the parish, are fitted up with every convenience requisite for teaching various trades and occupations, and are no doubt well salculated to be the means of conferring important and solid benefits upon the poor of Man-chester. Extensive as the building is, its size is not at first apparent. The general plan forms a quadrangle, covering, independent of the gar-dea, four scree of ground, the principal front being 460 feet in length. The arrangements comprise, school and class-rooms for boys, girls, and infauta, work-rooms, sick and fever wards, a dining-room, which serves also for a chapel, a dining-room, which serves also har a chapes, domestic offices, a surgary, lavatories, and mas-ters' rooms. The design was by Messrs. Tattersall and Dickson, the superintendence and completion of the building being mainly due to the latter. It is in the Elizabethan style, the materials being red brick with stone dges-sings. Approached from the Manchester road, the main front has a more imposing effect than we recollect to have seen elsewhere, a modern example of, in the same style of arconstra and its baluetraded steps, are com-posed with much skill and effect in the result. In the centre rise the two turrets. There is much stone work about the entrance, and the details partake largely of the Italian style; indeed, whatever merits there may be in the building, there is nothing which could not have been quite as well treated in a purer style of architecture than that employed. In the interior, there is little in the way of decoration to call for notice; the board-room is, however, a good apartment, with some tolerable furniture. The great merit of the building consists in the manner in which every part is adapted to the object of matruction in the various trades. The object of instruction in the various traues. lavatories are fitted up with numerous basine, in rows, cut out of blocks of stone, and with hathe for complete immersion. The total large baths for complete immersion. The total cost is understood to be about 40,000. The arrangements for ventilation cost 50004. (!) and were under the superintendence of Dr. Reid. Though this amount may include the heating, it appears enormous. Considering that Dr. Reid's plans do not appear to have yet met with any great success, we are surprised that they should have been adopted. Ventilation is undoubtedly a matter of paramount impor-tance, and by no individuals is held to be more so than by architects. If every architect of a public building had had some thousands allotted to him, solely for ventilation, and experiments in reference to it, the successful

ventilation of large buildings would not be, an it still is, a desideratum. However important ventilation may be, and we are prepared to ar-gue the great importance of it, it is not to be sought to the detriment of other, objects, the convenient arrangement of a building should not be sacrificed, much less the stability, and the beautiful is quite compatible with it. In the building here noticed, the turrate perform the office of ventilating should; the air is warmed by hot-water pines of large bore, and warmed by hot-water pipes of large bore, and is passed through the huilding by morraque fues, built out into the rooms in the most unsightly positions; some of them, we may venture to say, are not less than three feet square. In to say, are not less than three lest square. In the principal school-rooms, the air is admitted by numerous holes drilled in the floor, and passed out by valved apertures in the ceiling, which can be regulated. The dormitory is over the school-room; but as the two apert-ments could never he is use at the same mo-ment, the vestilation of the upper room is provided for, whilet its sequencies would not

breathe vitiated air. In a communication, lately received from a In a communication, latery received income valued friend, one of the board of guardiana, he says—" The apparatus has been tried as far as it is completed, and found is work well;" further he says, that he is "anxious to do justice to a man who has been attacked by withing senators, disappointed patentees, parasites of Mr. Barry, and a score of others, who, from senators, disappointed patentess, parsaites of Mr. Barry, and a soure of others, who, from various motives, have been induced to injure the reputation of one who. I honestly believe, to be practical in his views, and honest in bis intentions." In reference to this we may say, that no fair trial can take place till the huld-ing has been used for the intended purposes, is the full extent, which it cannot have been onhitherto; that Dr. Reid's place have been ob-jected to by men of every description, and party, who have had lamentable experiences of their instrumentable experiences of party, who have had lamentable experience, of their inefficiency. We are not aware of any instance of their success. They are enormously expensive, and injurious to the building and is objects, and should no longer be persisted in Every architect is able to receive, valuable in-formation from men of acience, emissed, is their own walk, and is anxious to seek it, but it is on him that the arrangement of every it is on him that the arrangement of avery part should depend, and no superstud, arene can be arrived at by any other course. If ventilation, as now managed, be actually de-structive of the health, which it is expected, to benefit, it would be positively better to leave it quite unattended to; at least, we yeothere to say that a skilful architect, if unfattered, would produce a botter possitively ond at the come time say that a skilful architect, if unfettered, would produce a better result, and at the same time consistent with any other end, which, is late attempts at ventilation, is deemed an after consideration. The ventilation must be adapted to the building, not the building to the venti-lation. We shall always be anxious to meet with any valuable suggestions from Dr. Beid, ar from any other individual, and should an instance of success in any plan be shown to us, shall gladly record an opinion, in, its favour. But, as present, the exidence as to Dr. Reid system is strikingly usfavourable. * 5

STONE STAIRCASES, UNDER THE BUILDINGS ACT,

Sin,----I lately commenced erecting a dwell-too late, to the Act, this certainly uppears to be the intention thereof. If so, I shall be compelled to put up a wooden staircase the same as my passage, &c., and may never have an opportunity of bringing in my stone staircase, as it is of peculiar construction. Perhaps you may be able to suggest some way in which I may be able to suggest some way in which is can use my stone ateps with the landings I have fixed. To me it appears unaccountable, that all the staircase, passage, &c., may be of wood, but not a part. Parhaps you can throw some light on the subject, and oblige Your constant reader,

A MASON.

. The wording of the Act in this respect is precise, and seems to leave no discration power. The regulation is certainly scopped ous. We should be inclined to send, the question to the referees.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

¹⁰ At an ordinary meeting held on Monday Jast, Mr. Papworth, V.P., in the chair, Mr. ⁹ W: C. Reed was elected an associate. A can-⁹didate as Fellow, was black-balled, on what account did not appear.

but A paper was read on the Kentish Rag Stone aby Mr. J. Whichcord, jun., associate. The district in which it is quarried is about thirty miles in length through the central part of Kent, and is about four to ten miles in breadth. This district comprises the towns of Seven-baks, Maidstone, and Lenham, &c. The quality of this stone is very variable, being in some districts hard and flinty, and in others almost as easy to work as Portland stone. It is in the quarries at Boughton, in the neigh-It bourhood of Maidstone, that the best qualities of stone are procured, and as the men em-ployed in them often find among the rubbish stones of a spherical shape, some as much as 12 inches diameter, and similar to those em-ployed for the artillery of the fourteenth and fifteenth centuries, it is not improbable that at * that period these quarries supplied stones for that and other purposes in the metropolis. It was to this quarry that Mr. Whichcord con-fined his observations, and a diagram accom-

⁴ panied his observations, and a diagram accom-⁴ panied his paper, which shewed the various ⁷ layers of stone and hassock, — the technical ⁴ name given to a species of sand which invari-¹⁴ ably intervenes between the different strata of " stone. These lavers are about twenty in number :

Firstly, the land rag, which is a hard stone, dark in colour, and is to be procured in lengths of five or six feet. This first layer is about "fifteen feet from the surface of the ground, the ^a fintervening space being occupied by the vege table mould; then a deep bed of loam of diffittervening space being occupied by the rege-'table mould; then a deep bed of loam of dif-ferent qualities; and lastly, three beds of 'hassock, separated from each other and the 'loam by three shallow layers of ferruginous sand.' The second layer of stone is termed header—laying, on account of its being prin-cipally used for small headers. Next in order is the great regr which is free of working ß is the green rag, which is free of working, and easy to be got in lengths of about six feet. The hassock, which divides this and the next layer of rag, is indurated enough to form good working stone. We then have a layer used principally for paving, and called yellow rag, succeeded by the pelsea, from which the largest stones can be procured, hard and strong in quality. Then the coleman and and strong in quality. Then the coleman and little coleman, separated by the hassock, and both of which give stones too hard and flinty to be used for other purposes than headers, &c. We now come to the thickest layer, called great rag, which from having many cross fissures cannot be got in blocks of any length, and is therefore used for headers or else for lime. The bed of hassock which lies directly under the great rag is of very superior quality, and re-sembles the Reigate stone. It is used by the maexceedingly well. We then have the Newing-ton cleaves, which is hard and difficult of working, but yields stones of large size. The next layer is an exceedingly shallow one, and is so flinty, as precludes its use for other purposes than for macadamizing roads. Then the Whiteland-bridge, from which stones of 12 , writeland-bridge, from which stores of 12 feet long can be quarried with certainty and ease: it is of a blue colour. The next in suc-cession is the Mainbridge, resembling the pre-ceding layer, but from which stores of so farge a scantling as from the Whiteland-bridge cannot be procured. Then comes the garl, tised generally for headstones : it is separated "By a bed of hassock, thicker than the others, "from the Horsebridge layer, which gives good "stones, of nearly 15 feet in length. We then find three beds called the header-layings, with their alternate beds of hassock ; these are very Inferior in quality, and of little depth. The next two layers are called the upper-bottom and under-bottom; they yield stones of fair quality and large dimensions. The hassock which separates them is rubbishy, and that ¹ which follows the under-bottom layer is ex-weedingly soft. We now come to the last layer, which is called white rag, resembling chalk in appearance, and useless as a stone, as it crumbles in the atmosphere. It reposes on a "Def bf hassocky clay, beneath which the "Duariymen have not penetrated: it is very "doubtfol whether any limestone is to be found

"fower that this.

The author then alluded to the various modes of dressing the different kinds of rag stone, and mentioned that the small hassocky spots which occur continually, in it render it anfavourable for tooling, as they give it the appearance, when smooth, of bad Portland; it is, therefore, usually picked. He also stated that, although the harder qualities of Kentish rag stone are scarcely inferior to granite in resisting pressure, the vents occurring in it render it dangerous to use as a bearer. The following analysis was made by Mr.

Phillips :-

CHURCH NEWS.

THE inhabitants of Rotherham are about to restore the south porch of their ancient church to its original state. The works are entrusted to Messrs. Weightman and Hadfield, architeets. The new church at Rise, in the un-cese of Bangor, was consecrated on the 12th ultimo. The interior of the roof is painted blue, and studded with gilt stars. There are four stained-glass windows. The east window is a representation of the last days of our Saviour upon earth-the crucifixion, the taking down from the cross, ac. The walls are deco-Tated with scrolls with appropriate texts of Scripture. It was built at the sole expense of Mr. Bethell, from a design by Mr. Chantrell, of Leeds, architect......On Wednesday next, of Leeds, architect......On Wednesday next, the 10th inst., the nave of the Holy Trinity Church, at Hull, will be re-opened by the Rev. Dr. Hook, Vicar of Leeds.....The church of St. Mary De Crypt, Gloucester, was re-opened with great pomp on Thursday week......An organ has recently been erected in St. Paul's Church, Herne Hill, by Bishop. The case in which it is contained, is of carved oak, cut by the machine of Mr. S. Pratt, of Bond-street; the cutings are of quatterfoils. gothic and bethe cuttings are of quatrefoils, gothic and he-raldic devices. It may be said to be in two compariments, being placed on each side of a gothic window, richly painted, at the west end of the church. In the process of taking of the whitewash from the interior of the Hungers ford Chapel, in Wellow Church, thirteen distemper drawings, representing our Saviour and the twelve apostles, have been discovered around the east window. The larger figures, eight in number, are about half the size of life, and the colouring of the whole is said to be well de-fined.----It is intended to make some extensive renovations and improvements in the pa-rish church of Liddington, Wilts, including a re-pewing of the church throughout, with the view of increasing the accommodation, which is much wanted.—The sam of 2,600/. Three-per Cent. Consols, has recently been transferred by Miss Jane Cook, of Cheltenham, to the trustees of the London Society for promoting Christianity among the Jews, for the purpose of enabling the committee to complete the building of the church on Mount Zion, according to the plan proposed by their architect. —George Liddell, Esq., has lately given a plot of ground, as a site for the new parish church of St. Paul, at Hall. The value of the donation is ascertained from the fact of 8501. having recently been refused for this piece of land. A monument has within the last week been erected in Gloucester Cathedral, to the memory of the late Major William Davy. It is of Chilmark stone, and consists of a central canopy, crocketed and crowned with a rich finial, flanked by clustered buttresses, terminating in pinnacles, and supported by corbel angels, bearing shields with initials. The facrests are emblazoned in panels mily arms and under the tablet, and in the spandril of the central arch. The inscription is engraved in the old black letter, with rubricated capitals. It is designed and executed by Mr. Osmond, of Salisbury.—The church lately erected at Woolfardisworthy, Devon, was consecrated on Friday last, by the Bishop of Exeter. It was designed by Mr. Hayward, of Exeter, and built

by Mr. Baker, of Southmolton. The velvet altar-cloth, the chair for the altar, the stone pulpit, and the memorial window, were presented to the church by different persons. of the new church of St. Stephen's Woodville, near Ashby-de-la-Zouche, when the Countess, Lady Gore, and the Hon. Captain Curzon, were present at the interesting ceremony. A new ecclesiastical district has been formed in Gheltenham, and a church, in the early Norman style, to be dedicated to St. Peter, will very shortly he erected. The committee of the Church Extension Society have already fixed upon a site and plan, and have also provided a sum of 50, per annum towards a permanent endowment.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

THE association met on Wednesday evening last; Mr. Pettigrew, F.R.S., in the chair. In opening the business of the evening, the chairman said, that some discoveries of a verv interesting nature had been made during some excavations on the Duke of Beaufort's estate at Badminton, and that his grace had stopped the works until their president and the draftsman of the association could visit the spot. Amongst a variety of antiquities exhibited, were some ancient swords, which led Mr. Planché (when describing them), to inquire if any information concerning the sword of Charles I. at Whitehall, removed from the Croker, the hon. sec., said he had addressed Lord Lincoln on the subject, but had not yet received a reply.

Allusion being made (in the course of an Interesting conversation on the preservation of monuments), to a letter in The Times of the preceding day, stating that the tombs of Henry IV. and his queen (at Canterbury), were about to be repaired in a doubtful manner, at a cost of 1,600*l.*, Mr. Pratt, the proprietor of the carving machine, said that parts of the tomb were now in his hands to be copied exactly.

Mr. C. Roach Smith, read a valuable paper on Roman antiquities found in and near London, which he exhibited, and at the end of it, brought before the meeting the statement of it, brought before the meeting the statement made by Mr. Tite at the Institute of Archi-tects, and his own letter on the subject, given in The BUILDER last week. Mr. Smith also read a correspondence with Mr. Tite, which appears in the present number of our jour-nal, and answered in detail the particular charges brought against him; which charges, he arguid, from the circumstances under which he argued, from the circumstances under which they were made, were intended to discredit the Archeological operation through him, their secretary. Mr. Lott, F.S.A., Mr. Jerdan, the chairman, and others, addressed the meeting on the subject, and a resolution was passed, expressing regret that Mr. Roach Smith should have been subjected to the attacks complained of, and thanking him warmly for the disin-terested zeal which he had ever exerted himself to preserve the antiquities of the city.

REPAIRS OF MAYNOOTH COLLEGR.--The Globe says, the board of Maynooth College recently made an application to Sir Robert Peel, stating that the sum of 30,000%, allocated for repairing the old and erecting new build-ings, would fall farshort of the requisite amount, as appeared by the plans and estimates of Mr. Pugin, the architect, which were forwarded to the right hon baronet, and it was submitted for the consideration of Government, whether, under such circumstances, an increase of the building fund should not be made. The reply of the Treasury was read at a meeting of the board on Friday se'night, peremptorily refusing any increase whatever. Already upwards of 2,0004. have been expended by the Board of Works in the repairs of the old college buildings, and much remains to be done, independently of the new buildings. The board, having no alter-native, determined to call on Mr. Pugin to make a corresponding reduction in his plans and estimates, in order that the sum allocated should cover all expenses. A building com-mittee was appointed to consult with the architect, consisting of Archbishops Crolly, Murray, Slattery, and MtHale; Right Rev. Dr. Kinsella, Lord Ffrench, Sir Patrick Bellew, and Mr. Hussey. Treasury was read at a meeting of the board

FREE I BUI EIDER.

STAIRCASE AT GROMWELL HALL, HIGHGATE.

HIGHGATE, 30 weil known to every Londoner, was formerly spriched with asveral magnificent Elizabethan mansions, which have long since disappeared. Among them was Dorchester House, a view of which, copied from a very rare print, will be bound in Mr. Prickett's small volume of the "History of Highgate." In the collection of drawings by John Thorpe (preserved in Sir John Soane's museum), which are of the date of Elizabeth and James E.; there are plus of houses at Highgate, but no elevations or names are added to them.

to them. Mathematika and the solution of the interesting and the building known as Cromwell Hall; in this neighbourbood, very little information, besides what the building itself affords, can be obtained. In this particular it is not at all singular, as there are

several ancient buildings of important character both in the neighbourhood of London and throughout England, of which the names of their first possessors have been lost; an old shield of arms placed in some conspicuous part of the structure, if it can be deciphered, is generally the only guide which will throw light on the subject. Sometimes, instead of one shield, we find a great number, as many, perhaps, as twenty, belonging to the ancient gentry in the neighbourhood, or it may be the armorial hearings of those families with whom the proprietor was connected by relationship, but not so closely as to entitle him to place them in his own escuteheon in the proud situation of regular quaterings; of gourse, when this is the case, we are in the dack, as to who possessed the house. For an instance of this kind we have the old manor-house of Hollingbourne, in Kest. If a shield of arms, either

in plaster or stone, is placed singly is the centre of a ceiling, or over a fire-place, such may, without fear, be given to the person who erected the building, unless, as was frequently the case in the civil wars, the proprietor of a sequestrated estate removed the eye-sort (to him) of the real owner's shield, and substituted his own. Whether this was done at Cromwell Hall, without having the names of the parties who, one after the other, had frem owners of the building, it is hazardous to av. The house is universally supposed to dare been built for, and inhabited by, General Jiton, who married, in 1646, Bridget Cromwill, eldest daughter of the protector; a shield of arms on the ceiling of the drawing room far, without examination, been pointed, out so be langing to Ireton, and with like corresement, the monogram A. C., in one of the fire place, was said to represent the initial, of the

Cromwell his wife. Ireton bore on his shield. ermine, two bendlets, gules ; the plaster shield on the drawing-room ceiling at Cromwell Hall has two bars gemal, and in chief a lion, passant gardant. I am indebted to a friend in the Herald's College for the information, that this coat stands in an ordinary of arms, the Eliza-beth to Tregoze, being azure, two bars gemal, and in chief a lion passant gardant, or. He remarked that a similar coat, but with different tinctures, might have been used by some pro-prietor of the old house, of an entirely different name, and that there was no match whatever to it to be found in the pedigree of Cromwell

The name of Tregoze is not mentioned in any topographical history of Highgate, and the connection of General Ireton's name with the building appears to rest upon no other founda-

and the countrey towards the south, verie farre

farre." This Cornwallis, Lyson supposes, was son of Sir Thomas Cornwallis, a man of consider-able eminence in the reigns of King Edward the Sixth and Queen Mary; he led a retired life during the reign of Queen Elizabeth, and died at a very advanced age in 1604. It is probable that the monogram A. C., previously noticed might below to a descendant of this noticed, might belong to a descendant of this Sir Thomas Cornwallis, one who bore some part in the first erection of the building; as to the personage for whom it was intended, I must leave the inquiry in the hands of those who have more inclination and more time than I have to pursue it; there can be little doubt from the style of the building, that of Charles the Second, and from the decorations of the interior being of a military character, the bouse must have been intended for an officer of dis-tinction. If he had been a royalist, his shield

of Cromwell Hall is the staircase; and this alone gives undeniable proof that the house was erected for some great military commander.

The print shows a view of the staircase on the ground-floor; it is carried from the basement to the attics in the same style. Of the design of the staircase it is hardly necessary to remark, it is deserving of great praise; nearly all the bays, of which there are thirteen are different: so are all the small thirteen, are different; so are all the small figures on the top of the standards; these are carved by no mean hand, their expression and attitudes are admirable. Some are represented as playing on drums and fifes, the mili-tary band of the infantry of the day, as the trumpet, cornet, and kettle drums formed those of the cavalry; others are saluting, mounting guard; some of them are supposed to be por-traits, and that they should be so does not traits, and that they should be so does not appear at all unlikely, so well are some of them excented. One has been stolen, or, to use a polite word, appropriated, by some thieving self-imagined antiquary. The real antiquary, supposing the figures were in safe keeping, would rather see them in their original posi-tion. The lost figure is said to have represented Oliver himself, — it was the last on the top of the staircaset his statue, however, would hardly tion. The lost figure is said to have represented Oliver himself,—it was the last on the top of the staircase; his statue, however, would hardly have been put where it could only have been seen by the domestics. These figures are each 1 foot 7 inches high,—some of them have been sedly mutilated; the costume is mostly that of the soldiers of Grouwell's army, but in one or

Digitized by GOOGLE

two, the costume approaches nearly that of the reign of James the First. The character of the ornamented bays will

58B

The character of the ornamented bays will be best seen by the two, given in detail, on the preceding page; the whole are of similar character, containing within the scroll-work, shields, arms, such as helmets, breast-plates, swords, pikes, and flags; musical instruments, wreaths of laurel, &c.; in some are represented instruments of war of earlier date: many of the small figures in the standards have circular shields on their left arms. In the whole of the bays the artistic filling up of the space, and the leaving of proper voids, is capitally attained.

The building contains a great deal more of detail interesting to the architect. The front itself is a good specimen of the heavy moulded brickwork of the day; several of the rooms contain richly-ornamented plaster ceilings,one in particular is extremely handsome, and the quaintly carved door-frames leading into all the rooms from the staircase, must not be forgotten. Several of the plaster friezes in the rooms are of much earlier style than the build ing itself; they were the plasterer's stock pat-terns of the day: some of them I have met with in old buildings in Yorkshire and Somer-The rooms are of a noble size, and setshire. findeed the whole building is planned on a grand scale; it is admirably adapted for its present purpose, the education of youth on the French avatem: the establishment is called French system: the establishment is called College Français de Londres, the master is the Rev. G. V. De Linde Monteusis. This gentleman kindly permitted me to inspect the building, for the purpose of making the sketches C. J. R. engraved in the present paper.

COLOURED DECORATIONS.

At a meeting of the Desorative Art Society, on November 26th, a paper "On Chromatic Decorations," was read by Mr. E. Cooper. He commenced with a chronological review of various modes of applying or using colour in Egypt, and on the continent of Europe, from remote times to the end of the 17th century. In referring to the stupendous and richly-decorated remains of temples and porticos in Egypt, the commented on the dull and opaque colours, contrasted with mat and burnished gold (laid on in leaves) which are found therein, and also "upon mummy cases; he described the coloured intaglios on the walls, and the painted ceilings of deep azure, studded with stars in the temple of Medeenet Haboo, at Thebes; he exhibited drawings of Egyptian ornament of excellent design, and remarked that no progressive improvement in decorative art is discernible in these works.

The temples of Greece were then noticed, where colour was applied to capitals, frieze, 'entablature, and the back grounds of the tympanum; also on the ogee mouldings, where hoheysuckle, egg, and other enrichments were 'painted or stencilled; and it was observed, 'that, although no remains have been discovered; it was reasonable to infer, from the emihent state of plustic art, that contemporary 'pictorial art had arrived at considerable perfection, and the names of some Greek artists were given, on the authority of Pliny and Quintilian. After some remarks on the vases of Greece, and the mural decorations of the sepulchres of Etruria, he directed especial attention to the magnificent baths or thermae, of Titus, at Rome (erected A.D. 70), and (referring to the illustrations by M. Ponce), he observed that the fresco paintings found there, display in the grouping, drawing, and management of drapery, a refined feeling and knowledge of art; and in his remarks on the colour used, he observed that the decorations were executed, most probable, by Greek artists.

executed, most probably, by Greek artists. The decorations of Pompeii and Herculaneum, being of the same period, were then described; but, as might be supposed, from their being provincial towns, they would be found inferior in execution and splendour to those of the capital. The arrangement on the walls, of masses of black, red, and white, exhibited a principle which was commented on at some length; and it was also remarked, that these examples do not afford an absolute criterion by which to estimate the perfection of the arts of that or the preceding age. Passing over sevaral centuries, he next noticed the early efforts of Christian art, remaining to us in the mostace of the churches and palaces of Itely; and after some remarks on the productions of Cimabue, Giotto, and Leonardo da Vinci, he entered upon a consideration of the decorative works of Michael Angelo and Raphael.

of Michael Angelo and Raphael. In this period of Italian art, the anachronisms and disregard of relative proportion, in the parts composing arabesque or grotesque decorations, were especially noticed, as well as the enrichments, similarity in design and colouring, existing between the works of Raphael and his school, and those in the baths of Titus, before alluded to, and which were discovered at this time: a striking instance was exhibited, in the decorations at Mantua, by Giulio Romano, and Andrea Mantagna. (See Gruner, plate 24, and plate 5 of the Baths.)

The magnificent decorations by the Venetians were next described, in which massive mouldings richly carved and gilt, divided the surface of ceilings and walls; the coffers or panels being filled with paintings by Titian, Tintoretto, &c., produced a gorgeous effect. The decorations of the ceiling of the sacristy attached to the Duomo, or cathedral at Venice were said to be worthy of recommendation, on account of durability and splendour, for open colonnades in this country (such as at the Royal Exchange); the back grounds were of vitrified gold, and exhibit all the beauty of ancient mosaic, combined with the harmonious colouring and beautiful ornament of the sixteenth century. This century witnessed the rise and deline of fine art in Italy, and in the following one, although we meet with some good artificers, they were mere copyists and mannerists, and not great artists.

In discussion, the terms arabesque, grotesque, moresque, &c., were argued; the modes of lighting, and the principles of gravitation of colours on walls of apartments were commented on, and a regret expressed that decorations in the houses of nobility are not sufficiently known or accessible to the inspection of decorators and artists.

CEMETERIES VERSUS CHURCHYARDS.

In the course of the alterations now going forward at Redcliffe church, Bristol, it has been found necessary to the security of the walls, by depth of several feet a portion of the soil which in the course of ages had risen far above its original level; and in doing this, many graves have been opened, and the bony tenants ejected from their dwellings. This course has naturally been met by great opposition on the part of the parishioners, and it has become a debateable question whether the dead should be allowed to rest, and the walls to decay, or whether the interests of the buried should give way to those of the living, and the bones be removed for the better security of the costly and magnificent temple. It is a painful question, but one that we think must be decided in favour of the building and those who have a living interest in its stability. It brings with it, however, some considerations on the presumed freedom from disturbance, in the rest afforded by the churchyard, and may serve to illustrate the fallacy of the notion, enter-tained by many, that the repose of the dead is more permanently secured by burial in a churchyard than in the public cemeteries.

That which has happened in the case of Redcliffe, has happened lately or must happen soon, in regard to half the churches in the country. Since the zealous spirit for restoring and preserving our occlesiastical edifices which distinguishes the present day, has gone abroad, it has been discovered that in order to defend the walls and pavements from the destructive agency of damp, a course similar to that now being pursued at Redcliffe, is in most cases necessary. Constant burial has a teadency gradually to raise the soil of the cherchyard; and the most reprehensible practice of burying close up to the church walls produces at once damp, and an instability arising from the removal of the due support, afforded by the earth, to the foundations of the walls. To remedy this there is no other course than to remove the graves.

In the course too, of improvements which the spirit of the age requires, churches have in some instances been swept away to improve the thoroughfares in towns, and the grave yards have been converted into pitched ways.

The new cometeries, whatever may be the

case in future ages, are not at present liable to such disturbances, and therefore they have an advantage in this respect, to add to the very important considerations that recommend them, in a sanatory point of view, over churchyards in towns.*

The truth is, we cling to the idea of supsrior sanctity in churchyard ground, and of more undisturbed repose existing within' the shadow of the churchyard yews, from the arsociations and habits of feeling that make all venerable abuses dear to us, and which it'requires at first an effort of reason to overcome; but which, once overcome, are looked back to with surprise that in spite of reason, they should ever have exercised such influence. It requires only that we grow accustomed to the new system of burial, that the yews and cypresses and willows of our new cemeteries have time to strike deep root in the soil, in order that we learn to associate these cities of the dead with the notions of undisturbed seclusion and hallowed tranquillity, which, in truth more properly belong to them, than at least to city churchyards. What spot can have more the aspect of a home of the dead, than the beautiful burying ground of Pêre-la-Chaise? It is not gloomy—it is not gay; but has a sort of cheerful solemnity completely harmonizing with the tone of mind in which death should be contemplated by the Christian.—Great Western Advertiser.

THE TROUBLES OF RAILWAY SURVEYORS.

WE lately referred (ante p. 564), to the opposition which gentlemen engaged in the railway surveys meet with from certain land, owners in various parts of the kingdom, and gave enset illustrating the desperate lengths to which this opposition is carried. Size the neveral other cases have occurred, affording additional proof, if such were required, of the necessity for parliamentary interference early in the ensuing aeaston,

On Tuesday lest, a company of railway auveyors were employed to take the levels, Sc., near Islip, Oxon, when they were interrupted by the villagers, who, by main force, put an end to their proceedings. At the Brentford Petty Sessions, on Monday,

At the Brentford Petty Session, on Monday, six railway surveyors were convicted on a charge of trespass on the grounds of Mr. Wilmot, at liseworth, and sentenced to a face of 1/. each, with a warning that the highest penalty would be enforced in other of future delinquency.

Last week an attempt was made by the surveyors to complete their operations over the estate of Mr. Leigh, of Adlington, for the London and Manchester Direct, but that gentleman, with a number of servants, forcibly resisted the attempt, and, after a fight, secured several of them, who, on being taken before the Macclesfield magistrates, were charged with a trespass, and were fined 5a. each, which, with expenses, amounted to 20s.

Another conflict has occurred at Saxby. The scene is related by the Leicester Advertiser.—The surveyors belonging to the Peterborough and Nottingham Junction Railway attempted to survey a portion of Lord Harborough's land at Saxby, near Stapleford Park. The tenant ordered them off, but they would not retire. Several of Lord Harberough's men were present, and one of them (Biddle, a keeper) stood before the surveyor, and prevented his carrying the chain forward. This gentlemen then rushed upon Biddle, and

A nis genitemen then rushed upon Biddle, and "In large towns, and among a compact population, as in London, where the daily expenditure of hervous and muscular energy of the majority of its inbabilants is so constant and so excessive-where with the professional, the literary troore expecially in crowded bugs neighbourhoods) trends on the heel of the morrow, and the toil of the day in searcely permitted to be forgorten in the repoke of night-how imthe heel of the morrow, and the toil of the day in searcely permitted to be forgorten in the repoke of night-how inthe heel of the morrow, and the toil of the day in searcely permitted to be forgorten in the repoke of night-how inthe heel of the morrow, and the toil of the day in searcely permitted to be forgorten in the repoke of night-how inthe heel of the morrow, and the toil of the day in searcely permitted to be forgorten in the repoke of night-how inthe seciety of which they are units, that dering the permitted the society of which they are units, these wasch. The strend by sheep, the stmosphere they are insecually breathing should be in as parsa sondition, or, in other wasch as free from mechanical admixture, as possible ; how important is it, I repeat, that presend to sciety to locate theseselves beyond the rench (at least they think sol of nuclarous return and sould. May they be wared in time? They more and sould. May they be wared in time? They more is weaking, until the shadows, generally dimly outlined in the distance, have skiden as the disinternand, by May & A. WALKER, Digitized by GOOGS and the tork of the start.

attempted to move him by main force, but not succeeding in that, he immediately drew a pistol, and threatened to'shoot him. Nothing dounted, the keeper replied, "Shoot away!" and a slight scuffle at once ensued; but, happily, the pistol was not discharged. Just as this was ended, Lord Clinton, one of the directors of the company, and Mr. Grindley, their London solicitor, came up, and the latter gentleman read a paper purporting to be a permission from Lord Harborough to the railway company to survey. This, however, had no effect upon the tenants and retainers of Lord Harborough. The whole party then moved off. Biddle applied to the nearest magistrate for a warrant against the surveyor, who had threatened to shoot him, which was granted; and the delinquent (a Mr. Charles Frow, of Thorpe, in Lincolnshire) was apprehended in Melton, and shut up in the county prison from Saturday to Monday, when the case was heard before the Rev. G. E. Gillett, of Waltham. Mr. Gillett said he should send the case to the assizes, and should require the defendant to find sureties for his appearance, himself in 100%, and two sureties in 50%. each.

At the petty sessions at Ashendon last week, four charges were preferred against two surveyors and their assistants, at the instance of the Duke of Buckingham. The surveyors and labourers employed in making surveys for the South and Midlands Raffway were charged with committing damages on a farm at Westcott, the property of the duke, and in the occupation of George Homan. One was charged with breaking a fence, and damaging it to the amount of one penny. Another with choppring up a fence, and damaging it to the amount of sizpence. Others with having each comimitted damage to the amount of twopence. They were all fined.

Before daylight, as the keepers on the estates about Osberton were on the watch, they white surprised by the strange vision of divers wandering lights. This was thought to be something in the way of poaching, and, prometry upon the intruders, they found them armed, not with snickle, drag-net, or air-gun, but with brass tubes, long poles and chains, the lights proceeding from divers bull's-eye länterns. Each party prepared for action, the intruders their long poles with a flag at one end and pointed with iron at the other, like so many foot-lancers. The keepers, finding the number of the enemy on the increase, best a retreat, and left the fields unmelested to the fos, who proved to be the surveyors for sume line of railway projected between Linonia and Retford, which Mr. Foljambe had refused permission to be surveyed by day, and of which they were making a stolen survey at might.

Cases of determined opposition, and some of them accompanied by violence, have also occurred at Appleton, about eight miles from York, at Gienfalloch, in Scotland, and at Hammersmith, near London. At Lincoln a rues was resorted to for getting surveys across the property of a refractory landowner. A surveyer held him in parley whilst his assistants performed their work, and then coolly told him his refueal was of no consequence, as the accessary survey was completed. We might fill soveral pages with similar notes.

Br. MARY'S CHURCH, AT BEVERELY.—A Social paper says that the restorations of this fine edifice are progressing satisfactorily, and the work already executed is done in a substantifal manner. A barrel drain of sufficient dimensions has been laid at a considerable depth round the church, which proves very afficient in keeping not only the theor of the nawe and chancel, but the whole building perfectly dry. The flagged area and parapet wall, and the approaches to the five entrances, are finished. The foundations of the fabric have heren carefully examined, and the basements of the buttressee, the walls, and their respective weather mouldings, repaired and restored to a considerable height ; so that the stability of the structure may so far now be considered as secure as when first erected. The interior of the crypt is being proceeded with, and what has fur ages seemed only a miserable-looking callar, choked up with accumulations of soil, and hence and debris uf every kind, already astance a handsome appearance.

FOREIGN ARCHITECTURAL AND COL-LATERAL INTELLIGENCE.

The Netwoork of French Learned and other Instructional Societies. - The Secretary of State for Public Instruction, Mr. Salvandy, has sent a circular to all the above establishments, calling upon them to furnish him with data of their origin, scope, exertions, means and income, charter of enrolment, laws, and regulations, &c., for compiling therefrom an "Annuary of all French Learned and In-structional Societies," to be published regularly every twelvemonth at the expense of Govern-ment (!) This work will astonish the world, ment (!) This work will astonish the world as it will shew the vast number of such establishments scattered over the whole of the country. It has been before the intention of Mr. Sulvandy to combine and connect all the societies with the French Institute, whereby, without a meddling or impeding interference, their exertions might be combined and centralised. In connection with this plan, was another, entertained by the corporation of the City of Paris-viz., to provide all the in-structional societies of the metropolis with one common building, for their collections, meet ings, exhibitions, &c.--[At a moment when societies and collections of national antiquities, Sc. are everywhere springing up or projected in this country—the idea of an annuary of Bri-tish instructional societies might be enter-tained, and a comparison with that of our neighbours lead to beneficial results on either side.]

Government Literory Works in France.— Our readers will perceive, from the list of foreign works, how many are published "by order and expense of Government"—others appear under the patronage of the Secretary of State for Public Works; all which, it is almost needless to observe, does scarcely ever take place in this country. But even works, which are printed quite as a private enterprise, are patronized in several ways in France and Belgium, unknown, hitherto, with us. *Individual* subscriptions by the sovereign, as such, take place, as a matter of course, in every monarchic country; but the next step takes, in France, is a subscription "pour les bibliothéques du Roi," and this amounts to ten or twelve copies. Next comes, then, the subscription "pour les bibliothèques publiques," made by order of the Secretary of State of Public Works, or any other to which the publication may more immediately refer, by which, a thus patronized work gets officially spread over the whole of France, in all the universities, colleges, and other superior schools.

Milan. Atelier of the Sulptor Marchesi. Large Burial-ground "extra muros." — Exalled patronage of arts is not only benefical in itself, but also by the example it sets before others. The King of Sardinia has done so much of late for art, that the Italians call him another "Re di Baviera." H. M. has chiefly bestowed his patronage on the sculptor Marchesi, whose atelier is one of extreme interest even with those who had seen the extensive art-workshops of Schwanthaler and Thorwaldsen. It is filled with his own sketches, studies, and models, besides the drawings, pictures, and models of other artists, all which is enhanced by the splendid and costly material in which he executes his works-buge solid blocks of Carrara marble. The style of Marchesi is chiefly formed after that of Canova, and therefore, greatly coincides with modern Italian taste, while it may less tally with that of the other European nations, who have identified themselves rather with the bold and eccentric way of Thorwaldsen. Marchesi has even gone beyond Canova, in adhering to a feminine and meck style of sculpture. He is executing now three most sculpture. He is executing now three most extensive works—some monuments for the late Emperor of Austria; and then nine colossal statues of Carrara marble; a great religious art-work destined for the new church of St. Carlo Boromeo at Milan. The first group of three figures, represents *Religion* with cross in its left-the next a mother with several children, one kissing the feet of the Saviour, personify-ing Love—the last, a blind man led by two virgins, Hope. The pedestal, also in marble, virgins, Hope. The pedestal, also in marble, will be adorned with profuse flower-garlands, equalling the finest works of the Netherland school. The church will be a *Rotonda* in the Roman style, with high cupols, a deep choir, and half round sisles. Another vast structure, executed by Mr. Aluisetit, is a Campo Santo, at

the expanse of the town-corporation of Milia. As the population of that city nears now 180,000 souls, the necessity for a huge burial ground has been deeply felt, and three millions of frances are reserved for that putpose. Besides the open burial-ground, edcompassed by a high railing, there will be a great number of sepulchral vaults and sepulohral chapels, to meet the wishes and means of the different ranks of society—a large church, a sepulture of honour or pantheon, for deserving citizess, and an open colonnade all around. The style of these buildings will be the ancient Greek or Roman. All this, however, is marred by a separation and repartition of the four corners of the cemetery—destined each for the burial of persons who have committed suicide, Protestants, Jews, and children who died unbaptized.— Allgemeine Zeitung.

Destruction of Antiquities in the Roman States.—The important architectural mondments of the eld volsean eity of Cora-great and reasowned long before the founding of Rome-are no more. Numerous ruins of different epochs, especially the cyclopean walls (contemporaneous with those of Micone), bespoke its greatness even in the Roman tilsés. Those beautiful architectural fragments on the Piazza before Sta. Maria della Piati-tas well as most of the inscriptions; "life-size marble figures, the polygons of the cyclopein walls of the city and castle, have all been dystroyed of late in various ways, for hurning lime, &c. Only the stupendous slabs of rock -15 to 20 feet long-have not been distarbed. The Commission for the Preservation of Antiquities at Rome, does not seem to exert Helf very actively.—Allgomeine Beitung.

WORKS IN THE PROVINCES.

SURVEVORS have lately been busily engaged in measuring the ground for the site of a new college at Galway. It is to be at the rear of the present college or school of Erasmus Smith's foundation, and to extend access to Bohermore. It will occupy a space of about eight access and will be principally built of eight acres, and will be principally hull on the ground of M. J. Blake, Eeq., M. P., a field occupied by Henry Comerford, Esq. Sir Watkin Williams Wynn, Bart, has given 2007, to build national schools at Ruabon. Nasmyth's pile-driving machine has just com-pleted the task of driving the piles for the gigantic coffer-dams in connection with the new dock about to be constructed at Devom-port for the steam navy. The coffer-dam is 1,650 feet in length by 20 feet wide, composed of three rows of piles driven as close together as possible; in the wat number driven by the steam pile-driver not one was split. The very last duty the machine had to perform was to complete the driving of some piles which were driven by the ordinary means as far as such could possibly drive them; these the steam pile-driver sent down to further deputs, varying from three to ten feet, praving thereby the superior driving power of the steam, over the superior driving power of the steam, over the ordinary machine. — A Gas Company has been formed at Sheffield, for the purpose of constructing additional gas warks at Grimsby: ospital 10,000L, in shares of 10A each, sup-ported by Lord Worsley and a wealthy com-mittee. — A company is in the source of formation for the coastruction of wet doelse on an extensive scale at Lynn, in Norfolk. Mr. Rendel is the engineer. With the view of improving the port of Colchester, so as to allow vessals of from 300 to 450 tons. burden to reach the Hythe, the following works are in contemplation : to make a new cut from Rowhedge to Stake Reach, on the west side; the point as the Wivenhoe side of the river to be taken off, and the river to be made more navigable to Wivenhoe; the shallow part of the river below Wivenhoe to be deepened; from the termination of the new cut, at Stake Reach to the Hythe, the river to be widened and deepened; to make new quay walls on both sides of the Hythe, and about 60 feet to be added to the river from the eastern side be added to the river from the eastern side (Mr. Hawkins' premises), so as to form a dock or basin for vessals; to place, locks near Rowhedge, so as to form a floating basis or essal from thence to the Hythe bridge. The cost is roughly estimated at 50,000. The projected Argyll canel is to be provided with leeks, or rather tide-gates, 56 feet wide, 259

THE BUILDER. THE BUILDER.

feet long, and 18 feet deep, in view tides, and the rest of the canal in proportion, thus allow-ing the largest steam-boats to pass through with ease, and avoiding the error which has been hitherto committed in all Scotch canals, that of making them so small, that none but yessels of small size can enter them, or The Kingston Cotton Mill Company, at Hull, have entered into contrasts for the building of one immenso mill, 167 yards long, 28 yards wide, and 4 stories, high, . This building will form one side of a square, and it is intended to add two others of preasely the mana dimensions. The site comprehends, shout twelve statute seres, and is within a mile of the town. Upwards of 2,000 tons of casting svill be requir for this one mill alone.' Messra lames Lillie sppointed a committee to consider of the best means of improving the river communication between that rivy and Great Yarmouth, so as to make it navigable for sea-borne vessels. The committee are empowered to adopt all requisite measures to ensure the passing of an Aet, nin acondance with the shore object, and some excavations have been made under the direction of Dr. Bromet, All that has wet, been made out is a hypocaust and a bath. These remains are distant about a mile and a half from the palace of the Bishop of Oxford, at Cuddeston; his lordship has taken much interest in the excavations, and has requested Dr. Buckland to superintend the continuance of them. RAILWAY JOTTINGS.

21

. r 5

THE rush to the Board of Trade on Sunday last to deposit plans, had in it something ludi crous : divers were the disasters that ensued. The great Western Railway was traversed all day long by special trains bearing these precious deposits. One serious collision took place, ising at Brentwood, upon the Bestern Countles Line; the designs, it is sold, combine stilly with good state, ---- Mr. Myhne's and Mr. Oampbell's portions of the North British Railway have just met at Dunbar, and the line for a distance of several miles may be said to be finished. ", The station office is now in course of construction, when it is said to be the intention of the Great.Western to apply for parliamentary powers to carry a new line to Birmingham on the broad gauge, and that the London and Eastern Counties Line at Stratford, on a site of ground known as Berkina's Field, and op-possie, to, the present station. The building will be one of some magnitude, and capable of affording graater facilities for increasing the of shorting grades fact theory increasing the prefix on that line, of railway......A calcula-tion has been going the round of the pro-virial press and originating in the Railway withentack, shewing that of thirty-eight of our leading will ways specified, four pay a dividend an their capital of 10 per cent. One pays a dividend of 9 per cent. Five pay a dividend of 8 per cent. One pays a dividend of 7 per cent. Five pay a dividend of 6 per cent. Seven pay a dividend of 5 per cent., and fifteen pay less than 5 per cent. Sir Wilfifteen pay less than 5 per cent.----Sir Wil-loughby Gordon, the Quarter Master General of the Forces, in his late examination before the Gauge Commissioners, stated that the effect of the rapidity of railways was such that there was as much efficiency with a small army as was formerly the one with /as hrgs one. Ge-neral Burgoyne in his evidence before the same commissioners shid, "with regard to the "dvastages of rakways" in a military point of view, I may be permitted to observe, that acting on the defensive against an invading enemy, we should have the use of them to the list. They would be of no use to the enemy, because they would have neither locomotive engines nor carriages to put on them. In the old warfare it was a great object to get pos-

senion of a rost of common mention, which was equally available for either party. It is quite a different thing in the case of railways. I do not consider it recommends do not consider it necessary, with the modern system of railways, to have troops stationed along the coast. The great reserves would be stationed in the interior." Such results must be made of the expense of erecting an electric telegraph to communicate from the terminus at Shoreditch to Norwich and Yarmouth. At present there is no intention of extending the same benefit along the line to Colchester. The junction between Stratford and the Thames will be opened in a short time, and will connect Blackwall, Cambridge, and Colchester. It verges off near the Stratford station and passes through several meadows to the edge of Bow Creek, which has been dammed in along the banks. The directors of the Eastern Counties have announced, that from the present time they are willing to issue yearly and half yearly tickets for the convenience of residents upon the line. The terms for an annual ticket, the whole distance from London to Colchester, first class carriage, is fixed at 63/., the minimum charge is 10%, which confers a second class yearly ticket from London to Ilford.

Correspondence.

VENTILATION.

SIR,—There is a long letter in your paper of 15th November, on the subject of Ventilation, which tells of a plan of ventilation of a large public building containing about 300 persons, many of whom were afflicted with fever and small-pox, that the system adopted by "an obscure country individual" was so successful, that six years have since elapsed without one case of fever or small-pox occur-ing. Allow me to ask "A Working Brick-layer." what is the nature of the plan? which

at present appears somewhat doubtful. I have adopted with success, a simple plan vis., having at the top of each window out-aide, a double blind, with a rebate about 2 inch distant in the frame filled with fine perforated zinc plate, the fiber gauge inside, and the window-sash regulated by a bolt with holes at distances, so that it can be let down to any degree of opening, allowing the air to pass through numberless small appertures; the inner gauge being kept warm by the heat of the room, causes a degree of warmth to be im-parted to the fresh air, and therefore no inconvenience arises. We know that in a tropical climate, the continued heat would be intoler-able if it were not from a constant breeze blowing, so that in the finest weather the wind absolutely whistles through the blinds on the windward side of the houses, and it is this incoseant change of air that makes it durable and even pleasant, but even then it is not advisable to sit or stand in the draught. I can therefore readily understand how persons must suffer in the Central Criminal Court, who are obliged by their duties to bear the draught of either hot or cold air. It should be more broken and diffused, and I think the plan I an effect. I am, Sir, &c. 55, Parliament-street, T. B. LAWRENCE.

Westminster, 27th Nov., 1845.

CABINETS D'AISANCE.

Stu,--In your paper of November 28th, is a letter on this subject, which is one of the utmost importance to the health and comfort of every one who resides in or visits London, and is imperatively urged on the authorities by the additional claim of decency. Public erections for this purpose would be expensive and offensive.

In most streets or lanes leading out of the great thoroughfares, are premises which by a small expenditure, may be adapted for these purposes; the rent to be paid by the sewer rates; to be distinguished by some inoffensive mark, and under the direction of the police.

-----....

WANSTEAD PARK, once the celebrated seat of the Earl of Mornington, is now converted into a brick-field. When the whole of the brick earth is exhausted, the site will be covered with villas. Aliscellanea.

BAD VENTILATION OF PLACES OF WOR-BAD VENTILATION OF PLACES OF W.98, SHIP.—Churches and chapels, though mora lofty than schools, are usually less in area, in proportion to the numbers frequenting them; and though in most cases they are occupied for fewer hours in the week, they seldom profit by much pains taken to change the air, whils; they are unoccupied. "In regard to churches," says a medical witness, "many illnesses and deaths proceed from faults of ventilation and warming; from the rush of cold air in one place on those who sit near the duors and windows, and the want of fresh air in other windows, and the want of fresh air in other places." And if such be the case with the congregation, in a building often of the most costly character, wherein a trifling expense would permanently secure abundant ventilation what must be the injury sustained by the preacher in the pilpit? Placed on a height at which his voice acts at a disadvantage, as if on purpose that he may breathe an atmosphere composed of the breath of all who sit beneath composed of the breath of all who sit beneath him on the floor, he has to exert his lungs to the utmost pitch, while they have the worst of the air to work with. And the more promis-ing his talents, the more successful his exer; tions in interesting and edifying a militude of hearers, so much the sconer is he likely to be consigned to silence, consumption, and the prese Still more nitible if meetile is the grave. Still more pitiable, if possible, is the lot of Sunday school children, whom moderu architects, and committees and commissioners, are apt to place in the recesses of a lofty root. Above the vent afforded by the windows, and with rarely any ventilation in the ceiling, they have the foul air of the whole building in a sort of halo round their heads. And there, when they can scarcely see the minister, much less hear him with parhear little commission less hear bim, with perhaps little convenience for sitting, and none for kneeling, and with their attention previously exhausted in school, they are required, under penalty of chastise-ment, to keep still, and silent, and awake, and in an atmosphere which of itself is quite enough to produce in a grown person, much more is a child, inattention, restlessness, and drowsi-ness. To say no more of the unbashhiness of a position such as this, I cannot refrain from expressing my apprehension that there must be hundreds of thousands in the land, who have bence conceived a deep and lasting aversion to the house of prayer. — The Unhealthy Condition of Dwellings, Sc., by the Rector of Alderlay.

w EARLY PAINTED DECORATIONS.learn from the Gloucester, Chromicle that some curious remains of the early art of painting; as practised in England, have been lately brought to view, at Southerop, in Gloucestarshirs. The chancel of the parish church, of the Anglo-Norman era, requiring restoration, on removing the accumulated coatings of whitewash from the walls, it was discovered that it had been at one time a perfect gallery of acrip-tural and other subjects, not the smallest por-tion, from the root to the floor, having been left unadorned. Most of these quaint designs were too far advanced in decay to be deciphered; but the Nativity, the Annunciation, and the Decapitation of St. John the Baptist, are still apparent, and shew that the recluse and devout designers possessed all then known of art, as well as all the learning of the time. A remarkable device for the decaration of a sacred edifice remains in one of the deep recesses of the lancet-shaped windows; it is the figure of a youth, in a red tunic, shooting an arrow at a red squirrel in a bright yellow tree, the bow held in the right hand. The costume of this figure seems to make the date some-where about the middle of the fourteenth century-five hundred years since.

THE ELECTRIC TELEGRAPH IN AMERICAN THE ELECTRIC TELEGEAPH IN AMERICA. ---We understand that an attempt to lay a pipe across the East River, at New York, for ease-veying the wires of the Electric Telegraph, has been completely successful; this pipe is of lead, in one continuous piece, helf a mike long, weighing 6,000lbs., and without a joint--per-fectly air-tight---and was securely laid across the river from a steam boat, engaged for the purpose, after considerable labour and diff-culty; in the pipe are four conservations culty; in the pipe are four copper wires, perfectly isolated, to safely, transmit the mag-netico-electric fluid. The whole was executed under the direction of Mr. 8. Colt, engineer, and the pipe was constructed by Messra. Tatham Brothers and Co.-Mining Journal.

NEW APPLICATION OF IRON DROSS .-French mechanic formed the idea that by subjecting iron drops to the slow cooling process which is known to produce a total change in the nature of glass, a new and useful species of stone might be obtained : and as iron dross, such as the large furnaces yield, is a wholly useless substance, the announced successful result of his preserving attempts cannot but be matter of great interest, more especially at the present time, when the smelting furnaces of England are in a hitherto unknown state of activity. The object which the Frenchman sought to accomplish was, to impart to iron-dross the compactness and hardness of granite, and at the same time to save the cost and habour which the hewing of the real stone requires. To this end he contrived to let the iron refuse, while in a fluid state, run into iron forms, which were previously brought to a red heat by being placed so as to receive the superfluous flame which issues from the mouth of the formace; and in order to insure the slow cooling, these forms are provided with double sides, between which sand is introduced, which is well known to be a bad conductor of heat; is well known to be a bad conductor of heat; the whole is then brought again to a glow heat, and in like manner again cooled off. By this procedure, it is asserted, the discoverer has suc-teeded in forming paving-stones, flags, large building-blocks and even pipes of any given form of a degree of hardness and polish equal; to the best hewn natural granite, and at the most triffing conceivable cost.

RAILWAY TERMINI IN LONDON.--Here-path laughs at the notion of having only one terminus in the heart of London for all the railways? How many streets would it require for exit and entry? What size must the terminus be? And how would it be possible for the inhabitants to pass and repass those streets without numerous and fearful accidents, par-ticularly at such times as Greenwich fair, Easter, Whitsuntide, &c.? At Derby the station is 40 scree area, and only three lines of railway run into it. The London and Bir-mingham, Great Western, and South Western Metropolitan termini together, we apprehend, considerably exceed that. Then there is the Eastern Counties, and Northern and Eastern, the Blackwall, the Greenwich with its milthe Blackwall, the Greenwich with its mil-lions, the Dover, Brighton, and a host of new schemes, coming into London. What space is it possible would be large enough for all these? Where in London is it to be got: and what would it cost if it could be got? Would 100 or 150 acres be sufficient? Comparatively speaking, London would have to be swept BARRY UCTSUS SOANE. — A writer in the

Athenæum, in an article on architectural mutations, says, relative to the alteration of Soane's Board of Trade, at Whitehall : -- " The front is already completely dismantled, and stripped of all its columns and stonework, which is almost enough to bring Sir John from his "domus ceterna' to protest against the auda-cious sacrilege, although Mr. Barry is not treating his work only as he himself did that of his brother knight, Sir Robert Taylor at the or no brother knight, Sir Robert Taylor at the Bank of England. Still Mr. Barry might be content with devouring as much of poor old Soane as he had already got, his Law Courts (on which he prided himself so much), and his Scala Regia, and Royal Gallery at the House of Lords, all of which, after escaping the con-flagration and the fate of perishing, like Se-mele, in a glorious blaze, will soon be destroyed more ignominiously by the rude and ruthless more ignominiously by the rude and ruthless hands of workmen. Truly Mr. Barry seems bent upon exterminating Soanean architecture altogether, at least as much of it as he possibly can; nor, we dare say, would he at all scruple to demolish the 'domus æterna' itself.

New AND ECONOMIC MODE OF GENE-BATINO STEAM.—A French engineer, M. Leonard, now in London, has discovered an exceedingly simple means of curtailing the quantity of coal hitherto required in the generation of steam. His principle, for which he has taken out a patent, is that of putting whale er other fish oil into the boiler, unnixed, or with more or less water. When the oil is at a temperature producing steam, water is thrown in, and steam is produced as fast as required by the machine, without the oil passing off in vapour, or decomposing. Various experi-ments have been made, and the saving in fuel is stated at from 40 to 50 per cent.

SPAPIELDS BURIAL GROUND. - Towards the close of last week, Mr. Bramhall the barrister who had been appointed arbitrater by the court of Queen's Bench, to decide upon the proper steps to be taken with respect to this Plague-spot in the metropolis, sat for the first time at Fendall's Hotel, Palace Yard. After a short conversation, the proceedings were postponed for a week to allow of an examina-tion of the grave-yard being made by a chemist and surgeon to be appointed by the arbitrator.

MONUMENT TO THE REV. DR. WATTS MONUMENT TO THE REV. DR. WATES.— The inauguration of a cenotaph to the memory of the late Dr. Watts, author of the well known "hymns," took place last week at the Albany Park Cemetery. It consists of a full-length figure of Dr. Watts, in his ecclesiastical contume nine feet in height, standing on a costume, nine feet in height, standing on a pedestal of Portland stone, thirteen feet high and six feet square. In his left hand he is represented holding a book, and two others are upon the seat on his right side. It stands about the centre of the grounds.

NEW HOSPITAL AT GREENOCK .- The late Sir Gabriel Wood, whose demise took place in London a few days ago, has given in charge of appointed executors, the princely sum of 80,000%, to be expended in the erection and maintenance of an hospital in Greenock, for the reception of the aged, infirm, and disabled seamen of that port.

Cenber.

For building stabling for 100 horses, omnibus sheds, and other works, at Upper Holloway, Mr. J. Wagstaff, architect.

REDUCTION IN THE PRICE OF BUNNETT' AND CORPE'S PATENT REVOLVING IRON SHUTTERS.

BUNNETT AND CORPE'S PATENT REVOLVING IBON SHUTTERS. THE validity of this Patent being com-pletely established, the Fatentee have much pleasure in stating that the very extensive domaind, and the employ-ment of improved machinery in the meanufasture, have given them an opportunity (of which they gratefully avail them-selves) of making a considerable reduction in the price of this well-improved machinery in the meanufasture, have given the cheapest as well as the best iron shutters in use. Every improvement suggested by practical skill and most exten-sive application this been adopted, and as affortive RE-VOLVING IEON SHUTTER can be constructed without infining B. and C.'s patent. These shutters can be ap-plied horisontally, either above or below the window, or vertically, as introduced by BUNNETT and CORFE, in some of the largest establishments : they are made with best as corrugated laths, if sequired. BUNNETT and CORFE also manufacture REVOLVING WOOD SHUTTERS, with their patent raising machinery, or withocut which no abutters can be suff or durable. BUNNETT and CORFE are likewise Patentees and Manufacturers of METALLIC SASH-BARS, MOULD-INGS, &c. . IN BRASS, COPFER, OR ZINC, FOR SHOP FRONTS, WINDOWS, SEYLIGHTS, AND VARIOUS OTHER PURPOSES. Shop Fronts fitted in a superior manner with Iron Shutters, Patent Basse or Zime Stables, Metaled Engraved Stall Board Plates, best Plate Glass, and intermed Bases Fittings of all kinds, es the most advantageous terms. Es-timates given and contracts taken in Town or Country--All kinds of metal works ensecuted to say design. Metal Draw-ing, Acling, and Stamping for the Trade. OFFICE, 36, LOMBARD-STREET, LONDON. WORKS, at DEPT-FORD, KENT.

The attention of Architects, Builders, Blind Makers, and the Trade generally, is particularly requested to the IMPORTANT Patented IMPROVEMENTS in the above enumerated Arti-cles, and inspection invited, at the Manufactory of the Patentees, R. HOWARD and Co., 115, Old Street, Londen; or at the Licen-

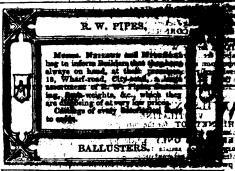

Engravings and Prospectuses may be had at the shove ad-dress, or will be forwarded on application.

The great importance of STRENGTH and STIFFNESS in the Laths of REVOLTING LEADS INTTERS, when required for SECURITY, is so obvious, that it is only necessary to point out the fact that the PATENT CONVEX LATHS ARE 12 TIMES STRENGER THAN THE OADDINARY FLAT. LATHS (as shown by the engravings and prospectus), to ensure their general adoption.

SATURDAY, DECEMBER 13, 1845.

HE announcement of the proposed revision of the Buildings Act, has brought us a flood of letters complaining of its operation. With some trifling exceptions, however,

the cases set forth relate to the administration of it rather than to the Act itself, and several of the letters apply wholly to the proceedings of one or two district surveyors only.

We are never willing to find fault, and would at any time step a little way out of the path of strict duty, to avoid hurting the feelings of a professional brother. Our object in alluding to one or two instances of unwise conduct on the part of district surveyors, at the present moment, is to induce those who are deputed to see the Act carried out, to " do their spiriting gently," and not by an avaricious grasping after fees, to increase still further the feeling of disapprobation which has been engendered. If they would consider for a moment, as we well know a large number of the body do, that they hold their office for the protection of the public, and not for their own personal advantage, their course of action would often be different from what it is. The Act is not put into an officer's hands simply that he may find occasions to demand a fee, but that he may see its provisions for the general good (often opposed to private interests), honestly carried out; provision is made in it to pay him fairly for all he does, but any thing beyond this he ought not to look for; and what is more, must not. To return to the letters before us.

The first we take up reproaches us in strong terms, for omitting to draw attention to an information laid by Mr. C. R. Badger against Mr. Barnee, for having "made certain additions to projections " from a house situate on a plot of back-ground in the Lewisham-road, contrary to the Act. Mr. Barnes shewed that the works complained of were commenced before the first of January last. Truth to say, the award of the referees on this matter was before us (every award comes before us), but having had occasion to comment on the proceedings of this gentleman, of " Lamb and Lion " notoriety, some time ago, we were led to delay noticing it, Suffice it to mention, the referees decided there was no ground for bringing the case before them, and marked their sense of the proceeding by making Mr. Badger pay the costs, 4/. 11s. 4d.

۲,

Another correspondent, in connection with the same neighbourhood, writes as follows :--

"6, Bath-terrace, Horsemonger-lane, Borough, Dec. 4, 1845.

Sis,—A friend of mine, a keeper of liverystables on Blackheath, has had a sign-board (about 5 feet by 3 feet, and 1 inch thick), fixed against the front of his stables, with four iron holdfasts driven into the joints of the brickwork; for doing which, the district surveyor made a claim of 30s. My friend hesitated to pay him, after which he reduced the amount of his claim to 10s., which was paid, and a receipt given for the amount. I shall feel obliged by your informing me, through your excellent journal, if the demand made by the surveyor was in accordance with the Buildings Act.—I am, Sir, &c.,

NICHOLAS METHEBELL."

THE - BUILDER. Now, this exorbitant demand was not only unwise, but, as it seems to ns, perfectly unjustifiable. It is such conduct as this, on the part of a very few individuals, which is bringing the whole body, most undeservedly, into disrepute. The Act sets forth the height at which signs or notice-boards must be fixed, and involves the necessity of sending notice to the district-surveyor before putting up such, that he may see the directions are complied with; but for a service like this, a merely nominal fee, if any, should be taken. For the inspection and removal of projections, which

involves writing notice, &c., the Act allows the surveyor to demand 10s. For such services as that alluded to by Mr. Metherell, or for seeing, for example, that a chimney-pot above 4 feet high is properly fixed, half-a-crown would be ample. This might easily be put on a proper footing by the referees.

A few days ago, Mr. Geo. Porter, the surveyor for the district of Newington, summoned Mr. John Wilson, builder, of Southwark, before a magistrate, for having neglected to give him notice of having begun to resume operations in the building of certain dwelling-houses, after suspending the progress of such building for three calendar months, for which omission he was liable, under the provisions of the Act, to a penalty of 20%.

It appeared that, in the latter end of the year 1844, the defendant, Mr. Wilson, gave the necessary notices to Mr. Porter for the erection of five dwelling-houses in the front of Pownall-terrace, in the Kennington-road, and, in order to avoid the provisions of the new Act, had formed a foundation, and laid down a certain quantity of brickwork, before the new Act actually came into force. Mr. Porter. conceiving that the building was not in such a state, when the new Act came into force, as to take it out of its provisions, the matter was submitted to the official referees, who made an award in his favour. Instead, however, of following up the award of the referees, Mr. Porter thought proper to proceed against Mr. Wilson under that clause of the Act by which a builder is required, where the operation of a building is suspended for three calendar months, to give notice to the surveyor of his intention to recommence the building, as if he were about to commence a new building. Mr. Wilson, considering the building to be under the operation of the old, and not the new Act, hed neglected to give this notice. The summones was ultimately dismissed on a technical objection.

It seems to us, with all deference to Mr. Porter, that this mode of proceeding carried an arbitrary aspect. It could hardly be expected that the builder, while contending that the work did not come under the provisions of the new Act, would give a notice admitting its control. The course taken by Mr. Porter we are compelled to place in the list of those we have termed unwise.

Those correspondents who complain of district surveyors for objecting to materials or workmanship, must not expect the slightest sympathy from us without the fullest proof that the objections were captious. On this head, and indeed in all cases where the interests of the public,—the actual purposes of the Act, are really concerned, the district surveyors will no where find more strenuous support than in the pages of THE BUILDER. The office is a responsible one. It is not a sinecure,—a quiet provision for life in acknowledgment of the merit of the holder, as some of the new surveyors really seem to think it. The money they are to receive, is for services rendered,

and should they fail to perform those services disgrace will follow. The recent fall of three houses in Cavendish-place, Wandsworth-road, and its fatal results, with two or three similar disasters, particulars of which are now before us, and which are said to reflect in some degree on the district surveyors, may serve to illustrate this assertion. Still we do not allude to these particular accidents with any view of imputing blame, our information is at present insufficient, but merely to shew the responsibility of the office, and to induce a proper consideration for it on the part of the public, when duly discharged.

We may mention, relative to the revision of the Act, that several committees have been appointed out of doors to consider the subject. A committee of the vestry of St. Marylebone met at the court-house last week; Mr. H. Biers in the chair. They were attended by Mr. John White, the district surveyor of the parish, and Mr. Scace, the parochial surveyor, and having gone through, and commented upon various matters requiring revision, adjourned for the purpose of preparing a report, to be brought up to the vestry on an early day.

THE RESTORATION OF THE PARTHENON AT THE BRITISH MUSEUM.

THE model of the Parthenon, restored by Mr. R. C. Lucas, to which we alluded some months ago, is now completed, and has been recently purchased by the trustees of the British Museum for public exhibition in the Elgin room. It is on a large scale, being about nine feet in length, by six in width. The structure of the temple is executed chiefly in wood, the sculptures are modelled in a kind of wax. It is placed upon a lofty basement, so that the pediment is sufficiently above the eye to convey something like an idea of the perspective in which the original was viewed. The figures and groups are all modelled with the greatest care, either from the torsoes brought by Lord Elgin from Greece, or still remaining there, or the drawings of Carrey made before the partial destruction of the Parthenon in 1687; those portions of the original design which have irretrievably pérished, have been supplied by the promptings of Mr. Lucas's own powers of invention, aided by a most careful study of all that the extant remains of ancient art, and the research and sagacity of modern archæology, could furnish, by way of authority and illustration. These divers materials have been combined with extraordinary industry, ingenuity, and judgment by Mr. Lucas, and with the happiest result. The impression produced by the restored model, small as its scale is, is novel and imposing. A new world of art seems disclosed to us. For the first time we behold the true character of Greek architecture.

In northern climates and modern times, the Doric order has never really engaged our sympathies; its cold, normal beauty of structure has been authoritatively proclaimed the standard of faultless simplicity, and admired as such, but the untenanted pediments, and empty metopes impart to the mind an impression of cheerless and desolate monotony; all who felt thus, unconsciously recognized the truth, that such Doric architecture is a mere lifeless thing, a body from which the spirit which once animated it had left. When we look at the model of the Parthenon, all seems instinct with vitality.

The pediments are filled with majestic forms, so arranged, as, out of the utmost variety of attitude and grouping, to produce one great harmonious composition. Along the sides of the temple, standing out like jewels on a diadem, are the metopes; each presents an allusion to the mythic and primeval period of Athenian history, a passage, as it were, from a great national epic; some exploit of Pallas, of the deities of the soil, or of Theseus or other Athenian heroes; some sacred religious ceremony; or as in the metopes brought over by Lord Elgin, a great contest like that of the Centaurs and Lapithæ, Digitized by

BUILDER. THE õ¥ö. THE TBUILDER. the people who had assembled area 594

is told in a succession of metopes, each a complete picture framed in its triglyphs, stand-ing out like the single combats which are suc-cessively presented to the eye in the battles in the Hiad, detached from the main action ; in the metopes, as in the description, from the infinite variety of movement and grouping, there is no monotony in the iteration of subject.

If we turn our eye from the bold projection of the metopes to the interior of the peristyle, we then behold, by a more subdued light and in a slighter relief, the matchless frieze. If in a slighter relief, the matchless frieze. If in the pediments we see the perfect beauty of divine forms as created by the hand of Phidias, if the metopes represent that second mythic period, the heroic age, so in the frieze do we see revealed to us the actual life of antiquity. The people among whom Phidias lived stand before us in bodily presence, as every five years in the most sacred festival of their city they moved in solemn array to the temple of their tutelary goddess. The procession of this frieze, from its continuity and the nature of its subject, is more studied and better underits subject, is more studied and better under-stood by the public than the rest of the sculp-tures in the Elgin room, but Mr. Lucas has done good service by showing in his model its relation to the metopes, and the consequent difference in the depth of its relief, to suit the diminished quantity of light. See some excellent remarks on this subject in the "Penny Cyclopædia," Basso relievo. We have glanced Syclopædia, Bassorelievo. We have gianced at a few chief features in Mr. Lucas's model, rather by way of invitation to the public to examine it for themselves, than as an accurate account of it. Our limits will not here permit us to do justice to a work the result of so much enterprize, judgment, research, and artistic power.

Nothing but the most resolute will and earn-est study of the antique would have enabled Mr. Lucas to deal with the many difficult questions which this question involved; to ascertain the original motive of the pedimental compositions, it was necessary for him to examine and compare the arguments of the dif-ferent writers on the mythology of the Par-thenon-arguments full of learned allusion, written mostly in foreign languages, and ap-pealing to habits of thought novel to the Eng-lish mind. With infinite tact, Mr. Lucas has is mind. With infinite fact, Mr. Licas has selected out of conflicting elements all the material most useful for his purpose; he has deferred to received authority, embodied sug-gestion, and, where conflicting theories were irreconcileable, he has with æsthetic acumen cut the Gordian knot of controversy, and relogies of design as an artist only can perceive. We regret that we can de stored the composition according to such anae regret that we can do no more than mention the chryselephantine of the Virgin God-dess, who stands all glorious within the cella, arrayed with a gorgeousness that would have tempted the cupidity of the temple-robbing monarch, Dionysius of Syracuse; nor can we enter upon the vexata questio of the metallic and polychrome decorations of the Par-thenon, which Mr. Lucas has, we think wisely, as far as possible eschewed.

Enabled by this model to realize more defi-nitely the idea of the great design in which architecture, sculpture, and painting were so marvellously combined by Phidias into one 9 harmonious composition, conveying by three different forms of expression, and, as it were, trilingually, one great idea, we are naturally 1.4 led to turn our eyes on the present condition of English art.

Why have we, in this country, arbitrarily put asunder what the Greeks had joined-Painting, Sculpture, and Archi tecture? Why did we set apart these three fair sisters at their second birth—the *renaissance*—and with step-motherly nurture bring them up in separate establishments, teaching them separate aims and principles of action, and giving to them divided interests? why, having done this, do we now as arbitrarily bring them together, after so many years of estrangement, and expect from them all at once, readiness in co-operation and common principles of design in the execution of our public works? The great task now demanded from English art, the decoration of the Houses of Parliament, so that on those walls shall be written the chronicle of the British race, in those niches enshrined the memory of their great men, in those windows "richly dight," the heraldic splendour of her regal lines-this subject, pregnant with great ideas, must not be made '

declaration and a theme " for a half taught school, nor can be dealt with by combining into one patchwork the compositions of single artists, working without concert or unity of purpose. It must be treated by a school directed by one mind, and taught to work out harmoniously, portions of one great design; to give utterance with one voice, to the great thought of which the design of such a building should bear the impress.

PRYOR'S BANK, FULHAM.

In a previous number of our journal,* we gave an engraving of an Electoral Chair belonging to Mr. Baylis, of the Pryor's Bank, Fulham, and said we might one day lay before our readers, some account of the extraordinary collection of Gothic decorations and utensils, deposited in that quaintest of quaint residences. The current number of *Fraser's Magazine* contains a charming article on this very subject, illustrated by twenty-nine woodcuts; and although to convey any thing like a complete account of Pryor's Bank, its treasures, and the kindnesses of its owners, Mr. Baylis and Mr. Whitmore, would need a volume, instead of the article sixteen pages long, here devoted to them, a very clear and pleasant notion of all is given by it.

A passing glance externally, as you pass over Putney-bridge, would ascribe it to the Cockney Gothic tribe; internally it is a mine of interest. "The whole edifice," says the writer in Fraser, "from the kitchen to the bed-rooms is a mu seum, arranged with a view to pictorial effect; and if it were to be called 'the Museum of British Antiquities,' it would be found more worthy of the name than the national institu-tion so designated. Rich as that collection is in the classic works of Italy and Greece, and the mysterious remains (until recently) of an-cient Egypt; specimens illustrative of Norman, Saxon, Romano-British, and Celtic manners, tastes, and manufactures are sought for in vain in the building nominally appropriated by the nation for their reception, arrangement, and preservation. Equally deficient is the British Museum in medieval antiquities, and the consequence is, that the artist who desires truthfulness in an English work, knows not where to seek for the necessary information.

In a print, published about forty years since, by J. Edington, 64, Gracechurch-street, of Fulham Church, as seen from the river, the ancient aspect of the modern Pryor's Bank is preserved. The situation of this humble residence having attracted the fancy of Mr. Walsh Porter, he purchased it, raised the building by an addi-tional story, replaced its latticed casements by windows of coloured glass, and fitted the interior with grotesque embellishments and theatrical decorations; and here he had frequently the honour of receiving and entertaining the late king, George IV., when Prince of Wales. It was then called Vine Cottage, and having been disposed of by Mr. Porter, became, in 1813, the residence of Lady Hawarden, and, subsequently, of William Holmes, Esq., M.P., who sold it to Mr. Baylis and Mr. Lechmere Whitmore about 1834.

By them a luxurious vine which covered the exterior was cut down, and the cottage, named after it, replaced by a modern antique house. Mr. Baylis being a true antiquary, his good taste induced him to respect neglected things, when remarkable as works of art, and inspired him and his friend Mr. Whitmore with the wish to collect and preserve some of the many fine specimens of ancient manufacture, that had found their way into this country from the Continent, as well as to rescue from destruction relics of old England. In the monuments and carvings which had been removed from dilapidated churches, and in the furniture which had been turned out of the noble mansions of England-the 'halls' and 'old places' -Mr. Baylis saw the tangible records of the history of his country; and, desirous of up-holding such memorials, he gleaned a rich harvest from the lumber of brokers' shops, and saved from oblivion articles illustrative of various tastes and periods, that were daily in the course of macadamisation or of being consumed for firewood.

The materials thus acquired were freely used by him in the construction of a new building upon the site of Vine Cottage, and adapted

suggested to the writer of the article already quoted, by the number and variety of these he inds in the kitchen. The history of these he inds in the kitchen. The history of these he inds in the kitchen. The history of these he inds in the kitchen. The history of these he says, would afford an opportunity for a dis-sertation on the rise and progress of the fine arts in this country, as they present most curi-ous and important specimens of early drawing, painting and poetry. "The old English plate was a square piece of wood, which indeed is not quite obsolete at the present hour. The improvement upon this primitive plate was a circular platter, with a raised edge; but there were also thin, circular, flat plates of beech-wood in use for the dessert of confection, and they were gilt and painted upon one side, and inscribed with pious, or instructive, or amor-ous mottos, suited to the taste of the society in which they were produced. Such circular plates are now well known to antiquaries under the name of 'roundels,' and were at one time generally supposed by them to have been used as cards for fortune-telling, or playing with at questions and answers. More sober research into their origin and use, shews that they were painted and decorated with conventional pat-terns by nuns, who left blank spaces for the motos, to be supplied by the more learned monks; and a set of these roundels generally consisted of twelve. As anoriments of the style monks; and a set of these roundels generally consisted of twelve. As specimens of the style of these mottos about the time of Henry VII or VIII., the following may be taken

belatter thes Beformation, coloured, prints su--paraeded, the painted manuscript 'poesies' of the nume and monks, and the elder De Passe, and other artists of the period of James I. and Charles I.; produced a variety of oval and circular engravings, which were pasted upon roundels and varished over. The subjects generally selected were those which naturally compared themselves into a set of two as arranged themselves late a set of twelve, as the months. By the Paritans, the beechen roundels thus decorated were regarded with the months. By the Paritans, the beechen roundels thus decorated were regarded with especial dislike, and they returned to the use of the anadormed trencher and (Godly platter.' When 5 the Merzy Monarch' was restored, he brought over with him from Holland plates and dishes manufactured at Delft, where the porcels in known as Faenza, Faience, Majolica, and Fynlina ware, made during the fifteenth century in the north of Italy, and upon the embellishments of which, according to Lamar-tinière, the pencils of Raffaelle, Gidlio Ro-mano, and the Caracci were employed, had been successfully, although coarsely imi-tated. And it must be confessed, that many of the old Dutch plates, dishes, and bowls, upon the kitchen-shelves of the Proof's Bank, de-serve to be admired for boldness of design, effective combinations of colour, and the manual dexterity displayed in the execution of the patterns. The superior deneary of the por-celain of China, which about this time began to be imported freely into England from the East, caused it to be preferred to the "Dutch ware," and the consequence of international commerce was, that the Chinese imitated Ea-ropean devices and patterns upon their porce-lain, probably with the view of rendering the article more acceptable in the Dutch and English markets. But while the Chinese were imitating us we were copying their style of art in the potteries of Staffordshire, with the commercial manufacturing advantage given by the power of transforming a print to the clay over the production of the same effect by by the power of transferring, a print to the clay over the production of the same effect by means of the pencil, an idea to doubt suggested by our roundels of iCharles, the First's time, and which process became of the same relative importance as printings to manuscript. This was the origin of our common blue and white a plate of what is known as f the willow pat-od term by bergo to scott mort ", water " a stat

A geben horene in the mouthe."

Sin, -On Wednesday evening last, after the regular business of the ordinary meeting of the British Archaeological Association, I brought forward and read the letter from Mr. Tite, printed in THE BUILDER of this week, which letter I had not received when I addressed you, in reference to the vague and erroneous state-ments uttered by Mr. Tite, and printed in THE

Although this letter contains much irrele-vant matter, and I am perfectly satisfied would, to the minds of all who know me, carry in itself conviction of the absurdity of the charges brought against me, yet, from the respectability of the writer, it is calculated to excite prejudice in quarters where I may presume I am un-known. A necessity therefore arises for my meeting the charges as publicly as possible, and I regret that Mr. Tite could not have made it convenient to accept the invitation sent him to be present last Wednesday at the meeting of the Association, when he would have had an opportunity of hearing my explanation, and of making any observations which he might have thought necessary. The statements made by Mr. Tite amount to a charge of breach of faith towards him, and of opposition to the Joint Gresham Committee in their endeavours to collect antiquities discovered on the site of the New Royal Exchange. As briefly as possible I proceed to meet the alleged facts he has adduced.

On the 24th of Nov. 1840, I obtained an order from Mr. Tite to visit the excavations, during the months of December and January. I was much engaged both at home and in the country, and made no visit to the Exchange that would have required the order, until the 1st of February. On the evening of 31st of January, I returned from an excursion in Kent. On this day occurred a circumstance upon which hangs the chief charge brought against me by Mr. Tite, nearly five years afterwards, which charge he asserts is supported by three witnesses. On entering my house, I noticed a fragment of a statue of Charles II., which I ascertained had been left by two drunken work-men, who stated that they had brought it from the Royal Exchange. I immediately gave orders to prevent a like occurrence, and when the men called in the morning, I ordered them to take it to the museum in Freeman's Court, and, moreover, paid them for a barrow to carry it in. Whether they took it back or not I cannot tell, but I suspect they took it in mis-take either to the Guildhall or to the British Museum. On the following afternoon I made my first formal visit to the excavations, intending to avail myself of the *privilege* granted by Mr. Tite, to obtain information, and to make sketches. I had scarcely entered, before I was stopped by a stout burly man, in whom I recognized a person who, some years previous, had been summoned by me before the Lord Mayor for ferociously assaulting a youth then in my employ. He immediately ordered me to leave the premises, and, using the most brutal lan-guage, threatened if I delayed, to get me kicked off. I mildly expostulated with him, and begged oy. I mildly expositulated with him, and begged him to tell me the meaning of such unprovoked conduct. "" Meaning "said he, "didn't ye get a man to bring ye an image tother day? and then didn't ye bribe 'im to take it to the Mu-seum?" I at once saw the ridiculous mistake the man had made, and I attempted to set him right, but my pacificatory efforts only increased his rage and violence. I then announced myself as under the especial protection of Mr. Tite, confirmed by a written order. His reply my pen rufuses to write; it included a substantive signifying the very reverse of truth, with a forcible participle, meaning total exclusion from mercy, prefixed, and concluded with a demand of "Show me the order." I respect-fully asked him to step with me to my house, or, to permit me to fetch it. This was an-swered by an insulting observation, concluding with "We act under the Gresham Committee, and have orders to hinder you from coming here. You have bought things of a rascal called Sullivan, who we had discharged, as great a blackguard as ever lived, and I can prove it." Who the university individual he alluded to was I have not the slightest notion. During the dialogue. I was every moment expecting this Gresham agentwould have struck me, and I believe he would, had he not been restrained by

of a new ана сулар арало у сулар арало у сулар

the people who had assembled around us, and by the appearance of another person in au-thority (Mr. Tite's second witness I presume), by the appearance of another person in an thority (Mr. Tite's second witness I presume), who had that morning, called upon me about the lost fragment of sculpture. To him J appealed, and asked whether I was to be sub-jected to this usage, holding as I did an order from Mr. Tite? He replied, "Mr. Tite can give you no order to buy things here, and we have orders from the Gresham Committee to prevent you coming upon the ground." I re-turned home, made notes of these particulars, and wrote to Mr. Tite. On the following day (I believe) I again visited the works and, in the presence of Mr. Tite, bad to encounter simi-lar treatment, Mr. Tite, observing that he had given me an order, and could do nothing more ! I then said, that if his order could not protect me from personal violence, if I came again I r then said, that it is other could not protect me from personal violence, if I came again I should feel, it necessary (in self-defence), to come armed, when, if the Gresham agent should think fit to put his threats into execution, by laying hands or feet on my person, he might run the risk of being shot. But if antiquaries and archæologists sometimes speak daggers and bullets, they seldom use any beyond the and bullets, they seldom use any beyond the sharp pointed and keen edged goose quill, and the pop-gun pellet of paper, which explodes in an ill-natured critique; and if the intem-perate servant, who had doubtless exceeded his orders, had been discharged by Mr. Tite (as he would have been by some gentlemen), I should instantly have pleaded for his restora-tion. tion.

For about two months I declined, on account of fear of a recurrence of these unpleasant obstructions, from visiting the excevations. obstructions, from visiting the exception These two months, and the two months previ-ous, comprise the period during which Mr. Tite says "nothing of importance was found;" Tite says "nothing of the pit (opened in "and then he speaks of the pit (opened in April) and says, that " the clerks of the works, and the contractor's foreman, were constantly complaining to me of your interference with the workmen, until it came to an actual quarrel." Now, if nothing had been found in January, February, and March, about what were the com-

February, and March, about what were the com-plaints made which led to the *quarrel* which took place on the 1st and 2nd of February, and not in April, when the pit was opened? In fact, when the *quarrel* occurred, nothing of importance was found, according to Mr. Tite's shewing, and when antiquities were discovered in the pit, no *quarrel* took place! From the beginning of February to the beginning of April, I was engaged in prosecu-ting researches on the site of the French Pro-testant. Church in Threadneedle-street, with the assistance, not of any city company or committee, but of a private individual, Mr. E. Moxhay, and the discovery and preser-vation of two beautiful tesselfated Roman pave-ments were the results of his liberality. Here let me contrast individual intelligence, generoments were the results of his liberality. Here let me contrast individual intelligence, generolet me contrast individual intelligence, genero-sity, and public spirit, with corporate ignorance, meanness, and selfishness. Had I applied to this corporation (now of a sudden made to affect so much anxiety to fit up their one room for a museum). I should have been laughed at. "Tis only rubble and rubbish," said the leader of the Court of Common Council, when, a short time since, that body gave up the rem-nant of the old city boundary wall, on Tower Hill, to be pulled down; and these pavements in their eyes would have been nothing more, and assuredly would not have been saved from demolition, as the city wall has been, in spite and assuredly would not have been saved from demolition, as the city wall has been, in spite of the efforts of the corporation. Drawings and models of these pavements have been made and circulated throughout the kingdom, and one of them has furnished an elegant design to a maker of floor-cloth in Moorgate-street. Mr. Moxhay placed them at my disposal, at the very period when Mr. Tite falsely accuses me of being actuated by *personal objects*. I re-commended that the pavement, which could be safely removed, should be sent to the British Museum, and entirely through my advice it was safely removed, should be sent to the British Museum, and entirely through my advice it was there deposited, and I placed models of both in the collection of the Society of Antiquaries. If I had been so anxious to "obtain posses-sion" of every thing for my own collection or for "personal objects," is it likely when these interesting and valuable remains were literally presented to me, I should have transferred them to a public museum? Was it likely when I acted thus in Thireadheedle-street, I should have shown, at the same time, so different a disposition on the site of the Royal Exchange? disposition on the site of the Royal Exchange? That I should have been lavish of pounds on

other ? without orders. At this time the prealluded to was being excavated, and I made hastysketches, and took notes occasionally, but not without fear of a recurrence of former direct obstrue: tion. My visits did not achif of such minute exemination as the subject fiemandel, but no guarrel took place, no complaints could have been made, for I never remember being there without seeing Mr. Rassell, the clerk of the works, or some of the gentlemen from Mr. Tite's office, and I must have heard of the complaints if there had "been any." On no oceasion did I ever mterfere (with anybody, and the only charges that cher be imagined to and the only charges that each be imagined to have been made must have been those preferred more than two months previous, which I have shown were about and false. I hasten now to the stories about the bell, and the leaden medalet, or jetton. Mr. Tite had read in the "Archeologia" that a bell, among other ob-jects, had been found in the pit, but he has never visited my museum to ascertain if I actually possessed this enviable relic, and, if so, how and by what mena, and at what period of how and by what mens, and at what period of time. He has not, in fact, taken the trouble to associatin the truth of any of the trumpery tales upon which he scenes to have founded his accusations against my conduct and character.

"When by the circulation of handbills, by " boarding round the site," and by other means considered necessary to their archeelogical butue, the Joint Committee of Gresham Affairs had had the run of the cover to themselves, I proceed to show how, alone, and single-handed, I succeeded in preserving what these zestions gentlemen, with their handbills and boards, had overlooked. Mr. Tite says truly that this pit was filled with soft peaty earth; but Mr. Tite is not perhaps aware that this soft peaty earth contained many minor objects of interest which it was impossible to detect by boards and handbills, and which were carted away in this soft peaty earth, and disposed of at a remote distance from the site of exhumation s' remoté distance from the site of exhumation in an open unfenced situation, accessible to snybódy who might have cared to examine it. From this rejected "soft peaty earth," far from the Royal Exchange, I procured, from time to time, many curious objects of ancient art, which certainly, but for my exertions, would never have been discovered and preserved. "MY. Tite's "Mountain in Labour" pro-dices a bell, and a medulet in lead ! The latter he says, "is a very remarkable curiosity, and surely the only proper place for such could not be any private collection!" This little peace of lead came into my possession long before I had the honour of knowing Mr.

little peace of lead came into my possession long before I had the honour of knowing Mr. Tite, although he says he is a Fellow of the Society of 'Antiquaries' of some standing. It was met with during some partial excavation, before the general works commenced. So little consequence did I attach to it, that it remained for months upon my table before I was induced to examine and clean it, when I deci-phered an inscription and the Tudor arms. It was previously a lump of worthless lead, but I regenerated its defaced impress, and thus made it an object of interest, but surely not an object to be envied the possession of. I exhibited it to the Numismatic Society, and to the Society of Antiquaries; I freely permitted a wood-cut of it to be made for one of the pic-terial weekly **newspapers**; and I adapted the inscription to the obverse of a medal of Prince Albert, slesigned by me, and engraved by Mr. Stothard * to commemorate the Prince 's ad went is Jay the first stone of the New Royal Exchange, the Joint Gresham Committee having omitted to order a medal to be engraved to record this interesting event. If Mr. Tite will now point out to me the more proper place, where he insinuates a botter use would have been made of this farthing's worth of lead, I will cheerfully code possession af it. Had I been a servant of the corporating and esized some thirty or forty gold inobles, on behalf of the city, and had never rendered to solence or to the city exchequestin proper account of the tweasure trove, then blue Lite might, with some reason and justice, have imputed to me " per-sonal objects," and have worthily stood forward as a public securer. But, L trust, I have said

the one spot, and coverous of farthings on the | enough to show that the accusations brought an after thought to inform that the accusations or ought against me are fair loss, marking and false; that they have all the appearance of being an after thought, and are calculated to mislead the public, and to injure private character; that they neither apply to me nor to my col-leagues in the city, and that they are unworthy the office Mr. Tite holds, through which office he has thought proper to disseminate them.—

I am, Sir, &c., CHARLES ROACH SMITH, 5, Liverpool-street, City, Dec. 6.

COMPETITION ALTAR-FIECE FOR ST. JAMES'S CHURCH, BERMONDSEY.

PAINTING and sculpture are essential as accompaniments and embellishments of architecture, and it can scarcely be said that architecture in its highest departments is complete or perfect without their aid. In the ancient Christian edifices of Europe, both were extensively employed, and painting, especially, seems to have been regarded not merely as an integral and necessary auxiliary, but in some instances as a feature of paramount importance. The architectural remains of Lombardy, of Venice, and of Sicily, with those of Normandy, and of our own country, shew that the painter was employed to an immense extent in the decorations of the altars, walls, vaulting, and other parts of churches. Passages from and other parts of churches. Passages from the Holy Scriptures; monkish legends of the lives of saints; memorials of the religious deeds of kings and princes; arabesque and floral decorations, may still be traced in abundant instances, proving incontestibly that the taste for pictorial art, and for its application to sacred purposes, flourished without interruption from the introduction of Christianity in Britain to the dissolution of monasteries by in Britain to the dissolution of monasteries by the tyrant, Henry VIII. After the Refor-mation, it was a favourite employment of bigots and fanatics to destroy and mutilate these, which had become objects of Roman Catholic superstition. The prejudice thus engendered against the introduction of pic-tures into churches, still subsists amongst many of the Protestant clergy; and has ope-rated most unfavorably on the development of art in Britain. An unworthy parsimony in the erection of our sacred edifices has further contributed to exclude from them the works of the painter, and has thereby deprived them (with but few exceptions) of their most effective and appropriate embellishments.

We may, however, hope that a better era for art has arrived. Painting and sculpture have received their due consideration in the works in progress for the accommodation of the Houses of Parliament; and the extensive application of the ancient models to new churches in all parts of England, has induced a desire to embellish these structures somewhat in accordance with those in imitation or emulation of which they have been constructed. Hence we find that stained glass, encaustic tiles, and similar accessories, are now largely employed. It is our present object to advert to the not less important point of the introduction of paintings in churches, not built in the mode adopted in the middle ages. In these the mode adopted in the middle ages. In these structures, modelled upon the classic forms of ancient Greece and Rome, the *altar-piece* is perhaps the only part to which painting can be successfully applied; and it is to be regretted that an object so well adapted to stimulate and everying the neurons of the action is the bicket exercise the powers of the artist in the highest branch of art should be so frequently neglected. Without adverting to the few pictures produced of late years as altar-pieces, we may proceed to notice the Ascension. by Mr. John Wood, which has just been completed for St. James's Church, at Bermondsey. It appears that the late Mr. Harcourt,

wealthy inhabitant of the parish, bequesthed the sum of 500%. for the purchase of a picture, to be placed in a recess over the communion table of that church. The trustees not being able to procure a satisfactory picture for the purpose, advertised for sketches, upon the understanding advertised for sketches, upon and advertised for sketches, upon and that the artist whose production. was selected should forwith execute the work, and receive the amount of the bequest. They fixed upon the ablest Ascension of Our Saviour as the subject, the and the finished sketches in oil were required to be 36 inches in height by 17 inches in width. The altar-piece, including a frame provided by idth.

the trustees. to be 25 feet in he in the tisk width. On the sthe of Departure regat by 1 Freet in 80 compositions were sent in ; several of them by members of the Royal Academy. Mr. Eastlake, R.A., and Mr. Haydon were sp-pointed to examine them, and to select the most maniform of the Model and the select the most meritorious; and Mr. Cooke, R.A., was to decide in the event of those gentlemen differ-ing in opinion. The two former however agreed that Mr. John Wood's sketch was the best of those submitted, and Mr. Cooke fully concurred in their ophilon. A decision thus unanimous, by artists of such high reputation and admitted taste, naturally excited the curiosity of all lovers of the arts; and it is therefore gratifying to find that the picture, which is now completed, fully justifies the opinion so given of its merits, and reflects the highest

honour on the artist. The figures in Mr. Wood's composition are considerably above the natural size. On a canvass of 275 square feet (25 feet by 11) a canvass of 275 square feet (25 feet by 11) the artist has given, in the upper part, a full-length figure of the Baviour, occupying nearly one-half of the picture. The figure appears baoyant in air, with a nimbus around the head, the radiation from which illumines with a golden effulgence the upper region of the sky. Clothed in a flowing robe, or mantle, even a white vestment, with arms extended, and a placed expression of countenance. He cause a placid expression of countenance, He casts a parting look towards his earthly disciples and associates, whilst his body is evidently in the act of ascension from them. The eleven disact or accension from them. ... The eleven dis-ciples, witnesses of the superhuman' event, the accension of their lord and master into²⁴ the heaven of heavens, " are at once astoninbed, terrified, 'and glorified by the beatific event. An incident so unparallel could not fail to produce varied and conflicting emotions in its witnesses. The artist bas endesvoired to portray these, in the stillades and expression of the apostles. They are represented to va-rious positions; standing, kneeting, pros-trated, with uplified hands and faces, bodies bent with reverential awe and deretion. The artist has apparently familinized himself with the best accounts, and provident distance of the age, personal character, and continues of the time which he had to depict; and he must have attained a high proficiency in his set. to have given not only variety, but simet peri sonal identity to the slaven apostlas ho has resonal identity to the stayes, apprises as an re-presented, and to have global distribution in con-tume which, hoth is, down.and.contensing, should satisfy the system of the critic, and the feelings of the Chusting, por states in the The production is one that can bardly fail to

advance the character of the British school. and to advance its/mariterious unthus considerably in his professions / We cannot conclude without expressing our hope that it will not be long before the name of John Wood is enrolled amongst the members of the Royal Academy.

.

CONSTRUCTION OF ROOFS.

Sin,-I have been recommended by some professional gentlemen, well acquainted with your journal, to submit to you a question respecting the comparative strength of queen-post and king-post roofs. The building to which I refer is Dorie, the pediment very flat, and the width of the roof 60 feet. The ceiling has sunk a few inches, in consequence of the heads of the queen-posts having yielded to the pressure, and thus, much of the weight of the roof has been brought down upon the It has been suggested, that the only beams. remedy is to substitute king-post principals; these slone having strength to beer a roof so that as the one in question. Others contend that as the one in question. Others contend that queen post principals are best. By giving your opinion, you would confer a favour on many persons besides your obedient servant, Hull, Dec. 4. H. N.

*** For the span named, we should use a queen-post roof. Both king and queen-post should be of hard oak, and the heads if formed in the common manner, should be as small as possible, as by their shrinking, sagging is caused. To lessen the possibility of this, it is a good plan to make the end of the principal rafter abut against the straining beam; in this case the tie-beams should be each in two pieces, notched on, one on each side and bolted together.

VIT ... VENTILATION OF STABLES. BOBGETFULNESS OF ABCHITEGTS' SERVICES.

Bluded to Mr. Dickinson's stables, in Curzonstract, and the system of ventilation there shoping Aspracesional services are too often jargatten in descriptions of new buildings, I Jargatten in descriptions of new buildings, I am sure you will take an early opportunity of stating that these stables were executed from, my plans and superintendence. Mr. Dickinson required an adequate and effectual yentilation; Mr. Sylvester was consulted, and advised the principles of the system; and the necessary structural arrangements and work-ing out of these principles were left to the architect.

If a similar division of labour were adopted in public buildinge, which require ventilation on a large scale, and the details of construction left to the architect to embody in the building, I think we should not have to complain of the monstrous excreasences which dis-figure many edifices where the ventilating doctors have been trying their processes, apporently used been trying their processes, ap-parently without, any regard to architectural grangements. The remarks in your last gumber on the ventilation of the schools at Swinton, are so perfectly applicable to the subject, that I, feel it unnecessary to say one word more.

3.From the experience which I have had. I am, inclined to believe that many of the failures which have attended the recent adoption of the yentilating system have arisen from the doctors attempting too, much. They are like some young practitioners in the medical art, relying askely on drugs and nostrums, and forgetting the "vis medicalitis nature." In both cases I the patient would enable him to throw off ea-support, that a slight additional power given to the patient would enable him to throw off ea-sity, his complaint. I am, Sir, See., Patient cost that a flow as LITTLE.

We gladly insert the above to rectify an of is side said with the want of information in that respect. We quite agree with our es-teemed correspondent, and have often remarked it, the architect's services are too frequently forgotten in describing the merits of a building. If the result be not satisfactory, if (in his en-dear-our to meet the views of his supployer and give him all he desires for some most inadequate amount); he should pare down too much, and a failure should occur, on him rests all the responsibility, and on him falls all the abuse. 7

Acres 64 CLAIM FOR RENT IN ASSESSING DILAPIDATIONS.

¹¹ Wit have great pleasure in laying the fol-lowing letter from Mr. George Smith (the sirchitect of the Mercers' Company), before our readers. In connection with Mr. Tatter-sall's, which appeared last week,• both bearing out the opinions we expressed in the first instance, it may be considered decisive. My DEAD SIR. I have carefully permed

My DEAR SIR,—I have carefully perused and considered the "Question in Assessing Dilapidatione," mentioned in THE BUILDER of the 220d ult, † on which you desire my opinion. 14 have much pleasure in acceding to the prequest, and take leave to state I am of opinion that rent is not recoverable under the openator that rent is not recoverable under the circumstances mentioned, nor is it customary twohsing it. The lessee has a choice of two remedies, either to sue for damages during the, existence of the lesse, or by action of ejectment, the neglect of either or both, I think would and should bar him from the claim of rent. This is my view and opinion of the subject, whatever may be the legal construction put upon the case.

Barta - I remain, my dear Sir, &c., GROBOR SMETH. 1.14

Mercers' Hall, Dec. 8, 1845.

MASONS .- The Great Western Advertiser says:---"At no period, perhaps, was there a greater demand for this class of workmen than there is now at Swanses. The erection of the new Wesleyan Chapel, the Unitarian Chapel, the new Station House, and several other extensive private buildings, has produced an utiprecedented demand for masons as well as for curpenters, &c., and excellent wages are received."

A FEW QUESTIONS RESPECTING SEWERS.

1. What are the dimensions of the several

sizes of sewers now in use? 2. What is the least size of a sewer, so that it may have the requisite space for examination, cleansing, repairing, or for opening new communications with new drams? 3. What is the desirable limit of the longest

length for the smallest sized sewer? 4. What is the least fail that a sewer should

have 9

5. Has any plan been tried for forming wells at convenient distances to collect the sediment from the sewage ?

6. What would be the best size and distances for such wells? 7. Is there any data to determine, in what

average time a given length and size of sewer would furnish a given quantity of sediment?

8. Supposing such deposit sediment-wells to be found useful, what would be the best material, what the average cost of each, and what would be the value of manure that might be collected in this way in London ?

9. Could an apparatus be contrived to take out the sediment, put it into suitable casks or other vessels, to be taken away in carts and conveyed by railway trucks into the country l

10. When the best form for sewers is de-termined, would it not be desirable to have the best form of bricks constructed for them?

11. Would not a form for the bottom of a ower, resembling an inverted Gothic arch, be better than the egg-shape?

better than the egg-snape r 12. Would it not be an improvement to have longitudinal timber, as a sill at the bottom of sewers, not only for the purpose of making an even fun for the sewage, but also to prevent unequal sinkings, which in some grounds must take place, and cause sediment deposits?

13. What difference, if any, is now made in the foundations of sowers, when in clay, gravel, sand, peat, de. ? 14. When there is sufficient fall in a sewer,

why is any inconvenient limit given to the height? 15. Why should not the height of sewers

when the fall and other circumstances will ad-tait of it, he such as would allow workmen to

walk upright when examining, cleansing, re-pairing, or forming new inlets? 16. State what is the least space required from the surface of a road to the top of a sewer ?

17. What depth and space is required under streets for water and gas-pipes? 18. When a new sewer is required, what is

the usual mode of determining every circum-stance that should be taken into consideration ? 19. Is there any prepared list of points for

inquiry? 30. What quantity of silt is taken out of

sewers on an average? 21. What is the greatest distance between the shafts to the different sized sewers?

22. What are the names and descriptions of tools, &c., used in the several operations in the formation and subsequent works, and to keep sewers in efficient order?

23. Has any plan been tried to prevent the dirt, &c. from streets being carried by rain into sewers, without stopping the free circulation of air ?

24. In applying the liquid sewage as manare, would it not be better to take off as much as possible from elevated positions to the country, than to allow all to run down to the Thames,

and have the whole to elevate? 25. What extent of ground would the sewage of the higher parts of London manure, without pumping any? 26. Could not a great quantity of liquid sewage be directed to some one, or to the sove-

ral railways, and be then drawn off by a tap into casks or tanks, on railway trucks, and thus conveyed into the country, where it would be usefuí ?

27. What is the probable quantity, and what would be the cost per ton, that could be ob-tained in this way?

28. Might not sewers be made advantage-ously sufficiently large to contain water and gas-pipes ?

Woald not the proposed new park at 9.4 · Battersea be a good opportunity to adopt an improved system of forming sewers ?-From Nov. 26, 1845. A LOOKBR-ON.

THE STATE OF THE GAS MAINS.

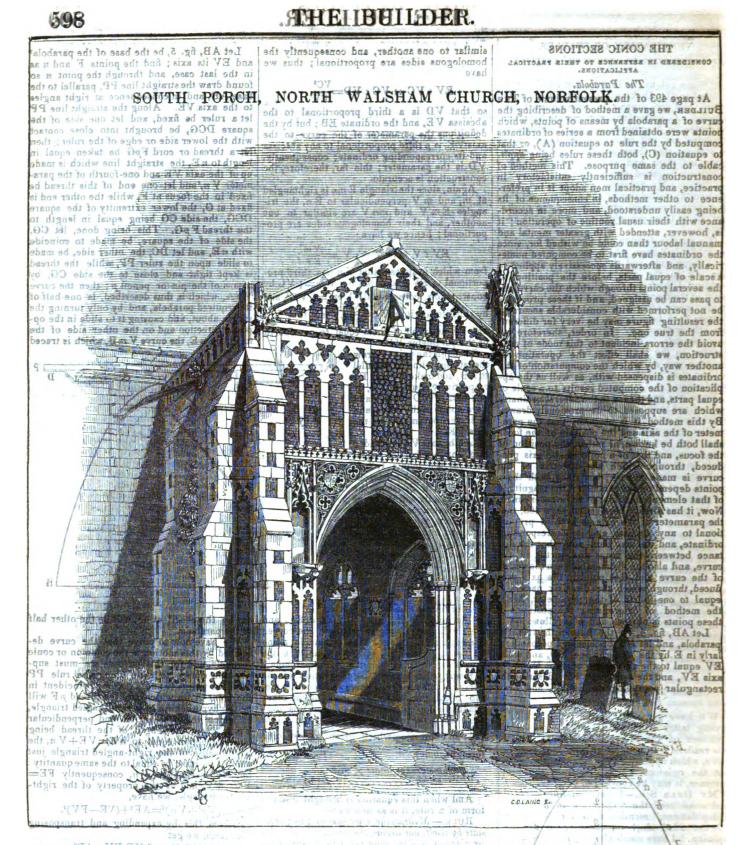

Sin,-It has long been matter of surprise to me, that the Ges Companies of London should pay so little attention to the laying of and keeping in order, the main pipes in the streets, and I believe that it is in a great measure lowing to this that the inhabitants of measure owing to take that the incentance or London are compelled to pay the high price for gas they do at present, occasioned by the great extant of leakage existing in the pipes, caused not only from dacay, but through the great careleseness displayed in their laying, great carelessances, displayed in their laying, and which leakage bears a very large per centage upon the gas made; I have known it to exceed 40 per cent. This loss might have been prevented (or nearly so), if the companies had but, employed persons compe-tent to undertake the work, and it behoves new companies to pay attention to this very im-portant branch of gas lighting; as it will give them the means of competing better with ex-isting companies, and supplying gas at a much lower rate than it is at present. The mains of the companies now established

The mains of the companies now established have for the most part been hid without ours or judgment, ignorant persons having been employed to superintend their laying, and the consequences are, the unequal supply of gre to different districts, and the lass by leakage,

a neve paid considerable statistical for this subject, and can bring forward proofs to agar-roborate my statements. It is accessive pro-sible to open the ground in any of the London streets without finding the earth; impres-nated with gas, and the iron gratings, give, evidence of the great wasta that is taking place, and this must be perceptible to any one in passing through the streets. I can refer to, the officers of the Commissioners of Sewers to bear me out in saying that it is dangerous entering the sewers, solely from this cause, until they have been ventilated by the opening of the air-holes. In addition to the nuisance, from the stench, it is most dangerous, as accident or design might occasion an explosion, that would be destructive to life and property; that would be destructive to life and property; and the Government ought to take such steps, as to make it compulsory on the different gas companies to make their main and service-pipes sound, and to see that the officers of the gas companies are competent to perform, the duties they undertake, by establishing a Board, of Examiners, as proposed by Dr. Jones in his lectures on "Gas and Gas Meters," and pra-vention notice from analying whe are entirely. venting parties from applying who are entirely, incompetent and wholly ignorant of the business, they profess, and whose only claim and meric. is that they have a friend strong the directors, whereby grocers, tailors, are get transformed into engineers, superintendents, inspectors, &c.; and it is from the ignorance of such parties that London is at present, the worst and dearest lighted city in which gas is introduced. dearest lighted city in which gas is introduced. Gas, under proper management, can and ought to be supplied from 4s. to 4s. 6d. per 1000 cubic feet, and many companies. would find, themselves in a very different position to what they are at present, and the shareholders would receive dividends instead of reports, as is the case at present with some of them. I shall resume this subject, as also on the quality of the London gas, gas fittings, and gas matters, if it should meet your views.—I am, &c., Dec. 5. "GARMON,"

-----2. 1. 110)

hear that the Royal Literary Institution at Bath has received a valuable present of about Bain has received a valuable present of about one hundred books and pamphlets, and several hundred engravings, illustrative of the city of Bath. The books and pamphlets relate chiefly to the history and antiquities of the Queen of the West, and show to what extent selence and literature have been indebted to her. The engravings are arranged in a large folio volume, beginning with the Roman altars of the earliest beginning with the Homma alters of the earliest period, and continued with successive maps of the city, views of the surrounding scenety, prints of its churches, public buildings, and public men. Of inseresting objects, of which engravings could not be found, drawings have been made. The collection was formed with much care, and at great capenas, by Capts Chapman, who has been often a resident of the Chapman, who has been often a resident of the city, and who now generously wishes that the public should enjoy the frait of his labours.

THE SOUTH PORCH OF NORTH WAL-

THE church of North Walsham is large, and mostly of a plain decorated character. I nave and ai-les, covered by a triple roof. It has chancel has aisles, being, in fact, a continu-ation of the nave and aisles, there being no external division or mark to separate the eastern portion of the church from the western; but internally the chuncel and the aisles were anciently divided from the nave by screens. The lower part of what was the rood screen is still remaining, and contains some good spandrils, very delicately carved i it also has the remains of painting and saints in the panels. The aisles were divided from the chancel by screens, as chapels. The nave piers are good, and of lofty proportions. The roofs are open, but very plain and rough. There is an enor-mous west gallery, yet behind it, there is a varant space large blough for an ordinary church, where the parish engine and ladders are kept: fiere, too, near the south door, is the font, enclosed by a wooden railing, having a very good carved oak eover.

The south porch, the subject of the present engraving, is of a later character than the main body of the church, being of good perpendicular

design. It is of a great size, and is open to the roof, never having been divided into two stories, as was frequently the case in large porches of this style. The part which is blocked up above the archway was, probably, a niche. The panelling on each side, and in the gable, buttresses, and plinth is filled in with the squared flint-work, so common among the churches of Norfolk. The flank has two windows, divided by a buttress, but they are bricked up as high as the springing. The tower of the church is large, situated at

The tower of the church is large, situated at the west end, and was of a great height, but is now in ruins. It was struck by lightning about a hundred years ago, since which time it has been gradually disappearing. A few years ago a great portion was obliged to be taken down. There is still, however, sufficient standing on the side next the church to stop the roof of the nave. JAMES K. COLLING.

On the north side of the chancel, near the east end, is a mural monument to the memory of Sir William Paston, knight, a native of the town, founder of the Grammar School, and ancestor of the first Earl of Yarmouth. It was erected during his life, by John Key, a freemason of London, who, by agreement dated 1607, undertook to fit up the tomb with an effigy of the knight in armour, 51 feet long, for the sum of 2002. Sir William died a few months after making this agreement, aged 80 years. The church is dedicated to St. Nicholas.

choias. The living is a vicarage, with the rectory of Antingham St. Mary annexed, in the archdeaconry of Norfolk and diocese of Norwich. King Edward the First, in his twelfth year, granted a licence to the Abbot of Holm to appropriate it, but this was not performed till becember 9, 1338, when Anthony, Bishop of Norwich, appropriated, it to the Convent of Holm, and it was to be transferred on the death of Roger de Hales, the then rector, On this event taking place the vicarage was formed, and the patronage was settled to be in the Abbat of Holm. The Lord Chancellor has the gift at 3361. The town of north Walsham is situate on the

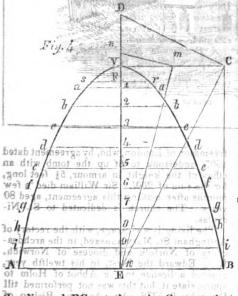

The town of north Walsham is situate on, the high road to Norwich, and consists of three streets, diverging from a central area, in which stands the church. It is about 15 miles N. Ness from Norwich, and 124 N.E. by N. from London. When the last census was taken it contained 2,655 inhabitants.

THE CONIC SECTIONS CONSIDERED IN REFERENCE TO THEIR PRACTICAL APPLICATIONS.

The Parabola.

At page 493 of the present volume of THE BUILDER, we gave a method of describing the curve of a parabola by means of points, which points were obtained from a series of ordinates computed by the rule to equation (A), or that to equation (C), both these rules being appli-cable to the same purpose. This method of construction is sufficiently satisfactory in practice, and practical men adopt it in prefer-ence to other methods, in consequence of its being easily understood, and more in accordance with their usual routine of operation ; it is, however, attended with greater mental and manual labour than could be wished for, since the ordinates have first to be computed numerically, and afterwards successively applied to a scale of equal parts, before the positions of the several points through which the curve has to pass can be assigned, and if these processes be not performed with considerable accuracy, the resulting figure may be very far different from the true one. In order, therefore, to avoid the errors incident to this mode of con-struction, we shall effect the operation in another way, by which the computation of the ordinates is dispensed with, as well as the ap-plication of the computed results to a scale of ordinates is dispensed with, as well as the application of the computed results to a scale of equal parts, and thence to the several ordinates which are supposed to be previously drawn. By this method, it is necessary that the parameter of the axis and the position of the focus shall both be known, or rather, the position of the focus, and that of a point in the axis produced, through which the directrix of the curve is made to pass; but since both these points depend on the parameter, the magnitude of that element must first of all be ascertained. Now, it has already been stated, page 463, that the parameter of the axis is a third proportional to any abscissa and its corresponding ordinate, and we may here add, that the distance between the focus and vertex of the curve, and also the distance between the vertex for the curve and that point in the axis produced, through which the directrix passes, is equal to one-fourth of the parameter, hence the method of determining the positions of these points is obvious, and is as follows:— Let AB, fig. 4, be the base of the required parabola, and let AB be bisected perpendicularly in E by the straight line ED, and make EV equal to the axis of the curve. Upon the axis EV, and the semi-base EB, describe the rectangular parallelogram EBCV, and draw

í.

لا: تو لو

the diagonal EC; at the point C, erect the perpendicular CD, meeting the production of the axis in the point D; then is VD the parameter of the curve to the axis, EV. Bisect VC in m, and at the point m erect

the perpendicular mn, meeting the production of the axis in the point n, and make VF equal to ∇n . then is F the focus and n the point in the axis through which the directrix of the

⁹⁰ Since the triangle ECD is rightangled at C by the construction, and CV perpendicular to ED, it follows from the eighth proposition of the sixth book of Euclid s "Elements of Geometry," that the triangles ECV and CDV are

similar to one another, and consequently the homologous sides are proportional; thus we have

VC² NORTH WARSHAM BHUR

so that VD is a third proportional to the abceissa VE, and the ordinate EB; but by the definitions the parameter of the curve to the axis VE, is a third proportional to any abscissa and its corresponding ordinate; consequently, VD is the parameter; this far, therefore, the construction is accurate.

Again, since the triangle Emn is rightangled at m, and m V perpendicular to En, the tri-angles Em V and mn V are similar to one another, and their homologous sides are proportional; hence we have

$$EV: V m: V m: V n = Vm$$

from which it appears that V n is a third pro-portional to EV and V m; but $V m = \frac{1}{2} V C$ by portional to EV and V m; but V m= $\frac{1}{2}$ VC by construction, consequently $\frac{V}{2}m^2 = \frac{1}{4}$ VC², and by substitution it is $V n = \frac{VC^2}{4EV}$; so that V n and VF are each of them equal to one-fourth of the parameter V D. Through the point F draw the straight line rs parallel

Through the point F draw the straight line rs parallel to AB, and make Fr and Fsrespectively equal to Fn, or one-half of VD; then r and s are points in the curve, and rs is the parameter to the axis VE.

Let the axis VE be divided into any number of equal parts in the points 1, 2, 3, 4, &c., the more numerous the points of division, the more correctly will the curve be delineated'; and through the several points thus de-termined, and parallel to the base AB, draw the series of double ordinates aa, bb, cc, dd, &c.; then from the focus F, with the several distances n 1, n 2,n3, n 4, &c., intersect the ordinates both ways in the points a, a; b, b; c, c; d, d, &c., and these will respectively be points in the curve; then with a fine pen and a steady hand let a line be drawn through all the points, and the line be delineated; and through

te drawn through all the points, and the line thus traced will be the curve of the parabola.

Having thus effected the delineation of the curve, it may be instructive to shew the me-thod of calculating the parameter and the other quantities dependent on it, and for this pur-pose we must recur to the expression $VD = VC^{*}$ an expression which given in a specific EV, an expression which, given in a specific

form, becomes

parameter=ordinate × ordinate ÷ abscissa (E)

And when this equation is brought into the form of a rule, it is as follows :-

RULE.— Multiply the semi-base or given ordi-nate by itself, and divide the product by the axis or abscissa, and the quotient will be the parameter sought. Or more briefly thus :- Divide the square of the ordinate by the abscissa for

the square of the or annual of the accessory of the parameter required. Example.—The axis and base of a parabola are each 30 inches; what is the parameter, and what is the distance of the focus and the directrix from the vertex of the curve? Here the abscissa is 30 inches, and the ordi-

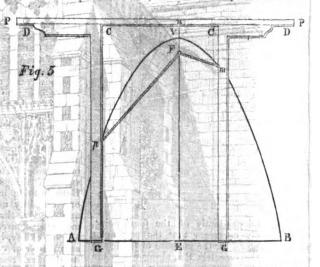

nate or semi-base is 15 inches, consequently by the rule, it is

parameter= $15 \times 15 \div 30 = 7.5$ inches,

and the fourth part of this is 1.010 more, distance between the vertex and the focus, and also between the vertex and the point which the directrix passes. It therefore follows, that if the axis be divided into ten equal parts of 3 inches each, the several radii by which the points in the curve are de-termined, are 4875, 7.875, 10.875, 13.875 16.875, 19.875, 22.875-25.875, 28.875, and 31.875 inches respectively. Add proceed with

There are various other methods by which the parabolic curve may be described, but the best and most expeditious of all is that in which it is generated by continued motion, and one mode of generating it in this way is of the Brat Earl of Yarrawollol an

Let AB, fig. 5, be the base of the parabola' and EV its axis; find the points F and n as in the last case, and through the point n so found draw the straight line PP, parallel to the base AB, and in consequence at right angles to the axis VE. Along the straight line PP let a ruler be fixed, and let one side of the square DCG, be brought into close contact with the lower side or edge of the ruler; then square DCG, be brought into close contact with the lower side or edge of the ruler; then let a thread or cord F_pG be taken equal in length to nE, the straight line which is made up of the axis VE and one-fourth of the para-meter V n_i and let one end of this thread be fixed in the focus at F, while the other end is nxed in the focus at F, while the other end is fixed at G, the lower extremity of the square DCG, the side CG being equal in length to the thread F pG. This being done, let CG, the side of the square, be made to coincide with nE, and let DC, the other side, be made to slide upon the ruler PP, while the thread is kept tight and close to the side CG, by means of the pin or nearly start the the start means of the pin or pencil p; then the curve ∇pA , which is thus described, is one-half of the required parabola, and by only turning the square about, and causing it to slide in the opposite direction and on the other side of the fixed line n E, the curve V m B, which is traced

out by the pencil at m, will be the other half of the parabola. We have now to prove that the curve de-

scribed by this motion is the common or conic scribed by this motion is the common or conic parabola, and for this purpose we must sup-pose the square to slide along the rule PP until the points G and p become coincident in the point A, in which case the thread p F will be the hypothenuse of a right-angled triangle, of which the base is AE and perpendicular FE.* Now the length of the thread being by construction equal to n E = V E + V n, the hypothenuse of the right-angled triangle just all ded to must be comal to the same quantity: hypotheness of the right-angled triangle just alluded to, must be equal to the same quantity: but VF is equal to Vn, consequently FE= VE-FV, and by the property of the right-angled triangle, we have,

$(VE+Vn)^2 = AE^2 + (VE-FV)^2$.

and from this by expanding and transposing the terms, we get

 $2 VE V n+2 VE FV = AE^2;$ but FV = V n by construction, therefore by substitution it is

4 Vn·VE=AE2, doudd HT

and since Vn is one-fourth of the parameter, the equation is

 $parameter \times abscissa = ordinate \times ordinate$, which, as we have already seen, is the equation of the common parabola.

There is another method of generating the curve by continued motion, which we think proper to introduce in this place, not that it is superior to the method just described, but be-cause the same principle is applicable to the other sections also, thus reducing the system of conic construction to one uniform principle, which is beautifully calculated to shew the mutual relation of the several sections to one another.

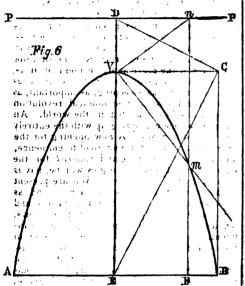

Let AB (fig. 6), be the base of the parabola, and VE its axis, exactly as in the two cases preceding; upon the semi-base EB, and axis VE, describe the rectangular parallelogram

• We have omitted drawing a straight line from A to F in the figure, but the reader can easily supply it in his copy, which will render the steps of the reasoning more easily un-derstood. Digitized by Google

EBOV, and draw the diagonal EO; at C, the extremity of the diagonal EO, arect the perin D, then is VD the parameter of the spine of the parameter of the parame and parallel to the base AB, draw the indefi-nice right line nP, which in this sage will be the directrix of the curves a state of a party Then, if the straight line of the moved in a direction always parallel to the cours V Re and in such a manner that the extramity as and an even a manner user the entrematy as thereof, may always be in contact with the asseight line *Pn*, and entry blong with *A*: the sile *Vn* of the right-angled-strongle.es *Vn* of which the right-angle is moreable about the pents *V*; then *it* follows, that the dentines interaction on *G* the side *N* or *it*. point V; then it follows, that and counterna-intersection we, of the straight line mB, with Vm, the other side of the triangle, does by this motion generate a conic parabola.

600

This method, it will be observed, determines

the curve independently of the focal point, and it is, only necessary that the parameter should be known for the purpose of fixing the position of the directrix Pn, along which the describing line must be carried; for in no other position will the moveable line intersect the curve, and the other side of the generating

the curve, and the other side of the generating triangle in the same point. If the moveable line nF be carried along parallel, to itself, until the points m and F do each coincide with B, the extremity of the base, then will Vm become the hypothenuse of a right-angled triangle, of which the base is EB, and perpendicular VE; and this triangle will manufestly be similar, in that case, to VnD or VCD^* ; hence we have

But when the point R coincides with B, the semi-base BB to equal to VO, and, by con-struction VD is equal to the parameter of the akis; (bence it is, a contract of the

absoisse : ordinale :: ordinale : parameter ;

and, by equating the products of the extremes and mouns, we get in

parameter × abscissa = ordinate × ordinate ;

which is also the equation to the conic para-bels; hence the truth of the construction is manufest. There are various other methods by which the curve may be generated; but since those which have now been exemplified are sufficient for every practical purpose, we shall not insist longer on the subject, having done enough to prepare the practical man for the important applications which are to follow.

"THE LOUVER EXHIBITION FOR 1846 .- The annual exhibition of the works of modern artists at the Liouvre will be opened on the 19th of March next, and closed on the 15th of May. All works intended for exhibition must be sent in between the 1st and 30th of

Rome and Lowbon Comparison The sub jet for the Baglish essay at Frinity College, Oumbridge; this year, is " Rome in the time of Augustus compared with London fit the nineteenth century.

• The reader should connect the points F and B by draw-ing a straight line in his copy, such being omitted in the

THE BHLE

FOREIGN ABCHITECTURAL AND COL-LATERAL INTELLIGENCE.

The " Clouga Maxima" of Rome and the Egg-shaped Severs of London .- If any thing can prove to us, that the very structure an aspect of ancient and modern times were different. the above two constructions can. In the first instance, we perceive a very small town-old, stern Rone, whereis a king (Tarquinus Priscus) considered it the scope and object of his life-or nearly so, to erect a structure, which, for ages to come, would afford cleanliness, and therefore comfort and salubrity (vitality) to his native city. The thing is done, and done thus, that the ultimate expansion of the capital of the world does not outstrip the first, primordial plan; and the Cloaca maxima of Tarquinius suffices for the Rome of Casar and Augustus,-even now, 2,400 years afterwards, a monument of admiation for every sensible beholder.-In modern times we manage things differently; we run after all and every sort of *private* comfort and ease, but whatever belongs to the province of public utility is a matter of chance, if not of corruption and jobbing. The subject of severs, however, has been, in its main features, so ably managed by other hands in this journal, that it does not behove us but to make a few comparative observations relative to the Roman work. Calling to our minds what we have seen of the Cloaca maxima, we do not believe that its inper surface (brick) was glazed. There was no necessity for it, at any rate. Every one who has seen Reman (sys, even mediaeval) bricks, knows what they are eval) bricks, knows what they are stone, nay, better than stone, combining hard-ness with toughness; moreover, the mortar of the same kind, so much so, that nothing but (modern) gunpowder, or the crowbar and pick-axe will dissever or break this ancient *material* of building. To dilate on this would be to of building. To dilate on this would be to speak of things unattainable, or *nearly so*. But one thing has come out of late here, and one certainly not neglected by our Roman masters, viz. that sewers, like any brick and mortar structure, must have time to set, to dry, and to solidify, if they are to be *solid*. This, as a matter of course, has its physical, if not its chemical reasons. The watery portion of the carbonate of lime has to evaporate before it is capable of entering with the grit and sand, and altogether with the stone or bricks into a firm agglutination, or perhaps (che-mical) amalgamation. The Roman king was, therefore, right in building his sewers without the bustle and the astounding harass and traffic of a capital of the world; and, consequently, there was no over-hurrying required, and the thing could go on in its natural and timely progress. But our sewers can not remain any sible to the influence of the air-the thing is impossible. They can neither dry, nor settle, but must be filled up, there and then. This anomaly has been clearly exposed, of late ; but we fear that no remedy has been hitherto proposed, which can or would be resorted to, as there is no spare time at hand, either in Fleet-

street, the Strand, &c.' Curious Appliances of the Cathedral of Orvietro.—A curious solemnity is yearly cele-brated in the interior of this beautiful cathedral, in the Roman states, viz. the letting off of a huge set of fireworks. To crown this or a nuge set of neworks. To crown this inconvenience, there are some exceedingly interesting old freeco pictures in the choir, by an unknown painter of Siena, as well as those, more known, of Signorelli, which, being acted upon in this vandalian manner for centuries next have been control with cost and dist past, have been coated with soot and dirt. Fortunately, two German painters, Messrs. Baltz and Pfannenschmidt, have of late applied themselves to cleanse these beautiful works; and thus it may be presumed, that this splendid old structure will no more be injured by the explosion of excelors and explicit

splendid old structure will no more be injured by the explosion of crackers and squibs. The Paving of the City of Vienna.—The corporation of that metropolis have arrived at that persuasion, that most solid works are the cheapest. An exceedingly costly mode of paving has therefore been carried into effect, which, however, is calculated to last at least a hundred years. It consists of solid cubes of granite, about a foot square, all whose six sides are grooved, logitudinally and transversally, for preventing the slipping of horses, &cr., thus, ready for use on every side. It is calculated that as any of these, gat either worn out on one side, or even broken at a corner, it will be

heaved out; and varied on the other side, and is the granite used at Vienna (similar to that mostly used here) is very hard, the experiment is sure to succeed. The expense, however; to; pave is that manner, even the small eriy of Vienna, amounts to more than is unillower florine (100,0002.). The only thing yet indis-pensable is the strong ramming in of these cubes, as it is well known that if increfy one of the paving stones of a certain surface gens shakey, the whole connection is broken, and the desease will spread to a large extent. As, however, Vienna is unlike London, not so astoundingly underwined by a vast number of heaved out; and tarned on the other side, and astoundingly undermined by a vast number of sewers, and water and gas pipes, the ramming in can be done with the necessary force and aolidity.

Reorganization of the Royal Society of Belgium-A recent decree of the king com-pletely re-constructs the above learned body, which, the fine arts being now added to ft, will henceforth take the appellation of "Royal Academy of Sciences, Literature, and the Fine Arts of Bolgium." The Society will form Arts of Bolgium." The Society will form three classes, viz. Physical, Mathematical, and Natural Science; Class of Literature, and Moral and Political Science; and Class of Fine Arts. Messus. Roelandt and Suys are the new members of architecture. (Novul all integre Simonis of sculpture, &c. (Novul all integre)

GHRIST CHURCH, PLYMOUTH b This fabria being completed, though not yet onsegrated, we avail aprophysic a description of the building from the Plymouth. Journal :--The general disposition of this edification is the same as was adopted by Mr. Wighwick in Triaity Church, his object being to put his employer to the expense of no more ground than is actually occupied by the building, and to avoid the cost of, any external, ornament beyond that which gives architectural character to the street-front, the sides and back of the church being con-cealed by, adjoining and surrounding houses. Of course there are no windows in the outer side walls, the main, body of light being ob-tained by means of algestories over the arcales of the nave. The architect is known to be averse to the one of internal pillars where they, can be avoided, but in this case (as at Trinity), where there is a great lateral where they, can be avoided, but in this case (as at Trinity), where there is a great lateral extent and galleries are imperative, they would have been, necessary, even if the build-ing had been, insulated, ... The west front exhibits a lofty gabled centre, flanked by octagonal turnets 64 feet high, and winged by two lower galled compartments, having angle pinnacle buttresses, reaching a height of above 40 feet. The octagonal turnets termi-nate with open laterans surmounted by above 40 feet. The occagonal threats termi-nate with open lasterns, surmounted by crocketted spirettes, resembling those of Magdalene College, Oxford. The three door-ways, respectively seen in the central and wing compartments, are adapted from the beautiful originals seen in Tatershall Church, Lincolnabire... The tracery of the great east beautiful originals seen in Tatershall Church, Lincolnabire. The tracery of the great east and west windows is from Aylabam Church, Norfolk. Over the wing doors are long and narrow single-light windows, with quare-foil apertures above, and over the large west window is a loop opening, ventilating the roof. All the carved work of the west front is of Can atops the plain portion of the mean rule. Caen stone, the plain portion of the masonry being of our local limestone. The front is 72 feet in extent, and 50 feet from the payement to the top of the gable. The style is Tudor Gothic.

Gothic. Internally, the church exhibits a nave of five arches in length, surmounted by a clere-story of coupled windows, the lawer timbers of the roof being left open to view, so as, in a general way, to resemble that of St. Mary's at Cambridge. The width of the nave is 31 feet; the height is nearly 40 feet; the sisles (including the thickness of the pillars) are 18 feet 6 inches wide. and the sallaries within feet 6 inches wide, and the gallaries within them are so kept back, as to leave the ascent of the pillare unimpeded. There is also a gallery at the west end, with staircase on either hand, occupying the depth of one arch of the nave, which is therefore a blank. At the east end of the nave an arched opening 32 fact high and 16 feet broad reveals the communion recess, which, from the confined space of . the ground, is necessarily only 9 foot deep. - Friday of Public

The paipt of novel construction, approached by 10 door front A the Well'y Holiby. Thefeet by Mobel' from the rearry Holby. This fost (of Caen stand) is heat the western mid-entrance. The church has been completed, including 861. for extres, for 61. 88. 6d. above the architect's estimate—the total cost of the building being 3,4751. The accomm dation is for 1,120 sitters, of whom 35 may here-after have to make way for an organ. The clear internal dimensions of the church are, from east to west 87 feet, and from north to south 68 feet.

THE BUILDER

WESTMINSTER COURT OF SEWERS.

ON Friday, Dec 5th, a Court was held. The collectors presented their reports, and the clerk declared the cash at the banker's to be 17,1761. 2s. 7d. Mr. Phillips was ordered to present to Mr. Dowley a report of the most faulty sewers in his districts to which he alluded in his report in the Book of Informations.*

A long discussion took place between some pplicants for leave to enter a sewer built by Mr. Ponsford, who produced to the Court his account of the cost to him of the sewer, 592 feet, second of the cost to him of the sever, 552 feet, 8111. 10s. 6d.; the digging he charged at 3s. a cubic yard, the brickwork in mortar at 151. 4s. 6d. per rod, and the brickwork in cement at 171. 3s. 6d. per rod. The Court thought his claim excessive, and ordered the surveyors to measure the work and the custom rod. measure the work, and the question was ad-journed to a future day. The question as to works likely to be done

and materials to be required, was again dis-cussed, and Mr. Allason having assured the Court that Mr. Bird had had sometimes two and sometimes three establishments, Mr. Leslie carried the Court with him, by shew-ing the vast amount of the works above 500., already provided for by special contracts, the expanse of cleansing sewers and gullies in the antiquated way, without a check on the expenditure, amounting to 2,000, per annum, and deducting this, included in his plan as a labour account, from the works above 501, it left a comparatively small amount of works to be done by the new establishment, and which it was still further proposed to reduce by a tu-bular system of gullies. The honourable cam-missioner stated, that every foot of the present gully drains took twenty bricks, and the average cost was one penny per brick. The sur-veyors' report was then read, without the schedule of materials, and Mr. Leslie moved, and was seconded by Mr. Thomas Leverton Donaldson, "That the surveyor be authorized to procure the necessary materials and other matters contained in his report, from time to

matters contained in the report, from time to time, and report at each meeting of the Court the amount so supplied." Carried nem. con. Mr. Wm. Donaldson's motion to prevent the clerk from printing any paper without the order of the chairman then came under dis-ementor, in the midst of which it was moved and carried that the Court do now adjourn.

LIGHTING MINES BY ELECTRICITY .-- M. Delarive has successed in obtaining a brilliant light for lighting mines by the galvanic bat-tery. His pile is composed of several concen-tric cylinders, of copper or platina, separated by porous cylinders, of copper or platina, separated by porous cylinders, and forming a series of four or five couples. An amalgam of liquid zinc, or, what is preferred, an amalgam of potassium, is the positive metal; and a solution of sulphate of copper, for copper cylinders, and a chlo-ruret of platina, for platina ones. The diffi-rultion meintiging constant light have been culties in maintaining constant light have been overcome by employing small hollow cylinders of coke, similar to those used in Bunsen's pile, of coke, similar to those used in Bunsen's pile, but smaller, and arranged like the wicks of a lamp. A ring, or disc, of metal is placed above these, and of the same diameter; and the electric current thus passes between the two. The current must be made to pass from the çoke cylinder, that the particles of carbon which are carried off may fall again with their own weight. The whole is placed in a glass globe, which must be hermetically sealed. There is no occasion to form a vacuum in it, as the small portion of oxygen is so soon absorbed; but it must be carefully excluded from the outer atmosphere. The pile is fitted with two metallic wires—one communicating with two metallic wires—one communicating with the cylinder of charcoal, and the other with the metallic-conductor.—Post.

SOME EFFECTS OF THE RAILWAY MOVEMENT.

WE find the following suggestive remarks in the Railway Review of the current month :---

"We are not opposed to railways or railway terprise. On the contrary, we hold that the enterprise. On the contrary, we hold that the present railway movemant, reckless as it is, will produce a revolution in this country as comprehensive, as sweeping, as important, as any political, meral, or economical revolution that yet has been enacted in the world. An entire new race will spring up with the entirely new genera of roads. A new opening for the exercise of intellect, a new road to eminence, and an infinity of space and materiel for the employment of men's energies will be, hay is created, by the new system. We are present at the birth of a new aristocracy. And as force was the patent by which the old won and heid its lofty position, so in these days of ours, will a similar, a virtual position, far more ap-fluential, be won and held by the controller of force—Intellect. Wealth, possessions, una-sisted by mental power, if only of the lowest order, is in the descending scale, while com-parative poverty, backed by wit, intelligence, and that quality which will, if it exiat, manifest itself in whatever it be employed on—Genium, is rapidly ascending. The director or chafty man of a board must gain and maintain the rank by talent, or he is soon discarded. "He must know and do. He must think only in so-far as it shall lead to profitable scion, and not enter the regions of impalpable specular-tion. He must work hard if he do his duty, he mats at honestly if he would preserve his reputation. He cannot uphold himself in the routany in which he has thrust himself by acting idleness. There all is boatle, activity becomes absolutely necessary to self-preserve-tion; if he be inert, he will be infallably' crushed among the coges and swift-whirting wheels in that scheme of perpeturit motion, which he has attempted is erest, guide, and sustais: No; show decess, application; all things, float in all degrees of density. They necessarily form important adjuncts to all our affairs. They have provided a cromplication so complicated, that as fast as new of therestion another confuses it, thus furnishing themselve enterprise. On the contrary, we hold that the present railway movement, reckless as it is, will produce a revolution in this country as far more important class is created in angineessive and surveyors; that is, taking our view of the railway revolution---namely, as ocholucing to: the progression of man, and furnishing wheley some and elevating occupation for the mastel energies and powers. This is an outbity note for the some of our aristocracy, like the obuited and the army, but, for the aspiring and intelli-gent among the powers middle diasees, and the humblest poor themselves. Here no pa-tronage, but that of genius, no influence, but that of known, and experienced ability to to his work, can obtain the man of anisors and the nost difference in a solution of the solution party interference, can evalue, That man whe is the most difference in other the solutions and party interference, can evalue, the solution of ronk and conventional influence. Here whe is the most difference, can evalue, the solution and party interference, can evalue, the solution of most weighty and legitimate qualifications for-office, honour, and its of some conventional rank and conventional influence. Here here there is hope for, the wong man who would ive a life of labour in the full exercise of his-intellectual feaulties; who would rether here employment at helf the water of the work of intellectual faculties; who would rather here employment at half the walkes of it by the to

682

Sec. 62

tained by his own ability. they twice the sum gained by the intersession of another, for doing bothing but that which in level with the commounds out man water in term with the court monest capacity. It is in this point of view, that we estimate so highly the point of view. for pool in the railway revelution. It pro-mises intellectual exercises and labours, for our, pepulation. It is mind that is evolved by the spread of steam communication. It is mind, though not of the highest order, that will sale the new confederacy. It is mind; matasels dailing, her highest effort, that is, and will be called into play to an extent hitherto un-equalled. It is stirring even the country singles; exciting the more active, but still plodding citizens of the country towns. They are auxious, fevered, activity, and it present maqual to the hour. Hence many are, the prey of swindling cormorants, who, thanks to also evanescent many of dathered, which hansat long retain one form, will be a short-lived race." population. It is mind that is evolved by the

RAILWAY INVESTMENT.

UNDER this head, the Westminster Review for the present December has an article which will be read with much interest by the hundreds who are at this moment contemplacing the state of the abare markyt with fear and thembling. To The jobjace is to show, that, the army of the Where is a value to more subor gover the and the second of the second seco

"What's, puchloned on 5 of that ither subrid noise Eet us hote, "says the writer, it that from "Whatever cause they may grise, the steriations "Br'confidence and Distruit in affairs of con-"Brees are as constant and certain suche the Berce are as constant and certain suche the and flow of the tides. Success has always led and now of the fides. Success has always ted to overtrailing; sometimes in tes, sometimes in 'tallow, and now in railroads, and overtaining and panic have succeeded each other strin torvals of searcely five years spart, we believe 'Point he days' of the merchants of Type and Sidon down to out own. It may; therefore Sidon down to out own." It may, therefore, " be assumed as 'an exiom, that spanic, is the "at's price greatly below its arcrige value and " him off fail flower, and inay, indeed in many " have first first in secret of the secret at large " him field for the secret of the secret at large " him field for the secret of the secret at large " him field for the secret of the secret at large " bij talists." They buy when there are no other buyers; and when all the world "are " segre to buy, they they their heads bobly and sell. Let us Wesrly understand our position. We have arrived at a new epoch in the his-tory of the world. If they epoch in the his-tion of hetters, ds was the printing press, as was the steam engling, so is the valway in the after the world. If is a revolution among nations. A noral revolution as affecting the "different fundwinding, the interchange of so-

difficient of Ruo whedge, the interchange of sothe relations; the perpetention of peace, the extension of resolution in all the velations of property."

We have already pointed out the following t to do so), but it may, nevertheless, be usefully repeated :

"The change new in progress is that of supersedingistone roads by iron roads. The first road was a trick ; the second one made with hard had rough materials, sometimes paved, and there fredently thrown beer upon the ground; the third's inacadamized road; and the humber of private Bills spiled for be-tween 1829 and 1833, for roads of this con-struction was 340 of 1833; for roads of this conof turnpike-roads in Great Britain alone, and the pablic roads of all skinds (including both erose country proads and transise roads) in Great Britain and Breamd extend to a length of somey here about 150,000 miles ! We have now stooroneer dahere as an on stands, for the granten naw of them, into iron roads as speedily as may be practicablen, and possibly (as the disposition to travel increases with facilities of

terenet \6 is the work Englishmen have set themselves to do, and the this generation, for the again, they will do it." benericug Jaci sont limitud to the second set of a second set of a

BUILDING STATISTICS.

BUILDING STATISTICS. SIE,---Will yeu have the goodness to state how many bushels of caments and, how many bushels of sand, are counted in a god of 272 feet of brickwork, reduced to 1 brick thick, When dement only is used, when cement, two-thicks and sand one-third; when cement, one-half and wand one-half, or in equal, pro-portions; when comant; one-third and sand two thirds.

two-thirds. Several books name the quantity, of compari-to a red, but all that I have even are uselyes, from not naming the proportion of sand on which the calculation is founded. Builders differ so much in their statements, and some are so energyerated, that it would be more setisfactory to your readers to have data, on which they can place more reliance. A few of these sort of particulars, provided the data may de implicitly depended on, would be of great use in essimating; setch, for instance, as the fol-leving:---The number, length, and scanlings of pantile lather in a bundle; the number, lengths, and sizes, of ingle, and double lathe in ditor; the member, fingle, and weights of hengths, and sizes, of single, and double laths in ditto; the mumber, sizes, and weights of various materials is entrin , hence, and weights of of work: the lengths, sizes, and weights of hoop-iron per handla; for band, and iron, soagies; the weights and sizes of nails, apikes, and screwn, dib Sobold, da, is, ; the quanti-ties of lime, hair, and sand, in one coat render, or lay: ditto in a yard of floated work, one coat and two coats, and in hold weights, sizes, and and two coats, and in hold weights, sizes, and qualities of tiles, slates, &c. Bliess, and athers, would be extremely useful in a tabeler form. But at another

in a tabaier form. But at present I seek most

THE BUILDER.

THOS. MILLINGTON begs to inform his Friends, that he still continues to manufacture the above in the same manner, and using only the best materials, that have given so much satisfaction for many years past. Every article will be made in the best manner, and the very lowest price charged. Lists may be had upon application. Drawings prepared.

FOREIGN WINDOW GLASS. THOS. MILLINGTON begs to inform his friends, that he continues to receive weekly large consignments of FOREIGN GLASS, which he is determined to offer upon the very lowest terms. Address, 97, Bishops-ghte-street Without.

PLUMBER'S BRASS WORK, WATER-CLOSET PUMPS, &.-These articles require the greatest attention and care in the manufacture, and will be found superior and cheaper than at any other manufactory. Best Pan Water Closets, 34s. ; 24 Lift Pumps and Planks, 44, 10s. od.; 3-inch Pumps, 54. 10s. od.; 3-inch Bill Ball and Stop Cocks, 30s. per dozen, and every article in this branch equally low. Every article warranted.-Address, THOS, MILLINGTON, 87, Bishopsgate-street.

VARNISH

THOS. MILLINGTON begs to inform the THOS. MILLIINGTON begs to inform the can be had at his Manufactory, of the best quality and at the very lowest price. T. M. has long been a manufacturer, and has devoted much time and attention to it, using only the best of gums, and sparing no expense in the manufacture. Fine Pale Oak or Wainscoat Varnish, per imperial gallon, 10s.; Fine Carriage Varnish, 12s.; Coogl. 18s.; Body Copal, 24s.; Gold Size, 10s; White Hard, 18s.; Brown Hard, 18s.; French, Polish, 18s. per gallon. Paint, Dryers, Colours, ready and ground, and every article in the trade. If quality is taken into consideration, this will be found the cheapest house in London. Address, 87, Bishopsgate-street Without.

ARNISH .--- It has long been a desideratum WARNISH.....It has long been a desideratum amongst the consumers of Varnish to obtain a good and genuine article; brilliancy, facility of drying, hardness, and darability are the qualifications necessary, but these are seldom if ever found united. The experience of a life-time devoted exclusively to the manufacture of this article, the great and important discoveries of modern chemistry, and the daily improvements in machinery, have enabled Mesars. George and Thomas Wallis to produce Varnishes (both oil and spirit) unrivalled in every respect, and they confidently recommend them to the trade, as deserving of notice both in price and quality. Builders, Coachmakers, Painters, and others may depend on being supplied with a genuine and unadulterated article. Fine Oil Varnish, from 10s. per gallon; best White Spirit Varnish, 91s. ditto; Best Spirit French Polish, 20s. ditto; White Lead, Oil, Turps, and Colours of every description at the very lowest prices...-WALLIS'S Varnish, Japan, and Colour Manufactory, 64, Long-acre, one door from Bow-street. Established 1750.

WALLIS'S PATENT LIQUID WOOD ALLIS'S PATENT LIQUID WOOD KNOTTING. — This newly-discovered Liquid Composition which Messrs. Geo. and Thos. Wallis have the satisfaction of introducing to the trade, possesses the im-portant qualification of effectually stopping Knots in Wood, however bad, and preventing them eating through and dis-figuring the paint above. Many substances have been used and much time spent in endeavouring to find a cure for a bad Knot, but hitherto without success. Messrs. Wallis therefore feel much plea-sure in offering to the public an article so long and anxiously called for.

called for. In the application, skill is not required; a boy can use it as well and effectually as the best workmen; it is put on to the work with a brush like common paint, can be used in all climates and situations, and does not require heat. Sold wholesale and retail, by Messrs. G. and T. Wallis, Varnish, Japan, and Colour Manufacturers, No. 64, Long Acre. Price 20s. per gallon.

O ARCHITECTS, ENGINEERS, CONTRACTORS, BUILDERS, MASONS, AND PLASTERERS, MER-CHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL. TO

BOILDERS, MASONS, AND THEORERS, MES, GHANTS, SHIPPERS, AND THE PUBLIC IN GENERAL. JOHNS and CO.'S PATENT STUCCO CEMENT.-The following are the positive advantages possessed by this Invention over every Cement hithurto in-troduced.-It will effectually resist Damp. It will have regested by this Invention over every Cement hithurto in lever crack, blitstr, nor peel off. It will form a complete Stone casing to any Building covered with it. It so closely resembles Stone that it is impossible to detect it. It sever requires either to be painted or coloured. It will know fresh and good in the cask in any Climate for any number of years. It is the only Cement that can be depended upon for export. It is the only Cement that can be depended upon for export. It is the only Cement that it is larger Proportion of Send than any other Cements begin to periah. It may be worked through the Winter, as froat has an office upon it. It may be used on the Inner Walls of new Houses, which may be papered over or painted directly. Roofs had or pointed with this Cement will remain usdamaged by the severat Storm. Any Plasterer may apply it, the Instru-tions for use being very elear and distinct. The first cost of this material does not exceed that of the chespest Cemants valuable advantages, nothing can approach it in point of economy. Architetta and Builders who have used this Cements have

Now in the joint with all the above-instead extraordinary and valuable advantages, nothing can approach it in point of economy. Architects and Builders who have used this Cement have declared that it requires only to be known, to be universally preferred. Byociment and its mode of application, together with a volume of Testimonials from every part of the Kingdom, may be obtained on application to MANN and CO., SOLE AGENTS for the Passitose, 5, Misichelane, Queue-street, Cheapside, London : of whom also may be head. JOHNS and CO.'S PATENT STONE-COLOUR STUCCO PAINT, expressly intended for this purpose than or other Cements, and which have become dirty and disco-loared. It is in every way better suited for this purpose than White Lead Paint, which will frequently everse. Of in fakas, MESSNS. JOHNS and CO.'S PATENT FAINT having an effinity for Sincco, binds itself with it, stopping the success, intervolvendering a pure stone-like effect, and in the finish producing a pure stone-like effect, producible by me ether Paint whishers. It is a chapten, and may be used by any Painter, used in the most exposed Marine situations.

TO ENGINEERS, ARCHITECTS, AND CON.

TRACTORS. GREAVES'S LIAS CEMENT an GROUND BLUE LIAS LIME, at 3, South Whan Paddington, London, and Works, Southam, Warwickahire Agent for Liverpool, Mr. W YLLE, 56, Gloater street, di for Manchester, Mr. J. THOMPSON, Back King streed ditto for Chester, Mr. J. HARRISON, Linen Hall-street. and

A TKINSON'S CEMENT.— The public is cellent Cement, which has now been in use for Architectural and Engineering works upwards of thirty years, is reduced to as. 8d. per bushel, and may be had in any quantity at Wyatt, Parker, and Co,'s Whart, Holland street, Surrey side of Blackfriars-bridge. N.B.— This Cement being of a light colour, requires no arti-ficial colouring or painting, and may be used for stucco with three parts its own quantity of sand. TKINSON'S CEMENT .- The public is

PORTLAND CEMENT, which does not District and regards and colouring, is perfectly by-draulic, and resists the action of Frost. The cost of the material and of working it is about the same as Atkinson's Cement, Manufactured by J. B. WHITE and SONS, Mil-bank-street, Weatminster, and sold at their Warehouses :--Druce's Wharf, Chelsea, Bell's Wharf, Chelsea, Bell's Wharf, Chelsea, Bell's Wharf, Deptored bridge, same Albion Wharf, Deptored bridge, same by Salmon and Co., Dublin, and at 36, Seel-street, Liverpool.

And at 36, Seel-street, Liverpool KEENE'S PATENT MARBLE CEMENT. WITHOUT noticing CAUTIONS, which are as absurd as they are uncalled for, or disperving sections, which carry with them their own refutation, the philos material will very advantageously stand the test of the sections, which carry with them their own refutation, the philos material will very advantageously stand the test of com-parison with any cement of a similar nature, however IN-VALUABLE, now before the public. They derive this point of Hyde-park; on the Brompton estate, and in many other public and private edifice, both in London and the country. Amongst others may be mentioned the works re-entity executed at the Colosseum, Regent's park, where its hardness and beauty of uppearance have caused it to be ex-tensively used for skirting and other mouldings, in place of void, for columns instead of marble, and as a substitutes tor store in paving the floore of the corridors and conserva-tion. Patentees and manuficturers, J. B. WHITE & SONS.

patentees and manufacturers, J. B. WHITE & SONS, Milbank-street, Westminster,

POLONCEAU'S BITUMEN PAVE-MENT for paving Foot walks, Tarraces, Gardan walks, Stables, Coach Houses, Granaries, Corn Stores, and Salt Warchouses. For the exclusion of Damp and Vermin in Basements it is particularly adapted, and for Roofing Dwell-ing Houses, Porticos, Balconiae, and Sheds. Price St. 6d. per square yast. BITUMEN for covering the Arches of Bridges, Calverts, See Ac. on Ballways and other places (with instructions for hying it down), may be had at the rate of 44s. per ton, by applying to JOHN FILKINGTON, 16, Wharf-room, City-road.

TO ARCHITECTS.

IN consequence of many complaints having veen made to the Company, by Architecta, of a spurious material having been used in the execution of Works where the USYASEL ARTHALTE had been specified for, the Directors, with a view to ensure the fulfilment of any such specification, have anthorised CERTIFICATES to be granted to Builders

SEYSSEL ASPHALTE

SEVSSEL ASPHALTE has been used. For the purpose of scenaring the use of the Gennine Article, Arghitects and others are recommanded to insert in their specifications the "Seyssel Alphalte, Cla-ridge's Patent," and not marryly "Apphalte," ar "Bitu-men," as in many cases where these terms have been used, gas-isr and other worthless and offensive sempositions have been introduced. I. FARELL, Sceritary. Strangate, near Westminster Seyssel Asphalts Company. Bridge, Jan., 1845. Books of Instructions for Use may be had at the Office of "The Builder," and of all Booksellers in Town and Conarty, price 1s.

.....

"..." In proof of the necessity of the above advertises, in "..." In proof of the necessity of the above advertises, in may be mentioned, that it has come to the knowledge of the Directors, that in certain works which have been associated by Mesers. GURTHS, builders, of Stratford, a spuriess material has been used by them, contrary to the specifications, which expressly mentioned, that "Clarkings's Asphalts" tras to

expressly mensioned, that "Clarkings's Asphales" was to be used. Also in the case of a work at Lewisbans encosted by Mouran ROBEET and DANIEL TOUNG, of 10. Crownares, Walworth-road, where Scyssel Asphalte was specified for, a spurious article was nevertheless inid down by them.

1

N Saturday last, a cause was tried before Lord Denman, in the Court of Queen's Bench, having considerable interest for the architectural professiou. Mr. George

Mair, the architect, was plaintiff, and Mr. Ward, a geatleman of fortune, residing in the Isle of Wight, was defendant. The action was brought to recovar a sum of about 511*l*., alleged to be due from the defendant to Mr. Mair, on account of services rendered in his professional character.

Adopting the substantially correct, abstract of the case that was given in The Times, it appeared from the evidence that the defendant had some years ago employed Messrs. Morgan and Lee to construct a mansion upon his demeene at Northwood, and that those gentlemen had furnished the original design for the building, and superintended the construction of the carcass of the house. The defendant, however, interfered very minutely in all the details of the proceedings, and Mr. Lee found his time so much occupied by this particular case, that he was obliged to resign. In these circumstances, Mr. Ward was introduced to Mr. Mair, then, in 1838, a young man who had been but a few years in the practical exercise of his profession, but who enjoyed a high reputation among his professional brethren. Mr. Mair having undertaken the conduct of the work, proceeded to perform all the duties of his position up to a recent period; when he resigned the engagement, in consequence of a difference between himself and his employer as to the principle upon which he was to receive compensation for his services. It did not appear that any contract, either expressed or perhaps implied, had been made between the parties upon this important subject. Mr. Mair alleged his expectation to be that he was to receive a commission of 5 per cent. upon the whole sum which might be expended in carrying his own designs into execution, together with his travelling expenses to and from the Isle of Wight, and a compensation of two guineas a-day for the time actually occupied in going and returning. Mr. Ward, on the other hand, supposed that the compensation in all departments of it, was to be nothing but what his own judgment should approve and his "generosity" bestow. At the time when the final difference and separation took place, he had given to the plaintiff several sums of money, amounting altogether to about 1,100%, beyond which, the plaintiff claimed about 500l. more.

The charge made was 5 per cent, on 23,000*l*.; 1,150*l*. and 540*l*. for travelling expenses, time, and money expended for the defendant.

The plaintiff produced a number of witnesses to prove the performance of the works, and that the principles on which he claimed payment were universally acted on by the whole architectural profession; these included Mr. George Smith, Mr. Tite, Mr. Shaw, Mr. Little, Mr. Wyatt, and Mr. Scoles, who all bore testimony to the excellence of more than 400 drawings which had been made for the works. Mr. Wyatt, who had seen the progress of the building, said he would not undertake to make the drawings for a thousand pounds, and Mr. Tite, THE BUILDER.

to whom the plaintiff is much indebted for powerful assistance, declared they were worth 1,400%. The works had been in hand several years, and the greatest attention had been paid to the matter by the plaintiff during the whole time. It may be well to mention, for the full understanding of the case, that the defendant had refused to allow an examination of the premises, so that the plaintiff's witnesses were compelled, in order to judge of the fairness of the charges, to obtain from the drawings the cubical contents of the buildings, and put such a sum per foot as they thought just.

The Attorney-general, on the part of the defendant, called no witnesses. Lord Denman, in summing up, told the jury, as he had previously urged during the trial, that, although the architects had all deposed to the existence of a custom to pay a commission upon the outlay, such custom could not bind the defendant, unless at the time of making the original engagement he understood that such were the terms upon which compensation was to be made. His lordship's argument was, that this mode of charge induced dishonesty, by making it to the interest of the architect to swell the sum as much as possible, for the sake of his commission! It might be custom, he said, but it certainly was not law. The question, then, for their consideration was, whether the plaintiff was in justice entitled to a larger sum than that which he had already received for the services which he had performed. After a short consultation, the foreman of the jury said : "We find a verdict for the plaintiff for the whole amount claimed ;"-without any reference, so far as we can learn, to the question of per centage.

The uncertainty which exists as regards architects' charges is embarrassing and hurtful, and calls for removal. Custom is strong : next to law the strongest; but in the face of the opinion expressed by Lord Denman, few would go into court with the view of enforcing a per centage, unless able to shew, by the time occupied, or the actual worth of separate services performed, which is not always practicable, other grounds for the charge. Lord Kenyon ruled, long ago, that a per centage could not be recovered; and Lord Ellenborough, in the matter Chapman, Gardiner, and Upward (architects) v. De Tustet, tried in 1817, ruled, that it could be; and the jury gave damages after the rate of 5 per cent. upon the total amount of the bills."* In "Starkie's Reports" it is said, relative to this case, that evidence was given that this was the usual mode of charging for the description of business done, and that Lord Ellenborough left it to the jury to say, whether this mode of charging was vicious or unreasonable; and if they thought it was, to deduct accordingly. Mr. Scarlett, on the part of the defendant. urged that it was unreasonable to suppose that a surveyor could be entitled to a remuneration fixed upon the amounts of the bills which he himself was to regulate and settle. It was his interest to swell the sum as much as possible for the sake of his commission; and therefore, he contended, that the plaintiff's demand was not founded in justice.

The assumption of Mr. Scarlett then, and of Lord Denman now, is in reality worth nothing: it is absurd to suppose, that any architect would waste a hundred pounds of his employer's money, and sacrifice the feeling of having done his duty, for a trumpery five pounds. A real objection to this mode of charge would seem to be this—that an architect's ability or standing in the profession goes for nothing. Mr. Brown, Jones (no Inigo), or Robinson, who makes drawings and superintends the crection of a huge warehouse, costing ten or fifteen thousand pounds, and Mr. William, of Wykeham, who designs and carries out a gem of a chapel with an expenditure of a tenth of that sum, are paid very differently by this system : the latter might require scores of drawings where the former needed one, saying nothing of the higher order of mind exhibited, while the remuneration would of course be but a tenth part. Not that a true artist,--one who loves his profession,-would ever think of this, or hesitate a moment between two such works if the choice were offered to him; still this is the pounds, shillings, and pence state of the case, and does not seem to be wholly correct.

Without, however, proposing any alteration in the mode of charge usually adopted, it does appear to be very desirable that its legality or otherwise should be set at rest. The custom is general, and the public know it. Lord Dane man says such custom will not bind, unless at the time of making an engagement with an architect, the employer understand that such: are the terms upon which compensation is to be made. It is not the custom to enter into an' agreement with an architect when his services are required any more than it is with a solicitor, but the mode of charging being universally known, we must consider, with all deference to his lordship, that it is understood by an employer if no other terms are stipulated.

The newspaper report states that the jury gave a verdict for the sum demanded, with intimation that it was not founded on a right to the commission, but upon the general value of the services which the plaintiff had performed. This, however, we venture to doubt, —certainly nothing was said by the intelligent foreman in delivering the verdict to induce this belief.

A committee was appointed by the council of the Institute of Architects, last session, to inquire into various points of professional practice. We cannot help thinking it would be advantageous, although we know others view the question differently, if this committee were to state the ordinary charges of the leading architects for different services. That a difference of opinion exists on various points in this respect (without reference to the charge of five per cent. on amount expended, for certain understood services), was shewn in the case before us. Mr. Mair claimed, in addition to the five per cent., the travelling expenses, and two guineas a day for the time occupied in the journeys. All allowed the first, as a matter of course, but with respect to the latter, the practice of his witnesses differed.

We will venture to say, there is not an architect in practice who has not desired to know, at one time or another, what was the ordinary charge of other architects for some particular service.

We shall be glad to assist in supplying this want, and therefore solicit members of the profession to favour us in confidence with a memorandum of their customary charges, and any remarks on the subject that may occur to them,—not to be put ferward in their names, but as materials for some general deductions.

SUPPLY OF WATER.—A local paper says, the directors of the South Shields Water-works purpose, if three thousand families will agree to take the water, to supply the working classes of the town with water ad *livium* at the rate of a penny per week.

[#] Quoted in Elmes's "Architectural Jurisprudence."

606

THE BUILDER

THE PUBLIC HEALTH.

DR. GUY, in a lecture on the Unhealthiness of Towns, recently published by the "Health of Towns' Association," gives the following

"1. That the districts inhabited by the paorer classes are badly drained and badly cleansed. That in the houses of the poor there is a

eat want of all the conveniences which contribute to cleasliness and decency,-an ample supply of water, efficient house-drains, and cee for the reception and discharge of refuse matter

3. That the rooms inhabited by the poor are over-crowded and ill-ventileted.

4. That the shops and workshops of the poor are also very imperfectly ventilated, and in other respects extremely unwholesome ; and that these evils are often greatly increased by long hours of work.

5. That in the districts inhabited by the poorer classes there is a great want of open spaces for exercise and recreation.

6. That the evils attendant upon scanty sup-plies of water in the houses of the poor are exaggerated by the want of cheap bathe and washing places. 7. That the several evils enumerated in the

six foregoing propositions, and the excessive liability to sickness, high rate of mertality, and curtafiment of human life, specified in the first four propositions, stand towards each other in the relation of cause and effect.

The economic results of the circumstances

the poor themselves, arising from loss of work or of situation, and the expenses attendant upon unnecessary sickness and premature death. 'nΤα which may be added, the increased contributions to benefit societies, rendered necessary by excessive sickness.

2. A heavy annual expense entailed upon the community in the shape of large contributions to hospitals and dispensaries, and the general charities of large towns, and of increased assessments to the poor-rates. 3. A loss sustained by the Government, in

consequence of the diminished physical power and greater liability to disease of recruits raised from among the inhabitants of large towns. 'To which must be added the expenses necessarily attendant upon the crimes springing out of the unfavourable physical circumstances, d consequent noral degradation of the poor. The moral and religious effects of the cirand consecut cumstances already detailed are :---

1. The sacrifice of self-respect, and the formation of had habits, among which the vice of intoxication holds a prominent place

2. An absence from schools and other places of instruction, from places of innocent recrea-tion and amusement; and from places of wor-ship, from a want of the means of cleanliness and

and of decent clothing. 3. A large amount of crime, directly pro-duced by over-crowding, and the admixture of persons of both sexes, and of all ages, in small and confined rooms.

The remedies for this fearful combination of evils, physical, economic, and moral, are partly in the power of the sufferers themselves, partly in that of landlords and employers, partly in the power of associations, and partly in the power of Government alone.

The remedies which the labouring class have at their own command are these :-

1. The disuse of intoxicating liquors, and the areful avoidance of the temptation to drink them under whatever shape it may offer itself. 2. The disuse on the part of mothers and nurses of Godfrey's cordial, children's quiet-ness, and every preparation of that class, what-

ever be its name. 3. Scrupulous cleanliness as far as the means of cleanliness are provided; personal cleanli-ness by the occasional use of warm baths; daily washing of the entire surface of the body with cold water; washing of the hands after work, and of the face, hands, and feet before retiring to rest; a frequent change of body and bed-linen; and household cleanliness.

4. The prompt removal, as far as it is prac-ticable, of all slops, and every kind of refuse

The practice of ventilation at all seasons of the year, by opening the doors and windows the first thing in the morning, and thoroughly airing the bed-clothes for a short time before retiring to rest; the introduction into the win dow of a perforated zinc plate, or other cheap and effectual means of admitting fresh air, without occasioning too much draft; and leaving the chimney open. 6. The choice, where it is practicable, of a

large and lofty room, preferring the higher stories of the house; and where it can be done without inconvenience, choosing a residence in the suburbs. When there are many in a family, making any sacrifice to secure two or more rooms

7. When there is a choice of employments, to avoid sedentary occupations, and those offering the greatest temptation to drink; where there is a choice of masters, preferring the one whose rooms are largest and best ventilated, and whose hours of work are most moderate; in those cases where work may be done either at home or at the workshop, to do it at home. The remedies which are in the power of

landlords and employers are these :-

1. The landlord will best consult his own pecuniary interest, at the same time that he will discharge a bounden and most grateful duty, by keeping his houses in good repair, supplying them with water and all proper con-veniences, and securing, as far as it is in his power, efficient cleansing and sewerage. He should also whitewash the rooms at least once a year; and should take care that, after the visit of any contagious, disorder, they be tho-roughly cleansed, fumigated, and ventilated. His pecuniary reward will be higher rents, and those rents better paid; and he will reap the joint recompense of justice and mercy.

2. The employer may do the same good on great scale, and reap the same rewards, by giving his workmen room to breathe, keeping his chimneys open, selling his stoves, hot water and hot air apparatuses, and returning to the good old English open fire-place, with its true economy; conducting the foul air of gas-lights, if he use them, into tubes fitted for its discharge, and resorting to some efficient means of ventilation. In large establishments the open fire-place will entail too great an expense; heating by hot water is therefore to be preferred ; but a free ventilation-a free entrance and free exit of air-is absolutely necessary. By paying his men on Friday, or on Saturday morning, and on his own premises; by adopting moderate hours of work; by encouraging, or, if he please, insisting on, the appropriation of a small part of his men's wages to insure them against casualties, he will be discharging high duties, and will see and enjoy their benefits. The things that are in the power of asso-

ciations may be stated thus :-

1. To promote inquiries into the actual phy-sical condition of the working-classes, and the influence which the circumstances that surround them have upon their health and well-being; to instruct the public by lectures and cheap publications, and to urge on the legislature by public meetings, petitions, and all constitutional means, the necessity of interference.

2. A very important kind of association for carrying out these great objects, is an association of the labouring classes themselves. Such an association has been recently set on foot, and from my heart I wish it all possible success.

The "Working Classes'Association" referred to has been formed in the metropolis for improvto has been formed in the metropolits for improv-ing the public health, and seems likely to effect much good. In the "First Address from the Committee," just now issued, in reply to the question, "Why is there so much discase among us?" The answer is, "Because, in numbers of things, we do just what by our nature we were never meant to do. For example :-

lst. Man is intended to draw in fresh air Almost all people, every time he breathes. when in their houses, and the working people in their shops, breathe the same air over and over sgain.* To shew the necessity of allowing fresh air continually to enter living rooms, and the bad air to escape, it may be stated that every person during each minute of his life destroys a quantity of air twice as large as himself.

2nd. Man ought to breathe pure air at every breath. Our sewers and drains are so bad, that the vapours and foul gases rise, and we breathe them.

• It is a melancholy fact, that by far the greatest mumber of houses and rooms prepared for the labouring classes to live and work in, are most hurtful to the health, and quite unfit for human beings to inhabit.

3rd. Man was intended to take emerciae in the open air every day. Neither his beart, his stomach and bowels, his liver, his akin, his lungs, his kidneys, nor his brain will act rightly without walking exercise every day. "Host of us do not get any walk, or only a very stort one, which is scarcely of any use.

4th. Man is formed to take simple, " state, 4th. Man is formed to take simple, "plaid, wholesome, food. He eats all sorts of things, which not only do him no good, but do him harm, and he drinks large quantities of beer, spirits, and wine which hurt his stomsch, and take away the proper use of his brain.

5th. Man ought to wash himself all over with water every day, so as to cleanse the pores of the skin, else they get stopped up, he cannot perspire rightly, and his skin cannot breathe. The majority of the people only wash their hands and faces every day. 6th. Man should wear clean clothes mext to

his skin, because the body gives off bad fluids. At present many people wear the same things day after day for weeks together. day

7th. Man was intended to live in the fight. Many, very many, have scarcely any fight in their rooms.

8th. Man in this climate must wear warm clothing. Many have no flannel, and are clad with heavy and useless things."

Under the head "How are the Disease to be put a stop to?" They say " "After thinking over what has been said about the causes of ill health, it must be con-

about the causes of ill health, it mins be con-sidered how the working-people can put in end to them, and it will be their that the people themselves can do a great deal, What can the work-people do? Ist, They can ventilate their monis—the plans for ventilating them will be shewn in the Address on Ventilation from the com-mittee. mittee.

2nd. They on claim assistance from the rich, so as to have good drainage in their houses, and to have proper sewers and those things necessary for the health and doceacies

of life. The TANK AND THE STAR people to provide them open appens of ground

for healthful exercises, and they can be a superior of the second
being sold. 5th. Working people, can be more clearly; they can be the and space themaelres in their houses, and they, cam petition, for a better supply of water. They, will also, make use of the baths and wath-houses preparing for them, instead of having the washing done at home, which can an avery thing they have to monifer which causes every thing they have to monider and decay.

6th. The working classes can seek, and endeavour to obtain, more light, in their homes, and they can improve upon the plans of clothing. . 9

= . COMPETITIONS P

CAMDEN TOWN CHURCH.

Sin,-Perceiving advertisements, from time to time in the columns of your admirable Journal, calling upon architects so submit designs in competition for various, public buildings, I think it my daty to direct your attantion to some circumstances monnested with the late competition for a church the be exected at Cumden Town. I think the case will justify my intrusion; and perhaps a police of it may be the weans of preventing, in source, degree, a recurrence of the causes for somplaint, and, at the same time, inform my hupther com-petitors of the jeopardy in which their designs . remain.

A limited number of architests submitted designs, by invitation, to the committee for building the new church early in April 1985, which designs were subsequently exhibited in the board-room of the commissioners in St. Pancras. Having waited with some patience until the latter end of September, I make a se-quest to two members of the committee for the ace return of my drawings; but as they failed, to comply with it, I wrote to the security, en-

A petition is now prepared for signature proving a vernment to secure Battersea fields are place for instant envoises. It may be control by the west-partia by secu-from the demassi parts of London for a penny or two petit if it is allowed to be built spon, one of the few results sources of health to the work-piople will be there for two

Digitized by GOOGLE

plaining the great inconvenience I suffered by their detention. To this I received a polite reply; but the drawings being still withheld, I arent, in company with one of the members of The committee, to the room, and took possession.

The drawings, when I was there ten days geven months before, with this addition, there were lines stretched across the room over its whole arcs, as if it had been metamorphosed into a laundry? The windows were wide open, and shirts, sheets, and architectural drawings were hanging out to dry? How often pur poor perspectives had been damped and dried I know not; but had poor Sidney Smith seen them, he would have entered into a facetious calculation as to the number of washings they had endured. Once a fortnight, he would have said, is not too often to indulge in laundry; and so $7 \times 2 = 14$ would have been the result.

When I had taken down and rinsed my wretched-looking bit of stationery, I dis-covered a large hole burnt in its very centre !-a round hole with a halo of variegated scorch ! I bethought me that the committee had peradventure, in some excess of past anxiety, ironed out my drawing, and so completed the

process. (Sidney Smith, when he was injured, rebuked by a joke and pointed a moral. I think I may venture to deduce from the foregoing facts, zome, advice profitable to our brethren. To some advice profitable to our brethren. To those who have drawings at Camden Town I would say, "Run and get them; for whilst I write they may be in ablution," and to those who desirp to join in future competitions I would add (with a desire to save their hopes and drawings from a damper), "Frame and glaze your designs."

Linclose my card as a voucher for the truth of these statements, and am, Sir, yours, &c., Portsmouth, Dec. 10, 1845. C. W. F. mule issa bus 🛲

FOREIGN ARCHITECTURAL AND COL-BATERAL INTELLIGENCE. - Set Dire 40.00015

London.—It hardly needs' repeating, what is recognized now a days by all sensible men, viz. that we moderns are very much behind the ancients and even medicevals, in most things connected with the sinctural of public and private works. Look (to point again at one thing) at the breades of those mediaval Italian-aye, and even larger Belgian and Bohemian efficies. We build sheltered walks Bonemian' cities I' i We build sheltered walks ((saloons, greenhouses, &c.) for our own indi-vidual and personal benefit they did it for the convenience of all." Thus Goethe says very truly, that Italian demoorsoy went so far as even to erect balls so huge, that they re-semble a market phase hammed in and covered in by walls - such for instance. that colord? in by walls - such for instance, that splondid structure, the Solone of the Procurazis at Padua. <u>There</u>, and under the shelter of those mile-long arcades of Italian cities—met every one who choose, the *nobie* and the *citta*dino, the lawyer, physician, and artisan; all being thus combined, not into the lump of "Receiling equality, but the wise equality of a "funity; gradations pre-ordained by Omnipo-"tence. If such plans were required and deemed most essential in media val Europe-how much "more with us 1 These athletic personages, unscathed by exorbitant luxaries, ailments, and maladies without end; moreover, under the serene sky of Italy, mild sun and balmy air-We, a nation of patients, with a morthern sun who rarely deigns to look at these lands. We moderns, however, imagine and project many things which have only one defect, viz., they we rarely effectable. Thus, a plan has been mooted of late to overspread all (or at least many) streets of London with transperent arendes or galleries. The thing is absolutely impossible considering the flood of people who circulate even in such spacious streets as the Sfrand, Oxford-street, &c. ; on which account In the only more foot-passengers, but also persons "Editions, role of iron, &c., are to be taken into understore." Fancy all these hemmed in "Within the narrow limits of an arcade ! Why, supernet of and the middle inters of the people because it is impossible.

all streets are arcuica.

There is a fact necessarily to be taken into acaccount on the present occasion-viz. that one-tenth of our population, at least, are subterra neous-the dwellers in the areas, vulgo, the cellars; although the New Building Act has, very properly, curtailed the number of London moles and hedgehogs. And thus it would be required to preserve the present footpath (trottoir) and on the inner side erect those arcades --still transparent, as not to encroach at all on the ground floor and arca dwellers. The appliance of cast-iron pillars, stone pedestals, and (duty-free) glass panes, would make the whole an exceedingly convenient, wholesome, and tidy concern — invaluable for the invalid, and an exceedingly convenient, wholesome, and tidy concern — invaluable for the invalid, and any one, who, by adequate free-air exercise and sociableness, even during our constant bad weather, wishes to escape the being numbered within this category. Plenty of free-air exer-cise would soon procure room for (the fewer number of) patients in the Free Hospital. Naples.—We have been favoured with a sight of the work presented to the members of

sight of the work presented to the members of the late Scientific Congress, of which but a few copies have reached this country. It is enti-tled, "Descrizione dei Luoghi celebri di Na-poli, e sue Vicinità" (1845, 2 vols. 4to.). It is published by order of the king, and contains a very deep-wrought description of the public edifices, monuments, &c. of the above capital. A list prefixed to the work contains the names of the different contributors, according to the different branches — as public edifices of the middle ages, art, and the like. It is illustrated by lithographs, representing the most important sights of Naples, which, although not master-pieces of execution, are respectable. The Embellishments of Paris.—This notice

could be almost stereotyped, just putting new heads here and there, as there seems, indeed, an energetic system at work, to make Paris the metropolis of modern architecture and art. The works for the building of the library of Stc. Genevieve, under the direction of Mr. Labrouste, architect, were so actively pro-gressed with last season, that the façade on the street des Sept-Voies is completed. As the cold season approaches, and for the sake of protecting the blocks from the ravages of the frost, those not yet worked in have been capped appear, and form an avenue common to the two colleges of St. Louis and Ste. Barbe, the approaches to which will be improved by the widening. The places around the Panthéon will also very soon be enlarged, and the owners of houses are already treated with for their property. From these, the alignement will be made towards the new library Ste. Geneviève.

Preparations for the Monument of Napoleon Preparations for the Invaluence of Interest in the Invalides.—It is now decided, that the tomb of the Emperor will be surrounded by statues of twelve of his marshals. They will be colossal, and executed after the portraits and busts existing in the various art museums, and symmetrically placed around the imperial cataphale, thus to form a sort of funeral pageant around the monument. Government has just purchased twelve huge blocks of white marble, which are lying in the vicinity of Leghorn, and which are to be conveyed to Paris by water, for being employed for the sculpturing of the above colossal statues.— Journal des Débats.

Prizes for virtuous acts — awarded by the French Institute.—After the revolution of 1830, the French went, for a time, in the train of Ideality-to which sentiment we may ascribe the addition of a department of moral and political science to their Royal Academy of Lite-rature, and the establishment of the above prizes; the latter cavilled at, still an acknowedgment for the artisan and other servants, tempted into acts of magnanimity. Mr. Dupin, president of the R. A., had to speak on the distribution of these prizes. He stated, that it was not the province of the Academy to decide on the doctrinal merit of good actions, and that it had endeavoured to reward actions, considered virtuous according to all codes of morality. The prizes consisted in sums, and medals of the amount, of 3,000 fr. (120%), 2,000, 1,500,

and several of 500 francs.—Journal des Débuts. Meeting of the "Society of Encouragement," at Paris. 261A Nov. Mr. Dumas in the chair. This is one of the minor, yet very useful sections of the French metropolis, to be com-pared with our Society of Aris. The arissian well at Monndorf (Luxembourg) was first adverted to, whose extraordinary low expense (vide BUILDER, p. 559) bids fair to make such wells exceedingly non-erous in every part of Europe.—Princess Galitzia has sent to the society 1,000 frances, for preparing a prize on a monetary unity, more expedient than the high English pound, and the French centime. —Air. Sorel exhibited a new apparatus of do-mestic heating, which consists in a liping of the chimney by a range of reflecting bricks. Mr. S. believes, that in burning coke, a saving of 60 per cent. on the present axpense of do-mestic fires might be effected. —Dr. Boucherie read a paper on the artificial preservation of timber for rallway purposes, by the means of chemical injections. Dr. B, states his expari-ments to be coalfrance by a test of three years. The most important is, that, while hitherto merily out was used in the construction of merely out was used in the construction of rails, Dr. B. says that inferior timber can be prepared by his process to do the same service.

Remedies against Pauperism. - This sort of national disease begins to attract much of public attention, and be matter of parliamentary discussion in several of the chambers in Germany. The following heads, adverted to in some of the late debates in Meckleaburg, seem to be worthy of notice :---Cultivation of all available soil in the most approved and scientific way; the undertaking of all and every sort of public works; an aniversal dif-fusion of a sound, proceed education, and the publishing of *practical* tracts on material as well as moral topics; gymnastic schoola () and public playgrounds; savings' banks—even in minor towns and less peopled localities; temperance societies; emigration, - Allgemeine Zeilany.

Progress of Art movement in Prussia. A great sumber of artists, many of them first rate, have addressed a memorial to the of State for Public Instruction, Secretary drawing his Excellency's attention to the inad-equate patronage bestowed on the arts in Prussia; and pointing, especially, at the back-ward state of monumental painting (freeco, encaustic or stereochromic) of the Prussian metropolis, compared with Paris and Munich. Mr. Eichhorn has received the memorial with extreme politeness, scenningly well pleased with the opportunity thus given to him, to bring this important subject under the notice of the king and the Council of State, in which number of architects and other artists and literati have a seat. J. L-

MERIT IN HUMBLE LIFE NOT TO BE DISREGARDED.

...

-I find in THE BUILDER of last Satur-Sin, day week, the article sent by me, and inserted by you in THE BUILDER of the 15th Nov. has at last been noticed by one of your correspondents, Mr. T. B. Lawrence, who, after referring to the case of ventilation so successreferring to the case of ventilation so success-fully adopted by an obscure country individual, requests to be informed by "A Working Bricklayer," what is the nature of the plan, which, he observes, at present appears somewhat doubtful. In reply, I beg leave to inform the gentleman, that the obscure country individual and the "Working Bricklayer" are one and gentleman, that the obscure country individual and the "Working Bricklayer" are one and the same person, and that after the opinion of an eminent M.D. was given, and rejected for its absurdity, the opinion of the "Working Bricklayer" was asked. He gave it; his system was adopted, and though more than six years have passed away, yet not one case of either fever or small-pox has occurred in the building. though in the town where it is the building, though in the town where it is situated scarlet fever has been very prevalent lately, and many have died. I cannot exactly understand whether Mr. L. means the plan is somewhat doubtful, or the success of the plan. If he means the latter, I can have testimonials from the most influential gentlemen in this town and vicinity. If he means the nature of the plan, it certainly was not stated by me what the plan, it certainly was not stated by me what the plan or system was; nor do I intend it at present for the following reasons. Having known for some years a simple, yet certain, method of destroying the black damp, or as it is called, carbonic acid gas, in wells, vaults, vats, &c., I gave publicity to it; the first time was after the loss of two or three lives in a grave in Aldgate churchyard. Twrote to the editor, of the Globe or Sun newspaper, I forget which, an article in order to prevent similar which, an article in order to provent similar accidents. When the fatal accident happened at Barclay's brewery, about two years ago,

608

where two men lost their lives by attempting to clean out a large vat contaminated with the deadly vapour, I wrote immediately to the firm, but common courtesy was wanting; no answer was returned. Well knowing by prac-Ucal experience the certain effects to be produced, I wrote to the Society of Arts and Sciences; they saw the infallibility of the means, and on the 2nd of June last, in the Society's Great Room in the Adelphi, the "Working Bricklayer" received from the hand of his Royal Highness Prince Albert, an honorary testimonial. After this mark of public approbation, several scientific gentle-men expressed their surprise that so simple and cheap a preventive should not have been almost universally known among men of science, and that a country "Working Brick-heyer" should bear away the bell. It was not for want of publicity; I gave it was not enough. It was prejudice, that deep-rooted prejudice, existing not in London alone, though it is much too prevalent there, but in other places, against any thing emanating from a plain country mechanic. Unless a man has the title of M.D., F.R.S., or some other, let his genius be ever so great, few are to be found to give him assistance. If he succeed in crawling ip to public notice and public usefulness, it must be by dint of his own exertions. It appears as if science, or scientific men, were confined to the metropolis, and even there, to superior stations in society, but it is not so. At ingenious young man from this town during the building of St. Paul's, went up for employment as a carver. When inquiring of the workmen, he was only laughed at by them, and called a "hodge carpenter," yet he perse-vered; saw Sir Christopher Wren, to whom he shewed a specimen of his abilities as a carver, and the carved work in the interior of the cathedral was executed by this countryman. The celebrated and almost inimitable painter, Gainsborough (the son of a little tradesman born in the same street in which I am now writing), is another proof, if any were wanting, that it is not the rich or great that alone possee the talent or scientific knowledge. These arks are made not out of vanity, or illfieling, but to shew that genius or science is not confined to large cities or opulent men, But resuming the subject, having felt the effect of this too-much-existing prejudice in the case of preventing accidents in wells, &c., it operates as a bar to giving publicity to the simple method I have adopted. I am wellaware one system will not suit all cases, but the means must be adapted to the case, and according to circumstances. I have read of various plans in advertisements, and in other sources of information, devised and adspted for effectual vestilation ; in particular that absurd one of Dr. Raid's, at the Central Criminal Court; but the more I read, the more I am convinced that the one simple idea on which effectual ventilation must stand or fall has not yet been mentioned or practised from in any accounts I

mentioned or practised from in any accounts I have as yet read upon the subject. But in courties to Mr. Lawrence, I assure him, that though I decline informing him of the plans which have been adopted successfully by me, at present, yat if he will have the kindness to give me his profession or trade, I shall not have the least objection to correspond with him upon these or any other subject in which air and its effects are the principals. But for the reasons before named, I feel inclined to write again to the Society of Arts and Sciences, where its intrinsic merits will stand or fall, and where there is not that prejudice existing against those who are placed in humble situations, which too often exists in the breasts of

many, especially against countrymen. I read, Mr. Editor, with great pleasure, the manly, straightforward, scientific remarks at the concluding part of the article on the training school at Swinton; it is observed "every architect is able to receive valuable information from men of science eminent in their own walk, and is anxious to seek it." this is very true in buildings, as well as ventilation or any other science, but it is very, very seldom practised by architects. Practical scientific workmen could, if requested, give architects much valuable information. The remark, "the ventilation must be adapted to the building, and not the building to the vantilation," is equally true. I also read with surprise the emormous expenditure bestowed upon ventilating the building; po less a sum than 5,0004.

THE BUILDER

appears to have been expended upon it. I am no seer, but have my own opinion upon the system adopted. Should it be found to answer, I shall be greatly surprised. I think no man who understood ventilation would adopt the plan of having numerous holes drilled in the floors of the principal school rooms. I would ask Dr. Reid, I would ask any scientific man, whether a constant upward eurient, or rather currents of air will not rather be the constant cause of colds and sore throats, as in the case of the Central Criminal Court. No doubt fresh air will be admitted, but I should suppose at the hazard of the health of every scholar.

I am, Sir, &c.

A. J. GREEN, Working Bricklayer. Sudbury, Suffolk, Dec. 8th, 1845.

• Without any desire to interfere with our correspondent's intention, to transmit the particulars of his system to the "Society of Arts," we would make this general remark that the pages of THE BUILDER are open to all who have real information to communicate, and that to the best of our ability we will judge if it be so or not, without stopping to inquire if it emanate from gentle or simple. We have the elevation of the operative classes ancerely and warmly at heart, and will do all in our power to advance it. If we can aid struggling merit, it will at all times be a satisfaction to us to do so.

BRICKWORK IN ASPHALTE.

LEABNING that the Seyssel Asphalte Company were engaged, under the superintendence of Mr. Mylne, in building, with asphalted brickwork, the interior of a new reservoir on Highgate Hill, we made a pilgrimage a few days ago to that now distant spot, which, measuring by time, has been removed, thanks to railways, as far from London as Windsor, for example, used to be. We found the reservoir nearly com-pleted, and apparently a very satisfactory work. It is 100 feet square at the top, and 13 feet deep. The bottom was puddled with clay 18 inches deep, and laid with 9 inches of brickwork in mortar, with a course of bricks flat, in asphalte, on that, covered with asphalte half an inch thick. The sides (sloped at an angle of 45 degrees), consist of two 42 inches of brickwork, in mortar, laid against the earth, with a third 41 inches in asphalte, covered on the face with half an inch of asphalte, as at the bottom. The top of the brick sides is coped with asphalte sprinkled with grit.

The facing of asphalte was given to each brick before it was laid, by putting a number of them close together in a frame, and pouring over them the required thickness of asphalte. The bricks were then separated, and each laid with asphalte, the joints being afterwards pointed up with the same material. In laying the bricks care was required to keep the face even, and it was found necessary to hold each brick in its proper position about half a minute, till the asphalte had set. This application of asphalte, somewhat novel in this country, promises to be of considerable value.

HEDGEROW TIMBER.—It has long been a question, whether a loss is not sustained in growing hedgerow timber. The following calculation, made by Mr. Isuac Foster, of Great Totham, Essex, a gentleman of much experience, appeared last week in the *Chelmsford Chronicle* :—

| £100 | 0 | 0 |
|--------------|--|--|
| 70 | 0 | 0 |
| 170 | 0 | 0 |
| 100 300 | - 0 0 | 0 |

So that the proprietor of 1,000 acres loses more than six thousand pounds by letting it stand. RAILWAY NEWS FROM PARIS. [PBOM QUE OWN CORRESPONDENT.]

THE statutes or by-laws of the Straebourg and Nantes railway companies have just been published. The capital of the former is fixed at 125,000,000 fr., divided into 250,000 shares of 500 francs each. More than one-third of the shares stand in the name of Englishmen, but is consist of fost Facilishmen hold a much but, in point of fact, Englishmen hold a much greater number, several of the largest French holders—Rothschild, Hottinguer, Laffitte, for holders—Rothschild, Hottingder, Lamite, for instance—representing our countrymen. The capital of the Nautes company is fixed at 40,000,000 fr., divided into 80,000 shares of 500 francs each. Nearly 30,000 shares stand in the names of Englishmen, but, as in the case of the other company, they really and truly hold a much greater number. The ad-indication which conferred these two really are judication which conferred these two railways upon the respective companies has been approved by royal ordinance, and nothing now remains to be done but a further approval by ordinance of their statutes, to give the compa-nies all their rights and privileges, and to esta-blish them as societés anonymes. Some of the Strasbourg companies, in rendering to their subscribers the sums overpaid as deposit, think right to deduct two, four, and even eight sons (4d.) per share, under the pretence of covering. the preliminary expenses, as if the interest on the sums paid up were not amply sufficient for the purpose. One of them has even had the monstrous audacity to keep one franc, 5 sous on each share, to make up for losses, occa-sioned by Bourse transactions, Iteally one is astounded at the iniquity of such a demand, when it is remembered that to presume to speculate at all with the money of the ahareholders, was a most scandalous breach of trust.

One question remains to be settled before the Paris to Strasbourg railway can be handed over to the company—it is relative to the station at Paris. The inhabitants of different quarters contend with much vivacity to have it placed in the midst of them; but, upon the whole, I am inclined to think that the site chosen by the Government is the beat that could be adopted, all things considered. It is situated in a street of sufficient width, and which can be made still wider; it is close to the two great mercantile streets of this capital—the faubourg St. Denis, and the faubourg St. Martin, and, above all, it is infinitely cheaper than any other site that could be proposed.

The day fixed for the adjudication of the railways from Paris to Lyons, and from Creil to St. Quentin is the 20th of the present month, and Friday before last was the latest day allowed for companies intending to offer for the concession of either line, to give, potice to tha Minister of Public Works, Similar "fusions" or amalgamations, to what were effected between the companies for the northern railway, from Paris to the Belgian frontier, were expected, but the result has not confirmed the expectation. Eleven of the Lyons companies have united, dividing among themselves the capital in the following manner:--

| • | Shares. |
|--------------------|---------|
| Receveurs-Généraux | 13.333 |
| Messageries | 43.333 |
| Union | 42.364 |
| Ganneron | 42.364 |
| Calon | 42.364 |
| Laffitte Blount | 42.364 |
| Lapinsonniére | 38.835 |
| Griolet | 27,500 |
| Ardoin Verdian | 24.209 |
| Hottinguer | 13.334 |
| Rothschild, fréres | 10,000 |

Total shares..... 400,000

The three companies of the postmasters Française and Engineers have also united themselves into one company, each taking an equal share of the capital. The Creil to St. Quentin companies were not able to agree among themselves as to the share which each should have in the capital; and accordingly no fewer than five gave the necessary notices to the Minister of Public Works of their intention to appear at the adjudication. The five companies are as follows :--

The company represented by Rothschild Fréres, Hotinguer, Laffitte Blount; the company represented by Mr. Cordier, deputy, Marquis de Diep, Baron D'Angré, &c.; the

Digitized by GOOGLE

company represented by Comte de Colbert, General Corbinean, &c.; the company represented by MM. Seguin, de l'Ousle, de Latena, Michelet, &c.; the company represented by He Duke of Vincence, Comte Lancosme, — Breves, Comte Lagrange, &c.

Dreves; Comte Lagrange, &c. b^aIs not such a result to be lamented by the shurtholders in all the companies of these two pharenoiders in an the companies of these two railways? They cannot all win, which is the first thing to be regretted, after having waited so long and spent so much money, and incurred so much inconvenience to have a share in these great mercantile undertakings. The next thing to be regretted is, that the winner will, by the competition, be compelled to accept the lease for a shorter period than could be de sired, whereby the shareholders will not obtain so large an interest as they may have had reason to expect. Some people say, that the cause of the opposition that will take place for the Paris to Lyons Railway, was the refusal of the eleven amalgamated companies to admit the smaller ones into their body. But I know from excellent authority, that it arose from the extravagant prefensions of those little companies themselves, not one of which had the Balf of its capital (i.e. the half of the tenth part of the capital paid up, but which, never-theless; chaimed to be considered equal, or nearly so, to such companies as that of Laffitte, the most wealthy and important mercantile nen of Empland and France. But after all, people attach no very great importance to the threat-ened 'opposition, - it being thought that the opposition of Public Works, or retire at the lest moment of its own second. With respect to the Creil to 'St. Quentin companies, the matter is different. Some of them are of the very afghest respectability and the most unquestionable substance. Hence it is feared that the competition will be very severe, it being of the utmost importance to them not to"be defeated after all their trouble and expenditure; and it being also of the very ut-Minist finiportures to the company of the Northerd rallway not to permit the Creil to St. Quentin fine, which is an embranchment or its own main line, to slip out of its hands. In fact, in the hands of a rival company the Creil 10"St. Quentin embranchment may be made a very formidable rival to the main line. The annual returns of the line from Creil to St, Quentin are calculated at 3,080,000 fr., which will yield St per cent. for the share-bolde rs on the capital they will have to dishurse

The Lyon's to Avignon Railway was announced by socking and working the line. "The Lyon's to Avignon Railway was announced by soint newspapers for adjudication on the 15th of January; but I have the best authous the 15th of January; but I have the best authous it is solved by soint of the subject. The difficulties and disputes as to the strate are now under the consideration of the Council des Ponts, et Chausses, and the Minister of Public Works.

The railways at present in course of executhere are running a career of uninterrupted prosperity. The receipts of last week on the Paris and Romen line were 125,516 fr., whilst those of the corresponding week of last year were 101,294 fr. The receipts last week of the Paris to Orleans Railway were 148,870 fr.; whilst in the same week last year they were only 123,216 fr. On the St. Germain and Yersailles (right bank), the receipts for the month of November were 177,077 fr., whilst in the month of November last year, they were not more than 140,750 fr. On the Versailles (left bank) Railway, the receipts for November were 45,613 fr.; in the same month last year, the Railway du Gard yielded 217,214 fr.; the same month of 1844 produced only 184,592 fr.

Our Bourse appears to have entirely recovered from the crisis which weighed upon it during the whole of the last month. On railway shares there has been a very general and a very striking improvement in prices. December, 1845.

"Trible CATHEDRAL OF ST. DENIS. — The minimum treeted to the memory of Louis XVFIT, in the values of the Cathedral of St. Datilis, is about being completed, and, when finished, that of Charles X., his successor, will be provided with. When this is done, all the Prevent Rings and Princes up to 1830 will be there represented when by a tomb, a monamenty or a ward. — Galiynan's Messenger. FREEMASONS OF THE CHURCH.

DEC. 97R.-Sir Walter James, Bart., M.P., Vice-president; in the chain. Mr. James Finn, her Majesty's new consult at Jerusalem, was elected corresponding delineator for that important locality. Mr. J. O. Halliwell, F.R.S., was elected an honorary fellow.

Was cleaves as minutery tenews. Mr. George Issace contributed two fine majuscules, illuminated on vellum is gold and colours, of the 14th century. Mr. W. H. Rogers exhibited a curious brooch of ancient Irish workmanship in brass; a chasele button of the 15th century in silver; and the seal of Macarius, Bishop of Antioch in the 15th century, having in the centre a figure of St. Peter sitting upon a throoe, on a pinnacle of which a cock is roosting: the handle terminates in grote-que heads. This seal was purchased from the collection of Mr. Till. Mr. Mayford exhibited an exchequer tally of the time of Edward III. Mr. E. B. Price exhibited specimens of foliated encaustic tiles from the ruins of Sunbridge Priory, Kent; Bradenstoke Abbey, Wilts; Reading, Berks; and St. Ann's, Blackfriars, Botolph-lane. The secretary, Mr. W. P. Griffith, exhibited a small sculptured female effigy, in stone, painted and gilt, from one of the religious establishments in Somersetshire; a very interesting relic in a perfect state of preservation. Its date is about the latter end of the 14th century. Also a painting of Harlington Church, Middlesex, by Mr. Vincent Figgras.

Mr. Cull then delivered an inaugural lecture on architectural acoustics. He began by calling attention to the science of acoustics as an important branch of physics, to the use of the science by physiologists to explain the offices of the several parts of the car in hearing, and to the applications of the science by architects in the erection of buildings, so that the tones of the human voice and of music should reach to the whole of an assembled auditory unimpaired by resonance, and undistarhed by echoes. He regretted that many buildings were monuments of acoustical ignorance. Sound, he suid, is not, as some philosophers describe it, motion, nor as others teach, resisted motion, but is a sensation sui generis. In all cases, however, the sound is resisted motion, however, the physical cause of In common tanguage we speak of noise, sound, and musical sound, to express distinctions in what we hear. "A quill," suys Dr. Thomas Young, "striking against a card causes a noise, but striking successively against the teeth of a wheel, or of a comb, a continued sound; and if the teeth of the wheel are at equal distances, and the velocity of the motion is constant, a musical sound. The general terms, pitch, loudness, quality, and duration, embrace all the distinctions which are audible in sound, and which are skilfully adapted by the musical composer to express sense and sentiment in music, which may therefore be appropriately termed a tonelanguage. In common noises, we detect only loudness and quality; in cound we distinguish loudness, quality, and duration; and in musical sound we discriminate loadness, quality, dura-tion, and pitch. Duration cannot be predicated of noise, because it is limited to the moment of collision, and is incupable of further extension. Mr. Cull described the physical causes of these distinctions in sound, and then explained the transmission of motion in the undulations of a stretched cord; of water disturbed by throwing a stone in it; of a field of corn, and of the particles of highly elastic bodies, in order to understand the conduction of sound by the air, which will form the subject of the next lecture.

After the lecture, it being the anniversary of the society's foundation, the secretary delivered an address, reviewing the progress made during the past year, which he considered the first year of active operation; noticing, also, the complete course of introductory lectures which had been read, as well as the assistance the society had given towards restoring objects of antiquarian interest (St. John's Gate, Clerkenwell), as an earnest of what the institution would do if sufficiently supported. The best thanks of the meeting were given to the vicepresidents, the treasurer, and the officers, for their zealous exertions during the past year, and they were re-elected for the year ensuing. The next lecture was unnonneed for Jan. 13, ("On Ecclediastical Design," by Mr. G. R. Lewis.

ANTIQUARIAN NEWS AND DISCOVERIES

DURING the past weik, a Roman tesselated pavement has been brought to light at Colchester. It is of considerable extent, and of the plain red description, without any variegated design. Remains have also been discovered, on the same spot, of fresco painted walls, and from portions of charceal and other appearances, it is supposed that the building in connection with these remains must have been destroyed by fire. At Bungay, in Suffolk, during the execution of some repairs at the Grammar School, a stone was discovered in the front of the house, with the following inscription; :

Exurgit intran tunnlo subtriate. cg.daren , 1.16 Sie Schola nostra redit clarior usta rogo-

1690. This date clears up a doubt as to the time when the present school was erected, the town having been almost entitely destroyed by fire on the lat March, 1683.—Cha the 28th ult the surface-ground in a paddock, at Orpington, suddenly gave way, and developed, at the depth of 16 feet, subterraneous arched chame bers.—*Galignani* gives an account of the recent discoveries of eighteen Galle-Romma tombs at Luxeuli (Haute Space). There monuments go back to the first centuries of the Christian era, and the greater muches owned appear to have belonged to the Prope prises as far as may be judged from the cup of the functions, represented on the interior of the functions, represented on the interior of the are written in legible characters at their keys.

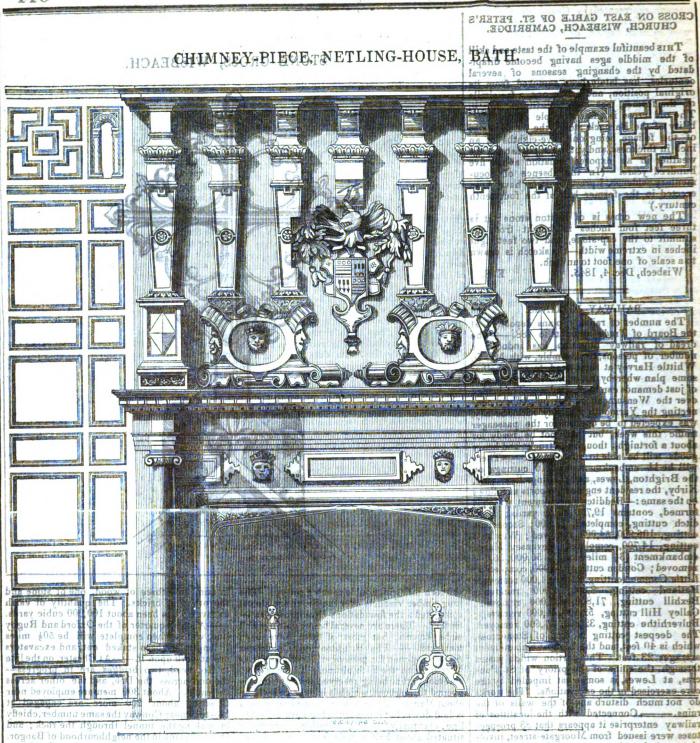

Mr. Hawkins, whose letter to the heading of national antiquities we recently printed, has addressed a letter to the obsergies, of sthe several reilways on the same subject. Houles, points out the bigh probability that, in the prof. gress of the railways now in the course of tors mation, many very interesting antiquitide will be brought to light : without some special ine terference for their protection, such objects are too often ignorantly destroyed by the work was by whom they are found. He asks the drame tors to give orders for the preservation pleasant tiquities found in making railways, and to affind ! facilities for the record of such discoveries, and for the inspection of the objects found in Mr. Hawkins remarks : "Autiquities out senty. be classified by the must extensive comparison of specimens; for such comparison is compared of specimens; for such comparison is smoother the actual justaponition. of the shirtist to available pared, a knowledge of the district to available they belong, and, as far as possible, of the sizer cumstances of their discovery if they meaned, partially preserved, or recorded, much of the is value on avidance is lost or if they are estimated. value as evidence is lost or, if they are seationed in collections for appris the minute distinctions and researchances on which short arranges depends can scarcely bo persent de orget parter oeived, rendered available, in archanorigicaliz research."---We are perdide desent time berge satisfactory replice base ligen propined outsing

CHIMNEY PIECE IN NETLING HOUSE, BATH.

WHILST Sir Walter Hungerford was building this, his town residence, John of Padua was engaged at Longlest; at a house at Bradford, known as the Duchess of Kingston's; and at Claverton, all within a few miles of each other that the knight was aided by this celebrated "builder" in his undertaking; and as much of the detail in the "Duchess's House" very choicly resembles this chimey-piece, I think

closely resembles this chimney-piece, I think it may be considered as a work of his. 'The Hungerford family were possessed of immense wealth? Thomas Lord Hungerford married a daughter of it the Percy,'' Earl of Northumberland, and gave their only daughter of the tal and Hunger with a down of no and heir to Lord Hastings, with a dowry of no less than eighty seven manors. This Hunger-ford has left us a fine specimen of the architecture of his time at Littlecot, in Wiltshire, near the town from which the family derive their name.

"Sin Edward Hungerford, in the time of Charles II,, dissipated all the estates of his ancestors. Amongst his recorded extravagances was the purchase, at the cost of 500%, of a blue wig to appear in at the coronation of the king. Farley Castle and the estates were in 1686 sold, and can be traced through the Bayatum and dent plane of the plane, to an extent which

Frampton families to the present possessor, Mr. Houlston; but what became of, or into whose hands fell, the town mansion, I am not able to find. It is at present in my possession, held under the Hospital of St. John ; a charity

of very early date. The room in which this chimney-piece is situated, is occupied by the Bath and West of England Agricultural Society, and their annual meeting is held in it. The house has from time to time been dreadfully mutilated, and now but little else remains of the works of Sir Walter Hungerford and his architect than the chimney piece before you; but thinking it the chimney piece before you ; but thinking it worthy of publication, and it having as yet escaped observation, you may, if you please, give it a place in THE BUILDER, under the authority of your obedient servant,

Bath, 1845. EDWARD DAVIS.

COUPLAND'S PATENT FURNACE.

This furnace is the result of some of the many efforts that have been made to prevent smoke and save fuel. The possibility of avoid-ing altogether the nuisance of smoke, and effecting a saving at the same time, being almost universally admitted, the only question is the best means of effecting the desired end. euverts and bridges have been built, six bamps and mibully sin are are doid w of soamut aft al of permanent road have been laid, and repute in the construction of the wird we have

tuses were issued from M ving capital to the amount of Cresham-street saed requiring the sum

coals are supplied from below the fire, up wards, and there is at the same time a passage of atmospheric air passing through the fuel, by which means all the products of the coals are consumed, whereby smoke is prevented. This is done by lowering at pleasure and in a portion of the fire bars sufficiently below the fire to enable a fresh supply of fuel to be placed thereon, and then raising them again to their former place, and retaining them there till the fuel is consumed and a fresh supply required, without interfering with the draught necessary for the combustion of the fuel while being so consumed. An extract from the *Liverpool Health of Towns' Advocate* will exemplify the increased heat gained by burning smoke. Mr. H. Holds-worth, of Manchester, has shewn, that in the front flue of a furnace, of common construction, the thermometer seldom rose above 1100 deg. Fahr., and often fell below 940 deg, the mean being 975 deg., while in the same furnace, when consuming its own smoke, the mean ten-perature was 1160 deg. The quantity of water exaporated by a pound of coal was one half greater than when the smoke was not com-sumed.

CROSS ON EAST GABLE OF ST. PETER'S CHURCH, WISBEACH, CAMBRIDGE.

THIS beautiful example of the taste and skill of the middle ages having become difapi-dated by the changing seasons of several centuries, has lately been removed from its original position, and a new one, a fac-simile of the former, has been substituted for if. The old cross is a fine example of the dura-bility of the Barnack stone, the small stalks of the foliage being only five-eighths of an inch in thickness, and yet it has withstood the weather in an exposed situation about five hundred years. (In the absence of docu-mentary evidence, I presume it to have been erected in the former half of the fourteenth century.) century.)

P

,, ıİ,

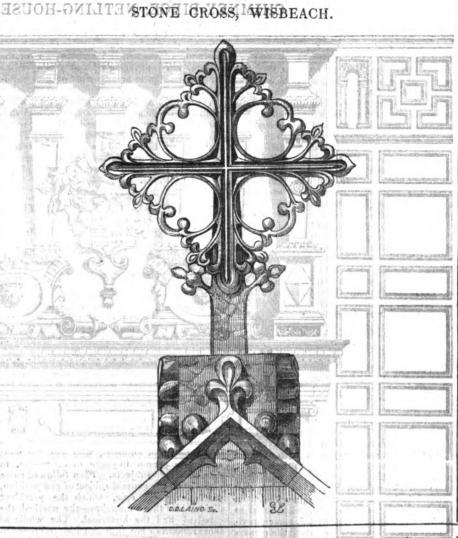

;5 1

<u>_</u>

century.) The new cross is of Ketton stone; it is three feet four inches in height from the summit to the cap stone, and two feet eight inches in extreme width—the sketch is drawn to a scale of one foot to an inch. Wisbech, Dec. 4, 1845. E. S.

RAILWAY JOTTINGS.

RAILWAY JOTTINGS. The number of railway plans deposited at the Board of Trade amounts to 788.—The dread of Trailway litigation has induced a number of persons, to assemble, with Mr. D. Whitle Harvey at their head, to see whether some plan whereby an equitable arrangement of just demands can be devised.—The bridge over the Wensum above Carrow Abbey, con-necting the Yarmouth Railway with the Ely, was expected to be opened for the passenger traffic this week, but will not be ready for about a fortnight, though the trucks and heavy goods will be able to run over it.—There will be 11 embankments and 10 cuttings on the Brighton, Lewes, and Hastings line. Mr. win be 11 embaaments and 10 cuttings on the Brighton, Lewes, and Hastings line. Mr. Kirby, the resident engineer, reports as follows on the same: --Redditch embankment, which is formed, contains 19,700 cubic yards; Red-ditch cutting, completed, 11,800; Stonecross cutting, 106,900, 54,000 removed; Westham cutting, 14,700, completed; Pevensey Marsh embankment (3) miles long), 50,000, 36,000 removed; Conden cutting, 13,000, completed: Little Common cutting, 25,800, 4,000 removed; Hatland cutting, 52,800, 4,000 removed; Bexhill cutting, 71,800, 37,000 removed; Galley Hill cutting, 52,500, 44,000 removed; Bulverhithe cutting is that of Stonecross, which is 40 feet, and the highest embankment averages 23 feet. The portion which passes through the ruips of the priory of St. Pan-cras, at Lewes, is somewhat impeded by the cras, at Lewes, is somewhat impeded by the care exercised in the excavations. The works do not much disturb any of the walls of the ruins.____Connected with the localities of railway enterprise it appears that 83 prospec-tuses were issued from Moorgate-street, invol-ving capital to the amount of 90,175,000, and from Greshan-street 20 prospectuses were issued requiring the sum of 17,580,000/. The operations to connect Richmond with the Great North of England Railway at Cowton Great North of England Railway at Cowton have commenced, and a great number of exca-vators are now employed in the neighbourhood of St. Martin's, near Eastby Abbey.— The electric telegraph is now completed between Dover and Edenbridge, as well as between the latter place and Maidstone. It will be continued from Edenbridge to the Doctor Bridge terminue and the Brightener? between the latter place and Maidstone. It will be continued from Edenbridge to the London Bridge terminus and the Bricklayers' Arms station.— The proprietors of the Lon-don Auction Mart have come to a resolution prohibiting, on their premises, the sale of rail-way scrip.— The great tunnel in the Shef-field and Manchester line, nearly three miles in length, is nearly completed, and the opening of it is expected to take place in a few weeks. Last week a party, including the engineer and one of the directors, passed through with an engine.— There exists a prospect, amounting almost to a certainty, that the Eastern Union fine will be opened early in the spring. The line commences with the Colchester Extension and Eastern Counties at Ardleigh, and, pro-ceeding thence towards Ipswich, passes over tableland at Manningtree Valley, Dedham, Lawford, and over the river Stour. The quantity of earthwork removed has exceeded 700,000 enbic yards, being two-thirds of the whole quan-tity required to complete a double road. Thirty culverts and bridges have been built, six miles of nermanent road have been haid. and culverts and bridges have been built, six miles of permanent road have been laid, and

thirteen miles of double fencing set up. The long timber viaducts over the Stour are almost completed; the foundations have proved satis-factory. There are several heavy cuttings and factory. There are several neavy cuttings and embankments, but most of them have been mastered. — The Brighton and Chichester line was opened for passenger's traffic as far as Worthing on the 24th ultimo. There was no Worthing on the 24th ultimo. There was no ceremony, that being reserved until the line is opened throughout, which it is expected will be about March. At present only one line of rails is laid down, but it is intended to have a double line eventually. The Worthing station is situated about half a mile from the centre of the town. — The coast line of the South Devon, near Teignmouth, met with another mishap last Sunday night. The *Exeter Gazette* says that during a neap tide, the waves, which Devon, near Teignmouth, met with another mishap last Sunday night. The *Exeter Gazette* says that during a neap tide, the waves, which were large and very wide apart, broke over the doomed wall in succession, making light of the roadway of sand, and causing the wall to tremble with the repeated shocks. This was particularly the case at the large breakwater about midway between this town and the Parson and Clerk, where the sea was fast washing away the *permanent* road; and soon after church time, the wall to the eastward of it was seen to totter; and after several distinctly perceptible vibrations, about 120 feet in length fell into the sea, leaving about 20 feet standing adjoining the breakwater, which was protected by a projection. — The engineer of the Manchester, Huddersfield, and Great Grimsby, line has reported that, from experiments recently made, the practicability of the pro-posed tunnel under the Trent is placed beyond question. — The works of the Cockermouth and Workington line have been let to Messrs. J. and W. Ritson, who completed the contract and Workington line have been let to Messrs. J. and W. Ritson, who completed the contract between Workington and Maryport. They engage to make the line for 37,000l. and to complete the whole in nine months after ob-taining postession of the land.— The Lytham and the Blackpool Branches of the Preston and Wyre Railway, the former 4 miles 6 furlongs in length, and the other somewhat less, are all but complete. The Lytham line is finished. There is no work of any magnitude on it ex-cepting in the construction of the bridges, five

in number,—three of wood, one of stone and the other of bricks. The quantity of earth excavated has been about 100,000 cubic yards. —About a quarter of the Oxford and Rugby line, which when complete will be 504 miles in length, has been staked out, and excavators are at work upon it.—At Chester, on the line to Holyhead, two bridges are in progress— the one across the Dee, and the other across the canal. About 300 men are employed near Chester ; about 200 more are engaged at Mostyn ; near Conway the same number, chiefly in making the tunnel through the rock ; and about as many in the neighbourhood of Bargor. —The different lines uniting at Leeds are reported to have agreed to contribute 100,000/, each towards the establishment of a central station.—It is estimated that since the proro-gation of parliament, 100,000/ % a wock line been suggested that the extremely unplica-sant motion experienced by passengers in most of the English lines arises chiefly from the top-heaviness of the carriges, and the insuffici, ency of the base. In many instances the wheeds of the English lines arcses chiefy itom the top-heaviness of the earriges, did the insufficial ency of the base. In many instances the wheels stand on a base is feet 6 time by 4 affects line the length of the body is all ito killeter; and the height between 9 and 10 feet from the adh. That such a top-heavy iconstruction could de steady at high velocities is italicist impossibles. It appears that in Germanysix wheel carviages nearly 30 feet long are used and are perfectly free of the inconvenience referred to. On some of the Irish lines 30 ft. carriages with six wheels have been adopted, and given great satisfaction. In the United States some of the carriages are 80 feet long. An immense number of work-men are employed on the Lancaster and Cara liste line. The embank ments and cuttings are very heavy, and the process of blasting large quantities of stone that obstruct various parts of the line is still continued. II The lengthened embankment near Carlisle is completed, and the viaducts at Gatthier are nearly formed some Mr. Gravatt, the engineer of the Great Eas, tern and Westerny has been charged publicly. by the directors of the company, with gross carelessness and culpable dilatoriness in the preparation of the plans, to an extent which

600

placed them in jeopardy, and he has been discharged from his office. -Part of the Furness Railway having to run along a marsh called Salthouse Marsh, which is covered by high tides, an embankment was formed whereon to lay the rails. The Preston Chronicle reports that, during the late gales, the sea has entirely swept away the whole of the embankment, crection of a new and enlarged station at Cambridge, nearly half a mile nearer the town, has been resolved upon. Improvements have been made at the Shoreditch terminus by the completion of a new suite of waiting rooms for row visducton the Lancester and Carlisle line is nearly finished. The last arch was keyed in on the 29th ult. The viaduct spans the romantic valley of Borrowdale nearitsjunction with that of the Lune, at an altitude of 68 feet, and is built of a light red freestone, 68 feet, and is built of a right feet, which is except the interior of the arches, which is composed of brickwork.-----The first contract composed of brickwork.-----The first contract on the Whiteby Branch of the York and North Midland line has been taken by Mr. Reed; it is about seven miles in length, from Pickering to Baindall; and the works have been commenced

UNDERGROUND ROOMS.

Sin,-Seeing by your valuable publication, there is some chance of the New Building Act updergoing a revision in the next session of Parliament, I heg to call public attention, through the medium of your pages, to Sche-dule K, which will render tenantless the underground apartments of nearly the whole of the small houses in London after July, 1846, without remunerating the owners for the loss of rent for the same, although each of these houses has been built agreeably to the old Act, and under the inspection of the several district surveyors. Therefore, Sir, I do think that should Schedule K be not entirely erased from the new Act at the expected revision, so far as existing buildings are concerned, some provi-sion should be made to remunerate the owners of such property, who are generally small tradesmen and frugal mechanica, persons who ought to be assisted and not injured by Acts of Parliament. 20,000,000/. were not long since voted to remunerate the rich owners of since voted to remunerate the rich owners of human flesh, whose property in the same was prohibited by Act of Parliament, I therefore ask, upon the broad principles of justice, for remuneration for the owners of small houses that may be effected by Schedule K. By inserting the above remarks in an early number, you will much oblige, Sir, yours, &c., Cumberland Market, Dec. 3rd. W. P.

CAMBRIDGE ANTIQUARIAN SOCIETY.

- - -

A SPRCIAL general meeting of the Cambridge Antiquarian Society was lately held at the Philosophical Society's rooms; the President; the Rev. Professor Willis, in the chair. The President opened the proceed-ing by reminding the meeting, that the Society had already existed for several years in this University, and had from time to time issued publications, on architectural and other subjects of antiquarian interest. It appeared that several of its existing laws would, if strictly adhered to, confine the Society's operations within very narrow limits, and that it had been proposed to offer some modification of these rules, in order to increase the efficiency of this Bociety. He considered that members of an University, highly educated as they are, coming as they do from all parts of the United Kingdom, periodically revisiting their homes, or travelling over the whole world, have greater opportunities for the collection and mutual communication of varied and curious information than 'persons in any other situation. Hence, the himitation of the Society's researches to Cambridge and its vicinity had been in fact practically disregarded. The well-known Society which lately occupied the field of architectural researches in this University by the second se

hold more frequent meetings, which taking place in the evening (and not as bitherto in the morning) might, it was hoped, assume a more attractive character than they had as yet possessed. He wished it to be clearly underpossessed. He wanted it to be clearly under-stood that, whilst giving to architecture a prominent place among the objects of its labours, the Society was desirous of confining itself to an historical and artistic view of the subject, not interfering with or giving advice for the erection or arrangement of new build-

It isstated that the subscription to the Society will in future be one guines annually, and that the evening meetings will be commenced in the ensuing term. The President expressed a hope that he should be enabled at an early meeting. to lay before the Society an architectural account of the recent discoveries in the chapel of Jesus College.

DISTRIBUTION OF PRIZES AT THE ROYAL ACADEMY. PROPOSED UNION OF THE STUDENTS.

ON Wednesday, the 10th., sixteen medals, gold and silver, were distributed amongst the competing students in the various branches of competing students in the various branches of art, including a gold medal with the discourses of Reynolds and West, to Mr. A. Johnson, for the best architectural design for a National Record office; and a silver medal, with the lectures of Barry, Opie, and Fuseli, to Mr. W. Walters, for the best architectural drawing of the Starry defort of Sommer House drawing of the Strand front of Somerset House.

Mr. Jones, the keeper, who took the chair in the absence of Sir Martin Shee, read an address to the students, written by the latter for the last distribution. It related principally to the importance which ought always to be attached to the choice of subjects in painting. On this point the president wrote with much earnestness, regretting that it was not always in the power of an artist, who was the most competent person to judge of his genius, to select his own subjects. Then followed some select his own subjects. Then followed some remarks on the general subject of composition, particularly the epic, which the president divided into three branches—the poetical, the classical, and the historical. The whole of these remarks were illustrated by reference to the best examples of the most celebrated pain-tera. In the course of them the president strongly condemned the introduction of discordant objects into pictorial compositions. There were examples among the best painters of these inappropriate introductions, but they were not on that account to be imitated, but rather shunned. The address concluded with some glowing anticipations of the effect the judicious adornment of the new houses of parliament would exercise over art

The day after the distribution, the students dined together at the Freemason's Tavern, which was chiefly noticeable for the announcement, that it is in contemplation to establish a monthly conversazione, so that the students may become better acquainted with each other. They are also about to form a museum of costume, which will be of the greatest utility to the student, and an establishment where any large work of art may be executed by any person who does not possess the required accommodation at home.

ROYAL INSTITUTE OF BRITISH ARCHITECTS:

At an ordinary meeting, held on Monday evening last, Mr. Tite, vice-president, in the chair, a number of donations were announced, chair, a number of donations were announced, including Mountfauçon's Antiquities, from Mr. Foxhall (a handsome gift), and a plan and section of Wren's church, St. Benet's Fink, about to be taken down, from Mr. Edwin Nash. Mr. R. L. Roumieu, of Lancaster-place, and Mr. David Bryce, of Edinburgh, were elected fellows. The chairman then read an elaborate notice of the proceedings taken in building the original Exchange, by Sir Thomas Gresham, and the Exchange built after the great fire in 1666; as derived from the records of the Corporation of London and the Mercers' Company. Mr. Tite also gave an interesting account of the antiquities dis-covered in preparing for the foundations of covered in preparing for the foundations of the present building, and exhibited a number of the articles that were found. We hope to print the substance of this paper at some length next week. . v: 5- i

MR. THE . MR. ROACH SHITH.

Sin, -The two letters which you have pub-lished from Mr. G. R. Sniph would have the ceived no further notice from me but the ano expression, that IF have " falsely " aleased him : to this allegation I consider it die a myself to make a very brief and shall hepige My principal design is; therefore, to for a sort in the strongest manher; the truth of the statements I have already made, and while, it will be readily seen, are in the main proved by Mr. S.'s own admissions. - nd 1

NOTES IN THE PROVINCES.

It is in contemplation to erect a bridge over the Mersey at Russorn. Some idea of is magnitude may be formed when we state that there are to be five wet arches of 280 feet that there are to be five wet arches of 280 feet span, 100 feet above high water mark at spring tides, and 168 dry arches of 30 feet span, and 54 feet high, making a total of 2,480 yards of arching. When completed, it will be the greatest work of the kind in Europe.——At the same place, Lord Francis Egerton is about to erect docks of great extent, also a custom-house, the present edifice being found most inconvenient for this thriving port.——A subscription has been set afloat for the purpose of re-newing and effecting other improvements of re-pewing and effecting other improvements in St. Michael's church, Coventry. The re-quired outlay is estimated at 5,0001.----The vorks at the two new churches at Morton and Stockwith, near Gainsbra', are rapidly ad-vancing; the roofs have been reared some time, and are nearly slated. The wood-work for the interior is in a state of forwardness, under the auperintendence of the contractor, England in Castle-street, Liverpool, are both to be built of stone, brought from the Darley Dele Quarries, Derbyshire, from which also was procured the stone used in the erection of the Liverpool Assize Courts.-----In Ireland, a decision has been at length come to with respect to the rival claims of Armagh and Belfast, for the site of the Northern College. The latter town has won the prize.----It is in contemplation, in the ensuing spring, to effect several improvements in the fine minster church at Wimborne; a substantial edifice is also to be erected for the endowed free school, in room of the present dilapidated building. ng less than aeven churches have been either rebuilt or newly founded, and nine schoolhouses erected, involving together an outlay of nearly 30,000% —— St. Mary's Episcopal chapel, at Dalkeith, was consecrated last week. It is a Gothic building, and a local paper says, that "no expense has been spared in its decoration, so as to render it suitable, in every respect, for the reception of her Majesty should guous to the Ipswich station-house. They are built on the humane principle, sanctioned by the Inspector of Prisons, which is, that in con-structing *s* place of confinement, due regard should be paid to the health of the accused, or well as to be converter. They are dere as well as to his security. They are dry, warm, and well-ventilated.—A plan for the warm, and well-ventilated .extension of Folkestone by the erection of a considerable number of houses on Lord Radnor's land, was submitted, a few evenings since, to a public meeting of the town's-people, G Rohins, Esq. The called by the mayor, G. Robins, Esq. The scheme, as explained by the originator, is on the principle of a building society, by the operation of which each member will, in sucssion, become possessed of a residence in will have to be pulled down. The estimated expense is 6,5004. — The London and Bir-mingham Bailway Company have publicly contradicted a report that they had altered their views with respect to the central station, which they propose to make near New-street, Bir-mingham. They further state that the pro-posal has received the sanction of the commissioners and governors of the Free school.-The members of the Royal Southern Yacht Club are about to erect at Cowes a new Clubhouse, at a cost of 6,000/. The foundationstone will be laid in a short time by the com-modore, the Marquis of Conyngham.—Mr. Peto is preparing plans for the improvement of Lowestoft harbour, and there is a prospect before long of sea-borne vessels reaching Beccles through Lowestoft, its natural port. — The extensive iron-works now in course of erection at Oakley, Fifeshire, are deserving of notice. The engine-house is built of etone from the new Carnock quarry, and is 40 feet below and 50 feet above the surface ground. There will be three or four windows in each front about 30 feet in height, each window THE BUILDER.

being arched and ornamented with a moulding; and the whole huilding surmounted with a very rick coping. The lever wall, which runs across the building from the foundation to the top, is 90 feet, and about six feet in thickness. It is built of polished stones of enormous size, each block being three tons in weight. So extensive is the building, that in it there are denosited 60,000 cubic feet of it there are deposited 60,000 cubic it there are deposited outline cubic feet of stones below the surface of the ground. The next most conspicuous objects are the fur-naces, two of which are far advanced, the chimney-stalks being each about 180 feet in height.—— Mr. Sotheron, the proprietor of Devices green is about to incluse the same Devizes green, is about to inclose the same, not with the view of excluding the public, but in order to make it more available and more useful to those who may be inclined to resort to it for air and exercise. New walks and ornamental plantations will be introduced secrating a portion of the Edinburgh Cemetery Company's grounds, together with the little Gothic chapel erected thereon, near Inverleithrow, took place on Saturday last.——A syndi-cate is about to be appointed at Cambridge for the purpose of ascertaining in what manner a tax may most conveniently be laid on the members of the university with the view of forming a new botanical garden. Already several suggestions have been made, having for their object such architectural improve ment of the town as the projected change will admit of .----The Cominittee of the Dock Trust, at Liverpool, purpose applying to Purliament next session for power to construct several large new docks on an extensive site, principally covered with buildings. at present The premises to be purchased number 643.

MR. BASEVI'S SUCCESSOR AT THE FITZ-WILLIAM MUSEUM, CAMBRIDGE.

THE Fitzwilliam Syndicate conceiving that the great loss which the university had suffered by the lamented death of Mr. Basevi, the architect of the New Fitzwilliam Museum, made it proper for them to offer to the Senate a report describing the state in which the designs for the building are left; and to bring under the notice of the Senate the state of the engagements made with the contractors for the execution of the work, wrote as follows :--

The Syndicate find by an examination of the drawings left by Mr. Basevi (which have been sent for their inspection by his brother, Mr. N. Basevi) that the designs for the greater part of the work remaining to be executed are in a forward state; but they conceive that these designs not having been perfected, require, for the completion of the work, the assistance of an architect of the same order as Mr. Basevi in professional eminence and skill.

The Syndicate think it highly desirable that the building should be completed with a close adherence to Mr. Basevi's intentions, so far as they appear in a settled form in his designs.

The Syndicate have also ascertained by inquiry of Mr. N. Basevi and of Mr. Baker, the state of the pending engagements with Mr. Baker; and the results of this inquiry will be laid upon the Registrar's table. The Syndicate, considering the high pro-

The Syndicate, considering the high professional character of Mr. Cockerell, and the confidence already reposed in him by the University, beg leave to recommend that Mr. Cockerell be appointed Mr. Basevi's successor as architect of the New Fitzwilliam Museum, with instructions to adhere as closely as may be to Mr. Basevi's designs in carrying on the work to its completion.

St. John's College Lodge, Dec. 9, 1845. There was a congregation on Monday, when grace was offered to appoint Mr. Cockerell to be the late Mr. Basevi's successor as architect to the New Fitzwilliam Museum, in conformity with the recommendation of the Fitzwilliam Syndicate in the above report.

THE SKRW ARGH AN OLD INVENTION.-"Now visit the Alcazar [Cathedral at Seville], but first observe a siggular Moorish skew arch, in a narrow street leading [from the Cathedral] to the Pueta de Xerez; it proves that the Moors practised this now assumed modern invention at least eight centuries ago." -Rord's Spain.

THE restoration of the interior of the man of this venerable and interesting structure is now goupleted. Fram the Hull Racket we learn that the galleries have, with all the modern pewe upon the ground floer, here taken away; the antire area of the nave cleared of every thing; and the stone-coloured paint removed from the lofty piers, their capitals, and i, and arches. Upon entering the great western door, we find ourselves apparently in a comfortable porch, but in reality passing through the great organ, which has been constructed upon a grand scale by Messra Foster and Andrews, of this town, after an elegant design by Mr. Lockwood : representing to the eye, looking west, the appearance of a handsbme gothic screen. The whole of the nevel is now fitted up with oak stalls, enriched with poppy heads, carred by Mr. George Pock, of Hall. Most of them are executed frach easts of existing models in Lincoln Cathedred, taken by Mr. Keyworth, sculptor, the Yorkshire Archiv-tectural Society's modsiles. For some distance eastward from the forit, the seats, or stalls, run transverse ; so that the standards of solid oak (no other timber having been permitted to be used in the bwark); with carved halt ray, however, to the anal which separates the nave from the transepts, a change takes place, and a change for the better it certainly place, and a change for the better it certainly is; here the church assumes the aspect of a cathedral choir, the stalls being arranged, parallel to the aisle, and the standards and poppy heads meeting the eye to the greatest advantage. 'A portion of this part of the church has been fitted up with separate stalls, which the churcher advantage is a neuroperior with which the churchwardens, it is presumed, will carefully allot. Adjoining these stalls, to the eastward, are smaller ones, on either side, for the singing men and choristers of the church; these abut upon the pulpit and the church; these abat upon the pulpit and the lectern, which form the most conspicuous objects in the nave. The pulpit, which is of stone, is fixed, adjoining the third pillar on the south side of the nave. It is de-signed in perfect keeping with the stile of the mave, and is highly enriched with a series of niches, which are, we understand, to be decorated with crimson and azure and gold. It is ascended by a winding staircase of stone, composed of fourteen steps. The reading desk is of oak; it occupies a position against the third pillar on the north side of the centre aisle of the nave. The front is composed of an oak screen of Gothic tracery, open and supported by buttresses of the same behind are three stalls for the officiating and supported by buttresses of the same, behind are three stalls for the officiating clergy. From this point to the tower the stalls continue to be placed as in a minster stalls continue to be placed as in a minister choir, the front towards the hisle being hand somely, though nearly decorated.

It is not, we find, at present the intention to pave the middle and side sisles with encaustic tiles, as was first intended; want of funds, we believe, is pleaded for this omission. The font, which is of Purbeck marble, and, highly enriched, has been thoroughly cleanaed of the many coats of stone-soloured painter which, up to a recent period, covered its sculp, tured ornaments, and it now occupies its proper position, near to the western door, We are sorry to find that it has not been restoned in its original manner, for some reason or another that we cannot account. The eight small pillars that stood originally round the centre shaft of it have been omitted. IVe trust that the proper authorities will see to, this matter, and not allow its ancient features to be altered.

The panels of the ceiling have been painted with ultra marine, whilst the members of the beams are "picked out" in colours, crimson and gold. The centre of the panels is studdedwith gold stars. In different parts of the roof are painted illustrations of the instruments of our Lord's passion, with monograms, &c. Some of the richly-carved capitals of the columns of the pave are decorated with crimson and blue and gold. The whole of the embellishments of the ceiling, &c., were done by Messrs, Binks and Son, of Hull, after the designs and under the superintendence of Mr. Lockwood, architect, to whose care was entrusted the entire restoration.

The cost which has at present been incurred is about 3,0004, of which sum the church, wardens have taken upon themselves the re-

ę ją

ROUND TOWERS IN FRANCE.

At a late sessional meeting of the Cork Cuvierian Society, Mr. Windele read a paper the antiquaries of that country regarded as resembling the Irish round tower, not only in form, but also in the mystery which hung over their origin and history, in which we have some curious speculation on this antiquaries' Sphynx. The French work from which Mr. Windele as extracted these remarks, transfere all the Irish round towers to England ; and, as it will be perceived, that of Ardmore among the rest. French are unlike the Irish towers. Those of the former are of various figures, principally octagonal and of very moderate height. The tower of Quineville called *Cheminée de Quine-*ville is one of these. It is situated within 8 lengues of Cherbourg, is hollow throughout, having neither stairs nor floors. It consists of a base circular within, and 17 feet high, con-structed in that style called by the Romans Opus reticulatum ; above this is placed a cylindrical column, 112 feet in height and 20 feet in circumference. The external face is ornamented with Corinthian and Tuscan pilasters supporting an entablature, above which rises a dome, roofed in the form of a transited cone. Some think that it has served as a Pharos, others, that it is an ancient befiry. But it is neither within view of the seam But it is neither within view of the sea nor per to any church. There are, however, in France, isolated towers in the vicinity of innches. They belong to the middle ages. The compary of the Innocents at Paris, is the compary of the Innocents at Paris, is the off an octagon form, surmounted by a come; it is 44 feet in height, and 12 feet in Martimers in the Martimers is the At Monthrau, near Martignon, is an optagon, 35 feet high and 16 in Men. The door is 8 feet above the ground. In the cloister of the Monastery des Dames, at Funtermalt, is an ancient tower, 76 feet in height and 20 feet in diameter. The learned inent, the long wearing themselves with conjectures over or the probable us dre wees of these 12 structures. Bat in 1790 (sic) M. Chas. Smith discovered, at London, a manuscript, which entirely cleared the obscurity of the subject. In that it was found that these towers were built in the 9th and 10th centuries, an epoch built in the Sin and JUID centuries, an epocn when singular practices often accompanied the intervise of religion, and that they served as penitential prisons : "Inclusaria acti in-penitential prisons : "Inclusaria acti in-built in construction in England many of the of Ardmore, which is 100 feet in height, if is constructed of out bricks if The "It is constructed of cut bricks! ጉሥ pinion held, that the tower of Quineville was tiqueral monument, sppears to the French an-tiquary to be the most probable and reasonable tiongst many other conjectures. NEW CHURCHES IN THE WEST RIDING OF YORKSHIRE.

No fewer than four new charches were lately consecrated in this riding during one week by the Lord Binkop. of Ripss. We obtain the following particulars from the Hull Packet, On the Tuesday his lordship consecrated St. James Church, Metham Mills, This church

has been erected at the sole expense of the late James Brook, Esq., of Boston. Seven or eight years ago a large echeol-room, with a small chapel at one end of it, licensed by the bishep for divine service, and two houses at the other end was erected at a cost of no less than 4,0004. For several obvious reasons it was considered desirable to have a separate church, and the same benevolent individual directed a church to be built, principally from the materials of the former. and at an additional expense of above 2,000%. It is of the gothic style, in the form of a cross. At the east end is a painted window presented by Mrs. Brook, the widow of the respected founder. The pulpit and reading-desk, presented by C. Brook, Jun., Esq., are of carved oak, by Mr. Wolstenholme, of York. A carved oak screen for the Commandments, above the communion place, has been presented by Mrs. C. Brook, and two oak chairs to match it, by Mrs. W. Leigh Brook. Every other part of the church corresponds with these, and no expense or trouble has been spared to exhibit a handsome example of church architecture without introducing any of the nevelties which are offensive to the feelings of some Protestants. It is designed to seat nearly 400 adults and above 250 children.

On Wednesday, his lordship consecrated the new church of St. Luke the Evangelist, at Miln's Bridge, near Huddersfield. This structhree is a specimen of Norman architecture, from the design of Mr. William Wallon, architeet, Huddersfield, and is calculated to contain 602 persons. It is built on ground liberally presented by Sir Jos. Radcliffe, Bart., by whom also an acre of ground has been given as a grave-yard, and an equal area for a parsonagehouse and grounds. The building fund was raised mainly from the family of Joseph Armitage, Esq., of Miln's Bridge House, by one member of which (Miss Armitage, of Honley) 1,000% was most munificently sub-actibed. The whole cost is about 2,500%.

On Thursday, his lordship consecrated a church which has been erected at Roberts' Town, a district in great need of such a pro-vision. The fabric is simple in its design, but affords ample accommodation.

On the following Tuesday, the new church at Garforth was consecrated by his lordship. This is of the early English order, of the cruciform shape, with aisles to the nave. The nave, tran-septs, and chancel, are of equal width, diverging from the tower openings, which have lofty and deeply moulded archivolts. The tower rises from four massive and shafted piers at the intersection of the nave and transepts, and is surmounted by a spire sixty feet high. The sittings are all open and uniform, providing for upwards of 500 persons. The pulpits and font are of Huddleston stone carved; the glass of the windows is in imitation of the ancient cathedral glass, of amber tint, with the excep-tion of the east window, which is of stained glass, executed and presented by the Misses Gascoigne of Parlington, and one given by Mr. G. F. Jones, of York, the architect.

SIR,—The subject of sewers and drainage baring at this time deservedly obtained much public attention, the most eligible form, com-bined with the least possible expense, naturally becomes a leading feature in the question; and believing the following may give some little force to the information already published, I

beg to mention it to you. I last year built about 1,500 feet run, of the egg-shaped sewer, with the small end down-wards, for T. O. Tyndall, Esq., in his park at Oliston, Bristel, preparatory to letting the frontage for villas and other building purposes, that form of sewer being considered, after much careful investigation, the best for keep-ing the current in the most compact hody, and ing the current in the most compact body, and therefore of giving it the greatest power to covry off the soil and prevent accumulations in its course.

With regard to expense, it did not in the estimated cost of making a sewer with upright sides, sentiming the armo superficial open space of water-way. Not having found it de-sirable to charge my good opinion of the egg-shaped form of sewer, I have lately prepared working drawings and specifications for up-wards of 3,000 feet run of sewer of a similar discription, which is proposed to be made at a arighbouring which is proposed to be made at a brighbouring which is proceeding statement be of any service, you're quite welcome to use it.

Some of the best authors, designers, and engravers of the day, whose names will shortly be sun-nounced, have engaged to aid in this undertaking.—Artisan-office, Wellington-street north, Strand.

nounced, have engaged to aid in this undertaking.—Artisan-office, Wellington-street north, Strand. PAINTING, SCULPTURE, ARCHITECTURE, ENGRAVING, &c. &c. Containing 38 pages of 84 columns. Extensively illus-trated. One Shilling Monthly. THE ART-UNION: Monthly Journal of the Fine Arts; the Arts Decorşive and Orna-mental; and Record of Brisish Maaufactures. Estab-lished in January, 1839. To MANUFACTURERS, Decorative and Ornamental Designers, their Employers, and Artisans, and all who are interested in impforing the Useful Arts by subjecting them to the influence of the Fine Arts, the ART-UNION Monthly Journal is recommended as supplying such prac-municate facts so as to render them available as auggestions to the producer, the several articles are illustrated by ex-planatory Woodcuts. Thus, papers have been publishers, the and recording the Useful arts by content of the several sto the producer, the several articles are illustrated by ex-planatory Woodcuts. Thus, papers have been publishers, the Manufacture of Torreciting &c.; said Others are in pre-paration addressed to every trade in which taste can be brought to co-operate with the artisan; and the mereantile value of the Useful Arts be augmented by the aid of the Fine Arts. Thé ART-UNION Journal, as its name imports, was in-

Manufacture of Forcetain, &c. c. ; and others are in pre-paradon addressed to every trade in which taste can be brought to co-operate with the artisan; and the mercantile value of the Useful Arts be augmented by the aid of the Fine Arts. The ART-UNION Journal, as its name imports, was in-atituind mainly to cafere the assessity of Unioà between the different branches of Art, and more particularly the intimate connection that exists between those Arts which have been regarded as entirely artistic, and those which have been regarded as entirely artistic, and those which have been regarded as entirely artistic, and those which have been regarded as entirely artistic, and those which have been deened exclusively mechanical; the purpose being to shew that mind as well as hand is repuired in every branch of Ornamental and Decorative Art. The pub-lication, therefore, is recommended to the strention of per-sons interested in the cultivation of the arts of Decoration and Ornament--in the furnishing of houses with taste elegance and judgment ; and in the introduction of im-provements in designs for British manufactures--from arti-ches of high importance to the most trilling matters in general use, which may be made subservient to the judicious education of the eye and mind--a work in which every manufacturer is unomericality asking an active part, and which he either advances or retards, more or less, by every article he multipliers and circulates among mankind. Thus we shall endeavour to give publicity, as far as our influence extends, to any improvement introduced into the external form and character of articles of British manufacture. The supremacy of our manufactures has, Indeed, been long manutained, and is universally acknowledged on the Con-tinent. While, however, the foreign producer admits our superiority in the very excital mains of substance and sorn to the forme of our productions. Mitherto his sar-carams have beeg sufficiently juut; but a time is approaching when we shall dirpas the foreign competitor

FIRE-PROOF SAFES.—125. ALDERSGATE-STREET, CITY.

CITY. CITY. THE CHEAPEST HOUSE in LONDON for WROUGHT.IRON FIRE.PROOF SAFES.— DOHN LEADBEATER, many years Manufacturer for Mears. Chubb, of St. Paul's Churchyard. Bankers, Mer-chants, Railway Companies, and the Public generally, are respectfully informed that he has constantly on SALE, at his Manufactory, 135, Aldergate-street, City, a large assortment of very superior WROUGHT.IRON FIRE.-PROOF SAFES, chests, boxes, and doors for strong-rooms or closets; the whole fitted up with improved de-tector locks, throwing from two to twelve bolls, warranted of the best materials and workmanship, yielding a positive security to cash, books, deeda, plate, &c. against the de-structive effects of fire, and the skill of the most expe-rienced burgiars, at considerably reduced prices. Made to order at the shortest notice, at his Manufactory, 136, Aldergate-street, City.

REDUCTION IN THE PRICE OF

Addregate-street, City. REDUCTION IN THE PRICE OF BUNNETT AND CORPE'S PATENT REVOLVING IRON SHUTTERS. THE validity of this Patent being com-pletely established, the Patentees have much pleasure in sisting that the very extensive demand, and the simploy-ment of improved machinery in the manufacture, have given them an opportunity (of which they gratefully avail them-selves) of making a considerable reduction in the price of this well-knowand tried invention, thereby rendering them the cheapest as well as the best iron shutters in use. Every improvement suggested by practical skill and most exten-sive application has been adopted, and no effective RE-VOLVING IRON SHUTTER can be constructed without infringing B. and C.'s patent. The worm and wheel, as patented by them, being the only safe, durable, and efficient mode of raising and lowering such shutters, these shutter can be applied horizontally, either above or below the window, or vertically, as introduced by BUNNETT and CORPE, in some of the largest establishments : they are made with bent or corrugated laths, if required. BUNNETT and CORPE also manufacture REVOLVING WOOD SHUTTERS, with their patent raising machinery, or with counterbalance weights, and with proper metallic hinges, without which no shutters can be asfor edurable. BUNNETT and CORPE are likewise Patentees and Manufacturers of METALLIC SASH-BARS, MOULD. INGS, &c., IN BASS, COPPER, OR ZINC, FOR SHOP FRONTS, WINDOWS, SKYLIGHTS, AND VARIOUS OTHER PURPOSES. Shop Fronts fitted in a superior manner with Iron Shutters, Patent Brass or Zinc Sahes, Moulded Engraved Stall Board Plates, best Plate Glass, and internal Brass Fittings of all kinds, on the most advantageons terms. E-mentes given and contracts taken in Town or Country.-All kinds of metal works executed to any design. Metal Draw-ing, Rolling, and Stamping for the Trade. OFFICE, 36, LOMBARD.STREET, LONDON. ADDRESS.

2190

-1

ITH the present number we close our volume for 1845. During the year that has passed since we issued our last address, we have striven earnestly to redeem the pro-

mises therein made, and to render T_{HE} BUILDER worthy of the encouragement and support kindly awarded to it by the public. In proof of this we are able, with respectful confidence, to appeal to the work itself, and venture to aver that it contains a body of information of the greatest value to a large and varied class. The public, we say it with pride and gratitude, have acknowledged our endeavours in the most substantial manner, and THE BUILDER is now the universally recognized organ of those who are engaged or interested in the arts of construction or design.

Self-gratulation is never becoming. If there be a time, however, when it appears less objectionable than usual, it is, perhaps, when justifying former professions, with the view of obtaining entire belief in those you are about to make; and we may therefore hope to be excused at this, the termination of the year, for the previous expression, and a further brief reference to what has been done during that time.

The volume contains 630 pages of letterpress, exclusive of advertisements and Supplements, and has 280 illustrations, — many of them of great excellence. Apart from the picturesque views, it will be found to contain, when looked at as a whole, a large number of Gothic details, practically useful, in the shape of decorated and perpendicular windows, doors, fonts and font covers, of various periods, bench-ends, &c., as well as many valuable examples of Elizabethan architecture and fittings.

"Improvement" has been our key note,---the improvement of the metropolis, the improvement of buildings in a sanatory and constructional point of view, the improvement of our operatives, improvements in ventilation, and improved form of sewers have been constantly urged by us with sincere zeal, resulting from a sense of their paramount importance.

The new year! how numerous are the emotions to which this sentence gives rise, how important are the duties that it reminds us of. Is it beyond our province to urge our young readers, briefly and in passing, not to disregard

• Covers for binding THE BUILDER may be obtained at the office as usual, price two shillings; or the publisher will undertake to bind sets at three shillings per volume. THE BUILDER.

its promptings, but to endeavour by industry and application, to supply the omissions of the past?

With the new year we shall again come before the public, with the determination to improve to the utmost the character of the journal, and to merit a further increase of public favour, and a numerous accession of readers: to our present friends and assistants we look with confidence for a continuation of their kind and valued support.

THE ARCHITECTURE OF FLORENCE.

In previous papers, illustrative of Italian architecture, we have endeavoured to indicate the materials for general history, to be deduced from the monuments of art. Had the pages of this journal been less devoted to matters purely professional, and momentary, than necessarily they are, we might have further excited the attention of our readers in a ground little trodden, and pregnant with interest. Let it suffice here to say, that to whatever phase of art we look, we need no lens to discover the impress of the age, which originated the work, the political and social state of the people. We have noticed the long dearth of art in Italy, previous to the influx of the Gothic style, as coexistent with internal commotion, and the decay of letters. We have examined the position of the art under the atmosphere of commercial prosperity in Venice, and Genoa; brilliant in spite of dissensions, internal as well as external; and, with the work before us, we now propose to speak of the peculiar influence upon, and character of, the architecture of Florence.

Not less distinguished for commercial greatness, than the other republics of Italy, Florence attained a remarkable eminence in art. Having acquired considerable wealth by attention to manufactures, its commerce was extended to all parts of Europe; and subsequently, the possession of a sea-port enabled the Florentines to compete with the Genoese and the Venetians, on the Mediterranean. Engaged in banking, the money trade of nearly all the kingdoms of Europe fell into their hands; and in several states, they were intrusted with the collecting and administration of the public revenues. But, that remarkable state of civil discord, into which all the cities of Italy fell, was nowhere more perceptible than in Florence. The rival parties of the Guelfs and the Ghibellines, and later, of the Neri and the Bianchi, kept the city in ceaseless commotion from an early period of its history to the time of the Medici. It was this very state of circumstances, which produced the peculiar style of Florentine architecture.

Florentine architecture. The influence of the Gothic style was felt in Florence until a late period. Though, in that city, probably the first advances towards the disuse of Gothic architecture were made, many of the old forms lingered in the principal façades even to the middle of the fifteenth century. In 1298, Arnolfo di Lapo, according to Vasari, but according to Molini, Arnolfo di Cambio da Colle, laid the foundations of the Cathedral of Sta. Maria del Fiore. This com-mencement was previous to what is generally understood by the "revival;" yet the building nderstood by the "revival;" yet the building eems to have been conceived in an original style of architecture. Orgagna and others fur-ther advanced the cathedral, and greatly con-tributed to the alteration of style. But in 1407, the city called a meeting of architects to discuss the best mode of completing the cathedral, and Brunelleschi boldly offered to raise the dome. This architect at length succeeded in producing the earliest, and perhaps the most wonderful, cupola of the world. The influence, which Brunelleschi thus acquired, enabled him to work that change in the style of Italy, which he had learned to contemplate, whilst engaged in the examination of architectural works in Rome. His abilities were exercised in other cities of Italy, and he was employed by Duke Filippo Maria on the fortifications of Milan. He left a school of architects imbued with the principles on which he worked, who rapidly spread the change. Almost at the same time,

* Architecture Toscane, ou, Palais, Maisons, et autres édifices de la Toscane, mesurés et désainés par A. Grandjéan de Montigmy et A. Famin, architectes, anciens Pensionnaires de l'Académie de France, à Rome. 'Paris, 1857. the dukes of Milan, and the princes of Italy were actuated by love of art; Alberti produced bis famous treatise,^o and further carried out the native style; and Roman forms and principles were everywhere dominant.

617

ples were everywhere dominant. The most striking characteristics of Florentine architecture are massiveness and severity. Large blocks of stone were easily pro-cured in the quarries of Tuscany, and solidity and strength were in some measure demanded in a residence, which had often to answer the purpose of a castle. In the refinement of details, the Florentine school is inferior to those of Venice and Rome, but for bold, imposing masses, no city is equal to Florence. The walls are, almost universally, rusticated the entire height, and in some cases with pleasing variety in the treatment. The apertures in the ground florence of the section of the the ground floor are at some distance from the ground, and are square, and small in size. The cornices are frequently on a grand scale, and are, in the earlier buildings, provided with the means of defence. The line of front is generally unbroken, and the plans do not display the same ingenuity, as those at Venice and Genoa.—The buildings of Florence, says the work before us, appear to be not the work of ordinary men; we enter them with respect, believing to find them inhabited by beings of a nature superior to ours. Whether the eye is arrested by monuments of the age of Cosmo de Medici, or of times which preceded or followed it, all in this imposing city carries the imprint of grandeur and majesty. Frequent revolutions obliged the chiefs of parties to comsider their personal safety, along with the magnificence of their dwellings. Externally, they are examples of the skilful union of grace they are examples of the skilful union of grace with simplicity and massiveness, internally, models of exquisite taste. After Rome, Flo-rence is the most interesting city to every artist. — The courts are often elegant, with fountains and gardens. The cornice is some-times of little height, but great projection, with two modillions, ranged one over the other in a curious manner.—The Pitti palace has a ba-lustrade, formed of small Ionic columns, sup-posed to be the earliest instance of that member. The rusticated archivolts are gene-rally of small stones, the intrados semicircular. member. The rusticated archivoits are gene-rally of small stones, the intrados semicircular, but the extrados a pointed arch. Up to the middle of the fifteenth century, the window with a central column, each light having a semicircular arch, the whole being covered by semicircular arch, the whole being covered by a semicircular head, was universal. Iron-work was much employed, and many of the buildings had lanterns at the angles, and rings suspended at intervals. About the middle of the fifteenth century flourished one Nicolo Grosso Caparra, an excellent worker in metal, and the cressets—"lumiere maravigliose," are beautiful specimens of his work. It is said, though the evidence is not clear. that the vight though the evidence is not clear, that the right of affixing such cressets way a peculiar howour, granted to the families, who had distinguished themselves by the gown or the sword, and that those of less consideration were only allowed to illuminate the battlements of their towers.

One of the earliest buildings of Florence is the Palazzo del Podestà. It is generally me derstood to have been built by Arnolfo di Lapo, but much resembles the style of Orgagua. It has a very decided Gothic character, and has the date 1250. The Palazzo Vecchio, erected by Arnolfo in 1298, had enormous battlements, and projecting machicolations. The building was greatly altered by Vasari, under Cosmo de Medici; and at that period gained the appearance represented in the work. The court is lavishly embellished with painting and sculpture, much of it of a later date. The "Piazza del Gran' Duca" contains many remarkable works of art. Passing by the statue of Cosmo the Great, a curious structure is the Loggia de' Lanzi. It is an excellent example of the transition from Gothic architecture; with much of the earlier style about the cornice and ornaments, it has semicircular arches, rising from shafts composed of clustered pilaters. It was built in the year 1256: Organa was the architect. Omitting many churches of early date, which are very slightly noticed in the book before us, we come to the Palazzo Riccardii. This building was commenced in 1430, under Michelozzi: it is a noble specimen of the styles It is in three stories, each rusticated, and is surmounted by a massive cornice. The ground story is lofty, and has five Jange arches and

AHEIBHILDER.

AWABDS OF THE OFFICIAL REFEREES DISTRICT SURVEYORS FEES.

MR. ENTECOTT, of Deptlord, having raised

MR. ENTECOTT, of Deptord, having raised and altered, a, kitchen huiding attached to a dwelling-house of the third fate. Mr. R. P. Browne, the district surveyor of Greenwich, required a fee of 17, 52, and on his refusing to pay it, summoned Mr. Entrot before Mr. Arail, one of the magistrates of the metropo-litan police courts. Mr. Trail, on hearing the case, expressed his doubts whether Sche-dule C, part 7, should not be taken in con-nection with Schedule L, and the attached building be taken of the rate to which it would belong if built by itself, viz. fourth-rate, and entitle Mr. Browne to the fee for additions and alterations to that rate, viz. 10s.

and alterations to that rate, viz. 10s. Mr. Browne contended, in support of his claim of 11. 5s., that Schedule C, part 7, ap-plied to construction and materials of attached or detached buildings only, and that Sche-dule L, so far as regarded the fees to be charged, is distinct, and that additions or alterations to attached or detached office-buildings are to be taken on the scale of the buildings to which they are attached, and that the building altered

they are attached, and that the building attered being attached to a building of the first class and third-rate, the fee was 11.5s. Mr. Trail, refraining from adjudicating on the question, the parties sought the award of the referees, and Mr. Browne agreed to pay the charges and expenses of the referees. The award was :- "That the fee charged by

the district surveyor for an alteration of an attached building, should be the fee appointed by the said Act to be paid for alterations of buildings of the rate to which such attached building shall by itself belong, and not of the rate of the building to which such attached building is attached."

ROOF-COVERINGS.

The references have decided (on the requisi-tion of Mr. M⁴Leod and Mr. Stow, of Camber-well), that asphalte of Seyssel may be deemed a proper substance for covering a roof or other structure, provided such roof or other struc-ture be wholly composed of, and be upborne by, incombastible matter, or matter indestructible by fire.

EXTERNAL LINE OF FRONTS.

Several awards have been made preventing the erection of shops or other projections, on the fore-courts of buildings, as the same would have projected in the opinion of the referees "beyond the general line of the fronts of the bouses."

SHOP-PRONTS

Mr. Hodges, in altering the Weavers' Arms, public-house, William-street, Bethnal-green, formed the whole front, as high as the firstfloor, in wood-work,---the brick piers between the doors and windows being covered with "11 inch deal to form rustic work." Mr. Hodges considered these might be deemed plasters or

That these parts " are not to be deemed such pilasters or woodwork as are by the said Act permitted, but that any such pilasters, with the entablature above the same, must be executed of the same materials, as are by the said Act directed to be used for external walls, or of such other proper and sufficient materials as the said official referees may approve and per-mit, and so that the same do not overhang, encroach, or drip, upon any public way."

WIDTH OF STREETS.

Mr. Pownall, district-surveyor, having served Mr. Thomas Archbutt with notice that certain buildings in course of erection by the latter on the south side of Bainbridge-street, Oxfordstreet, were not more than 21 feet from the buildings on the north side of the street, in-stead of 40 feet, as prescribed by the Act, the opinion of the referees was sought. They

said Danoridge street, opposite to the units-ings in question, has not been altered, and the thoroughfare of the said street his hot been stopped, the said street is to 'fe deemed to be an " already formed " street, within the meaning of the Metropolitan Buildings Act: and masmuch as the Duildings in question are being built not nearer to the balling of the ball thereto' withe sall of the distribution of the second sec Turthier übbertute overid schwalg their the same are not restrikany tei thir dide gloti specifie an relates to the distance and bath shuthings from the belt dage shuther and bath their init specet." ASSERTED ABUSES IN WESTMINSTER COURT OF SEWERS.

REPLY TO WR. LESLIE'S PAMPHLET.

On page 375 of the present volume of our journal, will be found some extracts from the letter addressed by Mr. Letle to the represen-tative vestries, "charging the Westminster Commission with misconduct. Sir James Graham, our readers will remember, forwarded a copy of this letter to the commissioners, and a copy of this letter to the commissioners, and required a reply. A committee to draw up the reply was appointed—consisting of Mr. Alderman John Johnson (the Lord Mayor), Messrs. Willoughby, H. Harrison, T. L. Do-nuldson, W. Hawkes, Frederick Crace, and John White,—and their report is now before us, We shall allow the commissioners to speak for themselves, as we did Mr. Leslie, and let the public judge between them. The report commences by objecting to the interference of the vestries, and asserts that they have no more authority to discuss the manage-ment of the sewers-rate than the Sewers Com-missioners have to question the disposal of the

missioners have to question the disposal of the

poor-rate by the vestries (?) It continues: — "The pamphlet takes a range for its observations of nearly forty years, and combines sweeping allegations with some particular statements, and much personal im-putation, and though there remain but eight acting commissioners of the early period, and the great body are of modern appointment, they are called upon to investigate the acts of their prodecessors, many years after the decease of the able and honourable chairman, as well as of the clerk and other officers, under whose respective authority and care the business was then conducted. We cannot but think that the time of the

court, and of your committee, might have been more justly, as well as usefully, passed in dis-cussing present improvements, rather than past transactions."

The report denies that the commissioners are self-nominated. With respect to the responsibility of the commissioners, it says: "It may be shortly stated, that it is the same as with other courts, their proceedings are subject to the review of all the courts in Westminster Hall; review of all the courts in Westminster Hall; and the law reports, as well as the records of the court, will sufficiently establish the fact that they are frequently made responsible. The commissioners, acting always collectively as a court, can, indeed, only be dealt with as a court, but individual misconduct, at all times, subjects the particular commissioner to the Characterized

Chancellor's supersedens. It is important to bear in mind the constitu-tion as well as actual composition of the Westtion as well as accused composition of the west-minster Court of Sewers, in considering its in-dividual members. The qualification of a con-missioner is a freehold, and the commissioners are the representatives of the freeholders of the are the representatives of the freeholders of the district whose property is subjected to sewers-rate. The choice of commissioners is, indeed, wested in the Crown, through the Lord Chan-cellor, as that of all justices is, because the occumissioners have judicial functions to exer-size; but they are not less the representatives of the freeholders on that account, and practically the commission has always embraced tically the commission has always embraced the great and principal proprietors of the dis-trict, as well as the professional and mercan-tile classes, so that the commissioners actually comprise the great proportion of the landlords within the limit of the commission; whilst in order to secure a due regard to the interests of the great proprietors, their chief professional agenta (heing also freeholders) are great agents (being also freeholders) are generally added to the commission."

"With respect to commissioners unduly pressing on the court their own interests, it must he remembered that it is the interest of must he remembered that it is the interact of the collective body to act on general principles, and that, in so large a number of commis-sioners, individual wishes are certain of being counteracted by the general sense, and it is practically found that the pressing of such individual interest defeats the very object in-tended? tended.

tended." "With respect to the allegations of the con-tracta being a long time in two families, it may be, in the first place, observed, that sewer work is a peciliar description of construction, and was more so formerly than since the introduc-tion of, railroads. I bat it requires a suitable plant and a fame of workmen accustomed to the varieties of poil, and the difficulties of springs, &c.; and it is obvious that parties

619

once efficiently provided for "such operations would do the work cheaper and better," and with greater dispatch than ordinary boilders." "It page 5 of the pamphlet, complaint is made that the sever across the Marquis of Lansdowne's garden cost 6,637/. 2s. 3d. 'Now the facts of this case deserve particular atten-tion, not only is illustrating the advantage of employing permanent contractors in sever work, but the occasional results of public ad-vertisement for tenders. "Landars for tenders."

Vertisements for tenders. Tenders for this work were received from Mesors. William Stewart, John Jones, and John Hughes for, 12,7004, and from Mr. Wil-John Hugas, ior, 12, 1940, 8th from Jur. Whi-liam Whitehead, for 8,7984, which so, far ex-ceeded the estimate of the surveyors that they were rejected by the nours, and the work was eventually done by blessas, Bird, their ordinary contractors, for 6,6374, 28, 30, including all

antractors, for 6,644,25, 54, including all outras, With reference to the second, ellegation on the contracts, the point for consideration is, whether the tenders accepted were not the lowest, and if not, whether they were not pre-ferred for a substantial and anfiltient, reason. In 1830, 1833, 1836, and 1841, also tenders, ac-cepted were the lowest; in 1832, Alexandre, Epn-nett and Hust's tender was preserved to Hr. Manafield's; and in 1856, to Mr. Sayist Ac-On referring to the using sectors by the conic to obtain and maintenand proceedings of 1822, which use extraoted in the Appendix No. 5, it will be seen what persent ent pre-ferred to a bubble and antipersent states by the conic to obtain and antipersent states by the conic to obtain and antipersent states by the states the bestimaterials of the set theory but is the world 'to suppres, that the persent by the states are used an abas the briefles that beet the subject of the court's espatial care at the previous meeting, and that Mr. James Mansfield (who by the way we not of the firm of Wigg and Alamatical ' having again pro-duced, such as angle of briefle, and again pro-duced, such as angle of briefle, and the firm of Wigg and Alamatical ' having again pro-duced, such as angle of briefle, and the act the and would not allow to be used on the works of the world mot allow to be used on the works of the sentery,' his tender was not accepted, and Meesre. Bennetit and Hunt's, being the next newlers,' dis tender was not accepted, and Mossie Beausti and Hunt's; being the next lowest, was accepted.

The question here is simply this, whether the allegation on the records was true. We should say, on the face of the whole same tion, as set forth in the Appenting 5 busneting the was, but we have the express subscript of Mr. Dowley, the matroyen at the patient for shying that the bucks and the distribution of field work and it such a with bucks and the new and allow to be used on the winks of the new and and these all the scale used is ide the president of the contract of the clining a kiner tends to mission and the standard of the clining of the standard of the s mlt Anriala

and then to take the lowest tender of the parties ao selected.

We apprehend the latter to be the best course för all important works, and emphatically so for sever work, which is concealed from the public eye, required to be durable, and executed with dispatch ; but we do not feel called upon to discuss this at large, for it will be sufficient for the justification of the Commissioners of Sewers to state that her Majesty's Board of Works adopts this course, and that most works of an important character are so contracted for."

"We now come to the comparisons drawn by the writer of the pamphlet between the Works of this Commission and that of Holborn and Finsbury, and we at once repudiate the valling in question the proceedings of another Commission. Composed of able and honourable men, as the Holborn Commission is, we have no doubt that their proceedings are based on a sense of public duty and the public benefit. Having no power to examine into the transactions of that Commission, and furnished only with a few materials for checking the statements in the pamphlet, we protest against the members of this Court being called upon to institute the comparison."

* The comparison made between the works of the two Commissions will more strikingly Histrate the unfairness of the allegations in

The periphet. "Irwill be seen, by the report in Appendix No! 8, that i Holborn sewer of 12 feet 10 inches, sectional area, with 10 feet 6 inches reduced brickwork, is compared with a West-trinster sewer of 15 feet, with 16 feet 6 inches brickwork; and a Holborn sewer of 9 feet 10 inches with 9 feet 6 inches brickwork, is compared with a Westminster sewer of 11 feet 54 inches with 14 feet 4 inches brickwork.

But this is by no means all, as the following comparison of the sites will show :---

| companies of the st | |
|--|---|
| Weelminder Commission. | Holborn Commission. |
| Albemarie - street, St. George's | |
| Cartle-street and Hem- ming's-row, St. Martin's | with { Parkfield-street, 1sling- ton, Battle-bridge, and Holloway-road. |
| Wellington - street and | with New-road, St. Pancras. |
| Berner's-street, St. Ma- | with Battle-bridge, and Hol- loway-road, and Bedford- square. |

Now, here, the constructing of sewers, in a maiden soil, unincun bered with vaults, old sewers, or any of the extraordinary obstructions which present themselves in old streets, is com-pared with those old streets where such diffi-culties occur."

construction of the sewer, but in the difficulty of excavating in a narrow court without damage to the houses on either side. Mr. Leslie states that the 'original report' in this case has been altered, and does not correspond with the copy on the records. We have com-pared, the two, and find that they exactly agree; and there is no reason to doubt but that the report is in the same condition now as when presented to the Court. We have also referred to the rough draft of his report, which has some alterations in it, made by the officer, as is generally the case with such papers ; they do not, however, affect the *bona fides* of the transaction, and were evidently made at the This case, in fact, only affords one more illustration of the difficulty and expense of constructing sewers in the older parts of the metropolis, and that a comparison with a line of sewers in a new district cannot fairly be sewers 1 made.** 39.0

mide, "* * Mr. Bowley mys on this matter, Appendix No. 10: "I would state, that the excess above the estimate arose from the peculiar situation and other circumstances attend-me the work in question. In the first place, I would remark that the waith of the court between the bouses does not ex-ored twelve feet, That the houses are very old and dilapi-flated, and that the front walls (which are built upon brest-buinners, and supported by score, posts, are much out of the perpendicular, and have a tendency, in the event of the foundations Leing disturbed by the slipping or falling of the earth during the execution of the works to the sever, to fall outwards into the court. This necessarily occasioned great of the building given way, the result might have been of the most serious fairtre. To guard against such a casually, it was deemed advasable to strut across the court from side to side, as no to put up raking shores to the work, the internal parts of the buyes, buy ty be interfired with, and to be afterwards

THELBUILDER

What the Sccretary of State will say to the reply remains to be seen; nor are we disposed to offer any supposition at this moment. One most important matter touching the public health, and involving in a great degree the question of the efficiency of the commission or its officers, is the present state of the sewers; and to this, on the part of the public, we feel ourselves under the necessity of calling the immediate attention of the Court. At a meet-ing on Friday, the 19th inst., when Mr. Dowley was called on for his report on the faulty sewers, pointed out by John Phillips, the clerk of the works, he said it was not ready, nor would it be in six months. This would seem inexplicable, but for what occurred afterwards.

r. Leslie stated that he had heard that Mr. M Phillips, in pursuance of the order of Court, had reported 123 sewers in his district as more or less filled with offensive matters, and some completely obstructed ! He thought it was a proper occasion to notice an occurrence of which he became cognizant that morning, in inquiring below what the labourers had been employed in. And this was one case not in Mr. Phillips's district, but in Mr. Morton's. The facts he had clicited were these: that about seven years ago 160 feet of second size sewer were built in the New-road, by the trustees of the Parochial Schools, communicating with the sewer into Devonshire-place. Mr. John White's house-drains, Devonshire-place House, New-road, having become stopped, he entered a complaint on the 28th November last. Since the complaint had been entered, out of the length of about eighty feet, sixty fire loads of silt, said to be Macadamised road-stuff, had been lifted up and carted away, and then about three feet in depth of the looser soil was washed down the Devonshire-place sewer.

Mr. John White said it was very extraordinary; the stuff appeared like putty, it was so tenacious.

The chairman, Edward Willoughby, Esq. tendered his resignation, which was accepted, and Capt. Bague moved, and Mr. France se-conded, a vote of thanks to the late chairman for his past services.

RAILWAY JOTTINGS.

Mr. Gravatt does not stand alone among the engineers in having failed to satisfy the ex-pectations, whether reasonable or unreasonable, of certain railway directors; the managing committee of the Dudley, Madeley, and Broseley Railway have met, and denounced Mr. Giles, their late consulting engineer, in consequence of his failure in effecting the deposits of the plans. They advertise that his services are dispensed with, and they contemplate takink such proceedings against him as counsel may advise. Mr. Blunt, another engineer, is severely denounced by his employers on the Derby and Manchester (Ashbourne) line, and was accused, at a public meeting, of gross neglect in his plans, which have been ex-amined by Mr. Hawkshaw, and found wanting. It appears, from a list relating to the number of schemes for new lines, in which the principal engineers are respectively engaged, that Mr. Brunel is connected with 14, Mr. Robert Stephenson with 34, Sir John Macneill with 37, Mr. Locke with 31, Mr. Vignolles with 22, Sir John Rennie with 20, Mr. Rastrick with 17, Mr. Miller with 10, Mr. Gravatt with 10, Mr. S. Hughes with 9, Mr. W. Cubitt with 11, Mr. Gibbs with 12, Messrs. Birch with 7, Mr. Blunt with 8, and Mr. Braithwaith with Q -On Saturday last the first sod was turned on the Bedford and Birmingham line, at Brogborough-hill, about the centre of the line. The ceremony was performed by the Duchess of Bedford, assisted by Lord Alford ; the Duke of Bedford being unable to attend, having

made good and left perfect in every respect, even to restoring portions of the paint. Hesides these works, others, far more expensive, were obliged to be resorted to for the security of the buildings; for instance, when the ground was in progress of being exca-rated, it was found necessary in many parts to dig out and wheel away the same for the entire width of the cours; in order to secure the foundations of the houses, in the course of which work, whatever brickwork was met with, forming areas, tanks, and cisterns, &c., had to be taken down, and built below the basements of the contignous honses, as also with the view of obtaining a solid foundation upon which to rebuild the areas, &c., it was deemed prudent to fill in at the sides of and over the sever with concrete, and to leave in most of the strats and planks below the level of the paving."

been summoned to London by Lord J. Russell. -An experimental fron carriage is said to be now running on one of the Belgian lines, and it is thought that eventually it will be found cheaper than wood, and as good.— It may be mentioned, as a proof of the immense amount of business now being carried on by manu-facturers of locomotives, that no firm engaged in the trade will contract to supply engines in less than three years. — The operations on that part of Messrs. Grahamsley and Reid's contract on the Newcastle and Berwick line, which is not sublet, have been stopped, in consequence of the workmen refusing to accept of the wages offered them, viz., from 14s. to 15s. per week: The men demand 18s., which have that the opening will be delayed. The portion near Bow-ereck has sufficient most .---- A great -A great number of men are already employed on the Trent Valley line, in the neighbourhood of Rugeley; the shafts for the tunnel at Shugborough are in a state of forwardness, and the general preparations are upth as to justify the expectation that the line will be opened in eighteen months from the present three the The Newcastle and Darlington company are about to commence their branch from Pelaw to Washington (five miles), and the extension of Mr. Stephenson, the English engineer, and Prof. Matteani have, at the request of Prince Demidoff and Prince Ponialowsky, who have ob-tained the grant for the railroad from Florence to Forli, been making surveys, to sacertain whether the said line is practicable. The re-sult is decidedly favourable to the undertaking. The line, if carried out, will form a means of rapid communication between the Mediterra-Railway Company have very recently provided baths, at one halfpenny, for their numerous servants and workmen at the Swindon station. On the first Saturday after the opening, fifteen thousand gallons of water were supplied to the baths, which were in constant use throughout the day. A laundry is in progress, and will shortly be opened by the company.—— The great tunnel connected with the Edinburgh and Glasgow line is near completion; workmen are engaged at it night and day. It is nearly 1,000 yards long. Upwards of three-fourths of it is inished. The other tannel, 170 yards long, is in a forward condition, and the rest of the line having been laid with the sleepers and rails, the company expect that it will be ready for opening by March or April. The opening of the iron bridge over the Wensum, near Norwich, and which connects the Norfolk line with the Norwich and Yarmouth, took place last Monday week. Its weight, including piles, which are of iron also, headed plates, &c., exceeds 323 tons. It is a swing bridge, so as to admit vessels navigating the river. The turning is effected by a wind-lass and the arrangement is ac simple the river. The turning is effected by a wind-lass, and the arrangement is so simple, as to afford a single person full power to work it. The centre forms 16 arches of 33 feet in length, and on each side are the standards, forming piers, surmounted by gas lamps, shew-ing red and green glasses, according to the state of the tide.—Part of the permanent way of the Middlebro' and Redcar line is finished, and it is expected that the whole will be completed by the early part of the summer.

ANCIENT PAINTING IN CARPENTERS'

HALL. A VEBX curious and interesting ancient fresco (?) painting has just been brought to light in the execution of certain restorations now in progress at Carpenters' Hall, London Wall. It is on the wall, at what may be termed the dais end of the Hall, and having been covered up from time immemorial, no one knew of its existence. The subject of it has reference to the craft of carpenters,-representing our Saviour and his father at that employment; likewise (as is conjectured) Solomos overlooking the erection of his temple, and Noah engaged in the construction of the Ark, in separate compartments. An artist employed by one of the archmological societian has been at work copying it, so that it will probably be engraved.

ARCHITECTS SIGNING THEIR DEEDS.

Sin, -- I humbly beg leave to write you a few lines with regard to architects inscribing their hames on their works, lately referred to in THE BUILDER. Melrose Abbey having been likewise noticed more than once in the same journal, I take the liberty of forwarding (and journal, I take the intervy of forwarding (and which I hope will not be unacceptable to you), a copy of an inscription which an old mason pointed out to me in the interior of the abbey. I think it is on a door-head which leads up to the belfry on the south front, but I am not certain, as it is five years since I saw it: --

F. John Murdo, sometyme called was I, Born in Paris certainelye, And had in charge the mason works Of Sanote Androges, the High Kirke : Pray to God and Mary baith To keeps this boly Kirke frae akaithe.

I am, Sir, Se.; ABAM PATERSON. · Brockhamgreen, 16th Dec., 1845.

OPENING MEETING OF THE SOCIETY FOR THE ENCOURAGEMENT OF ARTS, MANUFACTURES, AND COMMERCE.

" On the 17th inst. B. Bond Cabbell, Esq., ⁽¹⁾ On the 17th inst. B. Bond Cabbell, Esq., ¹**F.R.S.**, one of the vice-presidents, took the chair, and an address from the council was read by the secretary. The council congra-tulated the society on the anspicious com-mencement of their *ninety-second session*. Uning the recess the society had undergone a "complete reorganization, and the new system "of management proposed by the council had been almost manimously confirmed by two general meetings; so that the society being "this renewed in youth, would, it was antici-pated, display all the vigour and energy of a field influence of an old one. "It was the intention of the council to add

It was the intention of the council to add largely this year to the value and number of the premiums. In the fine arts, the mechanical the premiums. In the fine arts, the mechanical arts, the manufactures, agriculture, and com-merce of the country, rapid improvements were in progress, which it had been the peculiar province of this society for nearly a century to encourage and direct, and in which nearly 100,0007, had already been expended by it with 'great public advantage. In the present session many valuable subjects were about to be offered for competition by premiums; and so 'farge's a number' of important papers were now coming forward for notice, that the council be-lieved the suspices under which this session commenced were unusually bright, and they therefore' had to congratulate the members upon the improved prospects of the society. The first communication read to the society.

The first communication read to the society was a paper on certain improvements in con-structing the locomotive engines and permanent way of railways, with reference to the question of wide and narrow gauge, by Mr. J. G. Bodmer, formerly of Manchester, now of London.

formerly of Manchester, now of London. In this paper the author examines the ques-tion of the relative merits of wide and narrow gauge; he ascertains that the question is not one either of relative safety or danger, but that it resolves itself altimately into this inquiry: — Which gauge will admit of the most perfect means for obtaining high velocities with greater regularity and economy? At present, the admits, the broad gauge has the advan-tage in more powerful and speedy engines. But he then proceeded to shew that by placing the cylinders outside, and by in-creasing the fire box and flue surface in the minner he proposes, and by adopting the principle of compensation as in his double piston locomotives, high velocities may be obtained with security; safety; and advan-tage. In short, that as powerful an en-gine in every way may be placed on the narrow gauge as on the wide one, and one equally well adapted to high velocities. He equally well adapted to high velocities. He when went on to shew how the chief limit to increase of power, and the corresponding in-crease of weight in locomotive engines, concrease of weight in focomotive engines, con-sist wor so much in the construction of the "engines as in obtaining a permanent way, suit-"able for the scipport of such enormous loads. By these loads travelling at high velocities, conclusions are produced, which derange the perminent way, and are at present the chief, sources of danger and cost; and the chief limit to the speed. He approves of the tri-

angular sleeper originally invented by Rey-nolds, and he proposes to use a modification of that on a larger scale as a longitudinal bearing. He also proposes that the breadth of the rail should be so increased as to diminish the continual attrition so destructive to wheels, and procure greater durability. In the conclusion of the paper he suggests that an experimental railway sught to he constructed, either at the expense of the Government or of the joint railways, for ascertaining the best means for giving the increased velocity, which the public are beginning to demand, in the best manner. The paper gave rise to a long discussion, which elicited the opinions of engineers and scientific men present, on the merits of Mr. Bodmer's plan. The next paper read was a sequel to the former, by the same author, on improved crank axles and axle boxes, by which greater security and economy are obtained in railway trains running at high velocities.

CITY ANTIQUITIES. MR. TITE U. MR. BOACH SMITH.

SIB,-It is, doubtless, much more convenient and easy to Mr. Tite to assert and re assert, and to make a brief and final reply, than to substantiate and prove the truth of the statements he has made relative to my researches. If he imagine his charges are proved, or are capable of being proved, either by his own efforts to adduce facts to give a colouring to his assertions, or by any admission made by me, I suspect he is the only individual who has empfortured the last four number of Ture carefully read the last four numbers of THE BUILDER, and arrived at such a strange conclusion.

clusion. He has not only totally failed in making out a shadow of a case to justify his conduct, but he has hinself established, by most glaring and serious mistakes in dates, and in the consecu-tive occurrence of particular circumstances, his ignorance of the real state of the very matter in question. I not only said from the first that his charges were false, but I maintain that his own statements prove them to be so; and, had I not believed that he had been im-posed upon, and had too easily lent his ear posed upon, and had too easily lent his ear to idle and silly tales, I should have termed his charges wilfully false.

If Mr. Tite had given me an opportunity of meeting his accusations at the meeting of the Institute of British Architects, or had had the manliness to attend the meeting of the British Archaeological Association to which he and six of his friends had been invited to hear my exposition of the monstrous absurdity of his assertions, and when, had they been true, he he would have heard some curious instances of the manner in which valuable antiquities have often been collected far from the place at which they had been disinterred. Mr. Tite's re-searches, I suspect, have not led him to ramble far from the site of the new Royal Exchange, in he would net dishlare ar effect to disor he would not disbelieve, or affect to dis-believe, the fact of such objects being often found many miles from the site of their ex-humation, and often after the lapse of con-siderable time. A friend of mine, living in the suburbs of the metropolis, collected upwards of four hundred Roman coins, which had been deposited close to his house in dirt and gravel brought from London. Will Mr. Tite venture to say, that the industry and in-telligence of this gentleman, which saved from utter destruction objects of interest to science and history, " would have afforded no institution for not restraine the articles the justification for not restoring the articles so found to the proper authorities." The anti-quities I obtained, under almost similar circumstances, were not procured by the agency of Mr. Tite's servants, or those of the Gresham committee, although Mr. Tite may find it needful to bolster up his case by the invention of such notions in order to condemn them as my "admissions." In short, Mr. Tite has propagated stories which I have exposed to the world as unfounded in truth ; and he now tries, instead of honestly confessing his error,

tries, instead of nonestly contessing his error, or taking some stops to prove his assertions, to concoct something agreeable to himself, and calls it my "admission!" Mr. Tite still disputes my right to the leaden medalst, and talks about the "principle of property." Why does he not induce his patrons to institute an action at law for its re-

covery? Simply because he is well aware that the Joint Greeham Committee never possessed and never had any right to it. It became my legal property when it was presented to me by the legal owner, before, I think, Mr. Tite had any connection with the Royal Exchange, or any particular prospect of being appointed architect to the new edifice. It became both legally and morally mine, when from a dirty bit of worthless lead I created it an object of interest to the antiquary, and of envy to the illiberal and narrow-minded.

I heg leave to explain my meaning of the term "collesquea," which Mr. Tite seises upon in order to make allusion to the British term Archæological Association. In his speech to the Institute of British Architects, Mr. Tite laid strong stress upon the activity of "collectors," who secured all the city antiquitie for their own collections, to the great mortifi-cation of "city authorities." The only persons who have collected, that is to say, who have understood and preserved the precious remains understood and preserved the precious remains of antiquity, which for many long years, "city authorities" (proper authorities Mr. Tite terms them !) have regarded as "rubble and rubbish," are Messrs. Kempe, Gwilt, Newman, Chaffers, and Price, and these must be (in-cluding myself), the "collectors!" Mr. Tite referred to. If not, who are they? These gentlemen I feel proud in calling "my col-leagues." Our labours are partly before the public. If health and leisure permit, I hope before long to render such a complete account before long to render such a complete account of our stewardship, as will not be discreditable to our exertions to preserve the city antiqui-ties from the vandalism of committees, and the whole tribe of "city authorities," and from general profound ignorance and indifference. This account will include a full, and chronological detail of circumstances connected with increase detail of circlinstances connected with the excavations, made on the site of the Royal Exchange, the length of which, even were not your patience exhausted, world be an objection; perhaps, to its insertion in your pages on the present occasion.—I am, Bir, &c., O. Reace Suite.

Liverpool-street, City, Dec. 20th.

CAMBRIDGE CAMDEN SOCIETY.

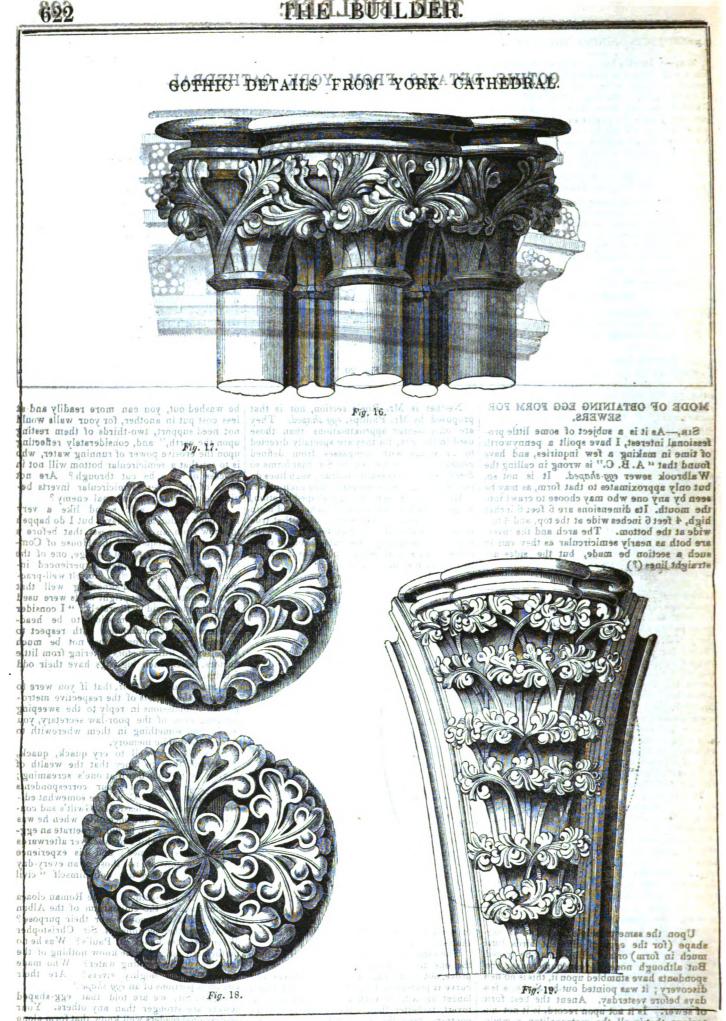

THE committee of this society have just issued a report of the present state of its issued a report of the present state of its operations and prospects. From it we learn that they have appointed A. J. B. Hope, Esq., M.P., M.A., Trinity College, to be chairman ; the Rev. F. W. Witts, M.A., King's College, to be treasurer; and the Rev. B. Webb, M.A., the Rev. J. M. Neale, M.A., of Trinity College, and Mr. F. A. Paley, M.A., of St. John's College, to be sccretaries.

Among the presents received by the society, special mention is made of some original drawings and measurements of St. Helen, Bishopeings and measurements of St. Helen, Disnopa-gate, by Mr. J. B. Gardiner; and some in-teresting rubbings of brasses, lately executed by the Messrs, Waller. Reference is also made to the following grants voted by the committee: towards the restoration of the church of St. John, Croxton-Kerriel, Lincoln; of the Norman Tower at Bury St. Edmund's and towards the re-Building of the Church of St. James, Woolsthorpe, Lincolnshire. Other

Chad, Birmingham, on Sunday last, after High Mass. It was this gentleman who gave to the church of the Holy Sepulchre the stone ultar which occasioned so much litigation."

Mr. Yates of PARKS IN LIVERPOOL. -Liverpool has given 50,000% for the establish-ment of public parks in that town. When he appeared at the recent Anti-Corn-Law meet-ing, he was received with vollies of cheers.

MODE OF OBTAINING EGG FORM FOR SEWERS.

SIR,—As it is a subject of some little professional interest, I have spoilt a pennyworth of time in making a few inquiries, and have found that "A. B. C." is wrong in calling the Walbrook sewer egg-shaped. It is not so, but only approximates to that form, as may be seen by any one who may choose to crawl into the mouth. Its dimensions are 6 feet 6 inches high, 4 feet 6 inches wide at the top, and 4 feet wide at the bottom. The arch and the invert are both as nearly semicircular as they can in such a section be made, but the sides are straight lines (?)

Neither is Mr. Roe's section, nor is that proposed by Mr. Phillips, egg.shaped. They are only nearer approximations than those used in the city, for they are specially directed to be struck with compasses from defined centres; and you well know, Sir, that forms so described are necessarily untrue; such lines do not, and cannot flow smoothly into each other.

Herewith is sent an egg-shaped section, adapted to a height of 4 feet 6 inches, and main width of 2 feet 9 inches, struck upon that true principle, which at once manifests itself to the eye. The bounding line cuts through ordinates obtainable at as many points as judgment or caprice may determine.

Upon the same principle, any kind of eggshape (for the eggs of different birds differ much in form) or any ellipsis may be traced. But although none of your numerous correspondents have stumbled upon it, this is no new discovery; it was pointed out by Serlio, a few days before yesterday. Anent the best form of sewer. Is it not upon record, is it not notorious, that in all the metropolitan commissions, excepting that of Westminster, who are old fashioned Car. 2. Act of Parliamentsewer builders, and who have not, until lately, dared to depart from the legislative wisdom of their country, that, beyond the memory of most men now living, semicircular bottoms have been used? Does not every bricklayer's labourer know it as a grandfather's story? Has it not heen put upon record that such things appear to have been used by the architect of "the Horse guards?" And, after all,

in what amount of perfection does the eggshaped sewer exceed the oblong ?

The same kind of reasoning which assumes the one to be better than the other, would prove, not only that a parabolic or hyperbolic curve is preferable to the oviform, but that a lancet arched, or even an acutely triangular invert, is better than either. If we, on the contrary, take the plea of the Westminster folk, "that segment bottoms are more convenient for walking in," to be of very great importance, that will, if carried a little farther, demonstrate the good old Roman flat bottom to be still more perfect.

Truth to say, each form has its advantages, and I am only surprised that one convenience of a segment bottom, long since remarked by an engineer of no mean more, when advocating its superiority over the semicircle, has not been publicly paraded. "If the bottom should detent the standard set of superior

be washed out, you can more readily and at less cost put in another, for your walls would not need support, two-thirds of them resting upon the earth," and, considerately reflecting upon the erosive power of running water, who is to say that a semicircular bottom will not in process of time be cut through? Are not some of the oldest semicircular inverts beginning to yield to the internal enemy? Doubtless this will sound like a very heterodox notion now-a-days; but I do happen

Doubtless this will sound like a very heterodox notion now-a-days; but I do happen to know from an ear witness, that before a Committee of Inquiry of the House of Commons into the subject of sewage, one of the most eminent and largely experienced inquirers of the present day, himself well-pracused in sewage, and knowing well that segment bottoms and upright walls were used in the district, said deliberately; "I consider the Westminster Commission to be headquarters for all information with respect to sewers;" we, therefore, must not be much surprised at little doctors differing from little doctors, when such big-wigs have their odd fancies.

I cannot but think, Sir, that if you were to obtain all the reports of the respective metropolitan commissions in reply to the sweeping condemnation of the poor-law secretary, you would find something in them wherewith to refresh the public memory.

It is all very well to cry quack, quack, quack, and then to fancy that the wealth of heaven is to pour down at one's screaming; but I dare say that your correspondents E. E. and A. B. C. will be somewhat edified by reading at least Mr. Gwilt's sad confession, that once, and once only, when he was a much younger man, he did perpetrate an eggshaped sewer, of which he was ever afterwards most heartily ashamed; and his experience and his opinions are not those of an every-day man, albeit he does not uub himself " civil engineer."

man, albeit he does not une hinsen that engineer." What are the sections of the Roman cloaca maxima, and of the emissarium of the Alban Lake? Did they not answer their purpose? What are the sections of Sir Christopher Wren's sewers under St. Paul's? Was he no mathematician? Did he know nothing of the laws obeyed by running water? Who made streamlets and mighty rivers? Are their channels portions of an egg shape?

Again, Sir, we are told that egg-shaped sewers are stronger than any others. Your professional readers well know that form alone will not give strength—good materials and good workmanship we the main requisites of any structure which aims at durability; and had these been more attended to, we should have heard more tess of mere form of being s The world does talk of the necessity of all

The world does talk of the necessity of all seven builders being civit emgineers, and being certificated as such will you allow an old man to tell you a little story, once punched into his napper case, and now brought into recollection by poor old Dowley and his man THE BUILDER.

Doull, not answering some crabbed questions, to much a *leur dise* as might have been done by men of more brass, and, mayhap, fess experience.

The Bristol merchants once established a board for the examination of merchant' captains. Well, that all looked very nite and as it ought to be; but mark the result—a vessel needed a captain; a man offered'himself, and, after a few puzzlers, was rejected as unqualified for taking charge of a vessel. But this poor ignorant chap had a friend, possessing a good memory slong with some modest assurance. He crammed well; presented himself, swallowed all the puzzlers in a jiffy, passed a most splendid examination; and was duly dubbed captain. When all was done, he said: "Now, gentlemen, am I to consider myself master of this ship?" "Certainly." He rejoinded, "And a pretty set of fellows you are. I am a tailor. I never set my foot in sait-water in my life; I never saw sait-water but from the pier-head, and you have passed me as fit to be a captain, but have rejected my brother, who is a thorough old mariner,—has been to the South Seas and every part of the globe, and never once ran his ship upon a rock."

never once ran his ship upon a rock.' So ended the Bristol merchants' board of examination: I am, Mr. Editor, with my most Numble daty. "Of the Market States of K. Y. IZZARD.

FOREIGN ARCHITECTURAL AND COL-

Ruins of an Ancient Town in the Caroline Mands, Por the sake of better understanding the importance of this (albeit not yet averred) discovery, a few words on the systems or gan-glia of civilization --- as appearing in architec-tecture and other radii of social life, may be premieed. Amongst the most extended systems of sivilization is the Baddah-Indian; the Buddah-Ohinese; the Greek-Egyptian, Tolteque, &c.; all of which are also mightily and strongly typified in their respective styles of architec-ture. But it must be borne in mind, that if ruins drist in the Caroline (or other South-See) Islands, they would belong to none of the hitkerto known systems of civilization-thenas following from some Sydney periodicals which have come to hand. "Among the Caroline islands is Asconsto, about 11° north lat., disislands' is Ascensed, about 11° north lat, dis-covered some years ago by H. M. S. Raven, and not yet properly laid down in maps. A gentleman who subsequently "attid there for several months---reports the following :--- 'On this island, perhaps on others of the same group, the language of the aborigines is more harmonious than in other islands of the Pacific, a great many works while with yours. a great many words ending with vowels.----There are at, a place called *Tamen*, ruins of a town, now only accessible by boats, the water town, now only accessible by boats, the water reaching up to the staps, of the houses. The huge walls are overgrown with bread, cocoa-nut, and other, ancient trees, and the ruins occupy a space of several miles. The stones of these edifices are laid bed and quoin, exhi-biting a considerable degree of art. Some of the hewn stones are 20 feet long, by 3 feet 5 inches, and no cement or mortar uniting them was observed. The walls have door and window places, and the material seemed to be different from the rock in the immediate neigh-bourhood, "There is a mountain in the island, the rock of which is covered with symbolic figures; and more extensive ruins than the above are shift to trist in the interior. The babits of these islanders exhibit traces of a different social system, water being carried about after meals for washing hands, &c. When about after meals for washing hands, &c. When asked about the origin of these buildings, they say, that ' they were boilt by men now above.'" -Nothing more has been, of late, ascertained about this curfous discovery, or rather asser-tion, than that drawings of them are now on their way to England. 'A few concluding re-marks on philosophical drachilecture may find here a place. "The first relates to the observahere a place. "Phe first relates to the observa-tion, that "the wayes teach up to the steps of the houses."" With 'our present geological knowledge, 'It is by not means required to sup-pose (for the sake of explaining the fact), that a general flood of the Pacific has taken place since these structures were treated. It is the columns of the Temple of Berapis, near Puoz-soli, which will the do it to the plain explana-tion of this fact in shother way. It has em-barrasied archeologists and others for a long

time to explain, whence these lithadomi and other marine shells came, which had fastened on the surface of these columns, at a height of 46 feet above the level of the Mediterra-nean-of course, since they were erected. It has been, however, since ascertained, not only by geological induction, but by written documents — that the Temple of Serapis (and the surrounding terrain), has been first sub-merged under, and, after centuries, sgain up-heaved above the level of the sea; a fact men-tioned also in Prof. Lyell's "Geology." In how far this has also been the case with the South Sea Island ruins, we are, of course, not able to know. A second observation of the kind may conclude our remarks. If men have existed before our historical times—as it seems they have in the present instance, and if they possessed arts and civilization, architectural ruins may yet come within our reach; but merely by excavations, or by the geological upheaving of terrains, submerged under the level of the sea.-- [In recommending this notice to our distant readers, and those connected with the South Sea Islands, we beg to remind them, that if these ruins exist, there is a fame to be obtained by their accurate elucidation. But even the ascertaining that they are merely basalt rocks—or do not exist at all, would be a service to science.] The German Antiquarian Societies.-There

The German Antiquarian Societies.— There is scarcely a German state (some of them very small), where one of the above societies has not been established of late; many receiving even a fixed yearly income from the state, which—to say it by the by, pays and supports all or most public establishments, as hospitals, polytechnic drawing schools, &c. These societies, moreover, have a wider scope than the English hitherto had, calling themselves mostly, "Society for antiquarian and historical knowledge—Gesellschaft für vater ländicshe Geschichts und Alter thums Kunde. As such, every thing relating to the art, history, and the social condition of antiquity or the middle ages comes within their reach; as may be gathered from the following beads, copied from their transactions: "On the proportion of artisans' wages in the thirteenthand fourteenth centuries; on the origin, the regulations, and revenue of the alms-house or hospitals of ——; the mines and meltinghouses of Bohemia in the reign of Charles IV; on the life of the foresters and miners in the middle ages."—It will then appear, that the German antiquarians do not limit their exertions to mere stone, or brick and mortar—but extend them also to the *moral agencies*, which move and shape these things.

Bouch, — Peter Caspar William, Privy Councillor of his Majesty the King of Prussia; Director of the Board of Commerce, Trade, and Architecture; Member of the Council of State—was born at Cleve in 1782, the son of a burging the component of the studies physician. He soon became fond of the studies in which his father was engaged, who, besides his profession, occupied himself with natural and artistical science. Having completed his minor studies at Berlin, he went to the Uni-versity of Halle, where he studied law and polytechnics, and entered, in 1801, the service of the state in the department of commercial and manufactural affairs. Prince Hardenberg first distinguished the talents and business-tact young Beuth, and employed him in his nisterial department. When the minister of ministerial department. When the minister received, subsequently, the orders to arrange the financial affairs of Prussia, and to frame, for that purpose, a new code of taxes and trades' regulations, he made Beuth a member of the commission, which enacted the famous Regeneration Laws of 1810. During the war of 1813, the ministerial *employé* did not stand aloof, and enrolled as a volunteer. After the peace, he was made Councillor of Finances in After the the department of commerce and trade. In 1821 he became a member of the council of state, and director of the board of these departments, as well as that of architecture. During his whole career, Benth stood forth for the freedom of commerce and trade; contending for the principle, that the state had no right of interfering with trade and commerce, except if a general inconvenience was to be apprehended from misapplied egotism and the adulteration of articles of food, &c.-Beuth was amongst those, who considered it wrong to

• We copy from the extensive German work : "Konversations Lexicon der Gegenwark. Leipzig, Brochhmas, 1839-1843, pp. 484.

protect any trade or occupation in preference to an other, be it by taxation or other infringement, by which, after all, only the great built of consumers is injured. He proclaimed, that it was the bounden duty of the state—to direct and lead the numerous class of tradespeople by improving, by all means possible, their tech-nical, artistic, and acientific culture, and thereby enable them to compete with other nations in those articles, which lay most within their grasp (landesthümlich). The Prussian government encouraged and assisted him in every shape possible—and commissioned him with the execution of his plans, the list of which is really stupendous:—the foundation of the Trades' Institute at Berlin, and the provincial trades' schools; travels of distinguished pupils of the former to foreign parts, at the expense of the state; the publishing of costly and other useful works (hand-books)—especially pat-terns for tradespeople and manufacturers examples for mechanics, masons, and carpenthe execution of the great state buildings ters; and other structures in the Prussian empire; the introduction of manufactural improvement from the United States, England, and France, which Beuth had become acquainted with during his several travels to these countries; the distribution of costly, novel, approved in struments and implements, in numerous specimens, as patterns and prizes amongst thế tradesinen of the provinces; the establishment of industrial exhibitions; the total reconstruc-tion of the Berlin Academy of Building isto a general building school of the empire. For the sake of stimulating school of the empire. For artisans to self-siction (1), he founded, in 1821, the Association of Industry of Prassis (*Pereis für Gewerbsfleiss in Preussen*), of which he acted as chairman. When King Friderle William IV, ascended the throne, his majesty if endeavours to elevate the social condition of th nation by every possible means, found an adequate instrument in Bouth, who was subsequently knighted by the king, and con-tinued his useful exertions until a late period. His merits were acknowledged by diplomas and other distinctions at home and abroadto which the vote of their medal by the Royal Institute of British Architects has been the last, but not the least honourable token bestowed on a really practical and metal minisen

would, rather than expatiate on dinner-party anecdotes and the like, tell us the comparative unatomy of *public works*, and regulations re-lating thereto, abroad—the public would have, perhaps, less to read, but they would know more. Every inhabitant of this metropolis must have been shocked, more or less, by the must have been shocked, more or less, by the great bustle and confusion which very often take place on our *free* bridges, like the London and Westminster—the more so, as persons carrying more or less bulky loads, beams, &c., are often obstructing the passage, tossing and *reflecting* at each other to the, at times, bodily lesion of children and others. The good folks of Dresden and Prague, where the two finest bridges in Europe have existed for the last 400 years, have rather cleverly guarded against such inconvenience so far, at least, as it is possible. Either by regulations enacted to that effect, or a silent understanding amongst the bridge goers -- both, however, beyond the memory of present generation, it has been achieved, that persons passing in the same direction, keep the same side of the bridge. Thus, the flood moves on; still the bridge. same flood, but there is no tossing, no reflecting at each other-there is a circulation. đ moving elements, but no chaos. As this journal has, one amongst the first, taken ap the huge matter of metropolitan improvements, we may be permitted, briefly, to state how this could be effected here, without even seemingly encroaching on ideas of private liberty. a set of boards be put up, stating that such an arrangement is *requested* to take place from a certain date. At that period, a few bradles might be stationed at the four approaches to the bridges- to direct people the way they have to go. Thus, the next morning, the thing would be in a fair train, and as soon as we (the swinish multitude) be once ked that way-why, we should follow up the thing as ıl. usu

The verbiage of "modernity." -A strange incongruity begins to dawn oh our mind-if bigitized by **穿鱼虎」时间上到星界**。

we consider how much toe have talked, and how little doug. Our mountains of paper destined for eternity—tally but badly with our alructures, which tumble down, even before they have been completed. We have hundreds of books on the elevation of mankind—but the dwellings of our humbler classes resemble rather, styes than any thing else. We have miontely analyzed effluris and every sort of waste, and offsl—still they are accumulated beneats and around our cities, to make expe-riments, as it were, in anima vili. Our legisriments, as it were, in anima vili. Our legis-latures have debated most profusely every po-sition and principle of public and private law, in the abstract and concrete—save one, how to In the abstract and concrete—save one, how to make mankind live and exist in the way of human beings. Well may one be inclined to repeat to all of them: "Be gone—make room for practical men." [Isis of Oken.] "The "Journal of Public Instruction" of Paris contains the following remarks on the late regulation of the "university" system in France: "One of the main objects for which free how combined into societu—is education:

nfen have combined into society — is education; pay, these terms may be considered, after all, a synonymous; as an imperfect system of public Instruction implies a defect in the social condifiup, of the nation, and, therefore, in the government. Aside the greatest freedom of private instruction, the duty of the state to afford one, normal and most extensive to the mass of citizens, stands paramount. Nay, most of the highest walks of science, literature, and of the highest walks of science, literature, and art cannot be taught but in establishments be-lighting to the mation—the state. The surest control, however, as well as the surest cor-rective for any abuses or deficiences in the public schools (of any kind), are private insti-tutions, as well primary as of a higher stamp; as a people wall instructed even elementarily, will pever allow that error should remain en-thropied in the sanctuary of knowledge, or its public establishments perverted and made use of for sordid and private purposes. The Council of for sordid and private purposes. The Council of University, now called into renewed ex-istence, as one taken from amongst the number of teachers of every grade, will be the surest constitutional check on the abuses or the faults of the whole educational system of France." 595 THE BRITISH ARCH & OLOGICAL ASSOCIATION.

DEC. 17. The treasurer in the chair. Nearly Wenty thembers were elected, among whom were: Monsicar Gaizot, the Viscout San-tarem; Messicurs Ch. Lénormant, Letronne, Vietor Hügti, Baron Taylor, &c.

or Belgie Weapons in bronze, discovered in levelling a huge barrow on the estate of the Hon. Col. G. D. Damer, at Carne, Dorset, and Major Sheppard a stone celt picked up near Gissbury, Sassex! Mr. Syer Cuming commu-Giesbury, Sossex: Mr. Syer Cuming commu-niteated an account illustrated by enlarged drawingsofrumerous pilgrims' signs, medalets add tokens in lead, collected during excava-tions for the foundations of new London bridge. Mr. Planché read a letter from Mr. bridge. Mr. Planché read a letter from Mr. Mirk Anthony Lower, relative to further dis-coveriés at Lewes, which will be described in detail at the hext public meeting of the asso-ciation. Mr. Burkitt exhibited some ancient deeds recently brought to light, relating to

Mr. W. H. Brooke, of Hastings, who had been engaged on behalf of the association to prepare drawings of mural paintings lately discevered in Battel church, communicated his report thereon, and exhibited his coloured sketches, thirteen in number. The report give an elaborate account of the discovery, which, but for the prompt exertions of the cen-trial committee would have been fruitless to the antiquarian world, as the remains were quickly re-plastered and re-whitewashed, and no efforts were made by local authorities to preserve a record of them. They comprise many subjects, such as the trial and condem-nation of our Saviour, Michael conquering Satan, shints, martyrs, &c., executed in a good style of art, and so closely resembling in many is those discovered in Preston church, near Brighton (See Archaologia), that Mr. Brooke is findlined to ascribe them to the same artist.

1Mir. Crofton Croker, the secretary, informed the meeting that he had received a polite and kind reply to his application to Lord Lincoln,

of the association, at the suggestion of Sir Samuel Meyrick, relative to the abstraction of the sword from the statue of Charles I., at Charing cross. This lordship had ordered an investigation to be set on foot, and at the same time stated, that any representations made by the association, relative to the better conserva-tion of ancient national monuments, would at all times meet his attention. Mr. Jewitt exhibited drawings in illustration

of a paper on the history and architectural peculiarities of St. Giles's church, Shrewsbury, which, by reason of its length, was postponed to the next meeting. Mr. Price inquired whether the committee

had received any intelligence of the threatened distruction of Bittorn manor-house and grounds, the site of the Roman Clausentum, near South-

ampton, by a proposed line of railway from London, Guildford, and Petersfield. Mr. Roach Smith congratulated the associa-tion upon the great activity of its members, in anticipating the disastrous effects of the spirt of destructiveness, and in sounding an alarm in time. The committee had already received information respecting the subject of Mr. Price's inquiry, and were prepared to adopt measures which he had no doubt, would preserve the interesting and classic spot (the property of Mrs. Stuart Hall, an associate of

the association), from violation. The meetings were then adjourned to the 14th of January.

COMPLAINT AGAINST THE DISTRICT SURVEYOR OF LEWISHAM.

THE following communication has been ad-dressed to us by Mr. Badger. SIR,—Having had my attention directed to the leading article of the last number of your publication (13th inst), containing strictures upon several of the metropolitan district surveyors, and in which also is inserted a letter with the signature of Nicholas Metherell, in with the signature of Nicholas Metherell, in reference to a certain transaction concerning myself, who therein gives a palpably incorrect and unfounded statement of particulars, I have to request that you will, as an act of justice, disabuse the public mind by finding a place in your columns for this communication and the your columns for this communication, and the subjoined letter of Mr. Whitmarsh, of the Green Man Hotel, Blackheath, who has kindly fur-nished the facts to which he alone was privy as regards myself, and who also disclaims the honour of Mr. Metherell's acquaintance. Mr. Whitmarsh's letter is in my possession, and may be seen by any party desirous of fur-ther satisfaction on that point. I shall only ibstance, in proof of the accuracy of the facts particularized with such exemplary minuteness particularized with such exemplary minuteness of detail by your correspondent, and upon whom you seem to have placed full reliance, Mr. M. gives the dimensions of the sign-board 5 feet by 3 feet; it setually is found to be 11 feet 8 inches by 3 feet 6 inches, and is fixed with bight budgets and not four as teted. eight holdfasts, and not four, as stated. These matters, however unimportant in themselves, yet I deem worthy of notice, as shewing the value of the testimony upon which the attempt has been made to affix a stigma upon my conduct.—I am, Sir, &c., CHARLES ROBERT BADGER.

Holwell-place, Blackheath-road, 17th Dec., 1845.

Blackheath, Dec. 16th, 1845. DEAR SIE,-I beg to state that you did not desire to exact thirty shillings for the fixing of the sign-board against the stable wall which Mr. Tomlinson rents of me, but stated, that he was liable for that amount, not having given notice. You also stated, that you had to make up your monthly account, and that your charge was tan shillings, which I paid you for Mr. Tamlinson. — I remain, yours truly, Thos. Whitmansh.

To C. Budger, Eeq., &c.

Wefeel it accessary first to remark, that preions to: the secting of these letters, we were ignorant of the hantep of the district survey complained (of)not being aware that Mr. Badger's district included Blackheath.

We immediately seat to sur informant re-quing that the should we statiste his statement, or retract, it, and the following is his replyment to barrie

SIR,-On the 3rd of December Mr. Tomlineon selicited my opinion, after shewing me

the sign board, saying the district surveyer has made me pay los, or fixing it; be wanted 30s., and if I can I will trounce him for it (meaning prosecute). I told Mr. Tomliason that I could not sufficiently inform him sy as that I could not sufficiently inform bin by as to guide him in any ulterior, proceeding, but that THE BUILDER would perhaps give an opinion if asked. He then requested me to write, and be repeated that he had paidl 05, and that the district surveyor wanted 30a., and he shewed me the receipt for 10s. On the appearance of my statement in THE BUILDEE on the 13th imitant, I went, to him, and he again said what I had written was correct. On my receiving an intimation from THE BUILDER that Mr. Badger had denied the truth of my statement in ZHE

the truth of my statement, I again went to see Mr. Tomlinson, who wished me to go with him and see Mr. Whitmarsh on the subject (till now I was not awars Mr. Whitmarsh had any thing to do in the matter), Mr. Whitmarsh then told me that Mr. Badger had called, and in a very humble manner, supplicated him to enable him (Mr. Badger) to clear himself be-fore his brother district surveyors, who were disposed to cansure him for what soppared in THE BUILDER. Mr. Whitmarsh said he did then write a statement for him, in some degree altering the appearance of the complaint and the same under the same under the same under the same under the same under the same under the same under the same under the same the wrote for her. Badger

was a mere act of kindness 10 AA MOITS OF On Friday last, I received from Mar Badger a letter threatening legal proceedings, unless I woold insert in Tum Bustone ademist of the truth of my statements and mediaght M. Mr. Whitmarch and Mr. Toulisson shay ap-peared surprised. Mr. Toulisson soid, Mr. Badger did demand 30s, and Mr. Whitmarch assured me that whatever he spight have writ-ten on babil of Mr. Badger was from the ten on behalf of Mr. Badger was from the peculiar manner in which he was soligited, and on account of his situation as a public officer! Mr. Whitmarsh adds more, " if I am in give evidence in this matter in a count of justice and on oathy I shall be obliged to may that the demand was tantamount to a demand of 30m and if what I wrote on his babalf, he hald an

THE BUILDER.

COLOURED DECORATIONS TUINO

Ar a meeting of the Decorative Art Stictety, on Dec. 10th, a continuitation of the paper " On Chromatic Decorations 'a England," Teported p. 588, aug., was read by Mr. E. Cooper. "He commenced by noticing the profitesive regard for coloured decorational "schildfull further the Norman and Cothic goodies," sittifuing to the simple effect produced by the political birble the rich grandeur of the earlier "schildd-grass windows at York and classibler," with the at-tendant painted decorations, on "ceilings" and walls, and the pavements of encaustic Hies. He attempted to elucidate the principles which predominate in the latter examples, by explain-ing the general application of the three pri-mary colours, and the more usual construction of the designs. He then noticed the stainedglass windows at King's College Chapel, Cam-bridge, where the whole of the subject and detail are designed with a feeling of the re-naissance (it is supposed by Guillo Romano). He said, from personal observation, that nearly all the coloured glass is what is technically termed pot-metal, and that where it is not so, as probably in the finest colours, it is enam-elled glass, and he observed that drawing and abadim ware allowed unart that an identificant elled glass, and he observed that drawing and ahading were placed, upon these, as is evident from their disappearance in unany cases, leav-ing the pot-metal only. A disconsinance was aljuded to, arising from the colours of back-ground and foreground in pictorial subjects being of the same intensity, and a method of producing light and distance by removing more or less from the thickness of the enamel, whe suggested as applicable to windows, and a specimen was exhibited. The lecturer then commented on the agreeable effect of stainedglass windows where the walls are of a simple or uniform colour, but urged careful consider or neutorm colour, but urged careful consider-stion when the walls are decorated with pic-tures; he observed that the altar-piece by Raphael, at King's College Chapel, is entirely neutralized in effect by the overwhelming coloured rays of light entering in every direc-tion urgers is the available of Cochition upon it; the earlier examples of Gothic windows were said to allow the transmission windows were said to allow the transmission of a greater proportion of pure light. The incient coloured glass had no superiority over that now producible, and the prevalent opi-pion of interiority had arisen from the greater use of painted glass instead of pot-metal, or enamelled glass. After some remarks on encaustic tiles (from specimens from Reading Abbey), and the peculiarities of Gothic drawing, colouring, and sculpture, he described some examples of transition or mixed Gothic and Italian characters, in the ceiling of the Chapel Royal, St. James's, and the chapel of Bishop West, in Ely Cathedral; and sho the fine specimen of baronial decorations fately, restored at Hampton Court. He then took occasion to censure the manner in which some of the coloured decorations in the spandrila below the windows of the aisles in Westminestmin ster Abbey have been destroyed or concealed by the misplaced and absurd mythological moby the misplaced and absurd mythological mo-numental tablets, and he noticed some fine and well-known examples of "high tombs," richly ornamented with marbles, colour, and gilding. The decorations of the Elizabethan period, were noticed, and a fine specimen of embossed silvered and coloured leather hangings from

the manor house, Billingshurst, was exhibited. The introduction of Italian architecture by The introduction of Italian architecture by Charles, led to the consideration of the ceiling of the Banqueting House, Whitehall, painted by Rubens; also of the works by Thornhill, Verrio, Sanguerre, and Charles de la Fosse, at Greenwich Hospital; St. Paul's, Chatsworth, and Montague House, now the British Museum. At present, he remarked, there appears to be a struggie for supremacy between the Gothic and struggle for supremacy between the Gothic and Italian styles; and 'in his criticism' on some Italiaa styles; and in his criticism of "some recent decorations, expressed an opision that the imitations have been unwetcoessfully ap-plied; instancing those in the Temple Church as partaking too freely of yellow orbroogs tint; the Ruyal Exchange its being too paise for their purpose return for the transferrer of the ornament; develd of any supportion of stating or design, and matchiel with the base state any effect that the archite is determined as grant plated. After some is determined by grant of is views on domestic decorations of the pred-sent day, Mr. Cooper submitted at the some to the applicability of Gothic decorations to the applicability of Gothic decorations to

Tomte PATHO century pone of the great cities of the presen day were paved, except Rome and Cordova day were paved, coopt Rohe and Cordova Pariacid and any this advantage, according the Rigord, physicias and historias to Philippe Auguste, who, relates that the king, being at the window of his palace, which comminded a view of the Step, perceived that the cer-riages manuffing the palace, which comminded a view of the step, perceived that the cer-riages manuffing the bire diffused a most offensive addur, which induced him to issue an order for the paring of the streets, not with standing the expense, of it, the dread of incurring which, he was aware, had hitherto defarred his predecessors. Since that period the city took the name of Paris, instead of its aloughs. Even London was not paved at that time, many of its principal streets were not thus improved till the 15th century. Holborn was done in 1417. Dajon commenced the paving of the streets in 1391. In 1285 an order from Philippe-le-Hardi commauded the citizens of Paris to pave and sweep the streets before their houses at their own expense; but before their houses at their own expense; but this mandate was so badly executed that in 1309 the city was swept at the public cost, under the inspection of the police. Till the fourteenth century, the inhabitants of Paris were suffered to throw, every nuisance from the windows, provided they cried out three times "Take care "This license was Inter-dicted in 1377, and still, more strictly in 1395. An order was also issued to prevent pigs run-ing through the skeets, in consequence of the accident which happened to the young Kings Philippe. That prince, returning from Rheims where he went to be crowned, while passing Saint Gervais, a pig sashed between his horse's, legs, and threw him down. The king fells backwards, and, in a few days, died of their injuries he had sustained in the fall.—Shorpe a London Magazine. before their houses at their own expense; but London Magazine.

BUILDER.

CHURCH ARCHITECTUBE.—A work of sement value, illustrating the various styles of wood-1 work in church architecture is at present in progress. The author, Mr. Bury, proposes to give perspective views and measured depi-tails of ancient pulpits, lecterns, stalls, screens... roofs, and other wooden fittings, engraved-by himself from his own sketches and meas-surements. A good work on this subject have long been called for, and it is to be hopedy that Mr. Bury will be encouraged to perse-vere in his undertaking; and that one new suit may be the preservation of drawings offi-many valuable relics, which, in spite of all efforts, are from time to time disappearing... The first part is now very nearly completed. CHUNOM ARCHITECTUBE.- A work of se The first part is now very nearly completed, and we are able to say, that the execution of the work will be in accordance with the im-portance of the subject. The book will be \$104. and each part will contain about 21 plates.

ARCHITECTURAL ANTIQUITIES OF SCOT-LAND. — We learn with much gratification, that the illustration of Scottish antiquities, with both pen and pencil, is at last about to be undertaken in a manner worthy of the subject. undertaken in a manner worthy of the subject. Fifteen years ago, Mr. Burn, the architect, mouted the subject, prompted solely by desire to see the antiquities of his country efficiently pourtrayed, but was unable to bring his project to bear. It is now, however, to be undertaken with his assistance by Mr. Billings, and pro-mises to be a most important work. A limited edition will be issued, with copious details for the professional man. Messrs. Blackwood are the publishers. Bourn. Mr. Burford's panorama of this

are the publishers. ROUKN.-Mr. Burford's panorama of this interesting city gives a faithful and wonder-fully effective representation of it, and as a work of art, merits great commendation. These who have not seen Rouen, and those who have, will alike derive pleasure from a visit to the gallery in Leicester-square.

PAYNE'S PATENT PROCESS FOR THE PRESER VATION AND IMPROVEMENT OF TIMBER, &c.

VATION AND IMPROVEMENT OF TIMBER, &c. **D** AYNE and LODER, beg to invite the at-tention of Engineers, Railway Companies, Architects, and others to the above process, and to state that they are prepared to erset the necessary apparatus in any part of the united Kingdom where the quantity is sufficiently large to eover the outlay of its removal. Further particulars can be obtained at Whitehall-Wharf Cannon-row, Westminster, or at their other stations, Fleet-wood-on-Wyre, Lancashire ; Wisbeach, Cambridgeshire; Union-Wharf, Bouthampton ; and Guildford, Surrey.

SIR WILLIAM BURNETT'S PATENT for the Preservation of Timber, Canvas, Cordage, Cot-ton, Woollen, &c., from Decay.

TESTIMONIALS,

ton, Woollen, Rc., from Leczy. TESTIMONIALS, From THOMAS GRAMAN, ESQ., M.A., F.R.S., L. and E., Professor of Chemistry, University College, London. "After making several experiments on wood prepared by the solution of chloride of sinc for the purpose of preserva-tion, and given the subject my best consideration. I have come to the following conclusions. "The wood appears to be fully and deeply penetrated by the metallic salt: I have found it in the centre of a large prepared paving block. "The atl, although very soluble, does not leave the wood y easily when exposed to the weather, or buried in dry or damp earth. It does not come to the surface of the wood by effor-essence, like the crystallizable salts. I have no doubt, indeed, that the greater part of the salts will remain in the wood is ex-pased to the attacks of insects, such as the whiteant in India, which I believe would be repelled by the poisonous metallic salt. "I deer being long macerated in cold water, or even boiled

posed to the attacks of insects, such as the white ant in India, which I believe would be repelled by the poisonous metallic salt. "After being long macerated in cold water, or even boiled in water, thin chips of the prepared wood retain a sensible quantity of the oxide of sinc; which I confirmed by Mr. Toplie's test, and observing that the wood can be permanently dyed from being clarged with a metallic mordant. "I have no doubt, from repeated observations made during several years, of the valuable preservative qualities of the solution of chloride of zinc, as applied in Sir. W. Burnett's process; and woold refer its beneficial action chiefly to the small quantity of the metallic salt which is permanently re-tained by the ligneous fibre in all circumstances of exposure. The oxide of zinc appears to alter and harden the rises of wood, and destroy the solubility, and prevent the tendency to decomposition of the asotised principles it contains, by entering into chemical combination with them. (Signed) "THOMAS GRAHAM." "University College, 25th October, 1845. From Professors BEANDE and COOPER. "Ista,—We have this day again examined the specimens of canvas and wood prepared according to the specification of your patent, and which, in the month of April, 1844, we placed in a damp cellar, where they have remained up to this date. "We are now enabled satisfactorily to corroborate the

of canvas and wood prepared according to the specification of your patent, and which, in the month of April, 1844, we placed in a damp cellar, where they have remained up to this date. "We are now enabled satisfactorily to corroborate the favourable opinion expressed in our former report. The ennyas remains amply protected from all fungous vegetation and rottenness, while a corresponding sample of the same piece, which had not been prepared by immersion in the solution of chloride of zinc, is entirely decayed, being mouldy, rotten, black, and in places resembles timber. "We have also lately compared the atrength of a fibre of a piece of canvas which we prepared according to your specification, in October, 1844, with that of the fibre of the same canvas, unprepared, and find that it has in that respect sustained ne injury. We are therefore of opinion that your process will not, after any lapse of time, tend to deteriorate the strength of the fibres of the substances in question. "In regard to the several samples of different apecies of wood above adverted to, cach of which was cut into two, one half being imbude according to the directions of your speci-fication with the dilute solution of chloride of zinc, while the other half was left in its original condition, we have also to make a favourable report, and to repeat our opinian of the effleacy of your process as a preventive of dry ret, and similar sources of decay; the unprepared specimens tre manifesting symptoms of decay and mildew, while those which have been protected by your preparation are clean and sound.--(Signed) "WILLIAM THOMAS BRANDE.
